The note on which I wish to end my first statement is that of efficiency and modernisation of our methods. I have seen many improvements at home and overseas in recent years. Good evidence of this at home is the computer which Mr. Michie opened on 30th December last. In India and our other territories there are varying degrees of mechanisation in different branches. What is right in one place may not be right elsewhere. And our staff must be carried along with our plans. But in the long run the test whether the service we provide will be preferred to the service of others is the test of efficiency, coupled of course with the human understanding of our customers' needs of which the three forbears of this Bank have always been proud. We intend to see that with the co-operation of our staff we use the best machinery and methods that are appropriate to each of our branches. The quality of service we offer shall be second to none.

RECORDS AND STATISTICS

Economic Survey: 1963-64

THE OFFICIAL survey of the Indian economy, which was distributed along with the budget papers in the past, was released during the current week. It is divided into two parts; the first part deals with a general review of the economy with emphasis on the future outlook and the tasks ahead, while the second part provides an analysis of agriculture, industrial production, coal and power, railways, budgetary transactions, monetary trends, capital market trends, prices, balance of payments and external assistance. We reproduce below both the parts:

In agriculture there was a decline in 1962-63 compared with the high-level attained in 1961-62, resulting in reduced availability of some essential articles of consumption, industrial production continued its upward trend. The overall rate of growth was not, however, commensurate with earlier expectations, and attention was sharply focussed on this in the review that was made in the middle of the year of the progress of the Plan as a whole. Considerable thought was, therefore, given to the problem of accelerating the rate of economic growth. It was recognised that improvements had to be effected in the implementation of the agricultural programme and in the execution and working of many public sector undertakings. The fiscal and monetary situation was also reviewed and a number of measures were taken in the latter part of the year to revive the capital market, to stimulate investment and output, to extend social security and to provide such relief to the consumer as was consistent with the claims of defence and development.

The Budget for 1963-64

Defence expenditure in 1962-63 was Rs. 505 crores according to Revised Estimates, representing an increase of Rs. 192 crores above the level in 1961-62. The Budget for 1963-64 made a provision for a further and substantial increase to a total of Rs. 867 crores. In accordance with the decision of the National Development Council, the development programme was strengthened alongside the increase in defence expeditures and the Budget made a provision for increasing the outlay on the Plan from Rs. 1,414 crores to Rs. 1,654 crores. A very considerable tax effort was needed to provide for the increased outlays and the Central and State Budgets sought to raise Rs. 334 crores through additional taxation and increases in railway fares and freights and postal charges. The Budget envisaged that the increase in Government expenditure would be financed primarily by additional tax revenues and efforts to mobilise private savings through market borrowings, small savings collections, etc. Nevertheless, the budgetary deficit was estimated to be Rs. 181 crores at the Centre, though every effort was to be made to reduce this.

The substantial rise in taxation was designed not only to raise revenue but to discourage in particular the consumption of items which had to be imported or for which an increase in demand was expected in the wake of the defence effort. It is noteworthy that as a result of the increase in taxes on kerosene, for instance, the rising trend in cosumption which had to be met by imports was checked, giving relief to the balance of payments.

In some respects, the budgetary provision for expenditure at the Centre had to be increased in the course of the year. The provision for Central assistance to the States for their plans, for example, was raised from Rs. 450 crores to Rs. 500 crores in October, 1963 and a further increase of Rs. 15 crores had to be sanctioned subsequently. On the side of receipts, while tax collections have been higher than expected, market borrowings were somewhat lower than envisaged in the Budget Estimates. The increase in the rates of return and the liberalisation of the limits of individual subscriptions stimulated small savings, net collections of which amounted to Rs. 71 crores in the first nine months of 1963-64 as against Rs. 30 crores in the corresponding period of 1962-63. Altogether, when the fiscal situation was reviewed towards the end of 1963, it was reckoned that, allowing for likely shortfalls in expenditure, the budgetary deficit of the Centre would be lower than the Budget estimate of Rs. 181 crores.

Production Trends

Agricultural production as a whole declined by 3.3 per cent in the 1962-63 crop season. The output of rice fell by 2.8 million tonnes or 8 per cent, and of sugarcane and wheat by about 7.5 per cent each. The state of agricultural production in 1962-63 was relevant for the supplies, in the earlier part of the year, of consumer articles as also of raw materials for several important industries. The cotton crop had recovered from the low level of the previous year and had reached 5.3 million bales in 1962-63; and the total production of cloth during the first half of 1963-64 was 3,468 million metres as against 3,339 million metres in the second half of the previous year. Although jute and mesta production declined, the production of jute manufactures increased since adequate stocks of jute were available and foreign demand was satisfactory. The decline in sugarcane production and the diversion of cane to the manufacture of gur and khandsari led to a sharp fall in the output of crystal sugar.

The availabilities of power and transport and of basic materials such as coal increased and shortages were relieved. Electricity generated was higher by 16 per cent in the first half of 1963-64 as compared with the corresponding period of 1962-63. The goods traffic carried by the railways went up by 10 per cent. The production of steel reached full capacity level towards the end of 1962-63 and aluminium output rose as a result of substantial additional capacity coming into production. The marked increases in the production of coal and cement achieved in the second half of 1962-63 were on the whole maintained, though demand for the latter continued to be in excess of supply. Machine tools, electrical machinery, transport equipment such as railway wagons and trucks and other items of capital equipment were produced in larger quantities. In engineering industries, increases in output were facilitated by increased indigenous content of production. Altogether, industrial output in the first half of the year under review showed an increase of 8.5 per cent over April-September 1962. These trends are expected to continue in the second half of the year also, and industrial production during 1963-64 as a whole should show an increase comparable to that in the previous year.

Prices & Short-term Measures

The decline in agricultural production and the consequent scarcity of supplies of consumables had begun to exert a pressure on prices during the early months of 1963. Accordingly, apart from limiting the scale of deficit financing, the Budget for 1963-64 had avoided large increases in indirect taxation on items of mass consumption which were produced domestically. Even so, there has been a steady upward pressure on prices in general over most of the year. Sugar prices had started rising from January 1963 and rice prices which had declined between October 1962 and March 1963 by 3 per cent went up between April and October 1963 by as much as 17½ per cent. The rise in rice prices was particularly sharp in West Bengal and Madhya Pradesh where the production of rice had shown a large decline. There was also a marked

increase in rice prices in Orissa and Maharashtra and, later in the year, in Andhra Pradesh, Madras and Kerala.

The situation was sought to be met by larger releases of rice and wheat from Central stocks to the States affected by the scarcity and by an increase in the number of fair price shops and consumer co-operatives. Larger imports of rice were also arranged. In the case of sugar, price and distribution controls were re-imposed in April 1963.

The normal seasonal tendency for wholesale prices in general to decline over the second half of the fiscal year has not been in evidence during the current year. The wholesale price index (1952-53 = 100) which had reached 136 at the end of October 1963 declined to 134 by the end of November, but it rose again in December and on January 25, it was 137. Rice prices have indeed declined since October—on an average by 8.5 per cent, the decline being marked in particular States where a sharp increase had occurred earlier. Even so, by the end of January 1964 they were 10 per cent higher than a year ago. Edible oil prices have fallen and gur prices have also shown a sharp decline since October. It is disturbing, however, that there has been a marked increase in prices of wheat, inferior cereals like jowar and of cotton in recent months.

The rise in the price level has been a matter of major concern throughout the year. To give relief to the lower income groups, the Compulsory Deposit Scheme was withdrawn in September 1963 so far as non-income tax-payers were concerned. There was an increase in pensions and a liberalisation of the terms of the Family Pension Scheme for Government employees in addition to compensation for the rise in cost of living. A number of steps are also being taken to reverse the rising trend in prices. In view of the expected larger crop of rice, Government have decided to step up the procurement programme with the object of building up a substantial stock. State Governments have been advised to stipulate margins to be maintained by traders and also to regulate trading practices through more effective supervision and inspecttion of trade transactions. Restrictions have been imposed on the movement of cotton in some areas and imports are being arranged. While these remedial measures are being taken, it is becoming increasingly clear that the primary approach to price stability has to be in terms of stimulating production and productivity.

Measures to Stimulate Production

The assurance of a fair minimum return has in recent years been recognised as being necessary to secure higher levels of agricultural production. The price support and buffer stock schemes for raw jute had resulted in increased output in 1961-62 and comfortable stock position since then. During the year under review, minimum prices of wheat and procurement prices of rice were raised. Minimum prices of jowar were also fixed for the first time, thus extending the coverage of the price support schemes to major food and commercial crops. In order to encourage the cultivation of sugarcane and improve the yield and quality, the minimum prices of sugarcane were increased. Fiscal incentives were also given to factories to stimulate larger production of sugar during the 1963-64 season.

Considerable attention has been given to the intensification of agricultural programmes since the Emergency. The "package" approach was extended to the production of important commercial crops in view of the increasing requirements of industry and exports. In July 1963 an Agricultural Refinance Corporation was set up to facilitate medium and long-term credit for the development of agriculture and allied activities.

Reappraisal by the National Development Council of the third five-year Plan in November 1963 indicated that a concerted drive was necessary to achieve the 5 per cent annual rate growth visualised at the beginning of the Plan and that improved organisation was required particularly in the field of agriculture. Following this reappraisal, an Agricultural Production Board, with the Central Ministers and a Member of the Planning Commission as members, was set up to ensure an integrated approach in matters of agricultural policy.

Both fiscal and price policies were employed to stimulate production in priority industries. An increase in price for additional production was allowed in 1962-63 to the cement industry as a result of which it was able to maintain high levels of production during the current year. The development rebate for the coal industry was increased from 20 per cent to 35 per cent with a view to encouraging investment and output. While the basic import duties on machinery were raised, concession was given for coal mining machinery and fertiliser manufacturing equipment.

Equitable Returns

There has been increasing recognition of the fact that while a measure of control over basic items in short supply is necessary in a planned economy, it is equally important to ensure that basic industries secure returns adequate to finance expansion and to attract capital which would otherwise go into non-priority industries. Apart from this, controls in actual operation over a long period do not always serve the purposes for which they were set up so that a continuing examination of the operation of controls is an important task of policy. In keeping with these considerations, price and distribution controls on 16 commodities including rayon yarn, staple fibre, various chemicals, soap and natural rubber were removed during the year. The problems of steel, coal and electricity have naturally called for more detailed examination. A committee of economists has reviewed the operation of the distribution and price controls on steel. The question of adjusting electricity tariffs in order to secure an adequate return on power generation and the need for revision of coal prices have been examined by inter-departmental committees. The recommendations of these committees are under consideration.

A number of steps to improve industrial efficiency and speed up the process of development were taken. In the public sector, measures were adopted to strengthen management and expedite decision making. The procedures with regard to the control of expansion of industrial capacity in the private sector were simplified. Arrangements were made to take prompt decisions on proposals submitted by potential foreign investors. The exemption limit for licensing under the Industries (Development and Regulation) Act was raised to Rs. 25 lakhs of fixed assets and capital issues below this amount were also freed from control. A committee of non-officials and officials recommended a revised procedure for considering applications for establishing capacity in certain key industries, and its proposals were accepted by Government. At the same time, the laws relating to banking and company operations were amended to provide safeguards against the concentration of economic power and against malpractices in business administration.

There had been a slackening in the raising of fresh capital and in the starting of new projects by private industry after the Emergency. While the foreign exchange required for import of equipment, components. etc. remained scarce, in the case of projects for which foreign exchange had been arranged, difficulties of rupee finance needed to be removed. Steps were therefore taken towards the end of the year to stimulate the flow of savings into industries of high priority. In order to enable priority projects to move forward, additional financial resources were made available by Government to the IFC and the ICICI, and as a measure of immediate relief it was announced that no premia for Emergency Risk Insurance would be collected during January-March 1964.

As longer-term measures, a Unit Trust was set up to channel small savings into industrial investment and Government announced that a Development Bank would be established

to finance private industrial expansion. The Bank will co-ordinate the activities of existing financial institutions and give assistance for the promotion of key industries as also industries requiring special assistance.

In the slack season of 1963 there was an unusually large contraction of bank credit to the private sector. Government borrowings from the banking system were significantly larger than in the previous year and money supply with the public increased substantially. The deposit resources of the banking system expanded; but time deposits increased less than demand deposits, partly as a result of the offer by non-financial institutions of high rates of return on funds deposited with them. After a review of monetary trends, a modification was made in the Reserve Bank's policy in regard to accommodation to the scheduled banks to enable them to meet the genuine credit needs during the busy season.

The expansion of bank credit to the private sector during the first two and a half months of the current busy season (November to mid-January) was substantially larger than in the corresponding period of the previous year whereas Government borrowings from the banking system have been significantly smaller. In part, the larger credit creation for the private sector reflected the expected increase in agricultural production and the replenishment of stocks which, in all probability, were run down during the previous year. It will, nevertheless, be necessary to keep a careful watch on credit trends with a view to ensuring that credit expansion does not lead to speculative hoarding of commodities. The accent of monetary policy will also necessarily have to be on realistic interest rates which reflect adequately the real cost of capital to the economy.

Balance of Payments

A major task of policy in recent years has been to conserve scarce foreign exchange resources and to secure progressive increases in export earnings. The budget for 1963-64 had, as noted earlier, increased import and excise duties with a view to curtail the consumption of commodities which were chiefly imported. The increase in direct taxation was accompanied by concessions in respect of exports. The gold policy of Government has also been directed towards conservation of foreign exchange which financed the smuggling of gold and while some features of the Gold Control were eased to meet the transitional problem arising from the unemployment of goldsmiths, there can be no slackening of the effort to discourage the use of gold in the country.

These and other measures have resulted in a degree of improvement in the balance of payments position during 1963-64. The level of sterling balances at the beginning of 1963-64 was about the same as at the beginning of 1962-63 and it is expected that the position at the end of 1963-64 would be no worse. There is, however, one major improvement in 1963-64 as compared with 1962-63. In 1963-64, India will have repaid a part of its drawals from the International Monetary Fund, while in 1962-63, it had actually borrowed from the International Monetary Fund.

The increase in export earnings over the previous year has been a major factor contributing towards this improvement. During April-November 1963, export earnings were Rs. 512 crores, i.e. Rs. 56 crores higher than in the corresponding period of the previous year and the rising trend in exports continues. On the import side, a higher proportion has been financed out of the external assistance which India receives from friendly countries. The improved utilisation is, in part, attributable to the delivery of plant and machinery ordered against earlier credits and in part due to a larger proportion of external aid being available in non-project form. It is important for the economy to speed up the utilisation of external assistance and a high-level committee was appointed to examine the problem. Its report is awaited.

Valuable as external assistance has been in promoting economic development and in achieving stability in the external balance, the growth in the external debt falling due for repayment over the next few years has become a matter of concern. The growing debt repayment burden underlines the paramount importance of strengthening the balance of payments as well as the need for avoiding arrangements for financing imports which result in short and medium-term payment liabilities and entail high interest charges.

Outlook & Tasks Ahead

In the ultimate analysis, a lasting solution to India's major economic problems can be sought only within the framework of a rapidly expanding economy. The need for accelerating the pace of growth has become all the greater in the context of substantially larger defence requirements. At the same time, the acceleration of economic growth must be achieved in an environment of reasonable stability of prices if the levels of living at the most vulnerable points in the society are to be protected and raised and if the economy as a whole is to be freed progresively from dependence on external assistance.

There are indications that the rise in national income in real terms will be higher in 1963-64 than in the first two years of the current Plan. The potential for a rapid rate of development has been built up as a result of the investment and effort already made in the past. Advance action is also being taken in relation to some of the schemes to be executed during the fourth Plan period. The favourable situation in regard to transport, power, and the like which exists now will have to be made full use of so as to push production and incomes to still higher levels during the remaining years of the current Plan. The paragraphs below indicate in brief the progress in basic sectors which is likely to occur as a result of present efforts and to suggest areas where further efforts will be necessary.

Agricultural output has been rising at an average annual rate of 3.5 per cent over the last 12 years. It would appear that significant returns are being secured from the investments in the agricultural sector. The increase in the utilisation rate of irrigation potential from 50 per cent in 1955-56 to 71 per cent at the end of the second Plan and around 80 per cent in the current year, indicates that the capital investment is being more productively employed.

The gross irrigation potential of major and medium schemes is expected to rise by 6.8 million acres during the last two years of the third Plan, as compared to an increase of 3.5 million acres during 1962-63 and 1963-64 and utilisation is expected to improve further. In 1964-65 an additional area of 3.2 million acres is expected to be brought under minor irrigation and soil conservation programmes should cover an additional area of 2.8 million acres. The substantial increase in supplies of fertilisers should also have an impact on agricultural output. The consumption of nitrogenous fertilisers (in terms of nitrogen) rose from 193,000 tonnes in 1960-61 to around 450,000 tonnes in 1963-64, and is expected to rise further to 570,000 tonnes in 1964-65 and 750,000 tonnes in 1965-66. The availability in adequate quantities of improved seeds has been important in raising output; and an additional area of 21 million acres is proposed to be brought under improved seeds in 1964-65. Similarly, supplies of pesticides, of bulk storage facilities and of credit for productive purposes will be substantially larger. Altogether, the flow of productive inputs to agriculture will be considerably higher, and the dependence on weather conditions should be further reduced.

That an expanding agricultural economy is essential to progress in other spheres is generally recognised. Without agriculture making its proper contribution, it would be difficult to secure the desired increase in national income, in savings or in exports; nor could costs and prices be held down to let development proceed smoothly. The success of an agricultural programme, however, depends ultimately on what happens at the farm level, on whether or not adequate arrangements exist to provide the individual farmers with the knowledge, the resources and above all the incentives needed for additional production. The intensive district development programmes and the package programmes for cotton, oilseeds and sugarcane provide a part of the answer to the organisational problem, and the creation of the Agricultural Production Board, the appointment of a Production Commissioner for commercial crops and the decision to deploy study teams to go into the problems of individual States are also important steps in the same direction. However, in the case of commercial crops like cotton, oilseeds and jute, where speedier progress has become imperative in the overall context, the time has come to consider whether the existing machinery should not be further strengthened to ensure that these commodities receive the specialised attention that is needed to secure quicker results.

Among agriculture-based industries, the jute mills have been able to utilise the additional supplies of raw jute efficiently as a result of the modernisation of equipment. The progress of modernisation of the cotton textile industry has, on the other hand, been slow. The expansion of capacity, particularly for the production of yarn, and modernisation need to be undertaken speedily to meet the increase in demand for cotton cloth as a result of higher incomes and population growth and to improve the competitive position in export markets. While the equipment for the purpose may be imported to some extent, primary reliance will need to be placed on the expansion of textile machinery manufacture. In the case of sugar industry, expansion of capacity and modernisation can now be effected with indigenous equipment.

Power for Industry

During the first three years of the third Plan, power generating capacity has increased by 1.97 million KW, and as a result the power requirements of industry are being met fairly adequately, though there are localised shortages. The additions to capacity expected are 2 million KW in 1964-65 and 2.9 million KW in 1965-66; and as a result, power requirements should continue to be adequately met even with significantly higher rates of increase in industrial production. The inter-connection of major power systems in regional grids will help to even out supplies. In order to secure continuing expansion of power generation at around the rate likely to be achieved by 1965-66, projects to meet requirements in the early years of the fourth Plan have been taken up in the current year. The power programme, particularly in the Bengal-Bihar area, will enable the use to be made of by-product coal from the coal washeries.

The Railways carried 194 million tonnes of originating traffic in 1963-64 and were able to meet in full the requirements of coal and steel industries. A further expansion of around 25 per cent is expected over the next two years, and goods traffic requirements should continue to be met. The increase in railway capacity is being achieved by larger production of wagons, increased use of diesel and electric locomotives and expansion and doubling of track. The expansion in the capacity for the manufacture of commercial road vehicles to 45,000 under projects now being implemented will also augment the availability of transport.

While mild steel production may rise only marginally during 1964-65, there should be a substantial increase to around 5.8 million tonnes of finished steel in 1965-66. The equipment for the expansion programmes of the public sector steel plants has already been ordered, and by 1967-68 the industry will have a capacity of 7 million tonnes of finished steel. The arrangements for financing the expansion plans of the private sector units are under consideration. A company has been formed for the implementation of the Bokaro Project. Certain categories of steel, and particularly flat products, will continue to be in short supply till additional production is available from Rourkela and from Bokaro. While progress in the field of special steels was initially slow, the projects under implementation should produce 50,000 tonnes in the last year of the third Plan and 75,000 tonnes by 1967-68. Aluminium production, which was 42,000 tonnes in 1962-63, is expected to be around 73,000 tonnes by 1965-66.

The expansion of cement output is now based on the use of indigenous equipment. The capacity of the industry is expected to rise by more than a third during the next two years. The cement machinery manufacturing industry can now produce about ten standard cement plants of 200,000 tonnes each year. Reference has been made, earlier to the manufacture of sugar plant. Capacity has also been installed for the manufacture of two paper plants per year with a capacity of producing 50 tonnes of paper per day.

Heavy Machinery Projects

The heavy machinery manufacturing projects in the public sector will produce equipment needed by the capital goods industries. The Heavy Engineering Corporation has ordered equipment worth around Rs. 67 crores for its heavy machine building, foundry forge, heavy machine tool and coal mining machinery projects, and machinery worth around Rs. 39 crores has arrived. Trial production has begun in the Heavy Machine Building Plant and the Mining Machinery Plant will be ready for commercial production in the coming year. While the Heavy Electrical Equipment Factory at Bhopal has expanded production, work has started on three more heavy electrical equipment manufacturing units; and the capacity for the manufacture of heavy electrical equipment from the projects under implementation is expected to amount to Rs. 20 crores in 1965-66 and Rs. 40 crores in 1967-68. Machine tool output will also rise; taking both public and private sectors together, the capacity resulting from projects in hand will be Rs. 25 crores in 1965-66 and Rs. 35 crores in 1967-68.

The petroleum refining capacity is expected to rise over the next two years from the current level of 6.8 million tonnes to 17.3 million tonnes. The Barauni Refinery will come into production during 1964-65. The erection of the refinery in Gujarat should be completed in 1964-65 and the Cochin unit should come into production in 1965-66. Plants for two more refineries are being examined as part of the advance action for the fourth Plan. The expansion of the refinery capacity will make possible the development of a petro-chemicals industry, which will provide a base for the production of fertilisers, synthetic rubber, plastics and many other valuable products. Two petro-chemical complexes are proposed to be established in the near future in Bombay and Gujarat. Taking account also of production which may be based on coal, the capacity for the manufacture of nitrogenous fertilisers (in terms of nitrogen), of projects completed or in hand will amount to 820,000 tonnes by 1967-68. In a number of other industries there will be significant increases in output during 1964-65 as the value of indigenous and imported equipment installed during 1963-64 was much larger than in the previous year.

As a result of the expansion of capital goods output and of the production of import substitutes such as fertilisers and steel, the import content of economic development is expected to be reduced. Nevertheless, there is urgent need for further increases in export earnings, in order to permit larger imports of components and raw materials to make full use of industrial capacity and to reduce the dependence on external assistance. The increase in exports during the last two years, in spite of the failure of agricultural output to expand adequately and the strains resulting from the Emergency, has been noteworthy. Further increases in earnings from exports can be secured only if the increases in domestic production of the commodities marketable abroad are accompanied by a measure of restraint on their consumption at home. It should

be possible to export commercial crops and their manufactures in larger quantities. The development of mining and transport facilities for iron ore should also result in a substantial expansion of exports during the next two years. In the long run, engineering products can make an important contribution, but in the next two or three years, the additional amounts earned from such exports can only be modest.

As already mentioned, there is also need for continuing vigilance in regard to prices. The current trend of wholesale and consumer prices reflects the growing pressure, to some extent inevitable in a developing economy, on supplies of foodgrains and other essential commodities. Not only is the consumer demand increasing, but with the rising standard of living, there is a shift in the pattern of consumption from coarse grains to rice and wheat and from coarse and medium cloth to fine and superfine cloth and art silk and rayon fabrics. While the ultimate solution to the price problem lies only in an increase in production, and an undue proliferation of controls of a kind which may impede growth must be avoided, continued action will be needed to avoid excess demand and to strengthen the framework of governmental regulation over the process of distribution.

It needs to be recalled at this juncture that the rate of population increase, which was around 2 per cent per annum in the decade of the fifties has since been larger, and is now in the neighbourhood of 2.3 per cent. Therefore, even a moderate rate of increase in per capita incomes can be achieved only if full use is made of the potential for raising agricultural and industrial outputs. In itself, the steady decline in death rates which has been responsible for the higher rate of population growth is a matter for great satisfaction as it signifies an improvement in national well-being which is not fully reflected in — and is indeed obscured by — statistics of per capita incomes. Even so, with the rate of population increase approaching what is a very high level by any standards, the family planning programme has assumed the greatest of urgency and importance.

The overall picture is one of promise of rising growth rates in the basic fields of industry, though these rates at present are somewhat below the expectations in the Plan. It will be necessary in the months and years to come to strengthen the forces which contribute to higher levels of growth not only in industry but also, and more fundamentally, in agriculture.

PART II

Agriculture

Agricultural production which had increased by 1.2 per cent in 1961-62 over the previous record level of 1960-61, declined by 3.3 per cent in 1962-63 on account of adverse weather conditions. There was a large decline in the production of rice and wheat, but the output of other cereals went up. The production of all major commercial crops, other than raw cotton declined. While raw cotton production regained the level reached at the end of the second Plan, raw jute output fell partly in response to the conditions of excess supply in the previous year. The decline in groundnuts and sugarcane was mainly on account of unfavourable weather.

Rice production fell by 2.8 million tonnes from the record level of 34.8 million tonnes in 1961-62. While there was a good crop in the South, a sharp decline in output occurred in Madhya Pradesh, Orissa and West Bengal. Production of wheat also declined by 9 lakh tonnes, due to adverse weather conditions in Uttar Pradesh. Although there was a notable increase in the output of jowar, bajra and other inferior cereals, production of foodgrains as a whole was 2.3 million tonnes lower in 1962-63 as compared with 1961-62.

The shortage of foodgrains resulting from the decline in production was in part made good by larger releases from Government stocks of rice and wheat. Imports of foodgrains in 1963 totalled 4.6 million tonnes as compared to 3.6 million tonnes in 1962. The total and per capita availability of foodgrains was slightly lower than in the previous year but since there are some indications that private stocks were run down, the consumption of foodgrains may have been maintained at the previous year's levels. In the case of rice, imports could be increased only within limits, and the sharp decline in production resulted in a marked lowering in the total and per capita availability of rice despite a substantial drawing down of Government stocks.

There was a marked increase in the production of raw cotton in 1962-63. According to official estimates, production was 5.3 million bales, which was about the same as in 1960-61 and nearly 18 per cent above the 1961-62 level. Imports during 1962-63 (September — August) amounted to 8.4 lakh bales, and although yarn production increased, the cotton stocks with the mills and trade rose to 1.7 million bales. As a measure of reassurance to the growers, the minimum support prices for cotton were raised by 17 per cent in April 1963. The ruling prices for cotton were, however, nearly 30 per cent above the minimum support prices. During 1963-64, cotton output is expected to be good.

Jute Production Declines

The output of raw jute and mesta declined by over a million bales in 1962-63, but supply was adequate in view of the stocks accumulated during the previous year. Government continued the policy of supporting raw jute prices at the operational minimum of Rs. 30 per maund (Rs. 80.38 per quintal) for the Assam Bottom variety. In addition to the purchases made by the Jute Buffer Stock Agency, the State Trading Corporation also gave support to the market during the year. The margin between the price received by the grower and that paid by the mills was sought to be reduced. During the current year, raw jute production has been good. Stocks were also substantial, amounting to 1.6 million bales at the end of October 1963. The requirements of the jute industry in the coming year should thus be fully met.

There was a fall of 7.5 per cent in the output of sugarcane in 1962-63, due partly to a reduction in area under cane in Uttar Pradesh and Bihar but largely to the adverse weather conditions that prevailed. The diversion of larger quantities of cane to the production of gur and khandsari, in response to the high prices of these commodities, resulted in a sharp decline in the quantities of cane crushed by the factories and in the production of sugar in Punjab, Uttar Pradesh and Bihar. To step up production of sugar in 1963-64, the basic minimum price of sugarcane was increased from Rs. 1.50 per maund in 1962-63 initially to Rs. 1.56 and subsequently to Rs. 1.75 per maund in respect of cane with a recovery of 9 per cent or less, with the provision that 1.5 nP. per maund would be added to the basic minimum price for every 0.1 per cent increase in recovery over 9.0 per cent. Factories located in certain areas of difficult cane supply on account of competition from gur and khandsari were permitted to pay a higher price of Rs. 2 per maund in case the minimum price according to the above formula worked out to be lower than Rs. 2 per maund. Government also took powers to regulate the disposal of sugarcane by growers in order to ensure adequate supplies to the sugar factories. As a result of these measures, an increase in the production of sugar in 1963-64 is expected.

The policy of price support to agricultural products was extended during the year to jowar, and it now applies to major foodgrains and commercial crops. A minimum price of Rs. 24.12 per quintal of white variety (and Rs. 22.78 per quintal of yellow variety) was fixed for jowar; the minimum price of wheat was raised by Rs. 2.68 per quintal or 8 per cent and there was an increase of Re. 0.67 to Rs. 2.68 per quintal (or approximately 5 per cent) in the procurement prices of rice in most States. The prevailing prices of these commodities in most parts of the country were higher than the minimum prices. The increase in minimum prices was, however, considered desirable as a protection against undue fall in prices in some pockets in surplus areas.

The supply of fertilisers and of other agricultural requirements has been increasing from year to year. The total availability of nitrogenous fertilisers from domestic production and imports was 280 thousand tonnes (in terms of nitrogen) in 1961-62 and 350 thousand tonnes in 1962-63, and is expected to go up to 450 thousand tonnes in 1963-64. The use of irrigation facilities spread further, the additional area benefiting from irrigation being 26 lakh acres in 1961-62, 33 lakh acres in 1962-63 and an estimated 55 lakh acres in 1963-64. The utilisation of new irrigation facilities from major and medium schemes rose to 80 per cent of the potential in 1963-64 as against 74 per cent in 1962-63 and 71 per cent at the end of the second Plan.

A number of steps were taken following the decision in November 1962 that special attention needed to be given to increasing agricultural output. The minor irrigation and soil conservation programmes were stepped up. The Central assistance for the States' agricultural programmes for 1963-64 has also been increased. Experience had shown that rapid increase in production could be secured if an intensive effort was made in the most productive areas instead of dispersing available resources over a wide field. "Package" programmes for increase in production of rice, millets, pulses, cotton and oilseeds were formulated. The organisation for implementing the programme for commercial crops was strengthened.

In pursuance of a decision of the National Development Council in November 1963, an Agricultural Production Board was constituted consisting of the Central Ministers and the Member of the Planning Commission concerned with agriculture and allied activities. The Board will ensure an integrated approach in matters of agricultural policy, secure effective co-ordination between Central and State Governments, review the progress of the development programmes and endeavour to remove any deficiencies.

While the average annual increase of agricultural output over the last twelve years has been about 3.5 per cent, the production in any given year is considerably influenced by weather conditions. The adverse weather conditions of 1962-63 had accounted for the decline in output in that year. During the kharif season of the current year, weather conditions on the whole have been more favourable. The production of jute in 1963-64 has turned out to be 59 lakh bales as compared to 54 lakh bales last year. The cotton crop is also good, and the rice crop is expected to be better than in the previous year.

Industrial Production

There was a further increase in industrial production during the year under review. Substantial increases occurred in the output of basic and producer goods industries; consumer goods industries did not do as well. There were significant additions to industrial capacity during the year.

The index of industrial production rose by 6.6 per cent in 1961-62 and by 3 per cent in 1962-63. There was a marked increase in production in the second half of 1962-63, the increase in comparison with the corresponding period of 1961-62 being 8.7 per cent. During April-September 1963, production was again 8.5 per cent higher than in April-Sepetmber 1962. The table opposite shows the indices of industrial production for the last few years.

The overall increases in industrial production as measured by the index depend primarily on the performance of the industries using agricultural raw materials, as these account for nearly half the weight in the index. In 1962-63, cotton textile output had declined in comparison to the previous year and this depressed the overall rate of growth of industrial production. The fall in output in spite of a comfortable cotton supply position was presumably due to slack demand for cloth. During the first half of 1963-64, cloth production increased in relation to the second half of 1962-63, although it was lower as compared witht the first half of that year. There is some indication that for 1963-64 as a whole the output of cotton textiles will show an improvement over the previous year's level particularly in the decentralised sector. Jute textile output had risen 20 per cent in 1962-63, reflecting the greater availability of raw jute and buoyant foreign demand. In the first half of 1963-64, there was a small increase in production over the high level of the previous year and output was maintained at a high level in the latter part of the year. The recent termination of the working time agreement should increase productive efficiency in the jute industry. Sugar production had declined substantially during the 1962-63 season, but is expected to be larger in 1963-64. Tea output particularly in north India has been affected by adverse weather conditions. Weather has, however, been favourable for the coffee crop and while production declined by 26 per cent in 1962-63, a substantial increase in output is likely in 1963-64.

Substantial Increases

There were very substantial increases in the production of steel and aluminium during 1962-63. The high level of aluminium production reached at the end of that year was maintained during the current year and a further increase is expected in the case of steel. The larger output of wagons and of trucks resulted in the increase of 8.3 per cent in the production of transport equipment during 1962-63; the production of cars, however, declined as a result of lower allocations for the import of components. Further increases in railway wagons and truck output are likely in 1963-64 and there will be some improvement in the indigenous content of trucks. The increase in machinery output, especially the output of machine tools, during the first half of the current year is likely to continue in the second half also. The chemical products which account for higher production in the first half of 1963-64 include ammonium sulphate, soda ash and caustic soda.

During the year under review, the public sector industries made further progress. The production of Heavy Electrical Plant at Bhopal is expected to reach Rs. 70 million as against Rs. 30 million in 1962-63. The third factory of Hindustan Marchine Tools at Pinjore in Punjab went into production in October 1963 and two other factories in Kerala and Andhra Pradesh are to be built. The production of machine tools by the Hindustan Machine Tools Limited is expected to be about Rs. 9 crores in 1963-64 in a total production of machine tools of Rs. 14.5 crores. The Heavy Machine Building Plant at Ranchi and the Coal Mining Machinery Plant at Durgapur were inaugurated in November 1963 and construction is in progress at the Foundry Forge Plant at Ranchi. Work has also satrted on the Heavy Machine Tool Plant. The development and construction work of the Kiriburu Iron Ore Mines was completed. Construction has also begun on three of the projects with the assistance of the USSR viz., the Antibio-

INDEX OF INDUSTRIAL PRODUCTION

(1956 = 100)

2nd Quarter ..	119	126	138	149	164
3rd Quarter ..	122	139	141	154	
4th Quarter ..	127	139	148	160	
Annual Average ..	120	133	142	153	

Note: Quarterly figures are seasonally adjusted.

tics Plant at Rishikesh, the Synthetic Drugs Plant at Hyderabad and the Surgical Instrument Plant at Madras.

The output of steel ingots rose from 4.3 million tonnes in 1961-62 to 5.4 million tonnes in 1962-63 and to an annual rate of 6 million tonnes in April-September, 1963. The producer-wise breakdown of steel production was as follows:

PRODUCTION OF STEEL INGOTS

(Million tonnes)

Producers	1961-62	1962-63	1963-64 (Apr.-Sept.)
TISCO	1.63	1.80	0.94
IISCO	0.93	1.00	0.51
Bhilai	0.79	1.06	0.56
Durgapur	0.46	0.73	0.47
Rourkela	0.35	0.70	0.46
Mysore	0.05	0.05	0.02
Others	0.05	0.06	0.03
TOTAL	4.26	5.40	2.99

The production in the second half of 1963-64 was at around the same level as in the first half. Further increases in production will be possible only when additional capacity is installed. By the end of the year, orders will have been placed for the equipment needed for the expansion programmes of the public sector plants. The private sector steel producers have drawn up expansion schemes and arrangements for financing these are being negotiated.

Certain categories of steel, and particularly flat products and special steels, continued to be in short supply. The requirements of special steels, which had increased due to the rise in machinery production, had to be met, as before, almost entirely through imports. Total imports of steel amounted to 11 lakh tonnes in 1961-62 and 9 lakh tonnes in 1962-63; in 1963-64, imports are likely to be somewhat higher than in the previous year.

For increasing the output of special steels, the conversion of the Mysore Iron and Steel Works for production of 74,000 tonnes per annum was approved by Government. Orders have been placed for a public sector plant at Durgapur and certain projects in the private sector are also going forward. The schemes covered by external assistance so far will result in the establishment of 50,000 tonnes of capacity by the last year of the Plan and of 75,000 tonnes of capacity by 1967-68. Progress in this field has been relatively slow.

While the supply of pig iron to foundries was stepped up to 1.2 million tonnes, the demand also rose and amounts to around 2 million tonnes. Arrangements are being made for import of small quantities. Schemes have been approved in the private sector for the establishment of additional capacity, and plans are also being drawn up for larger production of pig iron in the public sector plants, to be utilised at a later stage for conversion into steel.

Coal and Power

Although there was an improvement in the supply and in the arrangements for transport of coal during the first half of 1962-63, the overall position was difficult in relation to requirements. Arrangements were made for the substitution of oil for coal by some cement factories and power houses in areas distant from the mines and for a greater use of coastal and, to some extent, road transport. In the latter half of the year (October 1962-March 1963) aggregate output of coal rose substantially, being 34 million tonnes as against 30 million tonnes during the preceding half year. Demand in the last few months, however, has been less than anticipated. As a result, stocks at pitheads and with industries have increased somewhat. Nevertheless, during 1963-64 as a whole, output may be around 66 to 67 million tonnes i.e., 2 to 3 million tonnes more than in 1962-63.

During the current year, the railways were able to move considerably larger quantities of coal and transport was no longer a limiting factor in the availability of coal to industry. The daily average loading of wagons from the West Bengal/Bihar region increased from 5,000 in April-September 1962 to 5,600 in the same period of 1963.

The increase in production was, however, in the medium and lower grades and there was actually a decline in the supply of higher (selected) grades. One of the reasons for this was the downward regrading of certain seams.

The shortage of selected grades of coal, therefore, persisted. With the increase in coal washing capacity, the quantity of washed coal increased from 1.8 million tonnes in April-September 1962 to 2.9 million tonnes in the same period of 1963. Arrangements have been made for the installation of the coal-washing capacity envisaged in the Plan, but progress has been slow.

The grade-wise classification of coal had been revised in 1962-63 with a view to introduce an ash differential of one per cent between the various grades. There have been periodic price adjustments to promote the output of the superior grades. Further proposals with regard to price adjustments are under consideration.

Private Sector Mines

The requirements of imported equipment for the private sector mines will be financed from the loan of $35 million from the IBRD. The utilisation of the loan had been slow, but ordering of equipment was encouraged by the reduction of the import duty on coal-mining machinery and components to a uniform rate of 15 per cent. The development rebate available to the industry was raised from 20 per cent to 35 per cent in new mining machinery installed between 1963-64 and 1965-66. Government undertook to give a partial guarantee on loans by credit institutions to the private sector coal industry. The Reserve Bank of India provided additional assistance to commercial banks which provided finance. So far, orders have been placed for equipment worth Rs. 13 crores against the IBRD Loan of Rs. 17 crores. The public sector collieries have also made substantial progress with regard to the ordering of equipment. The planned output of heavy mining machinery in the country will assist the growth of the coal industry.

The requirements in the last year of the Plan have now been re-estimated and it is anticipated that while, for the next few years, both aggregate coal output and transport facilities will be adequate to meet demands, the main problem will be one of ensuring sufficient supplies of superior grades and of washed coal.

The progress in power development during the first three years of the third Plan was as follows:

POWER: INSTALLED CAPACITY

At the end of	Capacity (million kw.)	Annual percentage increase
1960-61	5.6	16
1961-62	6.0	8
1962-63	6.7	11
1963-64 (anticipated)	7.6	13

The progress in the first two years of the third Plan was relatively slow partly because of the cut-back in the power

BUSINESS & SERVICE

The Bank receives deposits, gives advances against approved securities, purchases bills, sells drafts and telegraphic transfers and transacts all types of Foreign Exchange business. Through its internal net-work of branches and world-wide business arrangements it provides every kind of banking service.

S. T. SADASIVAN,
General Manager.

programme due to the foreign exchange shortage in the middle of the second Plan. During the current year, a significant increase in capacity is expected. According to the estimates of the maximum demand and firm capacity likely to be established by the end of the year, there will be no deficit in the Western region and only small deficits in some of the States in the Northern and Eastern regions. In the South, however, there would be some shortage of power. Orders have been placed to cover not only the third Plan generating capacity but also some fourth Plan schemes. A considerable volume of equipment for the transmission and distribution of power, however, remains to be ordered, and this requirement is being given high priority. It is expected that the electricity generation target of 45 billion kwh. by 1965-66 will be reached ,although in terms of installed capacity there may be a slight shortfall in relation to earlier anticipation. The regional shortage are expected to be mitigated by diversion of surplus power from the neighbouring areas through the construction of inter-State grids.

The Electric Power Survey Committee, which completed its first survey in July 1963, has provided a broad picture of the power requirements in different parts of the country over the next few years. A major recommendation of the Committee is the establishment of Regional Grid organisations for effective planning, development and co-ordination of future generating and transmission capacity. Three Regional Electricity Boards have been decided upon so far, one in the Northern region (comprising the States of Jammu and Kashmir, Himachal Pradesh, Punjab, Delhi and Rajasthan), one in the South (comprising the States of Madras, Andhra Pradesh, Mysore and Kerala) and another in the Eastern region (Bihar, Orissa and West Bengal). The operation of these Boards should, apart from reducing the need for stand-by capacity, help secure a fuller and more economical use of the power supplies available in the respective regions.

Railways

In 1962-63, originating tonnage lifted by the Railways rose by 11 per cent and a further increase of about 9 per cent is anticipated in 1963-64. The bulk of the increase in goods traffic was in respect of raw materials and finished products for the steel industry and the requirements of the coal and steel industries and of other goods traffic were met in full in 1963-64. The outstanding registrations for wagons for general goods traffic have fallen as compared to earlier years. At the end of 1963 the indents on the broad gauge were equal to 2½ days' loading and those on the metre gauge somewhat under 3 days' loading. The following table sets out the increase in goods traffic :

Year	Originating traffic (million metric tons)	Annual percentage increase
1961-62	160	2.8
1962-63	179	11.4
1963-64	194 (Estimated)	8.5

The increase in tonnage carried was made possible because, among other things, of the higher output of railway wagons, which rose from 19,100 in 1961-62 to 26,000 in 1962-63 and about 32,000 in 1963-64. There has been good progress in the manufacture of many types of railway equipment and the foreign exchange content of the railway programme is expected to be about 18 per cent in the third Plan period as against 30 per cent during the second Plan.

Apart from the increase in rolling stock, progress in the electrification and dieselisation has also helped improve the transport situation. Against the target of electrification of 1490 route kilometres, 868 route kilometres were commissioned during the first two years of the Plan and another 980 are expected to be commissioned by the end of the next year. The proportion of goods traffic hauled by diesel and electric locomotives increased from 21 per cent of the total in 1962-63 to 29 per cent during April-November 1963.

Although the transport requirements of the steel plants will be less, the originating traffic expected to be carried in the last year of the Plan has now been estimated at 245 million tonnes. The railway programme, however, provides for capacity adequate for carrying 260 million tonnes. The goods traffic in terms of tonne-kilometres in 1965-66 is expected to be at the level originally envisaged in the Plan, as the movements of general goods involving longer leads will be larger.

Budgetary Transactions

The estimated expenditure according to the Budgets of the Central and State Governments during 1963-64 is Rs. 717 crores larger than that for the previous year; this compares with the increase of Rs. 632 crores in 1962-63 (according to Revised Estimates) over 1961-62. The acceleration was primarily caused by the increase in defence expenditures. From Rs. 313 crores in 1961-62, the expenditure on defence went up to Rs. 505 crores in 1962-63 (Revised Estimates) and during the current year the Budget has provided for an outlay of Rs. 867 crores. The budgeted increase in defence expenditures was thus Rs. 362 crores. Expenditure on the Plan was increased by Rs. 240 crores; and on developmental items outside the Plan by Rs. 59 crores, of which Rs. 38 crores represented increased provision for building buffer stocks of foodgrains. In brief, the increase in development and defence outlays accounted for nearly 92 per cent of the increase in Central and State outlays for 1963-64.

An increase in budgetary expenditures of this order would normally put considerable strain on the real resources of the economy. To avoid inflationary consequences, Government sought to cover as large a proportion of the increase in outlay as possible by augmenting current receipts. The Central Government sought to raise a sum of Rs. 249 crores through additional taxation, another Rs. 30 crores was expected to be realised from the increase in railway fares and freights and post and telegraph charges, and Rs. 20 crores from inter-State sales tax. The States introduced proposals which would yield Rs. 35 crores for the year. Altogether the fresh imposts were expected, according to the Budget proposals, to add Rs. 334 crores to the Central and State revenues, covering over 90 per cent of the increase in defence outlays. The overall deficit in the Central and State Budgets was kept down at Rs. 179 crores. This was lower than the Revised Estimate of Rs. 209 crores for 1962-63 and somewhat higher than the actuals for that year of Rs. 132 crores

After the presentation of the Budget, an additional sum of Rs. 65 crores has been given to the States to cover speedy implementation of certain Plan projects and a sum of Rs. 11 crores was voted as a supplementary demand by Parliament in November 1963 to finance defence expenditure not provided for in the Budget estimates.

As the Compulsory Deposit Scheme was withdrawn for the categories other than income-tax payers and premium rates under the Emergency Risk Insurance Scheme had been progressively lowered with no collections during January-March 1964, receipts will be less than provided for in the Budget. The actual net borrowing against market loans will be only Rs. 146 crores, as against the Budget provision of Rs. 174 crores. Receipts against external assistance are likely to be somewhat lower than in the Budget (although they would be higher than in 1962-63). On the other hand, collections from indirect taxes may accord with Budget estimates, and direct tax collections are expected to be higher. Small savings receipts have risen substantially. During the first nine months of the year, the net collections from small savings amounted to Rs. 71.16 crores as against Rs. 30.27 crores in the corresponding period of last year. Subscriptions to National Defence and Defence Deposit Certificates have been large and the deposits in the Post Office Savings Bank have also increased. On the whole, the overall deficit for the year, on account of the budgetary transactions of the Central and State Governments taken together, may be somewhat lower than provided for in the Budgets for 1963-64.

Monetary Trends

During the current financial year, upto 17th January, 1964, money supply with the public increased more than in the corresponding period of the previous year. Government borrowings from the banking system were larger; commercial bank lending to the private sector was, however, slightly smaller. The improvement in export earnings and the increased use of external assistance led to a small increase in the foreign assets of the Reserve Bank, whereas in the comparable period of the previous year there was a large decline. This also contributed to the larger increase in the money supply during the current financial year.

During the first seven months of the current fiscal year, most of which was the usual slack season, there was a large contraction in bank credit to the private sector in contrast to a small rise in the previous year. Government borrowings from the banks were, on the other hand, substantially larger. The increase in demand deposits was larger than that in time deposits partly in response to the attractive rates of return offered by institutions other than banks. Since the onset of the busy season in November, the credit extended by the banks to the private sector has increased substantially; Government borrowings from the banks have, however, been less than in the corresponding period of the previous year. The expansion of credit to the private sector for productive purposes was facilitated by a modification at the end of October in the Reserve Bank's policy in respect of lending to commercial banks. Legislation was also passed to regulate acceptance of deposits by non-banking institutions and to enable the Reserve Bank to regulate their operations.

Expanded Resources

The resources of the banking system expanded more in 1963-64 than in 1962-63. During the slack season of 1963 (May-October), deposits of the banks increased by Rs. 166 crores (excluding .PL. 480 | P.L. 665 deposits) as compared to Rs. 93 crores in the corresponding period of 1962. There was an unusually large contraction in the bank credit to the private sector, the decline being as much as Rs. 70 crores as against an increase of Rs. 2 crores in 1962. In part, the contraction in credit reflected the destocking of commodities like rice and sugar which were in short supply; in part, it may have been on account of subdued conditions in the capital market. In view of the large decline in the bank credit to the private sector and the increase in deposits, the banks had adequate resources to increase their investments in Government securities. Money market conditions were easy and the call money rate in Bombay fell to 1¾ per cent towards the end of the slack season.

During the current busy season (i.e. since the beginning of November 1963) the private sector demand for bank credit has increased. In October 1963, a modification was made in the Reserve Bank's system of quotas for lending to the commercial banks to ensure adequate finance for productive purposes during the busy season. As a result of the modification, scheduled banks can borrow from the Reserve Bank upto 150 per cent of the average of their statutory reserves in the preceding quarter, 75 per cent at the Bank rate and the remainder at 6 per cent. Additional borrowings are permitted at the discretion of the Reserve Bank and the rate charged on them is also 6 per cent. The commercial banks have been able to meet the increased demand for credit and their lending to the private sector went up by Rs. 181 crores between the end of October 1963 and 17th January, 1964, as compared to the increase of Rs. 92 crores in the corresponding period of the previous year. The call money rate in Bombay moved up and by 17th January, 1964, it was 5.10 per cent as compared with 4.86 per cent a year ago.

The basic considerations underlying the Reserve Bank's monetary policy have not undergone any change during the current year. While enabling larger flow of resources into productive investment, the objective of policy continues to be to check the use of bank finance for speculative purposes and also to ensure that interest rates in the organised sector reflect the scarcity of capital. Selective credit controls continued to be operated flexibly, and recently, the Reserve Bank has lowered the ceilings on scheduled bank advances against paddy and rice.

The financing of exports has high priority and during the year an Export Bills Credit Scheme was introduced. Special facilities were also made available to scheduled banks to finance small-scale industries and co-operatives and the expansion of capacity in the coal industry. An Agricultural Refinance Corporation was set up for facilitating medium and long-term credits for the development of agriculture and allied activities.

Capital Market

Following the increase in the Bank Rate by ½ per cent in January 1963, there was a further downward adjustment in the prices of Government securities. The index of prices of Government and semi-Government securities (1952-53 = 100) which had declined from 100.7 in June 1962 to 99.6 in December 1962 in a process of adjustment to higher yields offered on new Government loans, declined further to 98.6 by the middle of May 1963. The improvement in the liquidity of commercial banks and the increased demand for Government securities emanating from this as from other institutional investors gave some support to the gilt-edged market in the subsequent months. The index rose to 100.1 by the end of November and has remained stable since then.

Throughout the greater part of the year, the stock markets remained in a subdued condition. The decline in share prices which had started about the middle of 1962 was accentuated after the declaration of the Emergency and the 1963-64 Budget. The index of variable dividend industrial securities (1952-53 = 100) came down from 195 in May 1962 to 173 by the end of December 1962 and further to 158 by the end of June 1963. A considerable part of the decline in share prices was in the nature of a corrective to the earlier boom, but since the decline had been sharp, a number of measures were taken to stimulate activity in the stock markets. Forward trading was resumed in June 1963, financial assistance was given to the Industrial Finance Corporation and the Industrial Credit and Investment Corporation to enable them to increase their underwriting operations and the selective credit controls were relaxed in so far as advances against shares were concerned. The modification in the credit policy of the Reserve Bank in October 1963 as also the announcement of Government's decision to establish a Development Bank led to a recovery in share prices and the index by 25th January, 1964 was 169, i.e. the level prevalent a year ago.

Following the declaration of the Emergency, there was a slowing down in private capital issues. During the first nine months of 1963, the amount raised by non-Government companies by way of shares and debentures was Rs. 42 crores (exclusive of a portion of the Oil India debenture issue subscribed early in 1963), as compared to Rs. 57 crores in the corresponding period of the previous year. Subscriptions to new issues have recently shown an improvement.

An increase in prices was to be expected as a result of the fall in agricultural production, and particularly in the output of rice and sugarcane. Since the scarcity of rice was

concentrated in the Eastern region, Madhya Pradesh and Maharashtra, the rise in prices was particularly sharp in these areas. The price situation as it has emerged during the current year may be contrasted with the experience of the first two years of the third Plan. While there was a decline in wholesale prices of 3.5 per cent in the first year of the third Plan, there was an increase of like magnitude in the second year. At the beginning of the third year, therefore, the price level was no higher than at the beginning of the Plan. Between April and October 1963, prices went up by 6.8 per cent as compared to the rise of 6.1 per cent in the same period of 1962. There was a small decline in November 1963, but the price level increased again in subsequent weeks, mainly because of an increase in wheat prices. The uptrend in prices during the year was caused mainly by a rise in the prices of rice, gur and sugar. The prices of sugar and gur had started rising from January 1963 and in the case of rice there was a sharp increase during the lean season, the increase between April and October being 17.7 per cent. In West Bengal and Madhya Pradesh, the rise ranged from 21 to 22 per cent and in Maharashtra it was as high as 34 per cent. Indeed, the increase in prices of the food articles group as a whole accounted for more than four-fifths of the total rise during the first half of 1963-64. Among food articles, rice alone caused a quarter of the increase in the general price level, and gur more than a third. Cotton prices rose somewhat, in spite of a larger crop, because of increased demand. The production of cotton yarn, while higher than in 1962-63, was close to capacity and the price of yarn rose by 3.7 per cent over 1963. While mill cloth prices rose slightly, a large increase took place in the price of handloom cloth. Raw jute prices were stabilised, and so were those of jute manufactures. The wholesale price index number rose over the year ended 25th January, 1964 by 11.4 per cent for food articles, by 5.8 per cent for industrial raw materials and 2.7 per cent for manufactures. The following table sets out the index numbers for selected commodities :

INDEX NUMBERS OF WHOLESALE PRICES

(1952-53 = 100)

Groups/Commodities	Apr. 1, 1961	Jan. 26, 1963	Mar. 30, 1963	Oct. 26, 1963	Jan. 25, 1964
Food Articles ..	116.9	124.4	123.5	138.8	138.6
Cereals ..	99.7	103.1	102.8	118.2	118.7
of which					
Rice ..	100.9	108.7	111.4	131.1	120.0
Wheat ..	90.0	88.6	86.0	94.6	113.0
Sugar ..	127.0	130.1	140.6	135.9	142.7
Gur ..	110.7	154.6	152.8	264.3	204.7
Industrial Raw Materials ..	155.5	133.6	135.3	136.9	141.3
Manufactures ..	128.1	128.4	129.5	131.0	131.9
All Commodities ..	126.2	126.5	127.3	135.9	136.8

The Working Class Consumer Price Index (1949=100) had remained steady around 130 in the first three months of 1963 in response to the seasonal decline in wholesale prices of foodgrains and other food articles which had occurred during the previous three months. After April 1963, however, the index showed a steady increase reaching 138 by October 1963. In November there was no further increase, but consumer prices were 4 per cent higher than a year ago.

To prevent speculative price increases in food grains, Government arranged for enlarged distribution of rice and wheat through fair price shops. The number of fair price shops was increased from about 50,000 to nearly 60,000 during 1963, the number in West Bengal going up from 11,074 to 11,474. The issues of rice from Central stocks to the State Governments were stepped up. West Bengal, for instance was given an additional allocation of one lakh tonnes of rice and four lakh tonnes of wheat, over and above what it received in 1962.

Steps are being taken to review and strengthen the machinery for procurement and distribution of food grains. The State Governments have been urged to take effective steps for increasing the procurement of rice during the current year and for tightening the regulatory measures. Government is pursuing a policy of encouraging the establishment of consumer co-operative societies to facilitate the distribution at fair prices both of food grains and other articles. Under the centrally sponsored scheme of consumer co-operatives, 143 wholesale stores and 2,341 primary stores/branches have been set up. As indicated elsewhere in the Survey, further steps were also taken to assure the farmer of reasonable minimum prices for food grains. Similarly, steps were taken both to increase the return on sugarcane cultivation and to enable the factories to obtain larger supplies of sugarcane. Fiscal incentives have been given to stimulate production of sugar, among other things by early and late crushing by the factories. From a longer-term point of view, the capacity of the sugar industry is also being increased.

Controls Removed

During the year, controls on prices and distribution of a number of manufactured products were reviewed in order to ensure that they were consistent with the need for expansion in priority fields and that distribution controls adequately serve the purpose for which they were imposed. The price controls on 16 commodities were removed during the year; these were rayon yarn, staple fibre, caustic soda, soda ash, hydrochloric acid, chlorine, calcium carbide, bleaching powder, chilean nitrate, muriate of potash, sulphate of potash, washing soap, tyres and tubes, sheet glass, paper board, and natural rubber.

As a result of the decontrol, prices of some of the commodities have moved up. The manufacturers have increased the prices of tyres and tubes by 6 per cent and washing soap prices charged by one of the manufacturers have also been increased by 6.5 per cent. No material increase in the prices of rayon yarn has occurred and sheet glass prices are reported to have declined. In the case of chemicals, the only significant increase has taken place in caustic soda, the producers' prices of which have been increased by 10 per cent. On the whole, the increase in producer prices has not had a commensurate effect on the final consumer prices and the expectation that following the decontrol a part of the margins accruing to traders would become available to the industry seems to have been realised. The incentive provided by the increase in producer prices is likely to result in a further expansion of output.

The problems of controls and pricing policy in respect of basic industries like coal and steel and of power generation required detailed examination. A committee examined price and distribution controls on steel, and its report is under consideration. The views of steel producers and others concerned are also being taken into account. Coal prices are under review particularly from the point of view of stimulating the production of selected grades. A committee which examined the rates charged by electricity undertakings considered progressive adjustment in tariffs to bring up the rate of return to these undertakings to 10 per cent of the capital employed. At a conference of Central and State Ministers in charge of power, this matter was discussed and a Committee with State Ministers has been set up to recommend a sound rate policy for electricity.

Balance of Payments

During 1962-63, the fall in the foreign exchange reserves was less than in the previous year in spite of the increased import requirements resulting from the Emergency. The fall in reserves was Rs. 2.3 crores over the year, as compared to Rs. 59.2 crores in 1960-61 and Rs. 6.3 crores in 1961-62. The drawal on the International Monetary Fund was also less at Rs. 11.9 crores in 1962-63 as against Rs. 58.4 crores (after allowing for repayments) in 1961-62. The smaller decline in reserves in 1962-63 was the result of an increase of Rs. 14.5 crores in export earnings as well as increased utilisation of external assistance. While imports rose by Rs. 87.8 crores, there was an improvement on the invisibles account partly as a result of more stringent restrictions on foreign travel, private remittances, etc.

In the first half of 1963-64, the foreign exchange reserves declined by Rs. 27.9 crores as against Rs. 11.1 crores and Rs. 51.6 crores in the same halves of 1961-62 and 1962-63, respectively. Between the first halves of 1962-63 and 1963-64, export earnings rose by Rs. 55.1 crores, while receipts from official donations increased by Rs. 11.1 crores, and net receipts from other invisible items by Rs. 13.3 crores and from official loans by Rs. 39.8 crores. There was a rise of Rs. 58 crores in total imports as Government imports increased by Rs. 70.2 crores and private imports fell by Rs. 12.2 crores. There was a marked rise in the imports of capital equipment both by the Government and the private sector reflecting increased investment. These larger imports facilitated the absorption of foreign assistance, which was, however, somewhat below expectations.

The increase of Rs. 70.2 crores in Government imports during the half year under review as compared to the same period of the preceding year was largely accounted for by a rise of Rs. 45.7 crores in imports of capital equipment for Government projects and of Rs. 18.4 crores in imports of foodgrains. The increase in imports of capital equipment was related to the step-up in investment in the public sector: at Rs. 1,654 crores Plan outlay budgeted for 1963-64 exceeds the preceding year's outlay (Revised Estimates) by Rs. 240 crores. At the same time, the outlay on industry, minerals, transport and communications taken together, which has a relatively high imported capital goods component, is expected to increase from Rs. 619 crores to Rs. Rs. 754 crores. The increase of Rs. 18.4 crores in imports of foodgrains was needed to relieve the shortfall resulting from lower domestic production.

Machinery Imports Rise

Although total private imports showed a fall of Rs. 12.2 crores, machinery imports rose by Rs. 10.3 crores. On the other hand, imports of non-ferrous metals declined by Rs. 1.4 crores, and of textile yarns by Rs. 1.2 crores, since there were larger availabilities of aluminium and art silk yarn from domestic production. There was also some decline in imports of raw cotton. According to the balance of payments statistics, exports amounted to Rs. 370.6 crores in the first half of 1963-64 as compared to Rs. 315.5 crores in the same half of 1962-63. However, according to the trade statistics compiled by the Directorate General of Commercial Intelligence and Statistics, exports were Rs. 367.9 crores in April-September 1963 and Rs. 331.8 crores in the same period of 1962.

As in the past year, the largest contribution to export earnings came from the exports of jute manufactures which amounted to Rs. 81.7 crores in April-September 1963 as compared to Rs. 71.2 crores in April-September 1962. This increase was the result of a 3 per cent rise in the unit value combined with an 11 per cent increase in the volume of exports. The latter increase was made possible by larger domestic production accompanied by fairly buoyant world demand. Despite keen competition from Pakistan, which continued to operate an export bonus scheme, India has been able to maintain her share in the United States market, which is the principal market for jute goods in the world, at around 85 per cent; ground was, however, lost to Pakistan in some other markets. The fixation of minimum prices for raw jute which has also stabilised the production of raw jute has made an important contribution toward maintaining the export prices of jute goods. Exports of carpet-backing jute cloth which have been going up in recent years are a relatively new product with strong foreign demand. Efforts are being made to instal more broadlooms for the manufacture of this product.

The aggregate production of tea in 1962-63 is estimated to have declined by 10,000 metric tons or by 2.8 per cent, the entire shortfall being concentrated in the North Indian crop. Exports of tea in April-September 1963 and 1962 amounted to Rs. 52.6 crores and Rs. 55.3 crores respectively, thus showing a fall of Rs. 2.7 crores. This was entirely due to a drop of 8 million kgs. in the volume of exports while the average unit value of exports actually showed an increase of Re. 0.22 per kg.

Exports of cotton textiles earned Rs. 22.6 crores in April-September 1963 as compared to Rs. 21.3 crores in the same period of 1962. This was due to an encouraging rise of Rs. 1.1 crores in handloom goods exports. Apart from the fact that world demand for fibres is shifting from cotton to man-made fibres and amongst cotton fabrics from the inferior varieties such as the grey and unbleached cloth which India traditionally exports to the superior varieties, there are two other factors which have tended to undermine the exports of cotton textiles: the setting up of cotton textile mills by most of the developing countries and greater competition from other sources.

Coffee Exports Increase

Exports of coffee showed a moderate increase from Rs. 4.1 crores to Rs. 4.6 crores during the same period, which was entirely due to an increase in the volume of exports. The International Coffee Agreement has allotted to India a quota of 21.6 million kgs. The Indian coffee crop this year is larger by about 16 per cent while the international coffee market is likely to rule firm on account of the destruction of a sizable proportion of the Brazilian crop because of unfavourable weather conditions. Exports of cashew kernels have also continued to do well and during the first half of 1963-64, amounted to Rs. 11.2 crores as against Rs. 9.2 crores in the same period of the last year. Tobacco exports amounted to Rs. 17.2 crores in the first half of 1963-64 as compared to Rs. 12.5 crores in the same period of 1962-63.

Exports of sugar have been substantial for the past two years. During the half year under review, sugar exports amounted to Rs. 17.9 crores as against Rs. 8.7 crores during the same half of 1962-63 and Rs. 17 crores in the whole of 1962-63.

At Rs. 14.8 crores in April-September 1963, exports of oil cakes showed an increase of Rs. 2.1 crores over April-September 1962, while those of vegetable oils, non-essential, amounting to Rs. 9 crores in April-September 1963 registered a rise of Rs. 3.8 crores. Exports of iron ore have shown an increase of Rs. 1.6 crores in the same period from Rs. 14.6 crores to Rs. 16.2 crores and of engineering goods from Rs. 4.1 crores to Rs. 5.9 crores. Exports of petroleum products also increased from Rs. 1.7 crores in the first half of 1962-63 to Rs. 2.9 crores in that of 1963-64.

A region-wise analysis shows that, although in absolute terms, there has been an increase in exports to Western Europe including the European Common Market from Rs. 111 crores in April-September 1962 to Rs. 113.5 crores in April-September 1963, in relative terms, the share of this region in India's exports has declined from 33.4 per cent to 30.7 per cent. Within Western Europe itself, the share of the UK has gone down, both in absolute and relative terms, from Rs. 76.2 crores (23 per cent) to Rs. 75.1 crores (20.4 per cent). Exports to the European Common Market increased marginally from Rs. 25.3

crores to Rs. 28.6 crores, though their relative share showed a small decline from 7.6 per cent to 7.2 per cent. Other regions whose shares have gone down somewhat are Africa and Oceania.

On the other hand, exports to the United States increased from Rs. 52.7 crores to Rs. 65.5 crores and the share of that country in total exports went up from 15.9 per cent to 17.8 per cent. The ECAFE region also increased its offtake from India from Rs. 55.9 crores in the first half of 1962-63 (or 16.9 per cent) to Rs. 66.2 crores (or 18 per cent). An encouraging increase, both in absolute and in relative terms, was also registered in exports to the East European countries, from Rs. 44.7 crores (or 13.5 per cent) in April-September 1962 to Rs. 55.8 crores (or 15.2 per cent) in April-September 1963.

Among the export promotion measures taken in 1963 was the removal of the ban on the exports of several commodities as well as the liberalisation of export quotas for others including raw cotton, oil cakes and handloom fabrics. A Marketing Development Fund was constituted for providing assistance for export publicity and promotion. Legislation was passed for ensuring compulsory quality control and pre-shipment inspection. A Minerals and Metals Trading Corporation was established to look after the growing volume of state trading in ores. New export promotion councils were set up for basic chemicals, pharmaceuticals and soap and finished leather and its manufactures. The Railways announced a general rebate of 25 per cent in the freight for sixty-five engineering industry products booked for export from any station to any port.

The net position on account of invisibles other than official donations improved further during the half year. There were net receipts of Rs. 11.8 crores in April-September 1963 as compared to a net payment of Rs. 1.5 crores in April-September 1962. Net receipts from transportation increased from Rs. 9 crores to 13 crores, largely reflecting the rapid growth of Indian shipping by 200,000 GRT in the first two years of the third Plan. Net receipts from private donations were also somewhat higher at Rs. 16.0 crores as against Rs. 13.8 crores while those from miscellaneous transactions were larger at Rs. 9.7 crores as compared to Rs. 1.1 crores. The improvement in receipts from private donations and miscellaneous transactions may have been the result of the intensified restrictions on foreign travel and private remittances, and of a reduction in the smuggling of gold and other items. However, receipts from private donations were still well below the 1956-57 level of Rs. 47.8 crores.

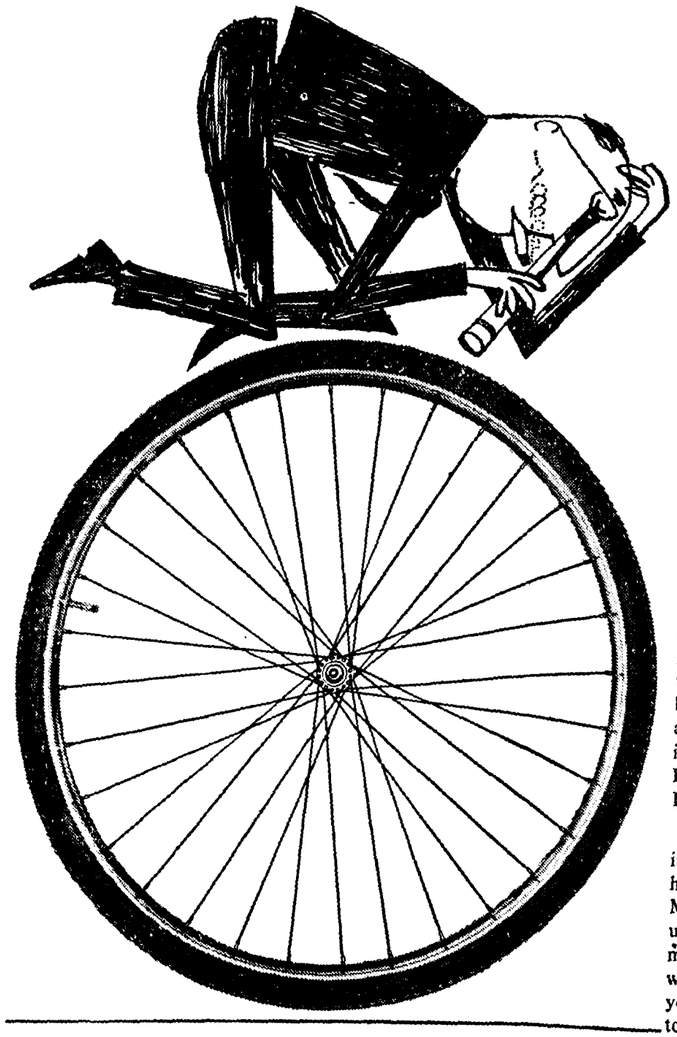
Downward Adjustment Needed

It may, however, be added that, from the foreign exchange point of view, the net surplus in the invisible account needs to be adjusted downward to eliminate the expenditure by the U.S. Embassy out of the portion retained by it from total accumulation of P.L. 480 rupee counterpart funds, since it is counterbalanced by increased capital payments of a book-keeping nature. The invisibles position (excluding official donations) thus adjusted shows net receipts of Rs. 8.2 crores in the first half of 1963-64 as against net payments of Rs. 9.1 crores in the first half of 1962-63.

With the depletion of the sterling balances, gross receipts from investment income have rapidly declined, while payments have risen with the growth of the country's external indebtedness. Gross receipts amounted to Rs. 5.8 crores and gross payments to Rs. 46.3 crores in April-September 1963, as compared to Rs. 9.4 crores and Rs. 43.4 crores, respectively in April-September 1962.

The net outflow of private capital both long-term and short-term was Rs. 6.2 crores in April-September 1963, as compared to Rs. 6.4 crores in April-September 1962. The figures of private capital movements recorded in the balance of payments, however, do not reflect the real trends since the balance of payments data exclude two important channels of inflow, namely, non-cash inflow of capital (which takes primarily the form of supply of equipment) and re-invested earnings of foreign companies. Nevertheless, the inflow of private foreign capital has been significantly less than was envisaged earlier.

In the half year under review, the net outflow of banking capital amounted to Rs. 19.6 crores as compared to Rs. 7.6 crores in the corresponding half of 1962-63. This was mainly in the nature of a reduction of the liabilities which were incurred in the latter half of the previous year when the lowering of the British bank rate to 4 per cent and the raising of the Indian bank rate to 4½ per cent had caused a significant inflow of funds. Repayments (net) of foreign loans amounted to Rs. 26.3 crores for April-September 1963 as compared to Rs. 22.4 crores in the first half of 1962-63.



External Assistance

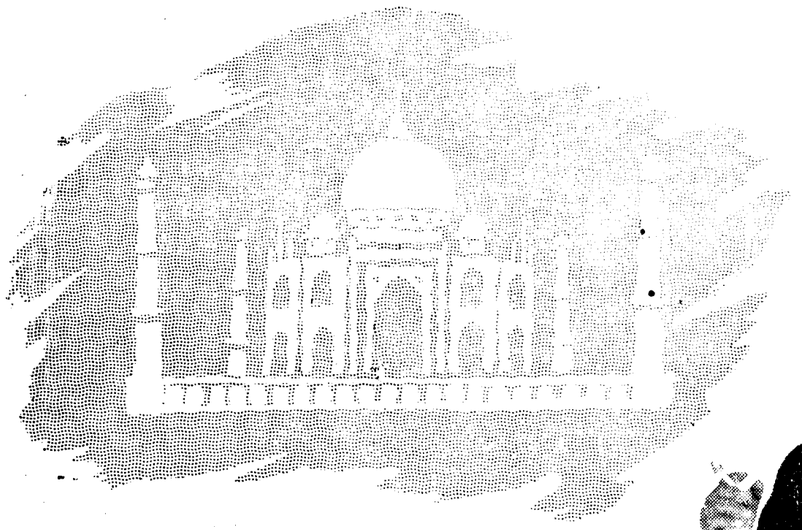
Payments against external assistance (other than under the American Surplus Disposals Programme) were estimated at Rs. 2,600 crores during the third Plan period. These would be covered partly by assistance amounting to Rs. 693 crores carried over from the second Plan period; on the other hand, part of the assistance promised during the third Plan will be disbursed in the fourth Plan period. The Aid India Consortium sponsored by the World Bank, which had pledged assistance amounting to Rs. 617 crores for 1961-62 and Rs. 510 crores for 1962-63, promised further assistance of Rs. 501 crores for 1963-64, making a total of Rs. 1,627 crores for the first three years of the third Plan. Detailed agreements were concluded till the end of December 1963 against these pledges for a total amount of Rs. 1,292 crores. Assistance promised upto the end of September 1963 outside the Consortium, mainly by the U.S.S.R. and other East European countries, and available for use during the third Plan amounted to a total of Rs. 396 crores, the bulk of which was authorised before the end of the second Plan period.

The above figures exclude assistance under the American Agricultural Surplus Disposals Programme, which has helped to maintain supplies both of foodgrains and of other commodities such as cotton. The value of such supplies available for import during the third Plan amounts to Rs. 630 crores, and the actual imports in the first 2½ years of the Plan amount to Rs. 294 crores.

In the second Plan and at the start of the third Plan, most aid was project-tied. In the case of such assistance, orders are placed after loan agreements are signed and the actual drawal of funds takes place as and when machinery is shipped. Increased imports of machinery against such project assistance have recently resulted in an improvement in utilisation. The availability of a larger share of external assistance in non-project form has also resulted in speedier drawals. While in 1961-62, the amount drawn against external assistance was Rs. 250 crores, there was an improvement to Rs. 321 crores in 1962-63. In the first half of 1963-64 the sum drawn was Rs. 180 crores and in the second half of the year, receipts are likely to be higher. A further significant improvement is expected in 1964-65.

The servicing of external debt is a growing burden on the balance of payments. Debt repayments had amounted to Rs. 60 crores in 1961-62 and Rs. 53 crores in 1962-63. Repayments against loans signed upto the end of 1963 are estimated to rise to a peak of Rs. 116 crores in 1968-69. Over the fourth Plan period, repayments against these loans will amount to Rs. 553 crores and interest charges to Rs. 273 crores. In addition, debts contracted in 1964 and later will have to be serviced. It is thus important that further borrowing should be on softer terms. Loans from the International Development Association and the U.S.A.I.D. have been repayable over 40 to 50 years, with long grace periods and nominal service charges; and there is a need for wider acceptance of this pattern.

HARVEY FABRICS ARE THE FIRST CHOICE OF LEADING CYCLE TYRE MANUFACTURERS



Tough, durable Harvey cotton tyre fabrics provide the sinews for the finest cycle-rickshaw and cycle tyres. That's why they are the first choice of leading tyre producers such as Dunlop, National Rubber Manufacturers, Oriental Rubber Industries and Cosmos India Rubber Works. Harveys' Cotton Cycle Tyre Cord Warp Sheet, Cotton Cycle Rickshaw Warp Sheet and Cotton Cycle Bead Wrapping Sheet are extensively used by the industry.

Harveys' Madura Mills are today India's largest producers of industrial fabrics. Through the years they have built up a world-wide reputation for consistently high quality. They have the men, machines and knowhow to produce a wide range of industrial fabrics like Tyre cords, Belting Ducks, Light and Heavy Canvases and Filter Cloths.

What's more, Harveys can weave industrial fabrics to *your* specifications—however rigid. Recent expansion at Madura Mills, with the installation of up-to-date high speed looms and precision machinery, have further increased Harveys' weaving capacity. They can now meet all your requirements in industrial fabrics... to your complete satisfaction.

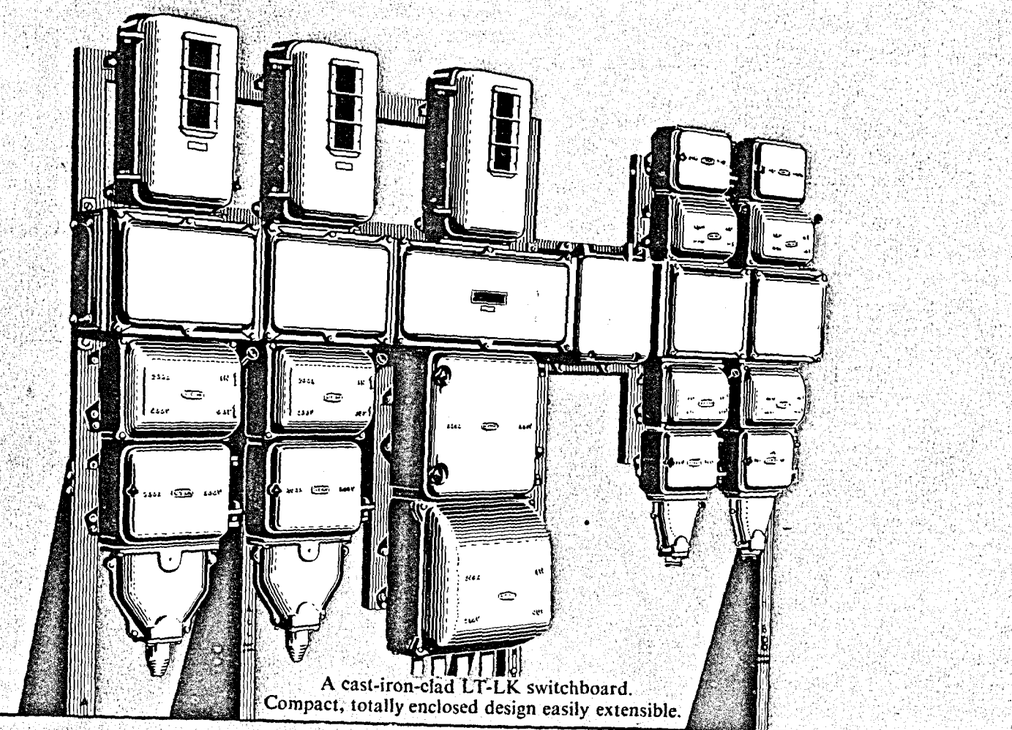
GORDON WOODROFFE & CO. (MADRAS) PRIVATE LTD., MADRAS.
Exporters of East India Tanned leathers.

The name of Gordon Woodroffe has been known and respected in India for nearly a hundred years. It was on the 1st August, 1868, that Mr. G.W.P. Woodroffe started trading in Madras and, from small beginnings, built up a successful business as an East India Merchant. A branch of the firm was opened in London and manufactured goods of various descriptions began to move from Britain to India while many varieties of South Indian produce were moving in the opposite direction from Madras to Britain. Over the years, the firm carried on many, if not all, the activities of East India Merchants and in 1925 the partnership was divided into two private limited liability companies, one in London and one in Madras.

By this time, Gordon Woodroffe & Co. had long been established in the export trade of semi-tanned Hides and Skins from Madras and, foreseeing perhaps that changes were bound to come, they began to think seriously about industrialisation. It was not surprising that their first venture in this new field should be concerned with leather, and on the 11th October, 1928, Gordon Woodroffe Leather Manufacturing Co. Ltd. was formed as a subsidiary Company with the main object of tanning, dressing and finishing leather for export. New machines, new methods and new processes have been introduced, production has been expanded almost to the point of maximum capacity and there can be few single units today which successfully produce so many varieties of leather. Crust leathers made from Indian cowhides are exported to the United Kingdom for finishing, imported hides are processed in various ways for export, indigenous hides are tanned and finished for the Indian market-particularly for the manufacturers of shoes for export- and mechanical and industrial leathers are produced for the manufacturers of textile accessories, leather belting and cycle saddles.



GORDON, WOODROFFE LEATHER MANUFACTURING CO. LTD. PALLAVARAM, MADRAS
Chrome and vegetable tanners, manufacturers of box and glace kid leathers.

TULLIS WOODROFFE & CO., LTD. MADRAS.
Manufacturers of Industrial and Textile leathers.

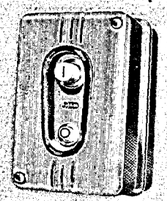
In 1953, the parent Company formed a new subsidiary, Tullis Woodroffe & Co. Ltd., in collaboration with John Tullis & Son Ltd. of Glasgow to manufacture picking bands for textile looms and a wide variety of industrial leather accessories.

In 1959, a third Company, Fenner Woodroffe & Co. Ltd., was formed in association with J. H. Fenner & Co. (Overseas) Ltd. of Hull to manufacture leather belting and allied lines.

FENNER WOODROFFE & CO., LTD. MADRAS.

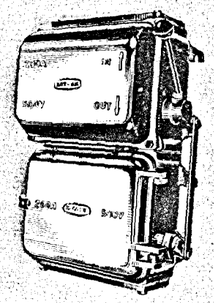
A cast-iron-clad LT-LK switchboard.
Compact, totally enclosed design easily extensible.

For Guaranteed Quality and Dependability insist on



LT-LK SWITCHGEAR

It is false economy to buy inferior switchgear. Of the finest quality, LT-LK is made in India in collaboration with the leading European manufacturers of switchgear—Laur. Knudsen Ltd. of Denmark.



L&T also manufactures control panels (floor or wall mounted or console type) for India's power generating and distribution stations and industrial installations.

Type MKI, 15 Amps automatic direct-to-line motor starters for motors up to 7.5 hp.

Type MFI, 15 Amps manually operated motor starters for motors up to 7.5 h.p.

Switch-fuse gear—available as switch unit, fuse unit, and combined switch-fuse unit in ratings of 60/100 to 1000 Amps, 500 Volts

The Two Faces of TTK

IN A WITTY string of verses arguing that "cancer can be fun", published in a recent issue of *New Statesman,* Mr. J. B. S. Haldane, the eminent biologist, who is now convalescing from surgery for cancer of the rectum, points out that among the gods of many mythologies the Roman god Janus must look slightly ridiculous. With his two faces turned in opposite directions, front and behind, poor god Janus is in the unenviable situation of having to contemplate eternally a view of his posterior. The Central budget for the coming year, though two-faced like Janus, is however not a matter for ridicule or resentment. It is a budget which has to be criticized more in sorrow than in anger, for here is the sad case of an abortion of good intentions, of political courage failing intellectual conviction.

That Mr. T. T. Krishnamachari firmly believes in a positive fiscal policy for stimulating the corporate sector and enabling it to secure more resources from its own earnings as well as from new investments out of personal savings in the community cannot, indeed, be denied. Not only in Part 'A' of his budget speech, but in many earlier pronouncements, he has been pleading for a comprehensive economic programme which would break through the stagnation in savings and investment and thereby push the economy towards higher levels of economic activity. In the fiscal proposals of the budget itself he has put forward a set of measures which share a common logic that the corporate sector should be enabled on the whole to retain more of its earnings for ploughing back into business instead of being made to pay more in the form of various taxes. Again, in his pattern of concessions and incentives to foreign private capital, he has attempted to remove some of the existing grievances and thereby improve the inflow of foreign equity capital and know-how. But it should surely not have been impossible for the Finance Minister to appreciate that these improvements in fiscal attitudes and measures, however valuable in themselves, could lead only to a half-way house.

Retained earnings are, no doubt, of major importance in the growth of industry. But even under the most favourable circumstances they can only meet a part of the additional finances required for substantial industrial growth. It is true that, by reducing the aggregate incidence of taxation on corporate earnings and encouraging inter-corporate investment by abolishing super-tax on inter-corporate dividends, the Finance Minister has sought to promote a certain extent of diversification of industries through existing companies. But surely this flexibility is not enough in a situation where hundreds and thousands of new industries will have to come in a steadily growing stream if the industrialisation of the nation is to be rapid enough and substantial enough. Industrial expansion on this scale cannot take place on the strength of the internal finances of the corporate sector alone. Those finances will have to be augmented by a large and sustained inflow of new investments from current personal savings in the community. The Finance Minister's budget proposals, however, have ignored the essentiality of the induction of personal savings into industry. He seems to have proceeded on the assumption that the bulk, if not very nearly all, of personal savings should be directed into public exchequer from which finance could be subsequently made available to industry through government or semi-government financial institutions. Whatever may be the virtues of this approach, it can certainly

not be claimed that it is the kind of fiscal or larger economic policy which would liven up or invigorate the capital market. The proposed dividend tax, extension of capital gains tax to bonus shares and the mobilization for Government purposes of the bulk of the investible savings of the upper middle classes through the annuity deposit scheme must surely reduce the ability and willingness of more and more people to invest more and more in shares generally and new issues in particular.

Added to this are the sudden large demands made specially on the income and wealth of the rich. The re-introduction of the expenditure tax is claimed to be designed to penalize conspicuous consumption or ostentatious living. Assuming that a tax of this kind could have an effect of that kind, the Finance Minister ought surely to have asked himself whether the other socio-economic conditions needed for the expenditure tax succeeding in its purpose are present. It is surely unrealistic to expect rich people to deny themselves the pleasure of current consumption when there are other features in the Government's fiscal and economic policies which must discourage rich men from earning more or saving more or investing more or accumulating wealth for the benefit of their progeny. Here we cannot overemphasize the importance of fiscal policy not being self-contradictory. If the aim is to restrain consumption among the well-to-do, it surely becomes important to make saving and investment more attractive. But if the earning and building of wealth is penalized it is surely unsound to expect restraint on consumption to be practised. On the contrary, the psychological attitude prompted in the rich would be one of living for the day. In such circumstances, the expenditure tax would become just another levy on income and capital of the well-to-do.

It is possible that the Finance Minister has revived the expenditure tax not because of his partiality for a pet notion of his but because he has found in it an easy way of implementing Bhubaneswar socialism. That the sudden and large increases in the estate duty and rigorous tightening up of the gift tax are tributes which New Delhi is paying to Bhubaneswar is of course only too obvious. It is true that death duties have been recognised in all progressive communities as a legitimate means of moderating disparities in wealth arising out of inheritance. Had the Finance Minister been content with a moderate accentuation of the rates of the estate duty it would have been easier to appreciate his approach. As it is, he has chosen to step up this duty to expropriatory limits, clearly indicating thereby that the purpose is to disperse not only big concentrations of personal wealth but even moderate fortunes within a period of one or two generations. This certainly is levelling down with a vengeance, for while the structure and grades of personal taxation taken as a whole will certainly operate to prevent people from accumulating new fortunes of even a few lakhs of rupees, the estate duty taken with the gift tax, must lead to the liquidation of industrial investments by the wealthy in order that their estates may be able to meet their tax liabilities. Thus while it is being made more and more difficult for new entrepreneurs to accumulate enough capital to make a start as industrialists, conditions are also being created for the dissolution of established business interests. It should, indeed, be extremely unlikely that this state of affairs can help in the industrialization of the country which would necessarily involve greater exertions on the part of existing business leaders as well as a steady emergence of new entrepreneurs.

It is possible that, having acted in a political hurry, the Finance Minister was not wholly aware of the larger and deeper implications of some of his budget proposals. It seems certainly to be the case that he has been led into exaggerating the extent of the relief given to companies through the replacement of the super profits tax by the surtax. It is possible that he is also mistaken in his assessment of the effects of other proposals in the budget. The behaviour of the stock exchanges since February 29, however, should by now have convinced him that the budget proposals have mis-judged the situation. Mr. Krishnamachari has not been able even to generate moderate enthusiasm in the capital market. If this passivity continues the prospects for economic expansion would be bleak indeed. The development of the national economy must at all times be a joint endeavour of the Government, foreign collaboration and domestic capital and enterprise. The two faces of Mr. Krishnamachari have been turned to the first two. It is a pity that there has not been a third face which could have been turned towards the third side of this equilateral triangle.

Eastern Economist 20 Years Ago

MARCH 3, 1944

The proposal to increase the corporation super tax to 3 annas in the rupee cannot be defended, if the object is not to impose additional handicaps on industry. But the decision to grant a rebate of one anna in the rupee on such of a company's total income as is not distributed in dividends except at fixed rates of dividends is a welcome recognition of the principle that profits ploughed back into industry should be differentially treated from profits distributed as dividends. We have more than once pressed for the adoption of this enlightened view of taxation and welcome this tardy and halting recognition of a principle which deserves extensive application in the interest of further industrial investment. Similarly, the limitation of the rates payable by insurance business to 63 pies, with retrospective effect to the provision for 1943-44 is good so far as it goes, though it is not adequate, compared to what obtains in the United Kingdom.

'D' is for Disincentives

IF THE super profits tax had destroyed Mr. Morarji Desai's standing as a Finance Minister, the surtax proposed by his successor is unlikely to add to the reputation of the latter. Mr Krishnamachari claims that his purpose is to generate confidence in the capital market and the corporate sector. He has had an excellent opportunity, but some cruel god had willed him to let it pass. Through a simple withdrawal of the SPT, the present Finance Minister could have brought about a revolution in business psychology and the investment climate. He has, indeed, withdrawn the SPT, but by an unhappy error of judgment, he has chosen to cancel much of the good effect of that surrender by proposing a substitute in the form of a surtax on companies' profits. We may assume perhaps that, at the last moment, he had found himself lacking in the political courage needed to revert to a normal pattern of company taxation. The evil that men do lives after them and the surtax is the stubborn remnant of the Desai legacy.

Fewer Excuses

In fairness to Mr Desai, however, it must be pointed out that his successor has fewer excuses for fiscal folly. This time last year the public exchequer had come steadily under enormous pressure to raise resources anyhow. In the resulting excitement, the then Finance Minister and his advisers, whether within the Finance Ministry or outside, seem to have lost their heads. Mr. Krishnamachari has had time and opportunity for retrospective wisdom. In the circumstances, it is indeed most unfortunate that he should have chosen to continue an inherently unsound scheme of company taxation, even if it be with modifications. It is no doubt true that the proposed surtax is less amateurish or crude than the SPT to the extent that it has exempted a higher rate of return over a far wider capital base. The SPT applies after a six per cent return on a rather rigorously defined capital base, whereas the proposed surtax would be attracted after a 10 per cent return on a more liberally construed capital base. Another difference to the advantage of the new tax is that it would be on a flat rate of 40 per cent on chargeable profits, whereas the SPT operates on a two-tier rate structure of 50 per cent on the first slab and 60 per cent on the next. The net effect of these differences would no doubt be to reduce the total burden of extra taxation of company earnings. The actual incidence will vary from company to company, but preliminary calculations show that for a large number of companies and over the corporate sector as a whole, the relief resulting from the substitution of the SPT with the surtax might be less substantial than is apparently assumed by the Finance Minister. This explains why the stock exchanges have not shown any great enthusiasm. By the same token, the Finance Minister's belief that his budget would stimulate industrial and business activity may not be borne out. Incidentally, in one vital respect, the surtax seems to be more onerous than the SPT. This is the absence of any provision for the carry forward of losses. It is possible that the Finance Minister may correct this lapse. That would no doubt be a considerable improvement, but it would still be an improvement in detail which will not alter the basic position.

The main objections to the SPT are that it is a tax on efficiency and that it seeks to apply, in an absolutely indefensible manner, the principle of progression to the taxation of corporate profits, thereby discriminating against the more efficient enterprises, besides being regressive in its ultimate incidence on shareholders. These objections will continue to apply to the surtax. All that Mr. Krishnamachari may claim is that by replacing the SPT by the surtax he would be mitigating the unevenness of the incidence of the additional taxation of company profits. That would still leave unanswered the question whether it is at all necessary to have this kind of extra taxation of corporate finances. Surely such additional taxation is inconsistent with the Finance Minister's own recognition of the need for strengthening the resources of the corporate sector. The best (because it would be the most direct and the most simple) way of doing this would therefore have been merely to have dropped the SPT and stopped with that. The Government's ways and means position would not have seriously come in the way of such a move and it is consequently most deplorable that the Finance Minister has failed to act in that manner. It is quite clear that the surtax is simply a creation of political expediency to which economic wisdom has been sacrificed.

Equally inappropriate to what professes to be an "incentives" budget is the proposed tax of 7½ per cent on all amounts distributed as dividend on equity capital. Roughly this would mean a direct addition of 2½ per cent to the total of 50 per cent of income tax and super tax payable by companies. If the purpose of this tax is merely to raise revenue, it would have been better had the Finance Minister merely raised the basic total of corporation tax to 52½ per cent. Had he done so and had he, at the same time, abolished the SPT without replacing it by any other levy, he could have served the interests of the exchequer without creating a feeling of onerous new burdens on the corporate sector. In that case, the reaction of the capital market would certainly have been much more constructive and Mr. Krishnamachari's claim that he had framed his budget with a view to stimulating the economy would have been easier to sustain.

For the Sake of It

Unfortunately, the Finance Minister has once again succumbed to the temptation of levying a new tax for the sake of levying a new tax. His argument that the dividend tax is needed to prevent "dissipation" through higher dividends of additional resources resulting from the substitution of the surtax for the SPT is altogether unconvincing. In the first place, the possible additional resources, as we have pointed out earlier, are likely to be much smaller than the Finance Minister supposes. Mr. Krishnamachari, we are afraid, is unduly impressed with his own generosity in replacing the SPT with the surtax. The generosity, we allow, may be in his intentions, but it is not likely that there will be much of it in the consequences of his actual proposals. This apart, the use of the word "dissipation" in the context in which the Finance Minister has used it betrays an uncharacteristically old-maidenish approach to the matter of dividends. Money distributed on dividends is certainly not dissipated either from the point of view of the corporate sector or from the point of view of the community at large. It is an elementary text-book maxim that dividend incomes carry a very high potential of saving and re-investment. It is generally the case that no significant part of dividend incomes is utilized in consumption expenditure. More important still, an increase in dividend levels is probably the best stimulant for the investor's interest in the corporate sector. The Finance Minister surely knows that people do not put more money in equities merely because of a brilliant Part "A" budget speech in which it has been argued with devout earnestness that the Government believes in promoting (and is determined to promote) a good climate for investment in the corporate sector. In the psychology of the investor, there is hardly any substitute for the powerful appeal which an attractive level of dividends in the corporate sector could make. The dividend tax, like the surtax, is entirely misplaced in what purports to be an "incentives" budget.

Passing on to the details of the dividend tax, it is cer

tainly odd that no exemption limit has been provided. The Finance Minister says that he wants to restrain higher dividends. We have said already that it is undesirable to restrain dividends. But even assuming for the moment that an increase in dividends is to be prevented, it is incomprehensible that the Finance Minister should have thought in terms of a general and absolute penalty on dividends as such, irrespective of whether there has been an increase or not. Indeed, the tax in its present form is so anomalous that even a company which is actually distributing a reduced amount in dividends will still have to pay it. Surely this could not have been the Finance Minister's intention. The principle that a floor should be provided is therefore hard to resist and, assuming that this tax is to stay, the least that the Finance Minister might do would be to apply the tax only to such amounts as are in excess of the highest amounts (corresponding to the equity base) which have been distributed in dividends in any of the previous three accounting years.

Powerful Disincentives

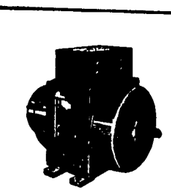
The surtax and the dividend tax are certainly two very powerful, and wholly incongruous, disincentives in a budget which is claimed to have been dedicated to the task of stimulating the economy. There are other afflictions as well. The proposal to bring the bonus element in bonus shares under the purview of the capital gains tax, for instance, is an avoidable deterrent to shareholding. The Finance Minister's contention that bonus shares are as much an accretion to capital assets as any other accretion which currently attracts the capital gains tax overlooks the fact that there is already a special tax of 12½ per cent on bonus shares. It is true, of course, that this tax is paid by companies, but the money, nevertheless, comes out of the pocket of the shareholder for all practical purposes. The real situation therefore, is that the shareholder has already been taxed on the capital gains in the bonus shares. To tax him again through the capital gains tax is certainly inequitable. This additional discouragement to shareholding must necessarily make nonsense of the Finance Minister's claim that he has been at pains to frame a budget which would create a healthy climate in the capital market. To put it differently, bonus shares should certainly not be subjected to a special tax in the hands of companies as well as a capital gains tax subsequently in the hands of the shareholders. If Mr. Krishnamachari is so anxious to extend the capital gains tax to bonus shares, he should surely see the reasonableness of abolishing the special tax on such issues.

We are not suggesting here that the budget proposals relating to the corporate sector are entirely devoid of small mercies. The proposal to provide to companies which engage in certain specified industries a rebate of super tax of the equivalent of the 10 per cent of income tax and super tax, which would be normally payable by them has rightly been widely appreciated. The industries chosen for this favoured treatment are those which occupy an important place in our economy and the development of which the Government considers necessary to encourage through special measures. In the Finance Bill, 14 such industries or industrial categories have been mentioned and power has been taken to notify additions to this list from time to time. It is possible that this rebate could offset a good deal of the increased tax liabilities which the favoured enterprises would be incurring on account of surtax. Their position in this respect is further improved by another concession that this rebate will also be applicable to them in respect of surtax to the extent of 20 per cent of tax assessed. It is perhaps not uncharitable to draw the inference that these rebates are essentially in the nature of conscience money and that the Finance Minister, having decided for reasons of political expediency to make amends for the repeal of the SPT by imposing a surtax, has let his bettter judgment prevail to the extent of mitigating the severity of the resultant tax burden at least in respect of enterprises engaged in high priority industries. While his motives could be sympathized with, it is not unfair to make it clear that the rebates in their context cannot really be regarded as positive incentives. An incentive would be positive only where the general burden of taxation is reasonable and the concession is a genuine one. Where the general burden of taxation has been increased by extraordinary fiscal measures, such concessions as may be given are to be considered strictly as reliefs merely and not as incentives.

The position is similar with regard to the concession given to new companies in the matter of the dividend tax. The Finance Minister has proposed to exempt them to the extent of a dividend of 10 per cent on equity capital for a period of five years from the first declaration of dividend by such a company. We had already argued that a dividend tax which is intended to discourage an increase in dividends, should even normally carry an exemption limit. To restrict this basic and legitimate provision to the particular case of new companies is to be viewed not so much as a favour shown to such companies as a penalty imposed on the rest of the corporate sector. Incidentally, it is indeed outrageous logic that it should be thought a wrong thing for established companies which, through enterprise or prudent management, have come to occupy a sound and strong financial position, to seek to share the monetary benefits of their success or prosperity with the shareholders who own it. Let us make it clear that we are not objecting to the concession proposed for new companies. Our point is that the very fact that the Finance Minister has found himself compelled to make this distinction has exposed the absurdity of the general scheme of the dividend tax with the absence from it of a provision for a normal exemption limit.

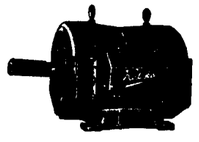
A tax concession to which we could extend unreserved approval is the proposal to exempt all inter-corporate dividends from super tax. Here is welcome recognition of the vital role which inter-corporate investments could make in quickening the pace of industrial expansion and promoting the diversification of industries with great economy of financial, managerial and other resources. This is a fine example

of the pragmatism which, fortunately, is not totally absent from the budget proposals, despite the overcrowding pressures of political expediency.



The group of companies which are generally referred to as Section 23-A companies (and which are now governed by Section 104 of Income Tax Act, 1961) has been the 'bete noire' of successive Finance Ministers. It is, therefore, wholly pleasing that the attention that this group has received in the budget is not wholly to its disadvantage. It is true that the rate of super tax applicable has been increased from 25 per cent to 35 per cent in this case, but these companies, where they are engaged in the specified industries eligible for the proposed rebate of super tax equivalent to 10 per cent of the income tax and super tax payable by them, have been allowed this general concession. This apart, in consonance with his desire to encourage the ploughing back of profits, the Finance Minister has freed this group from the existing requirement of compulsory distribution of dividend. For such other companies as are also subject to the requirement of compulsory distribution of dividend, the Central Board of Direct Taxes is to be empowered to exempt such portion of profits which it considers necessary to be retained to meet the development needs of the company concerned, subject to the limit of 20 per cent of the income required to be distributed.

While on the subject of concessions and reliefs it is perhaps permissible to bring to the attention of the Finance Minister an instance where it is certainly desirable to reverse yet another of the decisions of his predecessor. We are referring to the discontinuance in the budget for 1962-63 of the five-year exemption from wealth tax of shares held in new companies. This exemption, while it existed, was certainly a considerable encouragement to investment in the corporate sector and its withdrawal was equally clearly a discouragement. Since the Finance Minister is on the whole inclined to promote such investment, it is hoped that he will consider the restoration of this concession.



Misapprehensions

Finally, the Finance Minister's loud thinking on the future of the development rebate has naturally aroused certain misapprehensions. While there is appreciation of the fact that he has not abruptly made any changes in the existing position but has preferred to serve notice that modifications were to be expected after an interval, it is pointed out that there is still bound to result a climate of uncertainty about how and to what extent the Government proposes to modify the development rebate. It is being suggested in responsible quarters that in order to allay doubts and fears and to make possible the continuous and/or advance planning of new industrial projects, the Government might do well to make a policy declaration indicating the industries which might be affected and also the extent to which they may be affected by such changes as it is proposed to make in the scheme of the development rebate. While the changes themselves might be put into effect at a later date as proposed by the Finance Minister, an advance account of their nature might profitably be given now so that entrepreneurs and investors would be enabled to take into account probable trends in tax liabilities. This is a plea which is worth considering because, as circumstances are at present the development rebate, along with the "tax holiday", has come to occupy a position of overwhelming importance to the investment climate for industrial expansion.

The Finance Minister himself, in the interview he gave recently to 'The Economist', London, thought fit to make special mention of the development rebate as one of the in-built advantages of the tax structure in this country. It is, of course, not true that the development rebate is a positive benefit in itself. Its importance arises from the fact that but for it the totality of the fiscal burdens laid on the industrialization of the country would have been truly intolerable and virtually crippling of industrial activity. It is clear that such a strategic element in the tax structure should be treated at all times with the greatest circumspection. While the Finance Minister's desire to use the development rebate to further his strategy of selective encouragement of industrial expansion on the basis of national priorities is indeed legitimate up to a point, it would certainly be unwise to curtail unduly the scope of the development rebate because, as we have pointed out, it is really in the nature of a safety valve in the tax structure. If the basic system of taxation were reasonable, constructive and oriented towards economic expansion and dynamic industrialization, there would have been no need for gadgets like the development rebate. It is precisely because of the fiscal tyranny built into our tax structure that there is need for such extensive safety provisions. Mr. Krishnamachari, whatever his intentions or professions may be, has not by any means employed his present budget for the purpose of civilizing the tax structure to the extent needed. On the contrary, while pulling out a tooth here or trimming a claw there, he has also put in new fangs on his own. It would, therefore, be altogether imprudent to be in a hurry to tamper with the mitigatory aspect of the tax structure.

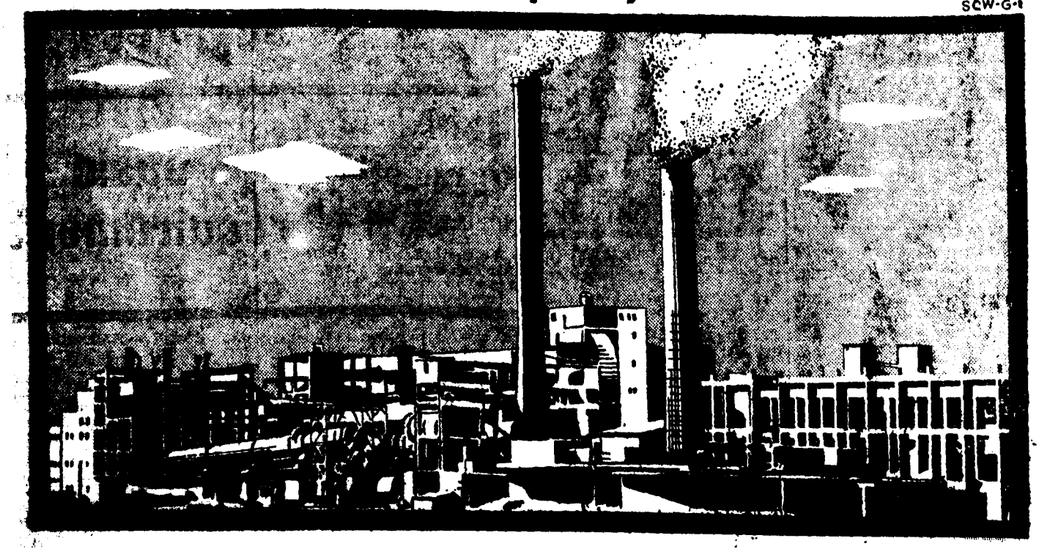
SATNA CEMENT WORKS forges ahead... steps up production from 750 tonnes to 1750 tonnes of cement per day

Started in 1959 with an initial output of 750 tonnes per day, the Works undertook an ambitious programme of expansion and has now been geared to produce 1750 tonnes of cement per day to meet the growing needs of the nation.



Khajuraho—symbol of the finest in Indian temple architecture, is also our trade name and signifies cement of the highest quality. That we are now able to produce per day 1000 tonnes more of this quality product is a matter of pride to us...and rightly so.

The Budget and the Price Line

ONE OF the more agreeable features of Mr. T. T. Krishnamachari's stewardship of the Government's economic policies in the months since he took over from Mr. Morarji Desai as Finance Minister is the concern he has been showing for defending the welfare of ordinary men and women. While recognising the stern realities of the circumstances in which a poor country has to find the massive means of financing its economic development as well as the defence outlays essential to its security, the Finance Minister has, at the same time, taken the humane and enlightened view that the vulnerable sections of the community should neither be expected to bear more of the burden of such financing than may be strictly necessary nor be denied current benefits in terms of welfare services or social security as is at all possible for the Government to provide.

In framing his budget proposals Mr. Krishnamachari has clearly endeavoured to be guided by these considerations. From this point of view the most significant feature of his budget is that, while attempting higher levels of Plan and defence outlays, it is striving hard to contain and control their inflationary potential. Although, even at the existing level of taxation, the Finance Minister could anticipate a surplus of Rs. 54 crores on revenue account, he has nevertheless decided to resort to further means of securing revenue so that the overall budgetary gap may be kept to the minimum. As a result, as against the overall deficit of Rs. 135 crores in the revised estimates for the current year, the corresponding gap in the budget year has been reduced to Rs. 86 crores. This is certainly creditable performance considering that more money is to be spent on the budget year on development as well as defence. It is gratifying to find that the resort to deficit financing is thus being substantially reduced. As a matter of fact, unless there are unforeseen adverse developments on the expenditure side, the quantum of deficit financing which is likely to be called for in the budget year ought to be marginal. The importance of this point should not be under-estimated when, as is the case now, prices have been steadily rising for some time on a wide front.

Restraining Consumption

In his budget speech the Finance Minister has emphasized the need for fiscal policy seeking to restrain consumption in the present circumstances. Up to a point this argument is certainly a respectable one and Mr. Krishnamachari has attempted to give practical shape to it in various ways. In the first place, the target for small savings has been fixed at Rs. 125 crores as against the record collections of Rs. 115 crores secured in the current year. Again, although the compulsory deposit scheme is now to be wholly withdrawn, the Finance Minister has proposed in its place an annuity deposit scheme on a graduated scale for income tax assessees at the income level above Rs. 15,000 per annum. We shall presently consider some of the drawbacks of the scheme, but here it must be acknowledged that so far as the limited purpose of restraining consumption as a part of an anti-inflationary programme is concerned, the scheme is certainly not without value.

Again, although the Finance Minister has not given any relief to the community from prevailing high level of excise taxation, he has at least refrained from adding to that burden. Although he has made changes in indirect taxes through which he expects to secure about Rs. 26 crores of net additional revenue, it is broadly true that none of the adjustments he has proposed is of a nature which would impose any additional burden on the community through higher prices. This is not an inconsiderable achievement.

There are a few more fiscal changes which again would have some healthy influence on the price level. For instance, the proposal to allow a rebate of super tax on contributions to recognised provident funds, deposits in the 10- and 15-year accounts of the post office cumulative time deposit scheme and premiums on life insurance should be an encouragement to voluntary savings and should have a moderating influence on the price level. In the changes proposed with regard to the capital gains tax, the Finance Minister seeks to apply a higher rate of taxation to house and landed property, the purpose being to restrain unhealthy speculation resulting in the boosting of the value of such property.

Against the background of these proposals, it could certainly be argued that the budget is bound to have a restraining effect on the price level. To what extent it is actually successful in this respect will be determined, however, not only by the negative consideration of the discouragement of consumption but also by the positive effect of any contribution which the budget as a whole could make to the stimulation of production. In the course of his budget speech, Mr. Krishnamachari has repeatedly avowed that an important part of his budget strategy is to seek to promote both current production and investment for future production. To the extent that the budget as a whole, and particularly those parts of it which relate to direct taxes, could in fact produce a favourable climate for investment and business activity, an important contribution to the management of the price situation would certainly have been made by the Finance Minister. On this score, however, judgment must wait. While Mr. Krishnamachari's purpose, undoubtedly, is to stimulate the economy, and while it certainly cannot be denied that many of his proposals relative to the corporate sector could be useful in this manner, there are also quite a few substantial disincentives in the proposals which he made with regard to direct taxation, the consequences of which may be inconsistent with a policy of stimulating the economy.

The Finance Minister has confessed to a healthy scepticism of price and other controls and has clearly affirmed that increased production, assisted by fiscal restraints on consump-

tion in the short period, is the only true answer to the problem of high prices and the shortage of goods and services. This certainly is true but even those who would most readily agree with Mr. Krishnamachari on this score would still feel constrained to point out that, so far as the creation of a favourable climate for investment goes, the totality of the Finance Minister's budgetary decisions may not succeed in giving that clear and forceful positive direction to the economy which is so urgently needed at the present time. Meanwhile, by withdrawing the compulsory deposit scheme completely and releasing income-tax payers from its scope, the Finance Minister has not only done a popular act but has also given appreciable relief to income-tax payers with incomes below the level of Rs. 15,000 to whom the annuity deposit scheme is not applicable. While it is true, that the Finance Minister's marginal adjustments have resulted in the lowering of the income tax liabilities at some points of the lower income brackets, it has been said that the Finance Minister has not given any substantial relief to the mass of the people either through substantial reductions in indirect taxes on consumption goods or through a substantial lowering of income tax rates throughout the lower brackets of incomes. This criticism ignores the fact that, given the high and rising levels of development and defence outlay, no net surrender of revenue on a mass scale is feasible. Where a budget manages to provide more for defence, development and social services without imposing an additional taxation on mass consumption or on the lower levels of income, as the present budget certainly has done, it must be reckoned a considerable achievement for its author. In this sense the present budget may reasonably be regarded as a welfare-oriented budget and the size of the solid contribution that it may make to the community's well-being would certainly be great if, despite some disincentives to capital formation and investment, the economy is still helped by the other favourable provisions in the budget to pick up and move forward towards higher production and investment levels.

the zero

The very ancient form of counting, known as 'Arabic' numerals, was in fact Indian in origin. The first traces of these are found in some of the rock-cut inscriptions in central India dating back to 300 B. C. The invention of '0' is considered one of the greatest in the world. This has made it possible to work on numbers like 1,030 or 3,042,050. The zero is of oriental origin—adopted by other countries.

The Growth in Taxes: 1950-51 —1964-65

THE BUDGET for 1964-65 has raised the total revenue of the Union Government to a new peak at Rs. 2,135.39 crores. There has been a steady rise in the size of the budget year after year, though it is not generally known that the present level is nearly five times the level in 1950-51, the base year for the first Plan. The total revenue of the Central Government in 1950-51 was Rs. 405.86 crores, after excluding the share of the States in the different taxes. It took more than ten years to double itself to Rs. 877.40 crores in 1960-61. The rise has been very steep in the last two years, the increase being Rs. 550.10 crores which is more than the total revenue in 1950-51 by one-third.

Table I below shows the manner in which the tax revenue and the non-tax revenue of the Union Government have increased since 1950-51. From the level of Rs. 357 crores in 1950-51, the tax revenue rose to Rs. 1,449.08 crores in 1964-65 (Budget). If the share of the States in the various taxes were included, the figure would rise to Rs. 1,706.12 crores. The tax revenue doubled itself in the decade 1950-51 to 1960-61; the same feat was once again accomplished in the four years between 1960-61 and 1964-65. A sharp jump during the last two years, especially in the wake of the emergency, was primarily responsible for taking the total tax figure to a new dizzy height. But for the emergency, the shocks of these new taxes would not have been absorbed in so orderly a manner.

Tax Incidence Increases

A study made by the "Tax Research Unit" of the Department of Economic Affairs had indicated in 1961 that the incidence of indirect taxation till 1958-59 was 5.7 per cent of consumer expenditure on all households, 9.3 per cent of consumer expenditure in urban households and 6.9 per cent of the consumer expenditure of rural households. If the same study were extended upto 1964-65, it would be found that the incidence had increased by more than hundred per cent. In the case of the income-tax paying urban households particularly, the effect of indirect taxation will be found to have increased from 13.8 per cent of the consumer expenditure to not less than 30 per cent.

It is customary for all Finance Ministers to compare their total tax revenue with national income, though Mr. T. T. Krishnamachari has made no such attempt. Usually, it is intended to prove that the percentage of taxation to national income in this country is not excessive and that there is ample room for further taxation. In one of his speeches last year, Mr. Morarji Desai had put the percentage at 11. The failure of the agricultural sector has kept the national income figure pegged down which at current prices may not exceed Rs. 17,000 crores in 1964-65. Since the Union taxes total upto Rs. 1,705.63 crores, the percentage works out to not more than 10. This manner of computation, however, is fallacious. In the total tax burden of the country must be included the taxes levied at the State level and by the local bodies. Again, the rural areas and the non-monetised sections of the population should be studied separately from the urban areas and the monetised sections. In an article entitled "Taxation and National Income" in 'Eastern Economist' dated June 14, 1963, it was shown that the incidence of taxation in urban and monetised areas as a percentage of income was much higher than the 10 to 11 per cent as given out by the official spokesmen. The allocation of the taxes between the rural and the urban sectors or between the monetised and the non-monetised sectors, after including the taxes levied at the State level and also at the level of local authorities, indicated that the urban and the monetised sectors of population had to pay more than 30 per cent of their income by way of taxes.

Even though the total additional taxation proposed in the latest budget is not more than Rs. 43.61 crores, in view of the steep rise in taxation in the budget for 1963-64, there was an expectation of some relief in taxation which, however, has not materialized. The budget proposals for 1964-65 include an increase of Rs. 19.54 crores by way of new changes in excise duties, a rise of Rs. 11.00 crores due to the variations introduced in the Corporation tax and a further sum of Rs. 6.37 crores from additional customs duties. The additional yields from estate duty, gift tax, expenditure tax and wealth tax flowing from the changes introduced are estimated to be Rs. 3.00 crores, Rs. 2.00 crores, Rs. 1.50 crores and Rs. 20 lakhs respectively.

Union Excise Up

The budgets of the Union Government have come to rely more and more on the Union excise duties for revenue than on customs. This fact is illustrated in Table II. In 1950-51, the customs revenue was Rs. 161.43 crores, 40.17 per cent of the tax revenue. In 1964-65, it rose to Rs. 336.37 crores but formed only 19.97 per cent of the total tax revenue, showing that the customs have steadily declined in importance as earners of tax revenue for the Union Government. The incidence of Union excise duties, on the other hand, has increased at a fast rate. Again, coming back to 1950-51, it is seen that the revenue from excises at Rs. 67.54 crores was 16.81 per cent of the gross tax revenue, but it now stands at Rs. 769.54 crores (for 1964-65) and forms 45.69 per cent of the tax revenue. The increases from excise duties are ascribed to three factors. With increase in industrial production, the volume of excise revenue has followed an upward course. The increase in the rates of duty on the various products is the second important reason. Thirdly, the list of articles under the purview of the excises has also been expanding. Till 1952-53, for example, a larger number of articles such as artificial silk, cement, footwear, woollen fabrics, electric fans etc. did not bear any of the Union excise duties. It is the combined effect of all these three different factors which has steadily increased the revenue of the Government from excise duties.

The philosophy of indirect taxation has been enunciated

TABLE I

by the Finance Minister in these words: "One of the essential conditions to be fulfilled by indirect taxes is that the revenue from items on which such taxes are imposed is sizable and secondly, that the incidence of these taxes should be identifiable". This rational approach is welcome as it will not only provide relief to a large number of small manufacturers but will also lessen the burden on the tax-gathering machinery. In the case of many products, the game of tax collection is not worth pursuing because the yield is not commensurate with the effort involved. On this basis, the Finance Minister has eliminated duty on a number of items. They include gramaphone records, all gases other than carbon dioxide used for the manufacture of aerated waters, low voltage electric meters and all acids other than sulphuric acid. Again, the excise duty on soap manufactured without the aid of power is proposed to be withdrawn, thus freeing a large number of soap manufacturers from the purview of excise control. The Finance Minister has also brought about some changes in excise duties by regrouping items under paper in order to simplify the schedule of rates and classification. In order to encourage the use of bagasse in the manufacture of paper, he has reduced the excise duty by 5 nP. per kilogram in the case of paper manufactured with more than 50 per cent bagasse. The special excise duty in respect of synthetic dyes, glassware, chinaware, porcelainware, cellophane and

certain types of writing and printing paper and electric bulbs is proposed to be abolished. There is to be some reduction on initial slabs on tyres as well. The schedule of duty on cigarettes is also being revised while in the case of one group, the duty is to be lowered, it will go up in the case of the other. Complete details regarding these alterations will be found elsewhere in this issue.

Taxes on incomes have shown, comparatively speaking, a slow rise during the last fourteen years from Rs. 132.37 crores in 1950-51 to Rs. 250.00 crores in 1964-65 — a rise of 89 per cent only. The yield from income-tax in future will show a sizable improvement only if the income tax paying classes are able to earn more. Also, if a major share of the increase in national income gets distributed among income groups below the exemption limits, the chances of a rise in revenue are bleak. A historical study of income-tax statistics, however, shows that the number of assessees has been slowly but steadily rising from year to year. More individuals are piercing through the exemption limit and joining income-tax paying groups every year. This is apparent from the following analysis regarding income-tax assessees for 1953-54 and 1961-62. We have to rest content for a comparison between these two years because comparable figures are not available for 1950-51 and 1964-65.

Table III sets out the number of assessees, pre-tax income and post-tax income, for all individuals including salary earners and non-salary earners in these two years. The number of assessees nearly doubled from 2,92,357 in 1953-54 to 5,73,132 in 1961-62. The non-salary earners increased at a faster rate than the salary earners. The number of non-salary

40,000 — 70,000	5,252	27,14	51,668	18,83	35,856	8,518	43,11	50,610	29,09	34,151
70,001 — 1,00,000	1,490	12,24	82,187	7,12	47,745	1,961	16,07	81,948	8,76	44,671
1,00,001 — & above	1,642	36,66	2,33,264	14,12	36,006	1,667	31,15	1,86,863	11,80	70,786

earners increased from 1,46,663 to 3,12,390, while the number of earners rose from 1,45,694 to 2,60,742. The pre-tax total income of all individuals increased from Rs. 410.94 crores to Rs. 740.92 crores. On the average, the pre-tax income per assessee fell from Rs. 14,056 to Rs. 12,928 primarily because of the faster increase of assessees in the lower income brackets and a relatively lower rise in the number of the assessees in the upper income brackets. In the income brackets Rs. 5,000 to Rs. 10,000, the number of assessees doubled from 177,615 to 349,003. At the other end of the scale, in the income bracket above Rs. 1 lakh, there was only a small increase from 2,224 to 2,649. It means that under the stimulus of increasing incomes, a larger number of individuals who were below the exemption limit in 1953-54 joined the ranks of income-tax paying class. The number of assessees in the higher income brackets is definitely rising but at a slow pace

Middle Classes Benefit

The new incomes which are being generated are, however, being shared to a large extent by the lower and the middle classes amongst the income-tax paying groups. As Table IV (P. 439) shows, the pre-tax income of the lower 70 per cent of the assessees commanded 37 per cent of the income in 1953-54, but its share rose to 41 per cent in 1961-62. Similarly, the middle 20 per cent which commanded a share of 23.5 per cent in the pre-tax income in 1953-54 recorded an improvement of one per cent to 24.5 per cent in 1961-62. The upper 10 per cent recorded a drop, indicating that the lower and the middle income brackets steadily gained at the expense of the upper 10 per cent. This swing was sharper in the case of the non-salary earners than in the case of salary earners. The relative percentage of the lower, the middle and the upper classes amongst the salary earners showed stability. The lower 70 per cent amongst the salary earners improved its share of pre-tax income from 41.6 per cent to 42 per cent only, the middle 20 per cent improved from 24.2 to 24.3 per cent only while the drop in the case of the upper 10 per cent was from 34.2 per cent to 33.7 per cent. In the case of non-salary earners, the lower 70 per cent gained sharply from 34.5 per cent of the income to 49 per cent, while the upper 10 per cent lost by 7 per cent.

It is, thus clear that the number of assessees continued to rise from year to year during the eight years under study. Similar was the case with the pre-tax as well as the post-tax incomes, with obvious inference that the increase to be expected in future in the lower brackets will be higher than in the upper income brackets.

Next to the Union excises, corporation tax is the fastest moving component of the Centre's tax structure. From Rs. 40.49 crores in 1950-51 to Rs. 306.00 crores in 1964-65 (Budget) is an impressive rise, though a part of it is due to the recent re-classification of the income-tax. The corporate sector has come under abruptly augmented fiscal pressure during the last two years as is indicated by the fact that receipts under this head have increased by Rs. 84.50 crores from Rs. 221.50 crores in 1962 is to Rs. 306.00 crores in 1964-65. While the growth of this source of revenue is partly the result of the steady investment in industry in the last 15 years, the tendency in successive budgets to resort to newer forms of taxation of corporate finances has also been largely responsible.

ASSAM LOOKS AHEAD

From ambitious industrial undertakings and hydel projects down to the humblest problem of settling village affairs through Panchayats, our planners have taken every thing into account; for our objective is the greatest good to the greatest number in every sphere at every level, and that is the goal of our Welfare State.

Assam's Third Five Year Plan with a total outlay of Rs. 120 crores aims at laying the foundation of a self-generating economy. The Plan seeks to give a more precise shape to all the projects by strengthening our economic and social structure.

Our pledge is to work hard, harder than ever before, to make Assam Strong and Prosperous.

(Issued by the Directorate of Information & Public Relations, Assam, Shillong).

Mixed Fare for Companies

IF THE primary objective before the Finance Minister, in the context of the corporate tax structure, was to correct its myopic elements and revive confidence in the corporate sector, he has completely failed to do so. The net effect of his reform measures has been the shift of burden from one set of companies to another with the overall result of giving to the exchequer an additional revenue of Rs. 11 crores. An effort has been made here to analyse, with the help of a few company balance sheets, the incidence of some of the new corporate tax measures which, quite against the wishes of the Finance Minister, are likely to dampen the investment climate.

The most significant change in the corporation tax structure has been the abolition of super profits tax and its replacement by the surtax on profits. The SPT was levied at the rate of 50 per cent on residue profits after tax, from six to 10 per cent of the capital base and at the rate of 60 per cent on residue profits in excess of 10 per cent of the capital base which in the case of SPT was capital plus reserves but not the long-term borrowings. It was a very severe imposition that crippled the growth element in the companies but its replacement by the surtax is not going to be a source of much relief to the corporate sector. New surtax under the Companies (Profits) Surtax Bill 1964, is quite like the SPT in many respects. Briefly, surtax is to be levied at a uniform rate of 40 per cent on that part of profits after tax which is more than 10 per cent of the capital base on Rs. 2 lakhs, whichever is higher. Capital base for the surtax includes equity and preference capital, reserves, debentures and long-term loans used for creating capital assets. It is true that the surtax will be applicable to a much smaller number of companies than the SPT, but from whatever precise evidence that is available at the moment, it appears that some of the companies that are likely to come under its purview may be hit nearly as hard as they were by the SPT. In a few cases, the burden may be even higher. An analysis of profits and taxes of 25 large companies in Table I below shows that the total incidence of the SPT on these companies was around Rs. 330.32 lakhs corresponding to a total corporation tax of Rs. 2,168.65 lakhs. The surtax now imposed will imply an imposition of Rs. 157.68 lakhs. Broadly speaking, the incidence of surtax on these 25 companies put together will be nearly half as compared to the SPT. It may be added that these 25 companies do not represent the corporate sector as a whole, as they do not form a fair sample of all the public limited companies. But this summary of profits and taxes of 25 companies does show the effect of this new compost on larger companies. Table II in which the surtax and SPT have been calculated separately for 51 biggest companies also confirms this trend. In these companies the SPT payable was Rs. 756.3 lakhs and the surtax on these very companies would have added up to Rs. 238.80 lakhs which comes to nearly 31.5 per cent of the SPT.

It may be noted that out of the 25 companies (Table I) only five were exempted from the SPT. But so far as surtax is concerned, as many as 12 of these companies are likely to claim exemption. Similarly out of 51 companies analysed in

TABLE I.

Jessop	152.82	76.41	16.22	92.63	60.61	68.77	3.26	1.31	73.34	47.99

Table II, only 12 were exempted from Super Profits Tax whereas as many as 29 are likely to be exempted from the imposition of surtax. The extension of the base for estimating liability which includes equity capital, preference capital, reserves including dividend reserves, debentures and loans from financial institutions and banks and foreign loans will definitely result in the exemption of various companies which came under the purview of Super Profits Tax where the capital base was limited. The impression given by the Finance Minister, however, was that surtax would result in a more equitable burden over the companies besides reducing the burden as a whole. This is only partly held out by the above mentioned facts. It is true that surtax in the case of these 25 companies would have been nearly half of what was paid by way of Super Profits Tax and would have been nearly 31.5 per cent of the Super Profits Tax in the case of 51 companies. But it has to be kept in mind that the burden of this incidence will fall on much fewer companies thereby making the total load lesser and yet comparatively less equitable. Moreover, the new surtax will benefit those companies which rely more upon long-term borrowings, as these loans will be included in the capital base. The companies that may earn higher rate of return with lesser long-term borrowings will, therefore, be at a comparative disadvantage. It may be added that the pattern of investment in certain industries is determined by the nature of manufacturing process and not determined by the will of the shareholders or the directors. The production processes of some industries have to have a heavier capital base. Similarly, there are a number of other companies wherein the production and distribution processes imply the maintenance of a high level costly superstructure for their efficient running while they do not need a heavy capital base. The capital base is, therefore, not a very dependable criterion to determine the ability to pay for such a heavy imposition as outlined in surtax. It appears that Hindustan Lever, Voltas, Dunlop Rubber, Century, Tata Chemicals, Hindustan Construction may be among the companies that might pay the highest amount of surtax. Other companies like Burmah-Shell, ESSO, Telco, Bird & Co., Union Carbide may be among those who had to pay the heaviest Super Profits Tax and they may have to pay comparatively lesser surtax. The transfer of burden from one group of companies to another is hardly a process of equalisation in the present context.

Dividend Tax

Another significant imposition in this budget is the dividend tax at the rate of 7.5 per cent on the total amount of dividend distributed on equity capital but excluding dividend on preference capital. Table II also shows clearly that this additional tax on dividend paid on equity share capital will mean collectively as much as Rs. 233.0 lakhs for 51 biggest units. Collectively, the incidence of this fresh dividend tax appears to be nearly as much as that of surtax, at least for these 51 companies.

The following table shows the impact of the latest taxation proposals on 25 companies drawn from different industries on the basis of their working results for 1962-63. The table also shows super-profits tax for that year and surtax and dividend tax which they would have paid had they been in force for that year.

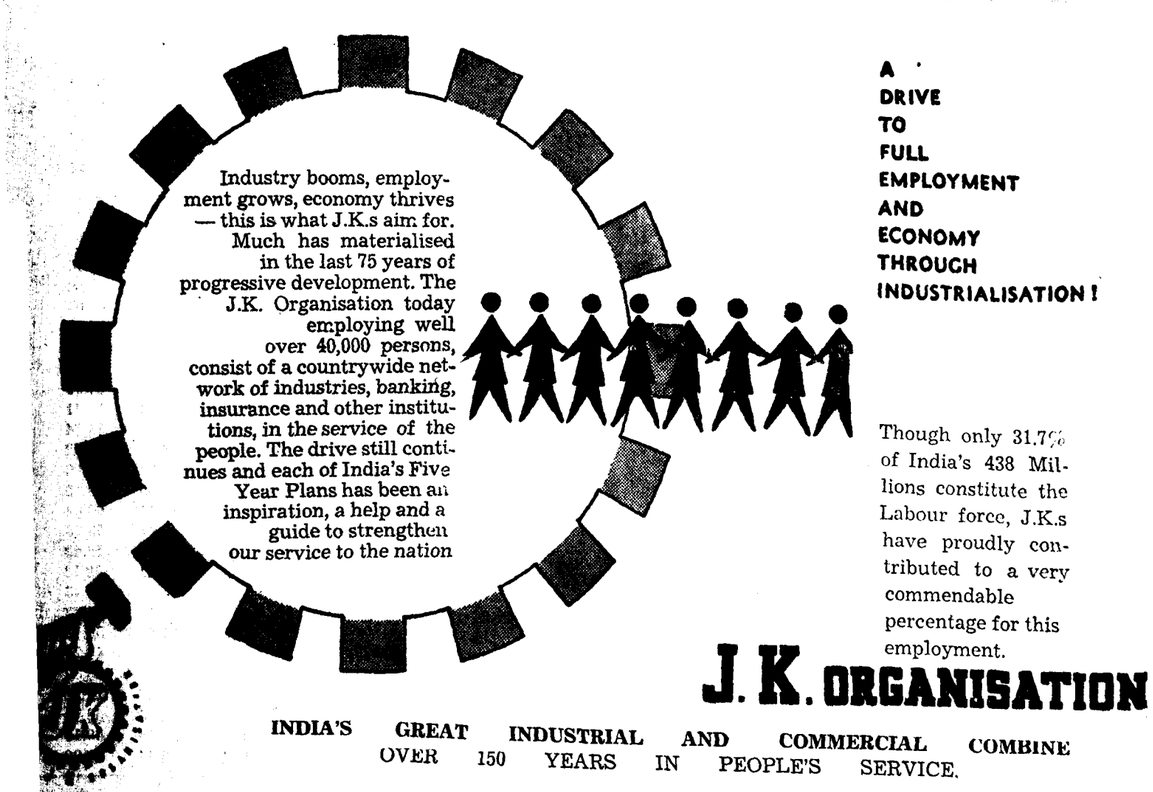

TABLE II.

ADDITIONAL TAXES PAYABLE BY 51 INDUSTRIAL GIANTS ACCORDING TO NEW BUDGET PROPOSALS

Relief in Personal Taxation?

IN HIS BUDGET speech, the Finance Minister, Mr. T. T. Krishnamachari, said: "The personal income-tax structure is being re-graded. This will mean a reduction of tax at all levels. With this change, the burden of income-tax in the lower brackets will be substantially lower than what it is now". A comparison of the new tax rates (without the Annuity Deposit Scheme) with last year's rates (without the Compulsory Deposit Scheme) shows that the Finance Minister's statement regarding the reduction of tax rates at all levels was not correct.

In the case of wholly earned incomes by salary for married persons with more than one child, the incidence has increased instead of decreasing at levels of income of Rs. 10,000 to Rs. 15,000. Table I (p. 449) shows that a relief of Rs. 9 has been provided in this category for annual income of Rs. 5,000; but in the case of an income of Rs. 10,000, there has been an increase by Rs. 29 from Rs. 680 to Rs. 709. Similar is the case at the income level of Rs. 15,000 where the increase is of the order of Rs. 40 from Rs. 1,544 to Rs. 1,584. Beyond this level there has been a steady relief in all income-tax brackets. The incidence in some of the lower income brackets is also higher according to the new rates for unmarried persons. Even at the net income level of Rs. 3,600 for unmarried persons, the increase is as heavy as Rs. 41 and it goes on increasing up to Rs. 5,000.

Table II shows that whereas income-tax incidence beyond the annual income of Rs. 15,000 tends to decrease, the Annuity Deposit, however, increases at a steep rate. The net consequence of the Annuity Deposit Scheme and the new tax rates is to increase the out-of-pocket money at all income levels beyond Rs. 15,000. The annuity deposits have been made compulsory for all Indian citizens. They will be deducted while computing the income for income-tax purposes in the year they are deposited. Deposits will be repaid in ten equated instalments of principal and interest after one year of the assessment. The deposits, when they are repaid, will be once again included in the income for income-tax purposes. This inclusion of the equated instalments of principal and interest for computing income-tax is not justified because it makes a farce of the initial deduction. It is strongly urged that the Annuity Deposit Scheme should be altered so as to exempt repayments of deposits from income-tax assessment. The scheme has provided that authors, artists, and actors etc. can make additional deposits over and above the rate prescribed under the scheme. It is also proposed that gratuity payments, which are liable to tax, can also be deposited upto half the amount under the scheme.

Annuity Deposit Scheme

The incomes of assessees who are covered by the Annuity Deposit Scheme, are not likely to remain stationary, but will continue to rise. If the repayments of the "equated instalments of principal and interest" under the scheme were included in the increased incomes of the assessees, when they would be called upon to pay higher rates of income-tax, because of increased incomes, it is certain that the benefit of the scheme would be completely nullified. It is, therefore, necessary that the future repayments of the instalments under the scheme should be exempted from personal taxes.

The Finance Bill has proposed a rebate in super tax in addition to the existing available rebate of income-tax on insurance premia and contributions to Provident Funds etc. which are provided under Section 87 of the Indian Income-Tax Act. The amount of rebate of income-tax and super-tax which is admissible to an assessee is subject to a ceiling of 50 per cent of the total amount which may qualify for such relief. While this change is welcome, it needs to be stressed that the incidence of the annuity deposits is so heavy that it is not likely to leave any margin for increasing contribution to life insurance or provident fund.

According to the existing provisions of the Income-Tax Act capital gains made by assessees in relation to assets held by them for more than one year are subject to the average income-tax rate applicable with the ceiling at 25 per cent. The Finance Bill seeks to increase the rates of capital gains tax. The Bill has introduced differentials between the rates applicable to capital gains in real estate as compared with gains on other assets. Capital gains resulting from lands or buildings or rights in building will be taxed at not less than 75 per cent of the average rate of income-tax and super-tax to their total income. In regard to the long-term capital gains and other assets, the Bill states that they will be taxed at 50 per cent of the average rate of income-tax and super-tax which is applicable to the total income of the assessees. Since the maximum rate of tax is up to 78 per cent of the total income, these new changes will make capital gains a much heavier penalty than hitherto.

Expenditure Tax

The Expenditure Tax which had been introduced for the first time by Mr. T. T. Krishnamachari in his 1957-58 budget and had been suspended by Mr. Morarji Desai, has again been introduced. Experience had indicated that the expenditure tax was cumbersome and it caused more harassment to the assessees and created more work for the Income-Tax Department than the revenue which flowed from this tax. The Finance Minister has stated that the Expenditure Tax has failed because of the large number of exemptions and high rates of taxes. He has, therefore, removed many of the exemptions and also reduced the rates. Amongst the exemptions abolished are: the expenditure incurred by an individual on the maintenance of his parents up to Rs. 4,000, medical expenses — either his own or his dependent's or parents' — and expenditure incurred on the education of the dependents. It may be stated that the total collections under the expenditure tax will be Rs. 1.55 crores in 1964-65 — the highest which has even been collected under this tax in any previous year.

It has not been noticed in the heat of the budget discussions that there has been a drastic reduction in the new Expenditure Tax rates as against the old. As the table below shows,

EXPENDITURE TAX

(Over and above the exemption limit of Rs. 36,000)

Old		New	
Expenditure	Rate	Expenditure	Rate
Upto 10,000	10%	Upto 12,000	5%
10,000 — 20,000	20%	12,000 — 24,000	7.5%
20,000 — 30,000	40%	24,000 — 36,000	10%
30,000 — 40,000	60%	36,000 — 48,000	15%

From aircraft plywoods to oil-tempered hardboards WESTERN INDIA PLYWOODS make the widest variety of specially processed woods

Today modern industry and architecture demand woods in a variety of specially processed forms: aircraft manufacture for instance, demands light yet strong plywoods, engine rooms require fire-proof plywoods, radio cabinets need specially processed plywoods for resonance, building construction and coach building demand oil-tempered superhardboards. WESTERN INDIA PLYWOODS, the largest manufacturers of plywoods in India, make numerous varieties and sizes of plywoods and hardboards to meet such industrial and architectural needs of our country. They are marketed under the trade names 'Westindply' for plywoods, and 'Weston' for hardboards.

THE WESTERN INDIA PLYWOODS LIMITED

P.O. Baliapatam, Cannanore District Kerala State.

over and above the exemption limit of Rs. 36,000, the old rates imposed an Expenditure Tax of 10 per cent up to an additional expenditure of Rs. 10,000. In the new rates, the slab has been widened to Rs. 12,000 and the rate has been reduced to 5 per cent of the additional expenditure only. Again, in the next slab, which again was of Rs. 10,000 in the old rates but is of Rs. 12,000 in the new rates, the expenditure tax has been reduced from 20 per cent to 7½ per cent. At the highest slab of more than Rs. 50,000 expenditure, the Expenditure Tax was 100 per cent but in the new rates it has been reduced to one-fifth the level at 20 per cent. It will, thus, be seen that the Expenditure Tax as now proposed is in a much milder form, though the element of harassment will still remain.

Wealth Tax

The Wealth Tax has undergone some changes in the Finance Bill which makes it applicable to a very large number of assessees who had escaped its clutches in the past. The exemption limit hitherto had been up to Rs. two lakhs. But now the exemption limit has been reduced to Rs. 1,00,000 only. This change will no doubt bring within its purview thousands of middle class families. The rate of Wealth Tax has been reduced for net wealth up to Rs. 4 lakhs in excess of the exemption limit from one per cent to half per cent, while there is no change in other slabs. The lowering of the exemption limit will cause hardship to a large number of assessees who have built houses in the urban areas through their savings. A welcome feature of the Wealth Tax, however, is if an assessee lives in a house owned by him, it is to be exempted from the tax, but this exemption will be up to Rs. 1 lakh only if his house is situated in a town with a population more than 10,000.

The Gift Tax has also undergone some changes in such a way as to discourage giving of gifts in future.The exemption limit for gifts by an individual to his or her spouse has been reduced from Rs 1 lakh to Rs 50,000. Again, gifts made to the same person over a period of subsequent four years are proposed to be aggregated with the value of other taxable gifts made by the assessee in the particular year. This clubbing together of gifts with the earlier years will sharpen the impact. The new rates of Gift Tax are higher than the old ones. On the first Rs. 5,000 of value of all taxable gifts, the tax will be 4 per cent. On the next 15,000 of the value of taxable gifts, it will be 8 per cent. The subsequent Rs. 25,000 of gifts will attract tax at 15 per cent followed by a rate of tax of 25 per cent for the subsequent gift of a lakh of rupees. Beyond the level of Rs 3,00,000, the gift tax is as high as 50 per cent.

TABLE I

INCOME-TAX ON SALARIED EARNED INCOME

(Rs.)

Annual Income	Married with more than one child			Unmarried		
	1963-64 (excl. CDS)	1964-65 (excl. ADS)	Difference (2—1)	1963-64 (excl. CDS)	1964-65 (excl. ADS)	Difference (5—4)
	(1)	(2)	(3)	(4)	(5)	(6)
3,200	—	—	—	99	100	+1
3,600	—	—	—	115	156	+14
4,200	60	36	—24	139	192	+53
5,000	93	84	—9	172	240	+68

16800	1976	1776	—200	2049	1932	—117
18,000	2293	2004	+289	2363	2160	+208
20,000	2855	2384	+471	2930	2540	—390

Similar is the case with the Estate Duty, the rates of which have been increased steeply. The first Rs. 50,000 of the estate are exempted. It remains unchanged at 4 per cent for estates valued from Rs. 50,001 to Rs. 1,00,000. Beyond that there is a steep rise, resulting in doubling the Estate Duty in the slab of Rs. 20 lakhs. It has been raised to 85 per cent above Rs. 20 lakhs. The impact of such confiscatory Estate Duty will be to level down the rich within two generations.

TABLE II

Impact of Indirect Tax Changes

AFTER THE massive dose of indirect taxation administered by Mr. Morarji Desai last year and in view of the tax revenues showing buoyancy despite the slackened pace of economic development during 1963-64, Mr. T. T. Krishnamahari this year could hardly have proposed additional customs and excise burdens. In fact, against the backdrop of inflationary pressures generated by indirect taxation over the past few years, especially by the last year's levies, expectations had come to be entertained that some relief in customs and excise duties would be given at least in respect of articles of mass consumption. While these hopes have been belied, it would still be uncharitable to deny the Union Finance Minister credit for moderation and restraint.

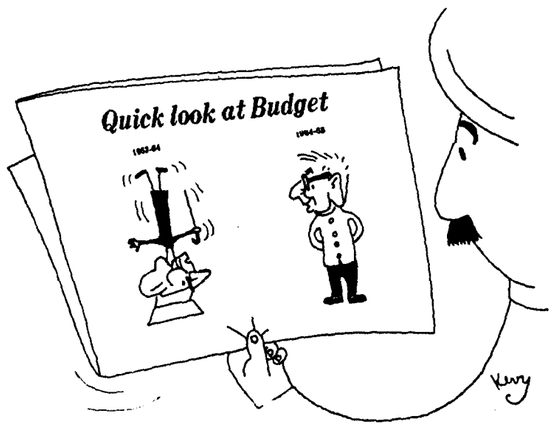
Under customs, tax burden in the financial year 1964-65 is proposed to be increased on dry fruits, copra, caustic soda and high carbon or spring steel wire. In the case of the first three items, however, it is to be no more than what it was before September 1, 1963, when tariff values of these commodities were lowered, thus reducing the incidence of duties on them. Customs levy on high carbon or spring steel wire is proposed to be stepped up for putting the indigenous product on a competitive basis with the imported one.

The incidence of excise duties is proposed to be raised in the case of some iron and steel products (particularly flat categories), superior varieties of cotton and woollen textiles, man-made fabrics, cigarettes valued at Rs. 7.50 to Rs. 15.00 per thousand; soaps manufactured with the aid of power, certain types of dispersed organic pigments which are replacing the use of other organic dyestuffs in textile printing, aluminium extrusions, footwear and rubber products such as latex foam sponge, tread rubber, cushion compound, cushion gum and crepe gum. The additional burden on all these commodities will be marginal, except in the case of flat steel, superior cotton and woollen textiles and man-made fabrics, particularly of non-cellulosic origin, viz. nylon and terylene.

Reliefs in Customs

As against these enhanced burdens, reliefs in customs duties have been proposed in the case of motor cars (including taxi cabs) imported in completely assembled state and raw jute. The levy on motor car imports is to be scaled down from 150 per cent to 60 per cent, presumably, in the interest of tourism and foreign technicians working in India. Export duty on raw jute is to be completely abolished as an export incentive measure. Excise duty concessions are proposed in the case of cigarettes valued at Rs. 15 to Rs. 25 per thousand, soaps manufactured without the aid of power (excise duties on these soaps are to be removed, but a levy on sodium silicate used in their manufacture is to be imposed. There will however, be a net relief to the tune of Rs. 8 lakhs per annum) and paper containing not less than 50 per cent bagasse pulp. Concessional rates of excise duty will also apply to paper manufacture from new units and from expansion of the existing ones for three years, the concession amounting to 25 per cent of the duty in the first year, 20 per cent in the second year and 15 per cent in the third. Some adjustments have as well been proposed in the excise duties on matches, paints and varnishes and wireless receiving sets. These will provide marginal relief in the case of certain categories of these items and small producers.

More significant reliefs from the burdens of excise duties, however, will accrue to the consumers of synthetic dyes, glassware, chinaware, porcelainware, cellophane and certain types of writing and printing paper and electric bulbs, from which items special excise levies are to be removed, and those of gramaphone records, gases other than carbon dioxide used in the manufacture of aerated waters, low-voltage electric motors and acids other than sulphuric acid, from which excises are being completely removed.



The net additional burden of indirect taxation proposed by Mr. Krishnamachari has been estimated by him at Rs. 25.9 crores. This should stand reduced to around Rs. 15 crores if note is taken of the fact that the increased excise levies on iron and steel contain in them an element of the hitherto accretions to the Iron and Steel Equalization Fund in the form of surcharges. This compares with the Rs. 182.20 crores additional burden proposed by Mr. Morarji Desai under customs and excises last year.

Effect on Industrial Costs

By itself, the Rs. 15 crores of new customs and excise burden can hardly provide a fillip to the inflationary tendencies in the economy. Two other recent decisions of the Union Government, however, should exert upward pressures on the price level in combination with the inflationary potential of the Rs. 333 crores step-up in Plan outlay,. Rs. 46 crores growth in defence expenditure, Rs. 191 crores increase in civil expenditure and accrual of some additional purchasing power in the hands of the income-tax payers up to Rs. 15,000 income per annum because of abolition of the Compulsory Deposit Scheme. These are the allowing of increases in steel and coal prices. They will adversely affect industrial costs.

Apart from the enhancement of the excise and countervailing import duties on steel, the controlled price of all the flat categories have been increased substantially — on an average by Rs. 30 per tonne. The prices of non-flat steel, which have been decontrolled, should also appreciate somewhat as the supply position of these items, though quite comfortable at present, may not remain easy with the steelworks rolling out the more difficult sections as a consequence of enlarged price differentials now provided.

An increase of Rs. 1.25 per tonne in the prices of the selected grades of non-coking coal supplied to industrial establishments, coupled with the enhanced freight proposed in the Railway Budget, however, should have greater impact on industrial costs, especially in areas distant from coal mines. The combined effect of the increase in coal prices and railway freight will be to raise fuel costs by Rs. 1.38 per tonne for the shortest distance to as much as Rs. 5.3 per tonne for distances 2,100 kms. and above. How for the increase in fuel costs will be mitigated by improvement in the quality of coal supplied to industrial establishments, it is difficult to say at present.

The Carrot and the Stick

From Our Correspondent

BOMBAY :

THE UNION FINANCE MINISTER'S Budget for 1964-65 may not have achieved all the purposes — to encourage production, to restrain consumption, to ensure people the fruits of their labour, to induce savings and to prevent profiteering — that Mr. Krishnamachari wanted, but they certainly represent an earnest effort to achieve them. In the process, however, not all the sections of the public have benefited equally, nor have all the desired objectives been fulfilled, at any rate to the extent claimed. Not unnaturally, therefore, there is speculation that, in formulating his proposals, the Finance Minister must have been torn between the need to take a pragmatic approach dictated by the realities of the situation and the pressure of ideology as embodied in the Bhubaneswar thesis of democratic socialism. In the result, according to some, he has produced neither a significantly growth budget nor a substantially socialist budget. Meanwhile, the proposals are complicated enough, in all conscience, to keep the markets still guessing as to its precise implications. Practically every important business man who has voiced his reactions to the proposals has had to qualify them carefully and also weigh the advantages and the disadvantages of the new pattern of taxation. Nearly all of them feel that, while seeking to rationalise and integrate the taxation pattern, the Finance Minister has also made it somewhat complex. The general feeling has been ably summed up by Mr. K. R. P. Shroff, President of the Bombay Stock Exchange, in his reactions that "the budget proposals form a mixed bag" and that "the Finance Minister has made use of the carrot and stick". It remains to be seen how far Mr. Krishnamachari will succeed.

Sensible Rationalisation

The market reactions here are best examined under two heads: one, as they affect the corporate sector, and, two, as they affect the individual. Broadly speaking, the corporate sector has gained more by what has been done away with than what it has suffered by what has been imposed afresh. The abolition of the Super-profits Tax, for instance, is a sensible rationalisation so also the reduction in the percentage of tax deducted at source from dividends, the rebate on corporation tax up to 10 per cent for companies engaged in development industries and the abolition of super-tax on inter-corporate dividends. On the other hand, the imposition of a surtax on profits, even though its incidence may prove less onerous than that of the super-profits tax is only a partial acceptance of the established fact that the super-profits tax weighed unconscionably heavily on the capital market. The Union Finance Minister seems to be content with providing only psychological satisfaction by just changing the appellation of the tax. Of course, this is not to underestimate such redeemable features as the placing on a par of 23A companies engaged in manufacturing or processing goods with public companies carrying on similar activities. 23A companies falling under this category have the additional advantage too of ploughing back their profits not ordinarily permissible in their case. But it is anybody's guess whether the creation of two types of 23A companies by excluding from this privileged position 23A companies not engaged in manufacturing is a right and workable step.

The most disturbing proposal from the point of view of the share markets, however, has been the proposed 7½ per cent tax on ordinary dividends, payable by all companies (except, of course, 23A companies). To quote the President of the Indian Merchants' Chamber, Mr. Dhirajlal Maganlal, this is "certainly objectionable in principle and will not only not help to stimulate capital market but rather act as a deterrent." By imposing this levy and, at the same time, exempting insurance premiums and provident fund contributions from super-tax, with the compulsory annuity deposit scheme thrown in, the Finance Minister seems to have not only hindered the flow of investment from the upper middle income groups into the private sector but actively helped that flow into the public sector. Similarly, while, from the point of view of satisfying certain ideological ends, the readjustments in the capital taxes and the re-imposition of the expenditure tax may have been called for, it is feared, they will have, at the some time, the effect of discouraging savings and capital formation so essential for the economy at this juncture. The re-imposition of the expenditure tax, in particular, a tax that had been abandoned after experience had proved it to the hilt to be futile as a revenue-raiser and uneconomic as a tax, has not unnaturally evoked the comment that Kaldor has staged a come-back through the back door.

Indecent Haste

Again, it is difficult to reconcile Mr. Krishnamachari's effort to stimulate foreign participation by implementing some of the recent recommendations of the National Council of Applied Economic Research with the indecent haste with which he seems to want to do away with the development rebate, that is, after 1966. This is a worse deal than that of his predecessor who only reduced the rate from 25 per cent to 20 per cent. Actually, many expected Mr. Krishnamachari to restore this unwarranted cut. Surprisingly enough, he has chosen to act otherwise. The withdrawal of this incentive will especially affect new entreprencurs who, in fact, are the people that need such incentives, what with all the handicaps of higher land prices, higher costs of plant and machinery, higher raw material costs and higher wages that they have to contend with 'vis-a-vis' the established industries. Equally unwarranted is the proposed tax on bonus shares. It is ironical that at a time when there has been so much of criticism of double taxation, the Finance Minister should have thought of adding yet another striking example wherein the bonus amount is to be taxed once in the hands of the company and, again, in the hands of the shareholders on receipt of the bonus shares. What makes the position patently unfair is the fact that the tax on bonus shares in the hands of the shareholders is attracted in the year of receipt of the bonus share. Although it is stated that, if these bonus shares are sold within thirty days of their receipt, they will be only taxed as the 'income' of the assessee and not as his 'capital gain', the legal position would appear to pose some doubt as the wordings in the relevant tax laws stand today.

It is one of the known ironies of every budget that not all industries stand to benefit or suffer alike. But it seems to be the unfortunate lot of the cotton mill industry to suffer more than the others. Thus, while professing to extend the healthy process of transferring the excise duty from cotton fabrics to yarn and processed cloth by proposing a compounded levy, the processing surcharges have been raised steeply and the yarn compounded duty fixed at a level not at all commensurate with the yarn duty. This will be evident from the table on page 454 which gives the prevailing rates as compared with the proposed rates.

It is doubtful whether this extra burden can be borne by the mill industry, specially by the section engaged in producing medium varieties. There are already fears, being whispered in textile circles, that this seemingly innocuous proposal might

well lead to a repetition of the 1957-58 crisis in the industry.

Now, a few words about the effect of the budget proposals on individuals. In so far as the lower slabs of salaried income are concerned, the Finance Minister's claim that rates of personal taxation have been lowered holds good. But, when it comes to higher slabs of incomes, the effect of the reduction is more than offset by the proposed annuity deposit. Surely, Mr. Krishnamachari could not have been

Category	Prevailing (Rates) (nP.)	Proposed (nP.)
Superfine	2-67	8.4
Fine	2-67	7.2
Higher Medium ..	2-16	5.5
Lower Medium ..	2-16	4.4
Coarse	1-34	2.2

thinking of the income groups between Rs. 15,000 and Rs. 50,000 as being responsible for all speculation and conspicuous consumption that he is rightly out to root out.

As a matter of fact, it is this section of tax payers that really form the main source of investment in equities. There is genuine concern, therefore, that the flow of funds from this source to the private sector might slow down. This apart, in not having made it clear to the public that the compulsory deposits under the 1963-64 proposals need not be paid without attracting additional surcharge as per the 1963 Finance Act, the Finance Minister does not appear to have implemented his own offer in the latest budget speech, namely, "to make a retrospective amendment to the relevant provisions of the Finance Act, 1963 to secure appropriate marginal relief in the additional surcharge." The provisions exempting provident fund contributions and insurance premium from super-tax within prescribed limits are also certainly welcome, but the upper limit prevents many that could possibly take advantage of the concession and benefit thereby. Similarly, the removal of the distinction between Indian and foreign employees in respect of their monthly income is a long overdue reform. However, there is still discrimination between a foreigner and an Indian in the matter of expenses on children's education in foreign countries, and this should be removed too as early as practicable.

Reference has already been made to readjustments of capital taxes. The upward revisions in the rates of the Gifts Tax and the Estate Duty are too stiff even for the first dose of democratic socialism that is sought to be administered. Without going into details, one cannot help feeling that this stiff dose would actually defeat the objectives of the Finance Minister himself. Considering the overall small net gain to the exchequer as a result of all these proposals, it may be asked whether the Finance Minister could not have abstained from any further imposts in 1964-65. This is why, perhaps, his elaborate essay at revisions and rationalisations of both direct and indirect taxes has been described by certain circles as "financial wizardry raher than financial wisdom."

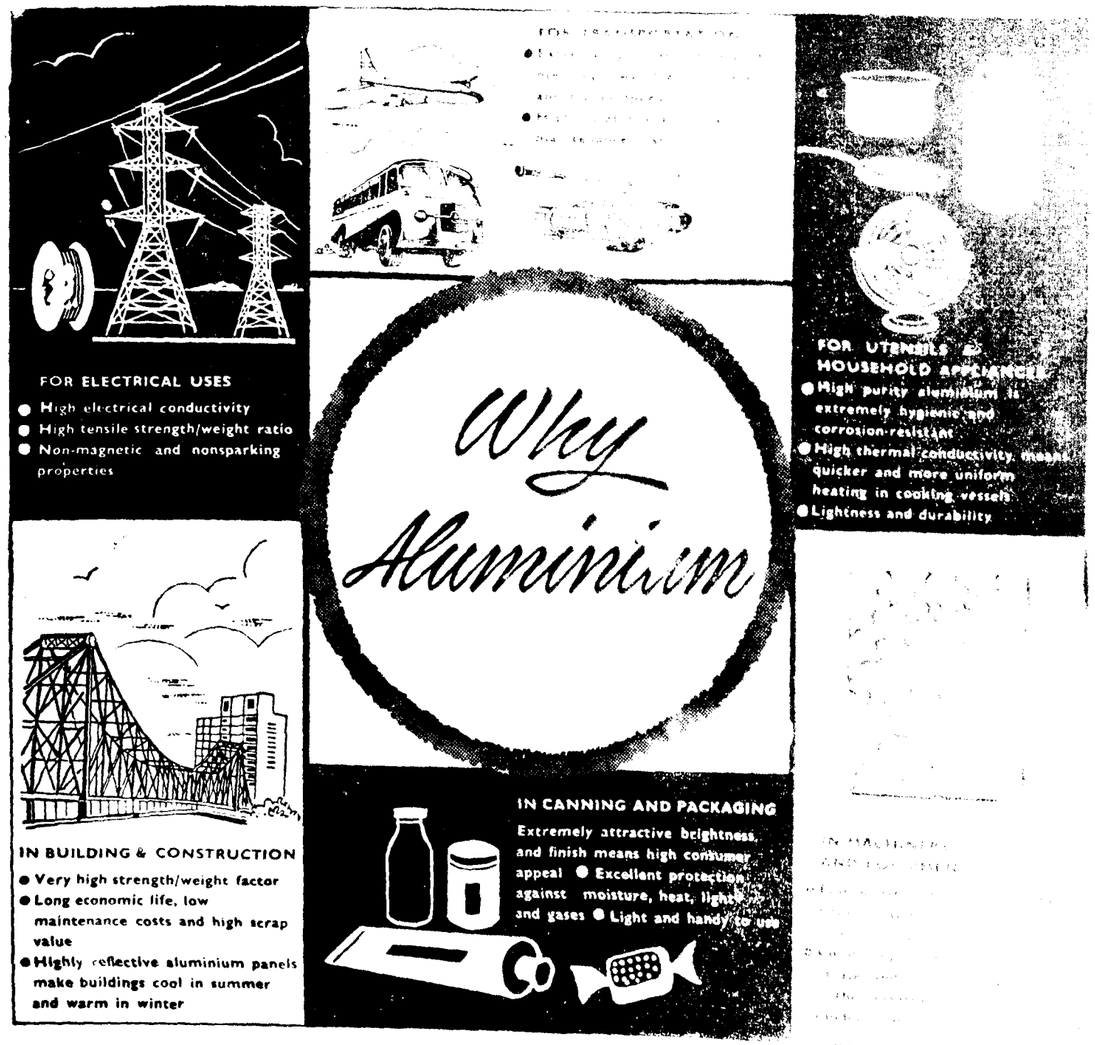
FROM BAMBOO TO FINE FABRICS

The spectacular prominence which man-made fibres have acquired in recent years in the global picture of the textile industry is among the more exciting romances of modern science and technology. These fibres form more than one fourth of the world production of apparel fibres. In our own country the growth of the man-made fibre industry has played an invaluable part in satisfying the developing desire of people at all levels of income for elegance and variety in clothing at economic prices. As is natural and necessary with a new and developing industry, technological advance is still quite rapid in this industry. One of these significant developments in technology, it may happily be recorded, has been achieved in our country which has been comparatively a new-comer in the field.



As is well-known, the manufacture of man-made cotton (staple fibre) is based on the extraction of pure cellulose from forest products, notably soft woods such as beach, birch and spruce. Soft woods, however, are grown on higher altitudes and in the temparate zones of the world. In India they cannot be grown anywhere except in the sub-montane regions of the Himalayas. Gwalior Rayon have therefore, been investigating the possibilities of extracting pure cellulose or rayon-grade pulp from a raw material which is easily and abundantly available in this country. For this purpose they have been experimenting with bamboo from which pulp is already produced for the paper industry. But the special problem here is to produce pulp of a particular grade which is suitable for the manufacture of staple fibre. After four years of research in the pilot plant in their factory at Nagda, Gwalior Rayon have succeeded in establishing a suitable process by which it has now become possible to extract from bamboo a quality of pulp which could be used in the place of imported soft wood pulp in the manufacture of staple fibre.

It is worth noting that India is the first country in the world to have succeeded in using bamboo as a source of rayon-grade pulp. As a result, this important technological achievement of Gwalior Rayon has attracted world-wide attention and is being studied with keen interest in all those countries where there is a considerable synthetic fibre industry. It is also worth recording that not only has the technical process for using bamboo for the manufacture of rayon-grade pulp been established and developed in this country by indigenous talent and enterprise, but a factory which would use this process on a commercial scale has also been designed and erected and is now being entirely operated by Indian technicians.

This pulp factory of Gwalior Rayon which has been set up at Birlakootam, near Calicut, in Kerala State, is thus a pioneer venture in one of the most modern and fast-expanding fields of industrial technology. This factory started working last year and is now producing 100 tons per day of rayon-grade pulp. About four tons of bamboo are required to produce one ton of pulp and the cultivation and conservation of bamboo supplies to feed the factory is, therefore, a related part of this project. The pulp from this plant is at present being used by Gwalior Rayon's staple fibre factory at Nagda, but it will shortly be made available to other rayon factories also. On the basis of an output of 100 tons of rayon-grade pulp there will be a saving of foreign exchange to the extent of about Rs. 3.50 crores annually. When the target of 150 tons is reached, the foreign exchange saving will increase to over Rs. 5 crores per year. The saving in the use of imported pulp not only results in economy in foreign exchange but is also otherwise significant in that the dependence of an important consumer goods industry on foreign sources for its main raw material has been considerably reduced. It is interesting to note that the manufacture of pulp from bamboo involves very little expenditure of foreign exchange, since, apart from bamboo, caustic soda and sulphuric acid which are the other two main requirements of this industry, are also produced in this country. Incidentally, the establishment of this technologically highly advanced industry in the State of Kerala has not only added a major industrial enterpise to the economy of that State but has also created profitable employment opportunities in a region where more jobs for educated or skilled personnel is an urgent social necessity.

A brief note on the manufacture of rayon-grade pulp from bamboo may perhaps be of some interest. Traditionally, cotton grown in the fields, wool from animals and silk from cocoons, have been the natural materials for clothing. With the advance of science and technology, the laboratories have been put on the job and fibres based on the chemical processing of forest products have come into their own. There are two broad stages in the manufacture of such fibres. First is the extraction of pure cellulose from forest products. The wood or bamboo is cut into small pieces which are cooked in sulphuric acid and subsequently in caustic soda solution to make them soft and pulpy. The resultant product is cleaned, washed, bleached and pressed into sheets. The second stage is to dissolve the cellulose with the help of caustic soda and carbon bisulphide and then regenerate it into fibre. This fibre is very much like the best quality of cotton and is called staple fibre. Staple fibre is normally produced in a bleached state but can also be dyed in various colours, the dyes being injected in the process of manufacture. The fibre is then spun into yarn-just like cotton-either pure or mixed with cotton or wool, and then woven into various fabrics. Since the manufacture of staple fibre is based on forest products, it has the double advantage of releasing cultivable land for priority purposes such as the growing of food and reducing the cost of clothing through the use of less expensive raw materials.

—Gwalior Rayon Silk Manufacturing (Wvg.) Co., Ltd.

The Budget and the Stock Markets

From Our Correspondent

MADRAS:

IF IT had been hoped that Mr. T. T. Krishnamachari's Budget for 1964-65 would have a revitalising effect on the industrial economy and maintain buoyancy in the stock and capital markets, while at the same time pursuing the objectives laid down at the recent Bhubaneswar Session of Congress, these hopes have been belied. The Union Finance Minister had no doubt to do a good deal of tight-rope walking as he had to bear in mind the criticism that might be provoked from Members of Congress Party belonging to two sides on account of some proposals which might appear to favour unduly industries and investors and as a result of other proposals which did not appear to serve the full purpose of soaking further the heavily rich. In spite of the complicated task, it was confidently felt that the industrial corporate sector and the smaller investors particularly would be afforded tangible relief and new industries, which were experiencing special difficulties, would be tangibly benefited. There was also a case for encouraging productive investment of new savings in industrial securities, for taking out additional insurance or for making contributions to recognised forms of saving by offering significant rebates in Income-tax or by exempting fresh investment in the initial capital of new approved industrial undertakings.

Justified Expectation

There was justification for this expectation from those in charge of many essential industries and middle-class investors as the Finance Minister was consistent in his public utterances after he made his broadcast speech to the nation emphasising the need for stimulating industrial and agricultural production and helping the economy to get out of its stagnant phase. The measures that followed in the last quarter of 1963 did not cost the Exchequer to any extent as the liberalisation of credit policies was done in an imaginative manner while large sums were made available to the Statutory Financial Corporations for extending underwriting operations, subscribing on a large scale to new issues and for granting liberal loans. On account of the belief that there would be a positive approach in the Central Budget, a bullish feeling was noticeable in the stock markets in the fortnight before the actual announcement of the Budget proposals even though there were some sceptics who held the view that the Budget bag might contain unexpected tricks and the new proposals would be complicated in character. It is rather unfortunate that these hopes which had solid justification have gone wrong.

Even when the Budget Estimates for 1964-65, on the basis of existing taxation, were presented there was a firm belief that the Finance Minister would not take any drastic steps to collect additional revenues. In fact, it was even argued that there was scope for affording considerable tax relief especially as budget receipts for 1963-64 had been grossly underestimated. In spite of a considerable higher level of expenditure there was a surplus of Rs. 54 crores on revenue account and the overall deficit was expected to be only Rs. 176 crores. For the revised estimates for 1963-64 the overall deficit declined to Rs. 136 crores from Rs. 181 crores while there was a big revenue surplus of Rs. 87 crores against an estimated deficit of Rs. 16 crores. Under these circumstances, the effort to gather Rs. 40 crores by way of additional taxation and another Rs. 50 crores on capital account under the annuity scheme has come as a great surprise. What is more, if the pluses and minuses are taken into account on the taxation side the heavy impact of the higher excise duties on superfine cotton fabrics and rayon yarn and the additional surcharge on customs duties will become evident. These will bear heavily on industries as well as consumers. The proposals to levy estate duty at the high level of 85 per cent on estates having a value of over Rs. 70 lakhs and correspondingly, heavier rates of Gift Tax have had a demoralising effect even though it was generally expected that there would be a significant increase in the rates under these heads. The Capital Gains Tax too has been made stiff while the relief offered to the public limited companies are considered meagre.

Immediately after the Finance Minister started giving out details regarding the estimates for 1964-65 there was a sharp rise in prices in Dalal Street and Lyons Range. In Madras, there was no special Budget session. The impression given by the earlier rise in prices for such scrips like Tata Steel to Rs. 153.50, Indian Iron to Rs. 26.20, Telco to Rs. 319 and Hindustan Motors to Rs. 20.60 was misleading as it persisted even after an announcement regarding changes in direct taxes which was made after those relating to indirect taxes. A section of the market was inclined to be still buoyant as the Super Profits Tax had been abolished and replaced by a more liberal surtax on profits. There was also a rebate of 10 per cent in respect of income-tax and super tax and 20 per cent surtax for industries belonging to a specified group. But the dividend tax of 7½ per cent was completely unexpected, while it had even been hoped that a higher development rebate might be accruing to specific industries. Instead, a note of warning has been given that industrialists should not proceed on the assumption that the development rebate would continue to be available in the same form for all industries after March 31, 1966. The heavier taxes on personal incomes and wealth had of course an upsetting effect but Dalal Street took a bearish view because it was decided to levy excise duties on superfine fabrics, rayon and staple fabrics.

Omnibus Dividend Tax

As the duties were already higher on the cotton textile industry and the rayon industry had not benefited to any great extent on account of decontrol, it may happen ultimately that the incidence of heavier excise duties would be passed on to consumers. A decision to this effect has actually been taken by the two industries. It is, however, feared that even efficient companies would be affected and that the benefit accruing from the new surtax on profits would be offset in great measure by the omnibus dividend tax on the amount distributed on equity capital. It was only known later that the Capital Gains Tax would be paid on the notional gains accruing on the issue of bonus shares by companies. The average rate of tax on capital gains will be heavy as it will henceforth be payable on the basis of half the average rate which is applicable to the individual. While hitherto the maximum was confined to 25 per cent, it is apprehended that this heavy incidence will have a retarding effect on fresh investment and the activities of the bigger class of investors. The taxation of gain accruing on bonus shares has, however, shattered the morale of the market as it will be determined on the basis of gain accruing to the individual taking into consideration the market value on the 31st day after the issue of shares. There are different interpretations regarding the manner in which the capital gains would be determined. But like the Super Profits Tax the determination of notional gains might create unintended and unexpected difficulties even in the investment portfolios of middle income groups.

It is not known whether the market value as a whole would be taken into consideration for ascertaining capital

gains on bonus shares or whether the average cost will be taken into consideration. The former procedure will be meangingless while the latter will penalise heavily conservative investors who have stuck on to their holdings not with a view to secure capital gains but with a view to keep them in their portfolio for income purposes. As the capital gains will not really relate to the benefit secured by investors on receipt of bonus shares, the incidence will be grossly inequitous especially as the rates have been revised drastically. The realisation that the net benefit derived by the industrial Corporate Sector would not be appreciable and that it would henceforth be impossible for the bigger investors particularly to extend large support to the stock markets has been responsible for the downward trend at prices noticeable in the past few days. It may be argued that, in the case of steel, engineering and some other groups of shares the decline in prices is not very pronounced and that only textile and rayon shares have been unduly affected. But it must be borne in mind that the announcement of partial decontrol over prices and distribution of certain categories of steel has had no effect on market sentiment and for industries to be in a position to attract fresh funds. A certain amount of optimism in future outlook is necessary.

Damaging Effect

The new budget will therefore, be determined by the criterion whether the above objectives have been achieved. In the absence of any great enthusiasm on the part of Indian interests even the fresh concessions announced to stimulate the inflow of foreign capital might not yield the desired results. It is perhaps a little early to pass the final verdict on the budget proposals. It cannot, however, be denied that they have had a damaging effect on general sentiment and for the fifth day in succession, prices have been fluctuating in a two-sided manner with the undertone extremely weak. The Life Insurance Corporation and the Unit Trust of India might probably try to prop up the market. But what is actually required is the creation of a climate which would encourage the employment of accummulated and fresh savings to a large extent in industrial securities. Even for the Life Insurance Corporation and the Unit Trust to be able to operate in a big way there should be savings available for taking up new policies or purchasing units if the lower income groups have been soaked by the clandestine reorganisation of the tax rates on a permanent basis and middle. The higher income groups have been affected by the annuity scheme. Savings, therefore, do not exist for other forms of activity. The concessions in respect of excise duty to some industries are no doubt welcome but even here it has been complained that they have not gone far enough. If, therefore, a budget which has tried to have new checks in balances has not succeeded in creating the desired climate for further industrial development, it can only be emphasised that, without sacrificing any of the Bhubaneswar objectives, the Finance Minister would be gracious enough to make such changes as would not liquidate the entrepreneurial class in a short period and leave a vacuum until such time as a mass of new investors would be prepared to take over or the Government succeeds in providing bulk of financial resources and enlisting the support of talented workers to promote and manage large new industrial units. It stands to reason that the tax on personal incomes and wealth should be reduced to realistic proportions and the drastic rates of estate duty particularly apply only in respect of estates which have been inherited after two or three generations. The capital gains tax should be less severe while the corporate sector must be in a position to plough back larger sums out of current earnings. This can be done only if the dividend tax is dropped and the method of determining the capital base for purposes of surtax on profits is also suitably modified.

The Budget and Investors

From Our Correspondent

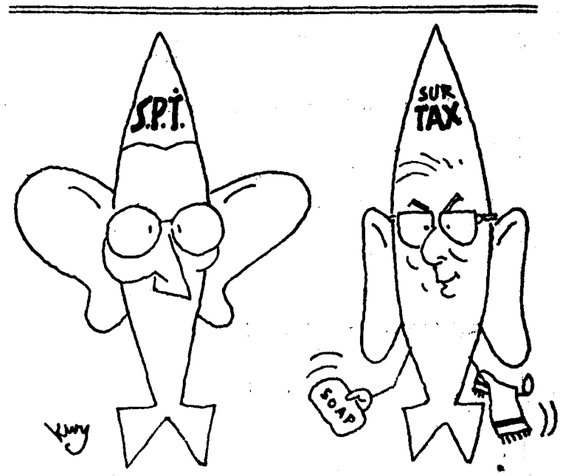
CALCUTTA:

ALTHOUGH the Union budget proposals for 1964-65 are a considerable improvement over those of last year inasmuch as they do not add to the burdens on industry and trade, they have failed to fulfil the optimistic expectations which the market had started entertaining after Mr. T. Krishnamachari took over the Union Finance portfolio in August last and the series of statements he made as Finance Minister. These statements had left no doubt about the official admission of the stagnation creeping into the country's economy in the last two years or so and, therefore, implied official recognition of the need to take remedial measures. Against the background of the urgency to increase savings and investments, the budget is a disappointment. No doubt, the proposals are designed to increase the savings of individuals as well as of the corporate sector, but such increased savings are not channelled to private industry to strengthen its growth and enable its diversification. The price movements on the Calcutta Stock Exchange and the extreme caution displayed by both operators and investors are explained by the dose of disappointment which the new taxation proposals have administered.

The private sector is often assailed by Government spokesmen as lacking in adequate entrepreneurship and in failing to utilize opportunities afforded to it under the Industrial Policy Resolution of 1956. On behalf of industry, it has been urged, as often as the indictment, that conditions should be created to enable it to plough back as much of profits as required for expansion and new entrepreneurship. However, it is unfortunate that the Government considers that it only has the right to the fruits of the private sector. It is no wonder that capital formation is very low as compared to requirements. It is also doubtful that the budget proposals will create conditions much different from those of the last two years.

Tax on Efficiency

It had been thought that the industry had made a strong case for the total abrogation of the super-profits tax, which had been rightly called a tax on efficiency and entrepreneurship. Although this tax is being given up, its replacement by a surtax on profits has alone caused the deepest sense of disappointment. It is realized that the latter tax will be less burdensome than the former. But all the same, the market thinks that it is a tax, like the former, on efficiency, and as such the more efficient firms would continue to be at a disadvantage.



A close examination of the budget proposals shows that these are a continuation of Mr. Krishnamachari's attempts in 1957 to achieve an integrated tax structure, having regard to the recommendations of Prof. Nicholas Kaldor. The expenditure tax, which had proved uneconomic in the Smithian sense, has come back to the Statute and Estate duties have been revised, vertically rather than even steeply — the exchequer hopes to collect more revenue from the capital gains tax, gift tax and the wealth tax.

Investors, small and big alike, have been affected in a number of ways. Companies will be forced to limit dividends inasmuch as they are to pay a tax at the rate of 7.5 per cent on the dividends they declare. This measure, perhaps, aims at making good the revenue loss to the Government as a result of the reduction of tax on dividends at source from 30 per cent to 20 per cent. Another restraining influence on investors is the proposal to treat bonus shares as a capital gain. It is easy to see that this proposal would discourage the issue of bonus shares.

For the salaried investor, the withdrawal of the much-hated Compulsory Deposit Scheme is not much relief. Although, as a result of the revised income-tax rates, an assessee will pay a lower sum as tax as compared to the existing tax plus the C.D.S., he will be paying a higher tax to the Government if note is taken of the returnable nature of the C.D.S. For the higher income groups, i.e. above Rs. 15,000 per head per annum, the abolition of C.D.S. would not only mean increased tax, but a part of their earnings will also be blocked in annuity deposits with the Government. The flow of funds to the capital market from the salaried group of investors, thus, should stand reduced further.

The tea industry has been disappointed by the budget proposals, for its earnest plea for excise duty relief has not been accepted by the Finance Minister. Although the last year's total Indian tea crop was lower — the heavy fall in the North Indian crop was made good only partly by a better crop in South India —, tea exports rose impressively as a result of withdrawal of the export duty in the 1963-64 budget. The revenue loss as a result of this measure was made good by the Government by effecting a steep rise in excise duty rates. The industry had represented that Indian tea was often being priced out of world markets as a result of price-cutting by other producing countries, notably Africa, Ceylon and Indonesia. There has been evidence that India has not been able to secure a fair share in the increased world consumption of tea in the recent years. The industry had, therefore, pleaded for tax relief so that it could plough back as much of profits as possible for expansion and development, and also attract new capital. The fall in Jutlibaris on the Calcutta Stock Exchange to Rs. 27.87 following the budget from Rs. 31.50 previously is illustrative of the disappointment caused to investors in tea shares. The Tea Association of India, which has expressed concern at the continuance of the heavy excise duty on tea, however, has thanked the Finance Minister for his gesture to allow rebate on income-tax, super-tax and surtax.

The raw jute trade has expressed happiness at the withdrawal of the export duty on raw jute. Domestic production of raw jute in the 1963-64 season has left an unmanageable surplus of the inferior varieties, and, although the Government had long ago fixed an export quota, the attempts by the trade as well as the State Trading Corporation to export such of the inferior fibres as are not wanted by mills in India,

THE CLEAN BOMB

have not proved an unqualified success. This has been done due to the fact that overseas buyers are able to get as much jute as they want at lower prices from Pakistan. Also, the quality of the Pakistani product is better. Mills in India have in their godowns fibre sufficient to meet their consumption for six months, or say up to the time the new crop comes in the market. As such, if it is only possible to find an export outlet for such quantities of the inferior fibre as still are held by cultivators as well as stockists, this will be a relief to mills. It is hoped, that the abolition of export duty on raw jute will help in stepping up fibre exports.

The jute mill industry and the domestic consumers of jute goods have been disappointed because excise duty on jute manufactures for internal consumption has been maintained. This levy was introduced for the first time in the 1963-64 budget and it had been represented since then, very often, that it had led to restriction of internal consumption at a time when mills looked forward to more markets for their heavy goods in the production of which lower grades of raw jute could be used in a higher proportion than either in hessian or specialities.

Speculative Indian Irons closed at Rs. 25.94 before the budget. In the special budget session of the Calcutta Stock Exchange, held on the evening of February 29, they rose to Rs. 26.28 before receding to Rs. 25.60 at the end of this session. Since then, the fluctuations in their price have been narrow with a pull towards a downward tendency. The partial decontrol of steel and the raising of the retension prices of the still controlled categories of steel on an average by Rs. 30 a tonne have been welcomed. But it is noted that steel producers are not entirely free to price the items taken off the control list. These prices are now to be fixed by a Joint Plant Committee which will be presided over by the Iron and Steel Controller and on which representatives of Government consumers such as the Railways may be in the majority. At the same time, excise duty on several steel items has been revised upward to add to costs, if the increase cannot be shifted either in part or in full.

It is noted that the budget accords a significant encouragement to foreign capital. This is as it should be. The industry has also lost no time in welcoming this very encouraging feature of the budget. Against the background of the success achieved by many Indian entreprenuers in the recent years in their attempts to enter into collaboration agreements with foreign manufacturers, the Finance Minister's charge, as reported in the overseas press, that "the biggest enemy of foreign capital in India is vested interests who do not want it to come in" is hardly proper. The proposals particularly noted in this respect are: (i) reduction in tax on engineering services; (ii) exemption to be provided to foreign investors from tax on income derived by them from loans granted by them to Indian companies on Government's approval and (iii) exemption from tax to be given to foreigners on their income from subscriptions in approved Indian securities, including private securities.

Appreciating the Finance Minister's difficulties to grant tax reliefs on a significant scale, Mr. A. D. Ogilvie, the President of the Associated Chambers of Commerce, has welcomed the reduction in inter-corporate taxation. He has, however, regretted the replacement of super-profits tax by other forms of corporate taxation.

The Indian Chamber of Commerce, Calcutta, pointing out to the anti-inflationary nature of the budget and the tax relief given to priority industries, has declared that the proposals for additional taxation are not in consonance with the objectives to accelerate the rate of economic growth. The President of the Calcutta Stock Exchange, Mr. C. L. Jhunjhunwala does not think that the budget proposals are designed to give incentives either to investors or to industrial production.

A View of the Budget

This script by V. Balasubramanian was broadcast in the "Matters of Moment" programme of the All India Radio on March 8, and is published here by courtesy of the AIR.

THE BUDGET proposals of the Central Government for the year 1964-65, presented to Parliament by the Finance Minister last week, attempt new directions in economic policy, although not perhaps a new economic policy itself. To agreed principles a firmer shape has been given, while to accepted obligations a greater sense of urgency has been imparted. It has long been recognised that the rapid economic development of the nation is largely dependent upon a progressive increase in saving and investment. In the five-year Plans and the policies and programmes framed from time to time to implement those Plans an attempt, no doubt, is being made to step up savings and investments. The particular merit of the present budget is that it brings to its task a clearer and a more comprehensive approach than has prevailed hitherto.

The first loyalty of the Central budget naturally is to development and defence. Consequently, it has taken care to provide for larger resources for either purpose. Outlay on the development programmes in the fourth year of the third Plan has been stepped up to Rs. 1,984 crores at the Centre and the States together. This represents an increase of Rs. 333 crores over the corresponding budget provision for the current year. Similarly, in the case of the expenditure on defence, the budget provision has been stepped up from Rs. 808 in the revised estimates for the current year to nearly Rs. 854 crores.

These higher allocations would naturally call for larger resources from the economy. Fortunately, a part of this demand would be met by the natural growth in tax revenues at the existing levels of taxation. Nevertheless, there would still be a problem of finding further resources. The Finance Minister has attempted to do it through various means for increasing savings in the community. An agreeable aspect of his effort in this direction is his decision to resort as little as possible to deficit financing. In view of the tendency of the price level to go up, this is certainly a sensible resolve.

Uncovered Gap

The revised estimates for the current year have indicated a total uncovered budgetary gap of Rs. 135 crores. As against this, the overall deficit in the budget year is expected to be only Rs. 86 crores. This, as has been mentioned a little while ago, has been due partly to the natural growth in tax revenue and partly to measures taken in the budget. Among the latter are the Finance Minister's proposals to borrow more from the public. The target for market loans has been stepped up. Emphasis on small savings has been similarly increased.

Now a word is useful on the economic significance of the reliance on loans and small savings. Loans and small savings, to the extent that they represent voluntary contributions for the purposes of the State in contrast with taxation which is a compulsory payment, always have an important place in the economy of a democratic community. In the context of rising prices they also have an additional economic significance because they represent a withdrawal of purchasing power from the community. This withdrawal assists in reducing the excess of money supply over the volume of goods and services and thereby serves a useful anti-inflationary purpose in restraining any upward movement of the price level.

The Central budget has also resorted to new taxation for finding part of the resources needed for the higher outlays on development and defence. This additional taxation, however, is of relatively modest dimensions. The actual tax element, in fact, is only of the extent of Rs. 44 crores, while the Finance Minister has sought to raise another Rs. 50 crores through the introduction of an Annuity Deposit Scheme. This scheme follows the decision in the budget to exempt income-tax payers also from the Compulsory Deposit Scheme, thereby completing the withdrawal of that scheme. The new scheme of annuity deposits is primarily a mechanism for securing a part of the savings of the relatively well-to-do classes of the community to the purposes of the public exchequer. It applies at income levels of Rs. 15,000 a year and beyond. Thus its incidence is on those sections of the community which may be presumed to have both the ability and the willingness to save.

Reference has been made earlier to the emphasis given to savings in the Central budget. The annuity deposit scheme is an important illustration of this emphasis. There are many others too, such as rebates on super-tax for recognised forms of savings for old age or family security.

Stimulating Savings

The Central budget thus attempts to stimulate savings in the community and direct those savings into nationally urgent and socially useful purposes. While one of the purposes of the budget certainly is to divert or direct a good proportion of the community's savings into the channels feeding the Government's own expenditure on development, defence, the social services and general administration, it has also taken pains to create conditions favourable for more saving and investment in the private sector of the economy as well.

Following the mid-term appraisal of the third Plan which was presented to Parliament towards the end of the last year, there has been some concern in the country at the slackening of the pace of increase in agricultural and industrial production. The need for measures to stimulate the economy so that there may be more rapid economic growth has been accepted on all hands. The Finance Minister on behalf of the Government has declared on many occasions that measures would be taken to remove the slack in the economy and impart greater vigour to it.

Consistent with this declaration the Central budget has proposed various fiscal measures for infusing confidence in the capital market, providing stimulus to the development of our basic industries and promoting and building up reserves in industry in general. In line with this purpose, the super profits tax levied in the budget for the current year has been discontinued and replaced by a new tax described in the budget as surtax on the excess profits of companies. The general incidence of the surtax on the corporate sector is likely to be much less heavy, and the draft made by it on the earnings of companies consequently much smaller.

Mr. Krishnamachari has also given additional reliefs to selected industries which are essential to the growth of the economy and the development of which it is, therefore, considered desirable to encourage through special measures. A list of these industries has been drawn up and it covers 14 categories including iron and steel, aluminium, industrial

machinery, coal, cement, fertilizers, paper and pulp, tea, coffee, and rubber. It is the intention of the Government to add to this list from time to time and the claims of other industries, perhaps not less important to the national economy, will no doubt be considered in due course. To summarise the purport of these and other allied reliefs granted to the corporate sector, their effect will be to strengthen the internal finances of industry in general and of those industries in particular which fall within the list of national priorities in development.

The budget thus seeks to encourage personal savings and direct a large part of them into investments in Government securities or towards providing for family security. It also seeks to reduce the Government's tax demand on company earnings so that more funds may be available especially for investment in industries of special importance to the national economy. A third object which has been pursued in the budget with similar enthusiasm is that of creating a favourable climate for foreign investments.

The Finance Minister has acknowledged that the quickening of the growth of the economy generally and of the development of basic industries in particular could be considerably assisted by a larger inflow of foreign capital and know-how. He has pointed out that in view of the nation's rapidly mounting repayment obligations on foreign loans, there is a large advantage in encouraging the inflow of foreign equity capital which does not involve the country in short-term liabilities of repayment. The budget, therefore, seeks to remove some of the obstructions and disincentives to foreign investments and has made a considerable advance in the direction of creating a positive climate in favour of foreign investment.

Importance of Corporate Sector

Mr. Krishnamachari's intentions are thus clear. He has recognised the important role which the corporate sector has to play in the development of the national economy. He has also appreciated the need for fiscal policy making it possible for the corporate sector to retain a high proportion of its earnings for furhter development besides attracting outside savings for expansion, especially through new enterprises. Within this larger comprehension, he has also shown understanding of favourable tax treatment of industries of particular national importance, and, secondly, foreign equity investments and know-how. He has framed the proposals in such a way that not only will there be more corporate investment but there will also be more investment of this kind in the directions considered necessary and desirable by the Government.

The re-imposition of the expenditure tax and the proposals for increasing the gift tax and the estate duty have in their totality been described in some quarters as an assault on property and wealth. He has made it clear that they are a part of the socio-economic strategy of the Government which is aimed at ending glaring economic disparities, reducing concentrations of wealth, restraining ostentatious consumption and curtailing the advantages of inherited wealth. The issue is thus one of social purpose.

Peaceful Document

For the rest, the Central Budget this year is a peaceful and benevolent document. Although it has not reduced the excise taxes on consumption goods, it certainly has the very considerable negative virtue of not having imposed any appreciable additional taxation on goods of mass consumption. It also has the virtue, as was pointed out at the outset, of dis-inflationary strategy for raising resources. In terms of helping to restrain the price level, this general policy is perhaps worth very much more than any specific relief in indirect taxes which the Finance Minister could have given. As it happens, the Finance Minister has given some relief to the low-income groups and this he has done in the case of income tax

Meanwhile, it is pleasant to see that the budget has not been a stern and serious document throughout and that it has been tied with some bits and pieces of gay ribbon. Thus the Finance Minister has tried to provide special tax relief to artistes, actors, and authors whose incomes are apt to be uncertain or widely fluctuating. He has given them the option of making a higher deposit under the annuity deposit scheme and thereby thinking out their tax liability.

Again, the income tax exemption, applicable to foreign technicians has also been extended to professors and teachers of foreign nationalities subject to the approval of the contract of their services by the Central Government. These are fine gestures indicating that the Government's budget need not be concerned only with the market place and that it could spare a kindly thought — and what is perhaps more to the point — a handful of cash to the arts and graces of life.

Budget Snippets

FOREIGN CAPITAL

SPEAKING AT a conference of the Indian Economic Association in Bombay, about two months before the presentation of the budget, Mr. T. T. Krishnamachari had foreshadowed a distinct shift in official thinking by stating that past inhibitions about foreign capital had no longer any justification when the public sector had established its 'vigilant presence' in most of the vital sectors of the economy, and that a stage had come when we would be justified in opening the doors even wider to private foreign investment as long as the burden that such investment might put on our balance of payments in future was not disproportionate to its contribution to our economic growth. Adding to this his view of the growing burden of foreign debt repayment in the coming years, and the requirement of a large volume of foreign exchange for the fourth Plan, the Finance Minister, in his budget for 1964-65, has proposed a few tax concessions to foreign investors. These concessions include the abolition of Super-Tax on inter-corporate dividends. The foreign companies' tax liability would now be at a flat rate of 25 per cent instead of a variable figure ranging from 25 per cent to 50 per cent. Fees for engineering services would now be taxed at the rate of 50 per cent instead of 63 per cent. New companies would not attract tax on dividends in the first year and four subsequent years if their dividends do not exceed 10 per cent.

The Government is also taking powers to give partial exemption from tax to loans raised abroad. In the past, the Government had powers for granting total exemption, but not partial exemption. The arrangement on the whole worked well, but there were some difficulties. Where the rate of interest was high, exemption was not granted because the Government was anxious to ensure reasonable rates of interest. Moreover, because of double taxation relief agreements, what the Government of India gave out often benefited not the foreign lender but the foreign Government.

The Government has also assumed powers to grant exemption from tax to foreign investments in approved securities as notified by the Government.

Profits made by foreign firms, with offices in India, out of exports from this country, are also being exempted. In the past, if a foreign company opened an office in India for making purchases, profits made abroad were liable to taxation under the principle of business connection. In practice, an assurance had been given that it would not be done so, but still many foreign firms were discouraged from setting up buying offices in India. The new provision has been made to give more trading flexibility.

As far as personal taxation is concerned, some relief has been given to foreigners by way of an educational allowance for children (Rs. 2,000 per child under 21 years, up to two children, or 25 per cent of income, whichever is less). The foreigners have also been exempted from the Annuity Deposit Scheme in this budget, whereas the 1963-64 budget did not grant any exemption to foreigners from the Compulsory Deposit Scheme.

The Finance Minister has, however, proposed an increase in the rate of tax from 63 per cent to 65 per cent on branch companies which have head offices abroad and to which all profits are remitted.

The incentives which the Finance Minister has extended to the foreign capital and know-how will naturally have to be assessed in the larger context of the general investment climate his budget may generate. Here it is possible to argue that he has isolated the case of foreign capital seeking investment in India from domestic capital to a degree not warranted by the prevailing circumstances — domestic capital being shy and short. There cannot be a more effective magnet for attracting foreign private capital than a flourishing domestic private sector, and this pre-supposes equally attractive terms for domestic investments. Therefore, the first step towards attracting more foreign capital is to create such conditions as will ensure a faster rate of capital formation and economic growth within the country. In this context, we find that while the proposed surtax on profits may be less burdensome than the SPT, it would still impose a very substantial additional burden on company earnings. Any attraction accruing to foreign capital must, therefore, necessarily flow from readjustment of the general corporate and personal tax structures and in this, the present budget has failed seriously.

PUBLIC LOANS

The Budget of the Central Government for 1964-65 assumes a credit of Rs. 295 crores from the new market loans. This does not include any amount to be raised on behalf of the States as it has been decided to allow the States to resume the former procedure of floating separate loans. Last year the arrangement of centralised borrowings has obviously not worked satisfactorily. The current budget assumed a credit of Rs. 393 crores from market loans including Rs. 100 crores to be raised on behalf of the States. On the basis of the loans actually floated during the year and after taking into account the conversion of ad hoc treasury bills of the value of Rs. 75 crores into dated securities, the revised estimates are placed at Rs. 441.70 crores. The amount actually raised was Rs. 366.70 crores against the target of Rs. 368 crores through five open market loans while 4½ per cent National Defence Bonds fetched an additional amount of Rs. 1.72 crores. Cash subscription accounted for Rs. 208.75 crores and conversion of maturing loans Rs. 157.95 crores. Ad hoc treasury bills were converted in January this year into further issues of 4½ per cent loan, 1973 (Rs. 50 crores) and 4½ per cent, 1986 (Rs. 25 crores).

Against the background of the current year's difficult experience, it cannot but be emphasized that the loan programme for the budget year is pitched high. There can be no doubt that there will be increasing quantum of subscriptions from the Life Insurance Corporation and the provident funds, but it seems that the banks perhaps may not be able to purchase securities in any large amount in 1964-65. The growth of bank deposits has not kept pace with the growth in advances and there has been an all time record increase in bank credit in the current season. The credit deposit ratio went up from 74 per cent in February, 1963 to 77 per cent in February, 1964. And then there is no likelihood of any significant seasonal decline of bank credit in the coming slack season. Hence all the available evidence suggests that banks will be in a tight position and surplus cash may not be available with banks for investment in government securities. It is true that higher liquidity ratio would become effective from September 1964 and to comply with the new statutory liquidity requirements some banks which at present are not having investments of about 25 per cent may be forced to purchase government securities, but it is doubtful whether the purchase of government securities by a few banks under compulsion will make any significant increase in the commercial banks

holding of government securities. Under the law, banks will be required to maintain a liqudity ratio of 28 per cent of aggregate deposits. The liquidity ratio will consist of 3 per cent statutory minimum cash ratio and the balance of 25 per cent in bill cash or approved securities which mainly consist of government securities.

At present government securities are the main liquid assets for seasonal adjustment of cash flows. In case of cash requirements the banks can either dispose of the securities or use it as a collateral for borrowing it from the Reserve Bank of India. Here it needs to be pointed out that banks have an alternative to borrow under the Bill Market Scheme. Instead of borrowing from the Reserve Bank of India against government securities and thus reducing their unencumbered liquid assets, the banks can borrow from the Reserve Bank against the bills created under the Bill Market Scheme. Since these bills are not included in the list of liquid assets for computation of the liquidity ratio borrowing against bills will not reduce the amount of liquid assets with the commercial banks. For many banks a shift in borrowings against government securities to borrowings against bills will release sufficient government securities to comply with the new liquidity requirements. To some extent the banks preference depends on the rate of interest charged on borrowing under the different heads. Considering the pressure of rising demand for bank credit, which may be generated further in the next year, it would be an error to expect strong bank support to loan issues.

SMALL SAVINGS

It is evident from the Budget speech of the Finance Minister that the small savings campaign is to be geared to greater effort. It may be noted that Rs. 241 crores were collected in the first Plan and Rs. 400 crores in the second Plan against a target of Rs. 225 crores and Rs. 500 crores respectively. In the first Plan the target was exceeded. A target of Rs. 600 crores has been fixed in the third Plan. In the current year the collections amount to Rs. 115 crores and it is expected that Rs. 125 crores would be collected next year through various small savings schemes. The collections during the first two years of the third Plan amounted to an average amount of Rs. 85 crores. Although the collections in the last few years have been much short of the target, progress realised every year is encouraging in the sense that it is difficult to build up a psychology of savings in an era of rising prices when alternative investments such as investments in commodities, goods, gold shares, property, etc. are apt to be more profitable.

The various small savings schemes at present in operation are post office savings bank, cumulative time deposits, national defence certificates, defence deposit certificates, 15 year annuity certificates etc. 15-year annuity certificates have an appeal for a particular class of investors and as such have limited potentialities as a device to collect small savings. The amount of net collections through the various schemes is as given in the table opposite.

The main factor in boosting the collections is the buoyant receipts from the National Defence Certificates and Defence Deposit Certificates, introduced in November 1962. Coming in the wake of the emergency in replacement of National Plan Savings Certificates and Treasury Savings Deposit Certificates, these new series have become popular with the investing public and have brought in large amounts during the current year. The increased collections under National Defence Certificates may partly be attributed to greater choice of denominations introduced in the new series which are now availble in denominations of Rs. 5, 10, 50, 100, 500, 5000 and 25,000. Even more important perhaps is the step up in the interest rates by ½ per cent on these certificates which now yield 6.25 per cent simple or 4.75 per cent compound rate of inferest free of income-tax. Defence Deposit Certificates are issued in denominations of Rs. 50 and multiples thereof and carry 4.50 per cent per annum interest, free of income-tax. Another factor accounting for higher collections is the increase in the limit of maximum holdings from Rs. 25,000 to Rs. 35,000 in the case of individuals and from Rs. 50,000 to Rs. 70,000 in the case of joint accounts.

Among the steps taken to promote the savings movement mention may also be made of the increase in the rate of interest on post office Savings Bank, Defence Deposit Certificates, introduction of a new 15-year account under the cumulative time deposit scheme, increase in the limits of holdings in the National Defence Certificates and the Defence Deposit Certificates by individuals, increase in the number of post offices doing savings bank work, increase in the rate of commission payable to authorised agents and better and wider co-operation with commercial and public utility concerns. Without belittling the progress of the Government, it needs to be pointed out that the third Plan target will not be attained, as has been pointed out by the Finance Minister himself. Nevertheless, if the tempo of collections witnessed during the year 1963-64 is maintained and steadily improved upon, the performance of small savings over the third Plan period would be good indeed.

STATE UNDERTAKINGS

In the scheme of financial resources for the third five-year Plan, it is laid down that Rs. 450 crores will accrue from public sector enterprises. But keeping in view the performance of the public sector in the year 1962-63, it is wondered if large surpluses would be available from these undertakings. Among the public undertakings, a statistical account of which is given in the Explanatory Memorandum on the Budget for 1964-65, the running concerns such as Nahan Foundry Ltd., National Building Construction Ltd. show clean losses. Praga Tools Corporation Ltd. and Hindustan Shipyards Ltd. do not show any profits, and in the case of Travancore Minerals Ltd.,

SMALL SAVINGS

(In crores of rupees)

"GOLDEN JUBILEE year of service 1914 - 1964"

FIRE BRICKS, FIRE CEMENTS, FIRE CLAYS, ACID RESISTING BRICKS & CEMENTS
in the service of the INDIAN INDUSTRY

With half a century's experience at our back we serve our customer's individual requirements. REFRACTORIES OF HIGH QUALITY for reliable service, can now reach you swiftly from our Factories at Ishwarnagar, New Delhi & Niwar (Dist. Jabalpur). We serve the Industry with Fire Bricks of all types, sizes and grades, with Alumina ranging from 30% to 70%, insulating bricks & mortars, Fire Clays, High Temperature Fire Cements, 85% Magnesia Composition etc., etc. We also manufacture complete requirements of Refractories for the Iron & Steel Industry, Railways, and Ordnance Factories.

THE ISHWAR INDUSTRIES LIMITED
FACTORIES at :
ISHWARNAGAR, NEW DELHI * NIWAR, DISTT. JABALPUR.

LEWIS & TYLOR (PRIVATE) LTD.

Manufacturers and Distributors :—

- Lantee Brand Solid Woven Hair Belting.
- Lantee Brand Solid Woven Cotton Belting.
- Lantee Brand Cotton Elevator Conveyor Belting.
- Lantee Brand Super Fire Fighting Hose.
- Lantee Brand Cotton/Canvas Water Delivery Hose. (Lined & Unlined).
- Lantee Brand Rubber Hoses of all types.
- Gripoly Brand Belt Preservative and Dressing.
- Lantee Brand Leather Belting.
- India Sterling Rubber Transmission Belting.
- India Super Rubber Transmission Belting.
- India Super Vee Belts.

Hindustan Housing Factory Ltd., National Instruments Ltd., Hindustan Salt Ltd., Mazagon Docks Ltd. etc. the profits are only nominal. In all the profits of 30 running concerns are quite meagre as compared to the magnitude of capital investment. A profit of Rs. 14.77 crores on an investment of Rs. 196.01 crores means a yield of 7.5 per cent. The dividend in these 30 running concerns totals up to only Rs. 2.22 crores which works out to 1.2 per cent on the total paid-up capital. Even if the net profit is broadly taken as a return on capital, it may be seen that it is much below normal return recorded by private sector undertakings. The table below relating to returns on capital in 30 undertakings in 1962-63 is self-explanatory:

TABLE I.
RETURNS ON CAPITAL IN 30 RUNNING UNDERTAKINGS IN 1962 - 63

(Rs. in Crores)

1.	Investment in Share Capital	196.01
2.	Net profit earned during 1962-63	14.77
3.	Dividend	2.22
4.	General and other Reserve Funds	5.88
5.	Development Rebate	4.93

A maximum profit of Rs. 2.16 crores was recorded by Hindustan Machine Tools Ltd., Fertilizer Corporation of India, State Trading Corporation of India and National Coal Development Corporation showed profits of Rs. 1.51 crores, Rs. 1.41 crores and Rs. 1.26 crores respectively. If we take out these four concerns, the performance of the remaining 26 concerns has nothing much to commend itself.

It will be observed that out of the 54 concerns, the results of which have been compiled in the Explanatory Memorandum, 30 are running concerns, 14 are under construction and nine are of promotional and developmental nature. Hindustan Steel stands as a class apart and shows a loss of Rs. 23.91 crores. To this Rourkela contributed Rs. 10.7 crores, Durgapur Rs. 8.4 crores, Bhilai Rs. 4.5 crores and Coal Washeries Rs. 25.3 lakhs. The table below outlines the pattern of investment in all these undertakings.

TABLE II.
INVESTMENT PATTERN OF GOVERNMENT UNDERTAKINGS

(Rs. in crores)

	No. of undertakings	Investment in share capital 1962-63	Capital investment Revised Estimates 1963-64	Capital investment Budget Estimates 1964-65
Undertaking under construction	14	201.24	58.67	38.10
Hindustan Steel Ltd.	1	367.00	81.00	100.00
Running Concerns	30	196.01	22.20	14.06
Promotional & Developmental undertakings	9	42.22	29.91	34.02
TOTAL	54	806.47	191.78	186.18

In nine promotional and developmental undertakings investment is comparatively small and is of the tune of Rs. 42.22 crores out of a total investment of Rs. 806.47 crores. Undertakings under construction show an investment of Rs. 201.24 crores. A further investment of Rs. 58.69 crores was added in 1963-64 and is envisaged to be increased further by Rs. 38.10 crores in 1964-65. Apart from the year 1962-63, the budget estimates for 1963-64 and 1964-65 also do not expect much by way of profits from these public sector undertakings.

STATE BANK OF MYSORE
(Subsidiary of the State Bank of India)
HEAD OFFICE: AVENUE ROAD, BANGALORE-9.

TRANSACTS ALL TYPES OF BANKING BUSINESS —
INLAND AND FOREIGN —

FINANCIAL ASSISTANCE GIVEN TO SMALL SCALE INDUSTRIES.

SAVINGS BANK ACCOUNTS ARE OPENED WITH AN INITIAL DEPOSIT OF RS. 5/- ONLY, CARRYING INTEREST AT 3% AND WITHDRAWABLE BY CHEQUES.

SAFE LOCKERS AVAILABLE AT BANGALORE, MADRAS AND MYSORE BRANCHES

Any Customer having a personal account with the Bank will be enabled to use any office of the Bank for transfer of money paid in cash for credit of his account to the extent of Rs. 1,000/- in any one instance FREE OF CHARGE.

R. P. NANDA,
GENERAL MANAGER

Direct and Indirect Taxation

THE INDIRECT taxes in the Union Budget take precedence over the direct taxes. This fact is illustrated in the summary of final estimates published on page 493 of this Special Number. A commodity-wise distribution of the tax yield for 1962-63, (Accounts), 1963-64 (Budget and Revised) and 1964-65 (Budget) is set out below :

EXCISES, PRODUCTION AND PRICES

BUDGET IMPACT ON NATIONAL ECONOMY : A BALANCE SHEET

FAVOURABLE FACTORS

ANNUAL PLAN outlay has been stepped up from Rs. 1,651 crores in the budget estimates for the current year to Rs. 1,984 crores.

Defence outlay on national security has been increased from Rs. 808.18 crores in the revised estimates for the current year to Rs. 853.90 crores.

The total uncovered budgetary gap is reduced from Rs. 135 crores in the revised estimates for the current year to Rs. 86 crores, thereby considerably bringing down reliance on deficit financing.

Receipts from new market loans are aimed to be higher at Rs. 295 crores as compared with Rs. 267 crores (after deducting the States' share of Rs. 101 crores) in the revised estimates for the current year; this considerable resort to public borrowing should have an anti-inflationary effect.

The target for small savings is fixed at Rs. 125 crores as against net collections of Rs. 115 crores in the revised estimates for the current year; this again should be anti-inflationary.

Thanks to the buoyancy of revenues (assisted, however, by some shortfall in expenditure), additional taxation relative to the high levels of Plan and defence outlays is on the whole moderate; while a net amount of Rs. 40 crores would accrue to the Centre as a result of the additional taxation proposals, another Rs. 50 crores is expected to be secured to the capital account following the introduction of the Annuity Deposit Scheme.

Although the total effect of the changes proposed in indirect taxes would bring in an additional revenue of about Rs. 26 crores, there should, broadly speaking, be no direct adverse effect anew on the price level or the cost of living; nor is it likely that the incidence of any one of these levies will be appreciably felt in any section of the community. On the contrary, a certain amount of relief has been provided through abolition of a few miscellaneous excise duties which have either no great revenue consequence or the incidence of which is not clear.

Powers have been taken to levy a regulatory duty of excise at the rate of 15 per cent in order to keep a check on unforeseen or undesirable developments in the price or production situation; this could be regarded as a desirable authority for the Government in view of its intentions to remove price controls wherever possible, notwithstanding the fact that inflationary pressures are more or less active in the economy.

The SPT has been replaced by a surtax on corporate profits which, it is hoped, will be more moderate and less uneven in its incidence. Fourteen categories of industries, occupying an important place in our economy, have been selected for preferential tax treatment and the Government has taken powers to notify additions to this list from time to time. This group will be eligible for a rebate of corporation tax equivalent to 10 per cent of income tax and super tax, normally payable by them, and also to a rebate in respect of surtax to the extent of 20 per cent of tax assessed. Inter-corporate dividends have been exempted from super tax. Deduction of income-tax at source from dividends is reduced from 30 per cent to 20 per cent for resident holders of shares and the existing requirement of compulsory distribution of dividends applicable to certain description of companies has been given up in respect of companies governed by Section 104 of the Income Tax Act, while in the case of others, the Government has taken powers to authorize partial exemption. These proposals are intended to infuse some confidence in the corporate sector and improve the climate for investment in industry.

Although the rate of super tax in the case of non-resident companies has been increased from 38 to 40 per cent in respect of income other than dividends and also royalties and fees for rendering technical services received from an Indian concern under an agreement approved by the Central Government the Super Tax on income from royalties and technical services will be at the rate of 25 per cent. Income-tax on dividends received by non-resident companies engaged in specified industries will be reduced from 25 per cent to 15 per cent. Resident assessees who are not citizens of India are to be allowed a rebate of income tax and super tax on a sum of Rs. 2,000 per child up to two children under 21 years of age receiving education outside India. The conditions governing exemption from tax on salary income for a period of three years which is at present being extended to certain categories of foreign technicians are to be relaxed and this concession is also to be extended to foreign teachers and professors coming to India on approved programmes. Incomes arising from a business connection which are related to the purchase in India for goods which are exported are to be exempted from tax. This exemption from tax will also be available to interest on approved foreign lending in the form of investment in approved securities. The purpose of all these concessions and reliefs is to provide greater encouragement to foreign capital and foreign investment.

The personal income tax structure has been re-graded and most of the surcharges integrated in a revised and simplified schedule of rates of income tax and super tax. This would mean a reduction of tax at most levels.

The compulsory deposit scheme which in its modified form only applies to income tax paying categories, has been discontinued altogether. The Finance Act 1963 is to be retrospectively amended to provide appropriate marginal relief from the additional surcharge imposed in the last budget on income tax payers in the small income groups.

Contributions to recognised provident funds, deposits in the 10- and 15-year accounts of the post office cumulative time deposit scheme and premia of life insurance, subject to the existing limit of Rs. 10,000 per annum are to be allowed rebate of super tax; the rebate of income tax and super tax, however, will cumulatively be limited to 50 per cent of payments or deposits qualifying for relief. This concession is expected both to encourage individual savings as well personal provision for family security.

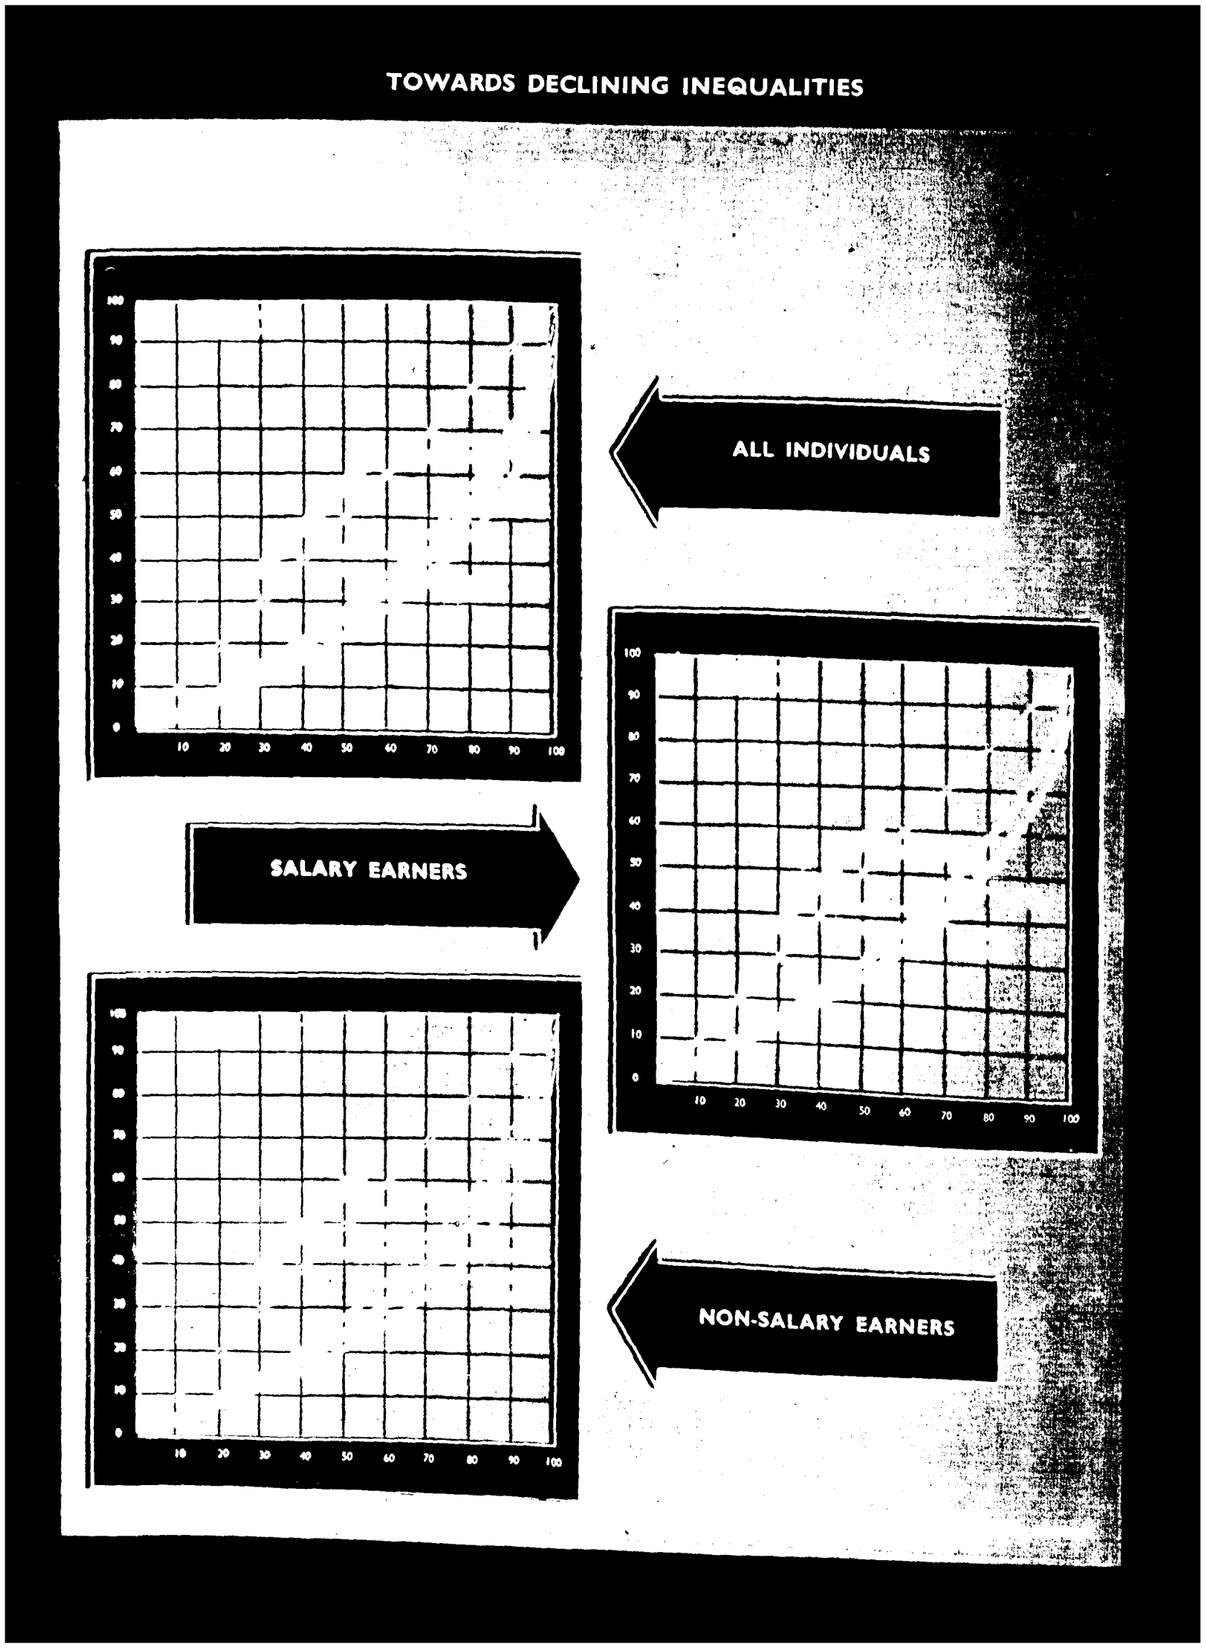
UNFAVOURABLE FACTORS

ALTHOUGH EVEN at the existing level of taxation the Finance Minister expects a revenue surplus of Rs. 54 crores, it has still not been possible for him to avoid additional taxation. Considering that all the sections of the public have been subjected to very heavy taxation last year in the wake of the emergency, the decision of the Finance Minister not only not to provide any net relief in taxation to the community, but on the contrary, to seek more revenue through additional taxation is bound to have a depressing effect on public and business morale.

While the drive for higher small savings and market borrowings would certainly help augment resources available for government spending, there is the possibility of a consequential curtailment of funds available with the public either for current consumption or for investment.

In spite of the fact that the Finance Minister admitted that the structure of indirect taxes needs extensive rationalization and simplification in the present budget itself he has not been able to make more than a few marginal adjustments. The conclusion is difficult to resist that the Government's need for a high level of revenue has been allowed to prevail over the desirability of reorganizing the structure of indirect taxes so as to make it less harsh, arbitrary or economically unsound. An additional criticism could be that despite the Finance Minister's protestations of awareness of the impact of heavy indirect taxation on production, the price line and the cost of living, he has in practice virtually sustained the *status quo*.

Although revenue from direct taxes has shown considerable buoyancy, the Finance Minister has not been content with letting the natural growth of revenue from such taxes provide the exchequer with additional funds. Although he has conceded more than once in his budget speech that an important need of the hour is to employ fiscal measures for promoting production and investment, he is still not able to abolish the SPT without imposing a different impost in its place. Although the surtax may be a more moderate tax than the super profits tax, the fact still remains that it also makes an additional demand on the internal resources of companies which it is difficult to justify in the present context of the need for more and more capital formation in the corporate sector. The surtax has also the disadvantage that it has cancelled much of the enthusiasm in the stock exchanges and the capital market generally over the abolition of the super profits tax.



The proposal to levy a tax at the rate of 7.5 per cent on the amounts distributed as dividend on equity capital is a strong and certain deterrent to capital formation and investors' interest in the corporate sector. In the form in which it is being proposed, with no provision for a base line of exemption, it amounts to a simple addition to the income tax and super tax on companies. Taken with the surtax it does constitute a substantial burden of special taxation of company earnings. This apart, at a time when there is an acknowledged need to encourage more people to invest more in the equities of companies, a tax deliberately intended to discourage companies from improving their dividends, even when their earnings and circumstances prompt them to do so, can hardly be regarded as an encouragement to investors.

The Finance Minister's declaration that the coverage and benefits of the development rebate might be curtailed after April 1, 1967 should cause widespread concern and uncertainty and hamper preliminary work on the processing of industrial projects. Seeing that development rebate is what makes the harsh aggregate of the tax burden barely bearable for new industries, prospects that its benefits may not continue to be available on the present scale are bound to interfere with industrial expansion.

Although the discontinuance of the compulsory deposit scheme has brought some relief at income levels below Rs. 15,000 per annum, the new annuity deposit scheme applicable beyond that level must certainly withdraw large amounts from potential investors in equity shares. The Finance Minister himself has noted with approval the growing tendency among the professional and other classes to invest in shares. His annuity deposit scheme, by impounding an appreciable part of the income of persons who have some capacity to invest, is bound to have the effect of starving the nascent interest of the professional and other income earners in the middle brackets in putting a part of their savings into equity shares.

The extension of the capital gains tax to bonus shares with reference to their market value, even when they are not actually sold or transferred, would hardly be regarded as an incentive to investors in equities.

The rate structures of the estate duty and the gift tax have been drastically revised in order to bring about a rapid levelling down of wealth especially through inheritance. Whatever may be the virtues of the egalitarian arguments advanced in favour of this move, the fact remains that the increases in the rates of estate duty and gift tax are so sudden and sharp that they are bound to have adverse consequences, both direct and indirect, for confidence in the capital market and the corporate sector. Where taxation becomes confiscatory and expropriatory, motivated by obvious political prejudices or passions, the psychological reactions in the community are hardly likely to be favourable to higher investment or business activity. More specifically, the tax obligations resulting from such heavy impositions are bound to lead to an extensive liquidation of share-holdings among the classes affected. This is hardly likely to help in maintaining general investor confidence.

BUDGET DOCUMENTS

Towards Higher Savings and Investment

PRESENTING THE budget of the Government of India for 1964-65 in Parliament on February 29, the Union Finance Minister, Mr. T. T. Krishnamachari, claimed that the policies he had formulated would substantially step up savings for investment in the accelerated growth of the economy.

The following is the text of Part 'A' of his budget speech:

In presenting the Budget of the Central Government for the year ahead, it is customary to start with a review of economic conditions in the year that is drawing to a close and to assess the policies and trends in progress so as to provide a backdrop for the Budget for the year to come. But my task in this respect is lightened by the fact that the year has witnessed a considerable reappraisal and reassessment of policies and performance, as well as a reaffirmation of the basic social values we seek to promote through all our endeavours. Honourable Members would recall that I had made before them a statement on the economic situation only a few weeks ago in December last. The Economic Survey which in the past used to be presented to Parliament along with the Budget papers has also been placed on the Table of the House on this occasion a few days earlier. I shall, therefore, confine myself to those aspects of the economic situation and perspective which are relevant to the proposals which I shall be placing before the House in the latter part of my statement today.

Defence and Development

By and large, the budgetary outturn for the current year bears testimony to our determination to strengthen our defences without slackening our developmental efforts or without resorting to unbridled deficit financing. The revised estimates for 1963-64 are presented in detail in a separate section of the Explanatory Memorandum which outlines the variations between the budget and the revised estimates in the same detail in which they were traditionally explained in the Budget speech. Accordingly, I do not propose now to dwell at length on the budgetary position for the current year as now estimated. But it is noteworthy that the overall deficit in the budget which was originally estimated at Rs. 181 crores is now placed at Rs. 135 crores. The improvement of Rs. 46 crores in the overall gap in the current year has taken place despite the net increase of Rs. 94 crores in loans and advances to States and of Rs. 27 crores in loans and advances to other parties. The major improvement in revenue is on account of Corporation Tax and Taxes on Income, which together show an increase of Rs. 70 crores, but this would be partly offset by an increase of Rs. 21 crores in the States' share of Income-tax. Customs and Union Excise Duties also show an improvement of nearly Rs. 35 crores.

It is a matter for particular satisfaction that collections under Small Savings which amounted to Rs. 73 crores only in 1962-63 are now expected to amount to Rs. 115 crores in 1963-64. Other miscellaneous Debt heads are also expected to show an improvement of Rs. 31 crores, but this will be offset by the decline in Emergency Risks Insurance receipts and Compulsory Deposits.

A part of the improvement in the budgetary position is also explained by the saving or shortfall in expenditure of Rs. 27 crores under Revenue and Rs. 64 crores under Capital other than Loans and Advances. Of the saving under Revenue, Rs. 16 crores occur under Defence and the balance under Civil heads. The major shortfalls in Capital expenditure are in respect of Defence, Rs. 43 crores; Hindustan Steel, Rs. 19 crores; Atomic Energy, Rs. 11 crores; and food purchases, Rs. 14 crores. On the other hand, Capital requirements of Railways would show an increase of Rs. 19 crores.

Turning to the economic scene, the most disturbing feature is the rise in the price level. While the increase in wholesale prices of the order of 8 per cent over the first three years of the current Plan period cannot be considered large by any standards, and particularly against the background of the sizable step-up in outlays under defence and development, the fact that the general index of wholesale prices rose by as much as 7.2 per cent between the end of the March 1963 and the end of January 1964 is certainly a cause for great concern. Government have already taken several steps to afford relief in the poorer sections of the community. We have, however, in the coming year to apply new measures of discipline, fiscal and others, to arrest this unhealthy trend.

Failure in Agriculture

Essentially, the rising trend in prices is explained by the inadequate rate of growth in agriculture. After increasing by 1.2 per cent in 1961-62, agricultural production declined by 3.3 per cent in 1962-63. Crop prospects for the current agricultural season, which seemed somewhat better to begin with, have been adversely affected by the recent severe winter conditions in some parts of the country. The recent increases in the prices of edible items have been causing Government a great deal of concern. The problem is being examined at the high level and with the greatest care. My colleague, the Minister of Food and Agriculture has had meetings with Chief Ministers and other concerned Ministers in the States and a programme of concerted action is being evolved. While attention has to be given to the regulation of distribution and prices, the main emphasis will be on higher production. The experience of intensive agricultural production in certain selected areas through what are known as 'package programmes' has led us to decide that we should concentrate our efforts in about 80 selected districts, covering approximately 1,500 development blocks, which hold out promises of quickest results. The impact of these and other measures which the State Governments are taking should be felt on the next Kharif crops. Government also propose to create a special organisation for this purpose in the Food and Agriculture Ministry to be headed by an officer, who has considerable experience in this field. It is also proposed to build up later on, specialised agencies for the stimulation of some of the cash crops as well.

On the industrial front production trends have been more satisfactory, the increase being 10 per cent over the first nine months of the current year compared with 8.5 per cent in the corresponding period of the previous year. Honourable Members are aware that a number of steps have been taken to stimulate industrial production and a measure of acceleration in the rate of growth over the coming year should be possible. Even so, it is clear that the preservation of a reasonable degree of stability in the months to come will call for a reduction in the volume of deficit financing in the coming year.

In this connection, the overall rate of monetary expansion in the economy will also call for a careful watch. During 1963, money supply with the public increased by Rs. 430

crores or 13.8 per cent as compared to an increase of 9.9 per cent in 1962 and 6.1 per cent in 1961. Government indebtedness to the banking system has been a major factor in monetary expansion in recent years; but bank credit to the private sector has also shown a brisk increase during the current busy season. While the Reserve Bank pursues a fairly liberal policy to help production and while the availability of credit to the farmer is being improved by the Agricultural Credit Department of the Reserve Bank, a close watch has to be kept on the situation to ensure that credit creation is kept within reasonable limits and does not encourage speculation of hoarding.

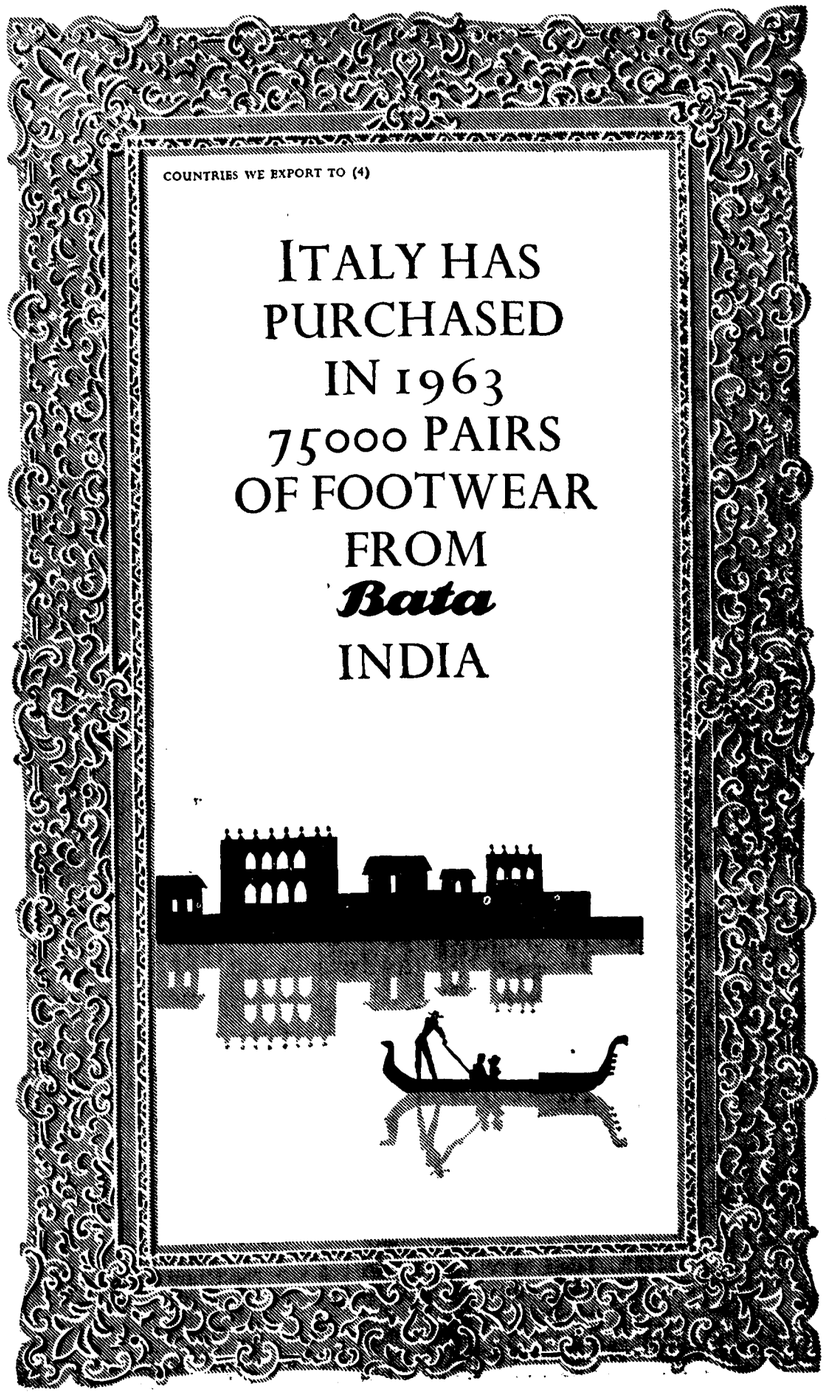
Exports Up

Externally, the current year has witnessed a welcome increase in export earnings and a comparatively satisfactory position in regard to foreign exchange reserves. On present indications, export receipts during 1963-64 should exceed Rs. 760 crores and thus show an improvement of at least 7 per cent over the corresponding receipts in 1962-63. Partly as a result of better export performance and partly in view of greater utilisation of external assistance, particularly of the non-project type, our foreign exchange reserves are likely to show a slight improvement over the current year as against a decline of Rs. 2.21 crores in 1962-63 and Rs. 6.30 crores in 1961-62. In addition, we have reduced our indebtedness to the International Monetary Fund by $50 million during this year as against an increase in such indebtedness of $25 million in 1962-63 and $122.5 million in 1961-62. While it is gratifying that the combined burden of defence and development has not put an intolerable strain on our balance of payments as a result both of our own efforts and the generosity of our friends, our reserves are still too low and we cannot afford to relax our efforts to strengthen them.

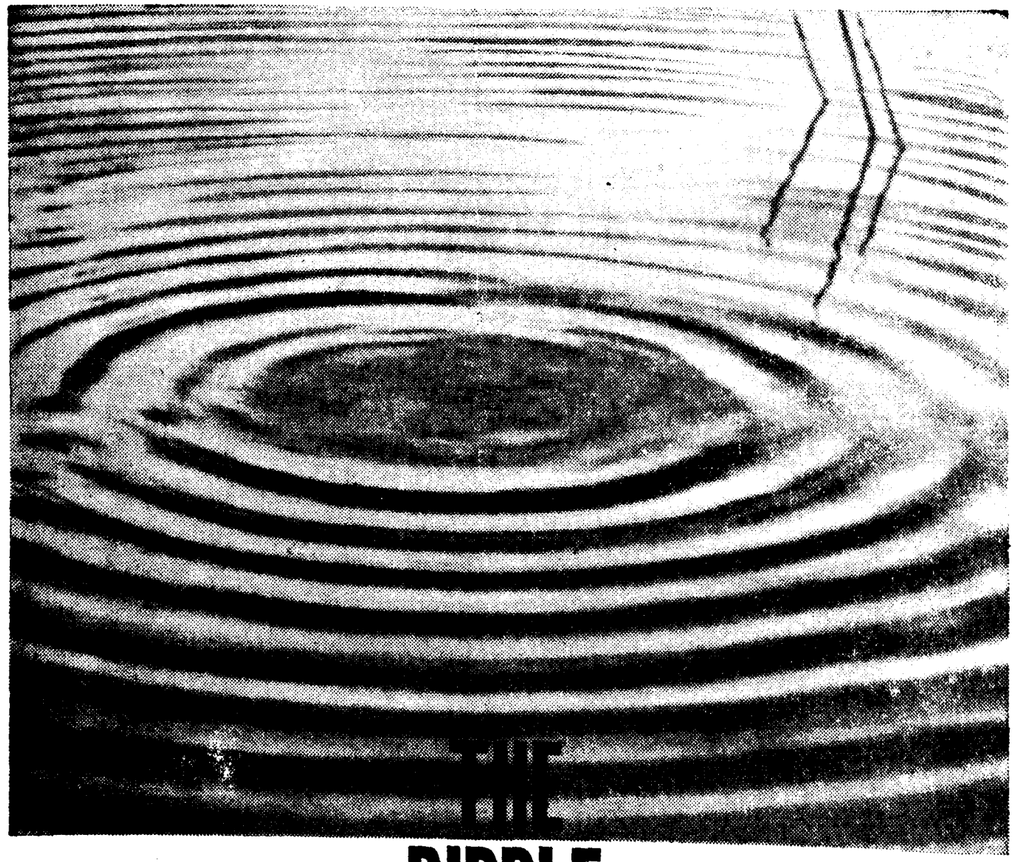
In the ultimate analysis, the three problems of prices, growth and balance of payments on which I have focussed my remarks so far are inter-related and we cannot solve any one of them without the fullest attention to the other two. Indeed, it is only to the extent that all these problems are tackled within the framework of an integrated policy, in regard to incomes, wages and investments that we can hope to ensure that the necessary investment potential is available for the development of the economy.

Lessons to Learn

Treating the problem of growth as an isolated factor and promoting growth by stepping up investment from the sources available within and without the country, without a corresponding policy for the incomes generated in the process, would only stimulate inflation. Similarly, a price policy which disregards the dynamics of growth, or the impact on investment decisions, cannot but be self-defeating in the same way as a price policy which is not co-ordinated with a corresponding policy in regard to wages. It is now generally agreed, for example, that trying to keep agricultural prices too low for producers may defeat the objective of raising agricultural production. But if this is the case, one cannot, at the same time, try to keep agricultural prices low for all consumers, or adopt a wage policy in which most wage-earners are compensated for the increase in agricultural prices. Nor can one succeed in raising resources for defence or development by taxation if each such effort leads to price increases which are passed on all along the line. These are, I think, a few lessons which have emerged from our experience in the recent past, which deserve to be borne in mind in framing budgetary and other policies for the period ahead.



As far as investment policy is concerned, there is little doubt that, at the present stage of the economy, it is just as important to make the most efficient use of the investments already completed as it is to step up further the tempo of investment. Often, in the race for making new starts, sufficient attention is not given to the fullest exploitation of the facilities already created. We cannot at the same time afford to postpone making new investments in development; nor can financial difficulties be allowed to slow down the completion of schemes which have already been taken up. From both these considerations, it follows that the level of investment next year in the public as well as the private sector must be stepped up as much as possible.



In a certain sense, the broad pattern of investment that we must undertake in India is self-evident; and it is easy enough to agree that we need to expand investment in irrigation works, fertiliser plants, power and transport programmes, or indeed basic and heavy industries which have a vital bearing on the future growth potential of the economy. But broad generalisations of this nature are of little real help at this stage when the most important questions to decide are in regard to the choice of the specific projects and programmes in each of these fields which promise the greatest benefit in relation to the cost they entail. Our present arrangements for the choice of specific projects and programmes after a detailed examination of the technical and economic aspects of practical alternatives leave much to be desired; and it is my intention to strengthen this aspect of the work of my Ministry during the months to come.

Hastening the Pace

Apart from this question of the size and pattern of investment, there is need for speedier execution of projects and of earning better returns from the investments that are being made. Many of the public sector projects are lagging behind the schedule of their construction and what is more disappointing is that their contribution to our resources is nowhere near the Plan estimates. It is of the utmost importance for our economy that enterprises in the public sector should not only make profits, but should make good profits. By that I mean that they should give a good dividend to the Exchequer and yet be able to build up reserves to finance their own future expansion. I know that some people think that public sector enterprises should work on no profits or low profits. Such an approach is wholly unsound in any society, more so in which the State seeks to own or control the major sectors in production. When the State does no more than build schools, hospitals and roads, it need not look to direct returns on its investments. But when the State begins to provide power and transport, when it owns steel plants, fertiliser plants and machine-building plants, it must make sizable profits out of them, build reserves, amortise loans and provide adequately for depreciation of assets and their replacement, so that the public sector can expand without adding unduly to the tax burden. This is reinforced by the fact that the products and services provided by the public sector are absorbed by the private sector which is not inhibited from making adequate profits. To the future growth of the public sector in India, a major contribution has to be made by the return on investments already made in the public sector.

It is equally important for our development that the private sector has the resources to expand in the fields assigned to it in our planning. In my statement last December I had referred to some of the steps to be taken towards this end. Since then, the House has enacted legislation for the establishment of the Unit Trust which has already come into being. The House will also be considering the Bill for the establishment of a Development Bank which is intended to make an additional contribution to the resources for the development of our industrial economy. Important and sig-

RIPPLE

The LIC is at the centre of a ripple whose widening impact is felt throughout the land.

On the one hand, LIC's operations are far reaching. They cover about 729 centres, a number which is steadily increasing. So is the number of new individuals in India being covered with Life Insurance.

On the other hand, the LIC invests over 2 million rupees a day in industry, agriculture, railways, transport, electricity and many other projects. The radiating effect of these investments creates more jobs, more incomes, more food—in fact, a higher standard of living—for everybody.

LIC—YOUR COMPANION IN PROGRESS

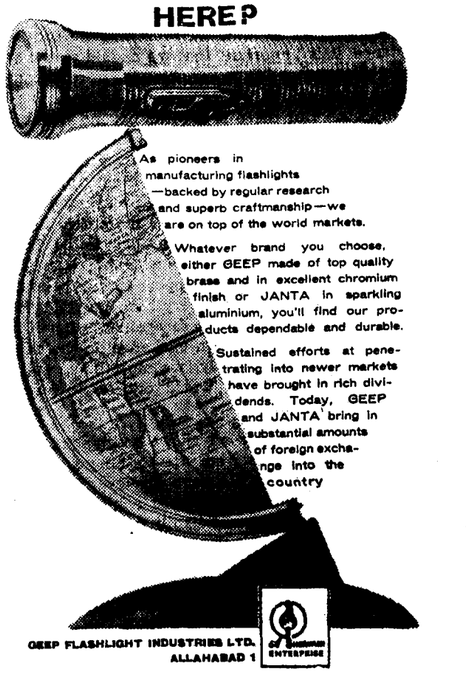
ASP/LIC-E-36

nificant as these measures are, basically the resources for develpoment are generated not entirely by the setting up of institutions such as these, but in the community through the savings that are made. One of the prime objectives of our economic and fiscal policy, therefore, must be to generate savings both in the hands of individuals and in the hands of corporate bodies.

One of the weaknesses in our economy has been that a high proportion of the community's savings is being diverted towards industries of low priority, towards quick speculative gains through purchase and sale of urban housing and the hoarding of commodities in short supply in a manner which tends to push up their prices. Some of these trends need rectification through fiscal measures to which I shall turn later. It is important that these savings should be canalised into the industries to which we attach the highest priority.

Controls Discourage Investment

Part of the distortion however, comes about through some of the short-term and, if I might say so, short-sighted devices to deal with the price situation. By imposing statutory controls on the prices of certain basic products, we often succeed in discouraging investment in the very industries which produce those items. This tends to perpetuate the shortage and to aggravate rather than relieve the pressure on prices. Often controls of this type do not result in the commodities in question being available to the consumer at lower prices. What happens is that the high prices which,the consumer continues to pay do not benefit the producer, but go into the pockets of others. And because these prices are not legally recognised, the Exchequer also is deprived of its dues. In curbing profiteering, fiscal devices can be used much more effectively than controls which lead to abuses. Reliance on price controls is only appropriate where it is possible to exercise effective check on distribution and consumption as well; in other words, there can be some form of rationing.



While conceding the need to provide private industry with resources for the development entrusted to it in our planning, I should like to say a word about the equally important point that we must not, in the process, allow concentration of economic power and growth of monopolies. The question which we have to consider is how we are to achieve this objective consistently with our concern to see that genuine and desirable development is not stifled. For a proper formulation of our policies and attitudes in this respect Government feel that there is need for an impartial and objective enquiry so as to bring the relevant data out in the open. It is, therefore, proposed to set up under the Commission of Enquiries Act a Commission to enquire into monopolies and the concentration of economic power in the Indian economy. While we must await its report, before undertaking any legislation or setting up any kind of a statutory body to deal with monopolistic practices, I should like to draw attention to some aspects of this problem.

There are basically three essential ingredients in any industrial or economic set up. They are: ownership, control and management. When discussing the question of monopolies, it is important to distinguish between these three elements and to have a clear appreciations of their relative roles. It is popularly believed that the ownership of industries in the private sector is concentrated in a few hands. This is only partially true. No doubt in a country like ours with such widespread poverty, a very large section of the population does not own any part of the industry, trade or banking which is carried on in the country. It is also true that the wealthier a person is, the larger would be his ownership of stocks and shares. At the same time, what is not often realised is that even the biggest industrial plants in the country today belong in terms of ownership, much more to the people at large than to their original founders with whose names they are popularly associated. The Life Insurance Corporation is itself a significant shareholder of many of the larger industrial and banking units in the private sector, Investment by private individuals, many of them of modest means, has also been increasing. Among the further measures through which Government propose to disperse the ownership of industry in the private sector, I would refer to the Unit Trust, our efforts to promote co-operative ownership, as we have done with a fair degree of success in the case of new sugar factories, and the measures which we adopt, and to which I shall turn later, to reduce the inequalities of wealth.

What is really disturbing is that despite diffused ownership, control is concentrated in a relatively few people. We have recently taken some major steps to weaken this stranglehold. The changes in the Banking Companies' Act and the amendments to the Company's Act have paved the ground for the State to have strategic control over the private sector in order to ensure that the investor in industry gets a square deal and that anti-social activities are curbed and controlled.

It is not, of course our intention to interfere in the detailed running of an enterprise in the private sector. Indeed, the running of the enterprise is not a matter of control, but of management. Management is a profession and technical job and the skills necessary for that have to be encouraged and rewarded not only in the private sector, but in the public sector also. One of the weaknesses in the public sector today

HOW ARE WE HERE?

GEEP FLASHLIGHT INDUSTRIES LTD. ALLAHABAD 1

STERLING-GF-95

is the lack of adequate managerial personnel. The last thing which we should do is to weaken the management. It is control which really is the vital element. In the society which we hope to establish on an enduring basis, the private sector, in the sphere assigned to it, will have the opportunity to grow, to attract individual savings, and to develop managerial skills, subject to the overall discipline of the State, to prevent monopolistic exploitation and pursuit of methods which do not help the growth of the economy. Our fiscal policies should give encouragement and support to larger investment in priority industries, to better and more efficient management by those who have the necessary talent and to a weakening of the devices, such as managing agencies and improvised selling agencies, through which dynastic domination of private industry is perpetuated.

The efforts which we make through our fiscal and other devices to encourage savings, to invest them soundly and to run our plants efficiently and profitably in the public interest, will, for many years to come, need to be sustained by the inflow of foreign exchange in the form of external capital which serves the dual purpose of filling the gap between domestic savings and levels of investment and our export earnings and import requirements. Much of our foreign assistance has been coming in the shape of credits and grants from friendly countries, as well as from international institutions, particularly the World Bank which takes an active role in organising the aid effort through annual meetings of the Consortium. We have, since the Emergency, been also helped by external aid to strengthen our defence effort. In addition, supplies of agricultural products, specially wheat and cotton, under the PL 480 programme of the United States have made a major contribution in meeting food and other material shortages in the country. We owe a debt of gratitude to these friendly countries and institutions, which I must, on this occasion, publicly acknowledge.

External Assistance

While for some years to come we must rely on continued external assistance, it is important that we should at the same time devote increasing attention to the objective of reducing our requirements of such aid. We can do so by reducing the level of our imports. But there is a point beyond which restrictions on imports, whether fiscal or administrative, begin to do more harm than good, result in idle capacity in industry and slower rate of growth and lead to higher prices with a consequent fall in export earnings, which may well exceed the saving in foreign exchange effected by the cut in imports. Our primary emphasis in import saving has to be not on additional measures of restriction, but on tuning our investment policies to give the maximum support to our balance of payments. Secondly, we must do everything possible to increase our export earnings, though here again, we have to be careful not to spend too much foreign exchange on the devices we use to help our exports. Finally, we must make full use of private capital sources in the world outside to augment the external aid we receive.

Quite apart from the credits which we receive from Governments, we could raise funds from the banking system and capital markets of the world. We have, however, to remember that our external debts are already at a high level. For the third Plan, we had a repayment liability of approximately Rs. 575 crores, including principal and interest, and the repayment liability for the fourth Plan is already in excess of Rs. 825 crores. In these circumstances, we should specially welcome foreign investment in the shape of equity capital which not only brings with it technical know-how and managerial skills, but has the special advantage of not adding to the heavy and growing burden of debt repayment. To attract private investment in appropriate fields, we have to offer some incentives and I shall deal with those which pertain to the fiscal field a little later.

I shall now turn to the budget provisions for the coming year. At the existing level of taxation, I have budgeted for a total revenue of Rs. 2,095 crores and expenditure of Rs. 2,041 crores, leading to a surplus of Rs. 54 crores on Revenue account.

Receipts Up

As compared to the revised estimates for the current year, the Revenue receipts next year would be more by Rs. 181 crores. The four principal heads of Revenue account for an improvement of Rs. 92 crores, while interest receipts are expected to go up by another Rs. 32 crores. Following the change in the procedure for the release of assistance under PL 480 on an advance basis, the grants for approved projects are now expected to exceed the current year's provision by Rs. 76 crores. But this would be covered by a corresponding transfer to the Special Development Fund for which the expenditure estimates take a debit. These improvements, however, will be partly offset by a drop of Rs. 12 crores under Emergency Risks Insurance receipts and Rs. 4 crores under the surplus profits of Reserve Bank accruing to Government.

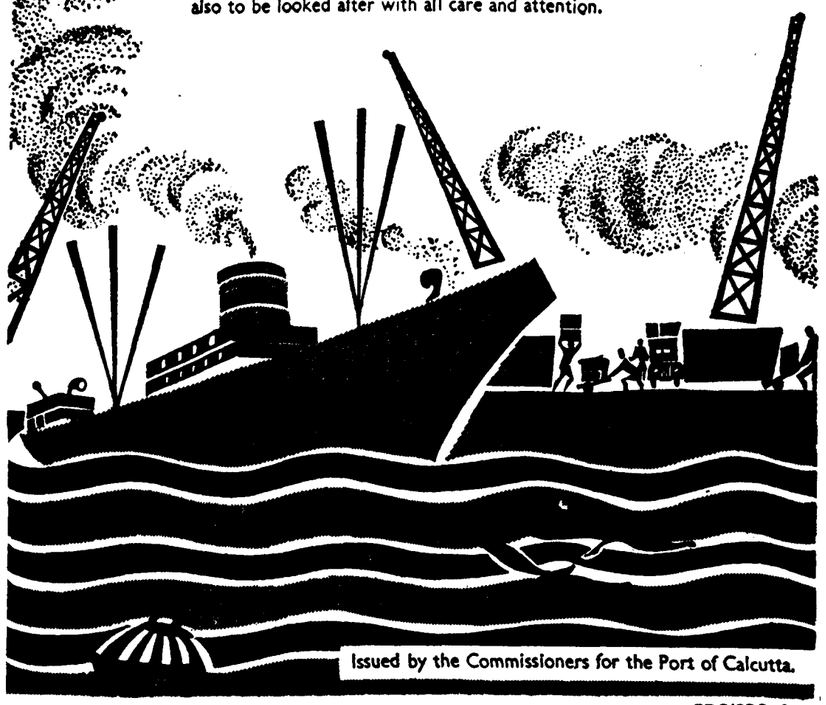
I am providing for Revenue expenditure of Rs. 2,041 crores next year, of which Rs. 718 crores will be for Defence Services and Rs. 1,323 crores for Civil purposes. The Defence requirements debitable to Revenue next year show an increase of Rs. 25 crores over the revised estimates of Rs. 693 crores for the current year, while Civil expenditure shows an increase of Rs. 191 crores. The growing volume and cost of public borrowings, mainly for development, account for an increase of Rs. 36 crores under Debt charges. A lump provision of Rs. 10 crores has been made on account of the increase in dearness allowance sanctioned recently with retrospective effect from 1st July, 1963. Miscellaneous Social and Developmental Services in the fourth year of the Plan are expected to cost Rs. 21 crores more, whereas grants to States for both Plan and non-Plan purposes would exceed the current year's Revised by Rs. 53 crores. The self-balancing items of grants under PL 480 deposits and Emergency Risks Insurance Receipts, to which I have just referred, together account for a net increase of Rs. 64 crores. The States' share of Union Excise Duties would also show an increase of Rs. 5 crores.

Liberal Estimate

In putting forth these estimates, I have tried to be as liberal as I could in estimating receipts and as strict as possible in providing funds for expenditure, taking into account the fact that actuals have, in the past, shown large increase in receipts and savings in expenditure. At the same time, I must add that if for purposes of our development or defence, we find it necessary, I shall not hesitate to come to the House for Supplementary Grants.

Excluding the adjustment for the transfer of loan assistance from U.S.A., which is notionally treated as Capital expenditure, Capital outlay next year is estimated at Rs. 706 crores representing an increase of Rs. 34 crores over the current year's Revised. The Defence Capital requirements next year at Rs. 136 crores show an increase of Rs. 20 crores over the current year.

The repayment of debt, both internal and external, will be of the order of Rs. 259 crores next year. Loans to parties other than State Governments at Rs. 254 crores will be higher by Rs. 64 crores. So far as States are concerned the revised estimates include Rs. 101 crores as their share in the market borrowing in the current year which was a combined effort for the States and the Centre. It has since been decided after



in tune with the progress of trade and industry

Serving a hinterland of 5,00,000 square miles with 180 million people, The Calcutta Port has to live up to the increasing demands of our national plans and progress. With the aid of over 42,000 workers and the best possible equipment, the Port helps the country to earn 50% of the foreign exchange from export. The task and target of the vital cause that this Port serves are as complex as they are extensive. By 1971, the traffic capacity has to be geared up to about 14 million tons from nearly 10 million tons in 1960. To be an active participant in the gigantic national programme of progress is the proud privilege of

CALCUTTA PORT COMMISSIONERS

consultation with the State Governments, to resume the practice of separate market operations by the Central and State Governments next year. Excluding the States' share of combined market loan, loans to States next year at Rs. 606 crores show an increase of Rs. 81 crores over the current Revised.

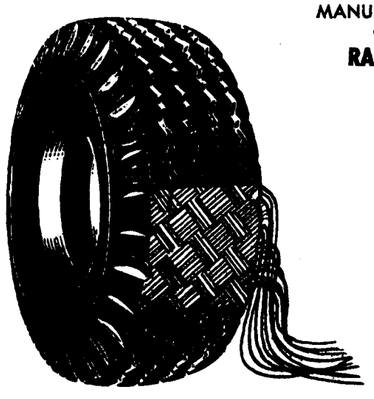
I must, at this juncture, digress to say that the financial position of most of the States has been causing me a good deal of concern. The total amount due to the Centre by the States at the end of the current financial year will be of the order of Rs. 3,000 crores. In addition, the States' liability on account of market loans at present amounts to Rs. 656 crores. Both in terms of loans from the Centre and market borrowings the States have been receiving more than what was originally contemplated in the Plan. Their share of Central taxes and duties has also been increasing. Yet most of them are constantly facing ways and means difficulties of a disturbing nature. The whole position will require careful review in the context of the fourth five-year Plan. While we should aim at giving the States a good deal of flexibility in allocating their own resources, so far as Central assistance is concerned we must also ensure that a major portion of it is related to the Capital expenditure on identifiable projects which are economically sound and can be expected to generate the resources for the repayment of their liabilities. Other devices will also have to be thought of. As a first step, it is proposed to set up the Fourth Finance Commission at the beginning of the next financial year so that its report becomes available before we finalise the shape and size of the fourth Plan.

Plan Implementation

Provision has been included in the budget next year for a total expenditure of Rs. 1,516 crores for implementing the Plan of which Rs. 253 crores will be on Revenue account and the balance of Rs. 1,263 crores as Capital outlay, including Loans. In addition, Railways are expected to provide Rs. 46 crores, Hindustan Steel Rs. 25 crores and other public sector enterprises Rs. 44 crores from their own resources. These estimates include Rs. 559 crores as assistance to the States of which Rs. 122 crores would be on Revenue account and Rs. 437 crores in the Capital budget. The States are expected to find Rs. 353 crores from their own resources. Thus, the total State Plans next year would be of the order of Rs. 912 crores as compared to the current year's budgeted outlay of Rs. 750 crores. With the Central outlay of Rs. 957 crores, contribution from public sector enterprises of Rs. 115 crores and State Plans of Rs. 912 crores, the total Plan outlay in the fourth year of the Plan would amount to Rs. 1,984 crores, showing a step-up of Rs. 333 crores over the budgeted outlay of Rs. 1,651 crores for the current year. Much of this additional outlay is to strengthen the agricultural sector, as well as to meet the cost of Plan projects which are nearing completion.

Larger outlays on Defence are also a matter of painful necessity for us. The Defence Budget in 1964-65, taking Revenue and Capital together, is somewhat lower than the budget estimate for the current year, but shows an increase of Rs. 46 crores over the Revised. No one in this House will grudge this increase though we may all regret it. For the current year's budget, the House was pleased to vote the necessary funds without asking for the usual details which, from the security angle, it would not have been prudent to disclose. We are now in a position to give a fuller picture and the budget papers contain the usual details. The point I would emphasise is that our defence effort depends largely on building up our production base and the steps we take to strengthen the economy are also those that will strengthen our defences. In recognition of this fact, even the outlays to be voted under the Ministry of Defence have a substantial provision for investment in productive enterprises.

For meeting the increased cost of development in the coming year and in the years thereafter together with our obligations to meet the needs of defence, it would be necessary to take all possible steps for mobilising resources. Promotion of savings would have to form a cardinal part of such mobilisation. I had indicated that we are likely to end the year with record collections of Rs. 115 crores through Small Savings. I am assuming for the coming year net collections of Rs. 125 crores. Even at this rate we are not likely to reach the target of Rs. 600 crores for the Plan. We have, therefore, to make special efforts to step up the level of savings in the community as a whole. To this end our policy in regard to incomes, wages and consumption has to be reoriented. Savings, and as a consequence, investment can only be generated by a margin between consumption and incomes or wages. While we cannot afford to neglect our efforts to improve the lot of low income groups, such efforts, I feel, should be directed more towards measures of social security than towards an increase in their expendable income. This is not the time for me to go into details but I will content myself by saying that Government intend to devote special attention to the task of mobilisation of savings and social security measures in the coming year. I am making suitable administrative arrangements for this purpose.



I may now summarise the overall budgetary position. Capital outlay will amount to Rs. 796 crores, loans to States and other parties Rs. 860 crores and debt repayments Rs. 259 crores, leading to a total disbursement of Rs. 1,915 crores. These are expected to be met to the extent of Rs. 54 crores from Revenue surplus, Rs. 997 crores from internal and external borrowings, Rs. 285 crores from repayment of loans, Rs. 125 crores from small savings and Rs. 278 crores from miscellaneous debt and deposit heads. These would leave a total uncovered budgetary gap of Rs. 176 crores at the existing level of taxation.

Package Deal for Corporate Sector

INTRODUCING EXTENSIVE changes in the area of direct taxation, the Union Finance Minister contended that the net effect of his proposals would be to strengthen corporate finances and improve the general investment climate, but emphasised that disparities in income and wealth were to be reduced through fiscal measures.

The following is the text of Part 'B' of his Budget speech:

I have stated often that the growth of the economy has not been commensurate with our expectations. The measures we have taken during the last six months have produced some improvement in the situation; but more has to be done to stimulate the economy. The existing taxation policy, good as far as it goes in the direction of producing revenue, has also to be geared to the paramount task of promoting growth. It is admitted on all hands that fiscal measures have a major role to play in the process of economic development. In this process of accelerating the tempo of development, care has also to be taken to ensure that we do not, at the same time, add to the forces of inflation which are always around the corner in an economy characterised by shortages of one kind or another.

Against this background, the overall deficit of Rs. 176 crores for 1964-65 which I have visualised at the existing rates of taxation is something which we have to temper, if not altogether avoid, particularly as it would come on top of successive doses of deficit financing and at a time when the upward spiralling of prices is causing concern. It is also necessary that the tax structure should not merely be attuned to the needs of growth and to the revival of the capital market, but it should also provide sufficient cushion for both corporate and individual savings with a check on unproductive spending. Taxation has, therefore, to be used as a sensitive and multipurpose tool, to encourage production, to keep a measure of restraint on rising levels of consumption, to ensure that people get the fruits of their labour, to induce savings and to prevent profiteering so that the inherent ills of a scarcity economy are not multiplied. Having stated all this, I realise that these very desirable goals cover a whole horizon and it is not possible at one stroke to serve all the purposes in a single year's budget proposals. But to the extent it is possible, I propose to address myself to these tasks; and the proposals I am making are intended primarily to serve these ends.

Indirect Taxes

I had given some thought to the structure of indirect taxes. While this will bear more scrutiny than I have been able to give them, I am proposing some changes in indirect taxes, both excise and customs, the cumulative effect of which will hardly add to the burden that the economy is now bearing.

One of the essential conditions to be fulfilled by indirect taxes is that the revenue from the items on which such taxes are imposed is sizable and secondly, that the incidence of these taxes should be identifiable. Applying these two criteria, it is proposed to remove the duty completely on a number of items. They are gramophone records, all gases other than carbon dioxide used for the manufacture of aerated waters, low voltage electric motors and all acids other than sulphuric acid. It is proposed to withdraw the excise duty on soap, manufactured without the aid of power and to levy an effective duty of Rs. 40 per tonne on sodium silicate which goes into the manufacture of such soap. This would free from excise control a large number of soap manufacturers. It is also proposed to modify the sub-classification of soap produced with the aid of power from four to two. Some changes are being made by regrouping items under paper in order to simplify the schedule of rates and classification. With a view to encourage the use of bagasse in the manufacture of paper, the duty on paper in the manufacture of which more than 50 per cent bagasse is used would be reduced by 5 naye paise per kilogram. The special duty of excise is being abolished in respect of synthetic dyes, glassware, chinaware, porcelainware, cellophane and certain types of writing and printing paper and electric bulbs and reduced on the initial slabs on tyres. The schedule of duty on cigarettes is being revised lowering the duty on one group and raising it slightly on another. It is proposed to revise the tariff description of plastics and electric wires and cables and of foot-wear and aluminium. The net result of these changes is a loss of revenue of Rs. 486 lakhs.

Excise on Pig Iron

It has been decided to abolish the surcharge on iron and steel, which is transferred to the Iron and Steel Equalisation Fund. The surcharge is being replaced by an increase in the effective rates of Excise Duty on pig iron, certain steels and steel products; some of these are being prescribed as ceiling rates so as to enable Government to increase the effective rates further if circumstances call for such a measure. The effective rates per tonne now proposed are Rs. 30 on pig iron, Rs. 90 on semi-finished steel and steel bars, rods and structurals, Rs. 110 on all flat products other than skelp and Rs. 150 on skelp. This will mean an increase in revenue of Rs. 1181 lakhs in 1964-65, more than compensating the loss of accural to the Iron & Steel Equalisation Fund.

It is proposed to extend further the process of transferring Excise Duty from cotton fabrics to yarn as well as to processed cloth. Increase in the duty of fine and super-fine yarn has become necessary in view of the high profits that are being made on such yarn which are spun from imported cotton. By levying a surcharge on sized yarn and also by prescribing higher effective rates for yarn other than in hanks, with the duty on yarn in hanks being kept at a comparatively low level, the impact of these duties on handloom cloth will not, it is expected, be felt. The lowering of duty on grey fabrics had necessitated lowering of the rates of compounded levy on power loom units of 5 to 49. Powerloom units of 50 and above will pay a preferential duty at 80 per cent of the rates applicable to composite mills. The addition to revenue as a result of these changes will be Rs. 981 lakhs on yarn and a reduction of Rs. 286 lakhs on fabrics. It is also proposed to raise the effective rates of duty by 50 per cent in the case of rayon yarn and about 100 per cent on other synthetic fibres and yarn and to reduce the special duty on cellulosic staple fibre.

In addition certain minor adjustments will be made in some of the other items of excise tariff such as paints, varnishes, worsted yarns, matches, rubber products and a few more; the details of these changes will be found in the Memorandum explaining the provisions in the Finance Bill, which is being separately circulated.

Taken all together, these changes in Excise Duties, would account for a net gain in revenue of Rs. 1954 lakhs in 1964-65, of which Rs. 39 lakhs will accrue to the States as their share. The net additional burden on industry will, however, be only about 1 per cent of the total estimated revenue from this source.

It is proposed to continue the power to levy regulatory

duty, both for Central Excise and Customs. There has been no occasion to use these powers during the current year. Nevertheless, the continuance of this power is necessary in order to meet unforeseen price or production situation. The lifting of control over prices of certain goods would also necessitate a watch on their movement. It is, therefore, proposed to take power to levy a regulatory duty of excise at the rate of 15 per cent.

Customs Duties

In regard to Customs Duties, my proposals are mainly confined to maintaining the actual incidence of duty as it was till a few months back. It is known that a number of items are assessed to import duty on basic tariff values. Before the coming into force of the Customs Act of 1962, the tariff values were based on market values which included certain post-importation charges. In view of the provisions of the new Customs Act, it became necessary to fix the tariff values without such charges. This resulted in the tariff values being lowered on certain articles, especially dry fruits, copra and caustic soda and consequently the import duty on these articles has gone down. It has been found that the benefit of lowering the incidence of duty on these articles has not been passed on to the consumer and it is, therefore, necessary to revise the rates of duty so as to keep the actual incidence at about the same level as it was before the change in tariff values was made. In the case of dry fruits it is proposed to adopt specific instead of 'ad valorem' rates based on tariff values for most varieties. The rate of duty on copra is being raised from 25 per cent to 30 per cent and that on caustic soda from 40 per cent to 80 per cent. In both cases the preferential rates will be 10 per cent lower. The increase in revenue as a result of these changes is expected to be Rs. 202 lakhs in 1964-65.

It is proposed to raise the import duty on high carbon or spring steel wire by 20 per cent to place the indigenous product on a competitive basis. The rate of duty on motor cars, which has gone up to 150 per cent, though actual imports are few, is very high and it is proposed to reduce this to 60 per cent. It is also proposed to abolish the export duty on jute.

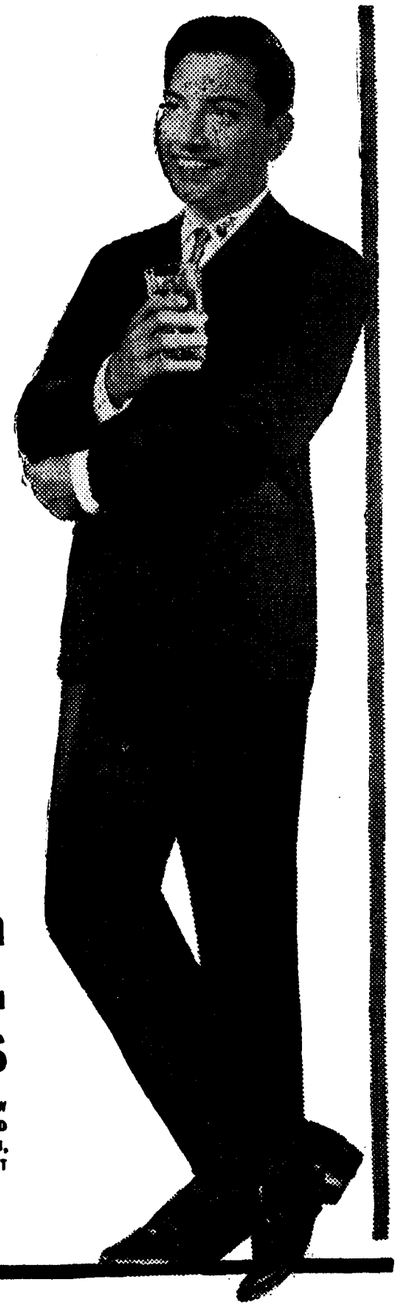
The net effect of the changes in the Customs duty will be an increase in revenue of Rs. 208 lakhs in 1964-65. There will also be additional revenue of Rs. 429 lakhs from countervailing duties.

The total effect of all the changes in indirect taxes will be a gain in Central revenue of a little over Rs. 25 crores in 1964-65.

Direct Taxes

Revenue from direct taxes has shown a considerable amount of buoyancy. This is partly due to the measures taken in recent years to close the gap between the tax due and the tax collected. Due to a shortage of staff and the difficulties of training new staff within a short period, assessments have been falling into arrears and even provisional assessments were not kept up-to-date. This has been partly remedied but a great deal remains to be done. The administrative drive for better collection and stricter enforcement requires to be supported by suitable legal powers. The tax structure itself, which has grown in a somewhat haphazard manner, needs a closer look and in this task one has to remember that direct taxes provide the means through fisc for change in the nature and direction of society towards the goal of removing inequalities in income distribution.

In the corporate sector, the primary need of the hour is to infuse some confidence. The resources of this sector have to be augmented from within as well as from without, and it is, therefore, necessary to provide incentives for the existing companies to plough back a larger share of their profits and also diminish the disincentive for inter-corporate investment. In this process, it seems to me necessary to make a distinction between capital intensive industries and others. The need for basic industries to grow is recognised on all hands. Therefore, selective support has to be given to these industries. I am aware that all the desirable things cannot be done simultaneously. Though our present need for larger resources makes it difficult to give up any source of revenue, I am sure the changes now proposed to be made and incentives that are being provided would be appreciated and confidence would generally revive.



There has been considerable criticism in respect of the Super Profits Tax and the uneven nature of its effect on industry as a whole. I understand that some of the corporate units with a large capital base have not been unduly affected by the Super Profits Tax as it is at present framed while some have to bear a much larger share of the burden. The net result has been that it has produced a psychological resistance and has to some extent affected industrial growth. I propose to address myself to re-modelling the corporate tax structure having in view the needs I have outlined earlier. The present tax on corporations of 25 per cent Income-tax and 25 per cent Super-tax would remain. In substitution of the Super Profits Tax, I propose to levy a surtax on profits of companies. The capital base for this purpose will consist of equity and preference capital, reserves, debentures, loans from approved financial institutions and loans for 10 years or more from banks, or from foreign sources for creating capital assets. This tax will be at the rate of 40 per cent on the residue of the profits after tax after deducting 10 per cent on the capital base.

Rebate of Corporation Tax

In order to encourage development of certain industries which occupy an important place in our economy, I propose to provide to companies which engage in such industries a rebate of Corporation Tax equivalent to 10 per cent of the Income-tax and Super-tax, which will be normally payable by them. This rebate will also be applicable in respect of surtax on such profits to the extent of 20 per cent of tax assessed. These industries are named in the Finance Bill and power is being taken to notify additions to this list from time to time. They include basic metals like steel, copper and aluminium, mining of coal, lignite, iron ore and bauxite, industrial machinery and machine tools, cement, fertilisers, paper and pulp, tractors, equipment for generation of electricity and tea, coffee and rubber.

The reliefs which are being given are intended to strengthen the reserves and augment the capacity of the corporate sector to develop. It is desirable to discourage the dissipation of these additional resources in higher dividends. With this object in view, it is proposed to levy a tax at the rate of 7.5 per cent on the amounts distributed as dividend on capital other than preference capital. Where dividend has, however, to be compulsorily distributed under the law, such distribution will not attract this tax. A new company has, however, to wait for some years before it can declare a dividend, such period varying with the nature of the undertaking. It would, therefore, be fair to exempt such companies from this tax to the extent of a dividend of 10 per cent on capital other than preference capital for a period of five years from the first declaration of dividend by such a company.

At present, inter-corporate dividends bear Income-tax at the rate of 25 per cent and Super-tax at varying rates depending on when the company was formed and whether it is an Indian company and is a subsidiary or not. It is proposed to abolish these fine distinctions and exempt all inter-corporate dividends from Super-tax. It is also proposed to remove

MARTIN BURN LOOK BACK TO OVER *180 YEARS OF SERVICE TO INDIA*

...to be able to compute this service by decades, not by years alone...to recall that our creed has consistently been the development of our country's resources through engineering and allied enterprises...to take pride in planning that makes the many units in our organization fall into a rational and complementary group and each one a leader in its particular field, a position which some of them, early pioneers in India, held even in the last century. For us looking back is a worthwhile proposition—an incentive to *move forward.*

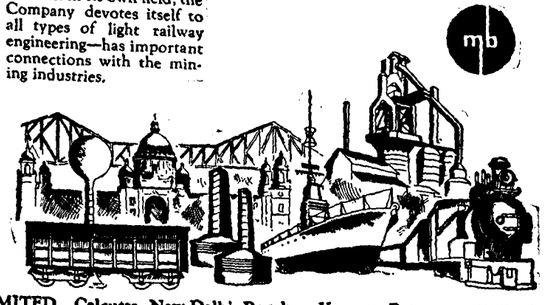
AMONG THE COMPANIES IN THE MARTIN BURN GROUP ARE:

THE INDIAN IRON & STEEL CO. LTD.: With a million ton integrated steel plant at Burnpur, the largest foundry in the Commonwealth at Kulti and its own collieries and iron ore mines, IISCO has an enviable record in production efficiency.

BURN & CO. LTD., HOWRAH WORKS: *Pioneers in foundry* practice in India, in structural steelwork fabrication and the manufacture of rolling stock—the origins of the Company go back to the year 1781.

BURN & CO. LTD., REFRACTORY & CERAMIC GROUP: Apart from stoneware pipes and chemical stoneware, the works of this group—eight in number and located in four states—manufacture nearly all types of refractories to meet the requirements of India's steel industry, power undertakings, railways, ordnance factories —in fact, any industry requiring refractory material for the maintenance of furnaces.

THE INDIAN STANDARD WAGON CO. LTD., SANTA: The oldest Indian unit started for the specific purpose of manufacturing railway rolling stock—has been mainly responsible for building up the wagon building industry. Also manufactures springs, forgings, pressings and stampings for heavy industry as well as automotive components.



THE HOOGHLY DOCKING & ENGINEERING CO. LTD.: Established in 1819, the Company has a shipbuilding yard, a dry dock and extensive workshops at Salkia.

ROBERT HUDSON (INDIA) LTD: A premier concern in its own field, the Company devotes itself to all types of light railway engineering—has important connections with the mining industries.

RAILWAY COMPANIES: Some of the first feeder railways in India, with six systems in four states.

ELECTRIC SUPPLY COMPANIES: *Pioneers* again in the generation and distribution of domestic power in India—serve 45 towns in Uttar Pradesh and Madhya Pradesh.

THE VAUGHAN BURN CRANE COMPANY LTD.: A collaboration with The Vaughan Crane Company Ltd. of Manchester ... Hand operated and electric overhead travelling cranes and chain pulley blocks.

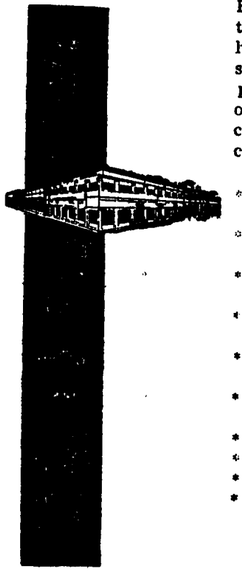
MARTIN BURN LIMITED Calcutta New Delhi Bombay Kanpur Patna MBGC-22A

the provisions in the Income-tax law respecting disallowance of expenditure incurred by companies on the remuneration of their Indian employees above Rs. 60,000 per annum for each employee. The imposition of this limit has not brought any perceptible advantage to revenue and besides being discriminatory is an ineffective restraint under tax law in respect of remuneration of Indian employees. Salaries of certain categories of employees are subject to restrictions under the Companies Act. I, therefore, see little advantage in continuing the application of this limitation. It is, however, proposed to introduce a new provision in the Income-tax Act limiting the amount of deduction admissible to companies for expenditure incurred by them in providing perquisites to their employees, whether of Indian or foreign nationality, to an amount of 20 per cent of the salary of each employee. Any expenditure in excess of that limit would not be deducted in computing the assessable income of the company. This will have the healthy effect of putting a curb on excessive expenditure on perquisites for companies' employees. It is also proposed to reduce the deduction of Income-tax at source from dividends from 30 per cent to 20 per cent for resident holders of shares. It is expected that this will be of some benefit to small investors who have to wait for quite some time to get their refunds.

I propose to increase the rate of Super-tax in the case of non-resident companies from 38 per cent to 40 per cent in respect of their income other than dividends and also royalties and fees for rendering technical services received from an Indian concern under an agreement approved by the Central Government.The Super-tax on income from royalties and technical fees will be at the rate of 25 per cent. The Income-tax for these companies will continue at the existing rate of 25 per cent.

Sec. 23-A Companies

I propose to increase the rate of Super-tax from 25 per cent to 35 per cent in the case of companies other than those in which the public are substantially interested or are wholly subsidiary of public companies, namely the group generally referred to as Section 23-A companies which are now governed by Section 104 of the Income-tax Act, 1961. Such of these companies as are engaged in specified industries will also be eligible for the proposed rebate of Super-tax equivalent to 10 per cent of the Income-tax and Super-tax payable by them. Income-tax on dividends received by non-resident companies engaged in the specific industries will be reduced from 25 per cent to 15 per cent. Further, I propose to exempt such Indian companies as are governed by Section 104 of the Income-tax Act, originally called Section 23-A companies, and are engaged in the manufacture or processing of goods or mining or generation and distribution of electricity or any other form of power, and other classes of companies as may be notified, from the existing requirement of compulsory distribution of dividends. This will enable such companies to plough back their profit after tax into the undertaking to the extent it may be necessary. For companies other than these, the Central Board of Direct Taxes will be empowered to exempt such portion of the profits which it considers necessary to be retained to meet the development needs of the company, subject to the limit of 20 per cent of the income required to be distributed.



I find that the provisions of the Income-tax Act allowing as deductible expenditure amounts spent wholly and exclusively for the purpose of business are being abused in respect of certain types of expenditure. Unduly large amounts are spent on daily allowance, on unnecessary bookings on planes and trains, on advertisement and on the maintenance of guest houses and suites of rooms in hotels outside the specific places of business, on providing conveyances and in paying high rents for accommodation for their officers and directors and in many other ways. I am afraid this tendency amongst companies is responsible in no small measure for the present high costs and the time has come to put a check at least on some of these expenses. It is not practicable to spell out all the restrictions in detail in the Act itself as some room will always be left for those inclined to evade these provisions to find ways of doing so. I feel it is necessary to have the power to make rules in this behalf where a specific provision is not practicable. A provision has been included in the Finance Bill for this purpose. Subject to these changes I propose to continue the existing corporate tax structure, including the rebate on incomes earned from exports.

I would have liked to discontinue the present general availability of development rebate and to confine it on a graduated basis to certain selected industries. I, however, appreciate that this might cause difficulties to concerns who have made plans for starting an industrial undertaking on the presumption that this rebate would continue to be available in the near future. In view of this, I would like to clarify that the continuance of the development rebate in its present form beyond 1st April, 1966 should not be assumed. I believe it is in the interest of industrial development to give such notice.

On the non-corporate side, I consider that the present rate structure of Income-tax and Super-tax needs revision. The

BHARAT ELECTRONICS LTD.
JALAHALLI – BANGALORE-13

structure has grown over years with annual additions and occasional reductions. A number of surcharges have been added to it under a variety of nomenclature. It has been represented to me that the working out of the tax due under the circumstances is itself a very difficult task even in the case of small and medium incomes and this throws an enormous weight of work on the staff which seems unnecessary. I feel it is time that we had a fresh look at the basic structure itself. In this context it is worth while mentioning that the motivating factor behind earned incomes should not be altogether ignored. Much of it is due to the incentive, the initiative and hard work of the earner himself, and for keeping up this effort and to enthuse the earner to greater efforts, it is necessary for him to have a feeling that at least some substantial portion of what he earns is left in his hands. In view of the present constitutional position and the need to augment the resources of the Centre, it is proposed to continue to levy a surcharge for the purposes of the Union.

The personal Income-tax structure is being re-graded. This will provide a revised and simplified schedule of rates of Income-tax and super tax in which most of the surcharges will be integrated and will mean a reduction of tax at all levels. With this change, the burden on the incomes in the lower brackets will be substantially lower than what it is now.

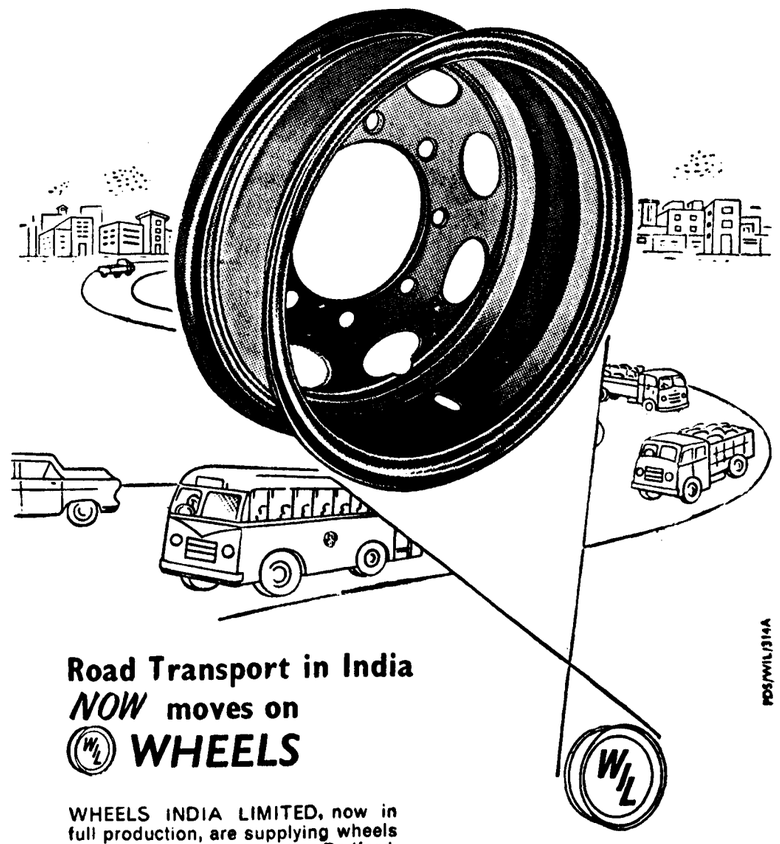
I propose to fix the Central surcharge on earned incomes above Rs. 100,000 at 10 per cent and on unearned incomes above Rs. 10,000 at 12½ per cent where such income does not exceed Rs. 25,000 and at 15 per cent where it exceeds Rs. 25,000 but does not exceed Rs. 75,000 and at 17.5 per cent above that amount.

Compulsory Deposit Scheme

The Compulsory Deposit Scheme, which, as the House is aware, is now only applicable to Income-tax paying category of persons, who can discharge a part of their liability in respect of additional surcharge by making a deposit, would be discontinued altogether. Income-tax payers in the small income groups were, I am afraid, hard hit by the scheme, particularly after discontinuance of the scheme for other categories in September last. I did not like to make a change then though I was alive to the need for giving marginal relief even in the current year on some of the lower incomes. I now propose to make a retrospective amendment to the relevant provisions of the Finance Act, 1963 to secure to such assessees appropriate marginal relief from the additional surcharge.

I propose to introduce an Annuity Deposit Scheme to replace the Compulsory Deposit Scheme which will operate at the income level above Rs. 15,000 per annum. This deposit will be at the rate of 5 per cent in the case of assessees having incomes between Rs. 15,000 and Rs. 20,000; at 7.5 per cent for those with incomes between Rs. 20,000 and Rs. 40,000; at 10 per cent for incomes between Rs. 40,000 and Rs. 70,000 and at 12.5 per cent where the income is above this amount. The deposit which will be compulsory for resident assessees who are citizens of India will be allowed as a deduction in computing the total income for the year in which it is made. It will be repayable in ten annual equated instalments of principal and interest commencing from one complete year after the year of assessment. The deposits in 1964-65 will earn interest at a rate slightly above 4 per cent per annum compound. Deposits which are repaid from year to year will, however, be assessed as part of the income of the assessee in the year in which it is so repaid. In addition, I also propose to extend on a voluntary basis the benefit of this arrangement to authors, actors and artists, who at their option can deposit a further amount not exceeding 15 per cent of their income under this Scheme in order to reduce the taxable income in the year in which it is earned and get it back in instalments over a period of ten years. It is expected that this can be used by them as savings for their future benefit with the advantage of a tax saving. I propose to extend this benefit to taxable gratuity income also. Persons receiving a gratuity liable to tax can make at their option a deposit up to 50 per cent of the amount of the gratuity under this Scheme and get the benefit of saving in tax.

With the coming into force of the Annuity Deposit Scheme the net income in the hands of assessees in the income group of Rs. 15,000 and above will be slightly lower than it has been hitherto, but there will be the advantage of an annual return in this form besides the savings in tax on the aggregate amount. I consider a marginal reduction in the expendable income of this group as something which is justified by the present conditions.



Tightening Assessment

The revised tax structure without taking into account the capital receipts from the Annuity Deposits would mean a lowering of revenue from these sources and a compensatory lowering of tax at all levels. I expect, however, to make good this loss wholly by tightening the tax assessment and collection machinery in a number of ways. As the House is aware there is a general feeling that Government is losing a fair share of its revenue due to evasion and avoidance. This has been attributed in part to the prevailing high rate of taxes. With a reduction in the tax rates now proposed I hope we shall hear less of this reason. The main steps proposed for checking evasion are five-fold. Firstly, every tax return will carry an affirmation about its correctness. This will, I hope, induce people to take additional care in preparing their return. Secondly, the tax due according to the return will have to be deposited within one month of the submission of the return, failing which the assessee will be liable to a substantial penalty. This will ensure quicker collection. Thirdly, the existing provision in the Income-tax Act regarding the levy of penalty for concealment of income is proposed to be amended. In the new provision where the income returned by a person is less than 90 per cent of the assessed income, the assessee should be deemed to have concealed his income unless he proves his 'bona fides'. Fourthly, it is proposed to take extensive powers to search for evaded wealth. The evil of unaccounted money has become so great that its mitigation, if not its total eradication, calls for drastic measures. It is intended to use the new powers effectively to ensure that no person possessing income or wealth that has escaped assessment remains out of the reach of law. I would like this to serve as a warning to persons entering into transactions involving large sums in cash. Fifthly, it is proposed to do away with the secrecy provision in the Income-tax Act and other similar enactments. The combined effect of all these steps will, it is hoped, prove beneficial to collection of revenues as well as to ensure a fairer deal to the honest taxpayer.

Rebate of Super-tax

I propose to allow rebate of Super-tax on contributions to recognised Provident Funds, deposits in the 10 and 15 year accounts of the Post Office Cumulative Time Deposit Scheme and premiums on life insurance but the limit for this purpose will continue to be at Rs. 10,000 per annum. Rebate of Income-tax and Super-tax will cumulatively be limited to 50 per cent of payments or deposits qualifying for relief.

Our tax rates cause some hardship to foreigners working in India. Many of them find it necessary to keep their school-going children in their own country. In western countries there are liberal concessions in Income-tax amongst other things for children's education. In the UK, it is fixed at £150 per child. I, therefore, propose to allow to resident assessees who are not citizens of India a rebate of Income-tax and Super-tax of a sum on Rs. 2,000 per child up to two

S.T.C., EXPRESS BUILDING, MATHURA ROAD, NEW DELHI. (INDIA)

children under 21 years of age receiving education outside India.

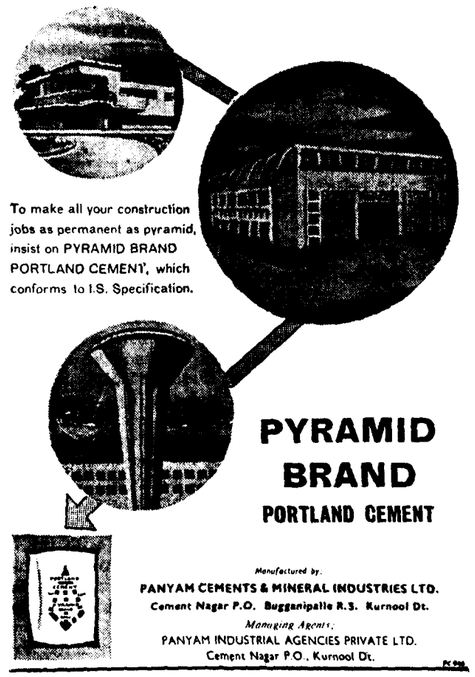
I also propose to extend the scope of two existing concessions. As the House is aware, under our Income-tax Act, certain categories of foreign technicians whose contracts have been approved before their arrival, enjoy exemption from tax on their salary income for a period of three years. In the absence of prior approval, the tax exemption is limited to one year. In some cases, it is found necessary to bring technicians at a short notice when it is not possible to obtain prior approval to their contracts of service. Sometimes it is found that the task for which a technician is brought out takes longer than was expected and the period may go beyond one year. To remove these difficulties, it is now proposed that the tax exemption for three years will be available provided approval is obtained within one year of the arrival of the technician in India. It is also proposed to extend the concession of exemption from tax to foreign teachers and professors coming to India on approved programmes.

Under our law, incomes arising from a business connection are liable to tax. While this principle is generally sound for developing countries, it is found necessary in the context of our present drive for higher exports to exempt from tax such income arising from purchase in India of goods which are exported. In order to encourage our exports, it is necessary to remove the disincentive of tax liability which does not exist in many other countries. I also propose to extend the scope of exemption from tax on interest on approved foreign lending by bringing within its scope investment in approved securities.

Capital Gains

The tax on capital gains, which is on the statute book, has certain drawbacks. It applies at the ceiling rate of 25 per cent on any capital gain made above Rs. 10,000. The tax laws as such in respect of capital gains require that the capital gain accrues only when there is a transfer of asset and a payment for it in an encashable form. Certain types of assets newly created like bonus shares which are in the nature of capital gains do not attract this tax. Apart from the fact that the tax impinges heavily on the lower receipts and lets off lightly larger receipts, it makes no distinction in regard to different types of property on the sale of which capital gain accrues. All these considerations make it necessary for the structure of the tax on capital gains to be revised.

At present, the law does not permit short-term gains made within one year to be treated as capital gains and treats it as income and this is as it should be Such short-term capital gains will also bear the surcharge in respect of unearned income. But in regard to the other types of capital gains, I propose to make three changes. The main one is that the tax on capital gains will be on a graduated scale in future without a ceiling of 25 per cent as at present. Secondly, the scale will be different for house and landed property and will be at the rate of 75 per cent of the appropriate slabs in the Income-tax cum Super-tax rate of personal taxation. Other types of property will bear tax at 50 per cent of the average rate of tax on personal income. The third change will be that it is proposed to provide that an invester in shares after receiving bonus shares shall be charged to tax on capital gains accruing to him in respect of such shares in the year in which they have been issued to him with reference to the market value of the bonus shares as on the 31st day from the date of their issue. There is no reason why capital gains in respect of bonus shares should be computed only when the shares are actually sold or transferred. Bonus shares result in a definite accretion to the capital of the assessee even before they are sold or transferred. Therefore, they will have to be distinguished from other assets. There is, however, no change in the present exemption limit



In regard to exporters, the existing rebate of Income-tax and Super-tax on profits derived from exports and on an amount of 2 per cent of the proceeds of exports or sale for exports by manufacturers is proposed to be continued. It has, however, been decided to exclude from the purview of the latter concession such articles as arms, ammunition, photographic films and newsprint and to include items such as non-jute textiles exported after the 29th February, 1964.

I have referred to the main changes which are proposed in the Income and Corporate Taxes. There are a few others in the Finance Bill which it is perhaps not necessary for me to refer to here.

Wealth Tax

In regard to Wealth Tax I propose to make a few minor changes in the rate structure. It has been decided to re-introduce the rate of 0.5 per cent for Wealth Tax on the first slab of a net wealth of Rs. 4,00,000 but beyond Rs. 1,00,000. Other slabs will be slightly re-arranged but their rates remain the same. It is also proposed to exempt from Wealth Tax the value of a house or part of the house owned or used by the assessee for residential purposes subject to the limit of Rs. 1 lakh where such a house is situate in a place with a population exceeding 10,000. Other exemptions remain.

I propose to completely re-cast the tax rate schedules of Estate Duty and Gift Tax. The Gift Tax was introduced as a complement to Estate Duty in order to deal with gifts which ultimately have the effect of reducing the value of the estate subject to duty. The social purposes connected with these two taxes have somewhat been haltingly reflected in the rate structure that now obtains. The time has now come to put a check on the passing on of wealth and property covering large amount by inheritance. It is conceded that the right of

a person to own and enjoy the fruits of his labour in his life subject to his social obligations should be ensured. But the acceptance of this principle does not justify allowing large family fortunes being passed on from one generation to another. If there is to be a limit on the amount of wealth to be passed on from one generation to another, we cannot escape from dealing with gifts which can be used as a means of avoiding or reducing the liability to the impact of Estate Duty. In this context, it has been found necessary to ensure that when gifts are made to the same donee over a period of five years, the gifts of such donee should be aggregated with the value of other taxable gifts made by the assessee during the preceding five years.

Estate Duty

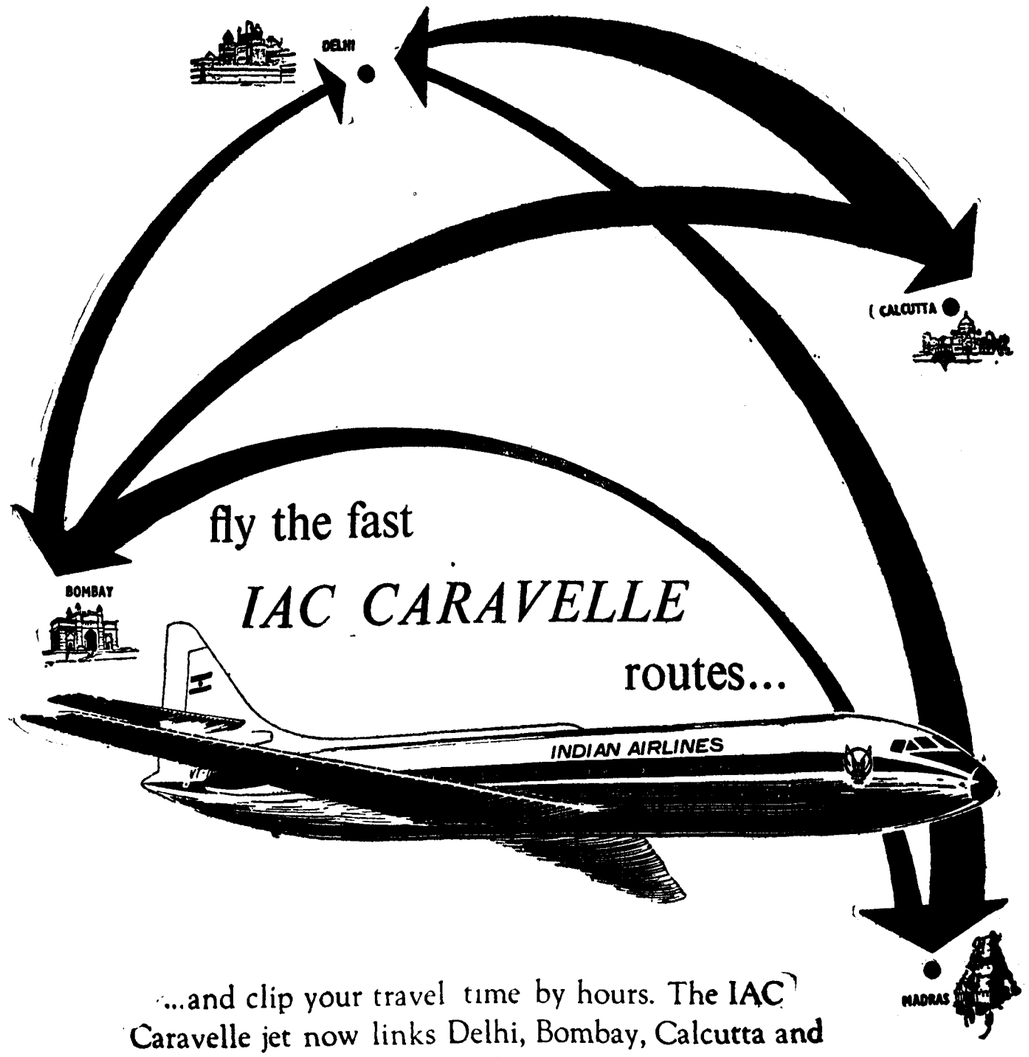
At present, the rates of Estate Duty are gradually reaching 40 per cent on estates of over Rs. 50 lakhs. I propose to replace it by a rate structure in which the rate of 40 per cent will be reached on an estate worth over Rs. 10 lakhs, going up to 50 per cent on the next slab of Rs. 5 lakhs and to 85 per cent on the value of the estates over Rs. 20 lakhs.

As the House is aware, the revenue from Estate Duty will accrue mostly to the States and the revised rates will apply only to property passing on death taking place after the rates have come into force. The total additional revenue expected in 1964-65 is Rs. 300 lakhs, of which Rs. 295 lakhs will accrue to the States.

I should like to clarify one point in connection with these changes. The Estate Duty covers agricultural lands also. Estate Duty in respect of agricultural land is a State subject. In view of Article 250 of the Constitution, the Parliament has power at present to legislate in this respect also. The State legislatures will, however, have to consider whether they would like the new rates to continue to apply to agricultural lands after the period mentioned in clause (2) of Article 250 is over and if thought proper, pass necessary resolutions for the purpose. On the passing of such resolutions by some States, further legislation will be undertaken.

In the matter of Gift Tax, in the existing scales the highest rate of 40 per cent is reached on gifts over Rs. 50,00,000. The highest rate which I now propose is 50 per cent which will be applicable to taxable gifts of a value above Rs. 3,45,000. The rate of 40 per cent will apply on gifts between Rs. 1,45,000 and Rs. 3,45,000. The existing exemption limit of Rs. 10,000 is proposed to be reduced to Rs. 5,000. It is hoped that these changes will restrict transfer of property by gift.

Discourage Spending



In circumstances arising out of the stepping up of the rates of Estate Duty and Gift Tax, and in order to discourage spending, I think it is necessary to reintroduce Expenditure Tax. I have carefully considered the circumstances and difficulties which made my predecessor suspend the collection of this tax. It seems to me that these difficulties arose on account of too many exemptions and the high rates of the tax. Besides, the wording of the charging section of the Act was highly defective and considerably limited the scope of the operation of the tax. This clause has now been re-drafted so as to attract Expenditure Tax on all expenditure above Rs. 36,000 per annum no matter from which source the money for expenditure came. It is also necessary to harmonise the process of lowering of the rates of Income-tax with the imposition and changes in Expenditure Tax with reduced rates. I, therefore, propose to reduce the exemptions and exceptions to the minimum, and to have the rates rising from 5 per cent to 20 per cent on successive slabs of Rs. 12,000. There will be no tax on first Rs. 36,000. The rate of tax will be 5 per cent on the next Rs. 12,000, 7.5 per cent on the slab of Rs. 12,000 after that and 10 per cent on the next slab of Rs. 12,000. It will be 15 per cent between Rs. 72,000 and Rs. 84,000 and 20 per cent above Rs. 84,000. I also propose not to apply the highest slab of 20 per cent for the expenditure in the years 1963-64 and 1964-65. I also propose to prescribe a compulsory return for certain categories of persons in order to ensure that evasion is reduced.

As a result of all the changes I have proposed in the direct taxes, there will be an additional revenue of Rs. 15 crores to the Centre. The abolition of the Compulsory Deposit Scheme and the introduction of Annuity Deposit Scheme will result in a net credit of Rs. 50 crores in 1964-65 on the capital side after allowing for a drop of Rs. 7 crores in the accretion to the Iron and Steel Equalisation Fund.

The combined effect of the changes in taxes and deposits will be a net gain to revenue of Rs. 40 crores and to capital of Rs. 50 crores leaving an overall gap of Rs. 86 crores. Given the present economic situation, to which I have referred earlier, this order of deficit, I think, should serve the best the requirements of growth as well as reasonable stability in prices. Honourable Members would note that in my remarks today, I have given attention to the overall deficit, rather than to the position on the revenue account. With the growing importance of capital expenditure in our budgets, it is no longer sufficient merely to balance the revenue budget. Indeed, the revenue budget must yield an increasing volume of surplus if the requirements of public investment are to be met without continually growing reliance on private or foreign savings.

In presenting the estimates for the coming year, I have taken substantial credit for higher collections of revenue by

improvement in administration and stricter enforcement. On the other hand, in estimating expenditure, I have enforced very tight budgeting. I have emphasised the role of savings in the community and Government itself should set an example by economising in expenditure and by not investing in less essential fields. Economy in administration is fully compatible with efficiency; and it shall be my constant endeavour to ensure that the administrative machinery of the Government is reorganised so that it is fully responsive to this need.

Our standards of performance, be it in economy in expenditure, or in efficiency in collection, have to improve if we are to put our limited resources to the best possible use. In formulating these proposals, my attempt has been to correct anomalies, to rationalise the structure of taxation, to initiate steps to plug loop-holes, to create incentives and to reduce unearned profits. Generally, I have attempted to create some cushion in our tax structure which could be relied upon in the event of an unforeseen contingency. We are passing through difficult times. We might perhaps have to face a rehabilitation problem of some dimension. Our defence requirements may also any day make a larger demand on our resources. We have to be ready to meet any such unforeseen demand by keeping a margin for safety in our budgetary transactions. But above all, we must prepare ourselves for shouldering ever-increasing responsibilities in the sphere of development, social justice and social security where, despite what has been done so far, the road ahead is still long and arduous. I hope that in framing my budget proposals, I have been able, at least in some measure, to keep my gaze fixed at this distant and difficult goal even as we prepare for meeting the requirements of the immediate future.

Exit S.P.T., Enter Surtax

ONE OF the major new proposals in the Central Budget is a levy of Surtax on the profits of companies in place of the Super Profits Tax. The following are the details of the Bill introduced in Parliament for this purpose:

Be it enacted by Parliament in the Fifteenth Year of the Republic of India as follows:

1. (1) This Act may be called the Companies (Profits) Surtax Act, 1964.

(2) It extends to the whole of India.

2. In this Act, unless the context otherwise requires, —

(1) "Assessee" means a person by whom surtax or any other sum of money is payable under this Act and includes every person in respect of whom any proceeding under this Act has been taken for the assesesment of his chargeable profits or of the amount of refund due to him or of the chargeable profits of any other person in respect of which he is assessable or of the amount of refund due to such other person;

(2) "assessment" includes re-assessment;

(3) "assessment year" means the period of twelve months commencing on the 1st day of April, every year;

(4) "Board" means the Central Board of Direct Taxes constituted under the Central Boards of Revenue Act, 1963;

(5) "chargeable profits" means the total income of an assessee computed under the Income-tax Act, 1961 for any previous year or years, as the case may be, and adjusted in accordance with the provisions of the First Schedule;

(6) "Income-tax Act" means the Income-tax Act, 1961;

(7) "prescribed" means prescribed by rules made under this Act;

(8) "statutory deduction" means an amount equal to ten per cent of the capital of the company as computed in accordance with the provisions of the Second Schedule, or an amount of two hundred thousand rupees, whichever is greater:

Provided that where the previous year is longer or shorter than a period of twelve months, the aforesaid amount of ten per cent, or, as the case may be, of two hundred thousand rupees shall be increased or decreased proportionately;

Provided further that where a company has different previous years in respect of its income, profits and gains, the aforesaid increase or decrease, as the case may be, shall be calculated with reference to the length of the previous year of the longest duration; and

(9) all other words and expressions used herein but not defined and defined in the Income-tax Act shall have the meanings respectively assigned to them in that Act.

Tax Authorities

3. (1) Every Director of Inspection, Commissioner of Income-tax, Appellate Assistant Commissioner of Income-tax, Inspecting Assistant Commissioner of Income-tax and Income-tax Officer shall have the like powers and perform the like functions, under this Act as he has and performs under the Income-tax Act, and for the exercise of his powers and the performance of his functions, his jurisdiction under this Act will be the same as that he has under the Income-tax Act.

(2) All officers and persons employed in the execution of this Act shall observe and follow the orders, instructions and directions of the Board:

Provided that no such orders, instructions or directions shall be given so as to interfere with the discretion of the Appellate Assistant Commissioner in the exercise of his appellate functions.

(3) Every Income-tax Officer, employed in the execution of this Act, shall observe and follow the orders, instructions and directions issued for his guidance by the Director of Inspection or by the Commissioner or by the Inspecting Assistant Commissioner under whose jurisdiction he performs his functions.

4. Subject to the provisions contained in this Act, there shall be charged on every company for every assessment year commencing on end from the first day of April, 1964, a tax (in this Act referred to as the surtax) in respect of so much of its chargeable profits of the previous year or previous years, as the case may be, as exceed the statutory deduction, at the rate or rates specified in the Third Schedule.

Return of Profits

5. (1) In the case of every company whose chargeable profits assessable under this Act exceeded during the previous year the amount of statutory deduction, its principal officer, or where in the case of a non-resident company any person has been treated as its agent under section 163 of the Income-tax Act, such person, shall furnish a return of the chargeable profits of the company during the previous year in the prescribed form and verified in the prescribed manner and setting forth such other particulars as may be prescribed, before the 30th day of September of the assessment year:

Provided that on an application made in this behalf, the Income-tax Officer may, in his discretion, extend the date for the furnishing of the return.

(2) In the case of any company which in the Income-tax Officer's opinion is assessable under this Act, the Income-tax Officer may, before the end of the relevant assessment year, serve a notice upon its principal officer, or where in the case of a non-resident company any person has been treated as its agent under section 163 of the Income-tax Act, upon such person, requiring him to furnish within thirty days from the date of service of the notice a return of the chargeable profits of the company during the previous year in the prescribed form and verified in the prescribed manner and setting forth such other particulars as may be prescribed:

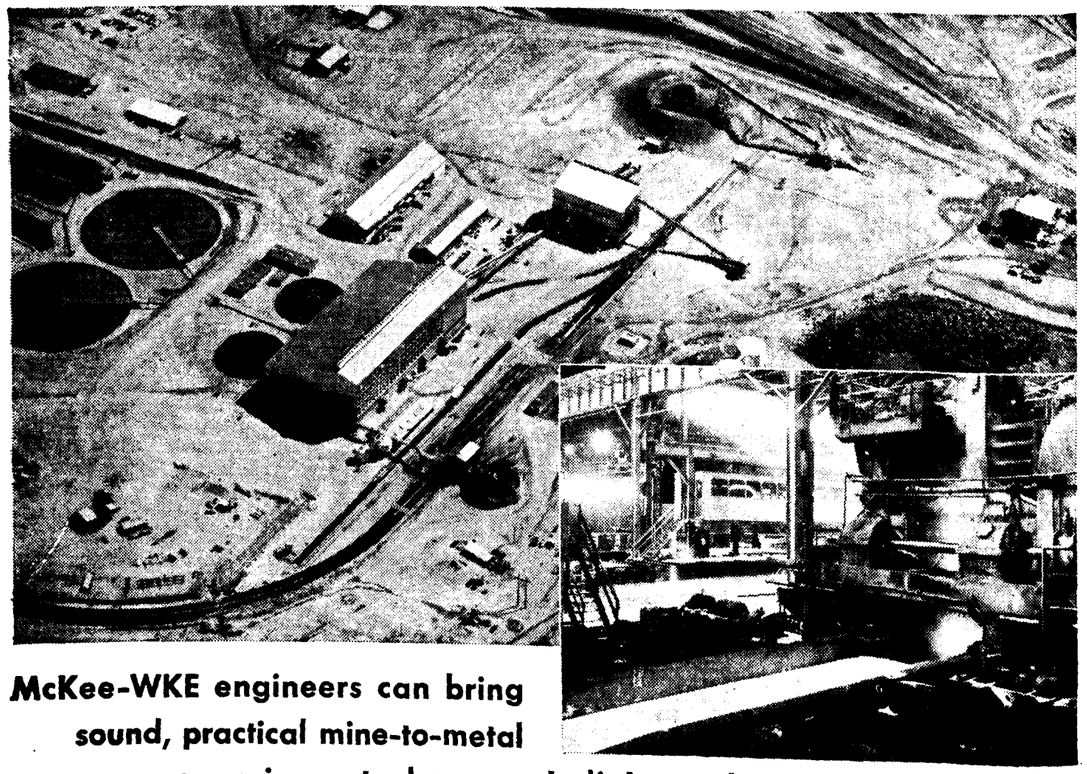
Provided that on an application made in this behalf, the Income-tax Officer may, in his discretion, extend the date for the furnishing of the return.

(3) Any assessee who has not furnished a return during the time allowed under sub-section (1) or sub-section (2), or having furnished a return under sub-section (1) or sub-section (2) discovers any omission or wrong statement therein, may furnish a return as the case may be, at any time before the assessment is made.

6. (1) For the purposes of making an assessment under this Act, the Income-tax Officer may serve on any person who has furnished a return under sub-section (1) of section 5 or upon whom a notice has been served under sub-section (2) of section 5 (whether a return has been furnished or not) a notice requiring him on a date therein to be specified, to produce or cause to be produced such accounts or documents or evidence as the Income-tax Officer may require for the purposes of this Act and may from time to time serve further notices requiring the production of such further accounts or documents or other evidence as he may require.

(2) The Income-tax Officer, after considering such accounts, documents or evidence, if any, as he has obtained under sub-section (1) and after taking into account any relevant material which he has gathered, shall, by an order in writing, assess the chargeable profits and the amount of the surtax payable on the basis of such assessement.

7. (1) The Income-tax Officer, before proceeding to make an assessment under section 6 (in this section referred to as the regular assessment) may, at any time after the expiry of



THE DAY BREAKS BRIGHTER TOMORROW

MILK. FOOD. Children grow straight and strong.
Today's care. Gentle as with a flower.
Today's protection. The shelter of mighty effort.
Tomorrow...a little less of care, a little more of joy.
And for HINDUSTAN LEVER, too, tomorrow begins today.
In the milk plant and research laboratory,
in the factory and office. Work, patience, care
to serve tomorrow's homes and the nation's needs
with products that grow better and better.

TODAY AND TOMORROW...HINDUSTAN LEVER SERVES THE HOME
WITH SOAPS, FOODS, TOILET PREPARATIONS

McKee-WKE engineers can bring sound, practical mine-to-metal experience to bear on India's steel plant projects

The two photos above illustrate the diversity of McKee-WKE mine-to-metal services in the ferrous and non-ferrous metals fields. The modern 15,000-ton-per-day copper concentrator at top was designed and built by the WKE Division. Among its other projects the WKE Division is now working on the Indian Government's first copper producing facilities. The WKE staff is providing engineering services for the mine, ore concentrator, smelter and refinery located at Khetri. This project, when completed, will be India's largest producer of copper. The small photo shows the entry end of a 120-inch, 4-high plate mill for which the McKee Metals Division supplied engineering-contracting services including the installation of machinery and equipment.

While these plants are far too large to be called commonplace, they are by no means unusual undertakings for the McKee-WKE staff. We frequently have a number of equally large plants in process simultaneously in widely separated world locations. The McKee organization has the scope and resources to design and construct comparable projects of any size in India.

ARTHUR G. **McKEE** & COMPANY

UNITED STATES: CLEVELAND • NEW YORK • CHICAGO • SAN FRANCISCO • HIBBING

ABROAD: LONDON • PARIS • TORONTO • MEXICO CITY • SAO PAULO • BUENOS AIRES

METALS DIVISION: Comprehensive engineering-contracting services for Blast Furnaces, Steel-Making Shops, Rolling Mills, Coke Ovens, Agglomerating, Sintering and Pelletizing Plants and related off-site facilities.

PETROLEUM & CHEMICALS DIVISION: Complete Refineries and individual Processing Units for all modern petroleum and petrochemical processes and for a wide range of organic and inorganic chemicals and chemical products.

WESTERN KNAPP ENGINEERING DIVISION: Plants and facilities for production of Non-Ferrous Metals, mining, preparation, handling, beneficiation and storage of Ores and Industrial Minerals, Coal and Aggregates.

the period allowed under sub-section (1) or sub-section (2) of section 5 for the furnishing of the return and whether the return has or has not been furnished, proceed to make in a summary manner a provisional assessment of the chargeable profits and the amount of the surtax payable thereon.

(2) Before making such provisional assessment, the Income-tax Officer shall give notice in the prescribed form to the person on whom the provisional assessment is to be made of his intention to do so, and shall with the notice forward a statement of the amount of the proposed assessment, and the said person shall be entitled to deliver to the Income-tax Officer at any time within fourteen days of the service of the said notice a statement of his objections, if any, to the amount of the proposed assessment.

(3) On expiry of the said fourteen days from the date of service of the notice referred to in sub-section (2), or earlier, if the assessee agrees to the proposed provisional assessment, the Income-tax Officer may, after taking into account the objections, if any made under sub-section (2), make a provisional assessment, and shall furnish a copy of the order of the assessment to the assessee:

Provided that assent to the amount of the provisional assessment, or failure to make objection to it, shall in no way prejudice the assessee in relation to the regular assessment.

(4) There shall be no right of appeal against a provisional assessment made under this section.

(5) After a regular assessment has been made, any amount paid or deemed to have been paid towards the provisional assessment made under this section shall be deemed to have been paid towards the regular assessment; and where the amount paid or deemed to have been paid towards the provisional assessment exceeds the amount payable under the regular assessment, the excess shall be refunded to the assessee.

Profits Escaping Assessment

8. If —

(a) the Income-tax Officer has reason to believe that by reason of the omission or failure on the part of the assessee to make a return under section 5 for any assessment year or to disclose fully and truly all material facts necessary for his assessment for any assessment year, chargeable profits for that year have escaped assessment or have been under-assessed or assessed at too low a rate or have been made the subject of excessive relief under this Act, or

(b) notwithstanding that there has been no omission or failure as mentioned in clause (a) on the part of the assessee, the Income-tax Officer has in consequence of information in his possession reason to believe that chargeable profits assessable for any assessment year have escaped assessment or have been under-assessed or assessed at too low a rate or have been the subject of excessive relief under this Act,

he may, in cases falling under clause (a) at any time, and in cases falling under clause (b) at any time within four years of the end of that assessment year, serve on the assessee a notice containing all or any of the requirements which may be included in a notice under section 5, and may proceed to assess or re-assess the amount chargeable to surtax, and the provisions of this Act shall, so far as may be, apply as if the notice were a notice issued under that section.

9. If the Income-tax Officer, in the course of any proceedings under this Act, is satisfied that any person has, without reasonable cause, failed to furnish the return required under section 5, or to produce or cause to be produced the accounts, documents or other evidence required by the Income-tax Officer under sub-section (1) of section 6, or has concealed the particulars of the chargeable profits or has furnished inaccurate particulars of such profits, he may direct that such person shall pay, by way of penalty, in addition to the amount of surtax payable, a sum not exceeding —

(a) where the person has failed to furnish the return required under section 5, the amount of surtax payable;

(b) in any other case, the amount of surtax which would have been avoided if the return made had been accepted as correct:

Provided that the Income-tax Officer shall not impose any penalty under this section without the previous authority of the Inspecting Assistant Commissioner.

10. No order imposing a penalty under section 9 shall be made unless the assessee has been given a reasonable opportunity of being heard.

Appeals

11. (1) Any person objecting to the amount of surtax for which he is liable as assessed by the Income-tax Officer or denying his liability to be assessed under this Act, or objecting to any penalty or fine imposed by the Income-tax Officer, or to the amount allowed by the Income-tax Officer by way of any relief under any provisions of this Act, or to any refusal by the Income-tax Officer to grant relief or to an order of rectification or amendment having the effect of enhancing the assessment or reducing the refund, or to an order refusing to allow the claim made by the assessee for a rectification under section 13 or amendment under section 14 may appeal to the Appellate Assistant Commissioner.

(2) Every appeal shall be in the prescribed form and shall be verified in the prescribed manner.

(3) An appeal shall be presented within thirty days of the following date, that is to say —

(a) where the appeal relates to assessment or penalty or fine, the date of service of the notice of demand relating to the assessment or penalty or fine, or

(b) in any other case, the date on which the intimation of the order sought to be appealed against is served:

Provided that the Appellate Assistant Commissioner may admit an appeal after the expiration of the said period if he is satisfied that the appellant had sufficient cause for not presenting it within that period.

(4) The Appellate Assistant Commissioner shall hear and determine the appeal and, subject to the provisions of this Act, pass such orders as he thinks fit and such orders may include an order enhancing the assessment or penalty:

Provided that an order enhancing the assessment or penalty shall not be made unless the person affected thereby has been given a reasonable opportunity of showing cause aganist such enhancement.

(5) The procedure to be adopted in the hearing and determination of the appeals shall, with any necessary modification, be in accordance with the procedure applicable in relation to income-tax.

Appellate Tribunal

12. (1) Any assessee aggrieved by an order passed by a Commissioner under section 16, or an order passed by an Appellate Assistant Commissioner under any provision of this Act, may appeal to the Appellate Tribunal against such order.

(2) The Commissioner may, if he objects to any order passed by the Appellate Assistant Commissioner under any provision of this Act, direct the Income-tax Officer to appeal to the Appellate Tribunal against the order.

(3) Every appeal under sub-section (1) or sub-section (2) shall be filed within sixty days of the date on which the order sought to be appealed against is communicated to the assessee or to the Commissioner, as the case may be.

(4) The Income-tax Officer or the assessee, as the case may be, on receipt of notice that an appeal against order of

the Appellate Assistant Commissioner has been preferred under sub-section (1) or sub-section (2) by the other party may, notwithstanding that he may not have appealed against such order or any part thereof, within thirty days of the receipt of the notice, file a memorandum of cross-objections, verified in the prescribed manner, against any part of the order of the Appellate Assisant Commissioner, and such memorandum shall be disposed of by the Appellate Tribunal as if it were an appeal presented within the time specified in sub-section (3).

(5) The Appellate Tribunal may admit an appeal or permit the filing of a memorandum of cross-objections after the expiry of the relevant period referred to in sub-section (2) or sub-section (4), if it is satisfied that there was sufficient cause for not presenting it within that period.

(6) An appeal at the Appellate Tribunal shall be in the prescribed form and shall be verified in the prescribed manner and, shall, except in the case of an appeal referred to in sub-section (2) or a memorandum of cross-objections referred to in sub-section (4), be accompanied by a fee of one hundred rupees.

(7) Subject to the provisions of this Act, in hearing and making an order on any appeal under this section, the Appellate Tribunal shall exercise the same powers and follow the same procedure as it exercises and follows in hearing and making an order on any appeal under the Income-tax Act.

13. (1) With a view to rectifying any mistake apparent from the record, the Commissioner, the Income-tax Officer, the Appellate Assistant Commissioner and the Appellate Tribunal may, of his, or its, own motion or on an application by the assessee in this behalf, amend any order passed by him or it in any proceeding under this Act within four years of the date on which such order was passed.

(2) An amendment which has the effect of enhancing the assessment or reducing a refund or otherwise increasing the liability of the assessee shall not be made under this section unless the authority concerned has given notice to the assessee of its intention so to do and has allowed the assessee a reasonable opportunity of being heard.

(3) Where an amendment is made under this section, the order shall be passed in writing by the authority concerned.

(4) Subject to the other provisions of this Act, where any such amendment has the effect of reducing the assessment, the Income-tax Officer shall make any refund which may be due to such assessee.

(5) Where any such amendment has the effect of enhancing the assessment or reducing the refund already made, the Income-tax Officer shall serve on the assessee a notice of demand in the prescribed form specifying the sum payable.

14. Where as a result of any order made under section 154 or section 155 of the Income-tax Act, it is necessary to recompute the chargeable profits determined in any assessment under this Act, the Income-tax Officer may proceed to recompute the chargeable profits, and determine the surtax payable or refundable on the basis of such recomputation and make the necessary amendment and the provisions of section 13 shall, so far as may be, apply thereto, the period of four years specified in sub-section (1) of that section being reckoned from the date of the order passed under the aforesaid section of the Income-tax Act.

15. Notwithstanding anything contained in clause (1) of section 109 of the Income-tax Act, in computing the distributable income of a company for the purposes of Chapter XI-D

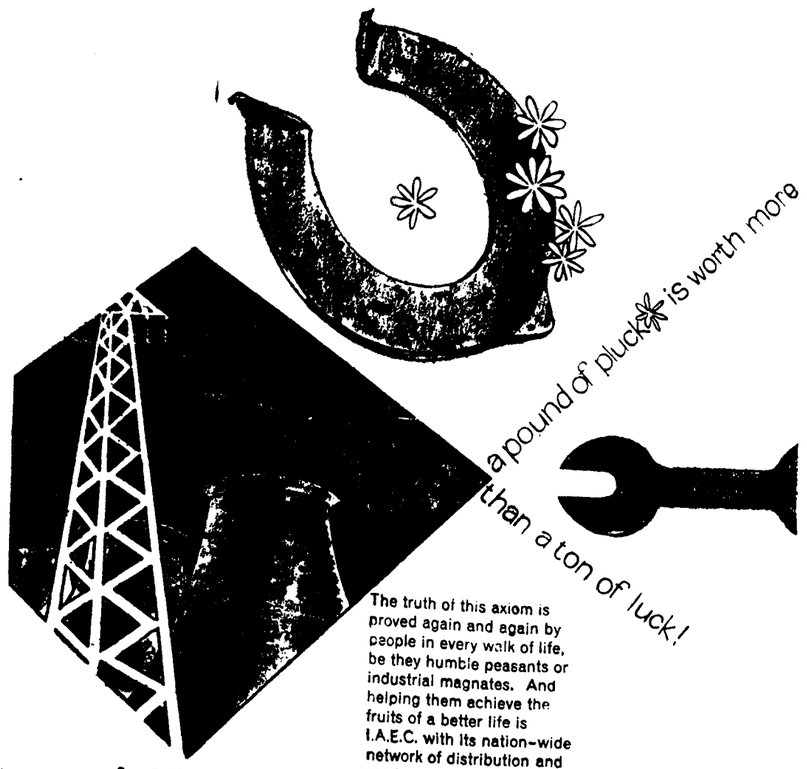
A FREE MERCHANT
LANDS IN MADRAS

The Madras Presidency of 1788 consisted of Fort St George, the surrounding hamlet of Madras City, and the Northern Circars
It was in that year that Thomas Parry completed his five months' voyage from England and set foot in Madras and established himself as a Free Merchant, trading in various commodities

Could he have dreamt then that, 176 years later, the firm founded by him would be contributing so much to the economy of the country, being engaged in the manufacture of fertilisers, sugar, confectionery, industrial and potable alcohol, chemicals, acids and sanitaryware, in the formulation of plant protection product, in the distribution throughout India of light and heavy machinery, pharmaceuticals and consumer goods, and in insurance, and shipping.

THOMAS PARRY

The E.I.D.-Parry Group of today consists of E.I.D.-Parry Ltd., Parry & Co., Ltd., and a number of subsidiary and associated concerns, in all nine companies of substance, providing employment for more than 10,000 people.



The Group continues to increase and broaden its activities, to provide employment to increasing numbers, and to play its full and responsible part in the country's drive to achieve economic independence and raise the standard of living.

of that Act, the surtax payable by the company for any assessment year shall be deductible from the total income of the company assessable for that assessment year.

16. (1) The Commissioner may call for and examine the record of any proceeding under this Act, and if he considers that any order passed therein by the Income-tax Officer is erroneous in so far as it is prejudicial to the interests of the revenue, he may, after giving the assessee an opportunity of being heard and after making or causing to be made such inquiry as he deems necessary, pass such order thereon as the circumstances of the case justify, including an order enhancing or modifying the assessment, or cancelling the assessment and directing a fresh assessment.

(2) No order shall be made under sub-section (1) —

(a) to revise an order of re-assessment made under section 8, or

(b) after the expiry of two years from the date of the order sought to be revised.

(3) Notwithstanding anything contained in sub-section (2), an order in revision under this section may be passed at any time in the case of an order which has been passed in consequence of, or to give effect to, any finding or direction contained in an order of the Appellate Tribunal, the High Court or the Supreme Court.

Explanation. — In computing the period of limitation for the purposes of sub-section (2), any period during which any proceeding under this section is stayed by an order or injunction of any court shall be excluded.

Revision of Orders

17. (1) The Commissioner may, either of his own motion or on an application by the assessee for revision, call for the record of any proceeding under this Act which has been taken by the Income-tax Officer or Appellate Assistant Commissioner subordinate to him and may make such inquiry or cause such inquiry to be made and, subject to the provisions of this Act, may pass such order thereon, not being an order prejudicial to the assessee, as he thinks fit.

(2) The Commissioner shall not of his own motion revise any order under this section if the order has been made more than one year previously.

(3) In the case of an application for revision under this section by the assessee, the application shall be made within one year from the date on which the order in question was communicated to him or the date on which he otherwise came to know of it, whichever is earlier:

Provided that the Commissioner may, if he is satisfied that the assessee was prevented by sufficient cause from making the application within that period, admit an application made after the expiry of that period.

(4) The Commissioner shall not revise any order under this section in the following cases —

(a) where an appeal against the order lies to the Appellate Assistant Commissioner or to the Appellate Tribunal but has not been made and the time within which such appeal may be made has not expired, or, in the case of an appeal to the Appellate Tribunal, the assessee has not waived his right of appeal; or

(b) where the order is pending on an appeal before the Appellate Assistant Commissioner, or

(c) where the order has been made the subject of an appeal to the Appellate Tribunal.

(5) Every application by an assessee for revision under this section shall be accompanied by a fee of twenty-five rupees.

Explanation 1. — An order by the Commissioner declining to interfere shall, for the purposes of this section, be deemed not to be an order prejudicial to the assessee.

Explanation 2. — For the purposes of this section, the Appellate Assistant Commissioner shall be deemed to be an authority subordinate to the Commissioner.

18. The provisions of the following sections and Schedules of the Income-tax Act and the Income-tax (Certificate Proceedings) Rules, 1962, as in force from time to time, shall apply with such modifications, if any, as may be prescribed, as if the said provisions and the rules referred to surtax instead of to income-tax and super-tax: —

2(44), 131 to 136 (both inclusive), 138, 140, 156, 160, 161, 162, 163, 166, 167, 170, 173, 175, 176, 178, 179, 220 to 229 (both inclusive), 231, 232, 233, 237 to 242 (both inclusive), 244, 245, 254 to 262 (both inclusive), 265, 266, 268, 269, 281, 282, 284, 287 to 293 (both inclusive), the Second Schedule and the Third Schedule:

Provided that references in the said provisions and the rules to the "assessee" shall be construed as reference to an assessee as defined in this Act.

19. (1) Notwithstanding anything contained in the Income-tax Act, all information contained in any statement or return made or furnished under the provisions of that Act or obtained or collected for the purposes of that Act may be used for the purposes of this Act.

(2) All information contained in any statement or return made or furnished under the provisions of this Act or obtained or collected for the purposes of this Act may be used for the purposes of the Income-tax Act.

20. If any person fails without reasonable cause to furnish in due time any return under sub-section (2) of section 5, or to produce or cause to be produced, any accounts or documents required to be produced under section 6, he shall be punishable with fine which may extend to five hundred rupees, and with a further fine which may extend to ten rupees for every day during which the default continues.

21. If a person makes in any return furnished under section 5 any statement which is false, and which he either knows or believes to be false, or does not believe to be true, he shall be punishable with simple imprisonment which may extend to six months, or with fine which may extend to one thousand rupees, or with both.

22. If a person makes or induces in any manner another person to make and deliver any account, statement or declaration relating to chargeable profits liable to surtax which is false and which he either knows to be false or does not believe to be true, he shall be punshable with simple imprisonment which may extend to six months, or with fine which may extend to one thousand rupees, or with both.

Institution of Proceedings

23. (1) A person shall not be proceeded against for an offence under section 20 or section 21 or section 22 or under the Indian Penal Code except at the instance of the Commissioner.

(2) The Commissioner may, either before or after the institution of proceedings, compound any offence punishable under section 20 or section 21 or section 22.

24. If the Central Government considers it necessary or expedient so to do for avoiding any hardship or anomaly or removnig any difficulty that may arise as a result of the application of this Act to the Union territories of Dadra and Nagar Haveli, Goa, Daman and Diu and Pondicherry, the Central Government may, by general or special order, make an exemption, reduction in rate or other modification in respect of surtax in favour of any class of assessees or in regard to the whole or any part of the chargeable profits of any class of assessees.

25. (1) The Board may, subject to the control of the Central Government, by notification in the Official Gazette,

makes rules for carrying out the purposes of this Act.

(2) In particular, and without prejudice to the generality of the foregoing power, such rules may provide for all or any of the following matters, namely:—

(a) the form in which returns under section 5 may be furnished and the manner in which they may be verified;

(b) the form in which notice for making provisional assessment shall be given;

(c) the form in which appeals under section 11 or section 12 may be filed and the manner in which they shall be verified;

(d) the procedure to be followed on applications for rectification of mistakes and applications for refunds;

(e) any other matter which by this Act is to be, or may be, prescribed.

(3) The Central Government shall cause every rule made under this section to be laid as soon as may be after it is made before each House of Parliament while it is in session for a total period of thirty days, which may be comprised in one session or in two successive sessions, and if, before the expiry of the session in which it is so laid or the session immediately following, both Houses agree in making any modification in the rule or both Houses agree that the rule should not be made, that rule shall thereafter have effect only in such modified form or be of no effect, as the case may be; so however that any such modification or annulment shall be without prejudice to the validity of anything previously done under this rule.

26. Nothing contained in this Act shall apply to any company which has no share capital.

THE FIRST SCHEDULE

[See Section 2(5)]

Rules for computing the chargeable profits

In computing the chargeable profits of a previous year, the total income computed for that year under the Income-tax Act shall be adjusted as follows:

1. Income, profits and gains and other sums falling within the following clauses shall be excluded from such total income, namely:—

(i) any income chargeable under the Income-tax Act under the head "Capital gains";

(ii) any compensation or other payment as is referred to in clause (ii) of section 28 of the Income-tax Act;

(iii) profits and gains of any business of life insurance;

(iv) any income referred to in sub-section (2) of section 41 of the Income-tax Act;

(v) the amount of profits and gains derived from an industrial undertaking or hotel, on which under section 84 of the Income-tax Act income-tax is not payable;

(vi) income chargeable under the Income-tax Act under the head "Interest on securities" derived from any security of the Central Government issued or declared to be income-tax free or from any security of a State Government issued income-tax free, the income-tax whereon is payable by the State Government;

(vii) any sum in respect of which a deduction of income-tax is allowed under the provisions of section 88 of the Income-tax Act;

(viii) income by way of dividends from an Indian company or a company which has made the prescribed arrangements for the declaration and payment of dividends within India;

(ix) income by way of royalties received from Government or a local authority or any Indian concern;

(x) in the case of a non-resident company which has not made the prescribed arrangements for the declaration and payment of dividends within India, its income by way of any interest or fees for rendering technical services received from Government or a local authority or any Indian concern;

(xi) in the case of a banking company —

(a) any sum which during the previous year is transferred by it to a reserve fund under sub-section (1) of section 17 of the Banking Companies Act, 1949 or is deposited by it with the Reserve Bank of India under sub-clause (ii) of clause (b) of sub-section (2) of section 11 of that Act, not exceeding the amount required under the aforesaid provisions to be so transferred or deposited, as the case may be, or

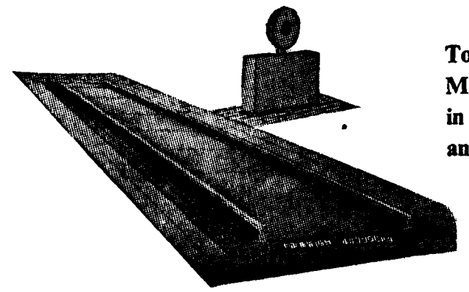
(b) any sum transferred by it during the previous year to any reserves in India including reserves not shown as such in its published balance-sheet in so far as the sums transferred to such reserves are attributable to income chargeable to tax under the Income-tax Act and have not been allowed as a deduction in computing its total income under that Act and in so far as the aggregate of such sums does not exceed the highest of the aggregate of such sums, if any, so transferred during any one of the three years prior to the previous year,

whichever is higher;

(xii) the amount of any deduction from the income-tax and super-tax chargeable on the total income allowed under the annual Finance Act in connection with export of any goods or merchandise out of India or the sale by a manufacturer of any articles to any person who exports them out of India.

2. The balance of the total income arrived at after making the exclusions mentioned in rule 1 shall be reduced by —

(i) the amount of income-tax and super-tax payable by the company in respect of its total income under the provisions of the Income-tax Act after making allowance for any relief, rebate or deduction in respect of income-tax and super-tax to which the company may be entitled under



FIRST TIME IN ASIA

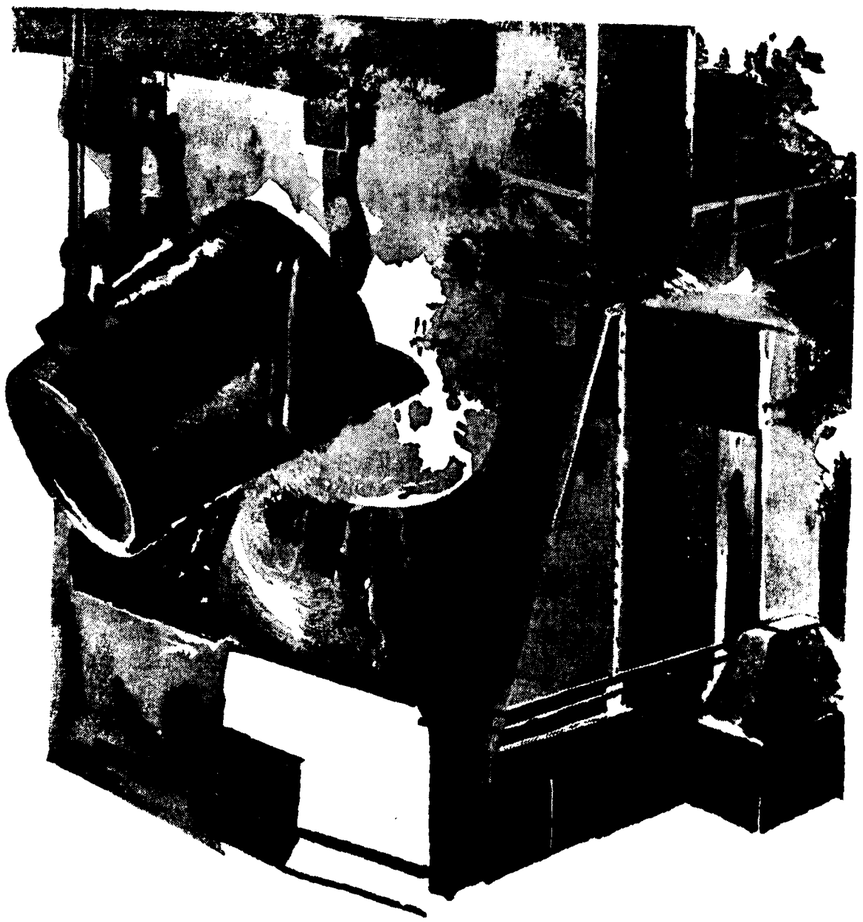
WE MANUFACTURE

WEIGHING MACHINES

OF 400 METRIC TONS

To-day ATLAS Weighing Machines stand second to none in the World in Capacity, Quality and Performance

Only one Weighing Machine of 400 metric tons is operating in India (The Tata Iron and Steel Co., Ltd., Jamshedpur) and that bears the proud name of 'ATLAS'. This machine vindicates the capacity of Indian engineers and workers and opens up a new vista of industrial potentiality of India. Realizing the capability of THE INDIA MACHINERY CO. LTD., the Government of India has waived its restrictions to manufacture Weighing Machines of more than 200 metric tons. Now India Machinery is making Weighing Machines of various types from 1 Kg. to 400 metric tons and has thus checked the huge drainage of valuable foreign exchange.



Karmavir Sri Alamohan Dass, the noted Industrialist, is the main spring behind this mighty achievement. His patriotic and pioneering zeal spurred him in the late 20's to undertake manufacturing machinery like, Weighing Machines, Machine Tools, Printing and Textile Machinery. That was a time when he had to beat a lonely track and building of machinery was quite unthinkable in India.

the provisions of the said Act or the annual Finance Act, and after excluding from such amount —

(a) the amount of income-tax and super-tax, if any, payable by the company in respect of any income referred to in clause (i) or clause (ii) or clause (iii) or clause (viii) of rule 1 included in the total income;

(b) an amount equal to the amount by which the rebate of super-tax admissible to the company under the provisions of the annual Finance Act is, under the provisions of the said Act, reduced with reference to any amount of dividends distributed by the company during the previous year relevant to the assessment year;

(ii) in the case of a company which has been charged to tax in a country outside India on any portion of its income, profits and gains included in its total income as computed under the Income-tax Act, the tax actually paid in respect of such income, profits and gains in the said country in accordance with the laws in force in that country after allowance of every relief due under the said laws:

Provided that the aforesaid reduction shall not be allowed unless the assessee produces evidence of the fact of the payment of the aforesaid tax in that country.

3. The net amount of income calculated in accordance with rule 2 shall be increased by the aggregate of —

(i) the amount of any interest payable by the company in respect of its debentures or moneys referred to in clause (v) of rule 1 of the Second Schedule for the previous year relevant to the assessment year allowed as a deduction in computing its total income;

(ii) any expenditure incurred on account of commission, entertainment and advertisement, to the extent such expenditure, in the opinion of the Income-tax Officer, is excessive having regard to the circumstances of the case:

Provided that the previous authority of the Inspecting Assistant Commissioner is obtained for holding such expenditure to be excessive.

THE SECOND SCHEDULE

[See Section 2(8)]

Rules for computing the Capital of a company for the purposes of surtax

1. Subject to the other provisions contained in this schedule, the capital of a company shall be the aggregate of the amounts, as on the first day of the previous year relevant to the assessment year, of—

(i) its paid-up share capital;

(ii) its reserves, if any, created under the proviso (b) to clause (vib) of sub-section (2) of section 10 of the Indian Income-tax Act, 1922 or under sub-section (3) of section 34 of the Income-tax Act, 1961;

(iii) its other reserves as reduced by the amounts credited to such reserves as have been allowed as a deduction in computing the income of the company for the purposes of the Indian Income-tax Act, 1922 or the Income-tax Act, 1961;

(iv) its debentures, if any

(v) any moneys borrowed by it from the Industrial Finance Corporation of India or the Industrial Credit and Investment Corporation of India or any other financial iinstitution which the Central Government may notify in this behalf in the Official Gazette or any moneys borrowed by it from any banking institution (not being a financial institution notified as aforesaid) under an agreement providing for the repayment of such moneys during a period of not less than ten years, or any moneys borrowed from any person in a country outside India for the creation of any capital asset in India.

Explanation: For the removal of doubts it is hereby declared that any amount standing to the credit of any account in the books of a company as on the first day of the previous year relevant to the assessment year which is of the nature of item (5) or item (6) or item (7) under the heading "RESERVES AND SURLPUS" or of any item under the heading "CURRENT LIABILITIES AND PROVISIONS" in the column relating to **Liabilities** in the **Form of Balance-sheet"** given in part I of Schedule VI to the Companies Act, 1956 shall not be regarded as a reserve for the purposes of computation of the capital of a company under the provisions of this Schedule.

2. Where a company owns any assets the income from which in accordance with clause (iii) or clause (vi) or clause (viii) of rule 1 of the First Schedule is required to be excluded from its total income in computing its chargeable profits, the amount of its capital as computed under rule 1 of this Schedule shall be diminished by the cost to it of the said assets on the first day of the previous year relevant to the assessment year in so far as such cost exceeds the aggregate of —

(i) any moneys borrowed [other than such moneys as are referred to in clause (v) of rule 1] and remaining outstanding as on the first day of the said previous year; and

(ii) the amount of any fund, any surplus and any such reserve as is not to be taken into account in computing the capital under rule 1.

Explanation 1: A paid-up share capital or reserve brought into existence by creating or increasing (by revaluation or otherwise) any book asset is not capital for computing the capital of a company for the purposes of this Act.

Explanation 2: Any premium received in cash by the company on the issue of its shares standing to the credit of the share premium account shall be regarded as forming part of its paid-up share capital.

Explanation 3: Where a company has different previous years in respect of its income, profits and gains, the computation of capital under rules 1, 2 and 3 shall be made with reference to the previous year which commenced first.

3. Where after the first day of the previous year relevant to the assessment year the capital of a company as computed in accordance with the foregoing rules of this Schedule is increased by any amount during that previous year on account of increase of paid-up share capital or issue of debentures or borrowing of any moneys refered to in clause (v) of rule 1 or is reduced by any amount on account of reduction of paid-up share capital or redemption of any debentures or repayment of any such moneys such capital shall be increased or reduced, as the case may be, by a sum which bears to that amount the same proportion as the number of days of the previous year during which the increase or the reduction remained effective bears to the total number of days in that previous year.

4. Where a part of the income, profits and gains of a company is not includible in its total income as computed under the Income-tax Act, its capital shall be the sum ascertained in accordance with rules 1, 2 and 3, diminished by an amount which bears to that sum the same proportion as the amount of the aforesaid income, profits and gains bears to the total amount of its income, profits and gains.

THE THIRD SCHEDULE

(See section 4)

Rates of surtax

1. On the amount by which the chargeable profits exceed the amount of the statutory deduction — 40 per cent:

Provided that where the total income of an assessee, being an Indian company or any other company which has

made the prescribed arrangements for the declaration and payment of dividends within India, includes any income, profits and gains attributable to the business of generation and distribution of electricity or of manufacture or production of any one or more of the articles specified in the list in paragraph 2, the assessee shall be entitled to a rebate equal to a sum of one-fifth of the amount which bears to the amount of the surtax payable by the assessee, the same proportion as the amount of the aforesaid inclusion bears to the amount of the total income of the assessee :

Provided further that if the Central Government, having regard to the stage of development of any industry and other relevant factors, considers it necessary or expedient so to do, it may, at any time by general or special order withdraw the benefit conferred by the preceding proviso in respect of the business of generation and distribution of electricity or of manufacture or production of any article specified in the said list or extend such benefit to any other business and such order shall have effect for the purposes of assessment under this Act for any such assessment year (not being the assessment year commencing on the first day of April, 1964) as may be specified in the said order.

2. The list of articles referred to in paragraph 1 shall be as follows:

(1) Iron and steel (metal), ferro-alloys and special steels.

(2) Aluminium, copper, lead and zinc.

(3) Coal, lignite, iron ore and bauxite.

(4) Industrial machinery specified under the heading "8 Industrial Machinery", sub-heading "A. Major items of specialised equipment used in specific industries", of the First Schedule to the Industries (Development and Regulation) Act, 1951.

(5) Boilers and steam generating plants, steam engines and turbines and internal combustion engines.

(6) Equipment for the generation, transmission and distribution of electricity, including transformers.

(7) Machine tools, precision tools, dies and jigs.

(8) Tractors and earth-moving machinery.

(9) Steel castings and forgings.

(10) Cement and refractories.

(11) Fertilisers.

(12) Paper and pulp.

(13) Tea, coffee and rubber.

(14) Component parts of the articles mentioned in items Nos. (4), (5), (6) and (8), that is to say, such parts as are essential for the working of the machinery referred to in items aforesaid and have been given for that purpose some special shape or quality which would not be essential for their use for any other purpose and are in complete finished form and ready for fitment.

NOTES ON CLAUSES

Clause 2 contains definitions of the various terms and expressions used in the clauses of the Bill.

Sub-clause (3) defines "assessment year" as being the period of twelve months commencing on the 1st day of April, every year.

Sub-clause (5) defines "chargeable profits" to mean the total income of the assessee for the previous year relevant to the assessment year as computed under the Income-tax Act, 1961 and adjusted in accordance with the provisions of the First Schedule.

Sub-clause (8) defines the term "statutory deduction" to mean an amount equal to ten per cent of the capital of the company as computed in accordance with the Second Schedule or an amount of Rs. 2 lakhs, whichever is greater. The amount of the statutory deduction is required to be adjusted in relation to the length of the previous year, if such year is longer or shorter than a period of 12 months.

Sub-clause (9) provides that all words and expressions used in the Bill but not defined therein and defined in the Income-tax Act, 1961 shall have the same meanings as in that Act.

Clause 3 seeks to give jurisdiction in respect of surtax to the same authorities as have jurisdiction under the Income tax Act, 1961.

Clause 4 seeks to make a provision for charging a tax named "surtax" on every company for the assessment year 1964-65 and subsequent assessment years on that amount of its chargeable profits during the previous year or the years which exceeds the amount of statutory deduction admissible to it at the rate or rates specified in the Third Schedule.

Clause 5—

Sub-clause (1) seeks to impose a liability on the principal officer of every company, and in the case of a non-resident company, also on the person who has been treated as its agent under section 163 of the Income-tax Act, 1961, to furnish a return of the chargeable profits of the company by the 30th day of September of the relevant assessment year, if such chargeable profits exceed the amount of the statutory deduction.

Issue of Notices

Sub-clause (2) seeks to enable the Income-tax Officer to issue a notice to a company requiring it to furnish a return of the chargeable profits within thirty days from the date of service of the notice.

Under both the sub-clause, the Income-tax Officer has been authorised to extend the time for furnishing the return.

Sub-clause (3) seeks to enable an assessee who has not furnished the return within the time allowed or who having furnished the return discovers any omissions therein, to file a return or a revised return, as the case may be, at any time before the completion of the assessment.

Clause 6 provides that the Income-tax Officer may call for accounts, documents for other evidence from the assessee for the purpose of his assessment, and shall make the assessment after considering all the material so obtained by him.

Clause 7 enables the Income-tax Officer to make a provisional assessment of the chargeable profits of an assessee at any time after the expiry of the period allowed for filing a return, subject to the issue of a 14 days' notice to him inviting his objections, if any, to the proposed assessment. It has been provided that there shall be no right of appeal against such a provisional assessment and that the tax paid on the provisional assessment shall be deemed to have been paid towards the regular assessment.

Clause 8 relates to the assessment or re-assessment of chargeable profits which have escaped assessment or have been under-assessed etc. It provides that in the case of an omission or failure on the part of the assessee to file a return or to disclose fully and truly all the materials necessary for his assessment, such proceedings may be initiated at any time, and in other cases within four years of the end of the relevant assessment year.

Clause 9 seeks to make a provision for the imposition of a penalty on an assessee for his failure, without reasonable cause, to furnish a return of his chargeable profits or to produce the accounts, documents or evidence required by the Income-tax Officer, and for any concealment or deliberate furnishing of inaccurate particulars of his chargeable profits.

Clause 10 provides that the assessee shall be given a reasonable opportunity of being heard before any penalty under clause 9 is imposed upon him.

Clause 11 relates to appeals by the assessees to the Appellate Assistant Commissioner against any order passed by the Income-tax Officer.

Clause 12 relates to appeals to the Appellate Tribunal by assessees or by the Income-tax Officer under the directions of the Commissioner of Income-tax against any order made by the Appellate Assistant Commissioner. It has been provided that in disposing of such appeals, the Tribunal shall exercise the same powers and follow the same procedure as it exercises and follows in disposing of any appeal under the Income-tax Act, 1961.

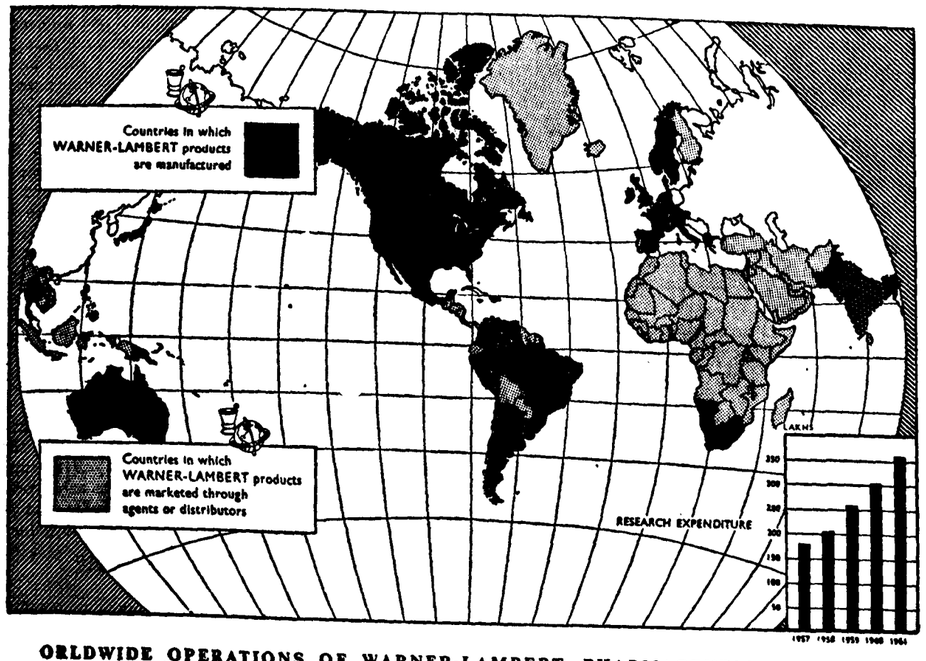
Rectification of Mistakes

Clause 13 provides for the rectification of mistakes apparent from the record of any proceedings by the Commissioner of Income-tax, the Appellate Assistant Commissioner and the Appellate Tribunal, **suo motu** or at the instance of the assessee, within four years of the date on which the order sought to be rectified has been passed.

Clause 14 seeks to enable the Income-tax Officer to recompute the chargeable profits of the assessee in consequence of any order of rectification or amendment passed under section 154 or section 155 of the Income-tax Act, 1961, in relation to the relevant income-tax assessment of the assessee, within four years from the date of the latter order.

Clause 15 seeks to provide that the surtax payable by a company for a particular assessment year shall be deducted from its total income for that assessment year in computing its distributable income for the purposes of Chapter XI-D of the Income-tax Act, 1961.

Clause 16 enables the Commissioner to revise any orders passed by the Income-tax Officer which are prejudicial to revenue, within a period of two years from the date of the order sought to be revised.



Clause 17 enables the Commissioner to give relief to the assessee on revision of any orders passed by the Income-tax Officer or the Appellate Assistant Commissioner subordinate to him, either of his own motion or on an application by the assessee.

Clause 18 seeks to make applicable to the proceedings relating to surtax, certain provisions of the Income-tax Act, 1961 pertaining to various matters for which no separate provisions have been made in the Bill, e.g., issue and service of notice of demand, recovery of arrear tax dues, assessment proceedings in the case of non-resident through an agent, liability of directors or private companies in liquidation, reference to High Court, appeal to Supreme Court, etc. It also seeks to apply the provisions of the Income-tax (Certificate Proceedings) Rules, 1962 to the proceedings of recovery of arrears of surtax.

Clause 19 provides that all information contained in any statement or returns made by the assessees or furnished in any proceeding under the Income-tax Act, 1961, may be used for the purposes of proceedings relating to surtax and 'vice versa'.

Clause 20 to 23 (both inclusive) relate to prosecution for various offences by way of failure to deliver returns without any reasonable cause, making of false statements, abetment

Serving the medical profession for over 100 years

WORLDWIDE OPERATIONS OF WARNER-LAMBERT PHARMACEUTICAL COMPANY

Sole Distributors in India: Martin & Harris (Private) Limited

of false returns, and the composition of such offences.

Clause 24 seeks to enable the Central Government to make an exemption, reduction in rate or other modification in respect of surtax in favour of any class of assessees or in regard to the whole or any part of the chargeable profits of any class of assessees in order to remove any difficulty or avoid any hardship that may arise as a result of application of surtax to the Union territories of Dadra and Nagar Haveli, Goa, Daman and Diu and Pondicherry.

Clause 25 seeks to enable the Central Board of Direct Taxes to make rules for carrying out the purposes of this enactment and in this behalf, 'inter alia', to prescribe various forms such as the form of return of chargeable profits.

Clause 26 seeks to exclude companies which have no share capital from the purview of surtax.

The First Schedule lays down rules for the computation of the chargeable profits. Under its provisions, 'chargeable profits' are to be computed by excluding from the assessee's total income (as computed under the Income-tax Act) certain items of income and sums which have been exempted from surtax; deducting from the balance amount the income-tax and super-tax payable by the company (subject to certain adjustments); and adding to the amount so arrived at, any interest payable by the assessee in respect of debentures, and specified loans referred to in rule 1(v) of the Second Schedule and such amount of any expenditure on commission, entertainment and adveritsement which may be considered by the Income-tax Officer (with the approval of the Inspecting Assistant Commissioner) to be excessive in the circumstances of the case.

The Second Schedule contains the rules for the computation of the capital of a company for the purpose of determining the amount of 'statutory deduction' admissible to a company. Under these rules, the capital of a company consists of the amounts, as on the first day of the relevant previous year, of its paid-up capital, reserves (including the reserves required to be created under the Indian Income-tax Act, 1922 and the Income-tax Act, 1961 for entitlement to development rebate), debentures and specified loans. If a company possesses assets, the income from which is not taken into account in computing the chargeable profits under certain provisions of the First Schedule, such as investments in shares of companies, the cost thereof (subject to certain adjustments for borrowed moneys not included in the capital of the company) is required to be deducted from the capital aforesaid.

The Third Schedule lays down that surtax shall be charged at the rate of 40 per cent of the amount by which the chargeable profits of a company for the relevant previous year exceed the amount of the statutory deduction admissible to it. It also provides that an Indian company or a company which has made the prescribed arrangements for the declaration and payment of dividends within India shall be entitled to a rebate calculated at 20 per cent of that part of the surtax which is attributable to any profits derived by it from the business of the generation and distribution of electricity or of the manufacture or production of any one or more of the articles specified in the list contained in the said Schedule. It also provides that the Central Government may, by issue of a notification in the Official Gazette, exclude any articles from or add any item to the said list for the purposes of an assessment for any assessment year subsequent to the assessment year 1964-65.

POWER
TO MAKE HIM
HAPPY

Electric power is playing a vital role to make the world of his future a happier place to live in. It is the life-blood sustaining our nation's vast industrial and agricultural programmes meant to help him live better and in greater comfort.

Comptons are proud of their share in this noble endeavour. Their activities embrace the designing, supplying and installing of entire power distribution systems as well as planned, scientific lighting for every purpose.

Finance Bill: Proposals Explained

(Clauses Referred to are Clauses in the Bill)

FOLLOWING IS the text of the official memorandum explaining the salient features of the new Finance Bill, which was introduced in Parliament on February 29, in order to give effect to the fiscal measures proposed in the Central Budget for 1964-65:

I. RATES FOR THE ASSESSMENT YEAR 1964-65 ON INCOMES OTHER THAN CAPITAL GAINS

1. Assessees other than companies

(a) Individuals, Hindu undivided families, unregistered firms and associations of persons etc.

(i) Income-tax and super-tax — It is proposed to substitute the structure of income slabs and the basic rates of income-tax and super-tax applicable for the assessment year 1963-64 by a simplified slab structure and revised rates of income-tax and super-tax.

(ii) Surcharges on income-tax and super-tax — It is proposed to abolish the various surcharges on income-tax and super-tax (including the additional surcharge on income-tax) leviable for the assessment year 1963-64 and to impose a single surcharge each on income-tax and super-tax, for purposes of the Union.

No surcharge will be leviable in respect of earned income where such income does not exceed Rs. 1 lakh. Where the earned income exceeds Rs. 1 lakh, surcharge will be leviable on the income-tax and super-tax chargeable on the excess amount at the rate of 10 per cent.

Unearned Income

In respect of unearned income, surcharge will be leviable only if such income exceeds Rs. 10,000. For unearned income between Rs. 10,000 — 25,000, the rate of this surcharge will be 12.5 per cent of the income-tax and super-tax payable by the assessee in respect of the whole unearned income (subject to marginal relief); between Rs. 25,001 — 75,000, the rate will be 15 per cent and above Rs. 75,000, it will be 17.5 per cent.

Annuity deposits. It is proposed to provide that resident assessees other than registered firms, local authorities and companies shall be liable to make a deposit named 'annuity deposit', compulsorily, in respect of assessment year 1964-65 and subsequent assessment years.

The persons liable to make annuity deposits will be individuals who are citizens of India, Hindu undivided families, unregistered firms, associations of persons (other than co-operative societies) and artificial juridical persons excluding corporations established by a Central, State or Provincial Act.

The amount of the annuity deposits will be calculated on the 'adjusted total income' of the assessee at the rate prescribed under clause 3 of the Finance Bill. An assessee whose total income includes any gratuity may, at his option deposit an additional amount of 50 per cent of such gratuity. Musicians, authors, artists, playwrights may also, at their option deposit an additional amount of 15 per cent of their income.

The 'adjusted total income' of an assessee will be arrived at by deducting from the total income, any past arrears of salary, balances in a provident fund transferred to the credit of an employee participating in a recognised provident fund, and any share of income from an unregistered firm or association of persons, where such firm or association is liable to make an annuity deposit. For the assessment year 1964-65 any salary income earned during the financial year 1963-64 will also be excluded from the total income for determining the amount of annuity deposit required to be made in respect of that assessment year. (This is because salary income earned during the financial year 1963-64 is assessable for the assessment year 1964-65 under the provisions of the Finance Act, 1963).

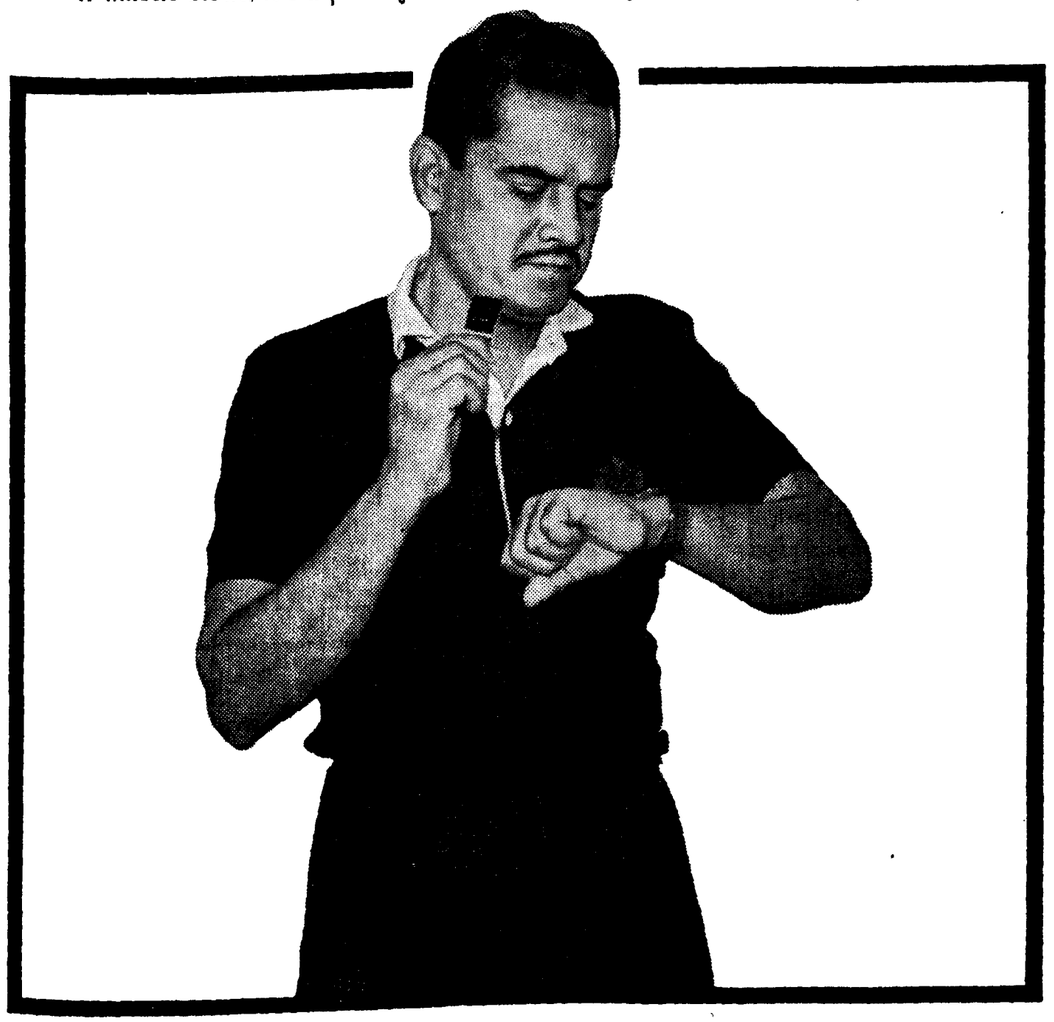
Under the rate schedule of annuity deposits, the liability to make annuity deposits arises when the total income exceeds Rs. 15,000. The rates of annuity deposits are 5 per cent in the case of an assessee whose total income is between Rs. 15,001 — 20,000; 7.5 per cent between Rs. 20,001 — 40,000; 10 per cent between Rs. 40,001 — 70,000 and 12.5 per cent over Rs. 70,000.

The amount of annuity deposit which an assessee is liable to make for an assessment year will be allowed as a deduction in computing his assessable income for that assessment year.

The deposits will be repayable in ten annual equated insalments of principal and interest at the rate notified by the Central Government in the Official Gazette. The annuity (both principal and interest) will be chargeable to tax as the income of the depositor for the year in which it is due to be paid.

Advance Deposit

Annuity deposits will be required to be made in advance during each financial year in respect of the assessee's income assessable for the assessment year next following that financial year. In the case of existing assessees who are liable to make deposits, notices for making advance deposits will be issued by the Income-tax Officer on the basis of the latest completed regular assessment of the assessee. The amount can be reduced if the assessee estimates that his current income would be less than the income on the basis of which the Income-tax Officer has issued the notice for advance deposit. New assessees who may be liable to make a deposit will be required to send an estimate of their total income and the amount which they are liable to deposit to the Income-tax Officer concerned before 1st March, and to make the deposit by the 15th March at the latest.



In calculating the advance tax payable under the Income-tax Act, the advance annuity deposit which an assessee is liable to make will be deducted from his income subject to payment of advance tax. Likewise, in calculating the amount of tax required to be deducted at source from salary income, the amount of annuity deposit calculated in respect of that income at the rates prescribed in the Finance Act will be deducted, whether the deposit has actually been made or not.

In respect of the income assessable for the assessment year 1964-65, annuity deposits are required to be made at the time when the tax is payable, but not later than the 31st March, 1965 in any case.

Any arrear dues of annuity deposit are recoverable like arrears of taxes under the provisions of the Income-tax Act. If a person fails to make the annuity deposit in due time, he will be liable to the imposition of a penalty not exceeding 50 per cent of the amount he was liable to deposit.

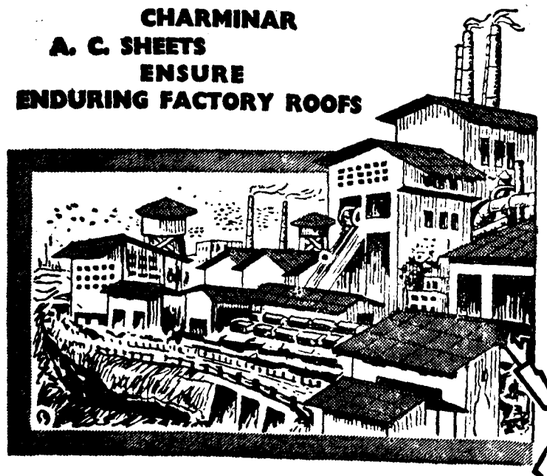
The effect of the revision of the rate structure of income-tax and super-tax, replacement of the surcharges applicable for the assessment year 1963-64 by a single surcharge on income-tax and super-tax and the introduction of the annuity deposit scheme will be that there will be a reduction in the

A whistle blows, it's a penalty...and referee Vaidya's decision is always correct!

On the field, he's an athletic, fast-moving figure. Watching the ball carefully. Keeping an eye out for infringements—fouls, off-sides. His decisions are never questioned, for Vaidya is respected by players and spectators alike. Not so long ago, he was a crack football player. He was chosen to represent India at the Olympics, but an accident kept him out. Today, he referees with skill, intelligence and good judgment... qualities which Vaidya brings to bear on his work as Technical Foreman at Burmah-Shell's Lub. Oil Blending Plant at Bombay.

'RECIPES' FOR OVER 300 LUBRICANTS

'Every engine and moving part,' says Vaidya, 'needs lubricating oil.' And it's Vaidya's job to supervise the blending of over 300 grades of lubricants. With the help of his colleagues, he ensures strict quality control in production so that the oils are on specification.



TODAY, AS EVER, PEOPLE LIKE VAIDYA ARE WORKING FOR YOU

'Work must be balanced by physical exercise and relaxation,' says Vaidya. 'That's why I play football and bridge.'

Vaidya and people like him—at all levels of responsibility—are Burmah-Shell. Today, as ever, they are hard at work...working to ensure that vital petroleum products, essential to India's growth and progress, are brought to you at the right place and time, in the right quantities.

BURMAH-SHELL are People in the service of the People

DONATE LIBERALLY TO THE NATIONAL DEFENCE FUND

STEPPING OUT TO TOMORROW

Day by day, month by month, the face of India changes fast. Mighty steel penstocks guide the rushing river waters to turn the turbines to produce electric power. Massive generators, dotted across the country, send this power vibrating along wires to turn the wheels of industry. Electric lamps are switched on in village homes. Long lines of steel pipes girdle vast stretches of land, carrying water to thirsty villages and liquid gold to refineries. Automatic signals guide rolling wheels along a criss-cross of steel tracks. Radio waves race across the skies to help mighty jet planes land on our soil with their precious cargo. And thus a nation steps out to tomorrow.

As electrical and mechanical contractors and maintenance specialists on behalf of leading West German manufacturers, we too are contributing our bit towards building a new India.

amount of tax payable at most levels of income.

(b) Registered firms.

A single revised rate schedule of income-tax has been prescribed for all registered firms irrespective of the number of partners in such a firm. However, the rate of Union surcharge on income-tax payable by registered firms remains the same as for the assessment year 1963-64.

2. Companies

Income-tax — In the case of companies, the rate of income-tax remains the same as for the assessment year 1963-64. However, companies which declare and pay their dividends outside India, i.e., foreign companies will be entitled to a rebate of income-tax of 10 per cent of the amount of dividends received by them from an Indian company in which the public are not substantially interested and which is carrying on the business of generation and distribution of electricity or is wholly or mainly engaged in the manufacture or production of any one or more of the articles specified in the list in Part IV of the First Schedule to the Bill.

Super-tax — Some changes have been made in the rates at which super-tax will be payable by companies.

In the case of Indian companies and other companies which declare and pay dividends in India, the changes are, briefly, as follows:—

Companies in which the public are substantially interested and whose total income does not exceed Rs. 25,000

Such companies will be charged to super-tax at 17.5 per cent as compared with the rate of 20 per cent for the assessment year 1963-64.

Companies in which the public are substantially interested and whose total income exceeds Rs. 25,000

In the case of such companies, the normal effective rate of super-tax will be 25 per cent as for the assessment year 1963-64. However, if such a company derives any income from the generation and distribution of electricity or from the production of any one or more of the articles in the basic industries specified in Part IV of the First Schedule to the Finance Bill, the super-tax payable by it in respect of such income will be 20 per cent only.

Companies in which the public are not substantially interested

In the case of such companies the effective rate of super-tax is proposed to be increased from 25 per cent (which was applicable for the assessment year 1963-64) to 35 per cent. However, if any such company derives income from the generation and distribution of electricity or from the production of any of the articles specified in the list in Part IV of the First Schedule to the Bill, the super-tax payable on such income will be only 29 per cent.

Levy of extra amount of super-tax with reference to distribution of dividends on equity capital

In the case of companies **other than those which are required to make a compulsory distribution of dividends** under terms of section 104 of the Income-tax Act, **a provision has** been made for charging an extra amount of super-tax calculated at 7.5 per cent of the whole amount of **dividend on equity capital** (and not dividends on preference shares) distributed by them during the previous year relevant to the assessment year 1964-65. However, in the case of a new company which since the commencement of its activities declared its first dividend not earlier than the period of five consecutive previous years (including the relevant previous year), this super-tax will be calculated only on that amount of the dividends which exceeds 10 per cent of its paid up **equity** capital.

Companies which have not made the prescribed arrangements for the declaration and payment of dividends within India

In the case of such companies, the rate of super-tax has been increased from 38 per cent (applicable for the assessment year 1963-64) to 40 per cent. However, it has been provided that on their income by way of royalties and fees for rendering technical services, received from an Indian concern under an agreement approved by the Central Government, the rate of super-tax will be only 25 per cent.

3. Export incentive

It is proposed to continue for the assesesment year 1964-65 the provision in the Finance Act, 1963 for the tax concessions in relation to exports of goods or merchandise outside India, viz., the rebate of 10 per cent of the tax payable on income from exports and the rebate of tax to manufacturers on 2 per cent of their exports, or sales in India to a person who exports the goods outside India. However, the second mentioned concession is proposed to be newly extended to export made after 29th February, 1964 of non-jute textiles

and to the discontinued in respect of certain articles such as arms and ammunition, photographic films, newsprint etc.

II. RATES FOR DEDUCTION OF INCOME-TAX AND SUPER-TAX AT SOURCE FROM INTEREST ON SECURITIES ETC.

Some changes have been made in the rates of deduction of tax at source from interest on securities etc. The proposed rates are specified in Part III of the First Schedule.

Shareholders (other than companies) who are resident in India. In their case, the rate at which income-tax is to be deducted at source is proposed to be fixed at 20 per cent as compared with 30 per cent for the financial year 1963-64.

Companies which have not made the prescribed arrangements for the declaration and payment of dividends within India, i.e., foreign companies. If such a company receive any dividends from an Indian company in which the public are not substantially interested and which is wholly or mainly engaged in a business of generation and distribution of electricity or the manufacture or production of any article specified in the list in Part IV of the First Schedule, income-tax will be deducted from such dividends at the rate of 15 per cent instead of at 25 per cent.

No super-tax will be deducted at source from dividends received by any company from an Indian company or a company which has made the prescribed arrangements for the declaration and payment of its dividends within India. This is because it is proposed to make a provision in the Income-tax Act exempting companies from super-tax in respect of such dividend income.

III. AMENDMENTS TO THE INCOME-TAX ACT, 1961

1. Income derived by a non-resident from business connection in India

It is proposed to amend the Explanation to section 9(1) of the Income-tax Act with a view to securing that a non-resident shall not be liable to tax on any income derived by him in India from purchasing goods which are exported by him outside India.

2. Exemption from tax of non-residents on income from interest on approved securities.

It is proposed to make a provision exempting a non-resident from tax on income from securities approved by the Central Government in this behalf by issue of a notification in the Official Gazette.

3. Exemption of foreign visiting professors and teachers from tax on salary income.

It is proposed to make a provision for exempting from tax the salary income earned in India by visiting professors and teachers of foreign nationality whose services are utilised in any university or educational institution in India. In order to be entitled to the exemption, the contract of service of the person concerned should be approved by the Central Government. The exemption will be for a period of thirty-six months and will be generally subject to the same conditions as are applicable to the exemption from tax of the salary income of foreign technicians.

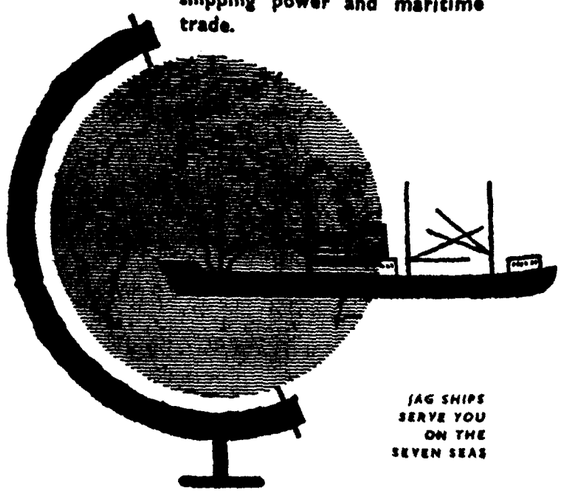
4. Exemption from tax of income from a business of livestock breeding, poultry and dairy farming for a certain period.

It is proposed to provide for the exemption from tax of income derived from a business of livestock breeding, or poultry or dairy farming for three assessment years from the assessment year 1965-66 to 1967-68.

5. Exemption of inter-corporate dividends from super-tax

It is proposed to provide that companies shall not be liable to pay super-tax on any income by way of dividends received by them from an Indian company or a company which has made the prescribed arrangements for the declaration or payment of dividends within India.

6. Rebate of super-tax in respect of sums paid as life insurance premiums etc.



It is proposed to make a provision for the allowance of a rebate of super-tax to individuals and Hindu undivided families on so much of the sums paid by them as Life insurance premiums, contributions to provident funds, deposits in the post office under the Cumulative Time Deposits Scheme etc., on which they are entitled to a rebate of income-tax under the provisions of Section 87 of the Income-tax Act. The total amount of the rebate of income-tax and super-tax admissible to an assessee will, however, be subject to a ceiling limit of 50 per cent of the total amount qualifying for relief.

7. Rebate of tax to resident individuals of foreign nationality on amount spent for education of children in a foreign country.

It is proposed to provide a rebate of income-tax and super-tax to resident individuals who are not citizens of India on the amount spent by them out of their assessable income for the full time education of dependent children (not over 21 years of age) in a university or any other educational institution outside India. The maximum amount qualifying for the rebate will be Rs. 2,000 per annum for each such child

upto two children (viz., Rs. 4,000) or 25 per cent of the total income, whichever is less.

Liability in respect of the value of any benefit or perquisite received by a person in exercise of his business or profession.

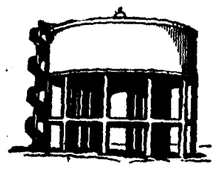
It is proposed to make a provision to the effect that the value of any benefit or perquisite, (whether convertible into money or not), received by a person in exercise of his business or profession, from any person shall be assessable in the hands of the recipient as his income under the head 'profits and gains of business or profession'.

Development rebate.

It is proposed to make a provision enabling the deduction on account of development rebate in respect of second hand ships acquired from a non-resident after 31-3-1964 or second hand machinery or plant newly imported from abroad installed after the aforesaid date at such rate or rates and subject to conditions as may be prescribed in the Income-tax Rules.

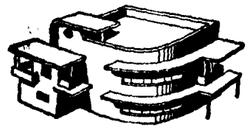
It is also proposed to make a provision enabling the Central Government to direct by issue of a notification that the deduction for development rebate shall not be admissible in respect of a ship acquired or machinery or plant installed after the period specified in the notification—such period being not less than three years from the date of issue of the notification.

10. Taxation of capital gains.



Under the existing provisions of the Income-tax Act, long-term capital gains (i.e. gains relating to capital assets held by the assessee for more than one year) are charged to tax in the case of assessees other than companies at the average rate of tax applicable to their total income subject to a maximum amount of income-tax calculated at 25 per cent of such capital gains. Thus, assessees whose total income is comparatively small have to pay tax on long-term capital gains at the full rate of tax applicable to their total income. It is now proposed to provide that in respect of long-term capital gains relating to buildings or lands or rights in buildings and lands, tax shall be payable by assessees other than companies at 75 per cent of the average rate of income-tax and super-tax applicable to their total income and at 50 per cent of such average rates in respect of other long-term capital gains.

In the case of companies no change is proposed to be made in regard to income-tax chargeable on long-term capital gains, the rate of which will be 25 per cent as before. However, in regard to super-tax on long-term capital gains (the existing rate of which is 5 per cent), it is proposed to provide that on long-term capital gains relating to buildings or lands or rights in buildings and lands, super-tax will be chargeable at 15 per cent and on other long-term capital gains at 5 per cent as before.



It is proposed to provide that in the case of an assessee holding equity shares as an investment and receiving bonus shares, tax shall be chargeable under the head "Capital gains" in respect of the bonus shares held by him as if such shares were transferred by him at their market value as on the thirty-first day from the date on which they were distributed.

It is also proposed to provide that for the purpose of computing any further capital gains when such shares are actually transferred by the assessee, the cost to him of the acquisition of such shares shall be taken to be the market value thereof as on the thirty-first day from the date of their distribution.

It is also proposed to provide that the cost of acquisition to an assessee of any shares received by him from a company

Reservoirs and water-tanks

in lieu of his original holdings on the conversion or reconversion of its stock or shares into shares or stock or conversion of one kind of shares into another kind etc., will be calculated with reference to the cost to the assessee of the original shares or stock held by him.

Further, it is proposed to provide that if in the opinion of the Income-tax Officer, the fair market value of a capital asset as on the date of its transfer by an assessee exceeds the full value of the consideration for it as declared by the assessee by an amount not less than 15 per cent of such declared value, the capital gains in respect of such asset shall be computed with reference to such fair market value. The Income-tax Officer will be required to obtain the previous approval of the Inspecting Assistant Commissioner concerned before applying this provision.

It is also proposed to enable an assessee to have any dispute as to the determination of fair market value of a capital asset referred, at the stage of appeal before the Appellate Tribunal, to a committee of valuers for arbitration.

11. Special provision for the computation of the income of a trade professional or similar association.

It is proposed to make a provision laying down that in the case of a trade, professional or similar association which does not distribute any part of its income to its members, the amount of any deficit (i.e., excess of expenditure incurred for the advancement of the interest of the members concerned over receipts from the members) will be allowed to be deducted in computing the assessable income of the association to the extent of 50 per cent of such income.

12. Restrictions over expenditure incurred after 31-3-1964 on advertisement, maintenance of residential accommodation, travelling etc.

It is proposed to make a provision to the effect that any expenditure incurred by an assessee after 31-3-1964 on advertisement, maintenance of residential accommodation, travelling (including hotel expenses or allowances paid in connection with travelling) shall be allowed as a deduction in computing the income under the head 'profits and gains of business or profession' only to the extent and subject to such conditions as may be prescribed in the Income-tax Rules.

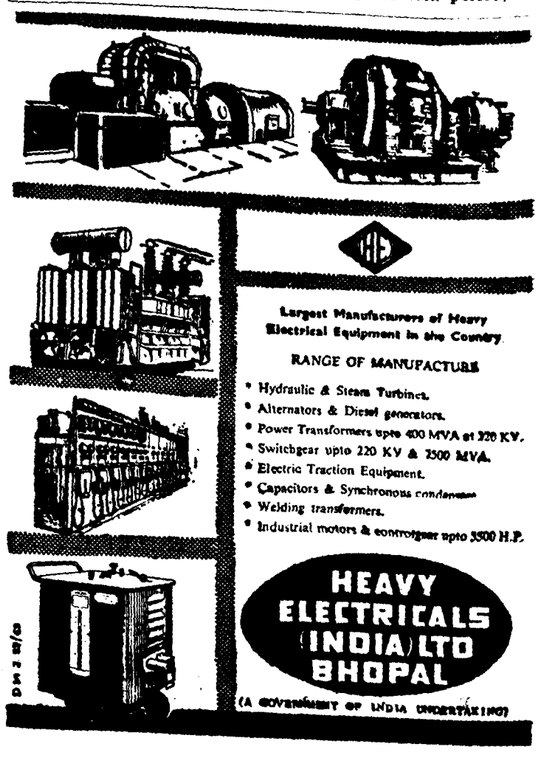
13. Disallowance in the case of companies of excessive expenditure incurred on the provision of any perquisite for their employees.

It is proposed to substitute the existing provision in section 40(c)(iii) of the Income-tax Act (relating to disallowance in the case of companies of any expenditure incurred by them on the remuneration or perquisite of their Indian employees in excess of Rs. 5,000 per month for each employee) by a new provision. Under the new provision, any expenditure incurred by a company after 29-2-1964 on providing any benefit, amenity or perquisite to any employees in excess of 20 per cent of his salary will not be allowed as a deduction in computing the assessable income of the company. In computing such expenditure, certain payments made by the company such as contributions made by it to a recognised provident fund or an approved superannuation fund or an approved gratuity fund shall not be taken into account.

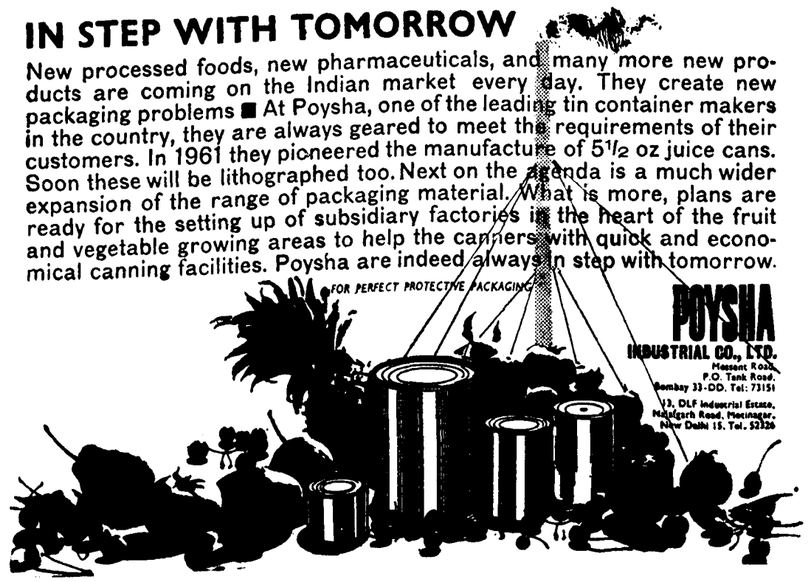
14. Unexplained money or valuable articles.

It is proposed to make a provision laying down that if an assessee is found, in any financial year, to be the owner of any money, bullion, jewellery or any other valuable article not recorded in his books of account and fails to explain, satisfactorily, the source of acquisition of such money, bullion etc., the money and the value of such articles may be deemed to be his income for that financial year.

15. Requirement of compulsory distribution of dividends in the case of companies in which the public are not substantially interested.



It is proposed to exempt Indian companies whose business consists wholly in the manufacture or processing of goods or in mining or the generation or distribution of electricity or any other form of power from the requirement under section 104 of the Income-tax Act of a minimum compulsory distribution of dividends upto the statutory percentage of distributable income.



It is proposed to enable the Central Government to exempt (by issue of a notification) any class of companies from the requirement of compulsory distribution of dividends if it considers it necessary or expedient in the public interest to do so.

It is also proposed to enable any company to make an application to the Central Board of Direct Taxes for a reduction of the minimum amount required to be distributed by it compulsorily under section 104 of the Income-tax Act if the company considers that having regard to the current requirements for the development of its business, the distribution of dividends larger than what it has already declared or proposes to declare would not be possible or advisable. The Central Board of Direct Taxes or any Commissioner of Income-tax authorised by it in this behalf can reduce the amount required to be distributed compulsorily up to 20 per cent of the statutory percentage of the disributable income of the company.

16. Self-assessment.

It is proposed to introduce a provision requiring assessees in whose case the amount of tax payable on the basis of their return (as reduced by any tax already paid) exceeds five hundred rupees, to pay the tax on the basis of the return 'suo motu', within thirty days of furnishing the return. If an assessee does not pay the tax during the said period, he

Consistent research has developed the USHA Sewing Machine into a superior product — with international repute. Jiyajeerao COTTON MILLS, LTD.
BIRLANAGAR (M.P.)

will be liable to imposition of a penalty not exceeding 50 per cent of the amount of tax so payable by him.

It is proposed to omit the provision contained in section 141A of the Income-tax Act under which an assessee who paid the tax due from him for an assessment year on the basis of his return or on the basis of his assessment by the Income-tax Officer before the 1st January of the relevant assessment year was entitled to a discount of 1 per cent of the tax so paid, and, conversely, was liable to pay interest at 2 per cent per annum on the amount of tax payable if he did not pay it by the 31st December of the relevant assessment year.

17. Concealment of income.

It is proposed to provide that where the income declared by an assessee in the return furnished by him is less than 90 per cent of the assessed income (reduced by expenditure incurred 'bona fide' for earning the income but disallowed), the assessee shall be deemed to have concealed his income or furnished inaccurate particulars thereof and be liable to penalty accordingly unless he produces proof to establish his 'bona fides' in the matter.

18. Punishment on conviction for making false statements in a declaration or abetment of false returns etc.

Under the existing provisions (in section 277 and section 278 of the Income-tax Act), the punishment for such offences is simple imprisonment upto six months or a fine upto one thousand rupees or both. It is now proposed to provide that the punishment shall be rigorous imprisonment for a minimum term of six months (unless special and adequate reasons to the contrary have been recorded in the judgment delivered by the Court) and a maximum term of two years.

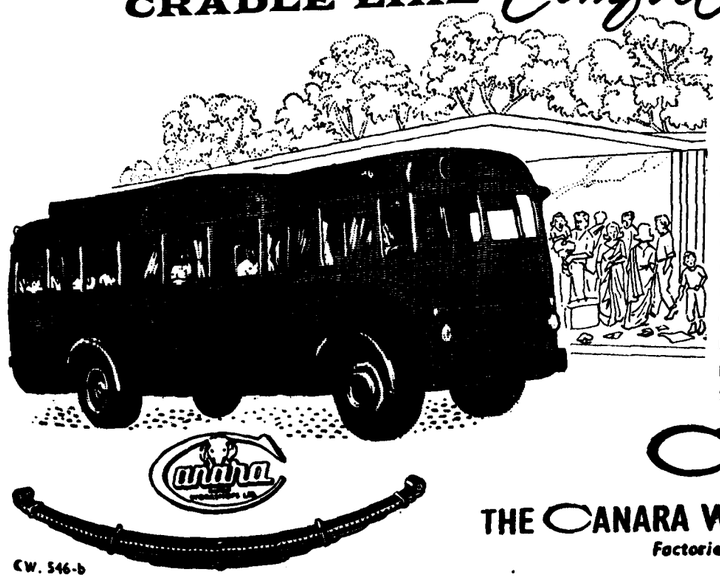
19. Powers of search and seizure.

It is proposed to substitute the existing provision in section 132 of the Income-tax Act (enabling the Commissioner of Income-tax to authorise an Income-tax Officer to make a search in any premises for any books of account or documents which may be useful for any proceedings under the Act and to seize them) by a new provision. Under the proposed provision, the Commissioner can authorise any Inspecting Assistant Commissioner or Income-tax Officer to make a search in any premises if he has reason to believe (in consequence of information) that a person has failed to comply with a requisition for production of books of account or documents or is not likely to comply with such a requisition or is in possession of any articles or things (including money) wholly disproportionate to his known sources of income. The officer authorised to make the search can seize any books of account or documents, place marks of identification thereon and make a note or inventory or any articles or things or money found in the premises, which in his opinion will be relevant to any proceedings under the Act.

20. Income-tax Officer's power of survey.

It is proposed to introduce a provision enabling the Income-tax Officer (or any Inspector of Income-tax authorised by him in this behalf) to enter any premises in his jurisdiction where any business or profession is carried on by an assessee and to inspect any books of account or documents, to take extracts therefrom and to place marks of identification thereon.

21. Abolition of provisions prohibiting the disclosure of information contained in assessment records.



The provisions contained in the Income-tax Act, prohibiting the disclosure of any information contained in the assessment records of an assessee are proposed to be omitted.

It is proposed to make a provision enabling the Commissioner of Income-tax to supply to any person, on an application by him, any information relating to any assessment made in the case of any assessee, if he is satisfied that there are no circumstances justifying the refusal of the information asked for.

It is also proposed to make a provision enabling the Central Government to publish the names of any assessees and

any particulars relating to assessment proceedings in respect of such assessees, if it is of the opinion that it is necessary or expedient in the public interest to publish such information. However, such publication as to the imposition of any penalty or any conviction for an offence connected with any proceedings under the Income-tax Act can be made only after the expiry of the time limit for filing the first appeal or the disposal of the first appeal in the matter, as the case may be.

22. Re-imposition of expenditure-tax under the Expenditure-tax Act, 1957 from the assessment year 1964-65.

It is proposed to revive the levy of expenditure-tax under the Expenditure Tax Act, 1957 from the assessment year 1964-65.

23. Discontinuance of the levy of super profits tax under the Super Profits Tax Act, 1963 from assessment year 1964-65.

It is proposed to discontinue the levy of super profits tax under the Super Profits Tax Act, 1963, from the assessment year 1964-65.

24. Marginal relief in respect of levy of additional surcharge on income-tax under the Finance Act, 1963.

It is proposed to make a retrospective amendment to the provision regarding marginal relief from the levy of additional surcharge on income-tax, contained in Paragraph A of Part I of the First Schedule to the Finance Act, 1963. The effect of the amendment will be that the amount of additional surcharge payable by an assessee under the operation of the Finance Act, 1963 will not exceed one-half of the amount by which the residual income of an assessee (i.e. total income as reduced by tax chargeable thereon) exceeds the exemption limit for income-tax. This will give relief to assessees whose total income exceeds the exemption limit for income-tax by a small amount.

IV. AMENDMENTS TO THE ESTATE DUTY ACT, 1953

(i) Levy of estate duty in respect of agricultural lands situate in Orissa, passing on deaths taking place on or after 23rd September, 1963.

In pursuance of a Resolution dated 23rd September, 1963 by the State Legislature of Orissa under terms of Article 252 of the Constitution, it is proposed to provide that estate duty under the Estate Duty Act, 1953 shall be leviable in respect of agricultural lands situate in the State of Orissa. The amendment will take effect from 23rd September, 1963.

(ii) Exemption from estate duty of the principal value of a residential house or part thereof.

It is proposed to provide that the principal value of a house or part thereof which was exclusively used by the deceased for his residence shall be exempt from estate duty subject to the condition that if the house is situated in a place with a population exceeding ten thousand, the amount on which exemption will be available will not exceed Rs. 1 lakh.

(iii) Omission of provision prohibiting the disclosure of infomation contained in records of estate duty assessments.

It is proposed to omit the provision in the Estate Duty Act which prohibits the disclosure of information contained in any records of proceedings relating to the assessment of estate duty.

It is also proposed to make a provision enabling the Controller to supply information to any person, on an application made by him, in regard to any assessment made under the Estate Duty Act, if he is satisfied that there are no circumsances justifying the refusal of the information asked for.

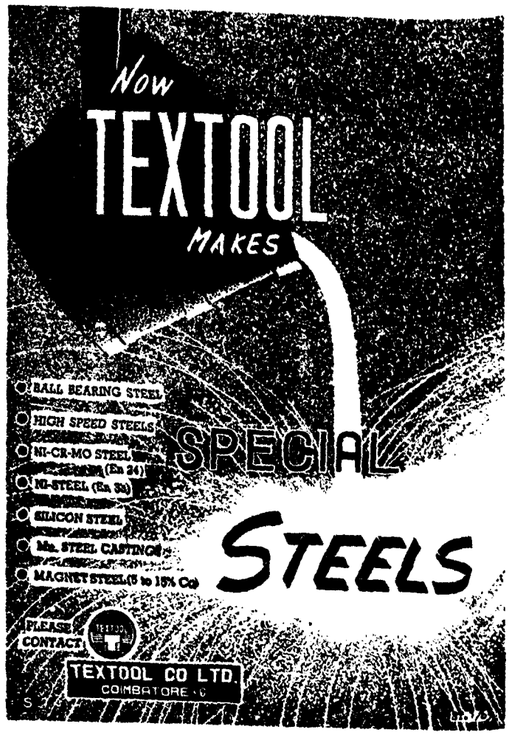
It is also proposed to make a provision enabling the Central Government to publish the names of any accountable persons or any particulars relating to proceedings under the Act, if it considers it necessary or expedient, in the public interest, to do so.

(iv) Changes in the rates of estate duty.

It is proposed to substitute the rate schedule of estate duty by a new rate schedule. Under the revised rate schedule, the rate of estate duty applicable to the principal value of an estate in the slab over Rs. 20 lakhs will be increased from the existing rate of 40 per cent to 85 per cent.

V. AMENDMENTS TO THE WEALTH-TAX ACT, 1957

(i) Exemption from wealth-tax of the value of a residential house or part thereof.



It is proposed to provide for the exemption from wealth-tax of the value of a house or part thereof belonging to the assessee and exclusively used by him as a residence. If such house is situated in a place with a population exceeding ten thousand, the amount in respect of which exemption is to be allowed will be limited to Rs. 1 lakh.

(ii) Omission of provision prohibiting the disclosure of information contained in assessment records of wealth-tax.

It is proposed to omit from the Wealth-tax Act, the existing provision prohibiting the disclosure of information contained in records of assessment proceedings of wealth-tax.

It is also proposed to make a provision enabling the Commissioner to supply to any person, on his application, any information relating to any assessee in respect of any assessment made under the Act, if he is satisfied that there are no circumstances justifying the refusal of the information asked for.

It is also proposed to make a provision enabling the Central Government to publish the names of any assessees and any particulars relating to any proceedings under the Act in

respect of such assessees, if it considers it necessary or expedient in the public interest to do so.

(iii) Changes in the rate schedule of wealth-tax.

It is proposed to substitute the existing rate schedule of wealth-tax in the cases of individuals and Hindu undivided families by new rate schedules. Under the new rate schedules, the initial slab of net wealth not chargeable to wealth-tax has been reduced in the case of individuals from Rs. 2 lakhs to Rs. 1 lakh and in the case of Hindu undivided families from Rs. 4 lakhs to Rs. 2 lakhs. The rate of wealth-tax applicable to net wealth falling in the slab above Rs. 20 lakhs has been retained, both for individuals and Hindu undivided families, at 2.5 per cent.

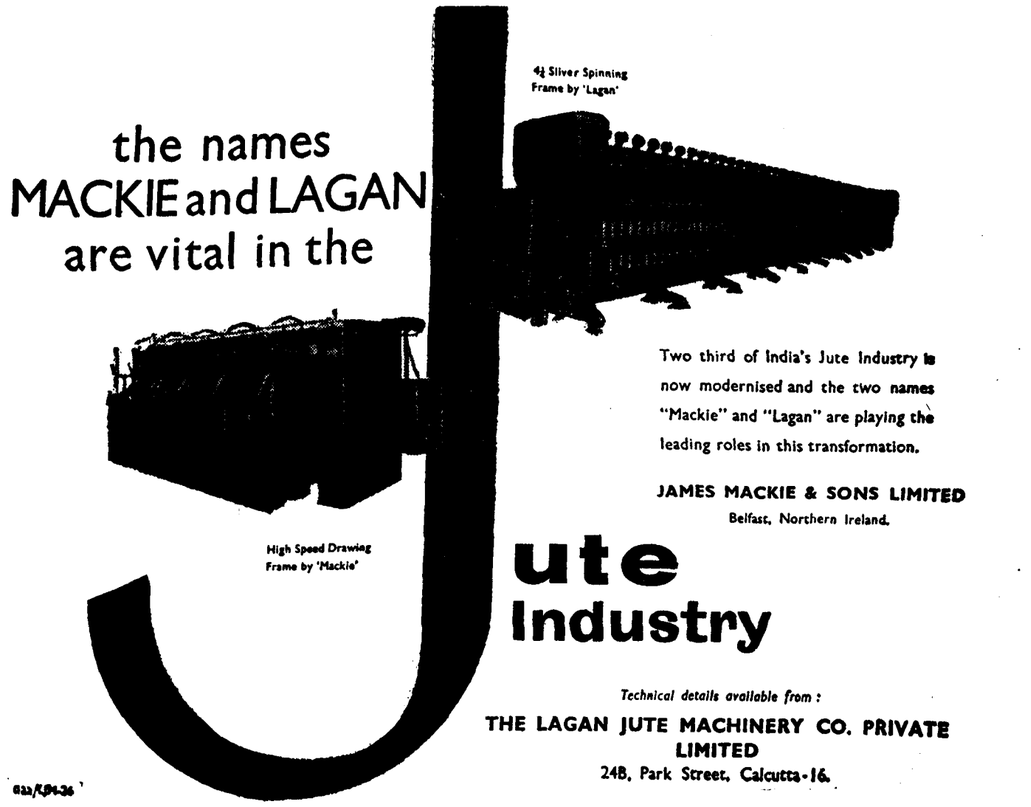
VI. AMENDMENTS TO THE EXPENDITURE-TAX ACT, 1957.

(i) Abolition of exemption from expenditure-tax in respect of certain items of expenditure.

It is proposed to withdraw the exemption available under section 5 of the Act in respect of certain items of expenditure, such as expenditure on purchase of products of any cottage industry or any work of art, or expenditure out of entertainmen allowance received by the assessee.

(ii) Withdrawal of certain deductions allowed in computing the taxable expenditure.

It is proposed to withdraw certain deductions allowable under the existing provisions of section 6 of the Act in computing the taxable expenditure, such as taxes and customs duty paid on purchase or import of articles for personal use, expenditure on marriages or on purchase of household goods or on medical treatment or education, and the basic allowance admissible to individuals and Hindu undivided families. It is also proposed to withdraw the deduction of 75 per cent of the average annual expenditure for three years prior to the previous year for assessment year 1958-59 which was admissible to assessees who made a claim in this behalf before making the return for assessment year 1958-59.



(iii) Removal of provision prohibiting the disclosure of information.

It is proposed to omit the existing provision in the Act prohibiting the disclosure of information contained in the records of proceedings of assessment of expenditure-tax.

It is also proposed to make provisions enabling the Commissioner to supply information to any person on an application by him regarding any assessee in respect of any assessment made under the Act, if he is satisfied that there are no circumstances justifying the refusal of such information. It is also proposed to make a provision enabling the Central Government to publish the names of any assessees and any particulars relating to any proceedings under the Act in respect of such assessees if it considers it necessary or expedient, in the public interest, to do so. Such publication as to any penalty imposed or any conviction for any offence in connection with any proceedings under the Act can be made only after the expiry of the time limit for the filing of the first appeal or the disposal of any such appeal filed, as the case may be.

(iv) Changes in the rates of expenditure-tax.

The existing rate schedule of expenditure-tax, applicable to individuals and Hindu undivided families, is sought to be

substituted by a new rate schedule. The rates under the new rate schedule are considerably lower than the rates under the existing Schedule. The first slab of Rs. 36,000 of taxable expenditure has been exempted from expenditure-tax. This exemption takes the place of the basic allowance available to individuals and Hindu undivided families under clause (h) of section 6(1) of the Act which is now sought to be withdrawn. Under the revised rate schedule, the highest rate for the assessment years 1964-65 and 1965-66 which will be attracted on expenditure over the slab of Rs. 72,000 will be 15 per cent and from the assessment year 1966-67 onwards, the highest rate which will be attracted on taxable expenditure over the slab of Rs. 84,000, will be 20 per cent.

VII. AMENDMENTS TO THE GIFT-TAX ACT, 1958.

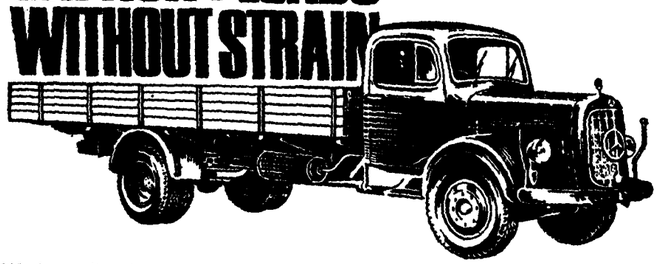
(i) Reduction of the amount of exemption in respect of value of gifts by an individual to his or her spouse.

It is proposed to reduce the amount of the exemption from gift-tax in respect of gifts by an individual to his or her spouse in one or more previous years, from the existing aggregate limit of Rs. 1 lakh to Rs. 50,000.

(ii) Aggregation of gifts made to the same donee during the relevant previous year and the four years immediately preceding that year.

It is proposed to make a provision to the effect that where an assessee has made taxable gifts to the same donee during the relevant previous year and during any one or more of the four years immediately preceding such previous year, the value of the gifts made to such donee during the said four years will be aggregated with the value of the taxable gifts made by the assessee during the relevant previous year. The value of taxable gifts made to such donee in the 4 earlier years, prior to 1st April, 1963 will be taken into account in the assessment of the assessee only for rate purposes. The value of taxable gifts to such donee (during the earlier 4 years) after 31st March, 1963 will be taken into account both for rate purposes and charging gift-tax on the assessee for the relevant assessment year. However, any gift-tax paid by the assessee in respect of the value of such gifts (made after 31-3-63) for any of the four earlier years will be allowed as a deduction in computing the amount of gift-tax payable by the assessee.

(iii) Removal of the provision prohibiting the disclosure of information contained in assessment records of gift-tax.



The existing provisions in the Act prohibiting the disclosure of information contained in the records of assessment proceedings of gift tax are proposed to be omitted.

It is also proposed to make provisions enabling the Commissioner to supply information regarding any assessee relating to any proceedings under the Act to any person on his application. It is also proposed to make a provision enabling the Central Government to publish the names of any assessees and any particulars relating to any proceedings under the Act in respect of such assessees, if it considers it necessary or expedient in the public interest to do so. These provisions are on the same lines as proposed to be made in the Expenditure Tax Act.

(iv) Changes in the rate schedule of gift-tax.

It is proposed to substitute the existing rate schedule of gift-tax by a new rate schedule. Under the new rate schedule

SPARE POWER FOR HAULING CAPACITY LOADS WITHOUT STRAIN

TM-B's lively 110 h.p. diesel engine provides enough power to haul capacity loads up the steepest gradients without strain. Rugged, durable, powerful, the TM-B [illegible] is built for gruelling service. Elimination of superfluous deadweight, the sturdy yet flexible chassis, the unique Heat Exchanger that maintains the engine at a constant operating temperature preventing overheating, the quality and design of each [illegible] component enable TM-Bs to haul the heaviest cargoes over the roughest terrain in all weathers. Brawny, yet thrifty, the TM-B's functional perfection gives operators profitable haulage with excellent fuel economy; and 132 TM-B Service Centres throughout India safeguard their investment.

A FORWARD LOOK

Based on the statement of the Chairman, Mr. N. Dandeker, circulated with the 29th Annual Report of the Company.

ALL FOR DEFENCE The year 1963 has been one of solid achievement for Indian Oxygen. It began with the Company mobilising all its resources to meet the requirements of our Armed Forces. We are glad to recall that their demands were satisfactorily met.

EARNING, DIVIDEND AND TAXES Total profits for the year came to over Rs. 1.4 crores. Out of this amount nearly Rs. 70 lakhs were paid out to the national exchequer as taxes. As for dividend, the Board of Directors recommended that a rate of 12% be maintained.

Sales for the year totalled over Rs. 10 crores—an increase of 15% over the previous year's figure. This reflected a steady growth not only of the Company but of industries within the country generally, both light and heavy, which are the principal consumers of industrial gases.

NEW PLANTS The setting up of the Company's new oxygen and acetylene plants at Hyderabad is nearing completion.

The Loxite Factory at Ranchi which will manufacture cartridges for liquid oxygen explosives will be completed soon.

Among the envisaged projects are a new argon purification plant at Bombay and a number of new installations at customers' works in various parts of the country.

The Company's Equipment Factory, now at Beliaghata in Calcutta, is being expanded under a new industrial licence. The expanded Equipment Factory will be located on a new site in Calcutta and is expected to go into production in 1966. The Electrode Factory at Calcutta is being further expanded and plans for a new Electrode Factory at Madras are being actively pursued. When these expansion schemes are completed electrodes covering a whole new range will be manufactured.

TONNAGE OXYGEN PLANT The Company has been entrusted with the management and operation of the tonnage oxygen plant at Jamshedpur put up by the Tata Iron and Steel Company Limited.

TOWARDS A BIGGER FUTURE To meet the growing demands of industrial and medical gases and to make the country self-sufficient in the indigenous manufacture of welding and allied equipment, the Company is launching on a Rs. 6-crore expansion programme scheduled to be completed in the next four years.

INDIAN OXYGEN LIMITED IOL

IOC-76

the highest rate of gift-tax will be 50 per cent which will be attracted on the slab over Rs. 3,45,000.

CUSTOMS

The proposals include :

(a) increases in rates of basic Customs Duty on certain articles (mainly in cases where the tariff values, and the consequent incidence of duty, have been appreciably reduced from the 1st September, 1963);

(b) continuance up to the 31st March, 1965 of, the surcharge imposed on all dutiable articles, under section 23 of the Finance Act, 1963 at a flat rate of 10 per cent of the duty otherwise payable. It will not be leviable on countervailing duties, nor will it be charged on those mineral oils on which the rates of duty have been kept equal to the Central Excise Duty;

(c) continuance up to the 30th April, 1965 of the provision in section 24 of the Finance Act, 1963, for the imposition of a regulatory duty of Customs at specified rates.

(d) reduction in the rate of basic Customs Duty on motor cars imported completely assembled; and

(e) abolition of the Export duty on raw jute, as a measure of export promotion.

Details of the increases or decreases in Basic Customs Duty, made through the Bill or by notification, are given in Table I. Further, net additional revenue amounting to Rs. 4.29 crores is expected from countervailing duties consequent on changes in Central Excise Duties. Details of these are given in Table II.

2. The total additional Customs revenue in 1964-65 as a result of the proposals in the Finance Bill and those being given effect to by notification, is estimated at Rs. 6.37 crores, made up as under :

Customs Duty	Rs. Crores
(a) increase	2.55
(b) decrease	.47
Net	2.08
Countervailing Duty (net)	4.29
TOTAL	6.37

CENTRAL EXCISE

PROPOSED IN THE RATES OF DUTY UNDER THE CENTRAL EXCISES AND SALT ACT, 1944.

(a) Tobacco

Manufactured Tobacco — Cigarettes

Tariff Item	Description	Unit	Existing rate of duty (Basic)	Proposed rate of duty (Basic)	Estimated additional revenue for 1964-65
			Rs.	Rs.	(Rs. lakhs)
4 II(2) (iii)	Value exceeds Rs. 15 a thousand but does not exceed Rs. 25 a thousand	1000 cigarettes	8.50	7.50)	(—) 53
4 II(2) (iv)	Value exceeds Rs. 7.50 a thousand but does not exceed Rs. 15 a thousand	-do-	4.20	4.40)	

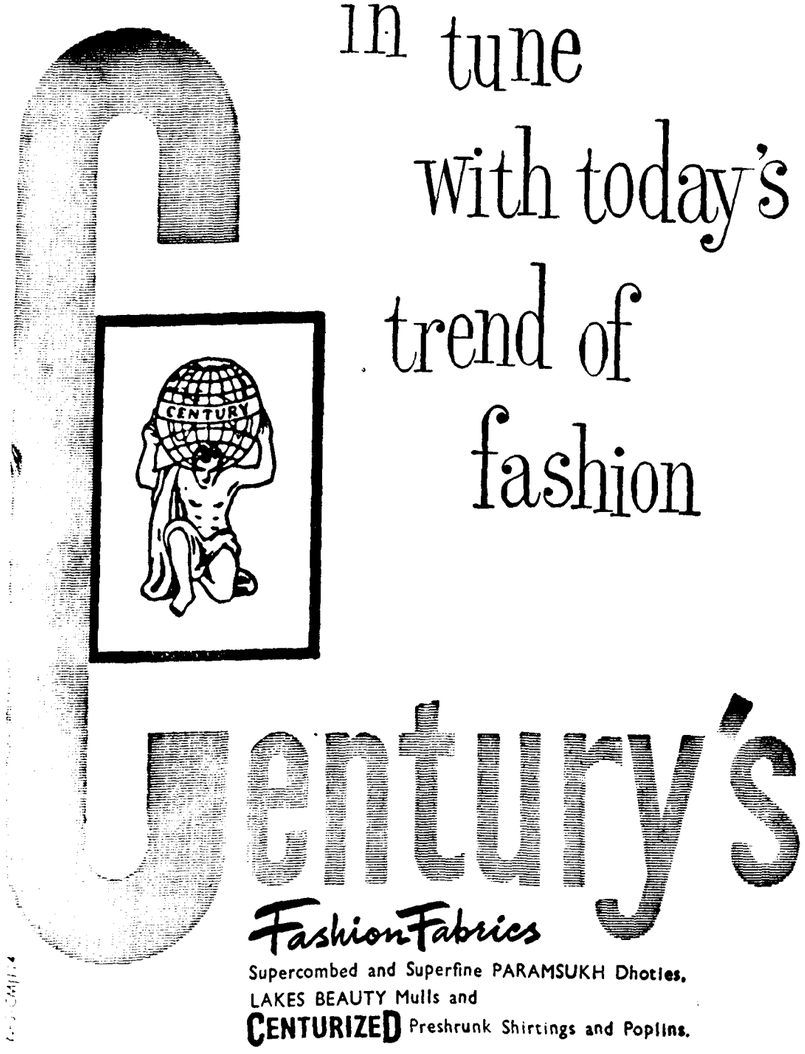
The proposal is intended to arrest the shift in production of cigarettes from value category (iii) which pays a higher duty to value category (iv) on which the duty is much lower.

(b) Pigments, Paints and Varnishes

Item	Unit	Existing rate of duty	Proposed rate of duty	Estimated additional revenue for 1964-65
		Rs.	Rs.	(Rs. lakhs)
14 Dispersed Organic Pigments	Kg.	0.17½	2.50	(+) 20

Certain types of dispersed organic pigments are being increasingly used for textile printing in place of some other organic dyestuffs which bear a higher incidence of duty. The proposal will remove this anamoly and also yield some additional revenue.

(c) Sodium Silicate (New Item)



Item	Unit	Proposed rate of duty		Estimated Revenue
			Rs.	(Rs. lakhs)
		Tariff rate	Effective rate (by notification)	
Sodium Silicate 14BB	Quintal	8.00	4.00	(+)40

Sodium silicate is being introduced as a new item in the Central Excise Tariff. It is a measure intended to counteract the loss of revenue caused by the exemption from duty granted to all varieties of soap manufactured without the aid of power.

(d) Soap

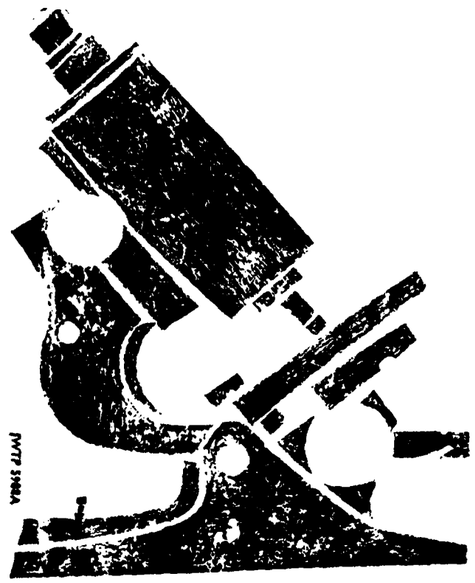
Item	Unit	Existing rate of duty (Basic)	Proposed rate of duty (Basic)	Estimated additional revenue
		Rs.	Rs.	(Rs. lakhs)
15				
(1) Soap, house hold and laundry	Quintal	15.50) 18.00)	18.00	(a) On account of increase in rate of duty (+) 8.00
(2) Other sorts		37.55	38.00	(b) On account of exemption* from duty on soap produced without the aid of power (—)48.00
			* (By notification)	Net (—)40.00

The existing tariff has been rationalised and the present classificaions have been reduced to two. In addition all soap

manufactured without the aid of power is being exempted totally from payment of duty.

(e) Paper

Item	Unit	Existing rate of duty Rs.	Proposed rate of duty Rs.	Estimated additional revenue (Rs. lakhs)
17.				
(1) Cigarette tissue	Kg.	1.00	1.00	
(2) Blotting, toilet, target, tissue other than cigarette tissue, teleprinter, typewriting, manifold, bank, bond, art paper, chrome paper, tubsized paper, stamp paper, cartridge paper, parchment and coated board (including art board, chrome board and board for playing cards).		0.50	0.50	No change
(3) Printing and writing paper, packing and wrapping paper, strawboard and pulpboard including grey board, corrugated board, duplex and triplex boards, other sorts	Kg.	0.22) 0.35)	0.35	
(4) All other kinds of paper and paper board, not otherwise specified		0.50	0.50	



(1) The number of sub-items of paper and board is being reduced from ten to four. This measure is intended to rationalise this tariff on the lines recommended by the Central Excise Re-organization Committee.

(2) Certain varieties of writing and printing paper not exceeding 75 grammes in weight per square metre which fall in sub-item (3) will, however, continue to pay duty at the existing rate of 22 naye paise per kilogram made effective by notification.

(f) Rayon and Synthetic fibres and yarn

Item	Unit	Existing rate of duty Rs.	Proposed rate of duty Rs.	Estimated additional revenue (Rs. lakhs)
		Tariff rate		
18	Kg.	4.50	9.00	
		Effective rates (By notification)		
(1) Staple fibre				
(a) of cellulosic origin		1.00	1.00	
(b) of non-cellulosic origin		1.00	2.00	
(2) Yarn of cellulosic origin				
(a) below 75 deniers		4.00	6.00	
(b) 75 — 100 deniers		3.00	4.50	
(c) above 100 deniers		2.00	3.00	
(3) Yarn of non-cellulosic origin				(+) 396
(a) below 75 deniers		4.50	9.00	
(b) 75 — 100 deniers		4.50	7.50	
(c) above 100 deniers		4.50	6.00	
(4) High tenancity or industrial yarns (for manufacture of fishing nets, parachute cords)		2.25	3.00	
(5) Staple fibre yarn		Nil	Nil	

This tariff item covers all man-made fibres and yarn including the non-collulosic varieties (such as nylon, terylene),

PHILIPS RESEARCH SPELLS TECHNICAL EXCELLENCE

A great deal of thought and research goes into the design of every Philips product used every minute of every day to satisfy countless human needs.

Yet research work, conducted in the Philips laboratories, is only one of the responsible factors. To complete the picture, add to it the invisible plus of international experience and know-how. You will not wonder Philips products are of the highest technical standard, the last word in reliability.

PHILIPS
contributing today to India's future

PHILIPS INDIA LIMITED

which are generally more highly priced than cellulosic varieties (such as viscose and acetate rayon and staple fibre). As a revenue measure, therefore, it is proposed to raise the tariff (ceiling) rate. The effective rates are being revised by notification in the manner indicated above.

(g) Cotton yarn

Item	Unit	Existing rate of duty Rs.	Proposed rate of duty Rs.	Estimated additional revenue (Rs. lakhs)
18A	Kg.	**Tariff rate**		
(1) Of counts 29 or more		0.30	1.00	
(2) Of counts less than 29		0.15	0 50	

Item	Proposed rate of duty Rs.	Estimated additional revenue (Rs. lakhs)
Effective rates have been revised by notification, as below:—		

French counts of and above	less than	In hanks nP./Kg.	Other than in hanks nP/Kg.	
—	6	—	10)	
6	14	—	15)	
14	22	—	25)	
22	29	5	35)	(+) 986
29	40	10	45)	
40	51	25	60)	
51	—	50	90)	

(1) The counts of yarn in the tariff item are being expressed in the French count system; this change has already been adopted by the Textile industry with the approval of the Textile Commissioner.

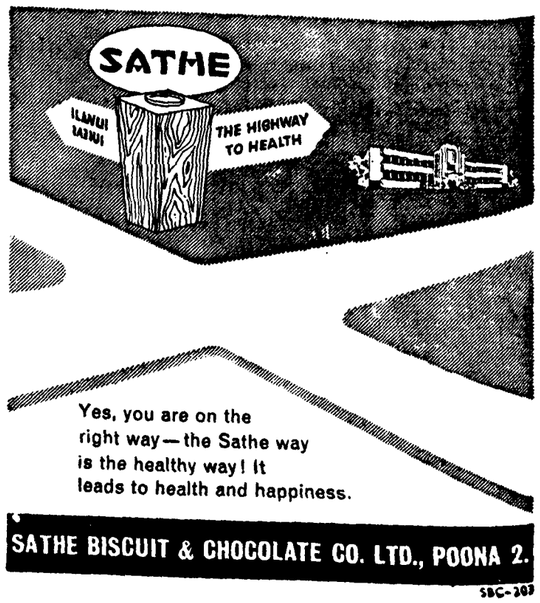
(2) Rates of duty on cotton yarn have been substantially enhanced not only to raise some additional revenue but also in the process, to transfer a larger portion of the total incidence to yarn from the fabric stage.

(3) In counts above 26s even though yarn in hanks will have to pay duty at rates higher than that paid at present for counts above 40s, the difference in effective rates of duty between yarn cleared in other forms and those in hanks have been substantially enhanced from the present level of about 10-18 naye paise to 10-40 naye paise per kilogram. This should provide differential support to the handloom sector.

(1) Worsted yarn

(h) Woollen yarn, all sorts including knitting wool

Item	Unit	Existing rate of duty	Proposed rate of duty	Estimated revenue (In lakhs)
18B		Ad valorem Tariff rate		
(1) Worsted yarn				
a) Less than 48s counts		15 per cent ad valorem	15 per cent ad valorem	
b) 48s counts and more.		15 per cent ad valorem	20 per cent ad valorem	
(2) Others		7½ per cent ad valorem	7½ per cent ad valorem	



Effective rates (by notification)

Item	Unit	Proposed rate of duty		Estimated additional revenue
		Tariff value Rs. per Kg.	Duty Rs. per Kg.	
(1) Worsted yarn				
a) Less than 48s counts		18.00	2.70)	
b) 48s and above counts		26.00	5.20)	(+) 39
(2) Others		8.00	0.60)	

nP. (as at present).

(1) Besides having some revenue significance, this proposal will make the costlier varieties of worsted yarn bear a higher incidence of duty.

(2) For administrative convenience and simplification of

THE

control, tariff values are being fixed for worsted and woollen yarn, as indicated above. This measure will also make the levy uniform.

(i) Pig Iron, steel ingots and iron or steel products

Item	Unit	Existing rate of duty Rs.	Proposed rate of duty Rs. Ceiling (by tariff)	Proposed rate of duty Rs. (Effective by notification)	Estimated additional revenue (Rs. lakhs)
			Rs.	Rs.	
25. Pig Iron	Metric Tonne	10.0	45.00	30.00	+240
26. Steel Ingots	-do-	39.35	50.00	50.00	
26AA. Iron and steel products	-do-				
(i) Semi-finished steel		69.35 (30 product duty plus 39.35 ingot duty)	90.00	90.00	
(ii) Bars, rods and structurals	-do-*		90.00	90.00	
(iii) Plates or sheets (other than skelp), and hoops and strips	7½% ad valorem plus ingot duty (57.50+39.35)*		200.00	110.00	

* By notification.

Item	Unit	Existing rate of duty Rs.	Proposed rate of duty Rs.		Estimated additional revenue (Rs. lakhs)
(iv) Skelp	..	7½% ad valorem plus ingot duty (52.50+39.35)*	200.00	150.00	(+) 941
	*By notification				
(v) Cast Iron Pipes and tubes	..	5% ad valorem plus Rs. 10 pig iron duty)	5% ad valorem plus Rs. 30.00 crude iron duty	Exempted if made from duty paid on iron in crude form	
(vi) Seamless Pipes and tubes	..	5% ad valorem plus Rs. 39.35 (Steel ingot duty)	5% ad valorem plus Rs. 50.00 (steel ingot duty)	110.00	
(vii) Other Pipes and tubes of steel	..	5% ad valorem plus Rs. 39.35 (Steel ingot duty)	5% ad valorem plus Rs. 50.00 (steel ingot duty)	Exempted if made from duty paid plates, sheet or skelp.	
(viii) Steel casting	..	5% ad valorem plus Rs. 39.35 (Steel ingot duty)	5% ad valorem plus Rs. 50.00 (steel ingot duty)	Exempted if made from duty paid ingots or semis	

The changes are mainly consequential to the abolition of surcharge on iron and steel.

Besides being a revenue measure, this proposal seeks to further simplify excise control.

(j) ALUMINIUM — ITEM 27(b)

It is proposed to amplify sub-item (b) of this Item so as to include 'aluminium extrusions" also which will now pay duty at Rs. 500 per tonne. At present such extrusion pay duty only at the crude stage duty of Rs. 300 per tonne. This change will yield an additional revenue of Rs. 15 lakhs.

(k) FOOTWEAR — ITEM 36

The tariff description of this item is being recast so as to remove all ambiguity and a common criterion is being fixed on the levy of duty on footwear as well as the dutiable component parts, which is not quite the case at present. This change is estimated to yield an additional revenue of Rs. 40 lakhs. The present statutory exemption in favour of complete footwear made in a factory employing less than 50 workers and using not more than 2 H.P. is being continued by a notification. Component parts for foam rubber chappals are also being exempted.

(l) COSMETICS, PLASTICS, ELECTRIC CABLES AND MOTOR VEHICLES — ITEMS 14F, 15A, 33B, 34

Proposals with regard to these items only involve modifications in their difinition so as to express them more clearly. They do not have any revenue significance.

II. CHANGES MADE BY NOTIFICATION

(m) PAINTS AND VARNISHES — ITEM 14

Concessional rates of duty in the case of oil paints and enamels are applicable to those manufacturers whose produc-

tion of these products does not exceed 1000 metric tonnes in a year. It is proposed—

(i) to reduce the concessional slab to 750 tonnes

(ii) to allow it on the first 750 tonnes cleared by any manufacturer whose output in the whole year does not exceed 3000 tones;

(iii) to lay down a conversion formula for vloume to weight for calculation of exemption limit.

2. This proposal is estimated to result in a loss of Rs. 10 lakhs a year.

(n) ACIDS

Item	Unit	Existing rate of duty	Proposed rate of duty	Estimated revenue (Rs. lakhs)
14G — Nitric, Hydrochloric and Sulphuric Acids (including fuming acids and anhydrides thereof all sorts)	Ad valorem	10 per cent ad valorem	Complete exemption to Hydrochloric and Nitric Acids	(—) 29

The proposed exemption is intended to give relief to small manufacturers and simplify administration.

(o) GASES

Item	Unit	Existing rate of duty	Proposed rate of duty	Estimated revenue (Rs. lakhs)
14 H — Compressed Liquified or Solidified gases	Ad valorem	10 per cent	Complete exemption to all gases except to carbon-dioxide used in the manufacture of aerated waters	(—) 189

These exemptions are given to provide relief to a large number of industries which use these gases in the process of manufacture.

(p) RUBBER PRODUCTS

Item	Unit	Existing rate of duty	Proposed rate of duty	Estimated revenue (Rs. lakhs)
		Tariff rates		
16 A — Rubber products	Ad valorem	20 per cent	20 per cent	
		Effective rates		
		Rs.	Rs.	
(i) Latex Foam Sponge	kilogram	1.55	2.15	(+) 25
(ii) Tread rubber, cushion compound, cushion gum and tread gum	kilogram	0.80	1.10	

Effective rates of duty have been enhanced on these rubber, products, whose prices have risen during the course of the year.

(q) PAPER — ITEM 17

(1) It is proposed to give a concession of 5 Naye paise per kilogram to paper containing not less than 50 per cent bagasse pulp.

(2) It is also proposed to give incentive to new units and to the expanded capacity of existing units for three years at the following rates :

First year	25 per cent of duty
Second year	20 per cent of duty
Third year	15 per cent of duty

(3) The scope of the slab exemption applicable to strawboard and pulp board has been extended to all manufacturers irrespective of their output on equitous considerations.

(4) The cumulative effecti of the changes is estimated to result in a loss of revenue of Rs. 29 lakhs.

(r) COTTON FABRICS

Proposals:

(i) Consequent on the transfer of an additional part of the burden of duty from grey fabrics to yarn, the effective rates of duty on the former have been reduced.

(ii) Processing duties have been rationalised. Processed

fabrics of superfine, fine and medium A varieties will now pay a duty increased by 5 Naye paise per square metre. Corresponding relief has been given to medium B and coarse varieties which undergo shrink-proofing and organdie processing.

(iii) Powerloom units with 50-300 powerlooms, who would have paid the same rates as payable by composite mills in respect of the basic and additional duties on grey fabrics from 1964-65, would now pay on 4/5th of these rates.

(iv) Simultaneously with the reduction in the rates on grey fabrics, rates of compounded duty for powerloom units with 5-49 looms have been substantially reduced, particularly for units producing only medium and/or coarse fabrics. The rates are given below :

	Existing rates per loom per shift per month		Proposed rates per loom per shift per month		
	Medium/ coarse Rs.	Fine/ S. fine Rs.		Medium/ coarse Rs.	Fine/ S. fine Rs.
(i) First 4 looms	10.00	12.50	(i) First 4 looms	Nil	Nil
(ii) Next 5 looms	15.00	37.50	(ii) Next 20 looms	2.50	37.50
(iii) Next 15 looms	25.00	75.00	(iii) Balance	5.00	75.00
(iv) Balance	35.00	175.00			

These proposals are estimated to result in a loss of Rs. 266 lakhs which would be more than made good by the increase proposed in rates of duty on yarn.

(s) ELECTRIC MOTORS

Item	Unit	Existing rate of duty	Proposed rate of duty	Estimated revenue (Rs. lakhs)
30	Ad valorem	15 per cent	Complete exemption to such motors which operate at a pressure not exceeding 50 volts	(—) 18

This will provide relief to the above types of motors (e.g., starter and toy motors) whose manufacture is a nascent industry.

(t) WIRELESS RECEIVING SETS

Item	Unit
33A	Ad valorem **Specific rates fixed by notification, as below :**

Existing rates			Proposed rates		
Price per set at the point of sale to the consumer		Duty per set	Price per set at the point of sale to the consumer		Proposed rate of duty per set
Exceeding Rs.	Not exceeding Rs.	Rs.	Exceeding Rs.	Not exceeding Rs.	Rs.
(i) —	150	Nil	(i) —	165	Nil
(ii) 150	250	15	(ii) 165	225	15
(iii) 250	375	30	(iii) 225	300	21
(iv) 375	500	75	(iv) 300	375	30
(v) 500	—	100	(v) 375	475	50
			(vi) 475	575	70
			(vii) 575	675	90
			(viii) 675	—	100

This proposal has no revenue significance.

(u) CINEMATOGRAPH FILMS EXPOSED — ITEM 37

The ceiling of 3,250 metres imposed on the length of films for entitling them to the lower concessional rates of duty is proposed to be enhanced to 4,000 metres. While its revenue implication is negligible, this proposal will ease to some extent the restriction on the producers of films some of whom are finding it difficult to cater to the taste of the public within the stipulated length.

(v) GRAMOPHONE RECORDS

Item	Unit	Existing rate of duty	Proposed rate of duty	Estimated Revenue (Rs. lakhs)
37 A	Ad valorem	15 per cent ad valorem	complete exemption	(—) 15

The proposed exemption is tended to arrest the fall in the production of these records.

(w) MATCHES

Item	Unit	Existing rate of duty	Proposed rate of duty	Estimated Revenue (Rs. lakhs)
38	Per thousand	Tariff rate	Effective rate per gross of 50s Rs.	
		65 nP. for every 1000 matches or fraction thereof (No change	'A' class factories 4.60 'B' class factories — 4.40 'C' class factories — 4.10 'D' class factories — 3.75 The ceiling for 'D' class factories to be raised from 50 million matches to 75 million matches	Change negligible

The proposed effective rates of duty are based in the recommendation of the Tariff Commission. In addition, with a view to conserve the soft wood resources in the country, additional concessions, as below, have been provided for factories using cardboard boxes and/or bamboo splints, and/or bamboo veneers :—

i) 30 nP. gross for card board boxes
ii) 30 nP. gross for bamboo splints) C & D Classes only)
iii) 20 nP. gross for bamboo veneers)

In addition B, C & D class factories will be allowed to pay the preferential duties applicable to their class even if their production exceeds the ceiling of their class by 20 per cent, 25 per cent and 33-1/3 per cent respectively.

III — CHANGES IN RATES OF SPECIAL EXCISE DUTY

Subject to the changes indicated below, it is proposed to continue as a revenue measure during 1964-65 special duties of excise, at the same rates which were levied by the Finance Act 1963:-

(1) The following articles of common use are being exempted totally by notification from payment of the Special Excise Duty, viz.,

i) printing and writing paper not exceeding 75 grammes per square metre;
ii) chinaware and porcelainware;
iii) electric bulbs up to 60 watts, except fluorescent tubes and miniature bulbs;
iv) cellophane;
v) glassware, other than sheet glass and plate glass;
vi) synthetic organic dyestuffs.

(2) In the case of cotton yarn, on which basic duties have been substantially increased, special duty will be charged on sized yarn; this change will be given effect to by notification.

(3) Partial exemption from payment of Special Excise Duty is proposed to be given by notification in the following cases:-

i) The Special Excise Duty on staple fibre of cellulosic origin is proposed to be reduced from 33-1/3 per cent to 15 per cent to facilitate clearance of stocks that have accumulated in the factories.

ii) Motor tyres and tubes are being exempted fully from Special Excise Duty on the first clearance of Rs. 50 lakhs and 50 per cent exemption on the next clearance of Rs. 50 lakhs for each factory producing such tyres in any financial year.

2. The net effect of all these concessions and the changes in the levy of Special Excise Duties consequential to the changes in the basic Excise Duties detailed in Parts I and II, will be a revenue loss of Rs. 119 lakhs from realisations of Special Duties of Excise.

IV — CHANGES IN ADDITIONAL DUTY OF EXCISE (IN LIEU OF SALES TAX)

Consequent on the downward revision of the compounded levy rates applicable to powerloom units with 5-49 powerlooms and the concession granted in the rates of additional duty on the fabrics manufactured in powerloom units with 50-300 powerlooms, there may be a loss in revenue to the tune of Rs. 20 lakhs a year.

The Budget: An Official Exposition

THE BUDGET speech of the Finance Minister laid great stress on the growth of the economy and on the promotion of savings and investments. An attempt has been made by the official spokesmen to bring out the brighter aspects of the new proposals — both in the corporate and personal taxes — in the Budget. Each incentive has been examined in detail and various provisions of the Finance Bill, which were ambiguous, have been explained; the complete rendering of the official case is reproduced below:

The budget proposals for 1964-65 in regard to income-tax and other Central direct taxes have been formulated in the light of the imperative needs at this stage of the growth of our economy of infusing confidence in the capital market, providing a stimulus for the development of our basic industries, promoting the building up of reserves in the industry and also the growth of personal savings. Other important objectives which have been kept in view are to place a measure of restraint on the rising levels of consumption in order to keep the forces of inflation under check, and curb profiteering which contributes in no small measure to the spiralling of price levels. Also set before the country is the goal of a socialistic pattern of society in which due encouragement is to be provided to the growth of earnings through individual initiative, skill and hard work and any undue concentration and inequalities of wealth, particularly wealth which is passed on from one person to another by way of gifts or by inheritance from generation to generation are to be minimised. Further, in the field of administration of direct taxes, it was necessary to take steps for simplifying the tax structure, expediting the collection of taxes and taking the necessary powers under the law for effectively detecting hidden hoards of wealth, taxes on which have been evaded and which is circulating in the black market and for bringing to book such tax offenders whose activities result in a high burden to the honest taxpayer. The various fiscal measures contemplated in the budget proposals have been framed for achieving these objectives in a harmonised way, consistently with the need for raising adequate resources for financing our development programmes and meeting the needs of defence.

Corporate Taxation

The primary need now is to revive the capital market, to provide the necessary incentive for an increase in production, particularly in our basic industries, and to create the conditions for a plough back of a larger share of profits in the industry. At the present stage of the development of our economy it is also necessary to remove any disincentives to foreign investment in our industries and the utilisation of the services of foreign technicians and experts. The proposals made towards achieving these objectives are:

(1) Discontinuance of Super-profits Tax levied under the Super Profits Tax Act, 1963 and introduction of a modified levy of Surtax on excess profits of companies.

The Super Profits Tax was found to operate as an inhibiting factor in the growth of the corporate sector of the economy because the standard deduction allowed under its provisions was only 6 per cent of the capital base. The rate of the tax was also high, being 50 per cent of the excess profits up to 4 per cent of the capital base and 60 per cent of the balance. The capital base consisted only of the paid-up capital and reserves and not the loan capital. The result was that many well-established companies which had been able to build up large reserves were better off than comparatively younger units which had not been able to build up adequate reserves or other units which were working to a considerable extent on loan capital such as debentures or long-term loans. All this resulted in a high incidence of tax on many companies. Therefore, it is proposed to replace the Super Profits Tax by a new tax in a modified form, named the 'surtax' on the excess profits of companies. The Surtax will come into effect from the assessment year 1964-65.

Surtax — Main Provisions: This tax will operate when the profits of companies from all sources, as reduced by the income-tax and super-tax payable on them exceeds 10 per cent of their capital base or a sum of Rs. 2 lakhs, whichever is higher. The capital base will consist of the entire paid-up capital of a company, its reserves (including the development rebate reserve) and also its debentures and certain other loan capital. This loan capital will consist of moneys borrowed from the IFC, the ICICI, and any other financial institutions which may be approved by the Central Government and also loans from banking institutions for a minimum 10-year period and any money borrowed abroad for the creation of any capital assets in India. The capital will be computed as on the 1st day of the relevant accounting year of a company subject to adjustments for any increase or decrease of such capital during the course of the year. As a corollary to the inclusion of such loan capital in the capital base, the interest payable on it will be added back to the profits as was done under Excess Profits Tax.

Uniform Rate

Rate of Surtax and Relief in respect of Profits from Specified Industries: The surtax will be levied at a uniform rate of 40 per cent of the entire excess profits of a company as compared to the two-tier system of rates of 50 per cent up to 4 per cent of the capital base and 60 per cent of the balance under the Super Profits Tax Act.

Further, provision has been made for granting a rebate of 20 per cent of the surtax attributable to profits derived from a business of generation and distribution of electricity or the manufacture or production of any one of the articles pertaining to the basic industries listed in the Third Schedule to the Companies (Profits) Surtax Bill, 1964. This list covers important basic industries such as those of production of iron and steel (Metal) ferro-alloys, special steels, iron ore, industrial machinery, coal, bauxite, cement, fertilisers, paper and pulp and also some of our industries which account for a considerable part of our exports, viz., tea, coffee and rubber. The list can be revised by the Central Government.

All the tax concessions and incentives available under the Income-tax Act, such as the 5-year tax holiday and the deduction for development rebate etc. will be available for the purpose of surtax as well. In addition, banking companies will be allowed a special deduction from their chargeable profits of the amount of statutory reserves created by them under the Banking Companies Act or any other reserves created by them in India subject to certain limits. Non-resident companies will also be exempt from surtax on their income by way of interest, royalties and fees for rendering technical services. Capital gains, inter-corporate dividends and profits of a business of life insurance will also be exempt from surtax. As the chargeable profits for the purpose of surtax are required to be computed with reference to the total income computed under the Income-tax Act, any carried forward business losses and unabsorbed depreciation allowance will be automatically allowed to be set off against the profits tax for the purpose of surtax also.

As the capital base for surtax has been extended to cover loan capital and the statutory deduction has been increased from 6 per cent applicable to super profits tax to 10 per cent and as the rate of surtax is only 40 per cent subject to a

rebate of 20 per cent in respect of profits from specified industries, the incidence of surtax will be appreciably lower than the incidence of super profits tax. New or small companies will also be adequately protected from a high incidence of tax because the minimum statutory deduction has been fixed at Rs. 2 lakhs as compared to Rs. 1 lakh under the Super Profits Tax Act. Because of these features, there will be no liability to surtax unless the profits before tax of a company exceed Rs. 4 lakhs and are higher than 20 per cent of its capital base including reserves and the loan capital.

Because of the special features of the surtax and its comparatively light incidence, no provision has been made for granting relief by way of the carry forward and set off of a 'deficiency' i.e., a shortfall in the profits from the amount of the statutory deduction (10 per cent of the capital base or Rs. 2 lakhs, whichever is higher).

Income-tax & Super-tax

Income-tax: The rate of income-tax on companies is proposed to be retained at 25 per cent as before. However, a foreign company will be charged to income-tax at a concessional rate of 15 per cent on any dividends received by it from an Indian private limited company which is carrying on the business of generation and distribution of electricity or is wholly or mainly engaged in the manufacture or production of any one or more of the articles in the basic industries specified in the list in Part IV of the First Schedule to the Finance Bill, 1964. These industries are the same as are specified in the Companies (Profits) Surtax Bill. The object of this concession to foreign companies is to ensure that foreign participation in Indian private limited companies engaged in basic industries is not adversely affected by the proposed increase in the rate of super tax by 10 per cent on private limited companies which are governed by section 104 of the Income-tax Act of 1961 and have to make a compulsory distribution of a certain amount of their profits.

Exemption of inter-corporate dividends from super-tax: One of the important changes proposed is the exemption of all companies from super-tax on any dividends received by them from an Indian company or any other company which has made the prescribed arrangements for the declaration and payment of dividends within India.

This will have the effect of encouraging inter-corporate investment and would particularly attract the inflow of investment by foreign companies in the equity capital of Indian companies. Incidentally, it will also simplify the system of taxation of companies because so far there were fine distinctions in the levy of supertax on inter-corporate dividends. (Inter-corporate dividends from some Indian companies engaged in certain basic industries and satisfying certain conditions were hitherto exempt from super-tax and on dividends from other companies, super-tax was charged at various concessional rates ranging from 5 per cent to 20 per cent depending on the date of incorporation of the company concerned or whether it was an Indian subsidiary company or not and various other circumstances).

Rate of super-tax in the case of Indian companies and other companies which declare and pay their dividends in India on income other than dividends and capital gains:

(i) Companies in which the public are substantially interested and whose total income does not exceed 25,000.

In these cases, the rate of super-tax is proposed to be reduced from 20 per cent applicable under the previous year's Finance Act to 17.5 per cent only. This will have the effect of encouraging small or new companies.

(ii) Companies in which the public are substantially interested and whose total income exceeds Rs. 25,000.

The existing general rate of super-tax at 25 per cent in the case of such companies is proposed to be retained. However, an important concession is sought to be made in the case of such of these companies which derive income from the business generation and distribution of electricity or the business of manufacture or production of any of the articles relating to the important industries listed in Part IV of the First Schedule to the Finance Bill. On such profits super-tax will be charged at the reduced rate of 20 per cent instead of 25 per cent. This reduction of 5 per cent in the rate of super-tax works out to 10 per cent of the income-tax and super-tax normally payable by such companies (income-tax 25 per cent plus super-tax 25 per cent or 50 per cent). This concession is designed to encourage production in various industries which are of special importance for our industrial development and exports.

(iii) Rate of super-tax and other provisions in the case of companies in which the public are NOT substantially interested.

In the case of such private limited companies the rate of super-tax is proposed to be increased from 25 per cent by 10 per cent to 35 per cent. The overall rate of tax on such companies on their income (other than inter-corporate dividends which are being exempted from super-tax) will thus be 60 per cent (income-tax 25 per cent 'plus' super-tax 35 per cent). Such companies are mostly closely held corporations controlled by a few wealthy persons. An analysis made by the Taxation Enquiry Commission (1953-54) in respect of 3005 companies of this category revealed that as many as 2589 of these (or 86 per cent) were controlled by four or fewer persons. Out of these, there were 944 companies (31.4 per cent of the total) in each of which the majority of shares were owned by one shareholder and 937 companies (31.2 per cent) in each of which the majority of shares were held by two shareholders. Wealthy assessees often use such companies as a medium for reducing the incidence of tax in their personal assessments by transferring their assets to companies controlled by them and accumulating their profits in the hands of the companies to the extent permissible under the Law.

Concession to Power Companies

Although the general rate of super-tax on such companies is sought to be increased to 35 per cent as mentioned before, it is proposed to give a concession to such of these companies which derive income from a business of generation and distribution of electricity or a business of the manufacture or production of any of the articles listed in Part IV of the First Schedule to the Finance Bill. On such profits, the rate of super-tax will be 29 per cent instead of 35 per cent. This concession of 6 per cent works out to 10 per cent of the normal rate of tax on such companies (income-tax 25 per cent plus super-tax 35 per cent or 60 per cent).

Exemption of Indian private limited companies wholly engaged in manufacturing or processing of goods or mining etc. from the requirement under section 104 of the Income-tax Act of compulsory distribution of dividends and relaxation of this provision in the case of non-investment companies.

While the rate of super-tax in the case of Sec. 104 companies is proposed to be increased, it is also sought to make certain concessions for them in regard to the statutory requirement of compulsory distribution of a specified percentage of their profits in order that they may be enabled to plough back a larger share of their profits in their industry and trade.

For this purpose it is proposed to exempt Indian companies whose business consists wholly in the manufacture or processing of goods, or in mining or the generation or distribution of electricity or any other form of power from the requirement of compulsory distribution of dividends. In regard to private limited companies (other than investment

companies), i.e. trading companies, it is proposed to make a provision in the IT Act enabling the Central Board of Direct Taxes to reduce the amount required to be distributed by them as dividends compulsorily to the extent of 20 per cent of the statutory percentage of distribution, if such reduction is justified having regard to the current requirements of the development of the business of the company.

It is also proposed to take powers for the Central Government to exempt by issue of a notification, any class of companies from the requirement of compulsory distribution of dividends, subject to any conditions, if it considers such a step necessary or expedient in the public interest.

The above provisions are designed to create the required conditions for the development of industry and trade in the private limited companies' sector consistently with the safeguarding of the interests of revenue.

(iv) Levy of an extra super-tax on Indian companies and other companies declaring and paying their dividends within India with reference to distribution of dividends on equity capital.

It is also necessary to discourage companies from frittering away profits by large distribution of dividends on their equity capital and to induce them to build up reserves for meeting their developmental needs in the future. It is, therefore, proposed to adopt the simple expedient of levying an extra super-tax calculated at the rate of 7.5 per cent of the amount of equity dividends distributed by them. Dividends on preference shares will not be subject to this levy as companies are under an obligation to pay such dividends at the stipulated rate. Companies which are required under the provisions of the Income-tax Act to distribute dividends compulsorily will also not be subjected to this levy. Further, as a new company takes some time to produce adequate profits for distributing any dividends on equity shares, it is proposed to grant them a concession. It is this: If more than 5 years have not elapsed since the declaration of their first dividend, no super-tax will be levied on the amount of their equity dividend up to 10 per cent of their paid up equity capital.

Rate of super-tax in the case of companies which have 'not' made the prescribed arrangements for the declaration and payment of dividends within India (i.e. foreign companies operating in India through branches or agencies) on income other than dividends and capital gains.

Increase in Super-tax

In the case of such companies, it is proposed to increase the rate of super-tax by 2 per cent from 38 per cent to 40 per cent. The overall rate of tax on such companies will then be 65 per cent (IT-25 per cent plus ST-38 per cent) under the previous year's Finance Act. A small increase in the rate of super-tax on such companies is justified as, intercorporate dividends have been exempt from super-tax, and that, by and large, such companies will not be liable to surtax because of the exemption from surtax of interest and royalty income and income from rendering technical services.

However, in order that foreign collaboration in our industries may not be adversely affected, it is proposed to provide that in respect of royalty income received by such a company from an Indian concern under an agreement after 1-4-1961 (when the Finance Act, 1961 was adopted) and fees for rendering technical services, received from an Indian concern under an agreement after 29-2-1964 approved by the Central Government, the rate of super-tax will be 25 per cent only. On such income the overall rate of tax will thus be 50 per cent only (IT-25 per cent and ST-25 per cent).

Rates of deduction of tax at source from dividends paid by an Indian company and any other company which declares and pays its dividends within India.

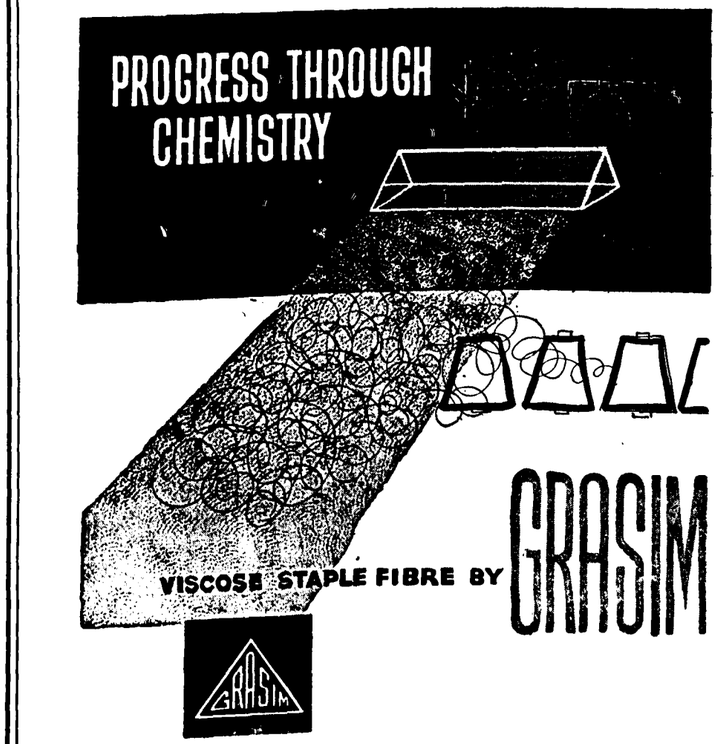
In the case of non-company shareholders who are resident in India, income-tax was deducted at source under the provisions of the Finance Act of the previous year at the rate of 30 per cent. It is proposed to reduce this rate by 10 per cent to 20 per cent only. This will give relief to resident shareholders whose income is of an amount which does not attract a high rate of income-tax. The shareholder will be enabled to have in his hands a higher immediate return from his share investments than before. This will minimise the hardship which sometimes arises when the issue of refunds happens to be delayed and render investment in shares more attractive.

In the case of companies the rate of deduction of income-tax at source from dividends will remain at 25 per cent as before. The only exception will be in the case of foreign corporate shareholders receiving dividends from an Indian section 104 company wholly or mainly engaged in a business of generation and distribution of electricity or the business of manufacture or production of any of the articles specified in Part IV of the First Schedule to the Finance Bill. On such dividends income-tax will be deducted at 15 per cent only because this is the rate at which income-tax is chargeable thereon on regular assessment in the case of foreign corporate shareholders.

In the case of company assessees, 'no super-tax will be required to be deducted at source from the dividends payable to them,' because, as stated before, inter-corporate dividends are proposed to be exempt from super-tax.

Export Incentive

It is proposed to continue the existing tax concession in relation to exports, to all assessees except foreign companies. These concessions are (i) a 10 per cent rebate of income-tax and super-tax payable on profits derived from the export of goods and merchandise outside India and (ii) a rebate of income-tax and super-tax calculated on 2 per cent of the amount of goods exported by a manufacturer or sold by him to another person in India and exported by such person directly.



It is, however, proposed to extend the second mentioned concession to 'non-jute' textiles exported after 29-2-1964 and to discontinue it in respect of certain articles such as arms and ammunition, photographic raw films and newsprint etc.

Abolition of restriction over salaries of Indian employees of companies to Rs. 5,000 per month and introduction of a new provision restricting the perquisites of employees of companies to 20 per cent of their salary.

The Finance Act, 1963 had introduced a provision in the Income-tax Act, 1961 under which any expenditure incurred by a company on the remuneration and perquisites of their 'Indian employees' in excess of Rs. 5,000 per month for each employee was required to be disallowed in computing the assessable income of the company. It is proposed to remove this provision as it is not only discriminatory against Indian employees but could also be circumvented in various ways such as payment of a salary to the same employee from more than one unit in a group of companies. There are already some provisions in the Companies Act regulating the remuneration of certain categories of office bearers of companies.

On the other hand it is proposed to restrict the expenditure incurred by companies after 29-2-1964 on providing perquisites to their employees, whether Indian or foreign nationality, to 20 per cent of their salary. Any expenditure in excess of this limit will not be allowed as a deduction in computing the assessable income of companies. This will put a healthy check on the proliferation of perquisites in the case of high paid employees and executives of companies. In computing this expenditure, payments by way of gratuity or contributions to recognised provident funds or approved superannuation funds and gratuity funds will not be taken into account.

31-3-1964 on advertisement, maintenance of guest houses, travelling etc.

There is a tendency among companies towards the incurring of excessive expenditure on advertisement and particularly on maintenance of expensive guest houses, unnecessary bookings in railways and planes and hotels and payments on a very high scale in respect of travelling and lodging and boarding allowances to big executives and directors. Such unproductive expenditure contributes in no small measure to an increase in the cost of living and is also incurred partly at the expense of the Exchequer and partly of the shareholders of the company. It is, therefore, proposed to make a provision laying down that such expenditure incurred after 31-3-1964 will be allowed as a deduction in the assessment of the business or professional income of an assessee only to the extent and subject to certain prescribed conditions. The circumstances in which such expenditure may be incurred are so many that it was not practicable to make specific provisions in the Income-tax Act itself. Necessary provisions will be made in the Income-tax Rules.

Provisions for encouraging investments by non-residents in securities in India and facilitating the import by Indian industrial undertakings of capital plant and machinery from abroad on credit facilities granted by non-residents.

In order to encourage foreign investments in approved securities (including debentures) in India, it is proposed to make a provision in the Income-tax Act exempting non-residents from tax on income from interest on approved securities.

Tax Exemptions

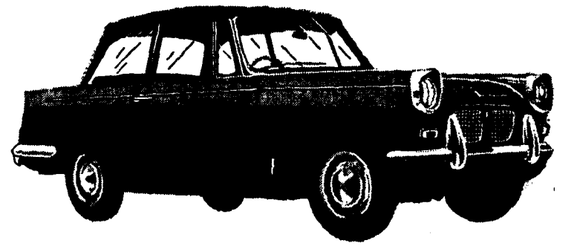
There is already a provision in the Income-tax Act under which a non-resident who advances moneys or allows credit facilities to an Indian industrial undertaking for acquiring capital plant or machinery or raw materials from abroad is exempt from tax on the interest that can be received by him from the industrial undertaking, provided the loan agreement has been approved by the Central Government. However, under this provision there could be no partial exemption of the interest calculated at a rate lower than that stipulated in the agreement. It may, however, not be desirable in many cases to allow exemption from tax on the interest calculated at the full rate stipulated in the agreement. Where the rate of interest is high and the entire amount is exempt from tax, the benefit passes on to the Exchequer of the home country of the non-resident where he is subjected to tax without allowing any double taxation relief because of the exemption allowed in India. It is, therefore, proposed to amend the existing provision so as to enable the Central Government to accord approval for exemption of the non-resident from tax on interest calculated at a rate lower than that stipulated in the loan agreement.

Liberalisation of the provision regarding exemption of foreign technicians from tax on salary income in India.

Under the existing provisions in the Income-tax Act, a foreign technician is entitled to exemption from tax on his salary income in India for a period of thirty six months, if his contract of service has been approved by the Central Government 'before the commencement of his service'. However, there are instances where the services of foreign technicians have to be engaged by Indian industrial undertakings at short notice which leaves no time for obtaining the prior approval of the Central Government to their contract of service. In order to get over this genuine difficulty, it is proposed that the exemption from tax will be available to the foreign technician even if the contract of his service has been approved by the Central Government within one year of his arrival in India.

Exemption of non-resident from tax on income attributable to purchase of goods in India which have been processed before export.

Under the existing provision in the Income-tax Act, a non-resident who purchases goods in India for export and maintains any office or agency in India for the purpose or subjects the goods to a manufacturing process before exporting them is liable to tax on the income attributable to such operations. It is proposed to do away with this provision as it acts as a disincentive in promoting the export of our goods outside India.



Exemption of foreign visiting professors and teachers from tax on salary income.

Professors and teachers of foreign nationality visiting our universities and other educational institutions play an important role in the progress and advancement of specialised studies in the fields of science, technology and arts in our country. Our high rates of progressive personal taxation give rise to difficulties in free utilisation of the services of foreign specialists and experts, particularly because the financial resources of our educational institutions are not large. It is, therefore, proposed to exempt from tax the salary income of professors and teachers of foreign nationality, subject to the approval of the contract of their services by the Central Government, on the same conditions as are applicable to the exemption of foreign technicians.

Rebate of tax to resident individuals of foreign nationality

on amounts spent for education of children in a foreign country.

Foreign managerial personnel and specialists who take up employment in companies and business firms in India have generally to educate their dependent children in foreign countries as boarding house students which involves considerable expenditure. Under the taxation laws of several countries, an allowance is given from the assessable income for meeting the cost of education of dependent children. For instance, in the UK, an individual is entitled to a deduction of £150 for the education of each dependent child receiving full time education. Having regard to the expenditure which foreigners resident in India have to incur on the education of their children abroad, it is proposed to allow them a rebate of income-tax and super-tax on such expenditure out of their assessable income, on an amount limited to Rs. 4,000 (Rs. 2,000 for each child up to 21 years of age, up to two children) or 25 per cent of their total income, whichever is less.

Direct Taxation

The rate structure of taxation of personal incomes and the incomes of unregistered firms, associations of persons etc. has been in need of overhauling because of its haphazard development through successive years with frequent sporadic increases and occasional reductions in the rates and changes in the income slabs. Also, it has been overburdened, in this process, by a multiplicity of overlapping surcharges. The large number of surcharges also results in too many refinements in calculations which are inconvenient both to the assessees and the Department. Apart from the aspect of simplification of the system, some of the important factors have to be kept in view. These are: the burden of taxation on earned income should be appreciably lighter than on unearned income above a certain lower limit; the overall burden of taxation at all levels of income should be so regulated that it leaves scope for the generation of savings and promotion of investment for a healthy growth of the economy. The tax burden on the assessees in the lower and middle income groups which went up considerably due to the imposition of the additional surcharge calculated on the whole of their residual income without any exemption also needed to be tempered down. In the context of our developmental and defence needs, it was also necessary to adopt measures for a systematic mobilisation of savings from amongst assessees of the middle income group upwards. The proposals in the budget regarding taxation of personal incomes and of the incomes of unregistered firms, association of persons etc. have been drawn up in the light of these objectives and purposes.

Changing of rate structure of income-tax and super-tax and replacement of the numerous existing surcharges by a single Union surcharge on income-tax and on super-tax.

The existing structure of income-slabs and basic rates of income-tax and super-tax have been replaced by a new simplified rate schedule of income-tax and super-tax, with a smoother progression curve. The maximum rate of income tax above the income slab of Rs. 20,000 remains at 25 per cent as before but in the schedule of rates of super-tax, the maximum rate of 47.5 per cent applicable under the Finance Act of the previous year to income above Rs. 70,000 has been rounded off upwards to 50 per cent.

The existing diverse surcharges on income-tax including the additional surcharge introduced last year and also the existing surcharges on super-tax are proposed to be abolished.

DC-57B

and replaced by a single Union surcharge on income-tax and on super-tax. Earned income up to Rs. 1 lakh will not attract any surcharge. Only where such income exceeds Rs. 1 lakh, a surcharge will be leviable at the rate of 10 per cent of the income-tax and super-tax chargeable on the excess amount.

Unearned income not exceeding Rs. 10,000 will also not be liable to surcharge. However, where such income is above Rs. 10,000 but does not exceed Rs. 25,000, a surcharge will be leviable at 12.5 per cent of the income-tax/super-tax payable on the whole of the unearned income subject to marginal relief on unearned income between Rs. 25,001—75,000 the rate of the surcharge will be 15 per cent, and in a case where such income exeeds Rs. 75,000, the rate will be 17.5 per cent.

With the abolition of the additional surcharge on income-tax for the assessment year 1964-65, the requirement of making deposits under the Compulsory Deposit Scheme Act, 1963 will automatically cease to operate. Assessees who have made advance deposits during the financial year 1963-64 in respect of income 'other than salaries' assessable for the assessment year 1964-65 will be entitled to a refund of the deposit with interest. However, in respect of salary income earned during 1963-64 and assessable for the assessment year 1964-65, deposits made during the financial year 1963-64 will not be refundable. This is because salary income assessable for the assessment year 1964-65 will be chargeable to tax under the operation of the Finance Act, 1963.

Annuity Deposit Scheme

It is proposed to make a provision from the assessment year 1964-65 onwards for the making of compulsory 'annuity deposits' by all assessees resident in India having an income exceeding Rs. 15,000. Exceptions are individuals who are not citizens of India and registered firms, local authorities, co-operative societies, companies and corporations established under a Central, State or Provincial Act.

The amount of the annuity deposits will be calculated on the 'adjusted total income' of an assessee at the rates prescribed under the clause 3 of the Finance Bill. The rates of annuity deposits are 5 per cent in the case of assessees whose total income is between Rs. 15,001—20,000; 7.5 per cent between Rs. 20,001—40,000; 10 per cent between Rs. 40,001—70,000 and 12.5 per cent over Rs. 70,000. An assessee whose total income includes any gratuity may, at his option deposit an additional amount of 50 per cent of such gratuity. Musicians, authors, artists, playwrights may also, at their option, deposit an additional amount of 15 per cent of their total income.

The 'adjusted total income' on which the amount of annuity deposit required to be made is calculated is arrived at by deducting from the total income certain items such as any past arrears of salary, balances in a provident fund transferred to the credit of an employee participating in a recognised provident fund, and any share of income from an unregistered firm or association of persons, where such firm or association is liable to make a deposit. For the assessment year 1964-65, any salary income earned during the financial year 1963-64 will also be excluded in arriving at the 'adjusted total income'. (This is because salary income earned during the financial year 1963-64 is assessable for the assessment year 1964-65 under the provisions of the Finance Act, 1963).

The amount of annuity deposit which an assessee is liable to make for an assessment year will be allowed as a deduction in computing his assessable income for that assessment year.

The deposits will be repayable in ten annual equated instalments of principal and interest at the rate notified by the Central Government. The annuity (both principal and interest) will be chargeable to tax as the income of the depositor for the year in which it is due to be paid.

Annuity deposits will be required to be made in advance during each financial year in respect of the assessee's income assessable for the assesment year next following that financial year. In the case of existing assessees who are liable to make deposits, notices for making advance deposits will be issued by the Income-tax Officer on the basis of the latest completed regular assessment for the assessee. The amount can be reduced if the assessee estimates that his current income would be less than the income on the basis of which the Income-tax Officer has issued the notice for advance deposit. New assessees who may be liable to make a deposit will be required to send an estimate of their total income and the amount which they are liable to deposit to the Income-tax Officer concerned before 1st March, and to make the deposit by the 15th March at the latest.

In calculating the advance tax payable under the Income-tax Act, the advance annuity deposit which an assessee is liable to make will be deducted from his income subject to payment of advance tax. Likewise, in calculating the amount of tax required to be deducted at source from salary income, the amount of annuity deposit calculated in respect of that income at the rates prescribed in the Finance Act will be deducted, whether the deposit has actually been made or not.

In respect of the income assessable for the assessment year 1964-65, annuity deposits are required to be made at the time when the tax is payable, but not later than the 31st March, 1965.

Any arrear dues of annuity deposit are recoverable like arrears of taxes under the provisions of the Income-tax Act. If a person fails to make the annuity deposit in due time, he will be liable to the imposition of a penalty not exceeding

PUNJAB NATIONAL BANK LTD.

The Oldest name in Modern Indian Banking

50 per cent of the amount he was liable to deposit.

The Central Government is enabled under the provisions relating to annuity deposits to frame a scheme to provide, 'inter alia', for the manner in which such deposits shall be made, the manner and intervals of payment of the annuities, the authorities by whom the annuities may be issued and all other matters which may be necessary or proper for the effective implementation of the scheme.

Features distinguishing the annuity deposit scheme from the compulsory deposit scheme.

(1) Annuity deposits will be required to be made by assessees whose total income exceeds Rs. 15,000.

(2) Persons in the higher income brackets are required to make a larger amount of deposit than persons in the lower brackets.

(3) The annuity deposits are deductible in computing the assessable income of an assessee.

(4) The annuity due to a depositor is chargeable to tax, both as to principal and interest as his income for the year in which it is due to be paid.

An assessee gets an initial advantage of a saving in tax due to the deduction of the annuity deposit in computing his assessable income but he is liable to pay tax on it over a deferred period of 10 years.

(5) Compulsory deposits are refundable after five years but annuity deposits are repayable annually in 10 equated instalments of principal and interest.

The effect of the revision of the rate structure of income-tax and super-tax, replacement of the existing surcharges by a single surcharge on income-tax and super-tax, and the introduction of the annuity deposit provisions is that there will be a reduction in the amount of tax payable at most levels of income. However, in the case of assessees in the income bracket above Rs. 15,000 who are required to make annuity deposits, the aggregate of the tax payable and the annuity deposit will be a little higher than the aggregate of the tax payable under the rates for 1963-64 and the element of compulsory deposit. This difference is due to the fact that the annuity deposits work out at an amount higher than the amount of compulsory deposit.

Grant of a rebate of super-tax in respect of sums paid as life insurance premiums etc.

So far, a rebate of income-tax alone was admissible in respect of sums paid as life insurance premiums, contributions to recognised provident funds, approved superannuation funds and deposits in the Post Office under the Cumulative Time Deposit Scheme. In order to encourage long-term small savings by individuals and Hindu undivided families, it is now proposed to allow a rebate of super-tax also in respect of such payments. The total amount of the income-tax and super-tax rebate allowable will, however, be limited to a maximum of 50 per cent of the payments qualifying for relief. The existing limits of the payments qualifying for relief are not being changed.

Taxation of Capital Gains

Several important changes in the existing system of taxation of capital gains are proposed to be made in order to remove some anomalies and shortcomings in the present provisions.

Long-term capital gains: Such capital gains, i.e., gains relating to capital assets held by the assessee for more than one year are usually taxed at a concessional rate because the

TOWARDS A WELFARE SOCIETY

The object of Planning is not merely to increase production but also to ensure equality of opportunities to all sections of people.

* The Government of Madras is aware of this and its programme of social security covers the most vulnerable sections of population.

* **Old Age Pension Scheme:** About 62,000 pensioners have already been admitted at a cost of Rs. 135 lakhs in the current year.

* **Free Education** is provided for all children of low paid Government Servants and poor persons.

* **The Midday Meals Scheme** now covers all schools provided much-needed nourishment to poor children.

* **Employees' State Insurance Scheme:** which is intended to benefit industrial labour is being extended.

accretion to the value of such assets takes place over a period longer than a year. Under the existing provisions, the tax on long-term capital gains in the case of non-company assessees is, therefore, limited to 25 per cent of the amount of such gains. This limit, however, results in a benefit only to those assessees whose total income is high so as to attract an average rate of tax above 25 per cent. Assessees having a small total income attracting an average rate of tax equal to or below 25 per cent do not get any benefit as the ceiling does not operate in their cases and they have to pay tax on long-term capital gains at the full average rate applicable to their total income, which is inequitable. It is, therefore, proposed to provide that in the case of assessees 'other than companies', the tax on long-term capital gains relating to 'lands and buildings' will be charged 'at 75 per cent of the average rate' applicable to their total income and in respect of other types of long-term capital gains, tax will be charged at '50 per cent of such average rate'. A higher tax on long-term capital gains relating to lands and buildings is fully justified because of the sharp rise in the prices of lands and buildings in recent times partly due to the limited availability of lands and buildings and increasing industrialisation and urbanisation and partly due to the activities of speculators.

Long-term Capital Gains

In the case of company assessees, the rate of income-tax on long-term capital gains will be 25 per cent as before. However, in respect of long-term capital gains relating to lands and buildings, it is proposed to increase the super-tax from the existing rate of 5 per cent to 15 per cent. In respect of other types of long-term capital gains, the rate of super-tax on companies will remain at 5 per cent.

Tax on capital gains in respect of bonus shares on accrual basis.

At present, tax is charged on capital gains in respect of bonus shares (as in respect of any other capital asset), only when such shares are actually disposed of by an assessee. However, the distribution of a bonus share by a company to an equity shareholder results in an immediate and definite accretion to his share capital and thereby it distinctly adds to his taxable capacity. In the circumstances, there is no valid justification for postponing the charging of tax on such capital gains till the time of actual transfer of the bonus shares by the assessee. It is, therefore, proposed to charge tax on capital gains in respect of bonus shares held by an investor in equity shares as if such shares were transferred by him at their fair market value on the 31st day from the date of their distribution. When the bonus shares are actually transferred by the assessee subsequently, their fair market value on 31st day will be taken to be their cost to the assessee for the purpose of determining the amount of capital gains or loss arising to him from the actual transfer.

Provision for countering the under-statement of the full value of consideration of a capital asset.

Often the full value of the consideration received for the transfer of a capital asset is grossly understated by unscrupulous assessees in order to reduce their liability to tax on capital gains. The additional amount of the consideration is received in such cases in cash, off the record, and it becomes very difficult to establish by evidence that the full value of the consideration has been understated. In order to get over this difficulty, it is proposed to make a provision that if in the opinion of the Income-tax Officer the 'fair market value' of a capital asset 'as on the date of its transfer' exceeds the full value of the consideration as 'declared' by the assessee by an amount not less than 15 per cent of such declared value, the capital gains in respect of such asset will be computed with reference to such fair market value. The Income-tax Officer will be required to obtain the previous approval of the Inspecting Asstt. Commissioner before applying this provision. If the assessee is not satisfied with the determination of the fair market value, it will be open to him to have the dispute referred to a committee of valuers for arbitration, at the stage of his appeal against the assessment before the Appellate Tribunal.

Development Rebate

Under the existing provisions of the Income-tax Act, assessees who acquire and instal new machinery or plant in their business are entitled to a deduction from their assessable income by way of development rebate at a uniform rate of 20 per cent of the cost of such machinery, except in the case of coal mining machinery plant installed during the period 1-4-1963 — 31-3-1966 for which the rate is 35 per cent. In respect of a new ship acquired by an assessee, the rate of development rebate is 25 per cent of its cost. It would be desirable to replace the existing system of allowing development rebate to all industries on a uniform basis by one of granting the rebate to selected industries on a graduated basis depending on appraisal of the developmental needs of important groups of industries. However, a sudden change would cause hardship to concerns which have already undertaken expansion programmes on the assumption that development rebate will continue to be available. In view of this position, a provision is proposed to be made enabling the Central Government to withdraw the deduction of development rebate by giving a '3-year' notice. The effect of the provision for the 3-year notice will be that any ship acquired or machinery or plant installed 'during a period of three years from the date of the notification issued by the' Central Go-

vernment' will continue to qualify for the development rebate.

Allowance of development rebate in respect of second hand ships acquired from a non-resident or machinery or plant newly imported from abroad, under certain conditions.

Under the existing provisions, a ship or machinery or plant should be new in order to qualify for development rebate. However, it would, sometimes, be desirable and expedient (from the point of view of quicker delivery and also economy in expenditure of foreign exchange) to allow development rebate in respect of second hand ships acquired from a non-resident or second hand plant or machinery in a good condition newly imported from abroad. It will, however, be necessary to lay down necessary conditions in order to ensure that this concession is not abused by assessees by importing second hand machinery which may be obsolete or not in a good condition at inflated prices from connected concerns in order to obtain the benefit of development rebate. It will also be justified to lay down a differential rate of development rebate for second hand ships or machinery or plant. Provisions for this purpose will be made in the Income-tax Rules after a careful examination of the issues involved. A provision enabling the grant of development rebate in respect of second hand ships or machinery or plant and empowering the Central Board of Direct Taxes to make provisions in the Income-tax Rules has been incorporated in the Finance Bill.

Provisions for expediting tax collections, countering tax evasion and bringing tax offenders to book more effectively.

'Requirement of payment of tax on self-assessment on the basis of the return filed'. The Finance Act of the previous year introduced a provision in the Income-tax Act under which an assessee who paid the tax dues on the basis of his return of income or on assessment by the Income-tax Officer by the 31st December of the relevant assessment year was entitled to a discount of 1 per cent of the tax so paid. Conversely, an assessee who does not pay his tax dues before the 1st January of the relevant assessment year was liable to pay interest at 2 per cent per annum on the amount of the tax due from him from 1st January to the date of payment. The inducement of 1 per cent discount is, however, not effective enough to ensure payment of tax on self-assessment basis. The provision for charging interest at 2 per cent per annum also resulted in an unproductive increase of calculation work involving small amounts.

It is, therefore, proposed to replace it by a new one. Under this provision an assessee whose net tax liability on the basis of his return exceeds Rs. 500 will be required to pay the tax on self-assessment within thirty days of filing the return of income. If he fails to do so, a penalty not exceeding 50 per cent of the tax payable by him will be imposed. The margin of Rs. 500 has been kept in order that small assessees and non-residents having a small income in India may not be put to inconvenience. This provision is designed to expedite the collection of taxes.

Assessment of value of any benefits or perquisite received by a person in excercise of his business or profession.

At present, there is no provision in the Act enabling the assessment of the value of a perquisite or benefit secured by a person engaged in a business or profession from another person in return for valuable consideration or services rendered, e.g., the rental value of a rent-free house availed of by a lawyer from a firm in return for his professional services to

FERTILIZER CORPORATION OF INDIA LIMITED

KEY ROLE IN INDIA'S GROWING ECONOMY

The Fertilizer Corporation of India is the biggest producer of chemical fertilisers in the country. The total capacity of the Corporation's existing production units and the chain of new projects under implementation will be 6,32,000 tons of Nitrogen and 45,000 tons of Phosphate annually.

About 47¾ lakh tons of nitrogenous fertilisers, valued at over Rs. 147 crores, already produced in the Corporation's operating factories have made a very substantial contribution in enriching the soil and increasing crop yields.

The Corporation has built up adequate technical know-how and talent to design, engineer and build fertiliser plants. The first complete fertiliser plant in India to be designed, engineered and built by the Corporation will be at Korba in Madhya Pradesh with a capacity of 1,00,000 tons of Nitrogen annually.

Chemical fertilizers are the farmer's best investment.
More fertilizers mean more agricultural production.

THE FERTILIZER CORPORATION OF INDIA LTD.
New Delhi

the firm. This loophole for avoidance of tax is now sought to be plugged.

Assessment of unexplained money or valuable articles.

In order to bring hidden hoards of wealth under assessment, it is proposed to make a provision to the effect that if an assessee is found, in any financial year, to be the owner of any money, bullion, jewellery or any other valuable articles not recorded in the books of account and fails to explain satisfactorily the source of acquisition of such money, bullion etc., the money and the value of such articles may be deemed to be his income for that financial year.

Levy of penalty for concealment of income.

Under the existing provisions in the Act, an assessee can be penalised for concealment of income only if the Income-tax Department is able to establish through positive evidence that the assessee had concealed his income or deliberately furnished inaccurate particulars. However, in practice, it becomes very difficult for the Department to discharge the onus of proving a deliberate concealment of income because the relevant facts and evidence remain with the assessee and the Department can proceed only on the basis of whatever evidence it can marshall in the face of opposition and manipulations by the assessee. It is now proposed that where the income declared by an assessee in his return is less than 90 per cent of the assessed income (reduced by expenditure incurred 'bona fide' for earning the income, but disallowed in the assessment), the assessee shall be deemed to have concealed his income or furnished inaccurate particulars and will be liable to penalty accordingly, unless he produces proof to establish his 'bona fides'. The onus for proof of the correctness of the return will thus be shifted, and rightly so, on the assessee. This will be in line with the law in Britain.

Income-tax Officer's powers of survey.

The Income-tax Officer should be able to make a survey for new assesses and to detect undisclosed books of accounts. Under a new provision proposed the Income-tax Officer (or an Inspector of Income-tax authorised by him) may enter any premises in his jurisdiction where any business or profession is carried on by an assessee and to inspect any books of account or documents there, to take extracts and to place marks of identification on them.

Search & Seizure

Powers of search and seizure: It is proposed to replace the existing provision in section 132 of the Income-tax Act. This enables the Commissioner of Income-tax to authorise an Income-tax Officer to search any premises for any books of account or documents which may be useful for any proceedings under the Act and to seize them. Under the new provision, the Commissioner can authorise any Inspecting Assistant Commissioner or Income-tax Officer to search any premises if he has reason to believe (based on information) that a person has failed to produce account books or documents or is not likely to comply with a requisition or is in possession of any articles or things (including money) wholly disproportionate to his known sources of income. The officer so authorised can seize any account books or documents, place marks of identification on them and make a note or inventory of any articles or things or money found in the premises which in his opinion will be relevant to any proceedings under the Act.

Returns of income to carry an affirmation as to their correctness.

In the form of return of income prescribed in the Income-tax Rules, verification is in the form of a declaration by the assessee that to the best of his knowledge and belief, the information given is correct and complete and that the income shown has been truly stated. It is now proposed to substitute the 'declaration' by an 'affirmation' by the assessee so as to induce in a greatest measure of care and truthfulness in the declaration of the particulars required to be given in the return.

Abolition of provisions in the Income-tax Act and other direct taxes' enactments prohibiting the disclosure of information contained in assessment records.

The Income-tax Act, the Wealth-tax Act and other direct tax enactments contain provisions prohibiting the disclosure of information contained in the assessment records of an assessee. These secrecy provisions give rise to manifold difficulties in furnishing information in the public interest to courts and various departments of Government and other bodies and for making inquiries in matters relating to tax offences or enquiries about the wealth of assessees in connection with disciplinary proceedings started against them by the Department in which they are employed. To overcome these difficulties a large number of exemptions to these provisions have been made from time to time, making them quite cumbersome. The ban on disclosure of information still however persists and it stands in the way of proper investigation of concealed income and wealth. It also stands in the way of publication by the Central Government of relevant information about assesseees, if such publication is considered by it to be in the public interest. It is, therefore, proposed to do away with the secrecy provisions altogether in the Income-tax Act and all other direct tax enactments. It is also proposed to enable the Commissioner (the Controller in respect of Estate Duty) to give information about any assessee in regard to assessments to any person on his application and on payment of the prescribed fee, if the Commissioner (or Controller) is satisfied that the information sought need not be refused. It is also proposed to enable the Central Government

to publish the names of any assessees and any particulars relating to assessment proceedings in respect of such assessee, if it is considered necessary or expedient in the public interest to do so. However, publication of the imposition of a penalty or any conviction for an offence connected with any proceedings for assessment would be made only after the expiry of the time limit for filing the first appeal or after the disposal of the first appeal.

Punishment of tax offenders, on conviction, for making false statements in declaration or abetment of false returns etc.

Under the existing provisions, the punishment for such offences is simple imprisonment up to six months or a fine up to one thousand rupees or both. It is now proposed that the punishment should be rigorous imprisonment for a minimum term of six months (unless special and adequate reasons to the contrary have been recorded in the judgment delivered by the Court) and a maximum term of two years.

Amendments to the Wealth-Tax Act.

The following changes are proposed to be made in the Wealth-tax Act, 1957:

(i) Exemption from wealth-tax of the value of a residential house or part of it.

Residential Houses

The existing exemption, in effect, applies only to a residential house situated in a village or a small town. It is desirable to allow this exemption in respect of a house or part of it belonging to the assessee and exclusively used by him for residential purposes even where such a house is situated in a large town or city, subject to a suitable limit on the amount qualifying for exemption. A provision has been made accordingly. If, however, such house is situated in a place with a population exceeding ten thousand, the amount to be excluded from the assessable wealth of the assessee will not exceed Rs. 1 lakh.

(ii) Changes in the rate schedule of wealth-tax.

Under the existing rate schedule of wealth-tax individuals are entitled to a basic exemption on the first Rs. 2 lakhs of the value of their assessable wealth. In the case of Hindu undivided families, the amount so exempt is Rs. 4 lakhs. These limits are too high in the context of our social and economic conditions. It is, therefore, proposed to reduce them to Rs. 1 lakh and Rs. 2 lakhs respectively in the cases of individuals and Hindu undivided families. The rate of wealth-tax on the next slab of Rs. 4 lakhs (Rs. 3 lakhs in the case of Hindu undivided families) has been fixed at 0.5 per cent only, as against the existing rate of 1 per cent. The rate of wealth-tax on the slab between Rs. 10—20 lakhs has been raised from 1.75 to 2 per cent. On wealth in the slab over Rs. 20 lakhs, the existing rate of 2.5 per cent is proposed to be continued.

Revival of the levy of Expenditure Tax, proposed amendments.

As has been stated earlier, it is necessary to adopt measures for putting a healthy restraint on the rising level of consumer spending in order to keep the forces of inflation under control and prevent further increases in the price level. To achieve this purpose, it is proposed to revive the levy of expenditure-tax with effect from the assessment year 1964-65.

The previous Finance Minister had discontinued the levy on the ground that it was unproductive and ineffective. This, is, however, due to the fact that the Act contains too many provisions for exemptions, deductions and allowances. It is, therefore, proposed to remove some of these exemptions and deductions such as expenditure on purchase of products of cottage industries and work of art, purchase and maintenance of livestock, celebration of marriages, medical treatment, purchase of household goods, payment of customs duty on articles imported for personal use etc. It is also proposed to withdraw the deduction of 75 per cent of the average annual expenditure for 3 years prior to the previous year for the assessment year 1958-59 which was admissible to assessees who made a claim before making the return for the assessment year 1958-59.

Changes in the rates of expenditure-tax.

The existing rate schedule of expenditure-tax applicable to individuals and Hindu undivided families is to be substituted by a new rate schedule. The rates under the new rate schedule are considerably lower than the existing rates. The first slab of Rs. 36,000 of taxable expenditure has been exempt from expenditure-tax. This exemption takes the place of the basic allowance available to individuals and Hindu undivided families under clause (h) of section 6(1) of the Act which is now sought to be withdrawn. Under the revised rate schedule, the highest rate for the assessment years 1964-65 and 1965-66 which will be attracted on expenditure over the slab of Rs. 72,000 will be 15 per cent and from the assessment year 1966-67 onwards the highest rate which will be attracted on taxable expenditure over the slab of Rs. 84,000, will be 20 per cent.

Restraint on Spending

The expenditure tax, it is emphasised, is intended to be more of a measure for placing a restraint on excessive spending than to bring in large returns of revenue.

Proposed amendments to the Estate Duty Act.

The main changes proposed to be made in respect of estate duty are

(i) Levy of estate duty in respect of agricultural lands situate in Orissa, passing on deaths taking place on or after 23rd September, 1963.

Following a Resolution dated 23rd September, 1963 by the State Legislature of Orissa under terms of Article 252 of the Constitution, it is proposed that estate duty shall be leviable in respect of agricultural lands situated in the State. The amendment will take effect from the date of the Resolution.

(ii) Exemption from estate duty of the principal value of a house or part thereof used exclusively for residence by the deceased.

It is proposed that the principal value of a house or part of it which was exclusively used by the dead person for his residence will be exempt from estate duty, subject to the condition that if the house is situated in a place with a population exceeding ten thousand, the amount on which exemption will be available will not exceed Rs. 1 lakh.

(iii) Changes in the rates of estate duty: Under the existing rate schedule, the first Rs. 50,000 of the value of the estate is free from duty and, therefore, the rates rise from 4 per cent on the slab of Rs. 50,000 through a slow progression to 40 per cent; that is highest rate applicable to the value of an estate over Rs. 50 lakhs. These rates are very low, as compared with the rates of estate duty in advanced western countries such as Britain where the maximum rate is 80 per cent. In order to reduce inequalities in wealth acquired adventitiously by succession or inheritance, it is necessary to raise these rates considerably. The rate schedule of estate duty has, therefore, been recast. Under this schedule, the rate of 40 per cent will be reached on an estate's value above Rs. 10 lakhs. The rate will go up to 50 per cent on the next slab of Rs. 5 lakhs and the maximum rate on an estate's value above Rs. 20 lakhs will be 85 per cent.

Gift Tax Act

The gift-tax is complementary to estate duty. Its purpose is to put a restraint on the passing of wealth by wealthy persons to their relations, nominess or other beneficiaries by way of gifts within their life time. By making such gifts, assessees not only reduce their tax liability on the income which would have otherwise arisen to them from the gifted wealth, but also reduce the liability to estate duty on the estate passing on their death. By mopping up a portion of the wealth passed on in this manner the gift tax effectively achieved an important social purpose also. The main amendments proposed are:

(i) Reduction of the amount of exemption in respect of value of gifts by an individual to his or her spouse.

It is proposed to reduce the amount of the exemption from gift-tax in respect of gifts by an individual to his or her spouse in one or more previous years, from the existing aggregate limit of Rs. 1 lakh to Rs. 50,000.

(ii) Aggregation of gifts made to the same donee during the relevant previous year and the four years immediately proceeding that year.

It is proposed that where an assessee has made taxable gifts to the same donee during the relevant previous year and during any one or more of the four years immediately preceding such previous year, the value of the gifts made to such donee during these four years will be aggregated with the value of the taxable gifts made by the assessee during the relevant previous year. The value of taxable gifts made to such a donee in the four earlier years, prior to 1st April, 1963 will be taken into account in the assessment of the assessee only for rate purposes. The value of taxable gifts to such a donee (during the earlier four years) after 31st March, 1963 will be taken into account both for rate purposes and charging gift-tax on the assessee for the relevant assessment year. However, any gift-tax paid by the assessee in

respect of the value of such gifts (made after 31-3-1963) for any of the four earlier years will be allowed as a deduction in computing the amount of gift-tax payable by the assessee.

(iii) Changes in the rate schedule of gift-tax. It is proposed to substitute the existing rate schedule of gift-tax by a new schedule. Under the existing schedule, the maximum rate is 40 per cent which is applicable on the value of gifts in the slab over Rs. 50 lakhs. The highest rate proposed now is 50 per cent, which will apply to the slab over Rs. 3,45,000. On the value of gifts falling in the slab between Rs. 1,45,000 and Rs. 3,45,000 the rate of gift tax will be 40 per cent.

Relief for Lower Incomes

A statistical analysis shows the comparative incidence of tax at different levels of earned and unearned personal incomes, between Rs. 4,200 and Rs. 20,000 at the rates of income-tax and surcharges (including the additional surcharge) applicable for the assessment year 1963-64 and the rates of tax and surcharge proposed for the assessment year 1964-65, taking into account also the annuity deposits in respect of incomes above Rs. 15,000.

Comparing the tax including the surcharges payable for the assessment year 1963-64 before deducting compulsory deposit with the tax and surcharge payable for the assessment year 1964-65, the burden for 1964-65 up to incomes of Rs. 15,000 is considerably lower than the burden for 1963-64.

In respect of earned income, (as compared with the tax liability for 1963-64 after deducting the element of compulsory deposit,) the incidence of tax for 1964-65 will be lower at all levels except those at Rs. 6,000, Rs. 9,000, Rs. 10,000, Rs. 11,000, Rs. 14,000 and Rs. 15,000. The maximum difference is Rs. 19 which occurs at the level of Rs. 10,000. At Rs. 15,000, the difference is Rs. 13 only. In respect of unearned income also, the incidence of tax for 1964-65 is lower at all levels except the levels between Rs. 11,000 and Rs. 15,000, the difference being from Rs. 16 to Rs. 47. These small variations of isolated levels of income are consequential to a revision of the rate structure.

On incomes exceeding Rs. 15,000, an annuity deposit is required to be made by the assessee. As this deposit is deductible in arriving at the income chargeable to tax, the assessee gets the benefit of a tax saving in respect of the year for which the deposit is made. However, the total amount which assessees with incomes above Rs. 15,000 have to pay by way of tax together with the annuity deposit works out to an amount which is a little higher than the tax together with the amount of compulsory deposit for the assessment year 1963-64.

The result is that the "take-home-pay-packet" in the case of assessees upto Rs. 15,000 will generally be fatter this year and the burden on incomes in the lower brackets will be substantially lower than what it is now.

Union Excise Duties

This year's Budget proposals envisage an additional taxation of Rs. 25.91 crores in indirect taxes of which the Customs duties would account for Rs. 6.37 crores and the balance of Rs. 19.54 crores from Union Excise duties. No part of the increase in Customs revenue is shareable with the States, whereas Rs. 39 lakhs out of the increase in excise duties has to be deducted as the States' share thus giving a net revenue of Rs. 19.15 crores of Union Excise duties as the Centre's share.

This is due almost entirely to the increase in the levies on the following three items, namely :

(i) Iron and Steel (in crude form and products),
(ii) Cotton textiles, and
(iii) Rayon & synthetic fibre and yarn.

Iron and Steel Products : The increases in the effective rates of duty made are principally on pig iron, steel ingots, semi-finished steel including rolled products and all flat products. The cumulative effect of the increase would yield an additional revenue of Rs. 11.81 crores. These increases are consequential to the abolition of the surcharge on iron and steel. The accruals to the Iron & Steel Equalisation Fund in the financial year 1963-64 were on an average at the rate of Rs. 1 crore per month. The increase in the excise levies would thus just counter-balance the financial effect of the abolition of the surcharge. There should thus be no perceptible overall increase in the prices of iron and steel products. The ceiling rates of some of the iron and steel products are substantially higher than the effective rates fixed at present and it should still be possible for the Government to increase the effective rates further should it become necessary to do so because of market prices rising unduly, following the decontrol of prices of several iron and steel items announced recently.

By rationalisation of the tariff and effective rates of duty the excise control is being further simplified by withdrawal of control on the vast majority of the manufacturers other than the primary and the secondary steel makers. The effective rates

	(i) Black sheets	96.85	110.00*
	(ii) Galvanised sheets	99.35	110.00*
	(iii) Hoops and strips	99.35	110.00*
6.	Skelp	91.85	150.00*
7.	Seamless pipes & tubes	5% Ad Val. + Rs. 39.35	110.00*
8.	Other pipes & tubes of steel	5% Ad Val. + Rs. 39.35 (Ingot duty)	Exempted if made from duty paid plates, sheets or skelp. Hence net duty comes to Rs. 110 or Rs. 150 per tonne.
9.	Cast Iron pipes & tubes	5% Ad Val. + Rs. 10.00 (Pig Iron duty)	Exempted if made from duty paid iron in crude form. Net duty comes to Rs. 30 per tonne.
10.	Steel casting	5% Ad Val. + Rs. 39.25 (Ingot duty)	Exempted if made from duty paid Ingots or semis. Hence net duty comes to Rs. 50 per tonne.

*Effective rates by notification.

of duty on the major items of iron and steel products as a result of the Budget changes as compared to the effective rates before 1-3-64 are shown in Table A (p. 563).

Cotton Textiles: The adjustment in the rates of duty on cotton textiles is expected to bring in an additional revenue of Rs. 6,95 crores. The changes made are consequent on the process of transferring the excise levy from grey cotton fabrics to yarn; this year part of the burden has also been transferred to processed fabrics of superior varieties. No doubt the increase on yarn has been substantial, but this additional incidence is sought to be mostly offset by the reduction on all varieties of grey fabrics particularly in the coarse and medium categories. Care has been taken to see that in regard to yarn supplied to the handloom sector in hanks, the margin of preference already enjoyed is not only retained but also in most cases enlarged. That is why duty on yarn in hanks has been fixed at much lower rates. Similarly the total incidence of duty on the finished and grey fabrics is more on the finer varieties than on the coarser ones. The cumulative effect of the changes on the grey fabrics manufactured in the different sectors of the textile industry are set out in Table B. Theoretically and in terms of averages the Budget changes should cause the following changes in the grey and process fabrics on different varieties as follows :

	Grey per Sq.M. nP.	Processed per Sq.M. nP.
Superfine	(+)0.25	(+)5.2
Fine	(+)1.54	(+)5.5
Medium A	(+)0.34	(+)5.4
Medium B	(+)0.24	(+)0.25
Coarse	(—)1.24	(—)1.2

It will thus be seen that the burden of the increase will be principally borne by the finer varieties; there is in fact reduction on the coarse varieties and only a marginal increase on the medium ones. The likely increases as a result of the Budget changes on selected popular varieties of fabrics are shown in Table C.

Synthetic fibres and yarn: The increases made in synthetic fibres and yarn would yield an additional revenue of Rs. 4.7 crores. The increases are relatively higher on non-

TABLE B.

COMBINED INCIDENCE OF YARN AND GREY FABRIC DUTY ON COTTON FABRICS PRODUCED IN DIFFERENT SECTORS OF INDUSTRY

(In nP. per Sq. metre)

S. No.	Description	Existing total yarn & fabric duty (grey stage) before 1-3-64	Proposed total yarn & fabric duty (grey stage) from 1-3-64

	(iii) Medium A	16.86	17.20
	(iv) Medium B	13.86	14.10
	(v) Coarse	9.94	8.70

Note: Yarn duty includes basic and special excise duties. Fabric duty includes basic, additional (in lieu of sales-tax) and handloom cess.

cellulosic synthetic yarns such as 'Terylene', 'Nylon and Dacron.' These yarns are used in higher priced fabrics which are not in any case, among the common man's requirements. No doubt a 50 per cent increase has been made also on rayon yarn, but here again the effective increase may not be felt so much on the coarser varieties of rayon fabrics. Staple fibre fabrics which are really the common man's fabrics, should now get some relief by the reduction of more than 18 nP per Kg. on staple fibre of cellulosic origin. The estimated effect of the increase in the excise duty on some of the varieties of Rayon, Nylon, Terylene and staple yarn fibrics are as follows :

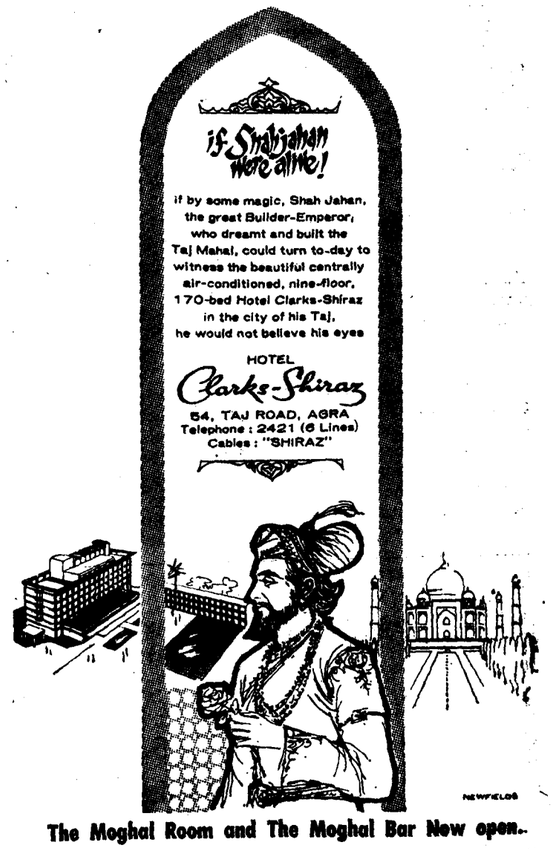
	Per metre
(1) Printed Acetate Rayon fabrics ..	17.6 nP.
(2) Rayon Satin	18.0 nP.
(3) Nylon sarees	26.0 nP.
(4) Terylene shirting	38.7 nP.
(5) Terylene suiting	47.0 nP.
(6) Staple yarn (Cellulosic fabrics) ..	(—)1.7 nP.

Other changes: Besides the major revenue items discussed above, some changes have been made in the Central Excise tariff principally to rationalise the description and for the rates of duty, a few of which may cause marginal increases in the levy. The more important of the changes are discussed below:

(i) **Worsted woollen yarn:** The increase will be borne mostly by the finer counts of yarn which go into the manufacture of worsted fabrics; the duty on yarn as also fabrics other than worsted will remain unchanged.

(ii) **Aluminium:** Although aluminium extrusion will now pay the same duty as all aluminium manufactures, if such extrusions are made out of other duty paid forms of aluminium, then appropriate set off will be given.

(iii) **Rubber Products:** The additional revenue of Rs. 30 lakhs will be the result of the increase in duty on Latex foam sponge' and 'tread rubber'.



(iv) **Footwear:** Although the scope of the tariff has been widened somewhat, action has been taken to maintain the 'status quo ante' in respect of complete footwear. Only some specified parts of footwear manufactured with the aid of power will pay duty but here again, rubber soles for the so-called Hawai chappals will be exempted from payment of duty.

(v) **Matches:** The rationalisation of the categories and the revision of rates is essentially based on the recommendations of the Tariff Commission and is designed to encourage an increase in production as well as some consolidation of the manufacturing units, especially in the small-scale sectors. Special concessions have been given for the use of card board and bamboo in the manufacture of match boxes. These are designed to conserve the soft wood resources of the country. The nature of variations made in the effective Central Excise

rate structure on manufacturing units with different production capacity is exemplified in Table D.

TABLE D.

EFFECT OF BUDGET CHANGES ON THE RATE STRUCTURE OF MATCHES PRODUCED IN FACTORIES OF DIFFERENT PRODUCTION CAPACITIES

S. No.	Annual production of factory	Weighted average duty per Gr. Boxes of 50s before 1-3-1964 Rs.	Proposed duty per Gr. Boxes of 50s from 1-3-1964 Rs.
1.	50 mn matches or 6940 Gr. Boxes of 50s	3.75	3.75
2.	100 mn. matches or 13880 Gr. Boxes of 50s	3.75	3.75
3.	200 mn matches or 27760 Gr. Boxes of 50s	3.92	4.10
4.	300 mn matches or 41640 Gr. Boxes of 50s	4.03	4.10
5.	400 mn matches or 55520 Gr. Boxes of 50s	4.12	4.10
6.	600 mn matches or 83280 Gr. Boxes of 50s	4.41	4.10
7.	1000 mn matches or 138800 Gr. Boxes of 50s	4.45	4.40
8.	4800 mn matches or 666240 Gr. Boxes of 50s	4.52	4.40

Reduction in excise duty: The reduction in excise duty has been quite substantial and would account for a total sum of Rs. 5.84 crores. These reliefs have been spread over a number of consumer goods (such as writing paper, glassware, chinaware, electric bulbs up to 60 watts.) and a substantial relief to the extent of over Rs. 3 crores on Acids and Gases Some of the reductions are also designed to encourage the production of smaller units or newly established units. The relief to the extent of over Rs. 2 crores on Acids and Gases would help to reduce the cost of production of certain nitrogenous fertilizers and heavy chemicals like Soda Ash.

On cigarettes, the reduction is in the category which include brands like 'Four Square', 'Scissors', 'Cavenders', 'Panama', 'May Pole' etc. and the increase is in the category which cover brands like 'Honey Dew', 'Passing Show', 'Red Lamp', 'Char Minar' etc.

The net additional revenue from customs duties is estimated at Rs. 6.37 crores. The bulk of this, namely, Rs. 4.29 crores, would come from countervailing duties, that is, additional duties imposed on imported articles to off-set increases in Central Excise duties on similar indigenous articles, and thus prevent the indigenous importer being placed at a disadvantage. Countervailing duties on art silk yarn and staple fibre account for about Rs. 4 crores. Countervailing duty on iron and steel products amounts to Rs. 1.35 crores, but this is largely offset by losses on articles such as coal-tar dyes, paper, tractors etc., on which there have been reductions in Central Excise duty.

The increases in the customs duties account for only Rs. 2½ crores. Most of this amount (about Rs. 2 crores) comes from articles on which the effective rates of duty fell sharply as a result of implementing certain provisions of the new Custom Act. The tariff values on these articles, which are fixed by notification, decreased considerably from 1-9-1963. For instance, the tariff value on a particular variety of dates fell from Rs. 145 per quintal to Rs. 105 per quintal, so that the incidence of import duty chargeable fell from Rs. 72.5 to Rs. 52.5 per quintal. Similarly, the incidence of import duty on copra (from preferential areas) fell from Rs. 19.5 to Rs. 15.75 per quintal, and on solid caustic soda, from Rs. 24.4 to Rs. 11.2 per quintal (plus countervailing duty in each case). The changes proposed in respect of dried fruits, copra and caustic soda seek to make up for this fall in the actual incidence of duty. The only other article on which import duty has been raised is high carbon or spring steel wire, where the duty has been raised by 20 per cent in order to place the indigenous product on a competitive basis. The additional revenue from this would be only Rs. 53 lakhs.

Incidence on Cars

The basic rate of import duty on motor cars has been reduced from 150 per cent to 60 per cent. The total duty, including countervailing duty and surcharges, was over 200 per cent, and will now be about 90 per cent as compared with 75 per cent prior to 1954. The high rate of duty had led to much hardship. Imports of cars by other than diplomatic personnel are subject to strict import control and ordinarily licences are given only to genuine and deserving cases of persons wishing to bring in used personal cars. It is not correct to think that luxury cars alone are imported into this country, as a monetary limit is also observed in granting licences. In many Western countries, a car is almost a necessity and even moderately paid persons, such as the staff of our missions abroad or businessmen are obliged to acquire them. Unusually they cannot sell them except at a heavy loss, as in most Western countries used cars have a very poor re-sale value. The supply position of Indian cars is tight and foreigners like Press correspondents, who need cars for their work but have no diplomatic privilege, had to import them after paying a very high duty. In view of the import licensing position which ensures that licences are given only in genuine cases, the very high rate of import duty was felt to be harsh. This has been ameliorated by the reduction in duty. There is no danger of abuse by such cars being sold for fantastic prices, because under the conditions of the licences issued, the cars cannot be sold in the open market without permission from the licensing authorities. Permission is ordinarily given only for sale to the State Trading Corporation.

In keeping with the general policy of reviewing the effect of export duties, the duty on raw jute has been abolished. This is estimated to result in a loss of Rs. 15 lakhs.

Budget Talked Out

THERE WAS too much shadow boxing in the general debate on the Central budget in the Lok Sabha for the public to be really impressed. The short question that had to be put to Mr. Krishnamachari, but was not, was whether the budget proposals taken as a whole would reasonably be expected to stimulate the economy by stepping up current production as well as investment in expansion. To the credit of the Finance Minister it must be said that even if this question was not asked on the Floor of the House, he himself did not fail to assume that it had been asked—and his answer was in an assertive affirmative. Mr. Krishnamachari, however, was expressing an opinion or perhaps a wish rather than facing facts.

Finance Ministers, disappointed with market reactions, are often found to say that the stock exchanges do not matter and may be ignored. On the present occasion, the holder of that high office is in the unenviable position of having discovered that it is the stock exchanges which are ignoring him. It may of course be readily conceded that the absence of a speculative boom in the wake of the Central budget should normally be taken as a tribute to its soundness. But what has gone wrong on this occasion is that there has not been a boom, but there has scarcely been any life in the markets. This is not a situation which can be glossed over, especially when the Finance Minister has been saying repeatedly that it is the Government's policy to stimulate the economy and that he believes that his budget will serve this purpose. The Finance Minister apparently believes that through the substitution of the surtax for the super profits tax he has substantially improved the investment climate and that he has extended considerable relief to the finances of industry. But this is a reading which has not been found convincing in the business world. In his reply to the debate, Mr. Krishnamachari claimed that an examination made in his Ministry of the balance-sheets of 31 of the bigger companies showed that 20 of them, which were paying super profits tax in the previous year, would probably be paying, under the budget proposals, a lower percentage of total income as tax. He did not indicate even broadly what would be the extent of the relief. The fact is that investigation of the revised tax incidence carried out on a far more extensive scale than has been attempted in the Finance Ministry has shown that the easing of the tax burden is likely to be only marginal in a large number of cases. It can surely not be claimed that for companies reporting earnings of a crore of rupees or more, a net reduction in tax liability of three or four lakhs of rupees could have any value either as a booster of morale or as a more material incentive.

The Finance Minister, moreover, has himself admitted that out of the 31 companies examined in his Ministry, 11 which were not liable to super profits tax may now have to pay surtax. In other words, so far as companies in this category are concerned, there has not only been no relief but there has been a fresh burden. In the circumstances any claim that the surtax, substituting for super profits tax, has provided general relief to industry from the abnormal financial burden imposed on it by the SPT must now be promptly abandoned. The Finance Minister has tried to explain away the situation by saying that the surtax, at any rate, has the virtue of mitigating the uneven burden imposed as between industries or enterprises by the operation of the SPT. This might at best be a

technical gain, but surely it is irrelevant to the basic purpose of revising fiscal policy to stimulate the economy. The objection of industry to the super profits tax was not on the score that the tax was lacking in technical tidiness. If industry resented the super profits tax it was because it objected to it as a pernicious principle of company taxation. The Finance Minister in his budget speech had himself acknowledged the psychological resistance to that tax. Does he really believe that this resistance was caused by the absence of aesthetics from the looks of the super profits tax? Had he really wanted to break down that psychological resistance, he should surely have done more than revamp the super profits tax into a surtax.

Actually, the change has made matters worse because the entirely unsound dogma that the principle of progression could be applied to the earnings of companies in the same way as it could be applied to the earnings of individuals — that is, on the consideration of equity — has now been reasserted and etched into the tax laws of the nation. This is all the more regrettable since, unlike Mr. Morarji Desai, the present Finance Minister has had the advantage of the impropriety of this form of company taxation having been discussed in a national forum for nearly 12 months. Mr. Krishnamachari seems to believe that by merely putting in a provision about a 10 per cent return on an enlarged capital base, he has done all he can or ought to do to make this highly discriminatory form of taxation acceptable. We would suggest that there has been a great deal of confusion over this question of a 10 per cent return. When this slogan was sought to be popularized by the Deputy Chairman of the Planning Commission some time before the budget, there were people, even in the business community, who were inclined to hail it as a nugget of economic wisdom. But what matters is not the notional return an industry may be allowed on its capital base for purposes of fanciful schemes of taxation but the dividend the ordinary investor, who risks his capital in that industry, is ultimately enabled to obtain.

Mr. Krishnamachari, somewhere in his reply to the budget debate, spoke of the need for a national incomes policy, but the mere fact that such a policy is not there at present, and may be indefinitely in gestation, is no justification for him as the Finance Minister of this country for not attempting to have some broad policy regarding dividends on equity capital which shareholders may reasonably expect, taking into account the admitted need for more rapid expansion of industry, especially in the priority sectors. It may perhaps be said in reply that the Finance Minister has at least taken note of the need for providing preferential tax treatment to priority industries, but even in their case a study of the total tax incidence, after taking into consideration the benefits given, seems to show that in comparison with the abnormal load imposed by the super profits tax, the budget proposals have not presented any substantial relief. In other words, the excessive taxation of companies initiated in the last budget has now been given a deceptively respectable form and the inference must necessarily follow that if some part at least of the slackening in industrial growth witnessed in recent months was due to the impact of this extraordinary measure of company taxation, it would be pointless to expect now that the situation could improve much or soon. This is precisely why the stock exchanges have failed to react enthusiastically to the budget proposals in general and the replacement of the super profits tax by the surtax in particular. The Finance Minister's legerdemain in this area of his budget proposals is hardly likely to help him perform the magic of restoring vigour and cheer to the economy. We realise that his intentions are good and that the Government's policy is in earnest about stimulating the economy. We, therefore, do not desire that the business community should scare itself. On the contrary, we would rather that it puts the best construction possible on everything that has been done or has been claimed to have been done in the budget for promoting industrial investment or expansion. At the same time, we woud be failing in our duty if we do not underline the point that this budget is, by no means, a budget of incentives. At best it might mark only a marginal improvement on the status quo in a situation where a bold and imaginative fiscal policy for enthusing the economy is so clearly called for.

It is to be hoped that when the Finance Bill and the Surtax Bill are taken up for consideration, Parliament will be able to give more informed and detailed attention to their repercussions on the climate for investment and business activity. In his reply to the general discussion in the Lok Sabha, Mr. Krishnamachari has no doubt been careful to discourage expectations of major or even substantial changes in any of the tax proposals. Such modifications as he had indicated his intention to effect are marginal. Nevertheless, the total effect of the surtax in its present form, added on to the dividend tax and the proposal to apply the capital gains tax to bonus shares, is so clearly likely to prejudice the investment climate and industrial growth — in spite of other reliefs and concessions including those given to the priority industries — that Parliament will be failing in its duty if it does not make an earnest effort to induce second thoughts in the Finance Minister and the Government. As it is, only Mr. Masani in the Lok Sabha had expressed himself in some detail on the inappropriateness and harmfulness of taxing dividends on capital appreciation in bonus shares. As he pointed out, it is indeed a strange way to seek to put more resources into industry by making investments in equity shares even less attractive than they are already.

Mr. Masani again, was virtually alone in criticizing the arbitrariness and utter lack of restraint exhibited in the sharpening of the fiscal axe against wealth by inheritance. In the circumstances, it is really very kind of the Finance Minister to have at least offered to consider the representations made for moderating the rates or the heavy progression which he has proposed. Mr. Krishnamachari could very easily have refrained from making even this gesture and it is to his credit that he has given some encouragement to hopes that better counsel might prevail. As Mr. Masani emphasized, the issue raised by the proposals relating to the estate duty and gift tax is not whether a few people should be allowed to enjoy great personal wealth through inheritance or not, but whether there should not be some restraint and moderation in dealing with the rights relating to property if the objective is to maintain an economic climate favouring the formation of capital and its investment for productive purposes and for enriching the resources of the community.

To Mr. Masani, again, must go the credit for raising another important issue of principle when he pointed out the limitations to the approach favoured in the budget of giving preferential tax treatment to selected industries. Here, as we argued in the Budget Number of *Eastern Economist*, there is need to distinguish between genuine tax concessions and those which are less than genuine. Genuine tax concessions are reliefs given in the light of certain specified deficiencies or adverse factors which cannot be provided for in the normal tax system. An example of such genuine tax preference could be fiscal concessions given, say, for industries started in depressed areas. Fiscal reliefs may be less than genuine when their purpose is merely to moderate for a few beneficiaries the adverse impact of a basically oppressive tax system, since the general blight of a repressive tax system on the economy as a whole would then remain and the result is that the aggregate economic growth is less than what it might be or what it should be. The so-called tax concessions given to priority industries in the present budget belong to what may be called the less-than-genuine category. That is why Mr. Masani's contention that the preferential tax scheme is, in fact, a discrimination against many industries rather than a discrimination in favour of some is so valid.

Apart from the fact that the choice of industries for preferred tax treatment must necessarily remain arbitrary and is apt to be a matter for horse trading, the selection could often lead to unforeseen absurdities. Thus, even in the list now proposed by the Finance Minister, the inclusion of coffee and rubber plantations seems pointless since income tax liabilities in both cases are wholly liabilities in respect of agricultural income taxes of State Governments. In the case of tea again, only 40 per cent of the tax on income is tax falling on the manufacturing part of the industry and, consequently, the relief intended by the Finance Minister will be limited to that percentage. In the case of electricity generation and distribution, again, so long as the statutory restriction on dividends, which is applicable to the industry, remains the investor is not in a position to benefit from any tax preference. These anomalies are pointed out only to show that the principle of selective preference, however useful it may seem in theory, is apt to be riddled with defects and difficulties in practical application.

From this point of view, the Finance Minister's clarification of his intentions regarding the development rebate is bound to have a mixed reception. It is good that he has made it clear that it is not proposed to scrap the scheme altogether after 1966-67 or even trim its benefits where priority industries are concerned. But he has also emphasized that, in the case of industries which the Government does not consider sufficiently important or deserving, the rebate may be reduced or perhaps even totally denied. Here again, is it not a fact that the development rebate, as we had pointed out in the Budget Number, is not so much a genuine concession as a necessary mitigation of the aggregate repressiveness and unreasonableness of the tax structure? Mr. Krishnamachari is credited with the intention of gradually bringing down corporate and personal income taxation to more normal levels according as he succeeds in speeding up tax collection and reducing tax evasion. It is amusing that having decided against gradualism in the case of stepping up the estate duty, he is all for gradualism where moderating the corporate and personal income tax structures are concerned. That apart, it is a moot point whether the efficiency of tax collection could be expected to improve ahead of a reasonable recasting of the tax structure or whether it may be expected only to accompany it. In any case, so far as a revision of the development rebate is concerned, the Finance Minister might well wait until he has succeeded in remodelling and redesigning the overall burden of corporate taxation and he should certainly not be in a hurry meanwhile to take away any part of the mitigatory or compensatory advantage of the development rebate for industrial expansion in general.

It is curious that, in the budget debate, issues of general economic policy seem to have occupied more time and attention than purely budgetary policies or proposals. This is because of the modern myth that the Government's budget is like the Sacred Tree or the Sacred Cow of less sophisticated societies to which simple men turn in prayer and have their wishes fulfilled. Mr. T. T. Krishnamachari was taken to task for, among other things, not having established an egalitarian society, although as many as 80 days have passed since Bhubaneswar. More than the Communists, Mr. K. D. Malaviya, of the ruling party, seems to have been most disappointed over this lapse. Not for him was the logic of another Congress member, Mr. Ravindra Varma, who had rhetorically asked earlier whether the gift tax, the wealth tax, the expenditure tax and the "85 per cent" estate duty did not add up to socialism.

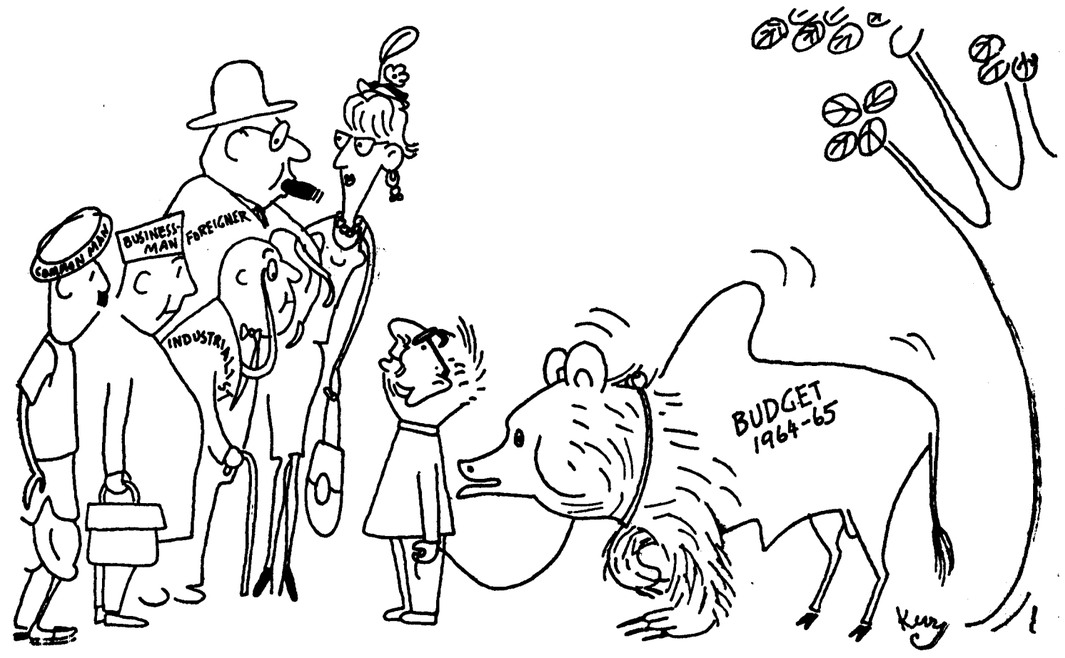
Inevitably, the proposal for a Monopolies Commission was debated in terms of whether it was intended to put the fear of God into the man-eaters of the private sector or throw dust into the eyes of simple-minded socialists. Mr. Masani, in an effort to be sweetly reason-

able, agreed that monopolies were bad, pointed out that his party was all for free competition and helpfully suggested that monopolies might also be found to exist in the public sector. He, therefore, wanted a full, free and impartial investigation of this question of monopoly to be followed up by action to establish an Erhardian free-market economy. The Finance Minister was, however, not to be taken in. After all, had he not in Part "A" of the budget speech himself indulged much earlier in an even more impressive philosophic dissertation on the anatomy of monopoly power? In his reply to the debate, Mr. Krishnamachari, therefore, was content with reminding his audience of the distinctions he had drawn between ownership, control and management. His thesis seems to be that while "ownership" is not a problem, "control" is and "management" could be. Others, of course, have other ideas and Mr. Krishna Menon, it may be recalled, giving his own version of what it is all about, had said in Bhubaneswar that the issue was not one of monopoly versus competition—being a good Marxist, he evidently has as little use for the capitalist concept of "competition" as he has for "monopoly". The point, as he sees it, is the excessive power over the economy and the life of the community allegedly wielded through concentrations of wealth or business control. It is true, of course, that Mr. Menon, consequently, ought to be more than satisfied with the estate duty as proposed by the Finance Minister, for this levy should certainly succeed in dispersing concentrations of either kind within a few generations. From this point of view, the Monopolies Commission would certainly be a superfluity. But since Mr. Menon, fortunately or otherwise, is not the Finance Minister, while Mr. Krishnamachari is, there is to be this Monopolies Commission which, at best, may remove some misconceptions or, at the worst, render the existing confusion worse confounded and possibly lead to correspondingly misguided action. Meanwhile, the thought is difficult to resist that the project for the Monopolies Commission is rather inconsistent with all those exciting exertions in drastically amending (and planning to amend further even more drastically) the Companies Act. The country has been told *ad nauseum* that the progressive tightening up of the Companies Act is for the purpose of eliminating or dealing with the abuses of ownership or control or management of companies. That the Government should show such lack of confidence in the efficacy of even their most lavishly advertised enactments throws an interesting sidelight on the psychology of the new despotism.

Next only to the interest shown in the Monopolies Commission during the budget debate in Lok Sabha was the concern displayed over the price level. Here, the Finance Minister could certainly have made some very large claims, but for some reason or the other he did not do so. So far as the budget is concerned, it can certainly be said in its favour that it is the most pronouncedly anti-inflationary budget in all the years since 1939. The emphasis in this budget has throughout been on the withdrawal of purchasing power from and the curtailment of disposable incomes in the community. In fact, there is even a clear risk that, in the context of a slackening of the economy which the budget proposals, unfortunately, are not doing enough to put right, there is a grave risk of the net effect of this budget proving to be even deflationary. But so far as the argument about inflation is concerned, the Finance Minister could certainly say that his budget is blameless.

In a larger area of economic policies, his known preference for dismantling price controls wherever possible is certainly a positive influence for stimulating production so that the increased availability of goods and services might have the natural effect of restraining increases in prices, or even bringing them down to the extent made possible through lower costs of production. This is not to say that the Government's policy for production or prices is not without dangerous defects. Much was said in the debate about agriculture and food prices. But the fact remains that unless the unit of cultivation is permitted to be of an economic size so that adequate capital investment could be made in the form of fertilizers, improved implements and intensive agricultural practices generally, agricultural production is unlikely to respond to the desired extent. The Finance Minister gave impressive figures of the growth of government-sponsored co-operative credit. Those statistics, however, cannot hide the fact that net personal investment in building up productive capital assets in agriculture has been steadily declining over the years. The findings of the National Sample Survey have clearly established this tendency. While it is true that public

Eastern Economist 20 Years Ago



MARCH 10, 1944

The seventeenth annual meeting of the Federation of Indian Chambers of Commerce and Industry held last weekend at New Delhi was in many ways a notable event. It endorsed unanimously and enthusiastically the industrialists' plan or, as Mr. G. D. Birla happily put it, the non-official plan for the Economic Development of India not only with a clear sense of responsibility but with a full awareness of the implications of the plan in its varied aspects. The horizon of the Indian business community has undoubtedly widened in recent years, and the acceptance of the Fifteen-Year Plan is an expression of this widened outlook. The emphasis on agriculture and rural prosperity in the speech of the President and in the resolution was happily laid. The recognition that despite the predominantly agricultural character of our economy, agriculture is yet very backward and unable to meet the demands made on it by the masses of the population for its food and other requirements was very significant coming from the business community who, one might expect, would only think of industry and industrialistion. On the other hand, the opinion was quite definitely expressed that only on the basis of prosperous agriculture with guaranteed fair minimum prices to the cultivator could the structure of industrial construction be strongly built.

investment in agriculture in the form of irrigation projects and the like is going up, the matching personal investment on individual farms is lacking. Until this situation is recognised and dealt with by restoring incentives for the ploughing of capital and good management into land, this country must continue to present to the world the ridiculous position of not being able to make up even over a period of years its marginal deficits not only in foodgrains but also in raw materials such as raw cotton.

The mention of raw cotton brings us to the subject of cloth, its prices and availabilities and their relevance to the cost of living. It is strange that despite the Government's and the nation's concern over the price line, the Finance Minister has failed to indicate either in his budget speeches or elsewhere any positive programme for increasing the production of cloth. Not very long ago, wrong-headed policies in the Food and Agriculture Ministry had led to an artificial decline in sugar production and to the present situation where the country has been made to lose export opportunities besides having to struggle with a domestic shortage. It is possible that even a worse muddle might emerge in the case of cloth if the present indifference of the Government to the developing cloth shortage persists. The problem is to add to the supply of raw cotton since there is enough manufacturing capacity for working extra shifts. It is necessary that the Government should take steps immediately to secure raw cotton from abroad, possibly under PL-480 and direct (as well as give assistance to) the industry to step up the output of cloth as early as possible. It is, in fact, necessary that a general policy of increasing production should be enjoined on all consumer goods industries since this is the only effective way of dealing satisfactorily with the price situation. The budget shows legitimate concern for the development of basic industries. But it is wrong to think that such concern can only be at the expense of similar concern for the full production in and expansion of consumer goods industries. On the contrary, to the extent that the Government is concerned with holding the price line and is keen on increasing the resources available for development, the full utilisation of existing capacities in consumer goods industries and the expansion of those capacities in the light of expanding consumer needs is as much an economic desideratum as it is a social imperative.

We need not have to belong to the communist party or to be its secret sympathizers to agitate or to be agitated about the price situation. The importance of increasing agricultural and consumer goods production through a series of positive policies and programmes is the first and foremost task for the Government and the community. The budget controversies may be stilled in a few weeks' time but these basic problems of increased production all round will continue to grow increasingly important. Even the budget will be tested ultimately not by what is now being said in its favour or against it, but by the contribution, small or big, that it may make in stimulating production in the 12 months during which its writ is to run.

Highlights of the Week

BHUBANESWAR IN REVERSE

THIS YEAR the annual session of the Indian Chambers of Commerce and Industry was not the impressive affair that it usually is. This is in spite of an excellent presidential address, much above the general standard of the FICCI presidential addresses, which Mr. Bharat Ram delivered much better than is normally the case. He dealt with most of the topical issues which were of concern to the business community, such as 'monopolies', 'nationalisation', 'prices', 'corruption in the administration'. 'controls' and 'restrictions on business'. Although the address said nothing that was exactly new — indeed it could not have done so since these subjects have been matters of perennial discussion —, the way Mr. Bharat Ram presented industry's view-point on every one of the questions was not only logical and forthright but also had the virtue of being positive and persuasive.

If, despite that fine start, the annual session did not quite manage to get off the ground, it was not wholly because the magic of the Nehru presence was denied to its inauguration this year. As a matter of fact, Mr. G. L. Nanda met the demands of a difficult assignment rather well. Although he is no orator and in spite of the fact that he was obviously being exceedingly careful about what he might say and what he might not, the Home Minister was certainly impressive in his apparent sincerity and his evident desire not to create an impression that he is doctrinaire, rigid or unrealistic. Mr. Nanda, in fact, spoke responsively about government co-operation with industry in promoting the development of the country and if he, nevertheless, found it necessary to emphasise the sanctity of democratic socialism, he cheerfully conceded the important contribution made by the private sector in increasing production. Although the Home Minister naturally did not wish to deal at length with the budget proposals or criticisms of those proposals, he made the important point that the selective approach to development reflected in some of the fiscal proposals must be accepted as an integral part of the Government's economic policies. At the same time, he tried to maintain that the Government's thinking was not being unduly influenced by the psychology of scarce resources".

The two main speeches at the inauguration of the session, in other words, were neither inappropriate nor inadequate. On the contrary, they did give a constructive direction to the proceedings that were to follow and it was because the hint was not taken that this year's annual session seems to have left behind an impression of inadequacy. For instance, the resolutions and the discussions centring in them, broadly speaking, dealt more with sterile controversies and narrow issues than with the current and urgent developments which have involved the destiny of the nation. It is true that the Federation, by its very nature, ought to attempt to draw the Government's attention to the complaints and grievances of the business community, but even in doing so, it must certainly strive at all times not to ignore the larger context. It is now fashionable to talk of presenting an image to the public. The Government, the business community, and in fact, every group or individual wants to project an image. But the language of Madison Avenue has its imitations and, unfortunately, there is no magic mirror gifted by some benevolent fairy which could be made to provide pleasant images at will.

The judgment of the public, whether of the Government or of the business community, will ultimately be determined not by publicity but by performance. It is always open to and possible for the Federation to carry on a running debate with the Government or politicians of varying degrees of responsibility on such issues as nationalisation or the place of the co-operative sector. But there is surely little to be gained by turning the entire annual session into a Bhubaneswar in reverse as was done on this occasion. These are not normal times. National security has been challenged and is being threatened on two fronts. The influx of refugees from East Pakistan is pregnant with possibilities of dangerous repercussion. The two great assets which this country has been able to enjoy over the last 16 years are the integrity of its territory and the stability of its social and political order. The continuance of that enjoyment cannot be taken for granted any longer. The business community, as much as any other section of the people has always been sensitive in its response to the needs and interests of the nation and the necessity for that high degree of sensitivity is greater now than it ever was since India became independent.

Mixed Bag

The resolutions discussed and adopted at the FICCI annual session were, indeed, a mixed bag and covered topics ranging from the forthcoming conference on world trade and development to be held in Geneva to the monstrous growth of population in this country. The main resolution, which was on "democracy, economic welfare and fiscal policy" blamed the slow rate of economic growth in the country on the doctrinaire approach shown in the fiscal and other economic policies of the Government. Discussion on this resolution gave an opportunity to business men to emphasise the dangers of and pitfalls in indiscriminate nationalisation, whether of banks or rice mills. It was also urged that it would be unrealistic to play up the notion of "co-operative sector" as experience has shown that this policy only leads to wastage or misuse of public funds besides leading to stagnation in production and dislocation of trade. An interesting feature of the discussion was the suggestion made by several business men that only broad public support and not narrow group influence could enable the business community to make its voice felt in the making of Government policies. This, no doubt, is a truism, but it, nevertheless, has enough force in it to sound impressive. In fact, it moved at least one speaker sufficiently to make him declare enthusiastically that the business community should get into politics in a big way.

On the present budget, the consensus was that the new surtax on company profits was only the existing super profits tax in a new form and with a new name. Incidentally, a statement on the budget proposals issued by the Committee of the Federation on the eve of the annual session, has been widely welcomed as a moderate and constructive representation of the Business angle. There was also a resolution on agricultural production and productivity, underlining the desirability of price incentives for the farmer and a stock-piling programme. Opinion, however, was strongly against state trading in foodgrains, which was firmly opposed in the speeches on another resolution calling impartially for more freedom for the trading community as well as greater discipline on the part of the trading community in the exercise of that freedom. The resolution on population asked for the study and adoption of methods followed in other countries for the control of population growth and recommended larger allocation of public funds for family planning programmes. Welcoming the Geneva meet on world trade, the annual session expressed the view that the objective of the conference could be realized only if the more developed countries could, as a result, be persuaded to pursue such commercial policies as would help the entry into the international market of processed, semi-processed and manufactured goods emerging from the developing nations.

SMALL CAR

THE RECENT statement by the Union Minister for Steel and Heavy Engineering, Mr. C. Subramaniam, regarding the possibility of Government deciding to take over one of the three automatic units and make an experiment for boosting production has created considerable interest in Madras State. It is even indicated in some sections of the press that Standard Motor Products of India Limited might be chosen for this experiment as it is the only integrated and unattached unit and can be geared more easily to achieve a higher level of production. While it is not clear how the Government can dictate the course of demand and supply and how the other two units will be affected, it is interesting to note that the foreign interests collaborating with Standard Motor Products have not reacted violently to this proposal. Indeed, Mr. Turnbull, Managing Director of Triumph-International Limited of Coventry (UK), who was on a short visit to the City, was inclined to be of the view that his management might be prepared to collaborate with the Government in any expansion scheme if the position was clear and the terms acceptable. He had, however, a feeling that the problems at issue are rather difficult as there may be initially new bottlenecks in regard to the import of plant and machinery and raw materials and components and parts for boosting production in the absence of adequate arrangements and the development of ancillary industries. These problems will have to be handled in any case and irrespective of the ultimate scheme for raising output to 50,000 units, which would cost anything up to £15 million without taking into consideration the outlay that would be necessary in creating related facilities in the ancillary industries. The immediate programme of expansion might be taken up as it would not cost more than £2.5 million. Even now, Standard Motor Products is in a position to step up output to 6,000 units only after the new press plant being installed comes into operation and with the Government agreeing to provide the necessary additional foreign-exchange for importing raw materials, components and parts. The expansion programme will relate to the further increase in capacity to 10,000 units and it may be possible to come up to 20,000 units without incurring any large additional expenditure. Now it is said that the first part of the programme can be completed in three years.

While the reaction of the British interests has not been adverse, it is difficult to understand how the Government, without giving invidious treatment to other two companies, can embark on a large-scale expansion of Standard Motor Products. There will probably be need for intense thinking on this subject before the scheme takes a definite shape. But Mr. Turnbull has said that he would be prepared to draw up a detailed project report after getting more precise details in this regard. Meanwhile, it has been emphasised that only an increase in the output of cars can be achieved with a larger capital outlay. But it may not be possible to reduce costs of production appreciably for sometime because of the necessity to incur large capital expenditure and the importance of integrated growth of ancillary industries. According to him, the initial reduction in selling price can be brought about only with reduced taxes.

ICICI

PERHAPS THE Government of India's decision to set up a development bank has prompted Mr. G. L. Mehta, Chairman of the Industrial Credit and Investment Corporation of India, Ltd., to define the role of the ICICI which also he rightly regards as a development bank. The role of a development bank, Mr. Mehta has said in his statement to the shareholders of the Corporation, is to ensure planning at the project level. The need for planning at the project level has been forcefully brought out by the manner in which production facilities already built up have been yielding results. That we are not using these resources to the maximum extent is common knowledge. But it is not clear whether it is equally evident to all that here is a woeful waste of capital resources, a luxury which a poor economy like ours can ill afford. Hence the especial relevance of Mr. Mehta's plea for an inventory of our production facilities unit by unit as a preliminary to taking steps to ensuring the maximum output. The ICICI Chairman need not be apologetic in describing this task as "unglamorous". The country needs today more of such "unglamorous" tasks than futile displays of the so-called big and showingly glamorous projects.

A mere cataloguing of its achievements may not mean much to the public. A more vivid picture would be possible if we referred to the latest results of working of the ICICI which have been just released. The gross assistance of nearly Rs. 25 crores sanctioned by the ICICI in 1963 constitutes a record. This assistance, needless to say, comprises both foreign currency loans and rupee assistance. The underwriting sanctions given by the ICICI in 1963 aggregated Rs. 3.68 crores. Of the issues actually made on the market amounting to Rs. 1.77 crores, the ICICI had to take up as much as Rs. 83 lakhs, a little less than 50 per cent, thanks to the state of the capital market in that year. This gives a real insight into the policy of the ICICI of coming forward and providing timely assistance to enable industries not to suffer for lack of funds. Notwithstanding a certain degree of risk that such a policy might entail, the ICICI has ended its last year's working with increased income all-round. Its profit figure for 1963, both before and after tax, compares favourably with the corresponding figure for 1962, so much so that the Corporation has raised its dividend to 7 per cent, the highest to be declared so far. Although it has to pay more tax as a result of the 1964-65 budget — the net additional tax liability has been estimated at about Rs. 1.50 lakhs — it is noteworthy that the ICICI looks forward to enlarged business in the current year and has already armed itself with adequate resources, both rupee and foreign currency, to meet the demand. The fact that the Government of India has given to the ICICI a further loan Rs. 10 crores and the World Bank has extended a fifth line of credit to the tune of 30 million dollars, the largest extended so far, provides an irrefutable evidence, if evidence were at all needed, of the appreciation of the vital role of this development bank. Being in able hands, its future is not only bound to be bright but equally assured.

New look with old toy

Dogmas in Debate

by Our Parliamentary Correspondent

IDEOLOGICAL CONSIDERATIONS dominating the general debate on the Central Budget in the Lok Sabha last week, Mr. T. T. Krishnamachari's grievance that the Opposition had not tried a "straightforward hit at the bull's-eye" is apparently justified. A large number of issues having no direct bearing on the budget proposals were introduced into the discussion. As a result, the principal issues involved were most of the time lost sight of. Although almost all the Members who participated in the debate expressed concern over the rising prices, yet most of them failed to support the Finance Minister in his attempts to extricate, through fiscal measures, the economy out of morass it has got seeped in since the launching of the third Plan.

The incentives given by Mr. Krishnamachari for fostering the growth of the economy, though not commensurate with what the occasion demanded, were interpreted, not only by the devout Communists, but also the leftists among the Ruling Party, as betraying the spirit of the Congress policy to usher in a socialistic order in the country. They decried the Finance Minister's proposals, suggesting that Mr. Krishnamachari had attempted to bypass the Industrial Policy Resolution of 1956 and his scheme of taxation ran counter to the principles adopted by the Ruling Party at the Bhubaneswar session. A former Union Cabinet Minister, Mr. K. D. Malaviya, even went to the extent of urging that a revised budget should be brought before the House in the next few months to make amends for the wrong done by the one under discussion.

These critics conveniently turned the proverbial Nelson's eye on the steep increases proposed by the Finance Minister in estate duty and gift tax and reimposition of expenditure tax, besides the attempts he made to take back from the corporate sector by the left hand what he had given by the right.

Push to Economy

The other extreme view was expressed by Mr. Rameshwar Tantia who characterised the Budget as a "super-socialistic one". The moderates and the rightists complimented the Finance Minister for his anxiety to give a forward push to the economy and his thought-provoking analysis of the contemporary economic situation. While welcoming the incentives given to foreign investors and the abolition of the super-profits tax, some of them, notably Mr. M. R. Masani, vehemently criticised the replacement of SPT by surtax on profits and a 7.5 per cent levy on all dividend declarations by the established companies. In the latter two measures they saw disincentives which ran counter to the Finance Minister's professed aim to stimulate the growth of the economy. Mr. Masani also opined that the concessions given to attract foreign capital did not go far enough. He as well wanted that the incentives given to the 14 capital-intensive key industries in the form of lower corporate taxation should be extended to the labour-intensive consumer industries in the interest of containing the price spiral. Mr. R. R. Morarka expressed the view that the proposals regarding gift tax and estate duty left no incentive for an honest man to work and earn.

The Finance Minister's proposals to abolish Compulsory Deposit Scheme and to set up a Monopolies Commission, of course, received general approbation. But the replacement of the CDS by Annuity Deposit Scheme in the case of incomes above Rs. 15,000 per annum was considered by some Members as a hindrance to capital formation in the private sector. The unenviable position in which Mr. Krishnamachari was placed in view of the necessity to find resources for defence and development and the urgency to give relief to the lower and middle classes evoked full sympathy only from a few. Among these were Mr. Ravindra Verma and Mr. K. C. Pant.

The agriculturist found a number of supporters of his cause in the Lok Sabha, although this subject could be related to the budget proposals only indirectly in the context of the general price level.

The Finance Minister's reply to the debate was effective. He stuck to his guns and yielded very little ground. Unlike his predecessor, Mr. Morarji Desai, he refrained from announcing any concession in the budget proposals, but hinted that he might modify the proposals in regard to estate duty, tax on capital gains and the Annuity Deposit Scheme in the light of the criticism offered and the representations made. The two specific issues which Mr. Krishnamachari said were being examined by him were: (i) the impact of estate duty, capital gains tax and other incidental costs which might have the effect of depriving a person entirely of his inherited money; and (ii) the distinction to be made in respect of bonus shares to be issued out of share premium moneys for the purposes of capital gains tax on such shares. In regard to the Annuity Deposit Scheme, the Finance Minister said he could make this scheme optional for old persons beyond the age of 70 and in the case of any other provided such a person paid taxes which would be higher than the ones normally payable by him.

Development Rebate

Clarifying the position about development rebate, Mr. Krishnamachari told the House that it would be available in the present form up to March 31, 1967. Beyond that date, this system would be revised in such a way so as to make available development rebate to selected industries; the system would not be scrapped altogether. In regard to gift tax, the Finance Minister said that he was taking steps to move an amendment to the Finance Bill to keep the exemption limit at Rs. 5,000.

While dwelling upon the proposed Monopolies Commission, Mr. Krishnamachari went further from what he had stated in his budget speech. The Commission, he said, would be expected not only to collect facts, but also to prepare a draft law and to exercise the law on the basis of its experience. About the soaring foodgrains prices, he opined that the only solution was to increase governmental control over the system of distribution at strategic points. The State Governments, he asserted, must be prepared to enforce the various regulations affecting transactions by wholesalers and those engaged in processing of foodgrains. If shortages persisted, the country must be prepared for the imposition of some controls over distribution, however unpleasant they might be.

While the general debate on the Union Budget monopolised attention in the Lok Sabha, the Rajya Sabha debated the Railway Budget. Most of the Members who participated in the latter criticised the railways for their operational inefficiency, wasteful expenditure, over-crowding, increasing incidence of accidents, poor departmental catering and substandard cleanliness. The debate, of course, was generally of a fairly high order, except when jarring notes were struck by some Members asking for improved railway facilities in their respective areas. This indicates that parochial sentiments do sometimes blur the vision.

A very cogent case was put forth by Mr. K. Santhanam against the 2 per cent increase in freight surcharge. He dismissed as unsound the argument that the incidence of the increased freight rates would be marginal on consumers and

Shalimar Industrial Finishes

Shalimar Paints offer you a wide range of industrial finishes, ready-made or specially formulated for stoving, air-drying, dipping and spraying; litho varnishes and stand oils, fire-resistant paints, epoxide chemical-resistant paints, wire enamels and insulating varnishes and compounds. Like every Shalimar product, Shalimar Industrial Finishes bring you the sum of four decisive elements—resources, research, know-how, quality-control—that guarantee superior quality and performance.

pathfinders in paintmaking

SHALIMAR PAINTS

A MEMBER OF THE COURTAULDS GROUP

JWTSPW 719 R

contended that the additional surcharge when ultimately passed on to the consumers would, undoubtedly, accentuate the inflationary tendencies in the economy. Mr. Gurupadaswami pointed out that the railways had been able to show improvement in operational efficiency against the background of a relative stagnation in the economy. If the economy had been uniformly buoyant, the transport needs to be met would have been of a higher order. Mr P. N. Sapru stressed the need for encouraging research, if necessary with the help of foreign experts, and pleaded for the acceptance of the Kunzru Committee's recommendation that the head of the Railway Inspectorate should be of the status of the General Manager. Mr. S. S. Patil wanted the railways to cut down waste and extravagance to achieve the laudable objective of 10 per cent return on capital outlay. A plea was also made for grant of representation to the public on the Railway Board.

Convention Committee

The reply of the Minister for Railways, Mr. H. C. Dasappa, contained the important announcement that a Railway Convention Committee would be set up next year to go into the financial position of the railways. He assured the House that a golden mean would be struck between perspective planning and emphasis on short-term development in building up the country's transport system. While stressing the difficulties in anticipating far in advance the transport needs of the different regions of the country in view of the industrialisation that is taking place, he promised that at the time of preparation of the fourth Plan, the long-term transport requirements of the country, especially during the next ten years, would not be lost sight of. In defence of the 2 per cent increase in freight surcharge, Mr. Dasappa pointed out that railways were not only a utility service, but also a commercial proposition. The increase in freight rates had to be effected in view of the mounting working expenses, especially labour costs. In percentage terms, the increase in passenger fares and freight rates since 1957 had been substantially lower than the increase in working expenses. This showed improvement in railways' operational efficiency.

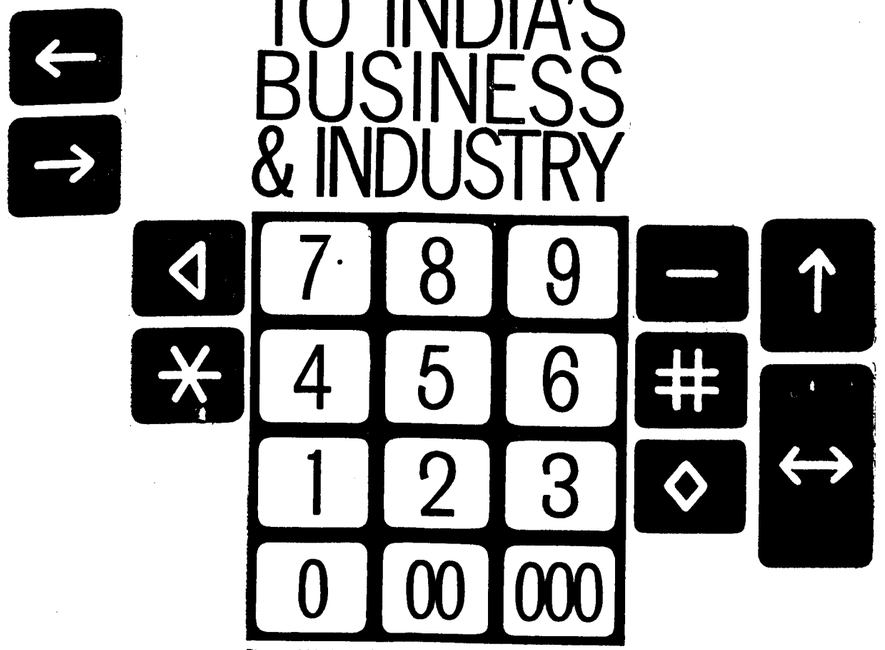
The Deputy Minister, Mr. Shah Nawaz Khan, held out the hope that over-crowding on some sections of the railways would be decreased with the introduction from April 1, 1964, of four more broad-gauge and 16 metre-gauge trains. The additional broad-gauge trains would run two each between Mangalore and Cannanore and Bombay Central and Bulsar. On certain other routes the number of coaches would be raised to relieve over-crowding. The suggestion for representation of the general public on the Railway Board was dismissed summarily by the other Deputy Minister for Railways, Mr. S. V. Ramaswamy. He said that trade, industry and the public were already associated with the railway administration at all strategic levels in advisory capacities. Mr. Ramaswamy had a dig at his critics in dealing with the suggestion that railways should try to achieve at least 10 per cent return on capital. He asked how it was possible in the face of stout opposition to any increase in passenger fares and even to rationalisation of freight rates.

The official spokesmen asserted that the efficiency of Indian railways compared very favourably with those of the other advanced countries of the world. They, however, recognised the need to improve it further. In regard to catering on the railways, the explanations offered left much to be desired.

The two Houses of Parliament also debated two other important matters — the threat to the country from China and the growing influx of refugees from East Pakistan. The former subject came up for discussion at some length in both the Lok Sabha and the Rajya Sabha in the form of two unofficial resolutions, sponsored by Mr. Tridib Choudhury in the Lower House and Mr. Bhupesh Gupta in the Upper House, calling for an end of the State of Emergency. The Home Minister, Mr. G. L. Nanda stoutly defended continuance of the emergency and pointed out that the threat from the enemy was not a whit less than what it was in November, 1962, when the State of Emergency was proclaimed. He drew attention to the Chinese entrenching themselves across the border and the intransigence of Peking towards Colombo proposals. He also dismissed as untenable the idea of confining the emergency to the border areas. The enemy, he said, had to be met not only on the border, but also through keeping up of supplies, stepping up of production and building up of the morale of the people. The loose talk that the emergency had outlived its purpose, Mr. Nanda pointed out, would be a damper to the nation's morale.

Grave concern was expressed by both the Houses over the plight of the minorities in East Pakistan. It was suggested by the Opposition in the Rajya Sabha that India should raise in the United Nations the question of killing and maltreatment of non-Muslims in East Pakistan. Mr. Nanda reiterated the Government's policy in this regard and asserted that the responsibility of Pakistan to protect its minorities was clear and unambiguous. India wanted Pakistan to realise this and live up to its responsibilities. On her part, India would have to accept all those who sought shelter here. No doubt this meant great hardship for both the migrants and the people of India, but we would have to put up with it. In the light of elucidation of the Government's policy by Mr. Nanda, it was clear that the Pakistani charge of India tempting minorities out of Pakistan was absurd. It amounted to adding insult to injury. The mass migration of the Christian minority from the district of Mymensing in East Bengal, the Home Minister pointed out, gave an edge to the grimness of the situation. It was encouraging that both the Opposition and the Treasury Benches looked at this new refugee problem as a non-party issue.

Question Hour



Buffer Stock of Grains: The Minister for Food, Mr A. M. Thomas, disclosed in the Rajya Sabha on March 9 that the Union Government proposed to build up a buffer stock of foodgrains to the tune of 6 million tonnes — 4 million tonnes of wheat and 2 million tonnes of rice — for bringing down food prices and meeting any crisis. The buffer stock of wheat would be built mainly from imports under PL 480 as local procurements would not be helpful in this regard due to shortage of production. The present imports of wheat, Mr. Thomas said, were of the order of 0.45 million tonnes per month. These were proposed to be increased to half a million tonnes. The current demand would be met from imports, leaving the existing reserve stock untouched. The buffer stock of rice would be built to the tune of one million tonnes from internal procurement (both by the Centre and the States) and to the extent of the remaining one million tonnes through imports.

Rice Mills: The Minister for Food stated in the Rajya Sabha on March 2 that it was not possible to introduce state trading in foodgrains. It was also not feasible to bring all the 46,000 rice mills in the country straightaway under co-operative management, he added. The proposal to take over rice mills progressively, Mr. Thomas went on to say, was discussed in general terms with the Food Ministers and Secretaries of the States at a conference held in New Delhi last month. These were proposed to be increased to half a million mills would be given only to those under co-operative management. The matter would be discussed in greater detail again after the State Governments had given thought to the question of how best the proposal of taking over rice mills progressively would be implemented in the respective States.

Sugar Exports: As regards sugar exports, Mr. Thomas told the Rajya Sabha on March 9 that contracts had been renewed for export of 200,000 tonnes of sugar during 1964—100,000 tonnes to the United States and 100,000 tonnes to the Far Eastern countries, mainly Japan. The expected realiza-

tions in terms of price and profit or loss involved to the Government in these deals would be known at the close of the pricing period and after completion of exports.

Scrap Prices: The Union Minister for Steel, Mines and Heavy Engineering, Mr. C. Subramaniam, told the Lok Sabha on March 6 that prices of scrap had gone up after decontrol. The Government had received representations from scrap using industries for reviving control on prices and distribution of scrap. It was, however, not considered necessary to do so as the prices of products manufactured from scrap were not under control and the manufacturers were free to adjust their prices to market conditions.

The following other information was provided by Mr. Subramaniam in the Lok Sabha that day.

Structurals Plant: The Government is considering the possibility of setting up a Heavy Structurals Plant in collaboration with Voest of Austria.

Demand for Coal: The demand for coal at the end of third Plan is likely to be less than the revised estimate of 90 million tonnes. The coal production target for the third Plan had been fixed earlier at 97 million tonnes after taking into account the estimates of demand as then intimated by the sponsoring authorities of the consumers of coal.

Coal Transport: Though sufficient rail capacity is now available and the transport of coal by rail is cheaper, it has been decided to continue moving this commodity by sea to the southern and western parts of the country to meet the industrial and other demands. The coastal shipping has been strengthened to carry two million tonnes of coal. If the traffic is withdrawn, it will create difficulties.

Oil Imports from Russia: The Minister for Petroleum and Chemicals, Mr. Humayun Kabir, informed the Lok Sabha on March 4 that the Indian Oil Company was negotiating a new agreement with the Soviet Union for import of oil products. Details of this agreement, however, had not yet been finalised. The private sector refineries, the Minister added, had already been permitted to operate at the maximum capacity available with them. No further expansion of their capacity appeared to be called for.

Newsprint Manufacture: The Minister for Industry, Mr. Nityanand Kanungo, revealed in the Rajya Sabha on March 4 that of the three private sector projects licensed for the manufacture of newsprint, the one licensed in Maharashtra had not shown any progress. This licence had, therefore, been revoked. The two other projects were licensed to be set up in Punjab and Uttar Pradesh. In the case of the Punjab scheme, the report of raw material survey and the project report were under the consideration of the Government. In respect of the Uttar Pradesh plant, the collaboration terms has been received from the party and were under scrutiny.

Tirupura Paper Mills: Mr. Kanungo also stated in the Rajya Sabha on March 4 that it had been decided to undertake the survey of raw material resources in Tirupura with a view to setting up a paper mill there.

The following other information was given by the Minister of Industry last week in the two Houses of Parliament.

Bhilai Cement Unit: The Government is considering an application from Hindustan Steel Limited for the grant of an industrial licence for the manufacture of 600,000 tonnes of portland blast furnace cement per annum at Bhilai.

Textile Machinery: The Government was negotiating with a British firm for the import of textile machinery. Among the items to be imported were included carding and finishing machines.

Coffee Exports: The Minister for International Trade, Mr. Manubhai Shah disclosed in the Rajya Sabha on March 4 that India was applying to the International Coffee Board for almost doubling the present quota of 21,384 tons allotted to it under the International Coffee Agreement. In 1963, India exported 30,000 tons of coffee out of a total production of 65,000 tons. Mr. Shah further stated that the prices of some varieties of Arabica coffee had gone down, but those of Robusta were going up. Exports of coffee from India were effected practically to all the parts of the world.

Coffee Plantation: Mr. Shah revealed in the Lok Sabha on March 6 that the United Planters' Association of India had submitted a scheme for grant of financial assisance, partly in the form of subsidy and partly as loan, to enable coffee planters to undertake replanting of 120,000 acres of low-yielding plants over a period of 12 years. The total outlay envisaged was approximately Rs. 24 crores. The Coffee Board had limited the amount to Rs. 10 crores. The scheme, as recommended by the Coffee Board, was under the examination of the Government.

Haldia Project: The Minister for Transport, Mr. Raj Bahadur, told the Lok Sabha on March 3 that India had applied for a loan of Rs. 14 crores from the World Bank for covering the foreign exchange expenditure required for the development of Haldia under the first phase of the project. Considerable progress had been made on the detailed planning of the various facilities to be provided at this port during the first phase of its development.

New Shipping Company: Mr. Raj Bahadur disclosed in the Rajya Sabha on March 2 that the specifications of the tankers to be purchased by the shipping company, proposed to be set up in the private sector in collaboration with Phillips Petroleum of the United States, for bringing oil to the Cochin Refinery, would be settled by consultation between the refinery and the shipping company managements. These would be submitted to the Director-General of Shipping for approval before the orders were placed. Phillips Petroleum would have 40 per cent share in the equity capital of this new shipping venture.

Avro Cost: The Minister for Defence Production, Mr. K. Raghuramaiah, informed the Lok Sabha on March 9 that the cost of the first aircraft in series II of Avro 748 had been estimated at about Rs. 32 lakhs. Of this, the foreign exchange content was Rs 20 lakhs. The actual cost of the basic aircraft and its indigenous content, however, were still being compiled.

Avadi Tank: Mr. Raghuramaiah told the Rajya Sabha on March 2 that the first batch of the tanks to be produced at the Avadi Heavy Vehicles Factory was expected to be ready in 1965-66. It had been decided to establish the heavy earth-moving equipment manufacturing factory at Kolar in Mysore.

Private Foreign Investments: In a written reply to a question put in the Lok Sabha on March 5, the Union Minister for Finance, Mr. T. T. Krishnamachari, gave the following figures about the outstanding foreign investments in the country from private sources:

As at the end of June 1948: Rs. 255.8 crores;
As at the end of December, 1953: Rs. 392 crores;

As at the end of December 1955, 1956, 1957, 1958, 1959 and 1960, respectively: Rs. 453.4 crores, Rs. 478.2 crores, Rs. 496.1 crores, Rs. 500.4 crores, Rs. 511.5 crores and Rs. 566.4 crores.

In 1961, 1962 and 1963, the fresh private foreign investments approved by the Government of India in Indian companies totalled Rs. 35.4 crores, Rs. 29.6 crores and Rs. 34.4 crores, restively.

Trading for Development

H. E. JEAN PAUL GARNIER
(French Ambassador in India)

The Soviet Ambassador in India, H.E. I. A. Benediktov, discussed in our issue of November 8, 1963 the purposes which, in his view, the forthcoming World Trade Conference to be held in Geneva should seek to serve and the means it could adopt. The British High Commissioner in India, H.E. Sir Paul Gore-Booth, presented in the issue of February 29, 1964 an appraisal of the British approach to questions of international trade expansion. Here the French Ambassador in India, H.E. Jean Paul Garnier, gives an account of the French role in promoting the expansion of the trade of developing countries and states what might be done at an international level to achieve this objective. The French Government's proposals for Geneva are discussed elsewhere in this issue by our Special Correspondent in Western Europe.

AMONG THE problems which confront the world community today, the expansion of the trade of the developing countries is one of the most essential, considering its importance in the process of economic progress. In industrialized countries as well as in the developing countries, one becomes increasingly aware that the present pattern of world trade does not provide the second group with sufficient opportunities for obtaining the resources they need to achieve substantial rates of growth. New solutions are required to face the challenge which the widening gap between the rich countries and the poor countries is creating for all of us.

For many years, France has devoted particular attention to this problem and has made several, and specific proposals to deal with it, as far as possible at the world level. Meanwhile, she has been doing what she could to arrive at, at least, partial solutions, in her relations with the countries of the Franc area, not without significant results. In this respect, French policy has not been derived from theoretical considerations but rather based on lessons of experience and aimed at finding practical remedies for practical difficulties.

First, it does not appear to us that it could be possible to rely only on free trade to solve the problems of the developing countries. If between highly industrialized countries, the free trade system is certainly the most suited to maintain prosperous and efficient economies, between countries or areas of different stages of development it would mean unequal and therefore dangerous competition, at the expense of the less-advanced. One has to remember that, only in recent years, after completing their post-war reconstruction, have the Western European countries and Japan been able to achieve full convertibility of their currencies and a high level of trade liberalization.

While it is an ultimate goal to achieve, free and full competition between all nations of the world would not benefit the developing countries, but rather lead to a worsening of their already weak position in international trade. This applies to trade in primary commodities as well as to trade in manufactured goods.

Market Organization

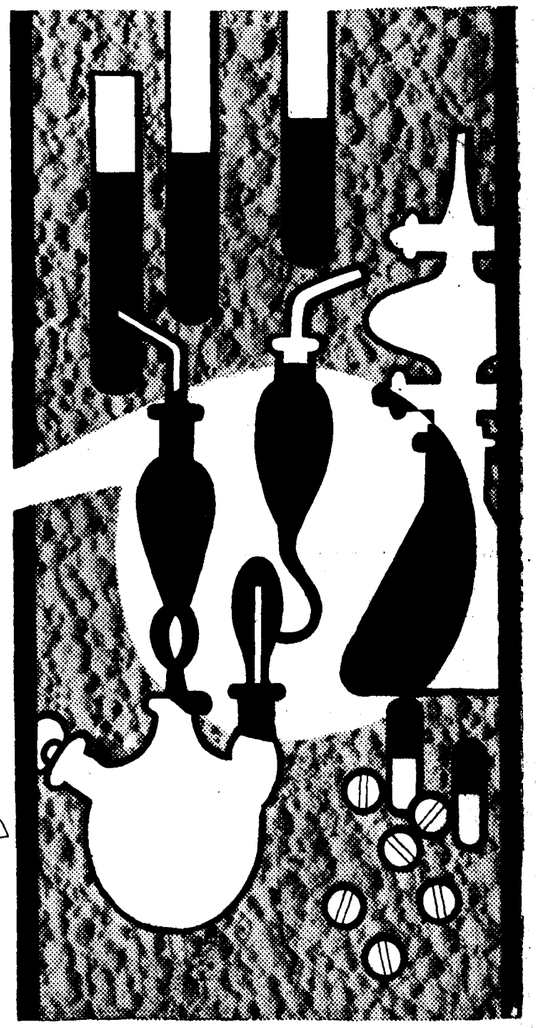
Moreover, as regards agricultural commodities, there is little and less question of unlimited competition, which would only result in a disastrous effect on producers, as most countries turn more and more to policies of managed domestic markets, ensuring fair prices to their farmers. In some cases, as in the Franc area, and to a lesser extent in the Commonwealth, industrialized countries have succeeded in providing similar advantages to certain producing countries. What is needed is to apply market organization at the international level as it has been at the national, and thus ensure to all developing countries opportunities which are now offered only to some of them.

From recent history, it appears also that economic development and especially industrial development has to be based on large domestic markets, protected from excessive outside competition, as a fundamental requirement for rapid growth. Everybody knows the part which the national market is playing in the economic achievements of big industrial countries such as the United States of America and the Soviet Union. In most other cases, however, national markets being too narrow, this leads naturally to regional groupings. For developing countries in particular, it does provide the best solution to the problems of industrialization by offering the enlarged outlets they need to expand their production of manufactured goods.

Regional economic groupings are now coming into existence in almost every part of the world, in Western countries as well as in state-controlled economies, in industrialized countries as well as in developing countries: Common Market, EFTA, COMECON, Latin America Free Trade Association, Central American Common Market, African Organisations, efforts undertaken by ECAFE countries to expand their regional trade—already quite sizable — and to co-operate in the planning of industrial development.

Starting from these brief considerations we shall summarize the French position on the two trade problems of developing countries, first regarding primary commodities, and secondly, manufactured goods.

Of all the problems with a decisive importance for the future of the developing countries, that of primary products is undoubtedly the most important. These products — foodstuffs from the temperate and tropical zones, agricultural raw materials, mineral products — account for 90 per cent of the export earnings of the underdeveloped countries; and for most of them, exports are practically limited to a very small number of products.



Such a situation will change only when the process of development brings about a progressive diversification of the economy. But this is a time-consuming process which itself depends on the export earnings from primary products. Foreign exchange resources are needed not only to pay for development imports, particularly of capital goods, but also to provide producers' incomes, which in their turn determine the level of living standards and of domestic savings. Foreign aid in any case cannot provide more than a limited supplement to local resources.

It is well known that the present conditions in the world market for primary products do not permit developing countries to earn sufficient incomes, with the result that these countries move in a vicious circle.

Speaking at the meeting of the FAO held in Rome in November 1963, M. Pisani, French Minister for Agriculture, outlined the problem as follows: "Faced with the twin problems of agriculture—feeding the hungry millions of the world and providing good living standards to the farmers—many people would want us to speak only of trade. The-

Thermocole®

KEEPS IT COOL AT CIBA

Research has a perfect setting at the new CIBA centre in Bombay. It has the perfect insulation, too, thanks to THERMOCOLE.

There are many organisations in India that know and use THERMOCOLE for insulation, and CIBA is one of them. No matter how hot and noisy it is outside, THERMOCOLE keeps it cool, quiet and comfortable inside.

THERMOCOLE is foamed polystyrene—the lightest rigid insulation material in the industry. It has a very low thermal conductivity. It can deaden airborne and vibrational sound and cut out heat, dust and humidity.

There is one sure way to work under ideal conditions: insulate against heat and sound with THERMOCOLE

The Trade Name—Thermocole is your Guarantee of Quality for Expanded Polystyrene

When the need is insulation against heat and sound, call in...

market system as it functions in agriculture, has nevertheless proved itself incapable of finding an effective solution to the problems of prices as well as for the production of food, incapable of fighting against famine, incapable of fighting against abundance, incapable of fighting against high prices, incapable of fighting against the slump in prices. The market system has never provided the farmer with the living standards which he has the right to expect, nor has it brought the much needed security to the consumer, in many parts of the world".

Various regional and international arrangements have of course been instituted to remedy this situation for certain products and for certain countries. Though they sometimes constitute the beginnings of more effective solutions, and though their role is not negligible, they do not yet mean anything more than partial and often provisional remedies. Hence the need to search for fuller and more lasting solutions.

The producers of industrial countries have generally succeeded in getting various laws of price support and protection of the domestic market to their benefit (agricultural production, copper, petrol) passed by their governments. Some industrialized countries, on the other hand, have tried to safeguard the interests of developing countries with which they had closest relations and traditional links: for instance, preferential system of the Commonwealth and especially Commonwealth Sugar Agreement, US Sugar Act and preferences to Philippines, preferential arrangements in the Franc zone.

French Concessions

France has gone farthest in this respect by granting to the producers of the Franc Zone advantages similar to those enjoyed by the national (French) producers. This means that for the majority of products, prices much higher than international prices have been guaranteed for the following items of commerce: wine and wheat from the Maghreb, sugar from Antilles, coffee, bananas, oil and oilseeds from French-speaking Africa. Such a system of price support has made it possible for these countries to earn an additional income of more than US $200 millions in 1961. Further, the Stabilisation Funds (Caisses de Stabilisation) have protected the African producers of tropical goods from the short-term price fluctuation in their exports to the international market.

The association of African countries to the EEC has no different purpose, although the technical system in some respects is not the same. While lowering the level of preferences formerly enjoyed by these countries, such a system is designed so as to provide them with advantages equivalent to those they were previously granted.

Besides regional arrangements, international agreements have been concluded in order to attain a certain measure of price stabilisation through the acceptance of common discipline by producers and importers. As everybody knows, France has always been in favour of this kind of arrangement. First there were the agreements on wheat, sugar, and tin. More recently, the agreement on coffee and the negotiations for an agreement on cocoa have shown that producing and consuming countries are becoming increasingly aware of the problems raised by the trade in primary commodities. The agreement on coffee, however, does not provide for a price system and one may fear it would not be efficient enough to cope with excessive downward trends, as in some previous years, or excessive upward trends, as occuring now.

Unfortunately, it has not been possible to reach an agreement on cocoa, which was to include a price system. These negotiations failed on the problem of fixing price levels, due to the opposition of certain consuming countries to accept anything but a very low scale of price.

Considering this situation, the French Government has proposed that international market for agricultural commodities should be organized so as to stabilize prices at a fair and equitable level, by taking into account the evolution in terms of trade. For certain commodities this could mean more or less stabilisation at levels not too far from the present prices (coffee, sugar, cocoa), for some others this could mean raising prices to some extent (wheat, oil seeds and vegetable oils). in other words, such a scheme — the so-called Baumgartner - Pisani Plan, first outlined by the two French Ministers, the former at GATT ministerial meeting in 1961, the latter at FAO Conference the same year — aims at applying to the commodities exported by all developing countries, the system of price-support which the richer countries have established for their own agriculture or for the exports of overseas producers enjoying preferential arrangements.

Reducing the Gap

For foodstuffs from temperate lands, (wheat, other grains, milk products, meat) and foodstuffs exported by temperate as well as by tropical areas (sugar, rice, oilseeds, and vegetable oils), international commodity agreements would provide for adjustment of commercial exports to requirements of importing countries, so as to keep prices within a fixed scale (as for instance in the present wheat agreement). Such prices would be established at levels near to the internal prices of the big producing countries (United States, EEC countries) so eliminating or at least reducing the gap which exists between the prices in the internal and the international markets. Surplus in excess of the normal commercial demand would be devoted to food assistance programmes to the benefit of developing countries, these programmes being financed by all industrialized countries as part of their effort in development aid.

As regards tropical foodstuffs it would be possible to rely on the usual commodity agreements on the pattern of the present coffee agreement or of the draft cocoa agreement. These agreements would have to provide for a price system, this implying an improvement on the coffee agreement, which, as stated before, does not include such a system. An agreement on tea, more or less along the same lines as for coffee or cocoa could also be envisaged, with a view to raising the price of this commodity. It would offer the possibility of providing a fair treatment to producing countries of South East Asia, the price of tea having in the long run (since 1924-28) lagged behind, compared with the increases which occurred for coffee and cocoa.

In the case of agricultural raw materials and mineral products, it would seem, on the contrary, unreasonable to envisage a systematic increase in prices which might accelarate the substitution process in the buyer countries. The best solution lies perhaps in the conclusion of the international agreements of stabilisation against short-term fluctuations on lines of the agreement on tin for other products such as copper, lead, zinc, rubber, jute.

Manufactured Goods

Up to now sales of manufactures have had only a very small share in the total exports of developing countries, with however a few important exceptions, as in the case of India. Nevertheless, with the process of economic diversification exports of manufactures are due to expand at an increasing rate.

But as far as they are directed to already industrialized countries, they have to face serious difficulties. The competition of national producers in the importing countries and of producers of other industrialized countries, often tends to prevent developing countries from expanding their sales to any substantial level: Take, for instance, the exports of India

to the United States and the competition of Japanese goods in this market.

Moreover, if the developing countries try to lower their prices at the expense of wages — which is indeed an objectionable solution as regards standard of living — or to grant subsidy to their exporters — which amounts to a subsidizing of rich countries by poor countries—, the importing countries rightly or wrongly would consider it as abnormal competition and react by restricting imports.

Developing countries are becoming increasingly aware of such difficulties and they seek to obtain preferential treatment for their exports in industrialized countries. Indeed, this solution could probably be an answer to the problems. As is known, EEC countries, including France, are considering favourably the possibility of evolving some scheme of this kind. One will remember that, at the recent ministerial meeting of GATT, last May, the Belgian Minister, Mr. Brasseur, outlined a plan by which the industrialized countries could grant special preference to developing countries on a "selective, i.e., according to the specific requirements of exporting countries, retrogressive and temporary basis". The idea will certainly be fully discussed at the forthcoming UN Conference for Trade and Development.

However, one has to bear in mind that such a preferential system does not fit quite well with a general reduction of tariffs, as contemplated in the Kennedy round, and as often claimed by the developing countries. If tariff reduction is granted on a world-wide basis, according to the most favoured nation clause, preferences enjoyed by developing countries would be so much reduced and in some cases to a very nominal rate.

Growth of Domestic Markets

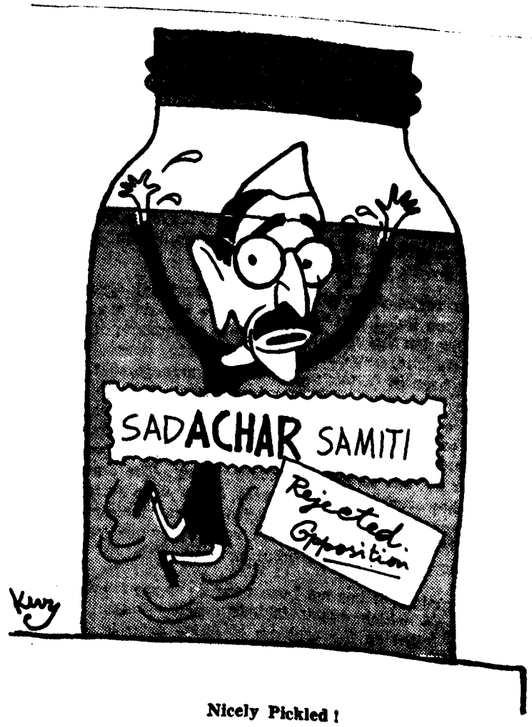
Anyway, even in the best conditions, it seems unlikely that developing countries could rely essentially on exports to industrialized countries. As already stated, their most promising opportunity appears to lie first and foremost in the growth of their own domestic markets, on the national and regional scale. Import substitution, so achieved at the optimum scale would secure far more possibilities in foreign exchange earnings. According to past experience, this is quite probably the only way to foster a balanced and well-sustained process of industrialization.

Provided the advanced countries accept the regional discrimination so created against their own exports, it affords the possibility of building up strong industrial capacities especially for heavy industries and to attract more largely and more efficiently foreign capital, public and private. So has been the story of OEEC in post-war Europe and of EEC in recent years. So has already started the process of regional integration in Latin America.

Instead of being heavily dependent on remote and difficult markets, as in colonial days, the developing countries might be able to achieve a greater control of their industrial progress, and attain a greater security in their economic planning. This would lead to a true and sound division of labour, allowing for full industrial diversity and averting the likelihood that the less developed countries would be left mainly with light industries, while advanced countries would keep for themselves the more sophisticated productions.

This is not by any means the same thing as saying that exports of manufactures to industrialized countries ought not to increase more and more. On the contrary, such a process is to take place normally and must be encouraged, may be through some special devices, as preferential treatment. In course of time, and after having reached the "take-off" stage, these countries would take their full share of world trade in manufactures, as already industrialized countries are now able to do. But to achieve such a goal, developing countries need a strong domestic industrial basis which could gradually enable them to complete successfully in the world markets. Increased participation in international trade has to be the result of an efficient process of industrialization, and not its prerequisite.

So are, briefly outlined, the French views on both the trade problems confronting the less developed countries in today's world, that of primary commodities and that of manufactured goods. Beyond deceptive appearances and dangerous illusions, they try to reach the core of these problems. They are derived from hard facts, which no country, industrialized or developing, could ignore, if it wished to improve to any substantial degree the situation of the latter in world economy.



First, that it is neither sensible nor realistic regarding agricultural commodities to rely on market organizations at the national level and to avoid any organization at the international level.

Secondly, that the problem of terms of trade needs an equitable and reasonable solution so as to expand export receipts of the developing countries and to increase their share in world trade.

Thirdly, that exports of manufactured goods by these countries require special measures and ought not to be subjected to the same rules as for the already industrialized countries.

Fourthly, that only enlarged internal markets, achieved in most cases through economic groupings, could provide the conditions needed for a rapid and healthy process of growth, especially as regards industrialization.

Being keenly aware of the structural deficiencies that characterise today's international relations, France is trying to contribute her share to the solution of the problems. But the task facing us cannot concern only some countries or a group of countries. Each step towards a better world has to be the common endeavour of all and every nation within the human community.

Nicely Pickled !

WINDOW ON THE WORLD

A Plan for the World Trade Conference

From our Special Correspondent

PARIS :

THE FRENCH Government has sent to the United Nations, for translation and distribution among the 2,500 delegates expected in Geneva on March 23 for the UN world trade conference, a document of 40 pages that summarises French ideas on the reform of international commerce. The study does not constitute a "plan" comparable to those that will be presented by the Russians (essentially the project of a new world trade organisation), by the Anglo-Saxons (the "seven-point declaration" adopted by GATT in December 1961) and by various groups of developing countries. But if, during the three months of the world trade conference, it appears that the Common Market Six are being put in the dock by the other 119 nations present, it is probable that the French document will be officially put forward as a plan designed to meet the principal demands of the developing nations. So the French memorandum could well be at the centre of the discussion before the conference closes in mid-June.

That is to suppose that there is any consecutive discussion in Geneva, and that the Tower of Babel of thousands of delegates from 125 countries is capable of getting down to debating any solid project. For the most evident danger is that complete confusion will emerge from the clash of quite contradictory points of view and the battle of propaganda, hypocrisy and envy. If that reef is avoided, if any comnion theme comes out, it is bound to be an impeachment of the Common Market. This is natural, after all. When the Americans began to fear the impact of that association on their trade, they called the Kennedy Round of negotiations, which will begin in Geneva under GATT's auspices before the world trade conference is over. Countries not belonging to GATT (and in the first place, Russia) and countries that regard GATT as a "rich nations' club" then took up the idea of a world trade conference, with roughly the same end in view; they are seeking, like the Americans, to cushion the blow to their trade that they expect to come from the Common Market.

Tangled Affair

Of course, lots of other issues have immediately become entangled in the affair: the rivalry between the UN and GATT, between the Communist bloc and the capitalist group, between the Six and the Free Trade Association and the Anglo-Saxons, between rich and poor nations, and so on. Hence the danger of fruitless confusion just referred to. If the meeting is to get anywhere, however, it must reflect the initial intentions: the Common Market is seen as a menace by outsiders, and the Six will be asked (just as in the Kennedy Round by the USA) what they propose to do about it.

The French document in question, which attempts a reply, consists of four proposals, relating respectively to trade in temperate-zone foodstuffs, to trade in commodities exported by developing countries, to the exports of manufactures by those same developing nations, and finally to the formation of regional groups (like those of the industrialised countries of Europe) within the developing world.

The first of these is the by now familiar Baumgartner-Pisani plan for the disposal of Western food surpluses. In substance, it means that the advanced nations as a group would implement something very like the US "Food for Peace" scheme. The market in temperate-zone foods would be organised in such manner that rich importers like Britain, Japan and West Germany would pay the full value of their imported food, as consumers already do inside rich exporting countries like the USA, France and Australasia. Exports from these latter would then not have to be subsidised by local taxpayers, who thus indirectly subsidise their industrial rivals in the first group of countries. Food equal in value to the extra revenue that Western farmers secured by selling to Britain etc at higher prices (instead of at the present dumping prices) would be contributed to a global "Food for Peace" fund. It would be given, as gifts, loans or other aid, to the developing countries. Thus there would be a net transfer of resources from the industrialised to the developing world, largely at the expense of the consumers in the rich countries.

"Fair" Prices

The proposal on commodity exports from the developing world is more original. For the existing system of "free" markets where supply and demand determine wildly fluctuating prices would be substituted an organised market where "fair" prices for tropical produce were fixed by agreement between virtually all the exporting and importing nations. The "fair" price for each commodity might be existing market prices plus a percentage equal to the above-mentioned gain that Western farmers would make when all their Western customers were obliged to pay non-subsidised prices for temperate-zone food. How to ensure that exporters of tropical commodities receive this higher, fair price? Well, markets would continue to function as now, but at the moment of importation of tropical produce into the West it would pay an import duty that would bring its cost up to the agreed fair price. This import duty would be returned to the exporting nation. (Thus it would not be an import duty at all but a "prelevement" such as the Common Market now effects on agricultural imports.) To avoid encouraging over-production, this import levy or "prelevement" would not go direct to the actual producers of tropical produce but to their government, which could pass on part of it to the producers and use the rest for development projects. Better still, the import levies collected in the West on tropical produce would go to a central fund managed by a group of developing countries, who would thus be required to co-operate as the West European nations did in sharing out American Marshall Aid.

On the manufactures exports of developing countries, the French study adopts the Brasseur plan put forward several times lately by the ex-Belgian Commerce Minister: Western nations would allocate specially favourable treatment to these industrial goods, more favourable than to similar goods from other industrialised countries. This could be done by tariff-quotas, for example. Such privileges would be selective, temporary and degressive, to ensure that the young industries of Asia and Africa did not go to sleep over their guaranteed outlets but sought to make themselves competitive. The French insist that such preferences are needed if Asian manufactures are to win markets in the West, because merely to abolish tariffs would be inadequate. Western consumers are prejudiced against Asian manufactures, and the Asians do not have sales networks in the West. In other words, the "liberal" solution of the Americans and British, which depends on universal tariff reduction, would not benefit the Asians, who need organised preferences. Of course, the Asians would have to be logical with themselves, and not demand both a "liberal" market (reduction of tariffs) and an "organised" market (guaranteed quota preferences).

The last suggestion is to apply to various regions of the

developing world the techniques of regional co-operation that have worked so well since the war in Europe, with American blessing. The European Payments Union and the Organisation for European Economic Co-operation enabled the West Europeans, during the period of reconstruction, to discriminate against dollar goods, to stimulate trade inside their region and to pool their savings of precious dollars. The same technique would work in regions like South Asia, Africa and Latin America where groups could be formed practising mutual trade preferences, discrimination against goods from outside and joint financing by a credit mechanism similar to the European Payments Union.

In sum, wherever it is a matter of choosing between liberal policies and organised markets, the French come down on the second side. They adopt the remark of an Indian delegate to GATT some years ago: Equality of treatment is equitable only between equals. The "law of the market" cherished by the liberals is seen as the law of the strongest partner in the market, and is held responsible for the widening gap between economic progress in the rich and the poor nations. To enshrine it in the free-trade schemes that will be put forward in Geneva by the Anglo-Saxons would, it is claimed, fail to benefit the Asians, Africans and Latin Americans, and would further increase the profits of Western importing oligopolies. The developing nations need to band together, first of all regionally, and secondly in global market-fixing bodies along with Western countries, if they are to exercise a countervailing power against the West.

One can foresee the reception this will have from the Americans and British who have, moreover, persuaded many developing nations that will be represented in Geneva that their salvation lies in tariff-reduction, most-favoured nation treatment, global free trade and no discrimination. Curiously, the Russians will appear in Geneva in the liberal camp for they too preach the "international division of labour", respect of the most-favoured nation clause and the evils of discrimination and regional groupings. The French document, then, which is to date the only answer the Six have ready for their coming impeachment, will start out with slender support. But an evolution of opinion can be forecast, and has indeed already begun. In any event, the real theme of the Geneva meeting on world trade, in so far as it succeeds in finding one, will be the opposition between global free trade and the doctrine of organised markets.

Britain's Storm Petrels

PAUL BAREAU

LONDON :

THE ECONOMIC danger signals are again flying in Britain. The recent expansion of the economy is all that could be desired and perhaps a little more than was intended. But there are ominius signs of wage-induced inflation and the overseas trade figures have taken an ominous turn for the worse. The general comment on this is one of annoyed impatience: will there never be an escape from the dreary round of rapid economic expansion, setting in motion inflationary tendencies and thus calling forth restrictive measures which bring expansion grinding to a halt?

The British economy is highly sensitive to this cycle. This is because of its dependence on overseas trade and, even more, because of the vulnerability of sterling given its position as a reserve and an international trading currency. No sooner inflationary tendencies become apparent than they are reflected in the flow of both exports and imports and also on foreign confidence in sterling and therefore on movements of capital. Hence the regular sequence of periods of expansion and stagnation which have marked the progress of the British economy since the end of the World War II.

Stop & Go

It is, however, grossly unfair to give to this process the derogatory definition of "Stop-Go-Stop" which is so often applied to it, particularly in the parlance of political polemics. There is never a "Stop". The post-war economic history of Britain shows an enormous improvement on what happened after World War I. There has been no depression worthy of that name. Unemployment has remained minimal. What there is of it is highly localised and linked with the fortunes of certain depressed industries and with an excessive immobility of labour. What has happened is not a succession of "go" and "stop" but a perceptible variation in the rates of expansion while the level of employment has remained relatively high.

It is impossible in a free economy to achieve an absolutely steady rate of growth. This is because in such an economy the consumer is king and his demands undergo fickle changes of mood. This is especially so where so many of the consumers of an economy's products reside in other countries and have the world competing for their customs. In these circumstances industry and commerce must for ever be changing their pattern. Although the overall volume of demand can be influenced by the intervention of the state, it cannot hope thereby to neutralise and overcome the impact on a highly industrialised economy of these changes in the pattern of demand. Recent events in the centrally planned communist countries prove that even in this context there can be consistent growth, even though most of them started their expansion from relatively low levels.

Touch of the Brake

What is needed in Britain is a policy that will minimise the fluctuations in economic expansion. And for that what is essential is good timing in successive applications of the brake and the accelerator. It seems now that the time has come to apply a touch of the brake. Britain can look back on a year of exceptional expansion. Industrial production in the last quarter of 1963 was no less than seven per cent greater than in the comparable period of 1962. Unemployment has again fallen below two per cent of the labour force. In many parts of the country the notified vacancies are well in excess of the men and women available to fill them. In these circumstances it is hardly surprising that demands for higher wages should be proliferating and also that they should be conceded in a large number of cases. These are the circumstances in the context of which one should assess the overseas trade figures for January which has given the authorities here such a shock. They showed an ominous fall in exports, an even more ominous rise in imports and a gap between the two of £120 million which is far and away the largest merchandise trade deficit ever incurred in any one month. How should these be interpreted?

No single month's figure tells a complete story and it will behove all concerned to see whether in the light of recent and forthcoming monthly figures they fall into the pattern of a trend. There is no doubt that imports have been rising rapidly. This, however, is an inevitable accompaniment of the impressive expansion in production to which I have already referred. The main increase in our purchases from overseas are industrial materials. And it is not merely the volume that is going up; it is also the price. Primary commodity prices are rising. This should be no cause for com-

His blood has saved many lives

Way back in 1935, at Jamshedpur's Main Hospital, a man lay dying. Only a transfusion of blood could save him. In those days, most people thought that blood donation permanently damaged health. But a young man came forward and voluntarily gave his blood to sustain the ebbing life. Between 1935 and 1955, the same man freely gave his blood no less than 40 times—on an average twice a year—for victims of industrial accidents, to save men critically ill.

This extraordinary man is T. S. Balam, a typist with Tata Steel at Jamshedpur, a happy, healthy family man of 50. Although he still wants to donate blood, doctors decline his offer in view of his advancing years.

Inspired by the selfless example of men like Balam, many, many others in the steel town have donated blood. No less than 20,000 employees of Tata Steel have had their blood tested and grouped, while many more are coming forward regularly for testing and grouping ... *to help prevent* avoidable deaths ... to save families from sorrow and ruin.

This is yet another instance of the fellow-feeling, born of the indivisible bond of labour, that binds together the steelmen in Jamshedpur, a city where industry is not merely a source of livelihood but a way of life.

plaint. The older industrialised countries have for too long flourished on low commodity prices and on the relative poverty of the countries producing these commodities. It is high time the pendulum swung in the other direction. It now remains to be seen whether this increased inflow of industrial material is later converted into an appropriate volume of exported manufactures.

There is a special and, it is to be hoped, non-recurring explanation of the particularly poor showing made by the January trade figures. It is the strike which closed the largest of the steel factories in South Wales from mid-December to the end of January. Not only did this prevent the export of a substantial tonnage of steel which would otherwise have been made, it also compelled the largest motor car manufacturers in Britain to import substantial quantities of sheet steel from Continental Europe. It may well be therefore that the January trade figures are not as bad as they may at first sight appear to be and that the fears engendered by them may prove to be no more than a quickly forgotten nightmare.

If, however, they mark a deteriorating trend in the balance of payments — and this is the more likely interpretation — corrective measures will have to be applied. There is talk of an early increase in Bank rate and of the use by the Chancellor of the Exchequer of the "regulator" by which he can move indirect taxes up or down by 10 per cent without waiting for the budget. Needless to say either of these general correctives would be somewhat unpopular. To apply them would be handing political ammunition to the Opposition, of which effective use would be made between now and the General Election.

The alternative — and it is one which is favoured by Labour Party spokesmen — is to apply more selective measures involving physical controls. Exchange control might be tightened in particular so as to check the hordes of British tourists who holiday abroad. Selective import controls could also be introduced, even though the machinery for these has in large measure been dismantled by successive Conservative Governments. Import controls always look a simple and direct way of correcting a balance of payments deficit. Alas, they would in the case of Britain invoke retaliation. In order to apply them this country would, moreover, have to obtain the necessary "by your leave" from the General Agreement on Tariffs and Trade and for that purpose would have to sign what would be tantamount to a declaration of insolvency. To me that does not seem the happiest way out of the present difficulties.

Major Issues for Geneva

GUY SIMS FITCH

WASHINGTON:

AT THE United Nations Conference on Trade and Development (UNCTAD), scheduled to run from March 23 to June 15 in Geneva, the world will have some 12 weeks in which to give a thorough airing to many economic problems affecting the developing lands. The conference agenda, centring on the role of trade in economic development, is comprehensive and far-ranging. One can reasonably expect, however, that attention is likely to focus on a few major areas of discussion.

First, what can be done to improve the earnings of developing countries from the export of primary commodities? These now constitute the bulk of their export trade, and regardless of the pace of industrial development, almost certainly will loom large in their foreign exchange earnings for some time to come.

Whatever the precise nature of the proposals advanced at the conference, emphasis is likely to be on such factors as expanding markets, coping with wide price fluctuations and reducing the heavy dependence of many countries on a few commodities. A good deal has been done in these directions already, of course, through international commodity arrangements, moves toward economic diversification, and other means.

Dynamic Picture

Second, how can developing nations increase their earnings from exports of manufactured and processed goods? This is the more dynamic part of the international economic picture, and it is here that developing lands must look increasingly for a significant expansion of their export earnings.

In view of its importance, this subject merits and undoubtedly will receive thorough consideration and analysis at the conference. There are many factors involved in achieving a substantial expansion of export earnings from manufactures, and specific proposals will have to be examined closely and carefully.

Third, how can countries of the Soviet Bloc — the so-called "state trading" countries — be brought more fully into the world trading pattern in a way that will enhance the bargaining power of the developing countries when dealing with them? The Soviet Union and other Bloc nations, for instance, tend to conduct their trade predominantly through bilateral agreements and to a considerable degree on a barter basis.

It follows that the developing nations may well have an interest in improving the terms and conditions of their trade with the Bloc, and in seeing that it is subject to the same scrutiny and to similar standards of performance as their trade with the free nations, who are their principal trading partners.

Fourth, is aid being given to the developing lands in a way and under terms that are the most satisfactory and desirable? Important questions bearing on the relationships between aid and trade programmes are likely to be examined, along with repayment problems of developing lands.

U.S. Role

It may be that the conference's discussions can point the way toward a broader assumption of international responsibility by all concerned. The United States could have a particularly constructive role to play in such discussions, in view of its long experience in this field and its demonstrated concern for the needs of the developing nations and the obligations of the advanced nations.

Finally, the conference probably will be taking up the institutions and organizations now operating in the related trade and aid fields. There are many such bodies, all performing useful functions — the General Agreement on Tariffs and Trade (GATT), the World Bank, the International Monetary Fund, the UN Regional Commissions, the Food and Agriculture Organization, and others.

As the conference proceeds, it may well seek some technique whereby all aspects of trade and development can be viewed as a whole in a world-wide forum. If such is the case, one can reasonably expect the United States to co-operate in seeking a useful reorganization of existing machinery — but always keeping in mind the vital importance of preserving the integrity and autonomy of the GATT, which is the world's chief instrument for the liberalization and expansion of trade, and of maintaining a sound and manageable structure within the United Nations.

Plan to Beneficiate Manganese Ore

By Our Special Correspondent

NEW DELHI:

THE UNION Government, it is understood, has sanctioned two pilot plants to be set up by the National Metallurgical Laboratory and the Indian Bureau of Mines for conducting experiments on beneficiation of low-grade manganese ores. Foreign exchange to the tune of Rs. 8.11 lakhs required for importing equipment for these plants is said to have been released recently.

This follows the recommendations of the Kapadia Committee set up by the Government in 1957 to go into the problem of retrieving low-grade manganese ores for consumption within the country and for exports. The Committee had suggested establishment of beneficiation plants for upgrading low-grade manganese ores, but had advised that since the ores available in the various regions of the country differed widely from each other in their chemical composition, elaborate tests needed to be conducted on pilot plant scale on the bulk samples of ores from different localities before any scheme for setting up beneficiation plants was drawn up.

The detailed pilot plant experiments are expected to be completed by 1965. On the basis of these, the Union Government will consider setting up of beneficiation plants in the various parts of the country on a custom basis. The third Plan contains the requisite provision for setting up such custom mills.

The need to start beneficiation of manganese ore arises from the fact that India has only about 125 million tonnes reserves of all grades of this ore and these may not last for more than 30 years if only the higher grades of this natural asset are used for export and domestic consumption, as at present.

A healthier trend has been noticeable of late in manganese ore exports from India. During the 11-month period to November, 1963, we exported 0.825 million tonnes of manganese ore, as against 0.78 million tonnes in 1962, 1.01 million tonnes in 1961, 1.16 million tonnes in 1960, 0.98 million tonnes in 1959 and 0.97 million tonnes in 1958. In 1958, exports of this commodity had declined sharply from 1.74 million tonnes in the preceding year. The Indian manganese ore, however, is meeting stiff competition in the world today from the new and richer deposits that are being developed nearer the consuming countries. A Committee, under the chairmanship of Mr. M. Butt, Joint Secretary, Department of Mines and Metals, has been entrusted the task of looking into the problems faced by the Indian manganese ore industry.

★★

With the requirements of machine tools expected to grow to Rs. 100 crores by 1970-71, from the estimated demand of Rs. 60 crores at the end of the current Plan period, the Union Department of Heavy Engineering is anxious that large-scale additional capacity should be set up for their manufacture. The indigenous production of machine tools, currently around Rs. 16 crores per annum, is anticipated to go up to Rs. 25 crores by 1965-66.

The machine tool categories for the manufacture of which a good deal of new capacity has to be created are: (a) Capstan and turret lathes; (b) Single and Multi-spindle automatic lathes; (c) Grinding machines, particularly surface grinding machines, cyclindrical grinding machines and centreless grinding machines; (d) Production type milling machines with automatic cycle, etc. (e) Gear-cutting and fishing equipment; (f) Sheet Metal working machinery; (g) Vertical turrets — low priced; (h) Planing machines — low priced; (i) Horizontal boring machines — low priced; (j) Broaching machines; (k) Tapping and threading machines; (l) Honing and lapping machines; (m) Machine tools accessories like dividing heads, circular tables, universal vices, collets, etc.

In view of the large investment required, the Union Minister for Steel, Mines and Heavy Engineering, Mr. C. Subramaniam, has indicated that a move may be made in this industry for setting up joint private-public sector ventures. In these, leading manufacturers of the world could also be made interested. Mr. Subramaniam as well favours that the existing private manufacturers of machine tools should join together for undertaking production of sophisticated and intricate tools.

Indigenous Content

With a view to fostering the development of the machine tools industry, the Union Government is also not insisting now on an initial indigenous content of 80 per cent. In fact, in 1963 it approved a number of cases with indigenous content of about 60 per cent only. In the case of intricate machine tools, even this 60 per cent indigenous content limit is not proposed to be adhered to strictly.

The demand for small tools is estimated to grow to Rs. 17 crores by the end of 1965-66. The current production of these tools is estimated around Rs. 12 crores. There is stated to be considerable scope for setting up additional capacity in the following categories of small tools; (a) Thread cutting/forming tools; (b) Precision measuring instruments and equipments; (c) Gear-cutting tools; (d) Broaching tools; (e) Milling cutters; (f) Reamers; (g) Grinding wheels and mounted paints.

The demand for jigs, fixtures, press tools, moulds and forging dies is expected to go up to even beyond Rs. 40 crores by 1970-71. Whatever capacity for the manufacture of these equipments is there in the country at present is mostly captive in the engineering industries. There is considered to be good scope for setting up specialized units in these lines of production. The Government welcomes the private sector to take up this job.

★★

The Neyveli thermal power station is expected to reach a capacity of 250 MW in another couple of months, 300 MW by September this year and 400 MW by the last quarter of 1965. Currently it has a capacity of 200 MW.

The expansion to 250 MW capacity is being effected under the original development programme of Neyveli lignite. Further expansion to 400 MW is being undertaken in accordance with the decision taken by the Union Government some time ago. Ultimately, this thermal power station is to be expanded to a capacity of 600 MW.

A contract has been signed here this week with Messrs. Technopromexport of the USSR for the supply of equipment, machinery and materials, valued at approximately Rs. 7.75 crores, for the expansion of the Neyveli power station to 400 MW. Two thermal units will be supplied — one for 50 MW and the other for 100 MW. The equipment for the former will start coming after April next and that for the 100 MW units in the first quarter of 1965.

The contract signed with Messrs. Technopromexport also provides for Soviet technical assistance for erecting and putting into operation the equipment delivered. The credit is being made available under the Indo-Soviet Agreement of 1960.

★★

Deep drilling is proposed to be undertaken in the Calcutta and Jwalamukhi areas for finding oil which, according to experts, should be available there in fairly large quantities. A rig will be in position in the Calcutta area in May next and drilling there will start soon thereafter. Drilling in this area has already been done up to a depth of 10,000 feet by the Standard-Vacuum Oil Company, now the Esso Standard Eastern, without yielding any fruitful results. It is now proposed to go to a depth of over 20,000 feet.

Similar is the case with the Jwalamukhi area where drilling has been going on for the past couple of years. According to one expert, big reserves of oil should be available in this region around a depth of 20,000/21,000 feet. This project, however, may be taken up a little later than the Calcutta scheme.

Concerted efforts are proposed to be made to explore for oil in about 100,000 sq. miles of area in various parts of the country during the next three or four years.

So far as Assam area is concerned, it contains about 50 million tonnes of proved oil reserves. It is hoped that another 100 million tonnes of crude reserves might be found in this State.

With approximately 80 per cent of the work finished, it is expected that the Gauhati-Siliguri pipeline will be completed by July 31, 1964, as scheduled. The work on the Haldia-Barauni-Kanpur pipeline system is also stated to be making rapid progress. The Haldia-Barauni section of this pipeline is scheduled for completion by the end of the current calendar year and there is every likelihood that this target will be achieved. The Barauni-Kanpur section is scheduled for completion by the middle of 1965. This is also considered a realistic target date.

★★

The Union Minister for Labour, Mr. D. Sanjivayya, is understood to have told the Informal Consultative Committee of Parliament attached to his Ministry, that the Government will take a decision in another three or four months' time on setting up one or more wage boards for the engineering industry. A large number of miscellaneous industries come under the engineering group. In view of the wide variety in the products and the sizes of various engineering establishments, an official Study Group has been set up to examine and suggest whether any standardisation of wage rates for the engineering industry as a whole would be possible, and if not, how the industry could be grouped for the purposes of appointment of wage boards. The Study Group has already visited a number of places in the country and is expected to complete its report in about two to three months. The Government decision on setting up one or more wage boards for the engineering industries will depend on the findings of this Study Group.

★★

Gwalior Rayon, a Birla enterprise, has been successful, after four years of research, in establishing a process by which rayon-grade pulp, hitherto manufactured solely from soft wood, can be produced from bamboo. Mr. D. P. Mandelia, Adviser, Gwalior Rayon, told newsmen in New Delhi on Thursday that this important technological achievement had attracted worldwide attention since India was the first country to use bamboo as a source for producing rayon-grade pulp on a commercial scale. He significantly pointed out that the process had been developed and established solely by indigenous talent and enterprise. The factory using this technique also had been designed and erected by Indians who were currently running it successfully. This pulp factory is located at Calicut and is turning out daily about 100 tons of pulp. The pulp is presently being used by the Gwalior Rayon's Nagda factory. It will be made available to other rayon manufacturers as well in the near future.

On the basis of the daily output of 100 tons of rayon-grade pulp, which requires about 400 tons of bamboo a day, there is said to be a saving of about Rs. 3.50 crores per annum in foreign exchange. When the output is raised to 150 tons per day, as planned, the foreign exchange saving will increase to about Rs. 5 crores per annum.

Need for Substitutes

The manufacture of rayon-grade pulp from bamboo involves very little foreign exchange expenditure, since caustic soda and sulphuric acid which are the other two main requirements of the industry, are also produced in the country. The cost of production at the Calicut factory compares quite favourably with the cost of raising an equivalent quantity of cotton of the same quality and cleanliness. This competitive advantage, however, could be considerably increased if the excise duty levied on staple fibre — in the case of production from bamboo, the excise levy amounts to about 40 per cent of the fibre price — is suitably revised. In view of the fact that India will be needing cotton to the tune of approximately 9 million bales by the end of the fourth Plan, there is obviously need to substitute cotton with man-made fibres. Attempts to raise cotton output to 9 million bales by 1970-71 will entail diversion of land from under food crops to cotton cultivation.

Birlas are stated to have also applied for a licence to set up a polynosic fibre manufacturing unit with a capacity of 50 tons per day. The project is estimated to cost Rs. 4/5 crores, of which the foreign exchange component will be nearly Rs. 100 lakhs. No final decision has been taken as yet to locate this factory. Three sites are being considered. These are Calicut, Nagda and Bombay.

★★

The responsibility for control and supervision of the functioning of the stock exchanges in the country, it is understood, will soon be transferred from the Department of Economic Affairs to the newly created Company Law Board. Such a transfer had been suggested by the Vivian Bose Commission with a view to enable the Company Law Administration to exercise an effective control over the corporate sector. The law under which the Company Law Board, formerly the Company Law Administration, was set up provides for the transfer of subjects relating to the corporate sector to the Board. The transfer of control on capital issues to the Company Law Board has also been under the consideration of the Government. But no decision in this regard is expected for some time.

The Chairman of the Company Law Board, Mr. R. C. Dutt, disclosed to newsmen here this week that a comprehensive bill to amend the Companies Act was likely to be introduced during the current session of Parliament. The Bill will aim at preventing recurrence of the malpractices pointed out by the Vivian Bose Commission in its report. Among other things the bill will call for the definition of the objects clause of the

Memorandum of Association of a company to be defined in more precise terms.

**

The Union Department of Iron and Steel, it is understood, has cleared the Punjab Government's scheme to establish a 100,000-tonne capacity pig iron plant based on the Mohindragarh iron ore deposit, subject to the condition that the State Government would submit proposals for meeting the foreign exchange requirements of the project to the satisfaction of the Government of India. The scheme is estimated to cost Rs. 5 crores with a foreign exchange component of Rs. 1 crores.

The Union Government, it is further learnt, had been requested to undertake mining of iron ore in Mohindragarh area on its own. But, in view of the relatively small dimensions of the deposits, it expressed its inability to include this scheme in the Central list.

The quality of Mohindragarh ore is stated to be fair. The iron content in it amounts to about 62 per cent. But its phosphoric content is high. The tests conducted by the National Metallurgical Laboratory, however, have established that this ore is suitable for pig iron production.

**

In view of the mounting stocks of medium and low-grade coals at the pitheads, the Union Government is said to be considering relaxation of the rules governing supplies of additional quantities of coal for brick burning and of soft coke for domestic consumption from the West Bengal/Bihar coalfields. Currently, the consumers desiring these additional supplies have to get their requests sponsored by the State Coal Controllers, as these supplies are being moved in block rakes under a planned programme.

The Coal Controller has been asked to examine the possibility of movement of BRK in wagon-loads wherein expeditious single destination or multi-destination movement in block rakes or half rakes is not possible. He has also been requested to consider the desirability of eliminating sponsoring authorities in regard to these supplies so that the consumers could be in a position to ask for direct supplies from the Coal Controller instead of routing them through the State authorities.

Three steps have already been taken to liberalise coal supplies to consumers. These are :

(1) Every consumer of coal who desires to have more stocks over and above the quota already fixed for him, can be given additional supplies without any limit.

(2) Consumers who already have sanctions for supplies of coal either monthly, casual or ad hoc, can directly approach the Coal Controller for additional supplies without the necessity of getting their cases recommended by the State authorities, provided they do not suspend their quotas under the normal bulk.

(3) The State Governments have been asked to relax the procedure for issue of licences for setting up brick kilns.

**

A number of important recommendations have been made by the Productivity Study Team of experts, sponsored by the National Productivity Council, for stepping up the development and productivity of the light electrical industry in India The Study Team has based its recommendation on the findings it had made after visiting several factories producing light electrical products in Calcutta, Madras, Bangalore, Bombay and Delhi in India, and Japan, USA and West Germany. The visits of this Team were arranged under the USAID programme.

The Team observes that while some of the companies engaged in the production of light engineering products in India had good management organisation and modern production planning and control, there were many that had little scientific management and modern outlook.

Among the highlights of the Team's recommendations are: (1) looking and planning ahead 5 to 10 years; (2) rational organisation and systematic budgeting, accounting and cost control; (3) improvement of plant layout and modernisation of plant; (4) decentralisation of authority; (5) setting standards and targets and checking up performance; (6) quality control from raw materials to the finished product and packing till the product is delivered; (7) sound selling organisation with technical personnel and trained salesmen; (8) scientific inventory control and reduction of inventories; (9) emphasis on research and development, i.e., better technology and methodology; (10) selection, training and education of work force; (11) talent spotting and development for higher responsibility; (12) encouragement for new ideas and suggestions; (13) improved communication and industrial relation; (14) constant endeavour to improve the product design based on customer's need for quality, style, convenience and the price he can afford, through standardisation, simplification and specialization; and (15) after sale service.

Mr. Jaisukhlal Hathi, the Minister of State in charge of the Departments of Supply and Technical Development, has been shifted in that status to the Ministry of Home Affairs. His place has been taken by Mr. R. M. Hajarnavis, hitherto Minister of State in the Ministry of Home Affairs. Mr. Hajarnavis remains Minister of State.

Fresh Imposts Unwarranted

From Our Correspondent

BOMBAY:

THE DISCUSSIONS on the budget at various levels in the week reflect clearly that the criticisms are now based mainly on the basic approach to the problem of economic development. Apart from the comments on the policy behind the budget, the specific proposals have received a more careful and precise appraisal from the business community. The Indian Merchants' Chamber has submitted to the Finance Minister a comprehensive memorandum on the budget proposals which may be said to cover the general run of observations by the industrial and business circles. The memorandum emphasises that the primary criterion behind the budgetary policy should inevitably be on modification and re-orientation of the tax system which would help to improve the performance of the economy in all sectors and at all levels without reducing the scope for raising the resources on an adequate scale, to meet the increasing requirements of defence and development. This would imply, in the view of the Chamber, that the budget proposals should be such as would stimulate savings, investments and capital formation and production and also attract foreign capital, thereby contributing cumulatively to a buoyancy in public revenues than what the present system has been able to provide. The memorandum further points out that the impact of taxation in the economy should be viewed in the background of the cumulative burden of additional taxation of the last year and this year which would amount to over Rs. 365 crores; and this would result in siphoning away all the resources from the common pool, thereby depleting the resources for development available to the private sector. In imposing an additional burden of taxation to the extent of about Rs. 43 crores, the emerging problems by way of an inadequate rate of growth in agricultural production and industry have not been fully taken into account and in the

DECLARES HIGHER BONUS

WHOLE LIFE ASSURANCES

Rs. 17 • 50

per thousand per annum

ENDOWMENT ASSURANCES

Rs. 14 • 00

per thousand per annum

4TH VALUATION RESULTS

Life Insurance Corporation of India

The Life Insurance Corporation has pleasure in declaring the rates of bonus as a result of the fourth Valuation of its liabilities and assets as at 31st March 1963. These bonus rates are applicable to with-profits policies issued by the Corporation and which were in force for full sum assured as at the date of Valuation.

The total sums assured and bonuses under 94,93,033 policies in force on the date of the Valuation amounted to Rs. 3,166 crores, and the total amount payable under 10,303 Life Annuities was Rs. 1,05,13,117 per annum. Out of the total profits available for distribution amounting to Rs. 26.71 crores, a sum of Rs. 25.39 crores has been utilised for allotting bonuses to the policyholders. Government's share of surplus amounted to Rs. 1.32 crores.

The rates of bonus on with-profits Policies of the erstwhile Insurers are governed by the Life Insurance Corporation of India (Classification of Policies for Differential Bonuses) Regulations, 1961 and these have been similarly increased, wherever applicable.

All Policies entitled to participate in profits on the Valuation date are eligible for :-

- **Two Years' bonus—if the Policy was effected in the months January to March of any year prior to 1.1.1963.**
- **One year's bonus—if the Policy was effected between 1.1.1963 and 31.3.1963 or in the months April to December of any year prior to 1.1.1963.**

Bonus intimations in respect of the fourth Valuation will be sent out to the policyholders as soon as possible.

view of the Chamber, if only the scope for effecting economies, cutting down expenditure and rationalising non-development and non-plan expenditure were fully explored, the community could have been given the relief from any further imposts in the budget year. The memorandum has also pointed out that the budget proposals would not only defeat the objectives laid down by the Finance Minister, but would also accentuate the inflationary pressures in the economy through the changes in the sphere of indirect taxation.

Corporate Enterprise Affected

Commenting on the taxation of bonus shares, the Chamber points out that the measure is against the judicial pronouncements and accountancy principles and has a definite element of double and fictional assessment and brings within the purview of taxation something which is not crystallised. This would also affect the ploughing back and creating of an investment climate which are factors of primary importance. Therefore, it is argued that this measure should be deleted as, otherwise, the whole base of the working of the corporate enterprise and productive effort would be adversely affected. In regard to estate duty, the rates proposed, the memorandum observes, are of such a heavy order that it would result in a person receiving a beneficial interest from an estate becoming virtually insolvent in cases where considerable property is left. It is, therefore, suggested that the existing slabs should be retained and the rates proportionately adjusted in such a manner that in respect of estate duty the rate at the highest slab does not exceed 60 per cent. The same objection against increasing the rates is made in respect of the gift tax, and it is urged that the rate should not exceed 50 per cent. In regard to the amendment reducing the base of levy on wealth tax, the memorandum urges for the retention of the rate of exemption at Rs. 200,000. In examining the impact of the total burden of personal taxation on all classes of tax payers, the memorandum points out that, though the cumbersome scheme of compulsory deposit has been abolished, the benefits would be practically marginal. It is only by raising the minimum taxable limit to a sufficiently higher level that real justice can be done to the lower and middle classes which are the backbone of society. And in this connection, the Chamber has urged for raising the minimum taxable limit in the case of individuals to Rs. 7,500, and for a Hindu undivided family to Rs. 15,000. Suggestions are also made that the amount of life insurance premium paid by the assessee should be allowed to be deducted from the deposit amount to be made under the annuity deposit scheme.

★★

In a review of the foreign exchange needs and other problems of the woollen industry, Mr. R. K. Birla, Chairman of the Development Council for Wool Industry, pointed out that the council had fixed the fourth Plan targets at 41.5 million yards for fabrics, 40 million pounds for worsted yarn, 22 million pounds for woollen yarn and 18 million pounds for shoddy yarn. The utilisation of the industries' installed capacity within the current provision of Rs. 5 crores of foreign exchange, according to him, posed a problem. It was in the context of the position regarding utilisation of the capacity and the rising costs of raw materials, Mr. Birla observed, that the woollen industry needed at least Rs. 29 crores in foreign exchange to achieve the fourth Plan targets. He deprecated the progressive decrease in the allotment of foreign exchange for the import of raw materials, particularly the recent 50 per cent cut in the allocation which did considerable damage to production. The industry can earn a significant amount of foreign exchange through stepping up of exports, particularly of raw wool, carpet yarn and machine-made carpets. In this regard, he referred to the attempts made by the industry to use indigenous raw wool for making fabrics both for home consumption and for exports. On account of the rough texture of the material, he said, there was no response from either domestic or foreign consumers. Besides, he pointed out that for the average production of 72 million pounds of Indian wool, the permit to export is limited to 30 million pounds. If this limit is removed, he thought India would be able to export a larger quantum. Emphasising the need for modernisation, he conceded the assistance given by the Government; at the same time, he said there was need to quicken the pace and this could be done if Government expedited the steps in finalising the arrangements for loans etc. from those countries which were anxious to help India with the most modern machineries on long-term deferred payment terms. He appealed to the industry to keep the interests of the consumer in view in respect of quality as well as the price of woollen products.

★★

The Seminar on "collective bargaining" under the auspices of the Indian Institute of Personnel Management held last week came to the conclusion that the prospects and possibilities for collective bargaining in India are considerably limited by the prevalence of such difficulties as multiplicity of unions, reluctance to determine the sole representative bargaining agency through election, inhibition caused by governmental legislations, rules and compulsory adjudication awards. The points that emerged at the Seminar were, that though the employers enjoyed almost complete freedom until 1947 various curbs have been placed after independence on them not by the growth of collective bargaining tendencies by organised labour, but by governmental regulations and compulsory adjudication; there was lack of any norms with regard to issues of collective bargaining and a plea was made for setting up of norms. It was emphasised that collective bargaining had a much wider goal than maintenance of industrial peace. The three issues raised were: (a) the extent of management organisation to ensure uniform industry-wise bargaining; (b) imparting of trade-union education to workers by management; and (c) whether the personnel officer should act as the management's representative or spokesman in management councils of labour interests. In the context of the significance of collective bargaining in the present state of development of industry in India, the issues raised should further stimulate thought on the subject.

Union Budget Will Not Promote Growth

From Our Correspondent

CALCUTTA :

INDUSTRY AND investors in this part of the country have every reason to feel disappointed, and disturbed, that Mr. T. T. Krishnamachari's Budget proposals for 1964-65 are what they had expected them not to be. The most representative statements made about the Budget point to this reaction. The Indian Chamber of Commerce appreciates the need to raise resources for defence and development. It also endorses the Union Finance Minister's objective of curbing the current inflationary tendencies in the economy, but emphatically states the view that despite the reliefs proposed for certain important industries the additional imposts on the corporate sector as a whole will not promote the larger objective of economic growth. The Chamber rightly feels that the burden of personal taxation will continue to be rigorous and the relief which is proposed for the lower and upper brackets of income is only marginal. Another aspect relating to personal taxation in the Budget which has been the subject of much acid comment, is the clever device of actually increasing the rates of tax in the

middle brackets of personal incomes in the name of regrading the tax structure, which has partly neutralised the benefits of abolition of the compulsory deposits scheme. As for the groups with annual incomes exceeding Rs. 15,000, it is being correctly pointed out that the annuity deposits scheme which will apply to people in these brackets, will deprive industry and trade of a good part of the investible funds which these classes of income earners have so far provided.

Industrial Equities

Apart from denying some people the opportunity to make the most profitable use of their surplus funds by thus cutting into their savings potential, the Union Finance Minister obviously has no intention of bettering the prospects for investors in industrial equities. The President of the Calcutta Stock Exchange has invited Mr.Krishnamachari's attention to the deleterious effect which the new impost of 7.5 per cent on distributed profits and extension of the capital gains tax to bonus shares received by a shareholder will have on investment. The dividend tax is not only undesirable, but is also iniquitous, because it accords a privileged position to preference shareholders who are not affected by the impost. The equity investors take the maximum risk — the risk of even losing all the capital invested in a company, yet the Finance Minister has chosen them for the purpose of his dividend limitation policy. The capital gains tax on bonus shares is also unfair in view of the fact that it does not stipulate any setting off of losses against it, the President points out. The legal decisions in the past have always been against the taxing of bonus shares received by a shareholder. "Both these measures as also the uncertainty created by the hinted discontinuance of development rebate after 1967 have generated a feeling of uncertainty in the minds of investors", the President observes.

★★

On behalf of another important industry — tea — authoritative opinion has been voiced that the latest Union Budget is unlikely to assist the industry in expanding its production and exports to the degree required. The Chairman of the Indian Tea Association, Mr. S. P. Sinha, has just given the reasons why he thinks the Budget will prove unhelpful. In the first place, the Budget has done nothing to minimise the burden of excise. Export duty has been abolished, but the excise levy has been raised to the point where it is neutralising the good effect of the export duty abolition to a substantial extent, because the previous practice of allowing some rebate in excise when tea is exported has been stopped. This policy is inconsistent with the objective of export promotion, although it may help the Government to expand its revenue. Mr. Sinha pointed out that although India still remains the world's largest single producer of tea — and a major earner of foreign exchange for this country also — her share in the world trade is not proportionate to her position as the leading producer. If this country is to maintain her present share of the world tea market, she has to fight increasing competition by raising the supply of quality tea. High quality tea still enjoys a premium, but this country has not been producing more of these grades. To increase the production of quality teas, Mr. Sinha stressed, it is essential to encourage the producer to expand and replant not on ground from which bushes have been recently uprooted, but on virgin soil with modern methods of propagation and the best stock which scientists and planters can provide.

This is what the Government's fiscal policy does not encourage.The cost of replanting tea is not allowed as a revenue charge, and there is still no depreciation on tea bushes. The industry is not permitted to deduct the cost of planting against anything but taxed profits. Fresh planting did not present any problem in the former days when the industry had adequate surplus to plough back into the business, but these days heavy taxation and labour and housing charges leave little for such purposes. In the circumstances, tea's fiscal burdens need to be eased if expansion of the industry is to be promoted. Discussing the corporate tax proposals of the latest Union Budget, Mr. Sinha has said that although the full implications of the complicated changes still remain to be worked out, at first sight it appears that their effects on the corporate sector will be adverse. An industry like tea which has a high proportion of foreign investment in its capital structure will be badly hit. The aggregate of income-tax and super tax for non-resident companies have been increased from 63 per cent to 65 per cent and they are not entitled to the 20 per cent rebate in the surtax. The sterling companies have been given no relief from the tax burden. For the resident companies also, such reliefs as are indicated in the Finance Bill will be offset by the proposed 7½ per cent tax on dividend distribution. The dividends have been disappointing during the current year and if dividends are to be limited in future through tax, the industry will have no great prospect of attracting capital. The only way to find finance for development is, therefore, to seek relief from the existing burden of taxation and to depend upon such assistance as the Government may provide.

★★

The coal industry's comments on the Union Budget have come through Mr. Pran Prashad, Chairman of the Indian Mining Association, at the Association's annual general meeting held last week. Mr. Prashad has welcomed the industry's inclusion in the "short list of industries which will be entitled under the Budget proposals .... to tax rebates." Together with the higher development rebate given earlier, Mr. Prashad feels that the Government has come a long way to meet the industry's viewpoint, but he is disappointed that the need for a depletion allowance is still to receive the Government's recognition. The coal industry has been asking for nothing more than a price structure which, while ensuring a fair and reasonable return to attract much-needed capital for development, will not give rise to a chain reaction of price increases in the coal-based industries.

The main complaint of the industry has been that the price allowed for its product has been unrealistically low, especially for the superior grades. Even the latest increases in prices have left some producers dissatisfied. The producers of medium and lower grades are disappointed as they have been given no increase at all . It is pointed out that Grade I non-coking coal as well as some others which have been left out of the scope of the latest price revision constitute together 75 per cent of the total production; Grade I alone accounts for 40 per cent of the total output. (The grades for which prices have been raised, it is said, form only 20 per cent of the total). The Swaminathan Committee on the recommendation of which the recent decision on prices is based had also recommended an increase in the prices of Grade I non-coking coal. A substantial increase in the production of these coals is also visualised under the third Plan, and the World Bank scheme of financial assistance is based on securing a higher output of this variety. Mr. Prashad, however, pleaded for a general increase in the differential between the prices of the lower and higher grades — the differential, as it obtains at present, in Mr. Prashad's opinion, being totally unjustifiable.

The coal industry's case for higher returns is justified by the fact that it is currently undertaking a scale of investment which it never did before in a short period of time. Much of this investment has been made possible by the World Bank loans and the larger of the collieries account for the bulk of the new investment. These collieries by and large produce the better grades. Therefore, the progress of India's industrialisation will greatly depend on the fortunes of these concerns which supply this country's basic industrial fuel. Mr. Prashad has made suggestions for revolutionising production technique which if implemented, would sooner or later lead to the closure of small collieries, which, incidentally, produce mainly the inferior grades of which the country now requires less than has been produced. According to Mr. Prashad, no other country in the world is today obliged to keep 850 and odd coal mines in production to mine merely 66 million tons of coal a year. The production of fuels at the lowest possible cost can in modern conditions be achieved only by units capable of ultimately producing upwards of half a million tonnes of coal per year. For the Indian coal industry, which is now well set on the road to expansion, there is splendid opportunity to "leap at once from the age of the pickaxe to the age of full mechanisation", obviating the long and tedious crawl through intervening stages of advance. "Can we afford to let this significant opportunity slip through our fingers?", he asks. But those who are familiar with the economics of the coal industry at present may well doubt whether these suggestions can be implemened as speedily as Mr. Prasad or the Association he represents would wish.

★★

While presenting his Budget for the next financial year, Mr. Fakhruddin Ali Ahmed, Finance Minister of Assam, announced a series of new taxation proposals which would only partially bridge the gap of Rs. 2.53 crores between the estimated revenue receipts and expenditure. The new taxation proposals — increased sales tax, higher sales tax on luxury goods, extension of the tax on coal, coke and coal gas, a duty on electricity, higher excise on liquor and increased rates of agricultural income-tax in certain slabs — will bring in an additional revenue of Rs. 85.9 lakhs. Since the revenue and capital budgets together show a deficit of about Rs. 6 crores, the State can do nothing to bridge this gap except to press the Centre to give more funds. The Finance Minister reiterated the old complaint that the Planning Commission is being unfair to the State by going back on its promise to allocate a certain amount of money. The former had originally approved the State plan for 1964-65 with an outlay of Rs. 34.2 crores, out of which the Centre was to provide Rs. 28.6 crores, but later the Commission arbitrarily and "unilaterally" cut down the size of the plan to Rs. 27.7 crores, in complete disregard of the economic needs of this problem-ridden State. However, the State Government has still provided for a Plan of Rs. 34.2 crores, and the gap which remains uncovered in the Budget would not have been there had the Planning Commission not subsequently gone back on its promise. Therefore, the State is taking up the matter with the Centre to allocate extra funds to cover the deficit. In the State's capital budget, power development claims 26 per cent of the total allocation and education comes next with 11 per cent. A feature of the budget as a whole, however, is the emphasis on social services, which claim 29 per cent of the proposed expenditure.

Dividend Tax Needs Modifications

From Our Correspondent

MADRAS :

THE FULL reaction to the budget proposals of Mr. T. T. Krishnamachari in the stock market circles is only now available and the Governing Body of the Madras Stock Exchange has thought it necessary to represent to the Government the need for affording substantial relief in corporate taxation. While it is appreciated that in the case of plantation companies, the dividend tax will not operate harshly as in the case of companies with non-agricultural incomes, it is emphasised that the relief under the modified Surtax on profits would not be available for many companies and the net burden of taxation will be higher particularly in the case of cotton textile and rayon industries because these are not eligible for the proposed rebate of 10 per cent in income-tax and super-tax and of 20 per cent in surtax. The net addition to tax liability is expected to be anything up to 2 per cent and only those companies which secure relief from other directions can afford this new burden.

As in the Madras market, the main activity centres round cotton textile, rayon and plantation shares, here is naturally a feeling that there will be a revival of activity only when the holders of shares are benefited in some manner or other. Indeed, far from getting any benefit, the excise duties on cotton textiles, particularly superfine yarn and rayon yarn, have been raised steeply which will fetch for the Exchequer about Rs. 12 crores in a full year. The objective of the higher duties on superfine yarn and the changes in the structure of excise duties up to the end product would seem to be to prevent the leakage of revenue from the powerloom sector. At the same time, it has been suggested that the move might discourage imports of long-staple cotton on which large sums have to be spent on foreign exchange. If this were the intention, it is difficult to understand how the excise duty on various grades of rayon yarn also has been raised. The answer probably would be that there will be a reduction in imports of wood-pulp and a more careful policy on the part of buyers to effect fresh purchases. The middle income groups will be directly affected by these levies apart from others as it has been decided by the producers in the two industries that the increase in excise duties would be passed on to the consumer in the shape of higher prices. It now remains to be seen what exactly will be the inhibiting effect of higher prices following higher taxation.

From the Industry's angle, it may, therefore, be said that the profit margins will not be affected and that the feeling of depression will be only temporary. But with the implications of the Bonus Commission's report not having been fully assessed and the fears that fresh difficulties might arise during the course of the year, there is no ready disposition to anticipate developments and take an optimistic view.

As regards the plantation industries, there is a sense of amusement over the inclusion of tea, coffee and rubber in the list of industries for getting a rebate of 10 per cent in income-tax and super-tax and of 20 per cent in surtax. The tea estates will probably benefit by the rebate in surtax though it is argued that the relief in income-tax and supertax will not be appreciable, while the incomes of rubber and coffee estates are mostly agricultural in character. There is, therefore, anxiety to know whether Government have any special purpose in including these industries in part IV of Schedule I of Finance Bill, 1964.

As for other industries, it is expected that the surtax will operate favourably and many companies will be benefited by the need to provide much smaller sums on this account. There is,however, a feeling that the dividend tax may have an offsetting effect in many cases and the small investor is inclined to be enthused more by the reduction in tax on dividends at source to 20 per cent from 30 per cent. The benefit derived by the income group between Rs 5,000 and Rs 20,000 on account of this reduced deduction will, however, be illusory as it will amount not even to the refund that would have been ordinarily obtained under the old tax structure as it has been painfully found that the average tax so far as the individuals in these groups are concerned will be very much higher than in 1963 and the refund will be only to the extent of the higher average tax and 20 per cent. It might so happen that the total income including the revised deduction will be less than before assuming

that the same gross dividends were paid. The rebates in excise duty in the case of paper and tyre units on a specified basis have no doubt been welcome. But it is felt that the relief in the case of new paper mills is more substantial as there will be an incentive in respect of the payment of the duty on total production for three years. For new mills as well as those who had undertaken expansion of their capacity, there is also a rebate in regard to corporate taxation because of the inclusion of the paper industry in the schedule referred to above. The tyre producers, however, are not quite happy as against the earlier expectations that they might be exempt from the whole excise duty on a specified proportion of the total output, the relief is confined to the special excise duty which is not payable on the first slab of stocks cleared having a value of Rs 50 lakhs and which is payable only on 50 per cent on the second slab of Rs 50 lakhs. This concession is available for all units unlike in the paper industry.

While the members of the stock exchange are worried about the general reaction that would be induced by the budget proposals and the trend of business in the coming weeks, the governing body has felt acutely about the implications of the decision of the Government to levy tax on bonus shares issued by the companies. If the published reports are correct and individuals are obliged to pay capital gains tax on the short-term basis on the whole of the market value of bonus shares under the procedure prescribed by the Government, investment activity would be seriously retarded. In view of the certain amount of finality about the various budget proposals and the anxiety of the Finance Minister to secure for the Exchequer as large revenues as possible, it is difficult to say whether he would be prepared to make any gesture. But it is still hoped that the dividend tax would be modified and the anomalies involved in the taxation of bonus shares on the proposed formula would be eliminated.

★★

Two more State Budgets have been presented — those of Madras and Kerala. Only the Madras Government has chosen to levy additional taxation for about Rs. one crore by increasing the sales-tax on cotton at the point of last purchase and on cotton yarn, cotton waste, artificial silk yarn and staple fibre at the point of first sale. As it was felt that the State Government was losing to some extent its share of revenues from the Central sales tax, on account of the Madras sale tax being maintained at one per cent, this adjustment has been made fetching an additional revenue of a crore of rupees. The total benefit will be more because there will be larger receipts from the Centre. Mr. Bhaktavatsalam apparently decided to utilise available resources for implementing plan schemes as the administrative machinery was capable of handling a larger volume of work and the problem related only to the availability of resources and not the implementation of schemes on account of the lack of technical personnel or inadequate planning. Indeed, it has been claimed by the Chief Minister that some of the schemes had been implemented ahead of schedule and that the total outlay is now expected over the period at Rs. 325 crores against the target of Rs. 291 crores. The expenditure on plan schemes during the current year on the revised basis is estimated at Rs. 68 crores against Rs. 60 crores originally expected. As there was also an increase in expenditure on other heads, there was a deficit of Rs. 3.02 crores notwithstanding the increase in revenue receipts to Rs. 130.98 crores from Rs. 124.45 crores. This deficit has been incurred for the second year in succession. In respect of 1964-65 also, it is expected that there will be a revenue deficit of Rs. 3.34 crores in spite of the fact that receipts on the basis of existing taxation were expected to be higher at Rs. 137.48 crores. As revenue expenditure is expected to rise further to Rs. 140.82 crores the deficit has become inescapable. This is expected to be reduced only by Rs. one crore on account of the increase in sales-tax referred to above.

The outlay on plan schemes in the next year will be Rs. 70.53 crores. Even so, there will be a balance of Rs. 76 crores left for 1965-66 in order to complete the target of Rs. 325 crores. There will obviously be an inadequacy of resources. But it is just likely that the receipts from the Central Government, both on account of the State's share of taxes and plan assistance will be much larger than estimated earlier and that the Madras Government would be able to complete the enlarged plan without much difficulty.

It has been explained that the increase in expenditure is mainly due to power projects, the Kodaiyar project in Kanyakumari District which was expected to be taken up in the fourth Plan costing Rs. 7.75 crores. Likewise, it had not been scheduled that the second stage of the Mettur Tunnel Scheme would be taken up immediately. But it has now been programmed that this scheme will be completed in both its stages by next year costing additionally Rs. 7 crores.

Dearness Allowance

The State Government had necessarily to defer its decision regarding the grant of additional dearness allowance to its employees and teachers as some adjustments had been made earlier and the Central Government had been asked whether it could subsidise in part the additional expenditure that may have to be incurred under this head while an announcement in this regard may be made later. The family pension scheme has, however, been liberalised and the scope for the old age pension scheme has been enlarged. The minimum pension also has been raised to Rs. 20 per mensem. A larger appropriation has been made for provision of educational facilities, secondary education being free for all. More schools and colleges are to be constructed while facilities for technical education are being further expanded. It is the only State which has over-fulfilled its target for raising additional tax revenues.

★★

The Kerala Chief Minister, however, could not proceed on the same basis as he had to frame his Budget proposals having regard to the general elections which are to be held in the State some months hence.There will no doubt be an increase in revenues in 1964-65 to Rs. 79.58 crores from Rs. 75.16 crores (revised) for the current year. Expenditure has been placed at Rs. 76 crores in 1964-65 against Rs. 70.04 crores, leaving a revenue surplus of Rs. 3.58 crores. This should have been helpful to the State Government for stepping up Plan expenditure on the estimated basis and the cut suggested by Planning Commission should not have caused any serious difficulty. It was, necessary, however, for Mr. Sankar to grant an increase in the dearness allowance, to revise the old age pension scheme, family pension scheme and also raise the minimum of pension to Rs. 20 per month. All these concessions which will be applicable to Government employees as well as teachers will nearly wipe out the revenue surplus. In view, however, of the urgency for proceeding with the implementation of Plan schemes, particularly power projects, the suggestion of the Planning Commission to reduce the outlay during the next year has not been accepted. Even on the basis drawn up by the Government it may not be possible to exceed the target. In fact, a very strenuous effort will have to be made to complete the target of Rs. 170 crores, an expenditure of only Rs. 90 crores having been made up to the end of the third year. Power projects alone will claim an allotment of Rs. 18.5 crores against only Rs. 11 crores in 1963-64. It has been stated that efforts are being made to persuade the Planning Commission not to reduce assistance; otherwise the implementation of the power projects like Sholayar and Subarigiri might suffer. This will have serious consequences for the State's economy as there is already an acute power shortage and in the next two years a large number of industrial units are expected to spring up particularly in the Cochin-Alwaye area.

The moving finger writes

THE FINANCE Minister will, no doubt, make many more important speeches in Parliament before the budget session is over. But it should be difficult even for him to add to the high reputation which Part "A" of the budget speech and his reply to the general debate on the budget in Lok Sabha have already brought him. I doubt that Mr. Krishnamachari is among History's great orators. Even that minor gift — the gift of the gab — which Mr. Nath Pai, for instance, possesses in ample measure, is not very much his. Although occasionally he does manage to turn in a neat phrase or two — remember "the man-eater"! — the Finance Minister's forte is his agile and analytical mind. He refuses to accept that anything at all in this wide world can be claimed to lie beyond the right of Man to know. Add to this the fact that he has the instinct of wanting to know and the intellect for "knowing", it is not surprising that even those who might happen to differ profoundly with him on specific issues are still apt to be impressed with the vast expanse of information he has at his command and his quick skill in marshalling that information to serve his purpose of the moment.

Few will disagree that the rich men of this land have little cause to love the Central budget which Mr. Krishnamachari has confronted them with. Is it not then strange that so many of our industrial leaders have been heard to speak with admiration and respect of his exposition or defence of his economic policies? Indeed, certain leading industrialists have been so enthusiastic over his budget speeches in Parliament that they have mailed the texts of those speeches to their counterparts abroad in the belief that these speeches are invaluable for a proper appreciation of our national policies and national economic climate. In this manner, interested foreign opinion is being kept informed of the trend of thinking in the Government here, and I have no doubt that Mr. Krishnamachari will find the ground thus prepared quite useful when he goes abroad after the budget session. Incidentally, I understand that the Finance Minister has a heavy programme of foreign visits to get through in the next few months and that he may make not one grand global tour but a series of short and separate journeys to a number of countries.

★★

It is pleasant to find the younger M.Ps. making a mark and I am certainly happy that Mr. Ravindra Varma from Kerala has been repeatedly successful in raising the level of discussion in Lok Sabha. His speech in the course of the general debate on the budget has been deservedly praised by such disparate persons as Mr. T. T. Krishnamachari and Mr. Masani. To have spoken in a way which could have appealed to both those quarters must be regarded as an achievement in itself. Mr. Krishnamachari was also inclined to express satisfaction with Mr. R. R. Morarka's speech which, considering everything, must be regarded as something in the nature of a rare surprise. Mr. Morarka, from his looks at any rate, is certainly another bright young man in Parliament, although in terms of sheer parliamentary experience he must be included among the veterans. Mr. K. C. Pant, another Lok Sabha M.P., who also made a notable contribution to the budget debate, no doubt combines the youth of Mr. Ravindra Varma with an inherited background of political maturity.

Mr. Pant has the gift of expressing strong views in soft language, but Mr. C. D. Pande in Rajya Sabha, believes in suiting style to substance. A forthright, even if not an elegant speaker, Mr. Pande has on many occasions in recent weeks defended the Finance Minister against others as well as attacked him himself with fine impartiality. While Mr. T. T. Krishnamachari certainly has reason to be grateful for Mr. Pande's many adroit counter-attacks on that professional baiter of Finance Ministers, Mr. Bhupesh Gupta, he cannot easily ignore either Mr. Pande's candid criticism of some of the harsh and arbitrary features of the budget documents this year. Participating in the discussion of the general budget in Rajya Sabha, Mr. Pande vigorously opposed the mandatory provision of six months' imprisonment in cases where evasion of tax was even technically proved. Incidentally, what makes this directive to the courts particularly objectionable is that the onus of proving innocence is being thrown on assessees where concealment of income for tax purposes is alleged. It is true that this is not the first time when such aberration from the Rule of Law is being put into the Statute Book. Similar provisions have been enacted, for instance, for dealing with smuggling or possession of or commerce or trade in smuggled goods. The point, however, is not whether there is a precedent but whether this basically wrong attitude towards one of the fundamental principles of civilised jurisprudence, which is that innocence should be presumed until guilt is proved, is to be allowed its cancerous growth from one bad precedent to another.

★★

The Minister for International Trade, I hear, is busy fitting himself out in grand style for the forthcoming Geneva conference on world trade. Mr. Manubhai Shah may not have the presence of a Prima Donna, but he certainly has the instinct. Not for him is a mere string of officials to fetch and carry. On the contrary, he must be accompanied in proper style. And so the President of the Federation of Indian Chambers of Commerce and Industry has been told that he must get ready for the Geneva sights and show. Another eminent fellow-traveller would be Mr. B. R. Bhagat, with his double distinction of association with the Finance Ministry and the Planning Commission. And as if Mr. Bhagat cannot represent the Planning Commission adequately, Dr. V. K. R. V. Rao is also to join the trip. Mr. Manubhai Shah, Mr. B. R. Bhagat and Dr. V. K. R. V. Rao, among themselves, should make a very good copy of Three Musketeers. Or, perhaps, they may not. I am afraid that in that good company of three men and true, there may well be one D'Artagnan too many.

★★

Talking of Dr. V. K. R. V. Rao, I see that he has called for an "intellectual" study of the population problem. I have great respect for intellect, especially for Dr. Rao's, but I also believe in the principle that there is a place for everything — and the place for the intellect, I venture to suggest, is definitely somewhere above the navel. So far as population growth is concerned, I am inclined to place more faith in the plastic coil which is reportedly being used in a mass family planning experiment in Burmingham in the United Kingdom. According to the London correspondent of "The Hindustan Times", this coil which costs about 12nP. could be inserted in the womb easily and it could thereafter function, while in that position, as a permanent control.

V. B.

Trade Winds

STEEL DECONTROL

THE GOVERNMENT of India has abolished statutory control over the price and distribution of all categories of steel, except pig iron and ingot moulds and bottom plates, billets and tin bars, plates, sheets and wide strip, skelp, tin plates, hoops and their respective defectives. The decontrolled categories constitute about two-thirds of India's total steel production.

The Minister of Steel, Mines and Heavy Engineering, Mr. C. Subramaniam, has announced the setting up of a Joint Plant Committee in pursuance of the main recommendation of the Raj Committee, which studied the question of planning and distribution of steel. The Joint Plant Committee will consist of representatives of the main producers and the Railways, with the Iron and Steel Controller as Chairman. Its main function will be the planning of production, both of the controlled and decontrolled categories "to make the best use of productive capacity on the one hand and to respond as quickly and sensitively as possible to the requirements of the consumers on the other."

The Minister has also stated that hereafter, everyone would be free to trade in all decontrolled categories of steel.

The Joint Plant Committee has announced that the revised prices for decontrolled categories would be brought into effect from 1st April, 1964. In the meantime, controlled prices prevailing on February 29, 1964 would be applicable to all despatches of decontrolled categories of steel between March 1 and 31, subject to adjustments to cover mainly equalised freight charges hitherto recovered from the Iron and Steel Controller's Equalisation Fund, increases in excise duties and differentials between tested and untested prices. The adjusted prices for interim period are given in the schedule below. The prices are applicable to supplies by the main steel producers, namely, Hindustan Steel Limited, the Tata Iron and Steel Company Limited and the Indian Iron & Steel Company Limited. Until further notice, all indents should continue to be forwarded to the Iron and Steel Controller.

PRICES FOR DECONTROLLED CATEGORIES
(Effective for all despatches from 1-3-1964 to 3-3-1964)

COAL PRICES

In May, 1963, the Government had set up a Study Group with representatives of various Ministries on it, to examine what incentives, if any, were needed by the coal industry to enable it to fulfil the task assigned to it in the current Plan The report of the Group has since been submitted. The Group has recommended incentives for encouraging the production of superior varieties of coals, particularly those needed for metallurgical purposes. It has also recommended a general increase in coal prices. A further suggestion made by the Group is that any incentives extended to the producers of coking coal should be linked with an agreement on the part of the producers that the supplies to the steel works will be subject to sampling and analysis to destination and payments made accordingly. This has been stipulated because any deterioration in the quality of coal supplied to the steel plants adversely affects the efficiency of the steel plants and also increases cost. Accordingly, a price increase of Rs. 1.25 per tonne has been notified by the Government, with effect from March 3, 1964, in the case of non-coking coal of Selected A and B Grades in West Bengal-Bihar, and "Selected Grade" in the outlying fields. In respect of coking coals, it has been notified that in addition to the prices existing prior to the present notification and which will even now continue to be in force every colliery owner shall be paid the following amounts where, in pursuance of an agreement between him and the consumer, the grade of the coal supplied is determined by sampling and analysis at the destination in accordance with the procedure laid down by Government: (i) In the case of any of the Grades of coking coal A to E (conforming to old Grades Selected A and B) .... Rs. 1.25 per tonne; (ii) In the case of any of the grades of coking coal F, G and H (conforming to old Grade I) .... Rs. 0.75 per tonne.

POWER DRIVEN PUMPS

Inaugurating the 9th annual general meeting of the Indian Pump Manufacturers' Association, the Union Minister for Food and Agriculture, Mr. Swaran Singh, said that there was no doubt that the industry for the manufacture of pumps had an unlimited scope for expansion during the coming years and that it would be wise to make plans for meeting the anticipated demand from right now even though in some categories of pumps the demand may not at present be large enough to justify the creation of manufacturing capacity. He said that the Government of India had recently established a Board for Agricultural Machinery and Implements and that this Board would examine the various handicaps and difficulties from which manufacturers suffered and will advise the Government about the measures necessary for their solution. The Minister pointed out that many of the implements purchased by farmers were lying unused because of the lack of adequate facilities for service and spares. He advised the manufacturers to ensure that their clients were provided with the required facilities.

In his presidential address, Mr. R. V. Deshpande said that the third Plan target for the manufacture of 1,50,000 pumps per annum had almost been achieved. Moreover, the manufacture of pumps suitable for industrial requirements such as for cement, paper, chemical and petroleum industries, had also been taken up. The production of pumps in 1961, 1962 and 1963 was 1,27,200, 1,33,400 and 1,50,000 numbers (estimated on the basis of eight months' production) respectively. Referring to exports, he said that the value of pumps exported in the year 1961-62 was Rs. 4,85,000 which increased to Rs. 12.75 lakhs in 1962-63. In the current year up to October, 1963, the exports have been at an average monthly rate of over Rs. 1,00,000. On the other hand, certain types and sizes of pumps were being imported every year (worth Rs. 2 crores per annum). In view of the necessity to cut down these imports during the fourth Plan, Mr. Deshpande urged upon the authorities to examine the question of how best the target of self-sufficiency in all kinds of pumps could be achieved.

DRUGS AND PHARMACEUTICALS

Inaugurating the re-constituted Development Council for Drugs and Pharmaceuticals in New Delhi, Mr. O. V. Alagesan, Minister of State in the Ministry of Petroleum and Chemicals, said that in the manufacture of antibiotics, which constituted one of the most important groups of drugs, the Government undertaking of Hindustan Antibiotics Limited at Pimpri, had made rapid strides. Starting from 9 MMU per annum capacity of penicillin, it had already achieved a capacity of 60 MMU per annum and a further expansion to 84 MMU had been taken on hand.

The Minister stated that another public sector undertaking namely, the Indian Drugs and Pharmaceuticals Limited was establishing three units with Soviet collaboration—one for the manufacture of antibiotics at Rishikesh, another for the production of synthetics drugs at Hyderabad and the third for the manufacture of surgical instruments at Madras.

The Rishikesh unit will produce 300 tonnes of antibiotics, i.e. 140 MMU/85 tonnes of penicillin, 85 tonnes of streptomycin, 120 tonnes of tetracycline and 10 tonnes of nystatin, with a sale value of about Rs. 20 crores per annum. The Hyderabad plant will produce only 350 tonnes of synthetic drugs and 4,560 tonnes of intermediates, with a sale value of about Rs. 9 crores. Both the Rishikesh and the Hyderabad plants are expected to commence trial operations by the middle of 1966. The Madras unit, which is expected to commence trial operation by the middle of 1965, will produce only 2.5 million pieces of surgical instruments of 25 main types (which are used in general surgery, ophthalmology, gynaecology and other branches of medicine), with a sale value of about Rs. 1.9 crores.

Mr. Alagesan said that the satisfactory performance of the firms in the private sector and those in the public sector was responsible for raising the output of pharmaceuticals from Rs. 11 crores in 1948 to about Rs. 100 crores in 1962-63. He was confident that the third Plan target of production of pharmaceuticals of the total value of Rs. 175 crores would be achieved by the end of the Plan. This rapid rate in production had enabled the country to reduce imports of finished preparations to a negligible amount.

Referring to exports, the Minister stated that supplies of drugs at competitive prices to the UNICEF organization for their south-east Asia campaigns would greatly help in developing more export markets. As UNICEF authorities were introducing modern drugs for the first time in several underdeveloped countries, products of quality supplied by Indian manufacturers, under UNICEF auspices, would help to create new markets. The Minister added that large scope also existed for stepping up exports of drugs of vegetable origin from India. Attention will have to be paid for their proper cultivation and standardization and setting up of extraction units. It was gratifying to note that several products of vegetable origin such as strychnine and brucine from nuxvomica, quinine from cinchona and emetine from ipecac had already been exported from the country. Several new schemes had also been undertaken for the extraction of juices from plants and their conversion into essential drugs and intermediary products which would be exported to various overseas markets. In this group were the steroid hormones and its intermediates and active principles of podophyllum. There was also large scope for increasing exports, depending on the progress of research in this country especially for the treatment of tropical diseases.

RECORD EXPORTS

The total exports in the month of December, 1963 amounted to Rs. 75 crores which is the highest monthly figure so far This brings the total exports in the first nine months of the financial year 1963-64 to Rs. 600 crores which is Rs. 70 crores more than the exports in the first nine months of the preceding year.

EXPORT BAN RELAXED

The ban on export of mica scrap and mica waste which was imposed from February 1, 1964, has been relaxed. Mica scrap and mica waste will now be licensed for export by the Export Trade Control authorities at the ports and will be subject to a minimum f.o.b. price of Rs. 200 per tonne.

LONDON CARPETS FAIR

India scored a big success at the International Carpet, Linoleum and Floor Coverings Fair held in London recently. A London firm (Kayam Carpets Ltd.) showed a range of Indian broadloom carpets which were the first of their kind. Traditionally, Indian carpets have been woven in squares with fringe trimming, whereas the new designs, produced for the first time on broadlooms, are available in 9ft. and 12 ft. widths and to any length.

Company Affairs

E.I.D.-PARRY

MR. H. V. R. Iengar, Chairman of E.I.D. Parry Ltd., reviewed the problems of the company in his statement circulated in connection with the annual general meeting to be held on March 30, 1964. Referring to the Ennore Fertilizer Factory, he stated that for putting up a complex unit like that a turn-key contract was given to Messrs. Simon - Carves Ltd. of the UK, who had earned good reputation. Although some teething troubles were expected in the commissioning of a works of such a complexity, events at Ennore had gone beyond what could be regarded as normal in this context. Against the possible total of 56,000 tonnes, only 11,500 tonnes had been produced till now.

The Chairman informed the shareholders that arrangements for the integration of Visakhapatnam Fertilizer Project to be taken up in collaboration with Messrs. California Chemical Company and Inernational Minerals and Chemical Corporation at a cost of Rs. 33 crores, are now nearing completion. It is expected that an offer of shares will be made to the public this month or the next. The company will hold approximately Rs. 55 lakhs of the equity shares capital of the new company of which approximately Rs. 49 lakhs will be subscribed in cash. It is also assisting the new company in implementation of its seeding programme to familiarise the farming community with the advantages that accrue from the use of complex fertilizers to be produced at Visakhapatnam. This Indo-American venture is one of the major projects included in the third five-year Plan, and will have an annual production capacity of nearly 365,000 tonnes of ammonium phosphate and 16,500 tonnes of urea which will result in a foreign exchange saving of the order of Rs. 10 crores every year.

In the context of sugar production, the Chairman pointed out that only a year ago the Government had restricted production by 10 per cent because a crisis of surplus was feared. Consequently, there was a cut in production and area planted with sugarcane accompanied by larger production of gur. The annual output of sugar in 1962-63 was only 21.5 lakh tonnes as against 27.2 lakh tonnes in the previous year. At the company's factory at Nellikuppam 317,757 tonnes of cane were crushed as against 383,455 tonnes in the previous year to produce 29,542 tonnes of sugar against 35,395 tonnes in 1962. In order to boost production, the Government offered an incentive by way of rebate on excise duty of 50 per cent on additional sugar production over the previous year's figure during the period July 1 to October 31. At Nellikuppam a special season was introduced in the months of September and October 1963 but unfortunately the Government of India ruled that the factories that had not in any previous year produced sugar during this period would not be eligible for rebate which, indeed, is very unfair logic and the company has made representation against this decision.

The Chairman indicated that with the assistance of Messrs. Doulton and Company Ltd., UK, it is progressing in the manufacture of sanitaryware goods and it has completed substantial expansion at Ranipet works where the third kiln has now been commissioned. A new range of patterns has been developed and introduced in the market with improved standards of quality.

BHASKAR TEXTILE ISSUE

Bhaskar Textile Mills Ltd. will enter the capital market with the issue of 140,000 equity shares of Rs. 10 each and 7,000 cumulative redeemable preference shares (9.5 per cent) of Rs. 100 each. The subscription list will open on March 23 and will close on April 4 or earlier at the discretion of the directors, but not before March 30. It has an authorised capital of Rs. one crore made up of 500,000 equity shares of Rs. 10 each and 50,000 preference shares of Rs. 100 each. Its subscribed capital is Rs. 14 lakhs in 140,000 equity shares. The entire proposed issue has been underwritten by Orissa State Financial Corporation, Industrial Finance Corporation of India, G. Padia & Co., Calcutta and the United Commercial Bank Ltd. The company has been granted a licence for the manufacture of cotton yarn with an installed capacity of 25,000 spindles. The present project is to set up a spinning plant of 15,000 spindles and has been allotted land by the Government of Orissa at Jharsuguda. Adequate supply of power has also been assured. It has obtained licences to import important items of machinery and has also placed orders for its supply. The plant is expected to go into production by June-September this year. The total cost of the present project including the working capital will be Rs. 1.09 crores which will be raised to the extent of Rs. 28 lakhs by the issue of equity capital, Rs. 7 lakhs by the issue of preference capital, Rs. 29 lakhs through deferred payment facilities and Rs. 45 lakhs through secured loan from the Bank of Baroda Ltd.

UCO BANK ISSUE

The United Commercial Bank Ltd. has reported higher net profit, after providing for depreciation, of Rs. 76.43 lakhs for the year ended December 31, 1963, against Rs. 73.33 lakhs last year. The depreciation is raised to Rs. 12.11 lakhs from Rs. 8.16 lakhs. The directors have transferred Rs. 17 lakhs to general reserve, Rs. 4 lakhs to gratuity trust fund and Rs. 19 lakhs to bonus to staff. A taxable dividend of Rs. 6 per share is proposed on the increased capital which now stands at Rs. 279.67 lakhs against Rs. 223.34 lakhs. The directors have considered it desirable to capitalise Rs. 20 lakhs out of Rs. 40 lakhs standing to the credit of the share premium account and they applied to the Controller of Capital Issues for consent. They now wait the final outcome of the year's budget proposals relating to the taxation of bonus shares before taking further action.

MORARJEE RIGHTS ISSUE

The directors of Morarjee Gokuldas Spinning and Weaving Company Ltd. have decided to raise an additional capital of Rs. 23 lakhs by the issue of 23,000 ordinary shares of Rs. 100 each at par. These shares are to be offered to the existing shareholders in the ratio of four new shares for every nine held. It is indicated that the company had proposed in December, 1962, to issue rights shares in the ratio of two new shares for every three shares held subject to the permission of the Controller of the Capital Issues. This proposal was withdrawn in view of the heavy premium insisted by the Controller. Now the Government has relaxed its policy and permission of the Controller is not required for an issue up to Rs. 25 lakhs.

COIMBATORE PIONEER FERTILIZERS

The subscription list of the Rs. 25-lakh public issue by Coimbatore Pioneer Fertilizers Ltd. opened on March 11, to close on March 25 or earlier, but not before March 14. The authorised capital of the company is Rs. 50 lakhs — Rs. 40 lakhs in 40,000 equity shares of Rs. 100 each and Rs. 10 lakhs in 10,000 (9.3 per cent) preference shares of Rs. 100 each. The issued capital is Rs. 40 lakhs — Rs. 30 lakhs in equity shares and Rs. 10 lakhs in preference shares. Of this, the equity shares of Rs. 9.15 lakhs have been subscribed by promoters, directors and their friends and associates. They will also subscribe to equity shares of Rs. 3.35 lakhs and preference shares of Rs. 2.50 lakhs. The balance of the issue—Rs. 17.50 lakhs in equity shares and Rs. 7.50 lakhs in preference shares.

VISADEX

THE DASHBOARD OF BUSINESS

Work the VISADEX way to get the best out of your men, machines and materials.

VISADEX can tell you what you need to know at a glance. VISADEX offers you a fluent indexing system by which records are kept on cards, while colour signals spotlight what things are in stock or needed, whether production is ahead of or behind schedule, sales are increasing or decreasing, where to intensify advertising, which department requires more personnel, who owes you and how much ... VISADEX, in short, affords greater control at less cost, besides keeping records secure.

Our VISADEX Representative will be happy to show you, without obligation, how simple VISADEX is to operate—either with Card Pockets or Brass Card-holders—and how easily it can meet your specific requirements.

Swiss Industries Fair Basle 11th—21st April 1964

When a country has no raw materials of its own, there's only one way to prosperity: import them, process them, re-export the finished products. And in doing so there's only one way to success: perfection. You'll find the proof at the Swiss Industries Fair Basle. You'll find it in tiny watches, in jewelry, in electrical engineering, heavy machinery, machine tools, tools, instruments, textiles... every one of the quality products presented at this trade fair reflects the high standard of Swiss industry, craftsmanship and resourcefulness. Your visit to Basle is an excellent opportunity for establishing useful contacts and initiating new business connections. For detailed information, booklet, catalogue... and good advice on a fast and comfortable flight to Basle simply contact

SWISSAIR

Bombay - Calcutta - Madras - New Delhi

—is now being offered for public subscription. The company proposes to manufacture superphosphate, sulphuric acid and other chemicals and the plant is expected to go into production by the end of 1964.

DHARAMSI CHEMICALS ISSUE

The Dharamsi Morarji Chemical Company Ltd. proposes to issue new equity shares of Rs. 50 each at par to be offered to the existing shareholders in the ratio of one new share for every three shares. The company's present paid-up capital is Rs. 41.38 lakhs. The proposed rights issue will bring an additional capital of Rs. 13.79 lakhs which is intended to meet a part of the company's expansion plans. At the moment, it plans to set up a 300-ton per day contact sulphuric acid plant, a 100-ton per day project to manufacture alumina sulphate besides a scheme to manufacture borax and boric acid in collaboration with Borax (Holdings) Ltd. and to set up a plant for the manufacture of industrial explosives.

MAHINDRA & MAHINDRA

Mahindra & Mahindra Ltd. has recorded favourable results for the year ended October 31, 1963. The gross profit has gone up from Rs. 122.40 lakhs to Rs. 148.43 lakhs and the turn-over has increased to Rs. 15.92 crores as against Rs. 13.88 crores last year. The directors have propoed to maintain the dividend at Rs. 1.25 a share and the company has been able to achieve this result through improved management and operations. After providing Rs. 17.18 lakhs for depreciation, Rs. 3.36 lakhs for development rebate reserve, Rs. 29.70 lakhs for payment of bonus to staff and Rs. 50.18 lakhs for taxation, there is a net profit of Rs. 48.01 lakhs. A sum of Rs. 14 lakhs has been provided to general reserve and Rs. 7.84 lakhs to Surtax and tax on dividends.

CHARTERED BANK'S RIGHTS ISSUE

The directors of the Chartered Bank have proposed to make a rights issue to shareholders in the proportion of £1 a share for every £6 stock held at 40 Shillings a share Meanwhile they have recommended a final dividend of 7½ per cent actual, less income-tax. The consolidated profit for the year 1963 is slightly lower at £1,069,378 as against £1,076,748 in the preceding year. After deducting a transfer of £450,000 to general reserve and the net cost of dividends at £606,375, the carry-forward is higher at £574,024.

YORK INDIA

The subscription list of York India Ltd. will open on March 16 and will close on March 21 or earlier but not before March 18. It plans to establish a factory to manufacture a wide variety of commercial and industrial refrigeration and airconditioning equipment for which it has entered into the technical and financial collaboration with Messrs. Borg-Warner Corporation and their export subsidiary Borg-Warner International Corporation, both of Chicago, USA. The factory to be located on Delhi-Mathura Road between Delhi and Faridabad, is expected to go into production in the latter half of 1965. Its authorised capital is Rs. 1 crore and issued, subscribed and paid-up capial is Rs. 10,000. The present issue is for Rs. 29.90 lakhs made up of 299,000 equity shares of Rs. 10 each. Shares worth Rs. 15 lakhs are to be allotted to the American collaborators and worth Rs. 7.40 lakhs for promoters, their associates and nominees. 75,000 equity shares of Rs. 10 each are to be offered to the public at par. The issue has been underwritten.

CAPITAL ISSUES

Six Companies have been authorized to raise fresh capital amounting to Rs. 12.67 crores. The consent of the Controller of Capital Issues is valid for 12 months.

Bokaro Steel Limited, a Central Government undertaking, is to issue a capital of Rs. 10 crores divided into 1,00,000 equity share of Rs. 1,000 each to be issued privately for cash at par. The capital will be utilized for setting up a new steel project at Bokaro.

Poysha Industrial Company Ltd., Bombay, having a subscribed capital of Rs. 25 lakhs, is to issue capital of Rs. 60 lakhs in equity shares of Rs. 10 each for cash at par. Out of this, shares of the value of Rs. 18 lakhs will be issued to the existing shareholders as rights and the remaining Rs. 42 lakhs to the public by prospectus. The money will be utilized for financing the expansion involved in the manufacture of tin containers.

Warrior (India) Limited, Bombay, is to raise further capital of Rs. 20 lakhs divided into 20,000 equity shares of 100 each at par on rights basis. Of this 10,500 shares will be allotted to Nuckey Scott and Company Ltd. of UK or to their nominees in consideration of the capital equipment to be imported by the company and 9,500 shares to Indian shareholders for cash. The money is needed for financing the expansion scheme involved in the manufacture of threading tools, viz. taps and dies.

In suppression of an earlier consent, **Thakur Shipping Co. Ltd., Bihar,** is to issue capital of Rs. 113 lakhs divided into 33,000 9.3 per cent cumulative redeemable preference shares of Rs. 100 each and 800,000 equity shares of Rs. 10 each at par. Of this, 320,000 equity shares will be allotted to Ultramar Fischer and Co., West Germany, for consideration other than cash. Of the remaining shares 33,000 preference shares and 330,000 equity shares will be offered for public subscription by prospectus. The capital will be utilized for purchasing ships from abroad.

Vijay Engineering Company Ldt., Howrah, is to issue capital of Rs. 44,58,900 divided into 295,890 equity shares of Rs. 10 each and 15,000 9.5 per cent cumulative redeemable preference shares of Rs. 100 each for cash at par. The proceeds would be utilized for the construction of a factory for the manuacture of cranes and hydraulic structures and tanks, etc.

Gujarat Machinery Manufacturers Limited is to issue Rs. 30 lakhs equity capital in charges of Rs. 100 each for cash at par. The money will be used for the manufacture of glass-lined equipment and printing machinery etc.

LICENCES ISSUED

The following licences were issued under the Industries (Development and Regulation) Act, 1951 during the fortnight ending February 29, 1964. The list contains the names and addresses of the licensees, the articles of manufacture and annual installed capacity.

(Week ending Feb. 22, 1964).

IRON & STEEL CASTINGS

Kay Steel Works, C/o Dr. Amarjit Singh, Principal, Medical College, Patiala (Patiala, Punjab) — Steel castings 3,600 tons.

COAL

National Coal Development Corporation Ltd., "Darbhanga House", Ranchi (Distt. Betul, Madhya Pradesh) — Coal 0.45 million tonnes.

ELECTRICAL EQUIPMENT

Hindustan Electric Co. Ltd., Thackersey House, Graham Road, Ballard Estates, Bombay-1 (Baroda, Gujarat) — H.V.

Tap changers for A.C. Electric Locos 80 Nos.

CHEMICAL MACHINERY

Dalal Engineering Private Ltd., Chinchavli, Malad, Bombay-64 (Distt. Thana, Maharashtra) — Change of location from Chinchavli, Malad, Bombay to Kavesar Village, Distt. Thana, Maharashtra.

CONVEYING EQUIPMENT

Coles Cranes of India Ltd,, 1, Taratola Rd., Garden Reach, Calcutta-24 (Kamarhatty, 24 Parganas, West Bengal) — Truck mounted 'Leda' cranes of 3-5 ton capacity 70 Nos.

INORGANIC HEAVY CHEMICALS

Titaghur Paper Mills Co. Ltd., Chartered Bank Buildings, Calcutta-1 (Choudwar, Distt. Cuttack, Orissa) — Alum 3,300 tonnes.

TEXTILE AUXILIARIES

Hindustan Lever Ltd., Scindia House, Dougall Road, Ballard Estate, Bombay-1 (Calcutta, West Bengal) — Synthetic Detergent Powder (Surf) 8,000 tonnes.

MISCELLANEOUS CHEMICALS

Hindusthan Gas and Industries Ltd., 22, New Tangara Rd., Calcutta-46 (Calcutta, West Bengal) — (Substantial Expansion) 1. Oxygen gas 120 m.c.ft., 2. Dissolved Acetylene gas 24 mc. ft. (New Article) 3. Nitrogen gas 15 m.c.ft. 4. Argon gas 3.75 m.c.ft.

COTTON TEXTILES

Bangalore Woollen, Cotton Silk Mills Co. Ltd., Agraharam Road, Bangalore-23 (Mysore) — Automatic looms 24 Nos. for the manufacture of terry towelling cloth. The Buckingham & Carnatic Co. Ltd., 7, Armenian Street, Madras-1 (Madras) — Automatic looms 48 Nos. for the manufacture of terry towelling cloth.

WOOLLEN TEXTILES

Oswal Woollen Mills Ltd., Millerganj Ludhiana (Ludhiana, Punjab)—Power looms 12 Nos. for the manufacture of woollen/worsted fabrics.

SYNTHETIC FIBRES

Manjushree Industries Ltd., 15, India Exchange Place, Calcutta-1 (Nahorkatiya, Lakhmipur, Assam) — Acrylonitrile including Acetylene Hydrogen Cyanide and Ammonia required as raw materials - 600 tons per month, Poly Acrytonitrile (acrylic fibre) 300 tons per month.

OTHER RUBBER GOODS

Health Products Private Ltd., 143, Mahatma Gandhi Road, Bombay-1, Proposed name: Modern Family Planning Products Ltd. (Thana, Maharashtra) — 1. Condoms and Sheaths 103.7 million Nos., 2. Diaphragms 1.2 million Nos., 3. Dumas caps check Pessaries 1.68 million Nos., 4. Gynaecic models 0.3 millions Nos., 5. Contraceptives, Gynaecic creams, and jellies 360 tonnes, 6. Tablets and suppositories for contraception and gynaecic medical use (including sampoon foam tablets) 54 million pieces.

ASBESTOS CEMENT

Hyderabad Asbestos Cement Products Ltd., Sanatnagar, Hyderabad-18 (Sanatnagar, Hyderabad, Andhra Pradesh) — Cement sheets, pipes and fittings 60,000 tonnes.

PLYWOOD

Jayshee Timber Industries, Prop. Jayshree Tea and Industries Ltd., India Exchange, Calcutta-1 (Bakultala, Andaman and Nicobar Islands) — Veneers, Commercial Plywood and allied products like block board and flush doors 15 million square feet.

ELECTRICAL EQUIPMENT

Larsen & Toubro Ltd., I.C. House, Dougall Rd., Ballard Estate, Bombay-1 (Maharashtra) — H.R.C. Fuses 2 lakhs No., Fuse bases 30,000 Nos., Fuse caps 30,000 Nos., Adaptors 30,000 Nos., Enclosures (in cast iron & steel sheet) for fuses 3,600 Nos.

(Week ending Feb. 29, 1964)

ELECTRICAL CABLES & WIRES

The Omega Insulated Cable Company (India) Ltd., 122.2 Mount Rd., Madras-6 (Madras) — A.C.S.R. and A.A Conductors 3,000 tons per annum.

COTTON TEXTILES

New Swadeshi Mills of Ahmedabad Ltd., Naroda Road, Ahmedabad (Gujarat) — Automatic looms 24 Nos. for the manufacture of terry towelling cloth. Modi Spg. & Wvg. Mills Co. Ltd., Modinagar (Modinagar, Uttar Pradesh) — Automatic looms 50 Nos. for the manufacture of terry towelling cloth. Kerala State Industrial Development Corporation Ltd., Vellayambalam, Trivandrum (Kerala) — Cotton yarn 13,000 spindles. Madurai Mills Co. Ltd., New Jail Road, Madurai (Madras) — Cotton waste yarn 480 spindles. Shree Satyanarayan Spg. Mills Private Ltd., Venkatarayapuram, Tanuku (Andhra Pradesh) — Automatc looms 100 Nos. for the manufacture of cotton cloth. The Coimbatore Cotton Mills Ltd., Singanallur Post, Coimbatore-5 (Madras) — Automatic looms 100 Nos. for the manufacture of cotton cloth.

CHANGE IN NAMES (Owners or Undertakings)

(During the fortnight ending 22nd February, 1964)

(Information pertains to particular licences)

From M/s. Shalimar Paint, Colour & Varnish Co. (P) Ltd., Howrah to M/s. Shalimar Paint Ltd., Howrah. From Sri Krishnarajendra Mills Ltd., Chitradurga to M/s. Kullappa Spinning Mills, Chitradurga.

From M/s. Parmar Mechanic Works, Surrendranagar to M/s. The Parmar Textile Industries, Surrendranagar.

LICENCES REVOKED OR SURRENDERED

M/s. Aichem Forgings Ltd., Bombay — Steel Forgings. M/s. R.S. Traders (Industrial Division) Bombay — Metal Clad Switches, Motor starters etc. M/s. Deepak Industries Ltd., Calcutta — Chain Pulley Blocks. M/s. International Equipment Corporation Pvt. Ltd., New Delhi — Weighing Machines.

Announcement regarding the proposed issue of capital by Bhaskar Textile Mills Ltd. A Copy of the Prospectus together with the documents as required by section 60 of the Companies Act, 1956, has been delivered to the Registrar of Companies, West Bengal for Registration.

BHASKAR TEXTILE MILLS LIMITED

INCORPORATED ON: 4th August, 1962.
REGISTERED OFFICE: 2, Brabourne Road, Calcutta-1.

EXISTING AND PROPOSED ACTIVITIES:

The Company was incorporated with the object of carrying on all or any of the businesses namely spinners, yarn merchants, cloth manufacturers etc. The Government of India have granted a licence bearing No. L/23/1/243/Tex/62 dated 4-4-1962, subsequently amended by letter No. 10/629/62-Tex (B) dated 5-9-1962 for manufacture of cotton yarn for this undertaking with an installed capacity of 25,000 spindles. The present project is to set up a spinning plant of 15,000 spindles. The Company has been allotted approximately 126.05 acres of land by Government of Orissa at Jharsuguda. Adequate supply of power has also been assured. Licences to import major items of machinery from abroad have since been obtained and orders for plant and machinery have already been placed with the manufacturers. It is expected that the plant will go into production by June/September, 1964.

LOCATION OF THE INDUSTRY :

Jharsuguda in the State of Orissa.

BOARD OF DIRECTORS:

Sri Surajmal Mohta, 2, Brabourne Road, Calcutta.
Sri P. D. Himatsingka, 6, Old Post Office Street, Calcutta.
Sri Baijnath Tapuriah, 9, Brabourne Road, Calcutta.
Sri Rasiklal Maneklal, Vasant Vilas, Babulnath Road, Bombay-7.
Sri Beni Prasad Maheshwari, 9, Brabourne Road, Calcutta.
Sri M. K. Mohta, 2, Brabourne Road, Calcutta.
Sri B. D. Kothari, P-10, Debendra Dutt Lane, Calcutta.

AUDITORS:

M/s. S. S. Kothari & Co., Chartered Accountants, 21, Old Court House Street, Calcutta.

M/s. Jhunjhunwala & Co., Chartered Accountants, 6, Commercial Buildings, Calcutta.

Authorised Capital:	No. of Shares	Nominal value of each share	Amount
Equity Shares	5,00,000	Rs. 10	Rs. 50,00,000
Preference Shares	50,000	Rs. 100	Rs. 50,00,000
			Rs. 1,00,00,000
Subscribed Capital:			
Equity Shares	1,40,000	Rs. 10	Rs. 14,00,000
Proposed Issue:			
Equity Shares	1,40,000	Rs. 10	Rs. 14,00,000
Preference Shares (9.5% Tax free Cumulative redeemable Preference Shares)	7,000	Rs. 100	Rs. 7,00,000
			Rs. 21,00,000

Terms of Payment:	Per Equity Share	Per Preference Share.
On application	Rs. 2-50 nP.	Rs. 25
On allotment	Rs. 2-50 nP.	Nil

APPLICATIONS FOR SHARES :

Applications for shares must be for 10 or multiples of 10.

Applications for Preference Shares must be for 5 or multiples of 5.

The entire issue of Equity and Preference Shares will be offered to the Public for subscription in cash at par. Subscription of the amount is assured by the reason of the whole issue having been underwritten.

DATE OF OPENING AND CLOSING OF THE SUBSCRIPTION LIST:

The subscription list will open at the commencement of Banking hours on 23rd March, 1964 and will close at the close of the Banking hours on 4th April, 1964, or earlier at the discretion of the Board of Directors but not before the close of the Banking hours on 30th March, 1964.

Application forms along with copies of the Prospectus can be had from the registered Office of the Company or from the underwriters, Bankers or Brokers, whose names and addresses are given below :

UNDERWRITERS :

Orissa State Financial Corporation,
Killa Maidan, Cuttack-1.

Industrial Finance Corporation of India,
Reserve Bank Building, Parliament Street, New Delhi-1.

G. Padia & Co.
India Exchange, Calcutta-1.

The United Commercial Bank Ltd.,
2, India Exchange Place, Calcutta-1.

BANKERS :

The United Commercial Bank Ltd.,
2, India Exchange Place, Calcutta-1, or any of their Branches in India.

The Bank of Baroda Ltd.,
India Exchange, Calcutta-1, or any of their Branches in India.

The American Express Co. Inc.,
21, Old Court House Street, Calcutta or any of their Branches in India.

BROKERS :

Rasiklal Maneklal & Co.,
Stock Exchange Old Building, Bombay.

G. Padia & Co.
India Exchange, Calcutta-1.

Murarka Brothers.
7, Lyons Range, Calcutta.

Harbans Singh Mehta & Co.,
33, Regal Building, Parliament Street, New Delhi.

Rajpal Chadha & Co.,
Delite Cinema Building, Asaf Ali Road, New Delhi.

CAPITAL OUTLAY :

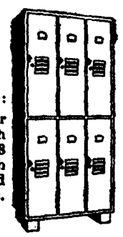
The total cost of the present project, including the work-

ing capital, will be Rs. 1,09,00,000 estimated as follows :

	Rs.
Land	1,25,000
Buildings	19,75,000
Machineries	69,50,000
Miscellaneous assets	4,50,000
Preliminary & Miscellaneous expenses of this issue	1,75,000
Working Capital	12,25,000
TOTAL	1,09,00,000

It is proposed to meet the capital outlay as follows :

FINANCIAL RESOURCES :

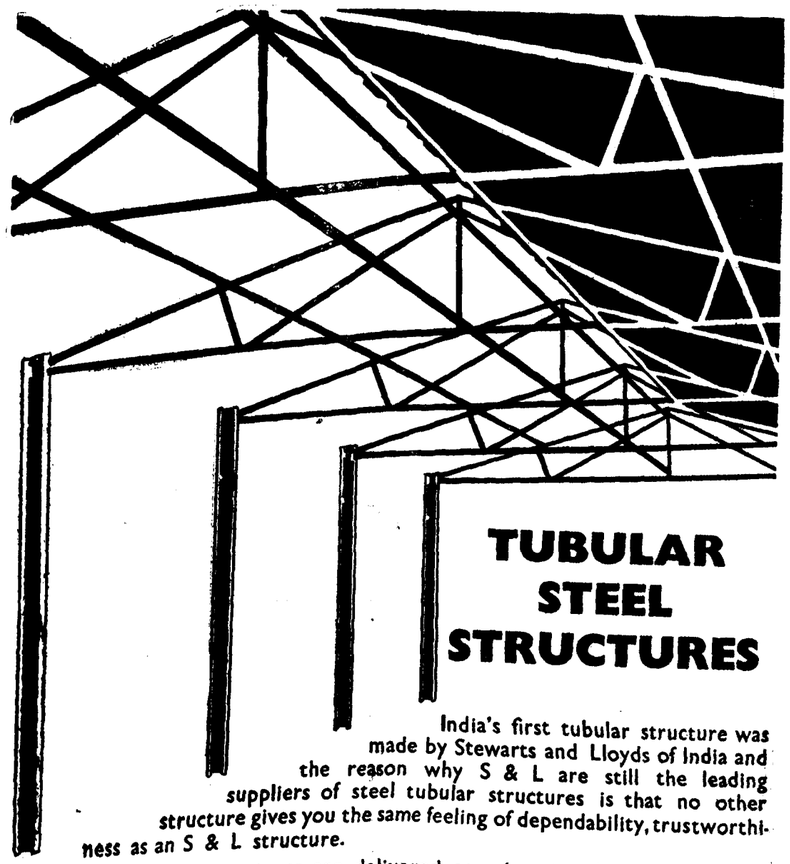


Equity Shares	28,00,000
Preference Shares	7,00,000
Deferred payment facilities	29,00,000
Secured loan from the Bank of Baroda Ltd	45,00,000
TOTAL	1,09,00,000

Rights of Preference Shares :

The Preference shareholders are entitled to a Cumulative Preferential dividend of 9.5 per cent per annum free of Company's tax. The shares are redeemable immediately after 12 years from the date of issue on 3 months notice.

ALLWYN
STEEL FURNITURE



Also available :
Workmen Locker Cupboards with 4, 6, 8, 12, & 18 lockers, both with unpickable locks and staple arrangements.

THE ALLWYN RANGE OF FINE STEEL FURNITURE includes wardrobes, beds, swivel chairs, executive desks, standard tables, tubular chairs, utility cabinets, filing units, racks, stands, locker cupboards, trays, waste-paper baskets.

HYDERABAD ALLWYN METAL WORKS LTD.
Sanatnagar, Hyderabad.

COMPANY MEETINGS

THE INDUSTRIAL CREDIT AND INVESTMENT CORPORATION OF INDIA LTD.

Statement of the Chairman, Shri G. L. Mehta, circulated to the Shareholders with the Directors' Report and Accounts for the year ended December 31, 1963

The Annual General Meeting of the Shareholders of the Corporation will be held at the Registered Office of the Corporation, 163 Backbay Reclamation, Bombay 1, on Thursday, April 9, 1964, at 4 p.m. The following is the statement by the Chairman, Shri G. L. Mehta, circulated to the Shareholders with the Directors' Report and Accounts for the year ended December 31, 1963.

I have great pleasure in welcoming you and placing before you the Ninth Annual Report of the Board of Directors of the Corporation for the year ended December 31, 1963.

2. The Chinese aggression came towards the end of 1962, and its impact on the economy was left during most of 1963. First came a budget which, in its call on the nation's resources, was unprecedented. Secondly, and more importantly, during most of the year, the economy seemed to show signs of faltering. I would like to state that this was not a new phenomenon but a confirmation and accentuation of a trend that had set in some time in the middle of 1962.

3. One consequence of the emergency was a realisation of more careful assessment and husbanding of our resources and of the need to seek their allocation according to priorities which necessarily had to be defence oriented. This, no doubt, was an operation whose object was to change the trend of the economy, and I shall not concern myself with it. But the Chinese action also seemed to have had a cathartic impact on the economy, inducing a considerable amount of rethinking on what I would like to call the efficiency of the economy and the factors influencing it. This being a matter vital to a development bank like ICICI, I shall briefly dwell on it.

4. Partly as a legacy of the last world war and to some extent in consonance with the philosophy of planning, we have now a vast mechanism of controls and regulation. Of these, those that concern us most are industrial licensing, capital issues control, import (and consequent exchange) control, and price fixation policy. All these policies affect the efficiency of industry and their justification must be sought in a balance between social benefits and economic cost.

5. In a planned economy, the channels into which investment flows have necessarily to be determined on 'a priori' long-term criteria. Moreover, we are far from an era of vast resources when we can afford to let them be used without regard to objectives. Consequently, we have priorities and a mechanism to ensure that resources are used according to these priorities. While there may be differences on specific points, I believe that broadly, the priorities we have set before ourselves are appropriate to our conditions and needs.

6. However, the essence of planning lies not only in laying down the right order of priorities but in setting up a mechanism to ensure the effective utilisation of resources. In the sphere of industry, for example, as regards the utilisation of foreign currency resources made available by international and foreign agencies or of the industrial capacity set up with such help, or in the synchronising of industrial capacity and the infra-structure (power, transport communications and so on), our administration has admittedly fallen short of the goals largely because of the magnitude, complexity and novelty of the tasks.

7. I have do doubts about the necessity for the regulatory function of the State in an economy like ours. In an economy where priorities have to be determined, industrial licensing is essential to ensure their observance in regard to industries. In an economy where capital is short, control on resort to the capital market is unavoidable. An economy which derives almost the whole of the foreign currency resources required for capital development from foreign assistance needs to ensure careful and prudent use of such resources not only to satisfy foreign lenders but also for its own benefit. And for all these reasons — development according to priorities, scarcity of indigenous and foreign currency resources — because the normal forces of competition do not operate to ensure a fair deal to the consumer, it may in some cases be necessary to impose limits on the prices an enterprise may charge to the consumer.

8. Granted the need for all these, the areas in which State intervention should take place need to be determined on grounds of social utility of such intervention or, as I said earlier, on a balance of social and economic considerations. While necessarily the demands on the State would be diverse and compelling, the State might be tempted to do too many things all at the same time.

9. A welcome result of the Chinese incursion and the subsequent stagnation of the economy has been to set off inquiries into the functioning of our economic system. As a first measure, the Government has already announced increased exemption limits for industrial licensing and capital issues control and removed price control on sixteen commodities; a Committee headed by Shri T. Swaminathan (Secretary of the Ministry of Heavy Engineering) is examining the impact of controls on industrial production and has already issued an interim report suggesting revised licensing procedures; another Committee headed by Dr. V. K. R. V. Rao, member of the Planning Commission, is at present considering import licensing procedures and machinery so as to recommend measures for accelerating the use of foreign currency resources. Measures for decontrol of steel prices are also under active consideration.

10. Gradually, as the year has passed by, economic conditions have stabilised. Our exports have increased easing somewhat the strain on foreign exchange resources. Money market conditions have been easy, and in the capital market conditions have to some extent improved; buyers have become selective, and the market for preference shares and debentures has tended to revive.

11. The Finance Minister has announced various steps to accelerate the tempo of activity in the economy. Besides relaxation in the Reserve Bank's lending policy, a Unit Trust is being set up to enable the middle classes to participate in investment in industrial securities. There is also a proposal to set up another development bank which would help to strengthen the institutional arrangements for providing industrial finance and particularly in bridging the gap in respect of large issues. The Finance Minister has also under

consideration the giving of fiscal incentives for reviving confidence in the capital market.

12. This is a beginning well made. But along with a search into procedures and machinery, it is also necessary to take stock of our productive capacity and to ensure the maximum output from it. While more and more factories and plants are being set up and are increasing our manufacturing capacity, we appear to have taken it for granted that once capacity is set up, it automatically gets fully utilised. In fact, for various reasons such as scarcity of foreign currency resources for maintenance imports, want of power and other ancillary facilities in some places, lack of adequate supervisory and skilled workers and inadequate selling effort, we are not using our resources to the maximum. This is a waste of capital resources which a poor economy like ours can hardly afford. Unglamorous as the task many appear, it is necessary that we make an inventory of our production facilities unit by unit and take steps to obtain the maximum output from them.

13. Such an inventory will also reveal many gaps in our industrial structure — in the form of lack of complementary production facilities for goods which, at present imported or import-restricted, can be produced internally. To relieve the immediate pressure on our foreign trade account and even to set free foreign currency resources for newer industries and further development, it is necessary to set up a priority programme for setting up these industries. It is time we tried to consolidate our gains in recent years, determine the gaps in our industrial structure and accordingly, devise priorities for the next phase of economic advance.

14. The hesitation shown by the economy during 1963 should thus be used to round the economic structure and to lay the basis for further advance on the course set for the economy. Economic development is a continuous task and there is no respite from it. But in its nature, development is a dynamic process, and men's minds and thinking often fail to keep up with the dynamism of the economy. The year 1963 is important in focussing the need for such adjustment.

15. The role of a development bank such as ICICI in the prevailing conditions needs to be clearly understood. I had stated in my last year's Statement that we considered the long-term prospects of industry in this country to be good and that we would be willing to stand by industry in the immediately difficult situation faced by it in the capital market. As the capital market seemed to dry up, industry increasingly turned to ICICI and other financial institutions for finance to implement projects which had been worked out, some of them even in the pre-emergency period. Often enough, financial plans had to be changed and entrepreneurs who would have issued rights shares turned to financial institutions for loans, and those who, in more normal times, would have approached the market directly turned to us for underwriting their issues to ensure their success. As a measure of our response to this demand, I may mention that in a year when investment seemed to falter and entrepreneurs tended to postpone undertaking further projects, ICICI's net assistance, as you will notice from the Directors' Report placed before you, has been a record maximum at Rs. 23.05 crores. In 1963, ICICI gave underwriting sanction for Rs. 3.68 crores for 18 operations. Of 11 issues (total ICICI underwriting being Rs. 177.5 lakhs) which came to the market, 3 operations for Rs. 65 lakhs were over-subscribed; in the case of the other 8 operations for Rs. 112.5 lakhs, we had to take up Rs. 83.25 lakhs. Clearly, apprehensions regarding the state of the capital market were not unfounded.

16. Moreover, a development bank like ICICI has a long-term contribution to make in an economy like ours. While planners must necessarily conceive and project in terms of national strategy and comprehensive policy, their plans have to be worked out in the form of individual projects, and the proper financing, management and economics of the projects ensured. This requires careful scrutiny of the details of individual projects, advice to entrepreneurs on various means of strengthening the viability of the projects by adequate safeguards in collaboration arrangements, and a close watch on the progress of the projects to ensure their timely completion and efficient working. If planning is found necessary at the national level, it is also indispensable at the project level. The role of a development bank is to ensure such planning at the project level.

17. The process of industrialisation consists in drawing into the vortex of industry persons from outside it. ICICI has, as a matter of general policy, tried to contribute to this development. Many projects financed by ICICI have been started by entrepreneurs for whom these projects were the first step in the industrial field. ICICI's new entrepreneurs have come from a variety of fields — trading, management, engineering and other professions. Promotion and management of industry requires qualities which the new entrepreneurs do not always possess from their earlier background. While to the established entrepreneur, a development bank like ICICI might appear only as a source of funds, I should mention that an institution of this character plays and should play an important part in providing various ancillary services to new entrepreneurs. We advise them on the various formalities to be fulfilled in setting up a manufacturing unit, on a suitable capital structure for the project and the need for (and, if so, the terms of) foreign collaboration arrangements.

18. I would also like to reiterate two other points which I had made in my last year's Statement: the role of ICICI in the underwriting field and the role of ICICI in financing non-traditional industries. Confidence is a tender plant and those who, carried away by the large over-subscription to new share issues during 1960-62, were inclined to under-rate the role of underwriters, would have been disillusioned by the lack of public response even to good issues in 1962-63. The readiness of institutions like ICICI to come forward with support and assistance has prevented a decline in the level of investment which this public apathy would otherwise have brought about. Moreover, since its inception ICICI has invested funds in non-traditional industries — particularly metal-based and chemical industries. This has involved taking greater risks; however, in keeping with the planning effort in the country, we have considered it desirable to mould our investment according to the requirements of the economy.

19. In these multifarious ways, ICICI as a development bank seeks to foster investment on healthy lines: in times of sluggishness in the capital market, it provides funds to enable the flow of investment to continue; in normal times, it carries out scrutiny of projects, guides entrepreneurs about their projects. ICICI itself has made special efforts to assist new entrepreneurs, to take up riskier forms of financing like underwriting and to invest in non-traditional industries. To carry out this task ICICI has developed a cadre of competent professional staff and evolved procedures to ensure sound judgment. In the final analysis, the quality of work depends upon the competence and interity and co-operative spirit of the staff, and our energies are continuously devoted to build up such staff and ensure the efficient working and development of the Corporation.

20. The efficiency of an economy depends upon having a machinery for decentralisd decision-taking and administration of such decisions. Even as governmental administration and industry become more complex, it is necessary all the time to review the division of functions and the nature of such

functions. In such a set-up, an independent development bank acts as a mechanism for ensuring planning at the project level. It is in this spirit that we carry on our work, and, I am sure, given confidence and resources, we shall be able to make this institution increasingly useful to the national economy.

21. The net financial assistance sanctioned by the Corporation during 1963 amounted to Rs. 23.05 crores. Of this, the amount sanctioned for new projects was Rs. 16.07 crores (including Rs. 7.36 crores in foreign exchange) in respect of 52 projects. The total cost of these projects (including working capital of Rs. 31.13 crores) would amount to Rs. 123.37 crores of which Rs. 36.91 crores would be required in foreign exchange for fixed assets. The total cost would be financed by share capital of Rs. 36.95 crores (34.98 crores ordinary and Rs. 1.97 crores preference), long-term loans of Rs. 52.68 crores and bank borrowings and cash accurals of Rs. 33.74 crores. When in normal production, the total turnover of these projects would be about Rs. 68.10 crores. The net foreign exchange savings as a result of output from these projects would be nearly Rs. 46 crores.

22. As the operations of the Corporation have increased, it has been found necessary to augment its resources, in respect of both foreign currency and rupee resources. Earlier in 1963, after a visit by a joint mission from the International Bank for Reconstruction and Development (World Bank) and International Finance Corporation (IFC), I went to the United States and had negotiations with the World Bank which resulted in the Bank sanctioning a loan of U.S. $ 30 million to ICICI, the largest single loan obtained by ICICI so far. Subsequent to this, the Government of India have sanctioned to ICICI a rupee loan of Rs. 10 crores out of PL 480 funds. Towards the end of 1963, the loan of DM 20 million from Kreditanstalt fur Wiederaufbau, referred to by me in my last year's Statement, was made effective. I take this opportunity to express our gratitude to the Government of India, the World Bank and the Kreditanstalt fur Wiederaufbau, for their loans and to the Government of India also for the guarantee on the World Bank loan. We value highly the co-operation and confidence of the Government and these institutions.

23. During 1963, the Corporation's income from interest, dividends and underwriting commission, etc., amounted to Rs. 236.13 lakhs. After allowing for interest on loans taken and for other expenses, profit subject to tax amounted to Rs. 101.54 lakhs against Rs. 78.92 lakhs in 1962. After providing Rs. 41.42 lakhs for taxation and Rs. 2.24 lakhs for Doubtful Debts, the balance carried to revenue appropriation account is Rs. 57.88 lakhs against Rs. 46.38 lakhs in 1962. Of this, Rs. 14.50 lakhs is transferred to Special Reserve. The capital gain of Rs. 7.79 lakhs has been transferred to Capital Reserve Not Available for Dividend. The Directors recommend a dividend of 7 per cent.

24. We have been able to extend and strengthen our relations with sister development banks outside India. Mr. Mobert Michel Titus of the Agricultural and Industrial Credit Corporation, Liberia, visited ICICI for a period of four weeks under a UN-TAO programme. Mr. Tat Pang Cheam of the Malayan Industrial Development Finance Ltd., Malaya, and Mr. Chamlong Tohtong of the Industrial Finance Corporation of Thailand, were with ICICI for a period of two weeks each. In addition, Shri R. N. Sahoo, Managing Director of the Orissa State Financial Corporation, Dr. G. Varade Gowda, Assistant Director of Industries, State Government of Mysore and Shri M. R. C. Warrier, Development Commissioner of the Kerala State Industrial Development Corporation, were with us for short periods to study procedures and working. We welcomed the opportunity of making contacts and rendering some service to similar institutions in the country and abroad.

25. Shri J. S. Raj, our Deputy General Manager, visited Tehran to attend a Conference on Stock Exchanges; later, he also went to Afghanistan on an IFC (Washington) mission to examine the problem of providing industrial finance there. In October 1963, Shri H. T. Parekh, our General Manager, attended the Second Regional Conference of Development Banks in Asia, convened by the Industrial and Mining Development Bank of Iran. I am also glad to state that at the request of the World Bank and IFC (Washington), we have lent the services of Shri J. S. Raj, for a period to head a new development bank being set up in Nigeria. In all these ways, we are co-operating with other institutions to provide a basis for friendly relations.

26. Finally, I would like to state that the present position of ICICI is due to the competence, devotion and team work of the ICICI staff. I take this opportunity to express my sincere appreciation of their work.

E.I.D.-PARRY LIMITED

Address by Mr. H. V. R. Iengar, Chairman, to Shareholders

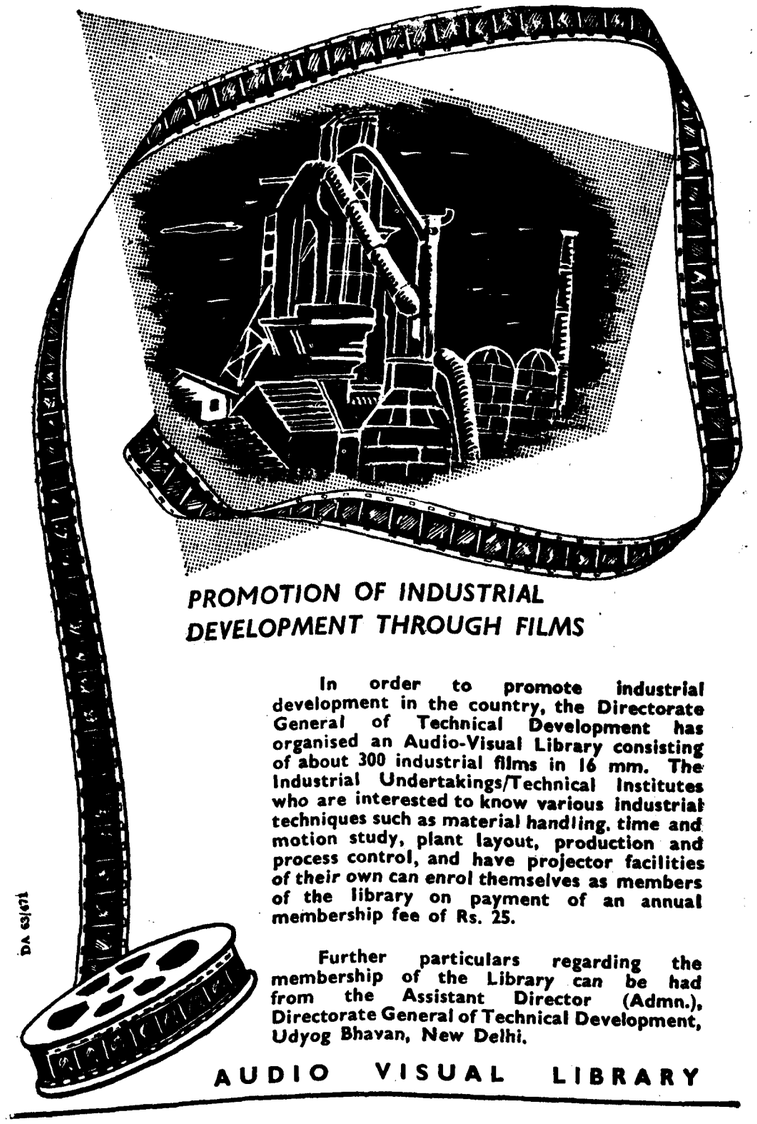
Sixty-sixth Annual General Meeting to be held on 30th March, 1964

The following statement has been circulated to Shareholders of E.I.D.-Parry Limited by the Chairman, Mr. H. V. R. Iengar.

In the speech which I delivered last year I made some observations on the general subject of British investment in India, of Indo-British co-operation and of the part that could be played by organisations such as this Company in promoting such co-operation. I would have greatly wished to have devoted the major part of my speech this year to some other subject of general importance, for I think this practice, which the Chairmen of some Companies have adopted, of discoursing at some length on a topic of general economic importance is a good practice. Unfortunately, however, I have so much to tell you about the domestic problems of our own Company that it would not be possible for me to travel beyond that without making the speech unduly long.

You will remember that in the speech last year I said, referring to the Ennore Fertiliser Factory, that although there had been delay in its commissioning, I thought that the major problems had been overcome, that the factory was at the time in full production and that it would make a substantial contribution to the earnings of the group during the year 1963. I much regret to have to tell the shareholders that my anticipations have not proved correct and that although the factory was in production at the time I prepared last year's speech, it was so only for a very brief period and that, since then, we have been dogged by a series of misfortunes for none of which the Company is responsible.

Although we were equipped within our organisation to put up a superphosphate factory and successfully commissioned, by purely departmental effort, the superphosphate factory of our wholly-owned subsidiary, Andhra Fertilisers Private Limited, at Tadepalle, we felt that for putting up a complex factory such as the one that has been attempted at Ennore it would be desirable to give what is commonly known as a turnkey contract to a firm with an established reputation. We accordingly gave such a contract to Messrs. Simon-Carves Limited of the UK in the confident expectation that the factory will be completed and put into commission to our satisfaction in time. The Directors were aware that in a work of the complexity of the Ennore Factory, teething troubles are to be expected, but events at Ennore have gone far beyond what can be regarded as normal in this context. I attach a statement to this speech setting out the major incidents that have taken place at Ennore. These indicate that on the part of the Contractors and some of their sub-contractors there have been lapses which we had not anticipated and which we had no reason to anticipate. This has been to us a bitter disappointment. The consequence has been that against a possible total of 56,000 tons, up-to-date only 11,500 ton have been produced. At the date of this speech the Works have been re-started, but in view of past performances, I hesitate to make any categorical statement as to when we will have a trouble-free run. In the meanwhile the Works have not yet been taken over by us. Shareholders will naturally want to be assured that everything is being done to get the Works functioning on a satisfactory basis as quickly as possible and that their interests in the matter of damages will be adequately protected. On both points I can give the fullest assurances to the shareholders. No one could be more distressed than your Directors that this project on which such high hopes had been built should have been subjected to so many frustrations and they have been giving the highest priority to ensuring that it is properly put on its feet. Naturally they are taking the best possible legal advice.



The financial significance of the difficulties that we have encountered at Ennore is that in the year 1962-63, we suffered a very heavy direct loss even without taking into account the dividend that we paid on the additional capital that was raised expressly for the Ennore Factory. But it says much for the inherent strength and resilience of the group that it has been able to absorb this serious loss and to show reasonable profits. Apart from demonstrating the inherent vitality of the group, our experience of last year also demonstrates the great advantages of the diversification of the group's activities.

Before dealing with the accounts, may I recapitulate a point that not all of our shareholders always remember? This meeting is a meeting of the shareholders of E.I.D.-Parry. This Company owns one hundred per cent of the equity in Parry and Co. but none of the Preference capital in that Company. E.I.D.-Parry also owns the entire capital of Andhra Fertilisers and Parry, Murray & Co. whilst Parry & Co. owns the entire share capital of the Mofussil Warehouse and Trading Co. The existence of these subsidiaries is due to historical reasons which it is not necessary to elaborate at this stage. The accounts that are presented of E.I.D.-Parry have been prepared in accordance with the requirements of the English Companies Act and are the Group accounts, that is to say, they show the profits of E.I.D.-Parry, of Parry & Co. and of the other subsidiaries all put together, and you will notice that the interests of outside shareholders, namely, the Preference shareholders of Parry & Co. have been shown separately and deducted from the total Group profits. Apart from statutory requirements, I think there is justification, in common sense, for this arrangement because, in fact, Parry & Co. (with the exception of the interest of the Preference shareholders) and the other subsidiaries are the property of the shareholders of E.I.D.-Parry. But you will appreciate that although Group profits as shown in the accounts pertain in the broad sense to the shareholders of E.I.D.-Parry a dividend to them can be paid only out of the profits of the main holding company, namely, E.I.D.-Parry.

The Group profits after taxation of the year under review together with the Group profits in previous years are shown below :

1959	£386,058
1960	£378,483
1961	£351,392
1962	£252,287
1963	£360,047

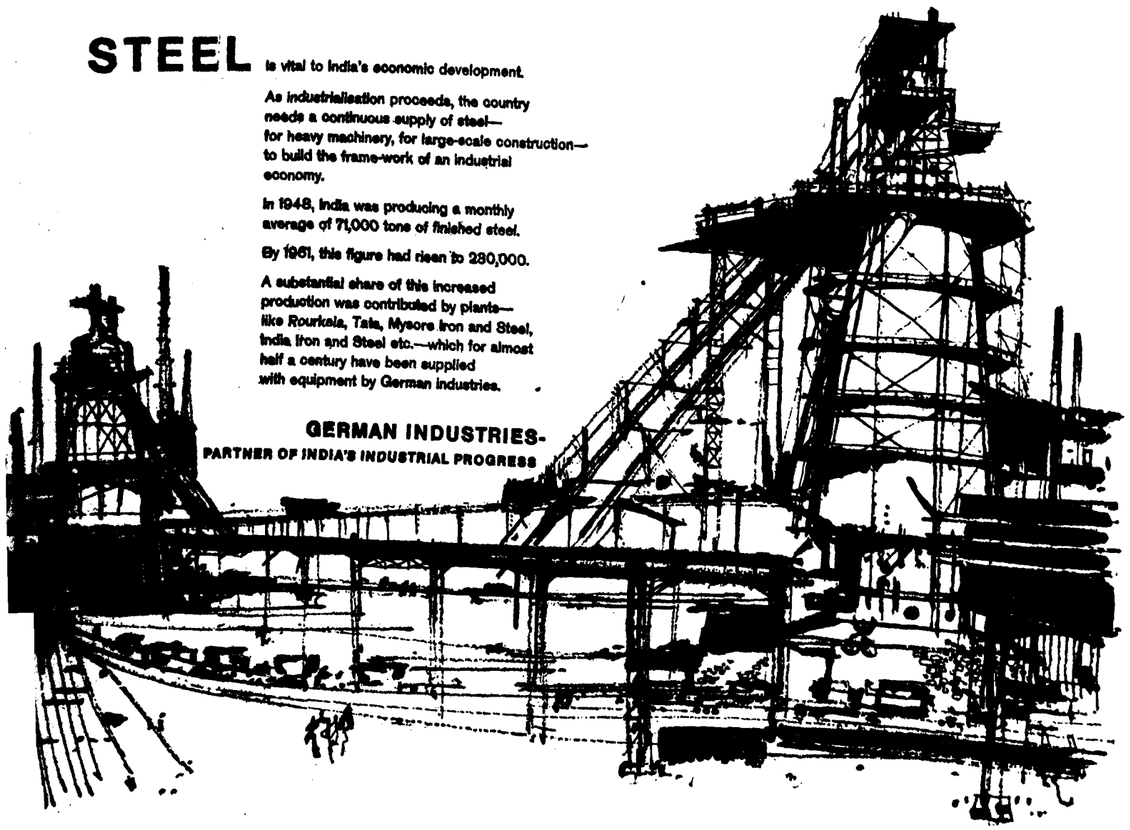
You will find that the figures for 1963 are substantially higher than the figures for 1962 in spite of the deplorable performance of Ennore. There are two main reasons for this. The first is that we have done well in our other activities such as sugar, pottery, and sales of fertilisers as well as general sales. In this connection, shareholders may be interested in the following figures. The sales of goods manufactured within the Group rose from £6.8 million in 1962 to £8.0 million in 1963. The sales of goods manufactured outside the Group and purchased by us outright rose likewise from £6.3 million to

PROMOTION OF INDUSTRIAL DEVELOPMENT THROUGH FILMS

In order to promote industrial development in the country, the Directorate General of Technical Development has organised an Audio-Visual Library consisting of about 300 industrial films in 16 mm. The Industrial Undertakings/Technical Institutes who are interested to know various industrial techniques such as material handling, time and motion study, plant layout, production and process control, and have projector facilities of their own can enrol themselves as members of the library on payment of an annual membership fee of Rs. 25.

Further particulars regarding the membership of the Library can be had from the Assistant Director (Admn.), Directorate General of Technical Development, Udyog Bhavan, New Delhi.

AUDIO VISUAL LIBRARY



STEEL is vital to India's economic development.

As industrialisation proceeds, the country needs a continuous supply of steel—for heavy machinery, for large-scale construction—to build the frame-work of an industrial economy.

In 1948, India was producing a monthly average of 71,000 tons of finished steel.

By 1961, this figure had risen to 230,000.

A substantial share of this increased production was contributed by plants—like Rourkela, Tata, Mysore Iron and Steel, India Iron and Steel etc.—which for almost half a century have been supplied with equipment by German industries.

GERMAN INDUSTRIES-
PARTNER OF INDIA'S INDUSTRIAL PROGRESS

£8.2 million. Sales on Consignment account rose from £5.0 million to £5.8 million. Shareholders may recall that in my speech at the last annual meeting, I pointed out that while the growing emphasis on manufacturing activities was undoubtedly correct, I attached great importance to the continuance of our trading activities — a view which gains point from our experience of last year. The second reason for the higher profits is that the taxation for 1963 is very much reduced, being only £189,509 against nearly £381,561 in the previous year. The reason for the reduced taxation is, of course, that we have become eligible for a heavy development rebate in respect of the Ennore Factory amounting in the year under review to as much as £217,350.

DIVIDEND

The Directors have given a great deal of attention to the problem of the dividend that should be declared for the year 1963. There are arguments to support the proposition that it would be justifiable to repeat the same dividend as for last year, namely, a total of 21-3/7 per cent. The main argument for this would be that the profits 'of the Group' for 1963 after tax are substantially higher than in 1962 and are, indeed, at the same level as the average for the years 1959, 1960 and 1961 and that it is legitimate for the shareholders to claim that the dividend should be based on the Group profits after taxation. There are, however, equally weighty arguments which suggest that the dividend should be reduced. In particular, I would mention that if we want to claim Development Rebate as indeed we must, we must by law appropriate £165,300 to the Development Rebate Reserve — this in effect largely represents the tax "windfall" given to new concerns to strengthen their reserves. After this appropriation the sum available for dividend from the net profit of E.I.D.-Parry is only £120,192 — as compared with £259,650 that we will need for dividends including the Ordinary Dividends of 21-3/7 per cent. This sum of £120,192 could, of course, be supplemented by recourse to the reserves. Shareholders will remember that in the year 1959 a Dividend Equalisation Reserve was created amounting to £150,000. If a dividend at the same rate as last year is to be declared, almost the whole of this reserve would have to be withdrawn leaving only a nominal sum in the reserve. Whether this would be appropriate would depend on whether we are satisfied that we would be able to repeat the same dividend for the year 1964 and subsequent years.

That depends to a large extent on Ennore, more particularly during the current year. We are satisfied that our other activities will show a sustained improvement but, unfortunately, we are not in a position at the moment to make any forthright prognostications about Ennore. In any event, it is clear that the year 1964 would also see a loss on Ennore and that the E.I.D.-Parry profits for that year, by themselves, may not justify a dividend of 21-3/7 per cent. To do this we would have to withdraw from the General Reserve.

Here again arguments could be made on both sides. It could be pointed out in justification for maintaining a dividend at last year's level, that although we may be withdrawing almost the whole of the Dividend Equalisation Reserve of £150,000 we would be putting into other reserves a sum of £262,800. In other words, the use of almost the entire Dividend Equalisation Reserve would not leave the total Reserve position any weaker. In fact, the net Reserve position would actually be stronger. But it must not be forgotten that the Development Rebate Reserve arises in reality from a tax concession and any prudent Company would wish to use such a concession to strengthen the reserve position. After the most careful consideration of the arguments on both sides, the Directors consider that it would be wise to make use of only part of the Dividend Equalisation Reserve in 1963 and leave the other part for use in 1964, if necessary. They have, accordingly, decided to recommend that a sum of £104,000 be taken out of the Dividend Equalisation Reserve for the year 1963 and that a total dividend of 18 per cent be paid to the shareholders.

SUGAR

Historically the manufacture of sugar has formed a big part of our activities though with increasing diversification its place in our total Group effort is getting gradually reduced. Nevertheless it remains important enough for me to refer to it. I am afraid the problems of the Sugar Industry continue to multiply. In 1963 we saw again an acute shortage of sugar throughout the country, and the re-introduction of control. It is ironical to recall that only a year ago Government restricted production by 10 per cent because they feared a crisis of surplus. Because of this cut in production the area planted with sugarcane was reduced as farmers had no indication from Government whether they would permit factories to crush all the available cane. At the same time attractive prices were offered for Gur, which in addition to its normal use in the Indian household, is also one of the basic raw materials for illicit distillation, and consequently cane for the legitimate sugar manufacturing industry was in short supply, especially in the North, and only 21.5 lakhs tonnes were produced throughout the country in 1962-63 against 27.2 lakhs tonnes in the previous year. With a rapidly increasing population and a rising demand for sugar, this was a serious set-back. In spite of the lower production Government exported 4½ lakhs tonnes, primarily at a loss, although international sugar prices started to rise before all the contracts were completed.

In the South the fall in production was not more pronounced than in the North, and the States of Madras, Mysore, Andhra, Kerala and Pondicherry produced 4.33 lakh tonnes against their previous year's production of 4.58 lakh tonnes. At Nellikuppam 3,17,757 tonnes of cane were crushed against 3,83,455 tonnes in the previous year, to make 29,542 tonnes of sugar against 35,395 tonnes in 1962.

It will be recalled that the Government of India, with the declared intention of paying for cane on the basis of quality, instituted a sliding scale for cane payments in 1962-63. In reality, however, the price paid continued to be much higher than the real value of the sugar in the cane, and farmers who grew cane of low quality were compensated almost to the extent of those whose cane of low quality were compensated almost to the extent of those whose cane was superior.

In order to boost production, Government offered an incentive by way of a rebate in excise duty of 50 per cent on the additional sugar produced over the previous year's figure in the period 1st July to 31st October. It will be observed that within 18 months the Government's policy changed from restriction in production to inducement for increased output. At Nellikuppam, for the first time, a special season was introduced in the months of September and October 1963. Although the experiment was not entirely satisfactory, and the recovery of sugar was lower than we expected, we had hoped that the excise duty rebate would, to some extent, compensate for the poor results. Unfortunately the Government of India ruled that factories who had not in any previous year produced sugar during the period 1st July to 31st October would not be eligible for the rebate and Nellikuppam fell under this category. Representations have been made against this decision and it is hoped that they will be successful.

There are more uncertainties for the sugar industry in 1964. The Government have progressively increased the price of cane and the latest increase of 7 nP. per maund was without any compensatory rise in the sugar price in South India. We will naturally do our best, but the degree of control exercised by Government and the constant shifts of policy are discour-

aging. As the years go by, I fear that sugar manufacture will become of less and less importance in the totality of our activities.

CERAMICS

Shareholders may remember the announcement made by Mr. Noel-Tod at the annual general meeting two years ago, of our agreement with Messrs. Doulton & Co. Ltd., U.K., in the matter of sanitaryware production. I am happy to say that our relationship with this Company continues to be most satisfactory and, with their assistance, we have completed a substantial expansion of the sanitaryware works at Ranipet, that the third kiln has now been commissioned and, in fact, will be officially inaugurated in the beginning of April. A new range of patterns has been developed and introduced on the market, standards and quality are improving progressively, and we are looking ahead to further interesting developments arising from our fruitful association with Messrs. Doulton & Co. Ltd.

VISAKHAPATNAM FERTILIZER PROJECT

In my speech last year and in those of my predecessors for the previous two years, reference was made to our association with California Chemical Company and International Minerals & Chemical Corporation in the Rs. 33 crore Fertiliser Factory at Visakhapatnam.

I am glad to inform you that arrangements for the integration of this Project are now nearing completion and it is anticipated that an offer of shares will be made to the public in March-April 1964.

Your Company will hold approximately Rs. 55 lakhs of the equity share capital of the new Company, which will operate the Visakhapatnam Fertiliser Project, of which approximately Rs. 40 lakhs will be subscribed for in cash.

Your Company's contribution to the success of this Project is not, however, limited merely to financial participation. We are assisting the new Company in the implementation of its seeding programme to familiarize the farming community with the advantages that will accrue from the use of complex fertilisers similar to that which will be produced by the Company and when the new Company's factory at Visakhapatnam goes into production, this Company will, in its capacity as Principal Selling Agents, be mainly responsible for the marketing of the factory's production.

We are proud to be associated with the American Collaborators in this venture, which is one of the major projects included in the Third Five-Year Plan. The Fertiliser Factory at Visakhapatnam will have an annual production capacity of about 365,000 tonnes of Ammonium Phosphate and 16,500 tonnes of Urea which will not only make an important contribution to the much needed increase in food production in the country but will also result in a foreign exchange saving of the order of Rs. 10 crores per annum.

STAFF RELATIONS

I am happy to state that our relations with all categories of employees have been satisfactory and I would like to take this opportunity of thanking them for the part they have played in the development of Group activities. I would in particular mention our staff at Ennore. They have had an exceedingly difficult and what must often have been a frustrating time but their cheerfulness and willingness to put in hard work have been most praiseworthy.

CHANGES IN MANAGEMENT

Mr. M. J. Edwards, the Managing Director, is retiring with effect from the 1st April after 35 years of service. I am sure shareholders will want to convey to him all their good wishes for his future. Mr. John K. John will be Joint Managing Director and Mr. Bowen, Deputy Managing Director from the same date. Having worked with them I can assure you that they will form a strong and coherent team.

NOTE: The above statement is not a report of the proceedings of the Annual General Meeting, which will be held on 30th March, 1964.

New Horizons

In pre-Independence era, India had plans and programmes for social and economic betterment of their people. But there was a fundamental weakness - the weakness of their belonging more to the Government than to the people.

Independence came, and with it a new awakening, and people's plans, for the people, by the people. The results were tangible - more and more of better and cheaper things, a better way of life for more and yet more people of our land.

We of the DALMIA ENTERPRISES have been constantly endeavouring to produce more and more of such goods that contribute towards improved living standards of our people. We are doing this not only since Independence but almost for a quarter of a century. The task is not so easy. Yet we are going ahead, undauntedly, in the hope of seeing a brighter tomorrow a new dawn.... along the new horizons.

SOMEONE. SOMEWHERE NEEDS ELECTRICAL CONSULTANTS

And AEI goes into action

All the superlatives come to mind. The Bhopal Project for the manufacture of heavy electrical equipment is the largest in Asia and among the biggest of its kind in the world. Its training school is one of the most comprehensive to be found anywhere. When completed, the Bhopal factory will employ about 30,000 people and meet a good part of India's requirements of electrical equipment. India can look to the project with understandable pride. AEI as official consultants, are happy to be associated with it.

East and West meet...

Highly skilled Indian engineers and AEI personnel work shoulder to shoulder at Bhopal, busy making switchgear, transformers, capacitors and traction motors for India's power projects and industry. Of five projected factory blocks three are operating;

when the remaining blocks are complete, production will extend to water and steam turbines, industrial motors and heavy rotating and other plants. The Bhopal factory combines the latest equipment, techniques and quality control measures. It will make a decisive contribution to industrial progress in India, and save vast sums of foreign exchange.

The tiger didn't like it...

...when they cleared away his jungle! At Bhopal, much attention is paid to welfare schemes for workers. A town has arisen on what was very recently thick jungle. There are neighbourhoods, laid out with an eye to space, light and utility. They house executives, clerical staff and workers. The

statistics on welfare read impressively. Over seven thousand homes have been built, 13 hostels, a 75-bed hospital, three dispensaries, three clubs and two auditoriums, including the Assembly Hall of the Training School. This city in miniature has 85 miles of road, a water purification plant, a sewage disposal unit, a modern telephone exchange and 15 cultural associations. The AEI hostel consists of two well-appointed buildings, where 25 AEI engineers from Britain are resident.

What would you do with 3,000 points of view?

The Bhopal training school is a small factory, complete with all departments, a rigid production schedule and a commercial output. The school offers courses to graduates, diploma holders, junior draughtsmen and artisans. About 300 full-time instructors and lecturers work with 3,000 students at a time. Three buildings house school, workshop and laboratories. Already, 4,200 trainees who have passed out are employed at the main factory. In addition, trainees are graduating to projects all over the country... A seat of technical learning has been successfully established at Bhopal.

40 years is a responsible age

The Bhopal project is one of the more recent associations between the Government of India and AEI. In India, AEI's activities date back about forty years and include contributions to the Jogindernagar power project (Punjab's first), the Bhakra Dam power project (Punjab's latest and India's largest), the steel works at Durgapur and the 720 mile oil pipeline in Assam. AEI has been manufacturing electrical equipment in India for over twenty years and a wide range of products is now serving the needs of industry and the home.

We don't usually indulge in name-dropping, but...

In our case it's justified. AEI is no newcomer. Its origins go back *more than sixty years*. Today, Associated Electrical Industries Limited embraces such famous names as British Thomson-Houston, Metropolitan Vickers, Siemens Edison Swan, Henley's, Ferguson Pailin, Birlec and Hotpoint. Worldwide, AEI operates 60 factories and employs 100,000 people. It produces everything electrical from lilliputian transistors to the world's biggest turbine generators.

Principal products worldwide

Steam and gas turbines and generators • Hydro-electric generators • Marine propulsion equipment • Electric drives for rolling mills and mine winders • Electric furnaces • Traction and railway signalling equipment • Transformers and switchgear • Power and telephone cables • Motors and their control gear • Electronic apparatus and radar equipment • Particle accelerators, electron microscopes and mass spectrometers • Industrial controls, instruments and meters • Semiconductor devices and power rectifiers • Private and public telephone exchanges and other telecommunication equipment • Lamps and lighting fittings • Heating equipment • Electro-medical apparatus • Nuclear power station equipment • Domestic appliances.

RECORDS AND STATISTICS

T.T.K. Sticks to His Guns

IN A REPLY to the general debate on the budget in Lok Sabha, the Finance Minister, more positive than persuasive in his defence of the budget proposals, indicated few possibilities of revision. The following is the text of his speech:

I have listened with care and attention to the speeches made on the Budget. Where I did not listen, I have gone through the text of the speeches as recorded. The overall impression of the reactions of Honourable Members to the Budget has not been disappointing. Nevertheless, it seemed that the considerable time and length taken by me in trying to outline the basic policies of Government and fit the proposals within their framework have not paid any great dividends. It may be that my Budget speech was not, perhaps, clear enough to enable Honourable Members to understand the basic policies and objectives behind the proposals.

While my gratitude is due to the Members who have supported the Budget proposals generally, I would, if I may be permitted, express my thanks for the critical appreciation of the Budget by an Honourable Member from Kerala and an Honourable Member from Rajasthan on my side of the House. In mentioning particularly the contributions of these two Members, it should not be understood that I am not appreciative of the support of the other Members, to all of whom I am grateful.

Burden on Society

It must be perfectly obvious to the House that no Government can ever bring in a Budget with an overall expenditure running to an order of Rs. 4,000 crores without casting some burden on society. What matters is, how is that burden cast? Is the incidence of the burden fair and equitable? Is that burden cast in such a manner that there will be continued progress? Is the overall effect calculated to make the *Economy move* forward or backward? I must, Sir, in all humility submit that the answers to these questions, as they relate to the Budget proposals before he House should be favourable. Again, in all humility, I must express my regret that many of the criticisms that have been levelled at the proposals miss these main points but go on to side-issues — some unrelated to a Central Budget and some having no connection with any of the Budget proposals.

It is perfectly clear that the political overtones that have dominated the speeches in the General Debate have to some extent blurred the principal issues. But I cannot complain. The Budget session is the time when Opposition Parties seek to drive the Government out of power and any attempt at a straight-forward hit at the bull's eye is a thing we on this side of the House should not complain about. But I do not think even the Opposition Members have tried to hit the bull's eye and put the Government out of power. Apparently, since they were not able to do so, they tried the other alternatives of political strategy left to them. Primarily, Sir, the attempt on the part of the Opposition was to divide the Party in power, to play on some imaginary differences in the Party as between groups of members, the so-called differences between Ministers themselves, to say that the Budget does not reflect the views of the Prime Minister or that advantage was being taken of certain circumstances to by-pass the Prime Minister's policies, to refer to the Congress Party's resolutions and to say that the Government were not living up to them. All these may be legitimate in political warfare; nonetheless they are not valid in any proper consideration of the proposals that are before the House. Nor is it the charter of the Opposition or any part of it to advise use, on this side of the House, on what we as a Party should do or to point to individual proposals as not being in consonance with the Party's principles. No man would seek to take medicine for curing his ills from a physician who wants to kill him. In this case, Members of the Opposition who seek to give us advice are not even qualified physicians, apart from the fact that their 'mala fides' in relation to the Government and the party in power are well-known. It will, therefore, be futile for me to go further into this aspect of the criticism. Like closed companies, in which the public are not substantially interested, these are also some parties in which the public are not substantially interested. I shall not devote too much time to them.

General Criticism

The other criticisms ranged over a wide field and it is rather difficult to classify them. Apart from the criticism of certain of the specific proposals, which on the whole were fewer in number than the general ones, the attack ranged over the following groups of subjects: neglect of agriculture in the Budget; lack of relief to the common man; prices; the Budget does not indicate any specific action against concentration of economic power; opposition to foreign investment in Indian industries; absence of mention in regard to rehabilitation of refugees from East Pakistan and no evidence of economies in administration. Added to all these, were criticisms of a personal nature, directed against me in particular, which unfortunately were indulged in both by members of the Opposition as well as by some members on my own side.

Sir, I do not propose to deal at any length with any criticism against me personally. Criticism that my Budget does not represent the views of the Party, and that it is a personal budget of mine are, to say the least, infantile and put forward for lack of criticisms of substance. On the other hand, the Honourable Member from Rajkot, representing as he does a singular point of view, felt that this Budget was not mine at all! Sir, there is no personality cult about this Budget and it really does not need for me to claim that the Budget is a Congress Party Budget and whoever presents it represents the Congress Party. I have no objection to anybody criticising the Congress Party as such. We can meet them on their ground. But that would be a different matter. However, if any member of the Party wishes to criticise the Budget on those grounds, the proper forum is the Party platform, not this House.

I shall, accordingly, turn to the more specific of the criticisms. The complaint that no mention has been made of agriculture is beside the point in any Central Budget. The Centre has broadly two methods of stimulating agricultural production. One through the Plan, by means of providing incentives to production, by subventions to agricultural programmes, to minor irrigation works, etc. And secondly, through the medium of the Central Ministry of Food & Agriculture which helps the State Governments in shaping their policy in regard to procurement and support prices, provision of fertilisers, the reaching of the results of agricultural research to the farmer and the like. Besides these two, through the co-operative organisation, the Ministry of Com-

NGB/46A

munity Development and the Reserve Bank help in the provision of credit for agriculturists and also to finance for the marketable surplus. The provision in the Plan to State Governments is of the order of Rs. 559 crores, of which the expenditure on agriculture and co-operation as such is of the order of Rs. 45 crores; on minor irrigation Rs. 48 crores; on other irrigation projects Rs. 136 crores; and that on power projects which have a bearing on agricultural production, Rs. 267 crores. There is also the provision for other types of help and stimulation in the Central Ministries' budgets. Besides these, I have referred to the taking up of intensive production programmes in eighty districts for which there is already a provision of Rs. 3 crores and further amounts will be provided as the scheme gathers momentum. Apart from these, there is nothing which the Central Government could do by making any special mention of, in the Budget.

Price of Fertilizers

Mention has been made of the need to reduce the price of fertilisers by persons who ought to know all about it. The provision of foreign exchange, year after year, for imports of fertilisers has been increasing while local production is also going up, though not quite so fast. However, there is an overall shortage of the popular types of fertilisers and use of the less popular varieties needs to be stimulated. Price is not the factor which is standing in the way of the increased use of fertilisers but the physical shortages and to accept the demand for a reduction in the Government's sale price will not benefit the consumer but only increase further black market prices for the more popular varieties. This is a criticism which is made without the book, and so is the mention of lower electricity tariffs in discussing the Central Budget without realising that this is a State subject. The power tariffs for Agriculture are already to some extent subsidised and anything lower than what they are now would only mean a heavier subsidy which again must come out of the common tax-payer so far as the State Governments are concerned. In regard to the rates of interest at which loans are provided to the co-operatives, Shri Ajit Prasad Jain mentioned that the Reserve Bank is lending at 2 per cent and has complained that there are too many intermediaries in the co-operative field who raise it to 8 per cent and over. He said that one of the tiers at least should be broken up and thereby a reduction in the rate effected. This is a point which no one will dispute. But again where does the Central Government budget come into this? Efforts are being made by the Central Ministries of Agriculture and Co-operation to persuade States to give up one link of the three intermediaries. But, so far, we have not been successful.

This should not, Sir, obscure the fact that there has been considerable progress both in the nature and quantum of the credit facilities available for agriculture.

It is estimated that the level of short and medium term advances for agricultural production provided by the co-operative credit structure in the last year of the third Plan will not be less than about Rs. 360 crores. This would be associated with a level of outstandings of central co-operative banks against primary agricultural credit societies estimated at about Rs. 340 crores which would be in addition to outstandings against other types of societies of over Rs. 65 crores, i.e., a total of Rs. 425 crores. Towards the end of the fourth Plan this figure is expected to reach Rs. 710 crores.

However, the co-operative banks are now not confining themselves to the provision of credit for agricultural production only, but are being called upon increasingly to finance a large variety of activities in the co-operative sector such as marketing and processing of agricultural produce, small-scale industries, distribution of consumer goods, etc. Thus, the operations of the co-operative banks are assuming dimensions which are comparable to what the operations of joint stock commercial banks, the main constituent of the country's banking system were some years ago.

The impressive growth of the state and Central co-operative banks is in no small measure due to the massive support from the Reserve Bank of India which provides assistance by way of (i) short-term loans to State co-operative banks for seasonal agricultural operations and marketing of crops; (ii) medium-term loans for specified agricultural purposes; (iii) short-term loans to State co-operative banks for production and marketing of handloom products; and (iv) loans to State Governments from the National Agricultural Credit (Long-Term Operations) Fund for participation in the share capital of co-operative credit institutions at all levels. The assistance provided by the Reserve Bank has shown a sharp increase and the short-term loans sanctioned in 1962-63 amounted to Rs. 163.94 crores as against the limits sanctioned of about Rs. 12 crores in 1951-52. The outstandings of these loans at the end of the year 1962-63 were Rs. 124.28 crores. The outstandings of medium-term loans on the same date were Rs. 10.56 crores as against nil in 1951-52. It may be pointed out that the Bank provides short-term loans for seasonal agricultural operations and marketing of crops at 2 per cent below the Bank Rate and for the production and marketing of handloom products at 1½ per cent below the Bank Rate. Similarly, medium term loans for agricultural purposes are provided at 1½ per cent below the Bank Rate. No such concessions are available to commercial banks.

The rapid progress achieved by the operations of the co-operative banks have also an important bearing on the currency and credit situation in the country. The continuation of the present policies will lead to a greater impact in this direction. The Reserve Bank as the Central Bank of the country is vested with responsibilities in the matter of monetary stability and the development of banking on sound lines. For enabling it to discharge these responsibilities satisfactorily, it has been vested with wide powers, under the Banking Companies Act, 1949, of regulation and control over joint stock commercial banks which are an important source of credit for commerce, trade and industry. This Act, however, specifically excludes co-operative societies from its purview and hence is not applicable to co-operative banks. The progress made in the last 15 years or so has made it increasingly clear that the present position under which the co-operative banks are outside the statutory control of the Reserve Bank needs to be reviewed.

Decline in Agriculture

Several Honourable Members referred to the rise in prices. Considering that the main reason for this, as the House is aware, was the decline in agricultural production, the scope for action through Budget proposals was necessarily limtied. I have tried to keep deficit financing at a moderate level; and the monetary policy weapon will also be used as and when necessary. In the case of foodgrains the only solution to my mind is to increase Government control over the system of distribution at strategic points. The State Governments must be prepared to enforce the various regulations affecting transactions at the wholesale traders' end and those engaged in the processing of foodgrains. If the shortage persists the country must be prepared for the imposition of some form of controls of distribution, however unpleasant they may be. If I do not dwell on the subject of prices at some length it is not because I do not consider it to be a matter of major concern but only because I think that the problem can be dealt with only by a major review of policies other than those relating to the Budget and this is being done in consultation with the State Governments. I for my part consider it essential for Government to take decision well before the sowing season for the kharif crops. Similarly, for other needs of the low and

middle income groups some devices will have to be thought of to keep the prices at a reasonable level.

At the same time, I can only say that I am not particularly happy at the dichotomy that has been made by some of the speakers as between town and rural folks and as between agriculturists and non-agriculturists in the matter of prices to be given to their produce and the regulation of prices for the consumer. In fact, every human being who is a producer not only consumes some part of his products but a whole lot of other things besides. Any general increase in the price level would, while it may benefit the agriculturist producers in their marketable surpluses, at the same time make serious inroads into the purchasing power of their surpluses if the prices of other articles they use go up. In the same way, subsidising of prices for urban dwellers and the cost of it to Government must inevitably come out of the people in the shape of taxes. So, in dealing with these problems what we should not do is to divide the people even in our minds but insist upon Government to have an integrated and inter-related view of the infra-structure of the price situation in the country.

I would repeat what I said in my budget speech that Government will have to evolve an integrated policy for incomes, wages, consumption and investment and this cannot be the task of the Central Government and the institutions under it alone. The State Governments and the political parties who have an influence on Government policies must also make their contribution in evolving such a policy.

Indirect Taxation

The lack of relief to the common man in Central Excise duties has been the burden of the song of many of the Members who spoke. This has been made a platform for agitation by certain Opposition parties. Kerosene and cloth have been highlighted as items where a reduction in the excise levy will go to reduce the cost to the consumer. But nobody has said how this is to be ensured. These again, Sir, are commodities in short supply and the ruling prices, where distribution control is not effective, are much higher than what they ought to be. In order to ensure that cloth is being supplied at reasonable rates, what is needed is a more rigid control over distribution rather than a reduction of excise duty, which if made is certain to be mopped up by the middleman. In regard to kerosene, it is known that the basic article is imported and any increase in supplies will mean a strain on our meagre foreign exchange reserves. It is also common knowledge that quite an appreciable quantity of low grade kerosene is mixed with lubricating oil and used by lorry transporters as fuel in substitution of high speed diesel oil. This leads to the other complaint that the common man does not get pure kerosene even for the high price he has to pay for it. A mere foregoing of a part of the revenue by the Central Government will not make kerosene cheaper for the common man. When people talk about matches, I do not know what to say. How much will the common man's burden be lightened by a reduction of duty on matches? The removal of excise duty on gramophone records seems to amuse people. The main reason for this is that the return from this duty is low.

Altogether, Sir, the scope of the relief that could be afforded directly to the consumer by a reduction in excise duties is comparatively limited in a period of shortages. In fact, as I have said in my Budget address, excise duties have to be raised for the purpose of mopping up that portion of prices which goes into the pockets of the middlemen who take advantage of scarcity conditions and also, for imposing a measure of restraint on demand in a period of scarcity. This is the philosophy behind our policy in regard to Excise. Where controls over distribution are not exercised and it is not possible to secure a direct reduction in prices to the people, it is our aim at least to reduce middlemen's margins so that the money coming to the Government offers thereby could be used for the people. To use these instruments in an effective and sensitive way, we have also asked Parliament to concede powers to Government to raise the rate of duties by executive order up to a certain extent.

Broadly speaking, there has been very little increase in excise duties in this Budget. The excise duty on iron and steel will yield only just a little more than what was being obtained from the Iron and Steel Equalisation Fund. The increase in the revenue comes, mostly from higher duties on flat products, which are in short supply and command a black market price. The adjustment of duties on yarn and cloth is again due to a short supply of fine and superfine yarn, spun out of foreign cotton, which have a large element of foreign exchange content in them. In the process, there has been a reduction of duty on coarse fabrics which are manufactured out of indigenous cotton. The incidence has been shifted; this will partly counteract the poaching into excise revenue by powerlooms, assuring at the same time certain preferential support to the handlooms. The affected interests are no doubt unhappy and will continue to be so but I have no doubt, Sir, that they will in time settle downt o the new rates.

A complaint was made about there being no mention of refugees from East Pakistan in the Budget speech. The allocation for this purpose has to come out of the budget of the Ministry of Works, Housing & Rehabilitation, which has also a provision for the Dandakaranya Project. As I have said in the final paragraph of my Budget Address, if this problem assumes a greater dimension which let us hope we will be spared, more monies will have to be found and the House will be taken into confidence at that time. The Budget Address is not a collection of emotional statements only and it will be wrong, therefore, to blame the Government or the Finance Minister for not highlighting many of the specific items for which detailed allocations have been made in the Demands for Grants of the various Ministries.

Economy in Administration

Again, the question of economies in Administration was raised. I have drawn attention to this factor in the last paragraph of my Address and this is indeed a matter of serious concern to us. I must begin by correcting Shri Masani's statement that there has been a large increase of Rs. 191 crores in administrative expenditure. The break-up of the increase in civil expenditure of Rs. 191 crores is as follows. Rs. 62 crores is on account of self-balancing items matched by a corresponding increase in revenue receipts and do not represent any net outgo. There is an increase of Rs. 53 crores on account of grants to States, both for Plan and non-Plan purposes and an increase of Rs. 36 crores for the servicing of public debt, most of which has been for developmental purposes, an increase of Rs. 10 crores to cover the payment of increased dearness allowance to low-paid employees, an increase in the statutory grants to States besides grants for Agriculture, Medical, Public Health, etc., all amounting to Rs. 18 crores. This explains, by and large, the reason for the increase of Rs. 191 crores in civil expenditure.

I may mention here that the Ministry of Home Affairs is being strengthened with an Administrative Reforms Division. Shri Dwivedy and a few other Members made the point that many recommendations made by the Estimates Committee and other Parliamentary Committees as well as by committees set up by Government, from time to time, were yet to be implemented. The intention is that the Administrative Reforms Division should comprehensively examine the recommendations of the several Committees that have, over a period

BUSINESS & SERVICE

The Bank receives deposits, gives advances against approved securities, purchases bills, sells drafts and telegraphic transfers and transacts all types of Foreign Exchange business. Through its internal net-work of branches and world-wide business arrangements it provides every kind of banking service.

S. T. SADASIVAN,
General Manager

UCO 3

of years, gone into the question of economy and efficiency in Administration and process them quickly for implementation.

Two other criticisms which have an economic bearing are those relating to concentration of economic power and private foreign investment. The criticism, from the opposite side and from their sympathisers on this side in regard to concentration of economic power has by now become an oft-repeated one. It is significant that free use should have been made of alledged references in the Mahalanobis Committee's report which is not yet a public document. I do not propose to explain further the nature and content of the concentration of economic power. I am not here to disprove that concentration has taken place to some extent. In a developing economy, a certain amount of proliferation in industrial activity on vertical lines can be permited both from the point of view of the advantage of economies of scale and of efficiency in manufacturing operations. It means that companies engaged in manufacture of one item may proceed to manufacture articles of a related variety. Even here, when I was Minister for Commerce and Industry, I discouraged the big producers from taking up production of ancillaries for the reason that ancillaries for all users, as for instance the ancillary equipment for motor vehicles, should be produced at one place, so that each producer does not have to go in for the limited production of ancillaries. But, unfortunately, in some cases, motor manufacturers have also taken up the manufacture of ancillary equipment. The type of concentration which is pernicious in its effects is the horizontal projection in which one group of producers extends their activities to a number of non-allied lines so as to get a big coverage. How this concentration of power operates in the matter of keeping prices at a high level, in the matter of cornering essential supplies and in ultimately exercising some kind of political patronage are all today matters of opinion, not always based on facts. So far, any expression of opinion on this question has amounted merely to a mention of the fact of concentration without throwing any light on its effects or on the devious ways in which they are felt over the entire economy. So much so, in assessing the effects there is an element of guess work, or there is an element of fear which more often than not is being turned to propaganda purposes.

Monopolies Commission

As the first systematic step for combating the ill-effects of such power, I have proposed the appointment of a Monopolies Commission. It seems to be a matter of some amusement, mixed with unfair criticism, that such a Commission is proposed to be appointed under the Commission of Enquiries Act. Honourable Members who have criticised the appointment of such a Commission and have equated it to one more of the several committees that Government appoints, have done so without a knowledge of the facts. There is at present no law covering monopolies on the statute book. The present laws, including the Companies Act, do not provide any method by which there can be a straight-forward reduction of concentration of power for specific purposes in view. These laws will have to be framed. I could have brought in a Monopolies Commission Act before bringing into being the Commission proposed in the Budget, but that would be in a sense putting the cart before the horse and I would have had to draw largely on the experience of foreign countries in this regard. That might or might not be suitable for our purposes. The intention is that this Commission of Enquiry after going through the collected facts and making certain enquiries thereon, should give us a draft law and if Parliament could be persuaded to pass it quickly the Commission itself may sit down to exercise the law on the basis of their acquired experience in regard to the existence of concentration of economic power and the abuses connected therewith. It is not necessary for this Commission of Equiry to take years to give us a draft law. The time factor would, of course, depend really on the extent and the nature of information available and not on Government's wishes to expedite, or its alleged desire to retard the bringing into being of a law for this purpose. This is all that is intended to be done and I cannot see how anybody who is at all serious in his approach to this problem, can fairly criticise Government's action in the regard.

Supplementing what I have said, Sir, I may draw attention to the substantial increase in the assistance that Government have extended to new entrepreneurs and to small industries, the most important objective in which is to encourage competition and reduce the dominance of large groups. Apart from certain new measures like the Unit Trust to which I referred in my speech, the establishment of the National Small Industries Corporation, Small Industries Service Institutes, various Boards for different cottage and handicrafts industries, for Governmental, technical, financial and marketing assistance, establishment of State Financial Corporations, Institution of the State Bank of India schemes of lending and the Credit Guarantee scheme for encouragement of commercial banks' lending to small industries are measures to increase decisively the participation of medium and small industry in the process of industrial development and to offset the natural advantages enjoyed by enterprises.

Largely in response to these measures, the quantum of assistance given by banks to small-industry has more than doubled in the course of three years, increasing from Rs. 21 crores in June 1960 to Rs. 43 crores in 1963 the rate of increase being more than 25 per cent per year. These sums no doubt are small, but commercial bank lending as such to the organised small-scale industrial sector has to be considered in the context of the very smallness of this sector. Thus, the paid-up capital of small public limited companies, below Rs. 5 lakhs each, formed barely 3 per cent of that of all companies.

Private Foreign Investment

Sir, a good deal has been said in the course of the debate about private foreign capital. There have been a number of policy pronouncements on the subject and I may reaffirm, Sir, that there has been no change in that policy. What has been engaging the attention of Government in the recent past is a re-assessment of performance within the framework of that policy. The target for the contribution which private foreign capital would make towards bridging our foreign exchange gap had been set at Rs. 300 crores for the third five-year Plan as a whole. The actual level of private foreign investment in India has remained at the much lower level of about Rs. 30 crores per annum for the first two years of the Plan. Excluding retained profits, the inflow of capital from abroad will be less. While no estimates of foreign exchange requirements for the fourth Plan have yet been made, a few things seem to be reasonably clear. Firstly, the fourth Plan will be bigger than the third Plan. Secondly, we cannot expect the countries which are helping us to keep stepping up the level of their aid as our Plans grow bigger. Thirdly, with the heavy increase in the burden of debt repayment for the fourth Plan referred to in the Budget speech, we must rely only on that type of external finance which won't further aggravate the debt repayment burden in the immediate future and equity investment is on such form of finance. Finally, in the fourth Plan, we must clearly embark in a big way in new fields of development for which even on technological considerations collaboration with reputed manufacturers abroad would be necessary and even desirable.

The question to which we have addressed ourselves is not one of modifying our policies regarding private foreign capital, but of fulfilling them. One of the major difficulties which foreigners have legitimately complained of is delay in getting clear and decisive answers to their proposals for

investment. Obviously, the answers must be in accord with our policies, but they must be prompt. A streamlining of the administrative arrangements to deal with such proposals has, therefore, been made. So far as the budget proposals are concerned, our aim has been to remove certain disincentives. It is obvious that if a foreign firm has investment in India, it must have a number of foreigners in the undertakings in which it participates; the more so because we encourage foreign investment, particularly in fields in which the level of technology is of a high order. The level of personal taxation in this country which is geared to our own conditions, has created problems for expatriates working here and the Budget proposals give them a certain degree of relief. Incidentally, this relief extends to foreign employees in all enterprises, including the public sector. Then, we have extended the rate of taxation of royalites to payments on account of engineering fees, which again are not exclusive to firms with private foreign investment, but include other projects as well, including those in the public sector. We have also removed the disincentive to foreign firms to have their offices and representatives in India to buy goods for exports by withdrawing the business connection principle in respect of exports. Then again, we have made it possible for Government to facilitate investments by foreigners in securities, as distinct from equity, and also made the application of tax relief to foreign technicians and to interests earned on foreign loans more flexible. These concessions again are not, in any sense, exclusive to projects with private foreign investment. The main fiscal benefit to private foreign investment in the Budget flows from the decision to exempt inter-corporate dividends from super-tax. This decision again is in no sense exclusively meant for foreign companies investing in India and applies without distinction to all inter-corporate investment. Indeed, the only change exclusively applicable to all foreign firms is the increase in the tax rate from 63 per cent to 65 per cent in the case of those foreign firms who operate through branches and whose dividends are declared abroad. We are not anxious to encourage foreign companies to operate in India through branches and what we are anxious to see is a growth in Indian companies which have private foreign capital in them, but the companies should be Indian companies incorporated in India and declaring their dividends in India.

Equity Investment

The point has been raised whether our policy regarding equity investment in the public sector has undergone any change. The policy in regard to private participation in public sector projects stands today exactly as it was defined in the Industrial Policy Resolution of 1956. It is worth quoting from it. The Industrial Policy Resolution clearly states that the inclusion of certain industries in Schedule A of the Industrial Policy Resolution does not preclude "the possibility of the State securing the co-operation of private enterprise in the establishment of new units when the national interests so require. Railways and air transport, arms and ammunition and atomic energy will, however, be developed as Central Government monopolies. Whenever co-operation with private enterprise is necessary, the State will ensure, either through majority participation in the capital or otherwise, that it has the requisite powers to guide the policy and control the operation of the undertaking."

In pursuance of this policy, many public sector projects do have private foreign investment in the equity. We would certainly be glad to take in such participation in industries, particularly where technologicall considerations make such participation desirable, provided the terms and conditions are satisfactory.

Another question which was raised was whether we have made any change in regard to the policy of the percentage of equity stock which foreigners can hold. Clearly, in the public sector, they cannot hold anything but a minority position; otherwise, the project cannot be described as a public sector project. In regard to the private sector, the policy of preferring a minority participation and making exceptions to this rule only in suitable cases and in exceptional circumstances continues unchanged.

Specific Tax Measures

Sir, I shall now turn to some of the criticisms of specific tax proposals that have been made. We have, during the last week, explained the tax proposals more fully in a series of official hand-outs and I shall make fuller notes on the proposals available to the House by the time the Finance Bill is taken up. On the specific criticism by Shri Masani, that there is no relief to the corporate sector since the Budget proposals are expected to bring in an additional revenue of Rs. 11 crores from this sector, I will only say that to concentrate attention on the over-all figure of revenue without going into specific tax reliefs is to miss the point.

The new structure in personal taxation has been explained in the Press and it will not be necessary for me to go into it again beyond pointing out that at income levels below Rs. 15,000 even in the few cases in which there is an increase in the income-tax, after deduction of the Compulsory Deposit the increases are marginal. In fact in the case of incomes where the tax itself is small the relief cannot be indicated by any sizable figure. The new structure is a considerably simplified one and has a smoother progression, in arriving at which there has been a marginal amount of higher incidence at a few levels of income. This should be understood in the proper perspective.

In the course of the debate, a few suggestions have been made about the Annuity Deposit Scheme. One of the suggestions has been that the Scheme should be optional. I am afraid it is not possible to agree to this suggestion except in the case of old persons. I am prepared to make it optional for persons above the age of 70. I am also prepared to consider giving of option to a person who does not want to make the Annuity Deposit for any special reasons of his own of opting out of it by paying tax which would be higher than the tax that would have been normally payable on this portion of the income. Such opting out will have to be made unattractive as it will not be in keeping with the objective of leaving a reduced expendible income in hand. The votes to be applied will require fuller consideration. On the other hand, it has also been suggested that persons may be given the option of not receiving the annual repayment when it falls due. I am afraid it is not possible to agree to this either. Whether the payment is taken or not, as the amount will have accrued to the person concerned, it will have to be treated as income in that particular year.

There are two points on which the Finance Bill introduced by me is at variance with what I have stated in my Budget speech. The first relates to the failure to indicate the first slab which will attract gift tax, namely gifts above Rs. 5,000. I am taking steps to move an amendment to the Bill to keep the exemption limit at Rs. 5,000 as was mentioned by me in the speech. All the subsequent slabs in the rate structure for Gift Tax have been worked out on this basis. It was through an oversight at the printers end that the necessary provision was not included in the Bill.

The other discrepancy is largely due to a misunderstanding of my intentions but not of a serious character, between my Budget speech and the appropriate provision in the Finance Bill. I stated in my Budget speech that the development rebate in its present form will cease after the 1st of April, 1966. In the Finance Bill, Clause 8 in respect of Section 33-

of the Income-tax Act, says that the development rebate would cover a further period of three years from now which takes it to 1967. I do not propose to amend this portion of the Finance Bill and it might be taken that the present position will continue until three years from the date of notification.

Development Rebate

It has been represented to me that I should indicate Government's policy in regard to the grant of development rebate after three years from now. At present, the development rebate applies at a uniform rate of 20 per cent, having been reduced from the previously prevailing rate of 25 per cent. In the case of one or two industries, the rate is higher. When the development rebate was reduced from 25 per cent to 20 per cent, there was a certain amount of criticism that people had already made commitments in the expectation of a rebate of 25 per cent and the plea was made that changes in development rebate should be made with due notice. This is a legitimate point and when a higher rate of development rebate was announced for the coal industry, it was made applicable for a certain period of time. The implication of the statement in the Budget speech is that the existing rates will continue to be in force till the beginning of the fourth Plan. Now it has been extended by a year. In the light of the priorities of the fourth Plan, a fresh system of rebates may have to be introduced and, therefore, a notice had to be given to industry that such a change might be made. This does not, however, mean that the system of development rebates is going to be scrapped altogether. The budget proposals have, in fact, given fresh incentives to investment in certain key industries by lowering the rate of Corporation Tax on them and there can be no question of reducing the development rebate in respect of them even in the fourth Plan, because they will obviously continue to be important. In the next budget, Government hope to announce the rates of development rebate to be made applicable during the fourth Plan period. Present thinking indicates that this will be on a graduated scale weighted in favour of the essential industries with higher capital content.

Shri A. P. Jain criticised the allowance of the statutory deduction at 10 per cent of the capital base in the new surtax which includes a certain amount of loan capital on the ground that, generally, the rate at which interest payable on such loans is much less than 10 per cent I may point out that under the provisions in the surtax bill, the amount of interest payable is added back to the profits for surtax in order to avoid a double deduction

It was also said that the exemption of inter-corporate investment from super-tax would facilitate inter-locking of companies and increase concentration. One objective in the new proposals in regard to exemption of dividends on inter-corporate investments from super-tax is to simplify the structure and to remove certain anomalies inherent in the differentiation between companies incorporated on different dates etc. We must also remember that while inter-corporate investments may be one form in which dominant groups extend their sphere of control, such investments in the main provide investment opportunities for corporate savings, most of which serve socially useful purposes. To the extent that they do not, and lead to any increase in concentration of economic power non-fiscal measures such as the Monopolies Commission, and as I had indicated in my Budget speech the Company Law regulations will be used to combat them. Again, given the need for generating corporate savings, it is better that they lead to the formation of independent and competitive companies than to the formation of units producing unrelated end-products under a monolithic ownership and management as would be the case if these are undertaken by wings of one big unit.

Some other points have also been represented to me, but I would like to consider them in greater detail before I express any view. For instance, it has been represented that the levy of capital gains tax on bonus shares issued out of share premium moneys required to be differentiated. It has also been represented that the total impact of Estate Duty and tax on capital gains and other incidental costs in respect of property received by inheritance which may have to be sold to pay the estate duty should not be such as to cover the entire value of the inheritance. All I can say at this stage is that these points are under examination.

The complaints made by those interested in industries about there being no concession at all would perhaps require some answer. I may tell the House that in the process of framing my tax proposals I had these proposals tested on the balance sheets of some of the bigger companies. In doing so I did not take into account the concessions given in respect of rebates on corporate tax or on surtax to certain industries. But I did take into account the surtax and the dividend tax on the basis of dividends distributed in the past year. Out of 31 companies examined, 20 companies were paying super profits tax in the previous year. In the case of all these 20 companies the tax as a percentage of the total income that would be levied according to the budgetary proposals would be less. In the case of some of the companies which were not liable to pay super profits tax, the position will be different. It only reveals that the operation of the super profits tax was somewhat uneven, and put an additional burden on many of the companies while some got away with advantages.

Taxation Reliefs

In the same way the criticism which I find not only voiced in the House but outside in the Press about there being no relief is not correct. In the case of persons of the 4,200 rupee bracket, after deducting the compulsory deposit where income from salaries was concerned, he was paying Rs. 60.90, he will now pay Rs. 36.00; in the next bracket of Rs. 5,000 he was paying Rs. 93.10, now he will pay Rs. 84.00; in the next slab of Rs. 6,000 he was paying Rs. 176.60, he will now pay Rs. 184.00; in the case of the next bracket of Rs. 7,500 he was paying Rs. 338.73, he will now pay Rs. 334.00; in the Rs. 9,000 bracket, he was paying Rs. 549.91, he will now pay Rs. 559; in the Rs. 10,000 bracket, he was paying Rs. 690.00, he will now pay Rs. 709.00. As against this, including compulsory deposit they were paying in the case of:

Rs. 4,200	Rs. 185.90
Rs. 5,000	Rs. 242.10
Rs. 6,000	Rs. 352.60
Rs. 7,500	Rs. 544.17
Rs. 9,000	Rs. 782.19
Rs. 10,000	Rs. 940.00

It cannot therefore be said that the changes have not benefitted the 'take-home pay', for these people, an advantage which has been denied to the upper slabs by reason of the introduction of the 'Annuity Deposit Scheme'.

I do not propose to deal further with the working of the public sector undertakings beyond what I had stated in my Budget speech. Hon'ble Members who doubted the wisdom of asking the public sector undertakings to make profits or in other words to create surpluses have been adequately answered by my colleague, Mr. Bhagat.

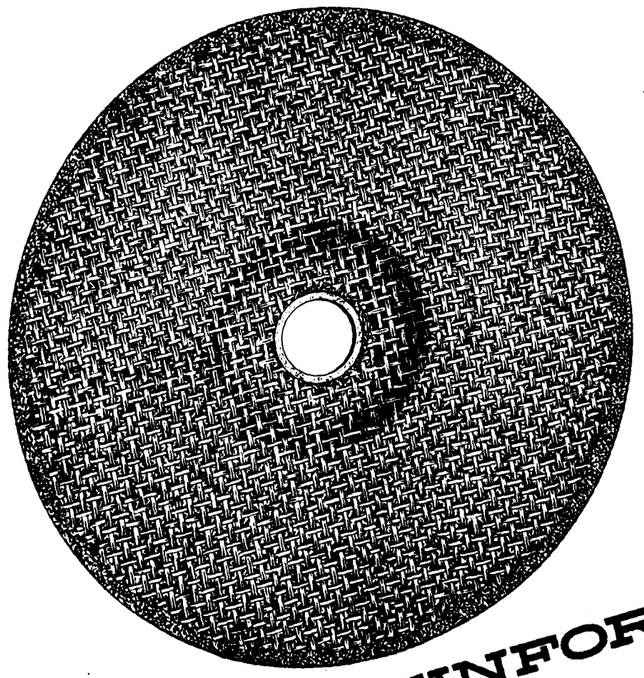
However, it may be worthwhile mentioning what happens to the Soviet Economy. Amongst some of the observations made on the profits in the Soviet Economy, the following has been said:

> "More attention by the West to the factor of profits in the Soviet economy is advisable also because of its rapidly increasing relative importance in financing 'accumulations' in the Soviet national income. In fact, the importance of the turnover tax, which until lately was the main instrument of financing state budgetary and non-budgetary

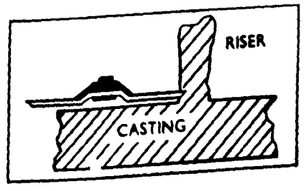
expenditure, seems to have been overshadowed by that of profits during more recent years."

The budgetary revenue including allocations from profits and direct and indirect taxation in the Soviet Union between the years 1956 and 1961 has been 109 per cent of what obtained in 1955 in 1956, 129 per cent in 1957, 160 per cent in 1958, 183 per cent in 1959, 200 per cent in 1960 and 213 per cent in 1961. The net profits of the enterprises and economic organisations on the basis of 100 for 1955 has been 105 in 1956, 125 in 1957, 161 in 1958, 184 in 1959, 203 in 1960 and 218 in 1961. The most vigorously growing major items in the State revenue are the allocations from profits which during the seven years 1955-1961 increased by 101 per cent while the revenue from the turnover tax increased by 28 per cent and that from direct taxation by only 21 per cent. These figures, I understand, have been compiled entirely from Soviet sources.

State Enterprises

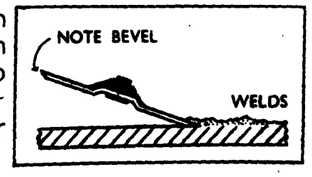


It will therefore be seen that once the State embarks on a programme of industrialisation under its aegis, it must expect these enterprises to make substantial contributions to the State's exchequer. My view, expressed in the Budget speech, continues to be the same—that the State enterprises must make increasing surpluses available or in the alternative at least finance their own expansions. If however in any particular project or a public sector enterprise, Government feels that the prices have to be subsidised in order to encourage producers to produce more or to remove distortions in the standards of living in the case of lower income groups, then these must come out of straight subsidies from Government. It is therefore wise not to confuse what is the obligation of the State towards the lower income groups and its responsibility in regard to returns from capital provided to industries or other enterprises. These are two different matters and any mixing of the two can only confuse us in regard to the basic objectives.



Quite a number of other matters, not wholly relevant to the Budget or even for that matter within the purview of the Central Government, have been mentioned by Honourable Members. I have no doubt the appropriate Ministries have taken note of such points as affect them and I am sure the House does not expect me to go into those matters here. These points will be brought up again during the consideration of the Finance Bill and also at the demands of several Ministries are taken up. I can assure the House that Government will take note of whatever is being said and furnish replies if it is within their competence to do so.

As I said at the outset, several Members have criticised the Budget, some negatively, some positively, each one from own angle. Many have highlighted some of the features of this Budget and to all of them I am grateful for having thrown some light on the Budget positively or negatively. I do not claim and I did not claim in my Budget Address that this is a perfect budget. But I do claim and fairly emphatically that this is a budget which has taken into account the defects in the fiscal structure and has tried to remedy them with a view to make the Economy move forward smoothly. Whatever may be the ultimate politico-economic structure of the country and our own desires in that matter, in fact no sector of the Economy can move forward unless there is a constant look at the hurdles in the way of progress and the changes that are taking place in the infra-structure of the Economy from time to time which not merely produce distortions in it, but also in the process create roadblocks. Critics speak rather lightly of the carrot and stick to the donkey. I am afraid, Sir, I have too much respect for the people of this country to think they will be goaded to run forward to get at a corrot or permit the stick being used. I had no intention of doing either of these things in presenting this Budget. The defects in the economic structure which inhibit progress are generally known. They are defects that arise all the time by the changes that take place in the human society in our march to progress. Since primordial interests of man always remain, the tendency for society to be acquisitive is known and even when one tries to get them away from this tendency, they are bound to revert to it again and that is why in any country, much more in a democratic one, Government have to be all the time at the helm to move the ship away from the shoals and the rocks in the way of progress.



Clear Goal

Sir, the goal that we have set for ourselves is clear. We shall march towards a free society in which freedom from fear, economic, political and personal, shall be assured and things that come in their way from time to time, in the way of such conditions coming into being would be pushed out. That is the perspective that we have set ourselves to. Call it by whatever name you like, democratic socialism or mere socialism or any form of it. The word itself has no precise connotation. It is what is being built round it that indicates how far that socialism is the one that would benefit people in a free society. In any civilised country in the field of industry and other activity big institutions become inevitable. In a big country which operates under a rather complicated federal political structure it is inevitable that the concept of anything that effects people should be big. There is no use crying out against Government monopolies. It cannot be helped. This country cannot be served except by a huge Centrally planned and directed railway system. It would also be inevitable that other modes of transport will have to be so planned in the future and carried out. The basic needs of the people of this country have again to be planned in a big way with an eye to serving the remote corners of the country. Power is one such. I have been devoting some attention to the energy surveys and every time I do so, the conclusion is irresistible — the Central planning and direction has to be precise and continuous and that one allocates the sphere of activity for thermal power, for hydro-electric power and atomic power. What then is the object of some Honourable Members in this House criticising Government and Governmental activities as being monopolistic. In fact, the monopoly to serve people effctively is that of the Government of the day. In dealing with private enterprise one recognises that they have a place and always shall have a place. It depends upon how you define private enterprise. The individual will remain an individual and will only respond to impulses that appeal to him as an individual. If we strain the compulsions in regard to directing those responses, he is always aware of the opportunity he has every five years for indicating his displeasure. After all, everything has to be done by the individual and the motive power behind his action is the incentive. It is different as between different individuals, groups of them, whether they be of an area, class or age. Sir, we have to take into account all these factors when we plan for economic progress. And to a certain extent fiscal policy being a handmaid for economic progress has also to take account of all these factors. I claim no credit for having introduced rather severe—and I admit they are severe —measures in order to do away with inequality in wealth and power. Such an act is basic for the sustenance of democracy and to give a positive content to a socialist economy. And it is a continuous act, continuous because we allow to a large extent within a limited sphere the individual freedom, and that freedom will always, having in mind human nature, go towards concentrating in his hands the good things of life. I therefore want Honourable Members to view the Budget from glimpse of the perspective that it gives. If in the process of working out the various measures we make mistakes, let us correct them. But I think it cannot be denied that the Budget takes us a step further on the road to progress, even though I should, as a person who presents it, have to say it.

A versatile, double-action abrasive tool—cuts through runners and risers—also grinds away heavy welds—eliminates the need for changing wheels!

SOMEONE, SOMEWHERE NEEDS ELECTRICAL EQUIPMENT AND TRAINING

And AEI goes into action

AEI is India's largest supplier of electrical equipment and the Commonwealth's biggest. 60 AEI factories and 100,000 employees the world over manufacture every type of equipment for the generation, distribution, control and use of electricity. Many of the important men in electrical engineering in India and abroad who buy and use AEI equipment were originally apprenticed in AEI factories. They are unanimous on one point: they owe a great deal to the intensive training given by AEI.

Remember how the acorn grew into an oak

From a small start in 1941 with 150 workers and an output of Rs. 1.5 lakhs annually, the AEI factory in Calcutta has grown into an important manufacturing unit. Today, it employs 726 men and produces a wide range of electrical equipment. AEI also markets

lamps and fans in India and plans to extend its lines of industrial and domestic appliances. 'The aim,' says Works Manager C. M. Meek, 'is to increase productivity using the same manpower and machinery.'

In India AEI produces

Transformers for power and distribution (Up to 5,000 kVA) • Transformers for electric furnaces (Up to 3,500 kVA) • Electric motors (Up to 500 h.p.) • Motor starters (Up to 100 h.p.) • Pumping sets (3, 5 and 7.5 h.p.) • High voltage isolators (Up to 132 kV and 800 amps.) • Metal-enclosed unit distribution switchboards (Up to 500 amps. at 660 volts) • Bus bar connectors (Up to 1,000 amps.) • Lighting fittings (Fluorescent, discharge and tungsten fittings of all types) • Electric furnaces (Heat treatment) • Electric furnaces (Melting) • L. T. circuit breakers (Oil circuit breakers up to 1,200 amps.)

Every month: enough cable soon to stretch from Bombay to Delhi and back!

AEI, by virtue of the collaboration agreement concluded in 1960 between Tatas and W.T. Henley's Telegraph Works Co. (since merged with AEI, U.K.) are now progressively increasing the manufacture of world famous Henley cables in India. At the new cable factory near Poona, thermoplastic and rubber insulated cables are manufactured for domestic and industrial use. The factory employs 400 people and output has already exceeded two million metres per month.

Planning 6,000 futures

AEI helps in the training of engineers the world over. In AEI's British factories more than 6,000 apprentices are undergoing training. 250 AEI U.K. trained engineers are now working at Heavy Electricals (India) Limited, Bhopal, where AEI are consultants; another 150 Bhopal-destined engineers are under training with AEI U.K. In addition 500 Indian engineers have taken their training in AEI's U.K. factories. This is a record believed to be unsurpassed by any other electrical engineering company operating in India. AEI's factory near Calcutta takes on 6 to 12 graduate engineers every year on a two year course. It also trains, by special arrangement with the Government, senior officers from defence services like the Navy. The training school at Bhopal, for which AEI are consultants, can train 3,000 men at a time. 6,200 trainees have registered so far; 4,200 have completed training; the rest are still under training. On graduation, some will be absorbed by the project; others will work at similar projects in different parts of the country. The Bhopal training school is fast becoming an important seat of technical learning in India.

40 years is a responsible age

In India, AEI's activities date back about forty years and include contributions to the Bhakra Dam power project (Punjab's latest and India's largest), the steel works at Durgapur and the 720 mile oil pipeline in Assam. Worldwide, AEI has many impressive achievements to its credit—the largest generating sets ever made for British power stations; locomotives and traction equipment for British and Indian railways; switchgear, cable and generators for the vast hydro-electric schemes at Kariba and Owen Falls in Africa; a large rectifier installation for the production of aluminium in Canada; turbo-electric propulsion machinery for the 45,000 ton P. & O. Orient passenger liner 'Canberra'...

We don't usually indulge in name-dropping, but...

In our case it's justified. AEI is no newcomer. Its origins go back *more than sixty years*. Today, Associated Electrical Industries Limited embraces such famous names as British Thomson-Houston, Metropolitan Vickers, Siemens Edison Swan, Henley's, Ferguson Pailin, Hotpoint and Birlec. The people, traditions and unexcelled experience of the parent companies remain unchanged.

Principal products worldwide

Steam and gas turbines and generators • Hydro-electric generators • Marine propulsion equipment • Electric drives for rolling mills and mine winders • Electric furnaces • Traction and railway signalling equipment • Transformers and switchgear • Power and telephone cables • Motors and their control gear • Electronic apparatus and radar equipment • Particle accelerators, electron microscopes and mass spectrometers • Industrial controls, instruments and meters • Semiconductor devices and power rectifiers • Private and public telephone exchanges and other telecommunication equipment • Lamps and lighting fittings • Heating equipment • Electro-medical apparatus • Nuclear power station equipment • Domestic appliances.

AEI

ASSOCIATED ELECTRICAL INDUSTRIES LIMITED Represented in India by ASSOCIATED ELECTRICAL INDUSTRIES (INDIA) PRIVATE LIMITED 13, Rajendra Nath Mukherjee Road, Calcutta 1.

A Matter of "Dum" or "Dee"

THE GENERAL debate on the budget in Rajya Sabha ended on Monday on a noisy note of colour-consciousness. The communists did not relish being described by the Finance Minister as a kind of political chameleon which could be red, pink or pale according to circumstances. Mr. Krishnamachari got dubbed as a black Congressman for his pains. Black, fortunately, is not one of the primary colours, whereas red is, and, therefore, for the Finance Minister there is hope of redemption yet. Red, on the other hand, is a primary colour and however hard the communists might try to camouflage their true colour by painting themselves pink or pale, it is unlikey that they can redeem themselves at all.

Passing on from the politics of colour to the economics of the budget, the discussion in Rajya Sabha has at least established the point that the more one tries to understand the budget, the more perplexing it becomes. To some extent this is because of the odd ambivalence which Mr. Krishnamachari has shown towards the more novel of his predecessor's measures. This ambivalence has not merely been confined to fiscal programmes. For instance, in the case of gold control, it was open to Mr Krishnamachari either to enforce it strictly or withdraw it on the ground that adequate enforcement in the absence of popular sympathy or support, was beyond the reasonable means of a democracy. Either course would have been honest and would have secured the respect of the public. But he chose to do neither. Instead, he modified gold control policy to the extent of allowing the conversion of old ornaments of more than 14 ct. purity into new ornaments of equal purity. This change, in truth, was not a concession but a virtual abrogation of gold control. Here is an open invitation to the public to violate gold control provided it is not done too openly. The result is that gold control regulations are being circumvented extensively with consequent lowering of public and private morality.

Similarly equivocal have been his attitudes and actions with regard to the compulsory deposit scheme and the super profits tax. It would have saved trouble all round had Mr. Krishnamachari merely modified the residual compulsory deposit scheme (which had earlier been restricted to income-tax assessees) to the further extent that incomes up to Rs. 15,000 per annum were freed from the liability, while incomes of Rs. 15,000 or more continued to be covered. Mr. Krishnamachari, however, has chosen to scrap the scheme altogether and introduce in its place an annuity deposit scheme for incomes of Rs. 15,000 or more. Initially, he was disposed to claim that his formula had reduced the tax burden on incomes below Rs. 15,000. It has since been shown that this is not so and the Finance Minister in his reply to the budget debate in Rajya Sabha virtually conceded that his original reading had not been correct.

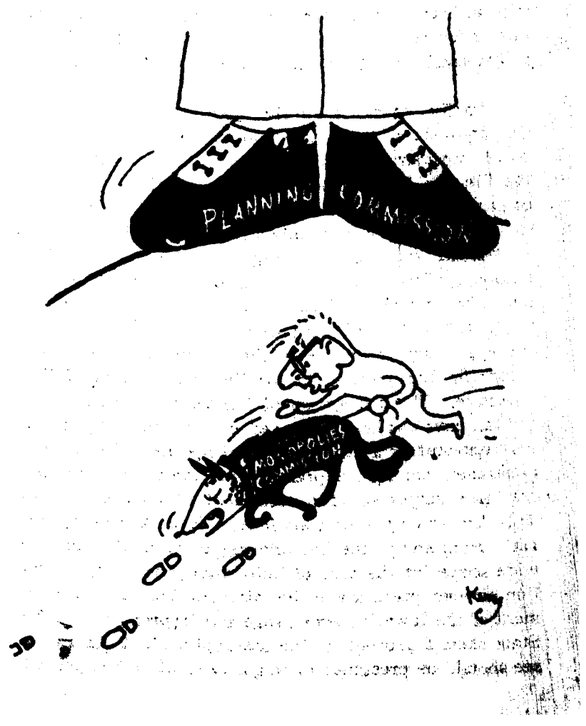
As regards the annuity deposit scheme, Mr Krishnamachari had argued that its purpose was only to curtail, for the time being, the disposable incomes of those affected. But an examination of the various provisions of the scheme is beginning to suggest that the repercussions of the levy may not be as simple or limited as is assumed by the Finance Minister. It is conceivable that, under this scheme, the affected tax-payers may not merely be temporarily deprived of a part of their disposable incomes but may have to undergo a permanent and substantial financial deprivation not contemplated presumably by the Finance Minister. In Lok Sabha, Mr. Krishnamachari, in cruel fun, offered to release people in their seventies from the obligation of the annuity deposit scheme. We hope, however, that this is not his last word on the subject and that he would consider

the possibility of reframing repayment terms as well as the tax liabilities attendant on repayment so that what is virtually a compulsory loan imposed arbitrarily on a small section of the people is rendered much less red in tooth and claw than it is at present. Incidentally, there is surely irony in the fact that while the compulsory deposit scheme was, in fact, not compulsory, the annuity deposit scheme is certainly a compulsory one.

As regards the substitution of the super profits tax with the surtax, here again the less equivocal and ambivalent course would have been to drop the SPT and make up for the loss of revenue by a temporary surcharge on the normal corporate tax. Unfortunately, this simple alternative failed to appeal to the Finance Minister. Instead, he needs must fit out in frills and fancy trimmings, a surtax to take the form of the super profits tax. It is difficult to see that this has any clear advantage. Mr. Krishnamachari is, no doubt, convinced that the surtax, generally speaking, has reduced the aggregate burden of taxation on companies from the SPT level. Now, this claim has several obvious limitations. Firstly, although the aggregate tax burden might have been reduced, the reduction has certainly not been of an order sufficient to put heart into the capital market or vigour into the economy as desired by the Finance Minister. Secondly, Mr. Krishnamachari himself has admitted that companies, in certain circumstances, might even be worse off with the surtax than they were with the SPT. It follows that it cannot be said for the surtax that it is in the nature of a general relief to industry, when the case obviously is that some companies are likely to be more unfavourably dealt with under the new tax than under SPT.

Finally, while it is a sound principle of taxation that new taxes should generally be avoided, especially when the existing taxes could be made to serve the purpose, it is also a prudent feature of good fiscal management that the implications of a new tax proposal should be simple to comprehend and that the proposal should be capable of making promptly a positive impact. The surtax certainly is deficient in these virtues. Whereas the SPT at least had the merit of being recognised promptly as an oppressive tax which was bound to halt industrial expansion, the surtax has reduced the entire nation, including the Finance Ministry, to the comic opera situation of the five blind men of Hindustan gone to find out what an elephant was like. Thanks to a whole host of refinements and rebates, even weeks after the budget, there is still considerable bewilderment over the precise pattern and extent of the impact of the surtax on company finances or industrial expansion.

The Finance Minister's attempted clarification in Lok Sabha in the course of his reply to the budget debate in that House, although intended to be helpful, only succeeded in making confusion worse confounded. He said: "Out of the 31 companies examined, 20 companies were paying super profits tax in the previous year. In the case of all these companies the tax as a percentage of the total income that would be levied according to the budgetary proposals would be less. In the case of some of the companies which were not liable to pay super profits tax, the position will be different. It only reveals that the operation of the super profits tax was somewhat uneven and put an additional burden on many of the companies, while others got away with advantage". The Finance Minister in this passage was certainly putting a far too favourable construction on the consequences of the surtax. It would have been more convincing had Mr. Krishnamachari indicated, at least broadly, the extent of the relief in the case of the 20 companies, and secondly, explained more fully what were the circumstances of the 11 companies which attracted to them a penalty despite the generally more liberal provisions of the surtax as compared with the super profits tax.



The Finance Minister's observations in this context, in fact, had the effect of turning a puzzle into a mystery. On the face of it, the surtax has a moderate rate structure; in the case of the SPT, the rate of tax of 50 per cent applies on residual profits between six and 10 per cent of the capital base and the rate of 60 per cent on residual profits in excess of 10 per cent of the capital base, but the surtax does not apply until the residue of profits — after deducting 10 per cent of the capital base, or Rs. 2 lakhs (whichever is higher) — has reached 10 per cent of the capital base; and even then the surtax rate would be only 40 per cent of such residual profits. This apart, the capital base as defined in the Surtax Bill has been considerably widened from the definition in the Super Profits Tax Act by the inclusion of long-term borrowed capital. The additions made are in regard to debentures, monies borrowed from the Industrial Finance Corporation of India or the Industrial Credit and Investment Corporation of India or any other financial institution which the Government may notify in this respect in the official gazette or any monies borrowed by it from any banking institution under an agreement providing for the repayment of such monies during a period of not less than 10 years or any monies borrowed from any person in the country outside India for the creation of any capital asset in India.

If, nevertheless, the surtax has not given substantial relief to some companies, while it has actually made the conditions of others worse in comparison with the situation under SPT, it must surely be because there must be commissions and omissions in the surtax scheme which tend to defeat the Finance Minister's own objective of giving substantial positive relief to the industry reeling under the impact of SPT. It follows that it is desirable and necessary for the Finance Minister to re-examine the Surtax Bill from this angle so that the new tax may be made to conform to the intentions of the economic and fiscal policies which the Government wants to pursue. Here attention may be drawn to some of the specific features in the surtax scheme which might detract from its acceptability as a superior alternative to the SPT. While borrowed capital has been included in the capital base for the surtax, interest paid on the capital has been included in chargeable profits. This has been done on the ground that there would otherwise be an element of double-counting in calculating the relief. We concede the truth of this retention but would also point out that since the cost of borrowed capital ranges from 7½ per cent to 9 per cent, the bulk of the advantage accruing from the widening of the capital base is lost, since the net effective benefit to residual profits will not be more than from 2½ per cent to one per cent of the borrowed capital. Granted that the purpose of admitting loan capital into the capital base is to mitigate the arbitrariness and unevenness of the super profits tax, especially in respect of its incidence on new companies, it would surely be more in conformity with the intentions of the Finance Minister if a larger net benefit could be secured to borrowed capital. We suggest that this may be done by providing that so far as the loan capital base is concerned, the exemption limit should be somewhat higher than 10 per cent, say, 12 per cent.

We have noted that the surtax has tried to be kinder than the SPT to companies which lean heavily on borrowed capital, but should this kindness be extended at the expense of those companies which have built up substantial reserves and through prudent management or high productivity have reached relatively high rates of profits? Whereas under the SPT, deduction from chargeable profits is available to the extent of 10 per cent of the total income before payment of any tax, no such concession is provided in respect of surtax. It may be recalled that the 10 per cent deduction from pre-tax profits was introduced into the Super Profits Tax Act in order to provide for repayment of debts, creation of additional fixed assets, payment of preference dividends in excess of six per cent or appropriations to a reserve which could be used for specified purposes within a period of five years. It is surely worth considering whether the principle of this deduction is not also relevant to the surtax.

The absence of a provision for relief by way of carryforward has been widely noted as a feature of the surtax which makes it compare unfavourably with the super profits tax. The Finance Minister has argued that the comparatively light incidence of the surtax makes it unnecessary to provide for this relief. We confess that we are unable to follow this extremely sophisticated argument, especially as there is a clear difference of opinion on how "light" is the incidence of the surtax in comparison with the incidence of the SPT. We do hope that, following the precedent of the SPT in regard to which the deficiency, or any part thereof, could be carried forward for three assessment years, the Finance Minister would still allow himself to be persuaded to provide for similar relief in the case of surtax.

In the course of his reply to the general debate in Rajya Sabha, Mr. Krishnamachari said that nothing more might be expected than a few refinements or minor adjustments. We do hope that some at least of the suggestions we had made in the earlier paragraphs would qualify for consideration even within the bounds of this strictly qualified generosity. We may indeed confess that, in the light of the Finance Minister's declaration, it may not be of practical significance to press for more substantial changes in his budget proposals. Nevertheless, it is certainly desirable to record once again our basic objections to some of the new fiscal proposals. We are convinced that Mr. Krishnamachari has made out no case at all for the imposition of an outright levy on all dividend distribution. Even assuming that it is necessary or desirable to discourage increased dividend distribution, the Finance Minister ought to have been content with levying an excess dividend tax and not a flat tax on all dividends. Unearned income has already been discriminated against in many ways and additional penalties on investment in equities are certainly not calculated to spread out the ownership of shares in the community which the Finance Minister himself has described as a healthy and agreeable development. In the United States, the number of shareholders in companies has increased from seven

million to 17 million within 10 years. In Japan, in recent times, the concept and the institution of a shareholding democracy has been spreading no less spectacularly and it is surely strange that it should have fallen to the lot of a noisily socialist India to curb and curtail the ability and willingness of small savers in the community to invest in and own shares. Not less illogical or less injurious to the strength and stability of the capital market is the extension of the capital gains tax to bonus shares. One effect of this tax would be to compel disinvestment in shares by affected assessees having to meet the tax obligations. In the case of other forms of capital gains, the tax liability arises only at the point of the sale proceeds of the asset being received in the hands of the assessee. The assessee is, therefore, in a position to meet his tax liability out of a part of his realizations. By extending the capital gains tax to bonus shares, the Finance Minister may be compelling the sale of assets mainly for the purpose of finding money for the payment of the tax. Surely, this is not going to help strengthen investors' interest in equities.

The Finance Minister's proposals relating to the estate duty and the gift tax have been justly criticized as arbitrary excesses. Whether these criticisms have made any real impact on him we confess we do not know at this stage. But Mr Krishnamachari did say in Lok Sabha that he was prepared to examine suggestions that the incidence of the increased duties might be expropriatory. We do hope that the arguments urged in favour of more moderate progression will at least qualify for the Finance Minister's attention in terms of his undertaking in Rajya Sabha that he might consider refinements and minor adjustments.

Finally, there is surely genuine concern in the country—not all of which motivated by narrow personal considerations—over some of the provisions of the Finance Bill relating to concealment of income or evasion of tax. Every citizen of this country, and more so every taxpayer, certainly has a personal as well as a national interest in seeing that the tax laws are enforced effectively and assessees are made to render unto Caesar what is Caesar's. Nevertheless a large and important section of the public is justifiably unable to see eye to eye with him in the matter of some of the means he has resorted to for the achievement of that objective. The abrogation of the secrecy provisions of the tax laws has been criticized in Parliament by speakers representing a cross-section of opinion. Even more uneasiness has been expressed over the attempt to hold assessees suspected of concealment of income responsible for proving their bona fides. Given the extraordinary complexity, the bewildering technicality and the wide scope for the play of individual judgment, discretion or even prejudice in the interpretation and enforcement of the laws, it seems dangerous to propose that the State should proceed on the assumption that the assessee should be presumed to be guilty until he has proved his innocence. It has been pointed out that the provision that the assessee is to be called upon to prove his bona fides only where concealment is suspected to have been in excess of 10 per cent of the assessed income is not a sufficient safeguard against abuse of authority or vindictiveness on the part of taxing authority, since a difference in interpretation, for instance, of what may constitute chargeable income in the form of perquisites, could well break through the protective limit of 10 per cent.

Mr. Krishnamachari had shown in the past that even when he is anxious to arm the executive with special powers, he was also keen on associating the exercise of those powers with judicial institutions or attitudes. That being so, we do hope that, on second thoughts, he would not insist on countenancing the infringment of the Rule of Law as is now contemplated in some of the provisions of the Finance Bill. It is true that he has repeatedly declared his intention to pursue and penalize "unaccounted" money. It may even be argued that, considering the extreme means he might possibly have been tempted to adopt for the purpose, what he has now sought to do in terms of tightening the tax laws could be regarded and accepted as a moderate re-

Eastern Economist 20 Years Ago

MARCH 17, 1944

AT THE press conference which took place in New Delhi last week and at other meetings the distinguished authors of the non-official plan were asked: What is the guarantee that over a period of fifteen years during which the plan is to be put through, the Government will not change and that successive governments will continue to execute the plan? If no such assurance can be given, will not planning result not merely in waste of time but in needless dislocation and disorganization of the economic life of the people of the country? Is success possible except under conditions of dictatorship or totalitarian economy? These questions were answered variously, and, in our opinion, satisfactorily. Speaking at the annual meeting of the Federation of Indian Chambers of Commerce and Industry, Mr. G. D. Birla said: "The success of the plan, first of all depends on a national government that can inspire confidence not only of the majority of the people but of almost all the important sections of the country. Then, such a government should be a stable government with a continuity of policy. The planning authority should be above party politics so as to be in a position to get the fullest co-operation of the people." Similarly views were also expressed by other signatories of the plan who pointed out that once the basic structure of the plan was accepted by the country differences would only be in the order of smalls and that its main feature would not be tossed about by the changing fortunes of the parties in elections. Sir Purshotamdas summed up the position by saying that the planners believed in the commonsense of the people who would ensure that the integrity of the plan was not allowed to be sabotaged by any party government.

action. That, however, could hardly be a reasonable justification for legal proposals which *per se* are neither fair nor even just. The power to tax, as we have said on a previous occasion, is an awesome power in the hands of the Government and it is, therefore, an obligation on the part of law-makers in a civilized community to exercise that power with dignity and restraint. No nation has ever been bullied or black-mailed into virtue. There is therefore no point or prudence in making the attempt.

Taxing Growth and the Common Man

THE ONLY industry in India which has been in existence for less than 15 years but has already attracted an increase in excise duty for the seventh time since 1956 (when the duty was first enforced) is the rayon industry. It is not surprising, therefore, that the industry has been obliged to complain to the Union Finance Minister that the latest instalment of additional tax is well-nigh the last straw on the camel's back. In a well-documented representation, the Association of Man-made Fibre Industry (AOMFI) has advised the Finance Minister that the imposition of the excise duty on the industry as per the 1964-65 budget "is out of the ordinary, burdensome and out of proportion to the capacity of the industry to bear" and has urged its withdrawal. The latest budget, it may be noted here, imposes an additional excise of 50 per cent in respect of filament yarn of cellulosic origin and of 100 per cent in respect of non-cellulose fibre. A comparison of the prevailing rates of excise duty with the proposed rate shows that, including the special excise, the cumulative burden on the industry has risen appreciably. Thus, the excise duty forms, in relation to the basic ex-factory selling price, some 50 to 72 per cent in respect of different deniers of yarn. In other words, whereas there have been so many increases in the rates of excise duty since 1956, the basic selling prices have, thanks to controls, almost remained constant.

A statement prepared by the AOMFI indicates that the incidence of the increase in excise duty since 1956 to-date works out to between 627 and 640 per cent on different deniers. Surely, on any reckoning, this is unconscionable. Compared with the excise duty imposed on traditional fibres like cotton, wool and silk, the excise duty on man-made fibres, notwithstanding the tender age of the latter vis-a-vis the other industries, is disproportionately high. Indeed, it is so high that a stage has been reached when the authorities cannot afford to cajole or brow-beat the industry to accept any further increase. The anomalous position in which the industry finds itself today will be evident from the following points made out by the AOMFI.

In the first place, the Indian consumer pays a much higher price for his yarn, compared to his confrere in most advanced countries where a similar yarn is consumed. At Rs. 11.46 per kg. for 150 denier, Rs. 12.43 per kg. for 120 denier, and Rs. 15.50 per kg. for 100 denier, the selling price (inclusive of excise duty) in India is higher in each case. The actual difference between selling prices in India and Japan for example, is as much as 173.85 per cent in respect of the price of 100 denier yarn. The disparity becomes all the more glaring when we compare the respective purchasing power of the Indian consumer with that of consumers in other countries. Secondly, the yield from the excise duty on the industry to the Exchequer continues to be under-estimated by the Finance Ministry, as actual figures of yield from time to time have clearly shown. In the present instance, the revenue from the latest increase has been estimated at only Rs. 396 lakhs from the 50 per cent increase in basic duty and Rs. 74 lakhs from the special duty. As against these estimates, the AOMFI estimates the yield to work out to Rs. 597 lakhs and Rs. 199 lakhs, respectively, or Rs. 326 lakhs higher in all. It is really a sporting offer on the part of the industry to suggest to the authorities that, if the exigencies of the circumstance demand that the industry should again be subjected to a further levy of Rs. 470 lakhs, they should fix the enhanced rates of duty at just those levels that would yield Rs. 470 lakhs and no more. Thirdly, it is common knowledge that, apart from every conceivable control that has been clamped on the industry, selling prices of viscose and filament yarn have been allowed to remain pegged at the 1957 level in spite of repeated representations and even a reference to the Tariff Commission (which is believed to have found from its preliminary investigations that there exists a good case for an increase in these prices). Again, pressure or persuasion has been employed, time and again, to make the industry absorb the greater part of the increase in the excise duty or to sell yarn at concession rates in the name of export promotion. Coming on the top of it all, what has been proposed in the 1964-65 budget is the unkindest cut of all.

In the context of this seemingly studied singling out of the rayon industry for repeated victimisation, it is necessary to ask the authorities whether they feel that the rayon industry is not making any contribution at all to the country's economic progress. Considering the important and the useful part that the industry has played all these years and is likely to play in the years to come as well, it seems that the development of this industry is not only essential but also such as to warrant priority consideration. If for nothing else, there must be unqualified praise to the industry at least for the rapid progress made by it since its inception in 1950. Within the course of a decade or a little more

the industry has been able to conserve for the country nearly Rs. 55 crores of foreign exchange by reducing the import bill to that extent. This is, of course, besides the contribution that the industry has made to the provision of employment and development of ancillary and allied industries, not to speak of its potentialities to a country that is about to develop the petro-chemical industry in a big way.

There is possibly a lurking doubt in the minds of some people that rayon is a luxury item confined only to the well-to-do. Such doubt should be dissipated by the findings of a recent expert survey which has established that rayon fabrics have become "a middle class urban necessity." Anyway, the conclusion is certainly not warranted that man-made fibres are a luxury in the same sense as, say, a motor car or a radiogram. Moreover, the use of rayon in India today, even as it is in a number of other countries which are faced with a shortage of cotton is a necessity. In fact, the growth of the rayon industry in different parts of the world is primarily due to the need for bridging the ever-widening gulf between the internal demand and the supply of cotton. It is needless to labour the point that cotton production in India has been lagging behind plan targets, which means that the country has no alternative but to tap other natural cellulose resources like rayon.

There is another important consideration why the country cannot afford to be indifferent to the needs of the industry. In a developing economy with a sharp increase in national outlay from year to year there is bound to be a steady increase in purchasing power which will exert pressure on prices. This pressure can only be neutralised by an adequate supply of essential goods and services like food, clothing, education, etc., and, in the field of clothing, the part that the rayon industry has to play is by no means inconsequential. In fine, there is need not only to keep the rayon industry going, but also to see it expand to meet the growing demand for clothing. If this is conceded it follows that there must be enough incentives provided to the industry to attract risk capital and managerial and technical talent. It is only when the tax structure is such as to allow sufficient reserves to be built up not only to maintain current position but also to implement expansion programmes and pay a reasonable return to shareholders that an adequate incentive may be said to exist for an industry. The latest Reserve Bank's survey of 1001 leading companies shows the average of profits as percentage of net worth to be 10.8 per cent. As against this, the average of profits of the rayon industry works to only 9 per cent which gives the direct lie to the belief, in certain circles, that the man-made fibre industry has been making fantastic profits. If, over and above all these, one also bears in mind certain basic and precise features of this industry, such as use of highly corrosive chemicals, round-the-clock operations, rapid obsolescence, uninterrupted research and, above all, keen competition and the consequent need for constant and promotional campaigns, one will be able to place in proper perspective the plea of the industry for relief from such excessive excise duties as the powers-that-be have chosen to impose.

EASTERN ECONOMIST BUDGET NUMBER

March 6, 1964

THE BUDGET NUMBERS of "Eastern Economist" are a popular and valued annual feature of the Journal. This year's Number should be of special interest and importance in view of the complexity as well as ingenuity of the economic and fiscal policies presented through the Central Budget.

An attempt has been made in the Budget Number to analyse the various aspects of the Budget proposals and study the Budget documents with a view to bringing out the larger and deeper implications of Government policies for the future course of the national economy. The result is an objective and critical evaluation of the economic situation and outlook at a significant turn in the course of national development.

The Budget Number is illustrated with graphs and diagrams and it features a special section in which important budget documents have been reproduced for record and reference. Priced at Rs. 5 per copy, the Budget Number is available to subscribers without extra charge – a facility which new subscribers may also avail themselves of by entering, before April 10, an annual subscription for "Eastern Economist" at the usual rate of Rs. 65.

Highlights of the Week

WHAT PRICE CEASE-FIRE?

IF PAKISTAN persists in seeking trouble along the cease-fire line in Kashmir, India will see to it that she finds it. This is the import of the Prime Minister's forthright declaration in Lok Sabha on Wednesday that Indian troops would cross the cease-fire line "if it becomes necessary to defend our territory. . . ." While shouts of approbation greeted the statement, it was also clear that the national mood was inclined to be rather more bellicose than Mr Nehru would presently wish it to be. Mr Hem Barua (P.S.P.) would have our troops occupy "Azad Kashmir" should Pakistan continue to carry out raids into Indian territory. Although Mr. Nehru rightly discountenanced such mock heroics, there is little doubt that the Indian people are fast becoming impatient with the hit-and-run tactics, in the military as well as in the diplomatic fields, of the Ayub regime.

Indeed, the national under-current of resentment has become so difficult to ignore that the correspondent of the London "Times" has found it necessary to inform its readers that "the demand and campaign for the possession of Kashmir, which ever since partition have poisoned relations on the sub-continent, have now reached a dangerous and irresponsible climax." The "Times" correspondent has told the Western countries bluntly that by tacitly encouraging Pakistan in its aggressive attitudes, they have placed themselves in a position where they must share the responsibility "for all the harm and suffering for the minorities in both countries that is likely to be the only result." This admonition, of course, is cruelly topical. On March 17, about 100 Muslim workers going to report for the night shift in a cotton mill in the Calcutta area were attacked and as a result 21 were killed and a few others injured. It may be recalled that this grim and ghastly episode was strikingly imitative of a similar orgy of communal violence in East Pakistan earlier this year, when the victims happened to be Hindus.

And Still They Come

Outbreaks such as these are the flash points of the basic state of tension, thanks to which a steady stream of refugees from East Pakistan has been crossing into Assam and West Bengal. Mr. Mehr Chand Khanna, Minister for Works, Housing and Rehabilitation, has said in the course of a statement that up to March 9, 58,000 refugees had reached West Bengal while about 75,000 had been received into Assam. Among those who had sought asylum in Assam were Christians numbering more than 37,000. Apart from the problem of relief and rehabilitation of bona fide refugees, the Assam Government has also had to deal with infiltration by Pakistani nationals. A delegation of the Assam Pradesh Congress Committee, which met the Home Minister, Mr. G. L. Nanda, has suggested that this infiltration should be stopped by establishing checkposts and organizing a "cordon sanitaire" along the border.

In the circumstances, the proceedings over Kashmir in the Security Council, where familiar complaints have currently been met with counter-complaints no less familiar, have become more unrealistic than ever, with a grand debate waging over the life-and-death question whether the debate should be continued now or adjourned to a future date. At the time of writing, India has asked for an adjournment and Pakistan has stoutly opposed this request which means that the collective wisdom of the world is being called upon to pronounce its views on a time-table.

WHEN BANKS BORROW

ON WEDNESDAY, March 11, the Reserve Bank gave a full turn to the monetary screw by tightening bank credit. The measures took the form of reducing the quota for borrowings by scheduled banks from the Reserve Bank from 150 per cent of the statutory reserves to 100 per cent and by introducing a penal rate of interest of 6.5 per cent per annum for special accommodation at the third tier. These decisions reverse the relatively liberal credit policy initiated about 4½ months earlier, on October 30, 1963 at the beginning of the busy season. Until the present changes were made, while the withdrawals within the permissible overall quota could be made at the bank rate of 4.5 per cent, withdrawals beyond that limit were charged 6 per cent. Now the Reserve Bank's system of quotas and lending rates for both bills and Government securities are to be as follows: First slab, 4.5 per cent per annum—quota for borrowing 50 per cent of the statutory reserves; and second slab, 6 per cent per annum — quota for borrowing another 50 per cent of the statutory reserves. Any borrowing beyond this limit will be in the nature of special accommodation calling for a careful assessment of a bank's overall position and will bear interest at a rate of 6.5 per cent per annum.

Official and semi-official expositions of this revised monetary policy have claimed that the purpose is only to curb the use of bank credit for speculative transactions, particularly in agricultural commodities. Consistent with this objective the Reserve Bank has also raised the margin on advances by scheduled banks against the security of groundnuts from 45 per cent to 50 per cent and has also re-imposed the ceiling on such advances. Scheduled banks have been asked, moreover, to reduce clean advances to those other than industrial borrowers.

Dear, Dearer....

It has been claimed for this policy that neither in its intentions nor in its consequences is it likely to hamper bank accommodation for genuine productive purposes, especially for augmenting the output of goods for defence or exports. The Reserve Bank has simultaneously advised the banking system to intensify its efforts to mobilise deposits by all possible measures, including a re-examination of the rates of interest offered by them on deposits. This piece of advice, coupled with the introduction of the three-tier system for Central Bank accommodation, has prompted reports that the Government may be poised for another and even more fundamental change in monetary policy, namely, a straight increase in the Bank rate. While there are undoubtedly enthusiasts for such an increase, both in official and non-official circles, more than one opinion have certainly been expressed on the wisdom of such action. Given the assumption that the latest credit measures are mainly intended to deal with currently rising prices in agricultural commodities, it may not be necessary to think in terms of an increase in the Bank rate in such a transient context. Secondly, even now there is extensive scepticism with regard to the Government's assurance that credit would continue to be freely available for all productive purposes. Industrial and business borrowers know from bitter experience that this is not and cannot actually be the case. They apprehend that an increase in the Bank rate might well formalize and lend a certain rigidity to a passing stringency. Thirdly, the banking industry as a whole is far from hopeful that an increase in deposit rates is either desirable in terms of the finances of the industry or for the particular purpose of attracting more deposits. The argument is that, in the matter of attracting deposits, there may perhaps be more to be gained by a vigorous pursuit of branch banking to attract new accounts than through paying more for deposits in an effort to enthuse those who have already developed the banking habit. Fourthly, financial circles point out that, although the Government's immediate concern may be to deal with the suspected hoarding of agricultural coommodities, the Finance Minister himself has made it clear that the basic problem is

one of stimulating current production as well as investment for future production. In Part "A" of his budget speech, the Finance Minister had dwelt on the fact that controls discouraged production and investment and this criticism of controls, it is pointed out in business circles, might apply to monetary and credit controls as much as to price or distribution controls. Meanwhile, with the superimposition of dear money measures on an already stringent monetary situation, the stock markets have found further reason to be depressed—a mood which has not been improved by talk of the Bank rate being raised.

COMMITTEE ON CUSTOMS TARIFF

THE PRESENT structure of the Indian Customs Tariff follows, in its broad aspects, the League of Nations Draft Customs Nomenclature prepared by the Sub-Committee of Experts of the Economic Committee of the League of Nations set up in 1927. In the post-war period, new classification and nomenclature of products have been evolved to suit the changed pattern of international trade. One of them is the "Brussels Tariff Nomenclature" prepared by the European Customs Union Study Group, 1955, which claims to have taken into account the common features of the tariff nomenclature of the 17 European countries which constituted the Group and also the latest technological and commercial developments. Another is the "Standard International Trade Classification" prepared by the UNO for compilation of national trade statistics on a uniform basis.

With the implementation of the successive five-year Plans, considerable progress has been made in industrial and economic development leading to a substantial change in the composition and pattern of India's external trade. Both the Government of India and the business community have, therefore, felt the need for a detailed study of the present tariffs with a view to revising them on modern lines and in a manner which, having regard to the pattern and composition of India's external trade, will be more appropriate. The need for a complete reform of the Indian Customs Tariff had also been stressed in the reports submitted by the various committees and commissions set up by the Government of India from time to time, the most important among them being the Ramaswami Mudaliar Committee. In view of all this, the Government of India has now appointed a Committee to conduct a comprehensive enquiry into the Indian customs tariff structure and to recommend the lines on which it may be revised and improved. The Committee will examine the present structure of the Indian Customs Tariff (Import and Export) Schedule with reference to the composition of products and pattern of India's import and export trade. In the light of the examination thus made and having regard to the international developments and changed pattern of trade, the Committee will recommend whether the Import Tariff Schedule should be based on the Brussels Tariff Nomenclature or other international nomenclatures or whether India may continue to have its separate import tariff schedule after necessary improvements. The Committee will also advise the Government regarding the revision of customs tariff schedule, with particular reference to the need for (a) the creation of additional tariff items for articles of recent development and of commercial importance; (b) revision of classification of machinery, iron and steel and textile industries in the context of the changed pattern of trade, and (c) provision for assessment of parts of articles. Suitable amendments to the classification and nomenclature of the export tariff schedule will also be considered by the Committee. Substantive provisions of the Indian Tariff Act, 1934, Tariff (Amendment) Act, 1949 and other relevant legislations will also be reviewed. The Committee, however, is not required to go into the question of rates of duty applicable to individual products or different classes of products, and it will not be concerned with the level of duty applicable under the customs tariff.

The Joint Secretary of the Ministry of International Trade will head the Committee. The members will consist of one officer each to be nominated by the Ministry of Finance (Department of Revenue), Ministry of Industry, Ministry of Petroleum and Chemicals, Department of Technical Development, Department of Iron and Steel, Department of Mines and Metals, the Chief Controller of Imports and Exports and the Export Promotion Directorate, and a representative each of the Tariff Commission, the Federation of the Indian Chambers of Commerce and Industry, the All-India Manufacturers' Organisation, the All-India Importers' Association, and the All-India Exporters' Chamber. A senior officer of the Ministry of Finance (Department of Revenue) will act as Member-Secretary. The Committee will co-opt members as may be necessary from time to time.

U.S. WHEAT FOR RAJASTHAN

FOLLOWING famine conditions in Rajasthan, the U.S. Government has come forward to provide relief for the people in distress. Ambassador Chester Bowles, in a simple ceremony at Jodhpur recently, presented a bag of wheat to a representative of the Rajasthan Government which symbolised a U.S. Government gift of 20,000 tons of wheat for this relief programme. The Government of India, in consultation with the Government of Rajasthan, has decided to distribute wheat in part payment to 100,000 workers engaged in building roads and water supply projects in the districts of Jodhpur, Bikaner, Barmer, and Jaiselmer. The U.S. wheat gift is sufficient to cover distribution at this rate for 20 weeks for a population of 500,000. Wheat valued at approximately Rs. 1.5 crores is a donation under Title II of U.S. P.L. 480 which provides for gifts for relief to people affected by natural calamities. It may be added that the United States had donated, under this Title, food worth more than Rs. 4 crores for the people affected by floods in Orissa and other parts of India.

STATE BANK OF TRAVANCORE

(Subsidiary of the State Bank of India)

Head Office: Trivandrum

OFFERS ATTRACTIVE INTEREST RATES ON DEPOSITS.

As a Subsidiary of the State Bank of India we have agency and drawing arrangements with all branches of State Bank of India and their Subsidiaries and can handle banking business of every description

Full particulars can be obtained from Head Office or the nearest branch.

T. R. Krishnaswami,
General Manager.

TTK Yields Little Ground

By Our Parliamentary Correspondent

NEW DELHI:

DEFENDING HIS budget proposals in the Rajya Sabha this week, Mr T. T. Krishnamachari asserted that there was very little room for manoeuvre in them. The Government had tried to put before the country a tax structure, both for the corporate sector and individuals, which might need "some chisling and refinement" but not any radical alteration. He, thus, ruled out any major modification in the taxation measures proposed for the next financial year.

The Finance Minister's reply to the budget debate in the Upper House, however, contained the welcome announcement that the family pension scheme, recently introduced for Central Government employees, will be extended to all other subscribers to the provident fund as a measure of social security. He proposed to make the scheme applicable to about 25 million contributors to the provident fund during the fourth Plan period, thus benefiting nearly 125 million persons dependent on them.

The Finance Minister reiterated that the only answer to high prices was some measure of effective control at strategic points; it might be in the form of State trading, control through co-operative societies, licensed dealers or operators. He refuted the charge that his budget proposals were capitalistic in character and emphasised that the proposals he had made in regard to property were very severe—more severe than in any other country in the world. He as well asserted that the concessions he had proposed for foreign investments did not in any way bypass the Industrial Policy Resolution of 1956. He wanted the public sector undertakings to make adequate profits and become model industrial enterprises.

Mixed Reception

Earlier, the House accorded a mixed reception to the budget proposals. The general refrain of speeches was not much different from that of those made in the Lok Sabha. Concern was expressed over the rising prices, States' finances and lack of relief for the poorer sections. The passage of time appeared to have chastened the critics with the result that the philosophy behind the budget came to be slightly better appreciated. Mr K. K. Shah and Mr A. D. Mani, of course, well brought out the dampening effect that the capital gains tax on bonus issues, the dividend tax and the steep upward revision in the estate duty and gift tax rates would have on investment in industry. Mr K. Santhanam pleaded for the setting up of a national valuation commission, with branches in every State, to evaluate taxable incomes and property. This, he argued, was necessary for checking large-scale tax evasion. Mr R. P. Sinha urged fostering of consumer industries for holding the price-line. Mr. Sitaram Jaipuria wanted that the list of industries entitled for rebate in surtax be extended to include consumer goods like sugar.

The Lok Sabha started consideration of demands for grants Ministry-wise and voted the demands for the Ministries of Education and Cultural Affairs and Petroleum and Chemicals. The Education Minister, Mr M. C. Chagla, announced the Government decision to set up a commission of experts to review and survey all the aspects of education. The discussion on the Ministry's affairs, however, lacked lustre. The various ills of the education system, such as the falling educational standards, lack of discipline among students and piracy in text-books, of course, were highlighted.

Mr Chagla reaffirmed the Government's faith in Hindi as the link language for India, but pointed out that Bengal and South had also to be persuaded to take to it. He pleaded tolerance towards non-Hindi speaking people and suggested that Hindi would succeed only by persuasion and not by compulsion. He agreed that the medium of University education should be the regional language or Hindi, but cautioned that, until they can replace English, especially in science and technical subjects, the standards of education would fall. With a view to reducing pressure on universities, Mr. Chagla proposed correspondence courses, evening colleges for working people and alternative vocational courses at the secondary stage. He also announced a crash programme for training of teachers and conversion of the Social Welfare Board into an autonomous body, subject to the scrutiny by Parliament.

The discussion on the demands for grants for the Ministry of Petroleum and Chemicals mostly followed the beaten track. The reply of Mr. Humayun Kabir, however, was refreshingly forward-looking. He disclosed that the Government had now decided to keep the supply of petroleum products ahead of demand and for this purpose, the oil refining capacity target would be pitched at a level 10 to 15 per cent in excess of requirements. This marks a great improvement in official thinking over what it used to be in the days of Mr. K. D. Malaviya.

Foreign Collaboration

The Minister for Petroleum and Chemicals also revealed that the nine proposals received by the Government for foreign collaboration in the proposed Madras Refinery were so attractive that they had led his Ministry to think in terms of not only going in for (along with the Madras Refinery) the Haldia Refinery but also another one. Offers for the Madras refinery, Mr. Kabir said, had been received from parties in Europe, the United States, Japan and Kuwait. Another important announcement made by Mr Kabir envisaged appointment of a committee to consider the question of prices of petroleum products afresh after the next financial year when the Damle Committee prices would no longer be in force.

Mr. Kabir indicated that the three private sector oil companies operating in India at present were willing to replace their refinery agreement by ordinary industrial licences. He, however, made no direct reference to the plea of these companies for expanding their refining capacities further. The Minister chartered a course of rapid expansion for the State-owned Indian Oil Company and announced that it had been decided to merge it with the Indian Refineries Limited.

Mr. Kabir expected significant developments in the activities of the Oil and Natural Gas Commission next year. Apart from intensifying its efforts at oil exploration within the country, this State agency, he envisaged, might participate in oil prospecting abroad as well. Discussions in this respect, the Minister stated, had taken place recently between the ONGC and the authorities in Kuwait and Iraq. About petrochemicals, Mr. Kabir announced the Government decision to build these complexes around every refinery in India.

In regard to fertilisers, Mr. Kabir indicated that the third Plan target would be achieved 12 to 18 months after the end of the Plan. The Planning Commission and the Union Finance Ministry, he said, had agreed to give high priority to fertiliser manufacture in the coming years and a crash programme to boost production was being drawn up. The Minister also indicated that it was proposed to sanction an additional capacity of 50,000 tonnes for synthetic rubber production

and that molasses and alcohol exports might be included in the restricted list.

Earlier, the Minister of State in the Ministry of Petroleum and Chemicals, Mr. O. V. Alagesan, expressed dissatisfaction at the slow development of the petro-chemical and fertiliser industries. He underlined the need for foreign collaboration in the petro-chemical industry and gave the encouraging news that the contract for setting up a benzene extraction unit at Koyali would be finalised within this month. He assured the House that foreign participation in petro-chemicals would not be allowed to shackle the Government's freedom of action.

Question Hour

Merger of Goa: Replying to a question in the Lok Sabha on March 16, the Prime Minister firmly ruled out, for the present, merger of Goa with any other State of the Indian Union. Some time, he said, was needed for the feelings raised during the liberation movement to quieten down. There was a strong party representing nearly half the population of Goa which was opposed to merger, he added.

Asked what duration of time would have to elapse before the question of this merger could be taken up again, the Prime Minister said that possibly five to ten years would have to go by.

L.I.C. Premium Rates: The Minister of State for Finance, Mr. B. R. Bhagat, told the Rajya Sabha on March 11 that there was no proposal at present to reduce the rates of premium of life insurance. The question would, however, be examined again, if necessary, when the results of the investigation of the mortality of assured lives during the years 1961 to 1964 were available. The Union Minister, Mr. T. T. Krishnamachari, added that mortality rates alone did not cover the case of insurers. There were other factors also which had to be taken into consideration. The increased cost of living, he said, had naturally affected insurance because the cost of procuring insurance was going up.

Indian Insurers in Ceylon: The Deputy Minister for External Affairs, Mr. Dinesh Singh, disclosed in the Rajya Sabha on March 10, that eight Indian insurance companies had been affected by the recent order of the Government of Ceylon nationalising insurance business in that country. No compensation had been paid to these concerns. Their assets and liabilities, however, were still vested in them. Six officers of these companies were in Ceylon at present winding up their business. All the other Indian nationals employed in these firms had returned to their parent organisations in India. The six officers still in Ceylon would return to their parent companies after winding up business in Ceylon.

Pakistan-Nepal Trade: The Union Minister without Portfolio, Mr. Lal Bahadur Shastri, told the Lok Sabha on March 16 that India had argreed to the request of the Nepalese Government to provide transit facilities for Nepalese trade with Pakistan. There was no question of exercising any control over this trade across India's frontiers. He allayed the fears that expansion of trade between Pakistan and Nepal would be at the cost of India.

Steel Policy: The Union Minister for Steel, Mines and Heavy Engineering, Mr. C. Subramaniam, told the Lok Sabha on March 13 that the Government was not contemplating any shift in policy in order to facilitate participation of foreign private capital in the Indian steel industry. He added that machinery for the Bokaro Plant had to be acquired from outside and the United States was one of the countries from where private concerns had shown interest. Referring to the fourth Plan steel target, Mr. Subramaniam said that the Steering Group on Steel had recommended a target of 13 million tonnes of rolled and mild steel and 17.25 million tonnes of steel ingots. Steps were being considered to ensure the raw materials needed for such a programme. The final target of steel production in the fourth Plan would be determined by the Government after taking into account all the relevant factors.

Alloy Steel: Mr. Subramaniam told the Rajya Sabha on March 12 that the Special Tool and Alloy Steel Project at Bhadrawati, designed to produce 77,000 tonnes of finished steel per annum, was expected to go into production this year, The Mysore Iron and Steel Works had concluded a technical collaboration agreement with Bohlens of Austria for this purpose.

Phyto-Chemical Plant: The Minister of State in the Ministry of Petroleum and Chemicals, Mr. O. V. Alagesan, revealed in the Lok Sabha on March 11 that the Union Government was having second thoughts on the proposed establishment of the phyto-chemical Plant in Kerala. The initial cost of the project, which was intended to be implemented with Soviet assistance, had gone up. This had put the economics of the entire proposal out of gear. The whole matter was being re-examined by the Indian Drugs and Pharmaceuticals Ltd.

Penicillin Prices: Mr. Alagesan told the Rajya Sabha on March 12 that the question of reduction in the sale prices of penicillin and penicillin products would be examined after the existing manufacturers had completed their expansion programmes which were currently under implementation.

Radar Manufacture: The Union Minister for Irrigation and Power, Dr. K. L. Rao, told the Rajya Sabha on March 11 that a proposal for the manufacture of radars indigenously for use in flood-forecasting was under the consideration of the Government. It was very likely that these radars would be manufactured by Bharat Electronics, Bangalore.

Road Board: The Minister for Transport, Mr. Raj Bahadur, stated in the Lok Sabha on March 10 that the State Governments generally did not seem to be favourably inclined to the proposal for setting up a Road Board. The matter, however, was still under the consideration of the Union Government. In order to facilitate the examination of the proposal, information in regard to Road Boards or any other similar bodies which might have been set up in some of the foreign countries was being collected.

Review of Projects: The Minister for Planning, Mr. B. R. Bhagat, told the Rajya Sabha on March 12 that the Planning Commission had carried out a detailed review of the programmes and projects for the iron and steel, non-ferrous metals, heavy engineering, fertilisers and cement industries in consultation with the Ministries concerned with the view to speeding up the rate of growth of these key industries. The following steps had been proposed: (1) Pig Iron—establishment of one blast furnace each at Bhilai and Durgapur in advance of the fourth Plan expansion programmes of these projects; (2) Non-ferrous Metals — expediting of the implementation of the aluminium projects in Mysore, Maharashtra and Madhya Pradesh; (3) Heavy Engineering — setting up of a second foundry/forge plant, a new heavy electrical equipment manufacturing unit, a roll foundry, a fabrication shop for fertilisers and chemical equipment and a structural plant; (4) Fertilisers — increasing of the supply of gas to the Rourkela Fertiliser Factory; and 5) Cement — setting up of additional capacity on an emergency basis for the production of slag cement.

WINDOW ON THE WORLD

Tactical Retreat

ASHOK V. DESAI

OXFORD:

GIVEN THE present political climate, Sir Alec Douglas-Home's decision against a March election was a relatively simple one to take; the opinion polls, reports from constituencies and the Party morale give the Conservatives little chance of immediate success. The decision on a June election is likely to be a little more difficult. The major event between now and June is the Budget on 14th April, and the indications are that it will be anything but an election Budget. The worsening of the balance of trade dictates a deflationary budget, and Government expenditure will rise at least six per cent over the last year. This leaves no alternative to a rise in taxes. Hence a decent interval will be necessary between the Budget and the election. Once the Budget is behind them, the Conservatives can expect to benefit from the growing prosperity over the summer. My guess, therefore, is that there will be an autumn election.

Assuming that the election is six months away, what can be said about the electoral prospects? At present the Labour Party has a lead of 5½ per cent according to the Gallup poll, and polls in the few months before elections have correctly predicted the winning party in the last three general elections. On the other hand, swings to the Government are not uncommon in the months before the election; discontented Government supporters, who often refrain from answering polls, go back to the Party fold when the election draws near. Besides, Labour needs to get two per cent more votes than the Conservatives to get the same number of seats since a larger proportion of its supporters is in safe constituencies. Hence it is unlikely that Labour will do as well in a general election as in polls. On the other hand, the odds against Conservatives are heavy; they would have to gain much ground before they can hope to win.

Labour Handicap

The Labour Party has suffered from some basic electoral disabilities in the last twelve years. It is worth giving them a look, since its chances of a win depend closely on how far it has left them behind for ever.

The first adverse factor has been structural changes in Britain's population. As in all Western countries, Britain's white collar population has grown much faster than the number of manual workers. With the post-war increase in earnings, middle-class standards of living have come within the reach of an increasing number of workers as well. With middle-class living come middle-class aspirations — aspirations to a house, car, television, holidays abroad and on the seaside; and the Conservatives with their tendencies towards lower taxes and laissez faire have catered to these aspirations better than Labour which inclines towards more puritan views.

Second, the Labour Party has been unable to put across its leanings towards nationalisation to the electorate. It has been unclear about the reasons itself. Nationalisation might be advocated as a means of redistributing income between wages and profits, between the rich and the poor. But the nationalisations of the late forties were designed to do just the opposite. The nationalised industries were told not to make profits in the long run; they were thus supposed to provide cheap goods to other privately owned industries. Just before the 1959 election, Mr Gaitskell proposed a state organisation to buy shares in private firms, thus bringing a share of profits and capital gains to the State. This would have been an effective way of redistributing incomes between the private and public sectors; but it never caught on, and in fact the Conservatives made much political capital by calling it "back-door nationalisation." As regards the argument that the Government must control the basic industries in the national interest, it has been difficult to interpret it as an argument for the transfer of ownership, as distinct from control. An argument could also be built up that nationalisation was necessary to reduce the political power of private enterprise, and in support the Labour Party might point to the contributions of industrialists to the Conservative Party funds, or to the extremely effective anti-nationalisation campaigns of the Institute of Directors, the Iron and Steel Federation and other industrialists' organisations in 1957-59. But it would be difficult to show that nationalisation was the only remedy here. Whichever the case for nationalisation might have been, the Labour Party has failed to convince the majority of it.

Third, the last two general elections were held—in fact, timed so that they were held—in times of relative prosperity, and the Conservatives could take credit for it. Labour had to make the much more difficult case that everything was not as well as it could be; it had to propose changes, whose appeal was marred by the prosperity. The appeal evidently failed; the electorate did not want experiments.

Fourth, the Conservatives have hitherto managed to show themselves as the more nationalistic party. This impression is not entirely fair; after all, the Labour Government dealt as roughly with Mr Moussadeq over Abadan as any Conservative Government might have done; and Britain's nuclear armoury is a heritage of the Labour era. But the Conservatives scored by taking a more nationalistic line on Suez, on immigration from the West Indies, India and Pakistan and on defence.

Finally, the view has dominated British public affairs that the payments difficulties which are the chief obstacle to growth in Britain have been due to price inflation, and that price rises are due to wage increases. Hence trade unions, their wage demands and strikes have acquired much stigma which has harmed the Labour Party as well.

The Climate Changes

These adversities beset the Labour Party less today than ever before. The new middle classes were against Labour because of its puritanism, because it seemed to believe that incomes and consumption had to be taxed to make room for more investment, and because of its inclination towards the socialization of housing. In these respects, it has acquired much electoral wisdom. Ironically enough, it is the Conservatives who are promising increased taxes this year. The needs of public investment —in roads, universities, arms and so on—are going to be so heavy that the days of bonanza budgets are over for a long time to come, and Sir Alec has discounted all hopes of a reduction in the general tax burden. In the meanwhile, the attractions of a free property market and free rents have declined. Houses are not being built fast enough; and towns, especially in the South-East, are getting congested. The consequence is exorbitant rents, rising property values, fortunes made out of speculation, and homeless families taking refuge in municipal poor houses. It is noteworthy that about the only trace the Profumo affair has left on British public life consists of the word it has contributed to the vocabulary—Rachmanism. Housing is a political issue of greater significance than the sex life of politicians, and Labour can take credit for some constructive thinking on it, while the Convervatives have the invidious task of defending the status quo. As a result, the middle class has much less reason to feel committed now.

The nationalistic image of the Conservatives was tarnished by their attempt to take Britain into the EEC. The belated decision to negotiate was a defeat for Conservative nationalism. But it could be and was based on an appeal to West European nationalism: Mr Macmillan did take up and use Professor Hallstein's argument that the future was going to be dominated by continental powers like the U.S.A., Russia, China etc., and Western Europe needed to unite to retain political weight. Now, it is an open question whether Western Europe is going to become a united power bloc with supra-national authority, and if it does not, it will be a sorry affair, divided against itself and ungenerous towards others. But the vision of a West European nation is an attractive one and could certainly be used as a political carrot. Anyway, the Conservatives did not take it up wholeheartedly, and allowed Labour to adopt the stance of nationalists and protectors of the Commonwealth. The traditional images of the two parties crumbled, and the loss of image is the gravest handicap of the Conservative Party today.

Common Market Affair

In my view, the decline of the Conservatives began with the Common Market affair, and this for two reasons. First, the decision to start the negotiations was taken by the Government, voluntarily but under strong pressure from the Americans. This was not in itself an error, for the Conservative rank and file are not used to initiating policies, and would normally regard opposition to the leadership as a sacrilege. But they do require time to become enthusiastic advocates of a new idea. And they had no time over the Common Market; it caught them confused and cacophonous like an unpractised choir that couldn't read a score. And it left them feeling out of touch with the leadership. Events since have accentuated this feeling—Mr Macmillan's drastic reshuffle of his cabinet in July 1961, the Profumo affair, and the choice of a dark horse as Prime Minister. The utterances of leaders do not find an echo in the rank and file; the boisterous willingness to be led, so essential to an electoral victory, is lacking.

Second, the Common Market discussion brought into the open the fact of Britain's slow growth in the 1950's. The economic success of the Common Market countries was advertised as one of its attractions, and it was argued that Britain needed the competition in the EEC as a bracer. While Britain's performance could be blamed on wage inflation, it was no good advertisement for the Conservatives. And the loss of economic and political status could not be forgotten with the failure of the negotiations, it is a fact which has to be lived with. It is reflected in event after event—the abandonment of the Blue Streak missile, the strains imposed by small military operations in East Africa and Cyprus, the inability to confront Sukarno, the neglect of public investment, overcrowding of schools, and more recently, the migration of scientists to America for lack of finances and facilities for research. The improvement of the British terms of trade in the early fifties brought the Conservatives enough freedom of manoeuvre to see them through two elections. Now, however, the economy is embattled, and so are the Conservatives.

The economic failure is reflected in the opinion polls: will it also decide the general election? Probably not. For where parties are so well balanced as Labour and the Conservatives abstentions from voting are the most important factor influencing the outcome of elections, and the people who refuse to answer opinion polls may be quite different in composition to those who fail to vote. The success of the Conservatives will depend greatly on how far they can induce their supporters to turn up at the polling booths, and keep away Labour supporters.

This consideration will evidently affect the timing: there cannot be an election in summer since relatively more Conservative supporters go away on holiday. Cold, wet evenings are good for the Conservatives since more of their supporters vote by day, while more Labour voters go in the evening after working hours; this favours autumn with its bad weather. Contentment and lack of excitement also keep away more Labour supporters, but the Conservatives cannot rely on keeping things cool this time.

Their political tactics must also be designed to get a high Conservative turn-out. This can be done by scaring supporters with the prospect of a Labour Government or by convincing them that urgent tasks remained for Conservatives and for them alone to do.

Scare campaigns have been an important and highly successful part of election strategy. The Zinoviev letter might be mentioned as the most daring example, although it has not been proved to be part of a scare campaign. In 1924 the Labour Government charged the editor of the Communist Workers' Weekly with sedition and then withdrew the charge. This led to an enquiry on whose report the Government was defeated in Parliament. It was heavily criticised for dropping the charge as well as for a proposed loan to Russia. In the middle of the ensuing election campaign, the Daily Mail published a letter purported to have been written by the Comintern to the British Communist Party, encouraging it to incite revolt and sedition. The original letter has not been found to this day; but it seriously embarrassed the Labour Party, and it lost the election. In the 1945 and 1950 campaigns, the Labour Party took special pains to inoculate the electorate against last-minute scares by making them expect one, and tried to portray the Conservatives as the party which would bring unemployment and scrap social services. Nevertheless, the Conservatives made some adroit use of scares in 1959. When Labour promised a 10 per cent rise in old-age pensions, building of hospitals, aid for depressed areas etc. in their election manifesto, the Conservatives began giving warnings that the resulting increase in public expenditure would lead to both higher taxes and inflation. Mr Gaitskell responded by promising that Labour would not increase the income tax. This was immediately advertised by the Conservatives as an attempt to bribe the electorate, and finally turned the tide against Labour.

Value of Scare

Scares will play their part in the next election as well; their value is well realised. Mr Wilson warns that the Conservatives will take Britain into the Common Market if elected; Sir Alec Home fears that Mr Wilson will bury the hydrogen bomb and leave Britain defenceless. Labour can profitably build on the fears that Conservatives will go on with their stop-go policies—deflating whenever a boom got going. These are all predictable election gambits. But to be really effective, a scare has to be fresh and sizzling, and no one can tell whether a good bombshell will burst just at the time of the election. It is, however, probably fair to say that considering Mr Wilson's political judgment, the Conservatives will find scares much more difficult to come by.

Barring scares, the outcome of the election would seem to depend on whether the Conservatives could demonstrate the need for the further continuance of their rule. They suffer from the fact that the future calls for different priorities in policy-making: growth will have to have a higher priority than the curbing of inflation to which they have paid so much attention since 1955. The Labour Party has a flying start on this issue: it has come out with proposals which would make profits taxation discriminate more heavily in favour of investment and which would accelerate research and improve its co-ordination. Mr Wilson's entire approach is oriented towards more rapid technical progress and use of ideas—this led to his being called "that slick salesman of synthetic science," it is alleged, by Sir Alec's ghost-writer.

I do not think this dig was supposed to do more than show the excellence of Sir Alec's enunciation, for he is equally sold

on synthetic science—he prefers to call it modernisation. Perhaps he does not rate it highly as a vote-catcher, perhaps he is not even very fond of it. But whether by conviction or by force of circumstances, he and the party he leads have begun to favour higher investment and more education. It does not help to look shame-faced about this: it will have to be incorporated into the image of the party.

If then, the Conservatives are to be fit for the election, they will have to show off their investment programmes — integrate them, wrap them up together, make them presentable. And more important, they will have to *convince* their supporters that the programmes are worthwhile, that they are worth fighting for. And this must be done in the short space of six months. Recently, Sir Alec declared himself against one-party rule, but asked the country for another ten years of *Conservative* government. It might well be thought that he was dragging his feet.

The Six Before Geneva

From our Special Correspondent

BRUSSELS:

THE COMMON Market Six will approach each of the coming Geneva conferences on international trade in radically different ways. At the first, the United Nations conference, they will appear as six individual nations because they have been unable to define a common attitude on the crucial issue of aid to developing countries. At the second, the GATT negotiations that are still called the Kennedy Round, they will, in contrast, speak with one voice because they are determined to defend the joint case on tariff reductions worked out by their Commission. This is anomalous because the Common Market as such is the chief accused in both these proceedings, both of which are liable to degenerate into a "settling of scores", with no ultimate benefit for world trade. Why should the Six be in agreement on how to defend their union against the Americans but unable to find a joint retort to the criticisms of that union by developing nations?

Not that they are totally disunited in this latter case. When the UN conference opens this month, the Common Market will be present in the person of its Commission (in addition to the six national delegations), which will have the rank of observer with a voice but no vote. Moreover, though they have failed to work out a joint stand, they have entrusted their present chairman of the Council to make an inaugural statement on their account. The chairman this quarter happens to be M. Maurice Brasseur, a former Belgian trade minister whose name is associated with a plan to promote the manufactures exports of developing countries. But when he speaks for the Six, M. Brasseur will have to remain fairly neutral on all the important issues, reserving defence of his "Brasseur Plan" for when he speaks on Belgium's behalf. The most the Six can agree on is to defend at the UN conference their common external tariff, their joint agricultural policy and their grant of "associate" status to certain African countries.

Radical Disagreement

The reason for this confusion within what is still the world's tightest-knit economic group is radical disagreement about how far the rich industrialised powers should help the developing countries. At the one end, the French and Belgians espouse the case for "organised markets": a global plan for disposal of Western food surpluses, schemes to support commodity prices, and use of quota system to regulate a planned increase of sales of *manufactures* in the West by developing nations. The main lines of this system of organised markets were set out here last week in an analysis of the French document on world trade prepared for circulation at the Geneva conference.

At the other end, Holland staunchly defends the Anglo-American view that world trade is to be promoted by liberal means exclusively, that is by reduction of tariffs all around and by preservation of "traditional" outlets such as America's food markets in West Europe. In between, West Germany and Italy, though apprehensive about the cost of ambitious Franco-Belgian schemes in favour of developing countries, are unable to accept the dogmatic liberal line and would no doubt have aligned themselves on the French side. Holland's firm refusal, however, is enough to prevent agreement, so the Six will appear this month in Geneva in disorder.

In May, on the other hand, they will present a united front against American demands for a form of tariff disarmament that would in effect leave the Common Market unprotected vis-a-vis high-tariff countries like the USA itself. At least, this unity has just been re-asserted after the visit to Washington of the Common Market's envoys, who sought to get the preliminary negotiations out of deadlock. That Washington voyage produced no more agreement than the earlier talks in Geneva, but the Six have maintained all the propositions the Americans reject. Before going into the details of this debate, one should note a general fact that explains, in large part, the European stand. The ECM Commission has just published figures showing that the total trade deficit of the Six last year doubled, from $1,400 million to $2,800 million, and that most of this huge gap appeared in their trade with the USA (accessorily, with Britain and Latin America).

Unequal Concessions

In other words, the Six are about to enter into negotiations with a country that is scoring an immense surplus in trade with them — and which asks for unequal concessions that would increase that surplus further. This is a matter that concerns them all equally, Holland and West Germany no less than France and Italy. For one needs to note that, although West Germany has a large trade surplus, most of this surplus is earned in commerce with her Common Market partners, whereas with the USA she runs a deficit as notable as any of the others. Her imports from the USA last year were worth 7,941 million DM (up sharply from 7,033 million in 1962), against exports to that country worth only 4,195 million DM (up moderately from 3,853 million the year before). Thus the one nation among the Six that currently has no anxieties about her foreign trade balance in general has as much cause as her partners to resist exaggerated American pretensions.

The debate between the USA and the Six over tariff reduction has made progress in that the Americans now admit the existence of the disparities which, the Six pointed out, make it unequal to reduce duties on both sides by an equal percentage. (Specifically, to halve a duty of 60 per cent in the US Customs schedule might be "equal" to halving a duty of 18 per cent in the ECM's common external tariff, but the proceeding has quite unequal consequences, which are all to the USA's advantage.) The Six claim to find 900 instances of such disparity; actually they started out with thousands, but whittled down the number by agreeing to disregard numerous cases where the commercial consequences would not be significant. For those 900, they have asked that the Americans (and the British too, they also being in the high-tariff clan) should halve their high duty while the Six be let off with a 25 per cent cut in their relatively low duty. The latest state of the discussion, after the Washington talks this month, is that the Americans admit *numerous* disparities where differential treatment will be required, but ask that the list of such exceptions be brought down from 900 to 450. This would be about one-tenth of the 5,000 products covered by the negotiation: the rest would be subject to the simple rule of a 50 per cent reduction on both sides.

This amounts to a convergence between two cases, both of which have much reason in their favour, and so seems to leave room for fruitful negotiation. It is sure that it will be very difficult negotiation, and it will certainly drag on through much of 1965, if not into 1966. Yet the ECM envoys to Washington have returned quite pessimistic. Dr. Mansholt has expressed their scepticism that the Kennedy Round will ever come to anything but a product-by-product bargaining, far removed from the grand design of John Kennedy. The reason for these doubts does not lie in the evolution of discussions about industrial tariffs, which we have just seen leaves room for hope. Rather, it stems from the blank opposition between the Six and the USA over trade in agricultural produce which forms an essential part of the Kennedy Round because so much of US exports to Europe consists of farm produce.

Here we discover once again the clash of doctrines about organised and "liberal" markets that we found at the centre of the United Nations trade conference, with the Americans arguing for reduction of tariffs on farm produce (plus preservation of traditional outlets) while the Six reply that organised markets, world trade pacts and harmonisation of farm-support policies are needful. The contrast of "organisation" and "liberalism" is probably misleading, for what the Americans really want is a carve-up of Western food markets that would perpetuate the present productivity-advantage of their farms over European; whereas the Six are answering that no country's farm policies are "liberal" but depend on subsidies, price supports, export aids and the like, and so it is not enough to fiddle with tariffs and quotas if one does not harmonise these State interventions.

It is idle to hope that, since agreement seems possible in the long run over trade in industrial goods, this question could be separated from trade in farm produce, where agreement is clearly remote. When the Americans suffered some loss of markets for their poultry in the Common Market, they countered by tripling or quadrupling duties on West German trucks and Dutch dextrine. That is, selling food to Europe and importing manufactures, the Americans will retaliate for any disadvantage their farmers suffer by increasing the protection their industrialists enjoy; the two subjects are inseparable. Apparent progress in the dispute about tariffs on manufactures is meaningless as long as positions remain basically contradictory in the field of trade in farm produce.

Indeed, far from there being any prospect of liberalisation of trade in manufactures across the Atlantic, there is ground to fear a repetition on a larger scale of the late "chicken war". For the common agricultural programme of the Six definitely spells a reduction of outlets for US farm produce in West Europe — not out of cussedness, but because that is inevitable as European farms boost their productivity to American levels and as European nations give preference to their neighbour's food, as must be the case inside any economic union. So the outlook for the Kennedy Round is not much better than for the earlier trade talks in Geneva.

Planning: Promise and Performance

From Our Special Correspondent

PARIS:

HOW GOOD are West Europe's economic planners at forecasting the evolution of their national economies? Though a majority of countries in this region now publish some sort of plan or programme, most are newcomers to the art and it is too early to compare promise and performance. Four of them, however, have been at it long enough for us to be able to compare the estimates and the actuals of their most recent plans: namely, France, Holland, Norway and Sweden. The table that follows does this, in the barest statistical fashion; the figures in it are annual percentage rates of growth over the years indicated for each of the global economic quantities such as GNP, industrial production, etc., and for each entry there are two figures, the forecast and the actual result. These figures have been selected from a much more complicated table drawn up by the United Nations Economic Commission for Europe, and it is hardly necessary to emphasise that the whole thing is bristling with statistical pitfalls. Ignoring here all such finer points, we will be entitled only to the most general impressions, as, for example, when forecasts and actuals persistently differ. (Differences of a few decimal points are not significant; the margin of error in this game is wider than that.) As it happens, such persistent, significant discrepancies do emerge, so we can learn something from the comparisons.

First of all, one should recall that this is not the first time that the ECE has tried to check up on the planners in this way. Ten years ago it compared the guesses of planners in several West European countries made just after the war, with the actual results achieved in the period of postwar reconstruction. The comparison was necessarily sketchy, for planning had not got under way at that time. But it appeared then that the planners' forecasts were regularly inferior to actual results, as regards increases in total production. The planners persistently erred on the pessimistic side by under estimating the increase in productivity per worker. This is worth recalling because the present study reveals that the same error was made in 1950's. Productivity grew faster than had been expected, so that industrial production and GNP rose more quickly than foreseen, in turn causing an expansion in foreign trade and consumption that exceeded estimates.

Imports				
Planned	8.6	3.9	3.5	2.3
Actual	11.8	7.3	3.8	7.7

It emerges that the planners in those four countries underestimated the expansion of GNP, except in France in this period where they were about *right*. (But that French plan was a very short, "interim", plan that had to be cast to allow for the economic revolution of the end-1958 monetary reform.) All under-estimated the growth of industrial production, save in Sweden, where agriculture did better than foreseen. This more rapid expansion was achieved with the small increment in the number employed that the planners foresaw more or

less correctly. So the error was due to increase in productivity, for which we find the explanation in the uniformly fast expansion of investments, which the planners nowhere expected. Having made that basic error, the planners all naturally under-estimated the growth in consumption, sometimes grossly so. For related reasons, they were all badly out in their forecasts of foreign trade. Exports generally rose faster than expected, while imports always did, and always very much faster in this case.

This concordance in error is surely no accident. Planners were not taking enough account of the rising efficiency of West European industry, and they thought that capital would be harder to accumulate than it actually was. Moreover, they overlooked the effects of increasing specialisation, or the division of labour, as between nations in West Europe. All the four countries considered belong to one or other of the trade groups (Free Trade Association or Common Market), and were therefore seeing the effects of economic integration in the shape of rapid increase in their foreign trade, both imports and exports, and also in the form of higher productivity in the lines in which they specialised. Investments and foreign trade having been under-estimated, the growth of national product (and of its main constituent, private consumption) necessarily was so too.

The French case, it has been noted, is not strictly comparable with the others because it was an emergency plan made necessary by the stabilisation operation. It has been cited here because it is the latest for which actuals are available. But if we take the previous completed French plan, we find the same errors of under-estimation. In 1954-57 the GNP was planned to rise 5% annually but in fact rose 5.4%; industrial production was planned to increase 5.2% annually but actually rose by 8.6%; investments were put down for a 5.8% yearly increment but really scored a 10% gain annually. On the contrary, employment had been expected to rise 0.4% each year, but in the event rose only 0.2%. Of course, the increase in imports and in consumption also far exceeded expectations, whence the necessity of the 1958 devalution of the French franc. In other words, there was the same story as emerges from the table, with the difference that the Common Market had not then got going, so French exports did not benefit from the specialisation of tasks that is visible in the later period.

Bad Guesses

From this series of bad guesses, the planners could have drawn either of two conclusions. Firstly, that the 1950's were an unusual period of economic progress, and so there is no reason to revise moderate expectations for the following decade. Secondly, they could have concluded that they have been persistently minimising the effects of rising productivity and economic integration, and so it is time to raise the sights for succeeding plans. I have nowhere seen it openly said, but a glance at the forecasts incorporated into current economic plans suggests that the planners have come to the second conclusion. For the period 1960-1970, the plans of the industrialised nations of northern Europe almost all bank on an annual increase of 4 to 5 points in GNP, or more than was attained in the 1950's, and of course much more than was forecast in most cases for the last decade.

The planners seem to have learned the lessons of earlier plans, because they base these more optimistic expectations on the very factors that falsified their previous forecasts. That is, they now expect persistent rises in productivity, rapidly increasing investments and a more profitable use of resources, thanks to division of labour within economic groupings. That would explain too why their various national forecasts are nowadays much closer together than they were a decade ago. Not only in the four countries cited, but among the newcomers to national planning, the estimates of probable increases in GNP, investment and the other global quantities are more concordant than they were.

Yet there is another reason for the less pessimistic forecasts being written into current national plans. It is that the view has gained ground that excessively cautious estimates by the planning authorities work to depress economic agents and thus limit progress to less than could have been achieved in a more optimistic climate. On the contrary, more sanguine expectations in a national plan stimulate efforts and thus have every chance of being realised. Or it may be that politicians in office feared that electoral opponents could exploit against them failure to attain glowing targets, but now that this has nowhere happened (but, on the contrary, actuals have usually exceeded prudent forecasts), they are willing to let their natural optimism have free rein. Either way, this is a reminder that economic planning is governed by intangible political and psychological factors, and is no science to be judged on the concordance of predictions and actual results.

Closer Indo-French Co-operation

By Our Special Correspondent

NEW DELHI:

THE INDO-FRENCH trade and economic relations should get a good fillip as a sequel to the signing of a special protocol between the two countries here this week. The protocol was signed on behalf of the French Government by Mr. Jean Wahl, Leader of the French Economic Mission which arrived in New Delhi last week, and on behalf of the Government of India by Mr. D. S. Joshi, Special Secretary, Ministry of International Trade.

The protocol not only visualises substantial liberalisation of imports from India by France, but also envisages collaboration by the latter in a number of key industries here. It as well proposes exchange of views, documents and experts between the planning authorities in India and France and hints at a decision having been taken by the two countries to achieve a minimum set of objectives at the forthcoming United Nations' Trade Conference in Geneva.

A special significance is attached to this protocol in view of the fact that Mr. Wahl is one of the principal advisers of the French President and his mission to India has resulted from President de Gaulle's decision to strengthen the economic ties between France and the developing countries.

In regard to trade, the protocol reveals that the French Government proposes to remove in the near future quota restrictions on some more items of interest to India. Among these are included woollen carpets, Kashmir rugs, basketware and sports goods. Restrictions on cotton and jute yarns imports were done away with by France last year. In the case of products on which restrictions will still continue, India will be given larger quota allotments. Increased facilities will be afforded in particular for India's jute goods for packing purposes. Simplification of administrative procedures has also been promised.

Industrial Collaboration

In the field of industrial collaboration, the protocol emphasises that the quickest results can be obtained in the petrochemicals, rilsan fibre, salt (mechanisation of salt works), fertilizer, iron and steel and aluminium industries. It has been suggested that specialist missions of French technicians may be sent to India to carry out the necessary studies particularly for French collaboration in these industries during the five years to 1970-71. India has also expressed desire to see established between the French and Indian undertakings agreements on technical co-operation for the production of glass, machine tools, measuring and control apparatus, scientific instruments and tractors.

The protocol takes notice of India's appreciation of the decision taken recently by the European Economic Community in the domain of tariffs and her desire that the EEC should expedite further measures in this direction.

As regards the forthcoming UN Conference on Trade and Development, the protocol says that the two delegations agreed that (1) stabilisation at sufficiently remunerative level of the prices of primary products and raw materials should be brought about; (2) "invisibles" element in the balance of payment of the developing countries should be improved; and (3) steps should be taken to expand the imports into developed countries of manufactured products from the developing countries.

Addressing newsmen on Sunday last, Mr. Wahl indicated that if there was to be greater industrial collaboration between France and India, France would naturally come out with larger economic aid. This could be the case both during the remaining period of the current Plan and the next Plan period.

The French industry, Mr. Wahl pointed out, did not feel any inhibition in extending collaboration to the public sector in any country. If an agreement were concluded between India and France on avoidance of double taxation (negotiations in this regard have been going on for quite some time now), it would help in attracting the French private capital to India, he said. He also hoped that the present administrative controls in India, which were found irksome by the foreign investors, would be simplified soon.

Trade between India and France, Mr. Wahl asserted, could be increased substantially if the Indian exporters established contacts with the French importers. There were tremendous possibilities of India exporting to France iron ore, manganese ore, electric fans, fancy goods, etc. One difficulty in the way of France importing manganese ore from India was that Indian supplies were not considered to be suitable to French specifications. This impression needed to be corrected.

Another delegation of French importers is in India currently to explore the possibilities of expanding trade between the two countries. Consisting of eminent representatives of the different sectors of the French import trade, it is particularly interested in purchasing from India large quantities of cotton and jute goods, manganese ore, vegetable oils, hides and skins, tobacco and tea.

***

India will be providing technical credit to the tune of Rs. 12.5 crores to the East European countries during 1964-65.

COUNTRY-WISE CREDIT LIMITS FOR 1964-65

(Rs. lakhs)

Country	Ceiling Limit for Technical Credit in 1964-65		Additional Amounts sanctioned
	Without interest	With interest	(With interest)
Poland ..	40	260	100 (up to March 31, 1964)
GDR ..	50	100	..
Czechoslovakia	65	135	..
Yugoslavia ..	75	105	120 (up to August 31, 1964)
Rumania ..	35	50	..
Hungary ..	50	150	25 (up to December 31, 1964)
Bulgaria ..	10	40	..
USSR ..	100	Unlimited	..

with a view to ensuring that their purchasing programmes are not affected for want of funds.

The necessity for providing these credits arises because payments for imports by India from these countries, which should balance her exports to them, are sometimes delayed on account of the deferred payment arrangements concluded with them or delayed deliveries.

According to the trade agreements concluded last year with the East European countries, India's total trade with them during 1964 is proposed to be increased to Rs. 335 crores, —Rs. 167.5 crores exports and Rs. 167.5 crores imports. The technical credits to be provided take note of this.

A technical credit to the extent of Rs. 3.5 crores is also proposed to be made available to the United Arab Republic for enabling her to make adequate purchases from this country during the next financial year. The total trade between India and the UAR, both ways, is approximately Rs. 23.5 crores.

**

According to an assessment made by the Union industrial licensing authorities recently, the indigenous production of power transformers, electric motors up to 500 HP and cables and wires is likely to fall short of the country's requirements in 1965-66. Currently, there is available 4 million KVA capacity for the manufacture of power transformers. The demand for them in 1965-66 is estimated around 7 million KVA. The current capacity and the 1965-66 demand estimates for the other two products are: electric motors up to 500 HP — 2.56 KW, 3.4 KW; cables and wires — 9835 KM, 10400 KM.

The Union Government is anxious that new proposals for the manufacture of these items should be sponsored not only for meeting the 1965-66 requirements but also those of the fourth Plan. On the basis of an average annual increase of power generation to the tune of 2.3 million KVA during the fourth Plan, the demand for power transformers is expected to go up to 13.15 KVA by 1970-71. Including the six million KVA capacity that might be available at the Heavy Electricals, Bhopal, there will be a gap of about 5.5 million KVA to be filled in this line of manufacture.

Scope for Further Licensing

The demand for electric motors up to 500 HP is expected to increase to about 9 million KW by the end of the fourth Plan period. There will be a gap of nearly 6.5 million KW in the capacity for producing these motors. The requirements of cables and wires in 1970-71 are expected to be of the order of 20,000 KM. There is, thus, a scope for further licensing of capacity for their manufacture to the tune of slightly over 10,000 KM.

Another line of manufacture where there is a large scope for establishment of capacity is power rectifiers. The requirements of these at present are being met through imports. The demand for power rectifiers is expected to increase substantially with the proposed establishment of capacity for the manufacture of aluminium, steel, caustic soda and various other chemicals.

**

The indications available here reveal that the developing nations will press forth at the UN Conference on Trade and Development, starting in Geneva next week, a plea for price support for primary commodities in the world markets. Consensus of opinion is said to be growing among the developing nations that unless some sort of parity is established between the prices of primary goods exported by them and those of capital goods exported by the developing nations, the development plans of the poorer nations have little chance of being pushed through.

India is likely to put forth a proposal that the World Trade Conference should agree to an upward revision of prices of primary products in a phased manner over a period of ten years. Three or four commodities may be given price support every year. To begin with, a programme of ensuring reasonable prices for such commodities as cotton, rice, wheat, copra, tobacco, tea, rubber and mineral oils may be undertaken.

A scheme of price stabilisation for these products, it is to be emphasised, should contain an escalation clause, providing for 5 per cent annual increase in prices so that the developing countries can look forward to an increasing volume of trade at remunerative prices in these commodities.

For making the price stabilisation schemes a success, it is felt that buffer stocks of these commodities should be built up and an International Monetary Compensating Fund constituted. Both the developed and the under-developed countries should contribute to the resources of this Fund, which may further be strengthened by additions of profits from sale of buffer stock at times when prices tend to spurt.

India is also likely to impress upon the World Trade Conference the need to remove both tariff and non-tariff barriers to the entry of manufactured goods from developing countries into the developed ones.

**

The Union Ministry for Petroleum and Chemicals is understood to have solicited help from the Italian Oil Combine ENI for setting up petro-chemical complexes in India. Exploratory talks in this connection are said to have been held with the ENI Chief, Prof. Baldrini, who is currently here. Assistance from ENI is also being sought for oil exploration, particularly in the Gulf of Cambay. The Italian combine is already engaged in oil prospecting in Uttar Pradesh as contractor to the Oil and Natural Gas Commission.

An approach is also likely to be made to ENI for securing facilities from it for training Indian technicians in various activities connected with oil. With the rapid growth proposed for the public sector in oil industry in this country, the shortage of trained personnel in this field is expected to grow more acute.

Three agreements have been signed here this week between the Governments of India and Britain, providing for the utilisation of the £12.5 million (Rs. 16.7 crores) balance credit committed by the latter for India's economic development at the Aid-India Consortium meeting held in July last. The first agreement is for a loan of £5 million. It will cover purchases of capital goods and components from Britain for projects and industries selected by the Union Government from an agreed list. The list includes: (i) components for British-oriented industries (up to a ceiling of £750,000 — Rs. 1 crore); (ii) capital goods for private sector industries (up to a ceiling of £1 million — Rs. 1.33 crores); (iii) a coastal ship; (iv) a bucket dredger and two hoppers, (v) equipment for the Nahorkatiya fertiliser plant; (vi) equipment for Singareni Collieries; (vii) equipment for the Hoshangabad paper mill; (viii) heat treatment furnace for the alloy steel plant at

GREATER SUPPLIES OF
Mobil LUBRICANTS

Durgapur; (ix) requirements of the Indian Copper Corporation's expansion programme and (x) equipment for Oil-India Ltd.

The second loan, also of £5 million, has been provided for general purposes, to be used to pay for current British exports to India.

The third agreement covers a sum of Rs. 2.5 million which is earmarked for puchase of capital equipment and components for the Bhopal Heavy Electricals project.

With these three loans, the total financial assistance provided by Britain during the third Plan so far amounts to £125 million — Rs. 16 crores.

Demand for Engineers

From Our Correspondent

BOMBAY :

IN THE Plan period of over a decade and more, the paucity of trained technical personnel for manning the industrial projects that have been set up, has been prominently highlighted by official spokesmen from time to time. While inaugurating, at the Indian Institute of Technology, Powai, a six-day Seminar on collaboration between industries and institutions in the field of technical education, sponsored by the Institute of Applied Manpower Research, New Delhi, Mr. C. Subramaniam, Union Minister for Steel, Mines and Heavy Engineering, observed that the demand for engineers was a function of the pattern of production and investment in the country. The existing universities and educational systems established to suit the requirements of a pre-eminently agrarian economy were not quite adequate to meet the demand of the scientific and industrial revolution that is overtaking the country at present. He said that with the production pattern as envisaged and the heavy investments, the demand would still further grow and we cannot, and should not, make any rough predictions based on current or past experience.

Planning in Russia

In this connection, the Minister said that he was impressed with man-power planning in Russia. The industrial units in that country took over some institutions under their patronage and linked their man-power planning with them. The flow of information and personnel between the educational institutions and industrial units was also assured. Similarly, free exchange of persons and information characterised the educational development in the USA and the UK. He said about 19 per cent of students in the UK universities took to technology in 1962-63, and this ratio would be raised to 28 per cent in 1980-81. In India, the comparative position is that only 5 per cent took to engineering and technology at present. Thus, there was an imperative need to step up the ratio of students who are diverted to technological courses and for this purpose our colleges, designed to turn out clerks, lawyers and civil servants, found it difficult to change over to production of scientists, technicians and industrial managers. Therefore, the essential condition of creating an educational base which provided a continuous stream of technical personnel to industries should be satisfied first; and in this process, as industry was the main customer of education, particularly technical education, there should be closer co-operation and freer exchange of information and personnel between industry and education.

In order to meet this objective, Mr. Subramaniam further emphasised that research sponsored by industry had to be increasingly undertaken not only by research institutes but also by educational institutions. In the advanced countries of the West, the universities were the pioneers in the modern scientific revolution, and many problems of applied sciences and technology were sponsored by industry for research in technical institutions. In India also such an attitude will have to be developed. The contact between the teaching institutions and the industry was most vital, as the students could not learn the spirit of innovation and research if they lost touch with the industrial units. Thus, linking of the teaching institutions with the nearby industrial units for assisting them in solving the problems will contribute to the desired end of mutual exploration of the possibilities in improving the efficiency of industry. Mr. Subramaniam particularly stressed that the qualitative shift from civil to mechanical, electrical, chemical or industrial engineering should be carefully examined.

In the light of the observations of Mr Subramaniam for a more effective co-ordination between education and industry, it would be useful to have a comprehensive examination of the problems which have emerged in building up an educational base which would not only be balanced but would be more purposive in achieving the objectives under industrial planning. In fact, the problem of re-organization of technical education is a part of the basic change in the scheme of general education and from this point of view, the discussions of the Seminar should provide adequate material for further thinking on this most vital subject.

★★

The salt industry has had always a development potential in the State of Maharashtra, though in the last two decades there had been practically no projection of the possibilities of further expansion in this sphere, compared to the rapid strides made in the States of Gujarat and Madras. The inauguration on March 14, of the Gogte Salt and Chemicals at Nalla Sopara, 30 miles north of Bombay, marks the first step in the Plan period for the development of salt industry in the State. Mr. S. G. Barve, the State Industries Minister, who inaugurated the factory, hailed the project as a fore-runner to industrialisation in Thana District which is a part of the under-developed area of Konkan. He welcomed this project since salt production in the State was lagging behind in the past and required to be boosted. This would also contribute towards the success of the scheme of diversification of industries.

Earning Foreign Exchange

Mr B. M. Gogte, who gave an account of the industrial project, said that the salt works would have an initial capacity of 50,000 tons per year, and in a period of 5 years it would have risen to 100,000 tons. The factory would not only meet the requirements of many local industries but would also contribute to the earning of foreign exchange after a period. The foreign exchange component of the plant was Rs. 6 lakhs and the whole cost would be Rs. 25 lakhs for a production capacity of 50,000 tons. In the background of the present production of salt in India at 3.6 million tons (which, it is expected, will increase by 6 million tons within the next 3 years) the present project would significantly help the Maharashtra State to earn for itself an important place on the salt map of India. Besides, as already indicated, the new licences issued for production of salt in the State were for the development of only 540 acres, while Gujarat and Madras have planned for development of 30,000 acres each. The demand for salt is also growing in the State. In and around Bombay, there are several caustic soda plants which require regular supplies of high grade salt for use in electrolytic process. The demand for quality salt for

these plants alone was about 80,000 tons a year and was expected to go up to 1.5 lakh tons in the next three years. It is a matter for disappointment that little has so far been done in India for the commercial manufacture of several grades of salt and there is great scope for development of this industry in Maharashtra. The bitterns which are left after the extraction of common salt in the solar salt works in India are not being utilised though they contain valuable chemicals like potassium chloride, magnesium chloride and bromine. It is possible to process these bitterns for the manufacture of magnesium carbonate, sodium sulphate and other compounds. There are other possibilities in the use of salt; before crystallisation of salt it is possible to separate calcium sulphate as gypsum and this can be converted into plaster of paris and used as surgical plaster, building boards, plaster for bone-setting and for other uses. Thus, there are many industrial and commercial uses of salt and the factory that is opened should give an opportunity for exploring every means of utilising salt and its by-products to the maximum for industrial and other uses.

Mr. S. K. Wankhade, the State Finance Minister, who presided over the inaugural function, took the opportunity to plead for a change in the outlook of banks in making available finance for starting industries in the small-scale sector. Though some progress had been noticed in the banks providing fund for small-scale industries, there was still a tendency to extend credit only to big business and, he pointed out that if banks had offered assistance to the small-scale sector, there would have been no talk of nationalisation of banks. The diversification of industries would naturally require a greater flow of financial assistance and it is quite appropriate that the Finance Minister should have referred to the role of the banking system in increasing the flow of funds to small-scale industries.

**

The Government of Gujarat has been planning for a more balanced distribution of industries from the point of view of a higher rate of development in the State. As an experiment in this direction, it is decided to arrange for a planned establishment of new industries in a specified area near Ahmedabad, in consultation with the City Co-ordination Council and the Gujarat Industrial Development Corporation. An area of 12,000 acres has been set apart in the east of Ahmedabad as an industrial area. This augurs well for a more studied location of industries in areas which could form the epicentre for further spread.

The Proper Pricing of Power

From Our Correspondent

CALCUTTA :

STILL FAR from satisfying the demands of her industrial and urban consumers in full, West Bengal, however, has an ambitious plans to electrify her villages. There is an integrated Rs. 100-crore scheme for complete rural electrification of the State by 1976, but to begin with, the West Bengal Government wishes to implement a Rs. 35 crore plan which would take electricity to at least 3,000 of the State's 38,500 villages by 1966. The scheme has already been forwarded to the Centre for approval; meanwhile, it will be discussed with Mr. Asoka Mehta, Deputy Chairman of the Planning Commission, when he comes here in the third week of the month. The Government maintains if New Delhi gives its sanction to West Bengal's thermal power projects, there should be no shortage of generating capacity to meet the requirements of the scheme. But the question is not as simple as that. The Centre's approval of power schemes of the States has the obvious financial implication for the former; in other words, the Centre will have to bear a substantial part of the cost itself. West Bengal feels aggrieved that not only has the Centre been sitting too long over the power projects which have been submitted for the latter's approval, but it is not willing to grant interest-free loans for power and irrigation schemes as Mr. G. L. Nanda is said to have once promised. At the discussions with the Planning Commission's Deputy Chairman next week, this question is likely to be taken up again.

Meanwhile, the State's Electricity Board, which will have to be entrusted with the rural electrification work if and when it is implemented, has been severely criticised by the Estimates Committee of the State Legislature as failing in its duties. In the first place, the SEB has been accused of making wrong local load surveys, with the result that the requirements of village industries have been consistently under-estimated. For instance, West Bengal's silk industry, which occupies an important place among the State's traditional small-scale industries, is now withering because of competition, and it is unable to strengthen its economic base without an adequate supply of power. The deep tubewell irrigation projects are not making any headway in the districts because of dearth of power. The Committee gives some more grounds for its criticism, but these two are the main ones. Finally, it recommends a reorganisation of the Board and a suitable reorientation of its policy.

These could help to some extent, but would they be enough when the basic commodity of power is itself in short supply? The Board has to borrow funds to finance its schemes and it is already so heavily indebted to the Government that it will have to pay above Rs. 2 crores in interest and towards principal by the end of the third Plan. Its working so far has ended in big deficits — that during 1963-64 at Rs. 24.23 lakhs was the heaviest so far. Consequently, the Board has been trying to achieve a better balance between its revenue and expenditure, and the Budget estimates for 1964-65 have been so framed that the anticipated deficit comes down to only Rs. 1.55 lakhs. These financial data explain why the Board is inclined to distribute power in areas where it would get the maximum revenue, and why it is unable to do much to help the State's projected rural electrification schemes. However, the question of making the Board's operations financially more profitable would depend upon the larger question of revising power tariffs, which has to be decided at a level higher than the Board itself. Meanwhile, the Board proposes to raise a market loan of Rs. 2 crores during the next financial year, which will bring the total of open market loans to Rs. 5.61 crores, against the target of Rs. 10 crores set under the third Plan. The revised estimate of the cost of all the schemes which the Board will undertake during the third Plan period has been now raised to around Rs. 57 crores, against the original Rs. 44.8 crores. Although it is trying its best to step up its revenue — in 1964-65 an increase of 87 per cent is expected in the revenue from Rs. 4.72 crores to Rs. 8.4 crores — the Board will not be able to contribute anything to the development schemes out of its own resources.

**

Assam's power projects are making good progress — this has been testified by the State Government as well as the Central Minister for Power, Dr. K. L. Rao. At present, it is producing 33 MW of electricity, but the Central Government has already given its approval for augmenting this capacity by 79 MW during 1964. When the additional power capacity is commissioned, the State, it is stated, will be self-sufficient as far as the present requirements are concerned. Among the new unit being installed, there is one of 30 MW capacity at Gauhati; two gas turbine sets of 12.5 MW capacity each are being installed in the same place. These units will help in the installation of the petrochemical complex the Oil and Natural Gas Commission is reported to be considering for this State.

**

A dispute concerning prices had threatened to stop rice supply from Orissa to West Bengal, but this was resolved last week by the Chief Minister of West Bengal, Mr. P. C. Sen, himself going to Bhubaneswar personally and settling the matter with the Orissa Government. Before this settlement, the West Bengal Government had fixed a price of Orissa rice which was substantially lower than what was being paid to West Bengal growers for similar grades. Orissa growers took exception to this action of the neighbouring State, feeling that West Bengal was taking undue advantage of the fact that Orissa has been placed in the same food zone as West Bengal. Consequently, an agitation grew to stop sending rice to West Bengal, and the agitation apparently had the sympathy of the local Government. West Bengal has had a bumper harvest this year, even so, her food requirements cannot be met out of local production entirely. A good part of the needs has to be obtained from Orissa which usually produces a surplus of rice in the food zone concerned. But if the prices to be paid to growers in that State are to be fixed on a discriminatory basis, a sharp fall in rice imports is bound to follow. Happily, the matter has been settled through Mr. P. C. Sen's personal intervention, and as a result, Orissa rice will fetch the same price as West Bengal's does. Orissa claims to have already despatched 35,000 tons of rice to West Bengal so far. The volume of despatch is usually higher at this time of the year.

**

The first Budget of Nagaland — that new addition to the family of eastern States — shows a deficit for 1964-65. The gross receipts have been estimated at Rs. 10.56 crores — of this revenue receipts from the State's own resources are only Rs. 25 lakhs. The balance is made up of grants and loans from the Central Government. Of the gross estimated expenditure of Rs. 11.17 crores, non-Plan expenditure amounts to Rs. 9.13 crores, and expenditure on Plan projects is fixed at Rs. 2.04 crores. In other words, the Government of Nagaland is run with the funds of the Centre, and this is going to be the case for as long as one can foresee. The Finance Minister, Mr. Hokishe Sema's Budget speech was less specific than it should have been, on the two important questions: (1) the law and order situation and (ii) the development of the Naga State. Mr. Sema has only hoped that with the co-operation of all, "the menace to peaceful living" could be soon ended, but his Budget mentions no other step except a provision of Rs. 1.5 lakhs which may be spent on giving financial assistance "in deserving cases", and for the rehabilitation of those hostiles who surrender and want to live as law-abiding citizens. As for development schemes, the Finance Minister claimed that "in spite of heavy odds", the progress has not been insignificant, the proof of which is that the expenditure on account of Plan schemes has been mounting. The Planning Commission had originally agreed to give Rs. 7.25 crores, for 1964-65, and schemes costing Rs. 4.04 crores have already been approved by the Commission.

**

Despite some heavy industries and great mineral resources, Bihar is still a predominantly agrarian State; 86 per cent of her population still depends on agriculture for a living. The pressure of population on land is consequently high. The average area of cultivated land per head is less than even 0.61 acres, which was the figure worked out in the 1951 census. Land utilisation in the State is the second highest in India. There is vast scope for setting up small industries, especially as ancillaries to the large industrial complexes such as already exist in Jamshedpur, and such as those which are coming up in places like Ranchi and Barauni. Several committees appointed by the State Government have emphasised this fact, but none has given a satisfactory reason as to why the local people themselves are so little interested in promoting these enterprises. From the records of the National Small Industries Corporation, it is found that applications from Bihar, to the Corporation for assistance so far number only 111, compared with 1,761 from Maharashtra and 1,325 from Madras. As for the firms which have registered themselves with the Corporation for the marketing of their finished goods, the number from Bihar is only 336, compared with 2,000 from West Bengal, 1,626 from Maharashtra and 1,306 from Madras. Orders received from the NSIC by firms in different States are very small in Bihar's case, accounting for goods worth only a few lakhs of rupees, as against Rs. 8 crores for Punjab, Rs. 5 crores for West Bengal, and Rs. 4 crores for Maharahtra. This indifference of the local people towards small enterprises is worth enquiring into. Perhaps there is need for a more positive encouragement from the Government.

Mysore Scrapes the Barrel

From Our Correspondent

MADRAS :

THE MYSORE Finance Minister is in the awkward position of being obliged to meet a heavy shortfall in resources in the last two years of the third Plan, in order to implement the various schemes, and at the same time not being able to levy additional taxation on account of the heavy burden already thrown upon the State's population and the rising cost of living. Mr. B. D. Jatti has actually indicated that against the Plan outlay of Rs. 250 crores, there will have to be much larger Central assistance as the State Government cannot gather Rs. 110 crores as originally anticipated on account of the delayed formulation of tax proposals and the sharp increase in non-Plan expenditure. The progress of work on the Sharavathy and other major projects has been satisfactory so far. But it will be necessary to keep a close watch on physical achievements as the estimates have gone wrong at some points and work also may be held up on account of the paucity of financial resources.

While thus the ways and means position is considerably strained and can be rectified only with the outright sale of securities held by the Government and in the sinking funds, it is hoped that the Central Government will take a sympathetic view of the requirements of the State Government and help at least the big projects like Sharavathy to be completed as early as possible. It is now estimated that the ultimate expenditure for installing capacity of 890 mW will be Rs. 85 crores on account of the need to import generating equipment from the USA which is definitely costlier than similar equipment from other sources. Besides the heavy expenditure incurred on the construction of the dam and the erection of generators, the distribution system alone may cost another Rs. 100 crores. It is needless to emphasise that the expenditure on the construction of transmission lines and distribution facilities cannot be grudged as otherwise Mysore State cannot hope to derive the full benefits out of the Sharavathy project. This expenditure would be worthwhile as the distribution system will be able to handle much larger quantities of electricity when the Kalinadi and other projects are completed. How exactly Mr. Jatti will be able to get over the many problems remains to be seen. Meantime, he has promised brisker collection of taxes, the practice of strict economies in expen-

diture and greater check over evasion of tax payments.

The Budget for 1964-65 estimates revenue receipts at Rs. 111.06 crores and expenditure at Rs. 110.99 crores leaving a small surplus under revenue account of Rs. 7.01 lakhs. But this surplus will be converted into a substantial deficit because the additional expenditure incurred on account of the introduction of old age pension and relief to pensioners and low paid staff has not been provided for in the Budget. Increased dearness to State Government employees drawing a basic pay up to Rs. 300 a month is to be granted. The benefit would be extended also to employees of Government concerns, local bodies and aided educational institutions. The additional expenditure is expected to be Rs. 1.25 crores annually. Old age pension to indigents above the age of 70 is being proposed at the rate of Rs. 15 per month while pensioners will get an ad-hoc increase of Rs. 5 per month in dearness allowance in the case of those drawing pensions up to Rs. 100 a month. This will involve an expenditure of Rs. 25 lakhs annually. The family pension scheme on the lines of the Central Government cannot be adopted on account of the paucity of funds. But it is being examined whether the existing scheme can be liberalised.

Sharavathy Project

With the availability of power from Sharavathy shortly, it can, however, be expected that the State would be able to get over many of its problems and plan further industrial development on a more definite basis. There is now the prospect of the huge aluminium project being erected in the west coast of Mysore as it has been stated that an agreement has been reached with the Maharashtra Government for obtaining bauxite and that proposals from various companies have been obtained for erecting the plant. These were being considered by the Central Government. There is also a proposal for starting a large newsprint factory while a fishing harbour is to be established with Yugoslav assistance. The cement industry is to be expanded in a big way with the installation of four new units. The Central Government has already agreed to the proposal for erecting factories at Nagargali and Wadi. The Government undertakings also are to be expanded in a big way while the biggest industrial project will relate to the scheme for producing alloy steel from Bhadravathi. The steel expansion plant taken up at a cost of Rs. 7 crores is now proposed to be converted completely into an alloy and special steel plant with an additional investment of Rs. 10 crores.

**

It has now been definitely indicated by the Madras State's Minister for Transport that the Government was thinking in terms of revising upward bus fares on all the routes operated by the State Transport Department. It is estimated that there would be a loss of Rs. 7 lakhs for the current year against a profit of around Rs. 10 lakhs earned in the previous years. The higher cost of operation is due to costlier fuel and higher motor vehicles tax imposed by the State Government recently. Mr. Venkataraman actually said that other State Governments had already increased the fares by 3 nP. per kilometre while it was proposed to have the maximum of 5 nP. per kilometer in the Madras State. Service and not profit making was the guiding principle. This is the main reason for the undertaking being run on a departmental basis.

There has been a sharp increase in the number of buses in operation and in the revenue gathered. Even though the income from every bus has increased by 50 per cent, operating expenses have been more than in proportion and it is now feared that passengers boarding the buses plying in the mofussil will have to pay an increase in fares by 22 per cent while in the City it may be anything up to 30 per cent. The difficulties of the State Government are no doubt appreciated and the travelling public has accepted that the long distance buses are doing really useful work. But the cumulative effect of the higher bus fares will be serious as, so far as the individual is concerned, the cost of living has increased sharply and in the urban areas particularly, the office-going public belonging to the lower income groups will be badly hit. There is no doubt that with the proposed increase in fares, there will be a deflation in the volume of traffic as railway travel will be considered much cheaper while in the City more people might like to use bicycles. Even so, the State Department buses will continue to be busy. Only, the rate of expansion might be slowed down for a time. It is now wondered what will be the move of other transport operators now that it has been definitely stated that there is no early prospect of nationalisation.

**

The Madras Stock Market has been truly quiet and business passing has been extremely restricted. Advices from Bombay and Calcutta have not been encouraging and prices have been marked down slightly all round. While there is anxiety to know what will be the reaction of the Finance Minister to the memoranda submitted by the Stock Exchange Associations and Industrial organisations regarding the grant of relief from some of the new tax proposals, Mr. T. T. Krishnamachari's reply in Parliament to the Budget debate has come as a great disappointment. The Finance Minister's reference to the opportunity for those above the age of 70 to opt out to the Annuity Scheme is considered a huge joke while the suggestion that income-tax payers might be exempt from the operation of the Annuity Scheme if they agree to pay a higher rate of tax than normal on that portion of the income which would have to be paid as annuity is considered cruel. The only constructive proposal that has been made relates to the likelihood of bonus shares issued out of the share premium account being differently treated for payment of capital gains tax. Otherwise, he has not given any indication of the Government's thinking in regard to the controversy about the notional determination of capital gains on the issue of bonus shares by companies, or the dividend tax which is considered iniquitous. It is, of course, generally agreed that the surtax on profits operates leniently. The assurance regarding the continuity of development rebate even after 1967 will be welcome by Indian entrepreneurs and foreign investors. It is still hoped that all industrial undertakings which have been granted licences and which are likely to be delayed in the construction stage, will be allowed to take advantage of the development rebate on the existing basis. The Finance Minister has stated that a new system of development rebate on a graduated basis might be announced next year.

The absence of any positive lead by the Finance Minister and the nervousness displayed by the bigger operators have given rise to the fears that many of the new capital issues that are awaiting to be placed on the market will not be successful. In Madras, a number of new issues such as Indian Graphic Arts, Coramandel Fertilizers and Chemicals and Plastics India Limited have to come on the market. There are many other new issues awaiting flotation in Bombay and Calcutta. The promoters in many cases would seem to be of the feeling that it would have been far more advantageous if they had come out with their propositions on the market early in February. The statutory financial corporations will no doubt be helpful in completing the underwriting arrangements. But they may be obliged to take up large parcels on their own account as the public response may not be quite encouraging in the absence of a recovery in the stock markets.

Meantime new fears have risen about the possibility of a further rise in short-term rates. The Reserve Bank's latest move imposing new credit restrictions has come as a great surprise and it is now wondered whether banks would be agreeable to increase their deposit rates and whether eventually there would even be an increase in the Reserve Bank's lending rate.

The moving finger writes

THIS HAS been a very interesting week indeed. A Deputy Minister at the Centre has had to go and tell her party men that she had not been taking part in any Tantrik rites or black magic abracadabra to destroy the Prime Minister as was alleged in a Bombay weekly. Another Bombay weekly, after having succeeded in provoking the comrades to set up an agitated defence of the fair name of one of their leaders, has had to publish an involved contradiction of a story put out by its editor that Mr. J. R. D. Tata was being offered the Finance portfolio. This has, in fact, been a week of mixed blessings for the newspaper world, with Mr. Satyanarayan Sinha threatening the big newspapers with the proposed Monopolies Commission, while promising to small newspapers an Ambar Charkha deal to be concocted by a small committee of non-officials under Mr. R. R. Diwakar.

The newspapers, in their turn, have also been serving a mixed fare to their readers. The Delhi Zoo — and I mean strictly "the zoo"—was a prolific source of stories. A tiger, a Nehru pet gifted to the zoo, was going blind and a lioness was bemoaning her barrenness, but as if to show that life was not all shadows, Rita, the female chimpanzee, had acquired a mate in Ravi, just imported from Holland, specifically to relieve Rita's solitude — and the resultant meeting of minds and mating of instincts prompted "Patriot" to shout, "I chimply love you, honey!" And that was not all, as there was yet another interesting acquisition at the zoo, a young hippo named Mani from Trivandrum in far Kerala, the majesty of whose arrival in the Capital, however, was considerably marred by the late running of the Janta Express from Madras.

**

This is not to suggest that the newspapers have had to go out for "silly season" stories, for the Socialists misled by Dr. Lohia were there to provide a spate of spontaneous nonsense. Those doughty warriors did some re-sculpturing of the Irwin statue before Parliament House, placed Mr. Maniram Bagri on a cot near the entrance to the Legislature and, thanks to a sudden accession of intelligence, contrived to whisk him away just when the Speaker was threatening him to turn nasty and the public was beginning to get bored.

And then there was the news of the release from prison of Mr. K. M. Nanavati, formerly of the Indian Navy — a case of justice tempered with mercy; but there was also that front-page story in "The Statesman" of March 18 — a story with a less happy ending for its principle, a bandit chief called Ramnath, who kept his date with the hangman at the Indore Jail and thus paid for his brief but bloody reign of terror in the Chambal Valley.

Talking of the justice that man metes out to man, there was also the judgment of the Supreme Court in a suit filed by another Nanavati for the annulment of his marriage with a woman who had given birth to a child too soon after the wedding date; it must, however, be said in fairness to the lady that although the Supreme Court, by a majority of two to one declared the marriage null and void, the dissenting Judge stuck to the point that there had been a concurrent finding of facts by the courts below that the woman was not pregnant before her marriage — all of which shows that there may be more things in heaven and earth than are dreamt of in our biology.

**

I am not easily amused, but the report in the Press that the Finance Minister advised a delegation of the Federation of Indian Chambers of Commerce and Industry that instead of complaining against tax measures the business community ought to give them a fair trial did draw out a chuckle from me. I know, of course, that Mr. Krishnamachari's sense of humour has an astringent quality, but I recall that this was precisely the advice which, at about this time last year, his predecessor was also giving to business men. I rightly concede that there should be a "fair trial", but the trouble is that it is the business community which is not getting a fair trial, thanks to idiosyncratic as well as ideological experimentation in Government policies. That apart, may I ask whether the Finance Minister would really wait for another year only to find that this "fair trial" business has not worked out. I suppose I should agree that a year is not a long time in the history of a nation, but a year is a considerable period in a five-year Plan, and when two babies are being born every day in the refugee camps, is it possible at all for the nation to think philosophically in terms of aeons of human existence? I wrote a great deal, and I wrote very strongly, about or against the Morarji budget of last year. I have again been writing much and I have again been writing strongly on the present budget. I make bold to plead that I have not merely been writing, but I have also been thinking — and with the best will in the world, I cannot help concluding that the hands of the clock of economic progress are being put back year after year. I am second to none in my admiration of Mr. Krishnamachari's genuine solicitude for the vulnerable sections of our community and his crusading zeal for social welfare or security, but I do not at all think that the good and noble purpose which he has in view can be achieved unless there is here and now an economic climate for more production and more investment. Mr. Krishnamachari cannot merely hope to serve the people or the people's cause by being soft on pensions while being hard on earnings. The State should not seek to turn the country into a vast orphanage or into an old people's home.

**

The nation has reason to be deeply grateful to Mrs. Indira Gandhi for the first few authentic words which have been publicly said since the Prime Minister's recent illness on the real state of his health. Mrs. Gandhi says that Mr Nehru looks, feels and is much better physically now than he was in the weeks or months preceding his illness. This is a tribute to the medical care he has received and his mental and physical capacity to respond to treatment and rest. But the question of the physical competence of a man in his seventies to continue to shoulder the responsibilities of government leadership of a nation facing grave difficulties and dangers still remains to be dealt with. Mrs. Gandhi has disclosed that the Prime Minister's medical advisers have urged him to relax after lunch, not to work at all after dinner and to take complete rest for one day in the week. The implications surely are that Mr. Nehru's state of health is now such that he has to husband his mental and physical energies most scrupulously. It is consequently wholly legitimate and relevant to ask whether he could really be regarded as being in a position to function as an active, full-time Prime Minister. It is surely in the national interest that this issue should be settled in the only way in which it is possible to settle it, that is by medical opinion of the highest competence, integrity and courage. It is one thing to contradict reports in the foreign Press of the Prime Minister's resignation or plans for retirement and it is another to reassure the people of this country that resignation or retirement is not necessary.

Trade Winds

RAJASTHAN CHAMBER

THE PLANS of the Rajasthan Chamber of Commerce for a new and modern building for itself took concrete shape on March 12 with Mr. G. D. Birla performing the foundation-laying ceremony of the J. K. Sabha Bhawan, an auditorium to accommodate about 800 persons. The Bhawan is a donation by Mr. Padampat Singhania on behalf of the J. K. Trust and will form part of a larger construction project which the Rajasthan Chamber of Commerce has in view. Mr. Ramnath Podar, President of the Chamber, stated that the Chamber had already collected for the purpose about Rs. 9 lakhs from the business community of Rajasthan and hoped to collect another Rs. 6 lakhs.

A silver plaque was presented to Mr. G. D. Birla on behalf of the Chamber in appreciation of his services to the business community of Rajasthan. Speaking on the occasion, Mr. Birla emphasised the desirability of business chambers equipping themselves with good buildings and a good organisation. The purpose of organisation, he pointed out, should be to educate public opinion which was important in a democracy. Mere propaganda or publicity would not, however, be of much use. The business community had to win the goodwill and trust of the public by keeping the needs and interests of the people of the country uppermost in its mind. Otherwise — Mr. Birla added bluntly — nobody would care for business men or what they said.

Discussing the task that lay ahead of the nation, Mr. Birla pointed out that, over a wide part of the world from Egypt to Indonesia, India was the only country where there was democracy, security and stability. Reminding his audience that during the freedom struggle and after the business community had always stood with the Congress, he said that the Congress Party was still the only political organisation capable of ensuring the stability of the country. He, therefore, pleaded that the business community and Congress men should understand each other so that they might work more effectively for the betterment of the lot of the 400 million people of this country. Mr. Birla, however, added that the future did not really lie either with the politician or with the business man in the narrow sense of one who buys and sells. It was the scientist and the technocrat who were becoming increasingly important in modern communities. So far as business men were concerned, what would matter was business acumen, enterprise and capacity for hard work. So long as these qualities were present, they were bound to ensure to the business community its proper place in the economic progress of the country. Viewed thus, inherited wealth was in itself not of decisive importance. Nor were government policies, fiscal or other, directed against such wealth. It was true that, with death duties rising to 85 per cent, vast fortunes could not be passed on hereafter to future generations of business men, but so long as the latter had the qualities of business leadership, they were bound to continue to play a useful and respected role in the life of the community, and the nation would need and reward their services.

Grave Challenges

Mr. Birla referred to the grave challenges facing the nation, and while appealing to politicians not to spoil the economic climate by stirring up sterile controveries, he advised the business community for its part to cultivate unity of purpose and dedicate itself to united action for the good of the people of the land. During the last 15 years many things had changed and new slogans had come up, but the fact remained that much of the economic progress of the country had come directly from the achievements of private industry. Describing this process, Mr. Birla pointed out that about five million people were employed in factories and business establishments. Production had been doubled since Independence and hundreds of new products were being manufactured in the country. So long as the business community could prove its willingness and ability to meet the new demands made on it by the nation, there was every reason to look forward to the future with hope and cheer.

INDIAN CONFECTIONERY

Inaugurating the eighteenth annual general meeting of the Indian Confectionery Manufacturers' Association, the Union Minister of Industry, Mr. Nityanand Kanungo, told the manufacturers that under the prevailing circumstances of the Indian economy, they would have to put up with shortages of various kinds including the shortage of raw materials such as sugar and cocoa beans, for some time to come. Mr. Kanungo added that the demand for plain sugar in the country was much more than that for made-up sugar, and, therefore, the consumer of plain sugar had a priority. Referring to the difficulty of procurement of sugar, as voiced by Mr. A. Bose in his presidential speech, the Minister said that an improvement in the procurement system would not increase the quality of sugar available for the confectionery industry. Regarding the industry's difficulties concerning the utilisation of import entitlements, the Minister advised the manufacturers to make a pool for exports and thereby distribute among themselves the benefits of import entitlements to their best advantage. Regarding the President's suggestion for the increase of import entitlement limit from 20 to 60 per cent, the Minister drew the attention of the manufacturers to the low priority enjoyed by their industry. Referring to the industry's demand for increased governmental incentives for exports, Mr. Kanungo emphasised the point that export performance depended more on good salesmanship than on the price and the quality of the product which, of course, had importance of their own.

In his presidential address, Mr. Bose said that the third Plan production target of 25,000 tons for the confectionery industry would be achieved without any difficulty provided the industry was assured of timely supplies of various essential wrapping, packing and raw materials. As assessed by Government, the annual production capacity of the industry, on single-shift basis, was 52,000 tons. But the actual production capacity, Mr. Bose pointed out, was only 20,000 tons, i.e. less than 40 per cent of the capacity. According to Mr. Bose, this was due to insufficient demand in the country. The demand was less because of high prices which, in turn, were due to the high cost of the basic raw material viz. sugar, which accounted for more than 40 per cent of the production cost. He, therefore, pleaded for the availability of sugar to the confectionery industry on subsidised prices. In support of his argument, he added that the supply of sugar for industrial purposes such as for use in food preservation industry, was being made at subsidised prices in certain foreign countries. He also suggested that the Government should exempt sugar utilized in confectionery industry from all internal taxes as a similar practice was being followed in many other countries. Mr. Bose further said that if a regular export market for the Indian confectionery was to be assured, the Government should provide sugar to the industry at the same price at which it was exported out of the country. Referring to the market within the country, Mr. Bose urged upon the Government to exempt confectionery from inter-State movement restrictions, irrespective of its sucrose content.

EXPORTS THROUGH FAIRS

Exclusive Indian Exhibitions are to be held in Belgrade and Kathmandu durnig 1964-65. The Exhibition in Belgrade is scheduled for February-March, 1965. Among the other exhibitions and fairs in which India proposes to participate during 1964-65 are: The International Fairs in Vancouver (Canada), Budapest, Paris, Barcelona, Poznan, Izmir (Turkey), Wellington (New Zealand) and Brno (Czechoslovakia). Participation is also proposed in the 7th US World Trade Fair in San Francisco, the Autumn Fairs in Zagreb and Helsinki and Spring Fair in Leipzig, the Food-stuff and House-hold Articles Display in Brussels, the Industrial Engineering International Exhibition in Sydney and the Milan Fair and Levant Fair in Italy. In the Asian and African regions, India is to participate in the Kabul International Exhibition ('Jashan' celebrations), the Industrial Exhibition in Colombo, the International Fairs in Bangkok and Accra and the Agricultural Show in Nairobi.

With the main object of promoting and organizing participation in industrial and trade fairs in India and abroad, a new autonomous organization, called the Indian Council of Trade Fairs and Exhibitions, was recently set up with its headquarters in Bombay. It will also have within its purview the establishment and maintenance of show-rooms, trade centres and depots in important commercial areas abroad.

The intention behind participation in these International Fairs, and the organization of exclusive Indian Exhibitions, is not only to give extensive, visual and commercial publicity to India's exportable merchandise but also to project abroad an image of our developing economy and to show the growing export potential of the country with a view to creating a demand for goods which India is likely to be able to export in the near future.

INVESTMENT GUARANTEE AGREEMENT

As disclosed by Mr. P. A. Menon, India's Ambassador to Bonn, the Government of India is planning a bilateral investment guarantee agreement with West Germay. The aim of the agreement would be to dispel German fears about the safety of investing capital in India.

Addressing the 64th Anniversary Assembly of the German East Asia Association, in Germany, Mr Menon welcomed the substantial German Government's development aid of 1,353 million marks to India, but complained that this was linked-up with specific projects, which narrowed the manoeuvring ability of the Indian Government. He described the flow of the West German capital into India as a mere trickle. Assuring the German investors, Mr. Menon said that the extensive British investments totalling 3,361 million marks, and the flow of 880 million marks of private capital from the United States should be clear proof that German investment in India were safe.

The West German investments in India were 15 million marks per year and totalled 69 million marks altogether. Mr. Menon said that India's heavy imports of machinery from West Germany in recent years had caused a deficit of 475 to 650 million marks every year in the balance of trade. The volume and value of mutual trade was falling, the situation for India being "very unfavourable". The Ambassador said that India wished to increase considerably her exports of machine products and electrical goods, tools, light wooden and steel furniture, sports goods and footwear to West Germany.

The Chairman of the East Asia Association, Mr. Hermann Waldemar Breuer pointed out that German businessmen preferred partnership with private firms when doing business abroad. He said Indo-German Investment Protection Agreement, safeguarding West German trading organizations, and similar other measures would certainly make the Indian market more attractive for German investors.

MINIMUM PRICE OF SUGARCANE

The Government of India has announced the basic minimum price of sugarcane payable by sugar factories during the crushing season 1964-65, which will commence in October-November, 1964. The price announced works out to Rs. 1.85 per maund, linked to a recovery of 9.4 per cent and below, with provision for increase in the minimum price by 1.5 nP. per maund for every 0.1 per cent increase in recovery over 9.4 per cent. This price is 4 nP. per maund higher than the price which is payable at 9.4 per cent recovery during the current crushing season. The price of Rs. 1.85 nP. per maund will be payable for recoveries of 9.4 per cent or below, while last year the minimum limit was related to a recovery of nine per cent. These prices will be the minimum payable by sugar factories for sugarcane delivered at the gate of the factories. The permissible limit for deduction from the cane price at receiving centres situated away from the factory-gate would be 1.5 nP. per maund per mile up to a distance of 8 miles. Thereafter up to 24 miles there would be no further deduction beyond 12 nP. per maund and the balance of transport costs i.e. up to 24 nP. per maund would be debited to costs of manufacture. This would constitute an additional advantage to the growers from whom in the past these deductions were made in full out of the cane price.

ERGONOMICS IN INDUSTRY

Inaugurating the symposium on ergonomics, Major-General, S. P. Vohra, Director of Electrical and Mechanical Engineering, Army Headquarters, stressed the need for a radical reorientation of the basic concepts of design of machinery and equipment in order to adapt them to the capabilities of the human agency operating them. With the application of ergonomic principles, industrial output in some of the Western countries has been stepped up by 10 to 50 per cent, incidence of errors has been cut down by even 90 per cent, human fatigue reduced and general efficiency increased. Ergonomics has a multi-disciplinary approach in which experts in the fields of physiology, psychology, engineering and other subjects pool their experience to design machines and devise labour saving methods to suit the workers.

The symposium was conducted under the joint auspices of the Defence Institute of Work Study and the Institution of Work Study(India),and was attended by representatives of industry, the scientists and the servicemen.

RUBBER AWARD

Beginning in 1922 with a single water-proofing unit, the rubber industry in India has in its fold today, about 800 manufacturing units producing almost every conceivable item, with a production turnover of more than Rs. 100 crores and giving employment to over 50,000 persons. That the people working in this industry should merit some recognition, the 'Polymer Publications' have instituted, commencing 1964, a prize; "Rubber News Gold Medal" to be awarded annually to an Indian citizen for outstanding services to the rubber industry, whether it be in the field of research and development, production techniques or process, management or other such spheres.

Company Affairs

UNITED COMMERCIAL BANK

THE DIRECTORS of the United Commercial Bank Ltd. in their annual report for the year ended December 31, 1963, have reported a net profit of Rs. 76.43 lakhs after providing for taxes etc. This compares favourably with the last year's profit of Rs. 73.33 lakhs. The bank recorded considerable progress in terms of deposits which improved from Rs. 105.74 crores at the end of 1962 to Rs. 120.98 crores at the end of the year under review. Major increase was recorded in fixed deposits which went up from Rs. 57.77 crores to Rs. 68.15 crores. Advances also increased from Rs. 71.08 crores to Rs. 85.95 crores. The directors contributed a sum of Rs. 2 lakhs to the National Defence Fund, transferred Rs. 17 lakhs to the reserve fund, Rs. 4 lakhs to the gratuity trust fund and Rs. 19 lakhs for bonus to staff. They have recommended the payment of dividend at the rate of Rs. 6 per share subject to deduction of tax which will absorb Rs. 33.60 lakhs. The directors consider it desirable to capitalise a sum of Rs. 20 lakhs out of Rs. 40 lakhs standing to the credit of the share premium account and have accordingly applied to the Controller of Capital Issues for his consent. They await the final outcome of this year's budget proposals relating to the taxation of bonus shares before taking further action. The bank's continued expansion was reflected in the number of branches which were 175 by the end of 1963 as against 160, a year before. It opened branches at Dum Dum and Jadavpur in Calcutta, Santa Cruz and Warden Road in Bombay, Theagaroyanagar in Madras, Shivaji Nagar in Poona, Chawri Bazar in Delhi and at Anand, Robertsganj, Jammu, Mesra, Jharia, Vasco da Gama, Aurangabad, Cambay, Mavoor, Korba and Pinjore.

STATE BANK OF INDIA

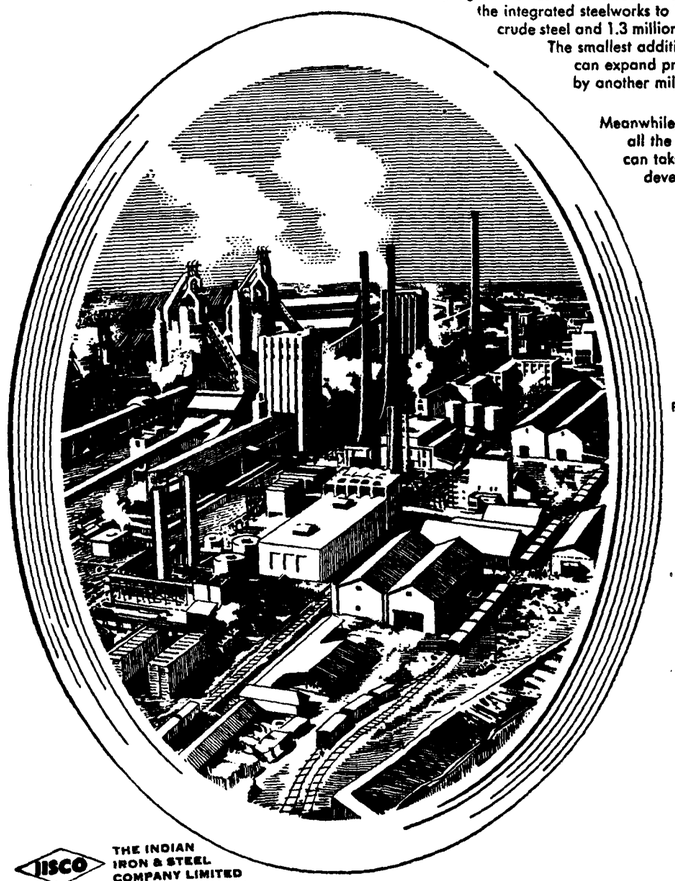
During the year ended December 31, 1963, the State Bank of India recorded an increase in its deposits from Rs. 567.37 crores to Rs. 594.40 crores. In line with deposits, advances also increased and touched a figure of Rs. 290.15 crores against Rs. 270.49 crores a year before. The composition of advances broadly remained the same — against 72 per cent for industries in 1962, the bank has advanced as much as 75 per cent to industries towards the end of 1963. Commerce claimed something like 9.6 per cent against 9.5 per cent last year. Profit during the year increased to Rs. 274.82 lakhs as against Rs. 269.25 lakhs last year. Dividend to the shareholders at the rate of Rs. 23 per share, subject to deduction of tax (made up of interim dividend at the rate of Rs. 10 per share and final dividend at the rate of Rs. 13 per share) will absorb Rs. 129.38 lakhs. A sum of Rs. 55 lakhs has been transferred to reserve fund, Rs. 8.61 lakhs to pension funds, Rs. 82 lakhs to bonus to staff, Rs. 5 lakhs to staff welfare fund and Rs. 5 lakhs to staff co-operative housing fund. A sum of Rs. 35.51 lakhs is to be carried forward. The bank opened 20 branches under the Second Branch Expansion Programme in 1963 as compared with 25 branches in 1962. Apart from this programme, nine branches were opened in metropolitan cities and big towns. At the close of the year, the bank had 1,076 offices comprising four local head offices, the office in London, five offices in Pakistan, one office in Ceylon and 733 branches and 332 sub-offices in India.

HIND CYCLE—GWALIOR RAYON AMALGAMATION

A scheme of amalgamation of Hind Cycles Ltd. with the Gwalior Rayon Silk Manufacturing (Weaving) Company Ltd. has been finalised. It will be effective from April 1, 1964. It provides that every member of the Hind Cycles Ltd. holding equity shares of Rs. 100 each in that company will be allotted 2.5 equity shares of Rs. 10 each of Gwalior Rayon credited as fully paid-up and ranking in all respects 'pari passu' with the existing ordinary shares of the latter. Every member of the Hind Cycles Ltd. with 5 per cent redeemable cumulative preference shares of Rs. 100 each will be allotted 5 per cent redeemable cumulative preference shares of Rs. 100 each of Gwalior Rayon to be called Series 'C' together with a cash payment of Rs. 15 per share. The holders of 5½ per cent redeemable cumulative preference shares of Rs. 100 each will be allotted 5½ per cent redeemable cumulative preference shares of Rs. 100 each of Gwalior Rayon to be called series 'D' plus a cash payment of Rs. 16.50 per share. The shareholders of 5 per cent redeemable cumulative preference shares of Rs. 25 each in Hind Cycles Ltd. will be allotted the similar share of Rs. 25 in Gwalior Rayon to be called series 'E' plus a cash payment of Rs. 3.75 per share. The shareholders of 8.57 per cent redeemable cumulative preference shares of Rs. 100 each in Hind Cycles Ltd. will be allotted 8.57 per cent redeemable cumulative preference shares of Rs. 100 each in Gwalior Rayon to be called series 'F' plus a cash payment of Rs. 25.71 per share.

The cash payments to be made to the shareholders of preference shares of Hind Cycles Ltd. represent the arrears of preference dividend for the three years ending March 31, 1964. If the scheme of amalgamation is sanctioned and put into effect, the Hind Cycles Ltd. will be dissolved without being wound up in which case the shareholders of the Hind Cycles will forfeit the dividend. The Directors of Gwalior Rayon, however, feel that in fairness to the shareholders of preference shares of Hind Cycles Ltd. they should not be deprived of their right for arrears. The new series of preference shares 'C', 'D', 'E' are redeemable at par at any time on giving three months' notice, while series 'F' will be redeemable at par on March 6, 1971. The existing series 'A' and 'B' are redeemable at par on March 31, 1972, by giving a year's notice. A scheme of amalgamation requires the approval of the respective shareholders of both the companies and the sanction of the High Court of Madhya Pradesh.

ELECTRIC CONSTRUCTION



The directors of Electric Construction and Equipment Company Limited, have reported a net profit of Rs. 11.84 lakhs for the year ended October 31, 1963. A sum of Rs. 5.50 lakhs is to be transferred to general reserve, Rs. 6.25 lakhs to dividend reserve and Rs. 21,399 are to be carried forward. Dividend on equity shares at the rate of Re. 1 per share of Rs. 10 each absorbed Rs. 6.09 lakhs. Sales and earnings touched the record level and the expansion programme continued according to schedule. Net sales were around Rs. 2.86 crores against Rs. 2.08 crores last year. The directors have reported that production of transformers at Cossipore and Vizag divisions accounted for a major portion of the company's business. A programme of increasing the range and variety of electric motors produced is being pursued vigorously and for this plans are being formulated to set up new unit to manufacture a wider range of motors. The unit at Budge Budge to produce switchgears and lifts maintained a steady rate of progress. The Government has approved the collaboration agreement which the company has entered into with Messrs. Ateliers de Constructions Eletriques de Delle of France for the manufacture of a wide variety of switchgears and production is hoped to be started towards the beginning of 1965. Progressive manufacture of lifts is also continuing and now nearly 95 per cent of the total component parts of single speed lifts are being manufactured locally. The construction work of the company's factory to produce house service meters at Hyderabad was completed and initial production of single phase meters was started during November 1963. The manufacture of poly phase meters is intended to be taken up towards the later part of the current year. When the factory

BURNPUR
—A PORTRAIT
IN STEEL

A busy steeltown. Alive to the problems of the day, prepared for the challenge of tomorrow. Thousands live and work here day and night. All of them think in terms of steel—and more steel, for India.

Yet less than ten years ago, the rated annual capacity at Burnpur was about half a million tons of crude steel and a similar quantity of pig iron. A two-step expansion programme has since raised annual production at the integrated steelworks to 1 million tons of crude steel and 1.3 million tons of pig iron. The smallest additional capital cost can expand production further, by another million tons of steel if need be.

Meanwhile, IISCO steel—in all the shapes that steel can take—serves India's developing economy.

Over 7 lakhs Customers

reaches full capacity, it will produce 6,000 nos. of single phase meters and 18,000 poly phase meters on a single shift basis. The company is contemplating the manufacture of transformers and switchgears at Sonepat in Punjab for which an industrial licence has been received and the project is being pursued.

NATIONAL RAYON

The directors of National Rayon Corporation Ltd. have maintained the dividend at Rs. 16 a share, less tax, for the year ended December 31, 1963. The directors have also decided to issue rights in the ratio of one share for every 10 held. The gross profit has risen from Rs. 2.18 crores to Rs. 2.54 crores and sales have risen from Rs. 8.27 crores to Rs. 11.64 crores. After providing Rs. 1.32 crores for depreciation, Rs. 66 lakhs for taxation and Rs. 9.15 lakhs for development rebate reserve, the net profit is Rs. 46.31 lakhs against Rs. 21.31 lakhs in the previous year. The preference dividend at 5.55 per cent absorbs Rs. 9.67 lakhs and equity dividend at 16 per cent Rs. 38.57 lakhs.

DENA BANK

The working results of Devkaran Nanjee Banking Co. Ltd., for the year ended December 31, 1963 show a rise of Rs. 8.02 crores in its total deposits from Rs. 51.07 crores to Rs. 59.09 crores. Savings bank deposits alone accounted for an increase of Rs. 3.45 crores. Despite a sharp rise in its total deposits, its borrowing from other banking companies increased from Rs. 71 lakhs to Rs. 168.75 lakhs. The bank advances and bills discounted have gone up by Rs. 7.07 crores to Rs. 38.81 crores, showing an increase in advances-deposits ratios. It may be added that at the end of 1963 advances to industry were around 53.06 per cent, advances to trade 30.55 per cent and other advances 16.39 per cent. Investments have also been strengthened by Rs. 4.17 crores to Rs. 20.19 crores, raising the investment ratio. Income from interest and discount recorded an increase and profit after providing for taxation also improved from Rs. 24.08 lakhs to Rs. 26.59 lakhs. The bank opened 17 new branches bringing the total to 129 at the end of 1963. An interim dividend of Rs. 2 per share had been paid and now a final dividend is proposed to be paid at the rate of Rs. 4 per share, making in all 12 per cent per annum, subject to deduction of tax.

BANK OF RAJASTHAN

During the year ended December 31, 1963, the Bank of Rajasthan Ltd. recorded an increase in its deposits to Rs. 7.18 crores as against Rs. 6.27 crores at the end of 1962. The profit of the bank during the year under review amounted to Rs. 4.09 lakhs as against Rs. 2.34 lakhs last year. After providing Rs. 1.02 lakhs for income-tax, the directors have recommended the payment of dividend at the rate of 10 per cent, subject to tax, which is the same as last year. It will absorb Rs. 1.17 lakhs.

BANK OF INDIA

The Bank of India Ltd. has recorded an increase in the deposits from Rs. 157.16 crores to Rs. 173.97 crores during 1963. Advances have risen from Rs. 127.20 crores to Rs. 135.93 crores. It has made a profit of Rs. 125 lakhs against Rs. 111.53 lakhs in the previous year. Its working funds have increased from Rs. 191.31 crores to Rs. 213.45 crores. The Directors have recommended a final dividend of 10 per cent, less tax, making 18 per cent for the year. Subject to the consent from Controller of Capital Issues, the directors propose to increase the authorised capital of the company from Rs. 10 crores to Rs. 11 crores by the creation of 200,000 "A" category shares of the face value of Rs. 50 each and issue therefrom 40,500 'A' shares as fully paid bonus shares in the proportion of one such bonus share for every 20 existing shares whether ordinary shares and/or 'A' category ordinary shares by capitalising Rs. 20.25 lakhs out of the share premium account.

NATIONAL EKCO

The new radio factory of National Ekco Radio and Engineering Company was inaugurated in Bombay recently by its Chairman, Mr. A. D. Shroff. Built on a 7½ acre site of Andheri, the new factory is claimed to be the largest radio factory. The proportion of indigenous material now being used in the manufacure of radios has gone up to 84 per cent from 20 per cent in 1957 and the substitution of the indigenous from the imported items is being carried out systematically. The present production is nearly 70,000 sets per year and it hopes to raise this capacity to 200,000 sets a year.

PHALTAN SUGAR

The Phaltan Sugar Works Limited proposes to issue upto 20,000 cumulative producers' participating preferenoe shares of Rs. 50 each to be offered at par to canegrowers who agree to deliver cane to the company. The directors point out that in view of the Maharashtra Agricultural Lands (Ceiling on Holdings) Act. 1961, the company has handed over the possession of surplus agricultural lands to the State Government. It has, therefore, to buy cane supplied from outside sources. This scheme of participation in the company by the cane-suppliers of the adjacent areas has been formulated to ensure a continuous supply of cane. The suppliers will be offered preference share capital with a cumulative preference dividend of 8 per cent.

During the year 1962-63, the company manufactured nearly 161,000 bags of raw sugar for export with a recovery of 12.94 per cent. The production has been higher by 10,724 bags despite lesser crushing, mainly owing to the increased recovery. The company could not complete its expansion programme due to the late delivery of imported machinery, but it is expected to be completed in time for the 1964-65 season.

WALCHANDNAGAR

During the year ended September 30, 1963, Walchandnagar Industries Limited recorded a sharp rise in its profits from Rs. 67.11 lakhs to a peak figure of Rs. 82.80 lakhs. There was a larger turnover in sugar mill machinery. The sugarcane crushing was lower at 189,966 tonnes against 203,239 tonnes and sugar output also dropped from 248,015 bags to 230,634 bags following a drop in recovery from 12.25 per cent to 12.13 per cent. The production of spirit improved substantially from 7.62 lakh litres to 37.22 lakh litres.

The company has recently entered into an agreement with a Czechoslovak firm for the manufacture of cement plant and its parts at Walchandnagar. A Swiss firm has agreed to provide technical collaboration for the manufacture of paper plant and ancillary equipments. The draft of the proposed agreement has been sent for Government approval. It is also negotiating with another Swiss firm — MAAG-Gear-Wheel Company Limited, Zurich, for technical collaboration for the manufacture of speed-reduction gears, penions and their accessories. Proposals to manufacture steam turbine for sugar mills in collaboration with G & J Wier Limited, Glasgow, U.K. is also under consideration. It has been granted a foreign exchange loan of $525,300 by the I.C.I.C.I. to meet the cost of the imported equipment for the proposed cement machinery making project.

AEROQUIP PRODUCTS

Aeroquip Corporation of the U.S. has entered into a financial collaboration with Mr. K. R. Patel's group for the manufacture of aeroquip products in India. American participant will subscribe 49 per cent of the equity capital against which machinery and equipment will be imported and the

balance will be held by the Indian participants and the Indian public. Under this collaboration high pressure hose assemblies, self-sealing couplings and other fittings required for development projects will be manufactured in India. Aeroquip is to produce the first hose line which could be made up simply by cutting the hose to the desired length and then attaching the fittings quickly in the field. This was the answer to the serious difficulties being encountered during the war years by the users of the hydraulic equipment.

BOMBAY OXYGEN

Bombay Oxygen Corporation Ltd. has announced that its acetylene plant has gone into operation on March 10. The operation of the oxygen and acetylene plants would meet the demand of the States of Maharashtra and Gujarat and other adjacent areas. The capacity of the acetylene plant is 640 cubic metres per shift per day, whereas that of the oxygen plant is 5,760 cubic metres per day.

BOMBAY DYEING

The Directors of the Bombay Dyeing and Manufacturing Company Ltd. have maintained the final dividend of Rs. 2.50 a share less tax for a year ended December 31, 1963, making a total of Rs. 3.50 a share or 14 per cent for the whole year.

ENGEL INDIA MACHINES

The shares of the Engel India Machines and Tools Ltd., which were recently offered to the public, have been fully subscribed. Allotment letters have been despatched to the applicants in accordance with the scheme of allotment approved by the Calcutta Stock Exchange Association. Official permission has been granted to the company by the Calcutta Stock Exchange Association for listing and dealing in its shares at the Calcutta Stock Exchange.

AMERICAN EXPRESS DIVIDEND

The Board of Directors of American Express Company at its monthly meeting held recently declared a quarterly dividend of 35c per share on its $5 par common stock payable on April 1, to shareholders of record of March 6. In making the announcement, President Howard L. Clark said this is the same quarterly dividend as was paid in each quarter of 1963 and the 95th consecutive year in which American Express will have paid dividends.

CAPITAL ISSUES

Five companies have been authorised to raise fresh capital exceeding Rs. 6.44 crores. Of these, two are State Government Undertakings and one is a Central Government Undertaking. Three companies are issuing equities, one is issuing equities plus cumulative redeemable preference shares and the fifth is raising its capital through debenture bonds. Two companies involve foreign collaboration. The consent of the Controller of Capital Issues is valid for 12 months in all cases.

The Industrial Development Corporation of Orissa Ltd., a State Government Undertaking, is to issue capital of Rs. 175.44 lakhs divided into 1,75,440 equity shares of Rs. 100 each to be issued for cash at par. The money will be utilised for financing the expansion of the Low Shaft Furnace Plant and a Cast Iron Pipe Plant and a Grey Iron Foundry.

Andhra Pradesh Industrial Development Corporation Ltd., a State Government Undertaking, will be issuing capital of Rs. 1 crore in debenture bonds, carrying interest at 4¾ per cent payable half-yearly. The bonds will be issued to the State Bank of India and/or its subsidiaries for cash at par. The capital will be utilised for the purpose of rendering financial assistance to industries in Andhra Pradesh and also for the promotion of industrial projects.

Hindustan Cables Limited, a Central Government Undertaking is to issue capital of Rs. 19 lakhs divided into 1,900 equity shares of Rs. 1,000 each, to be issued for cash at par. The money will be utilised for manufacture of telecommunication cables.

Madras Alloy and Stainless Steels Limited, Madras, is to issue Rs. 300 lakhs in equity shares of Rs. 10 each, to be issued for cash at par, of which shares of the value not exceeding Rs. 16 lakhs may be offered to English Steel Corporation Limited and Firth-Vickers Stainless Steels Limited, both of U.K. The capital will be utilised in financing the company's project for the manufacture of stainless steel sheets, tool and die steels etc.

Thakur Chipboards Limited, Bihar, will be issuing capital of Rs. 50 lakhs divided into (i) 4 lakhs equity shares of Rs. 10 each and (ii) 10,000, 9.5 per cent (free of company's tax but subject to deduction of taxes at source at the prescribed rates) cumulative redeemable preference shares of Rs. 100 each. Equity shares of the value not exceeding Rs. 17.5 lakhs would be offered to Ultramar Fischer & Company, Dusseldorf, West Germany, against the supply of plant and machinery. The balance shares would be for cash at par. The money will be utilised for the construction of a factory for the manufacture of chipboard.

LICENCES ISSUED

The following licences were issued under the Industries (Development and Regulation) Act, 1951 — during the week ending 7th March, 1964. The list contains the names and addresses of the licensees, the items of manufacture and annual installed capacity.

COAL

Shri M. C. Khanna, Ranidih & Pipratand Collieries, P.O. Mohuda, Distt. Dhanbad (Dhanbad Distt., Bihar) — Coal 30,000 tonnes.

INTERNAL COMBUSTION ENGINES

Rockwell India Ltd., C/o Batliboi & Company, Forbes Street, Fort, Bombay-1 (Gujarat) — Light Weight Gasoline Engines. 1st year 3,000 nos. 2nd year 4,200 nos. 3rd year and onward 7,000 nos.

ELECTRICAL EQUIPMENT

Shri P. Kumar, Industrial Estate, Lal baug, Bombay (Poona, Maharashtra) — Press Steel Radiators for (a) Transformers 1,32,000 sq. meters. (b) Other Heat-transfer applications in Chemical, Textile and other Engineering Industries 68,000 sq. meters.

AUTOMOBILES

Globe Auto Electricals Ltd., Green's Mansions, Gateway of India, Bombay-1. (Mulund, Greater Bombay, Maharashtra) — Ignition Switches for automobiles, 25,000 Nos.

INORGANIC CHEMICALS

Excel Industries Pvt. Ltd., 184-187, Ghodbunder Road, Jogeshwari, Bombay-10, (Jogeshwari, Bombay, Maharashtra) — Dicalcium Phosphate (Tooth Paste grade) 1,000 metric tonnes. Sodium Tri Poly Phosphate - 1,000 metric tonnes. Tetra Sodium Pyro-Phosphate (Detergent grade) — 5000 metric tonnes.

COTTON TEXTILES

North Gujarat Cotton Mills, Siddhpur (Gujarat) — 9036 spindles for manufacture of cotton yarn. N. K. Cotton Mills Ltd., Sadabad Gate, Hathras (Hathras, Uttar Pradesh) — 12,284 spindles for manufacture of cotton yarn. Niranjan Mills Pvt. Ltd., Falsawadi, Surat-3 (Gujarat) — 12,000 spindles for manufacture of cotton yarn. Arunoday Mills Ltd., 'Jyoti', Vallabhkanya, Vidyala Road, Rajkot (Gujarat) — 13,000 spindles for manufacture of cotton yarn. Bharat Commerce and Industries Ltd., Rajpura, Distt. Patiala, (Rajpura, Punjab) — 13,000 spindles for manufacture of cotton yarn. Dawn Mills Co. Ltd., State Bank Building, Bank Street, Fort, Bombay (Maharashtra) — 100 automatic looms for manufacture of cotton cloth. Modi Spg. and Wvg. Mills Co. Ltd., Modinagar (U.P.) (Modinagar, Uttar Pradesh) — 100 automatic looms for manufacture of cotton cloth. The Gokak Mills Ltd., Gokak Falls, Belgaum Distt., Gokak Falls, Belgaum Distt. (Mysore State) — 20,000 spindles for manufacture of cotton yarn. D. P. F. Textiles Pvt. Ltd., Mettupalayam Road, G. N. Mills Post, Coimbatore Distt. (Madras) — 12,006 spindles for manufacture of cotton yarn. The Vijayalakshmi Mills Ltd., Kuniyamuthur P.O., Coimbatore-8 (Madras) — 100 automatic looms for the manufacture of cotton cloth. Swadeshi Cotton Mills Co. Ltd., Kanpur (Kanpur, Uttar Pradesh) — 48, automatic looms for manufacture of terry towelling cloth. Jagatjit Cotton Textiles Mills Ltd., Thapar House, 25-Brabourne Road, Calcutta (Phagwara, Punjab) — 24, automatic looms for the manufacture of terry towelling cloth. Bombay Dyeing and Manufacturing Co. Ltd., Neville House, Graham Road, Ballard Estate, Bombay (Maharashtra) — 26, automatic looms for the manufacture of terry towelling cloth. Ahmedabad Kaiseri-Hind Mills Co. Ltd., Ahmedabad (Gujarat) — 2,000 spindles for manufacture of cotton yarn. Mahalakshmi Mills Co. Ltd., Beawar (Beawar, Rajasthan) — 7,500 spindles for manufacture of cotton yarn. Jaya Shree Textiles and Industries Ltd., Rishra, (Distt. Hooghly), (Rishara, West Bengal) — 148 plain looms. Bharat Commerce and Industries Ltd., Kolshet Road, Thana (Thana, Maharashtra) — 13,000 spindles for the manufacture of cotton yarn. The Kanti Cotton Mills Private Ltd., Surindranagar (Surendranagar, Gujarat) — 6,180 spindles for the manufacture of cotton yarn.

PAPER

Orient Paper Mills Ltd., 15, India Exchange Place, Calcutta-1 (Brajraj Nagar, Orissa) — Paper & Board 11,600 tonnes, Pulp 11,600 tonnes. Sirpur Paper Mills Ltd., 15, India Exchange Place, Calcutta-1 (Sirpur, Kaghaznagar, Andhra Pradesh) — Paper & Board 12,000 tonnes, Pulp 12,000 tonnes. Shree Gopal Paper Mills Ltd., 25, Brabourne Road, Calcutta (Yamunanagar, Ambala Distt. Punjab) — Paper and Board 7,000 tonnes, Pulp 7,000 tonnes. Bengal Paper Mills Co. Ltd., 14, Netaji Subhas Road, Calcutta-1 (Raniganj, Distt. Burdwan, West Bengal) — Paper & Board 21,000 tons, Pulp 21,000 tons.

CERAMICS

Kiran Engineering Corporation, Maheshwari Mansions, 34, Napeansea Road, Bombay-6 (Near Vijapur, Distt. Mahisana, Gujarat), Proposed name: "Ceramics and Hardware (Gujarat) Ltd." — High Tension insulators 2,400 tonnes.

BOOKS BRIEFLY

Rural Household Saving

Rural Household Saving Survey, 1962: Published by National Council of Applied Economic Research, New Delhi; Pp. 8; Price one rupee only.

THE PRELIMINARY estimates of rural household saving in India released recently by the National Council of Applied Economic Research indicated that in 1962, aggregate saving in the rural sector was of the order of Rs. 8,300 crores, disclosing a six per cent saving-income ratio. Eliminating the net increase in livestock and in consumer durables, which are usually not taken as a part of saving, the saving-income ratio works out to 4.7 per cent. The corresponding ratio for the urban sector was earlier estimated by the Council at 12.2 per cent.

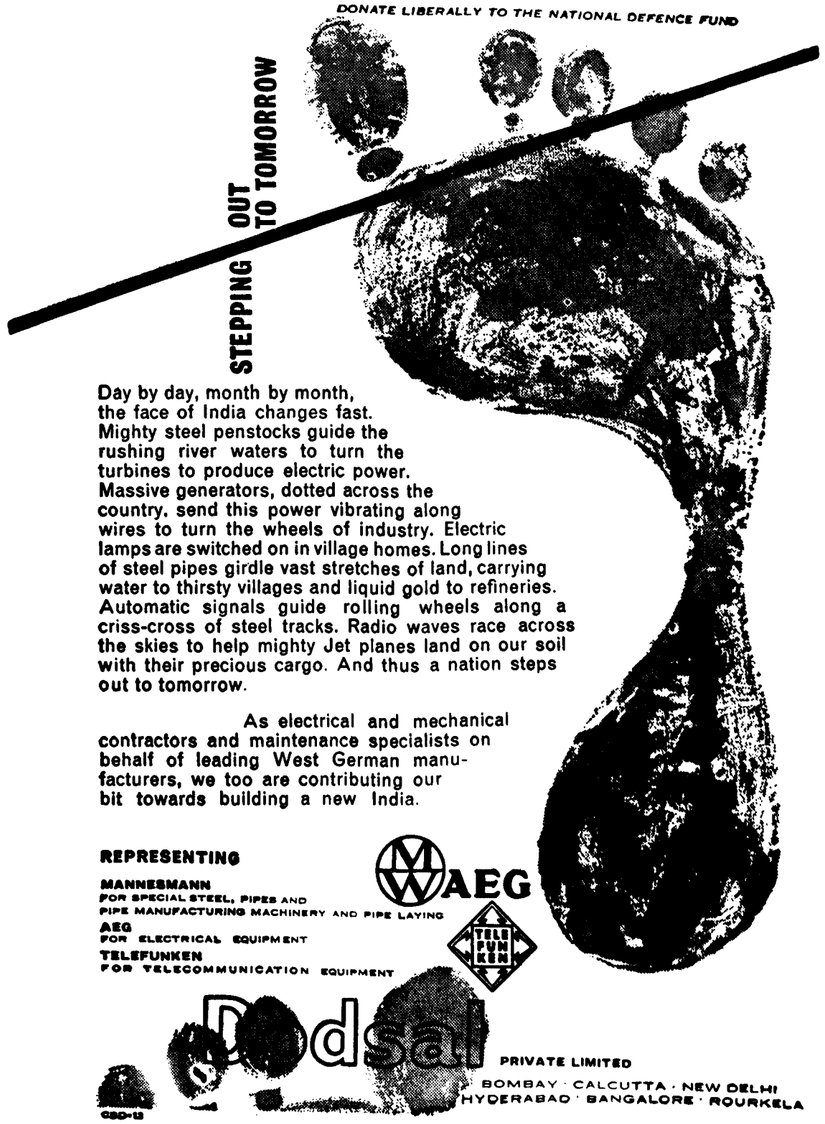
The survey was conducted in the first quarter of 1963, but related to the calendar year 1962. The saving component considered consisted of the changes in assets and liabilities of the rural households. A representative sample of 8,655 households was selected in a three-stage sample design. The stages were: (1) districts; (2) places under 10,000 population and (3) households within such places. The districts were grouped in 60 strata with per capita gross agricultural production, population etc. as the stratification variables. A standard procedure for control was applied and one district was selected out of each stratum. In all, 320 places were selected out of which only 19 were towns according to the census classificaion. The definition adopted by the National Council put all towns below 10,000 of population in the rural sector. Earlier, the urban households survey had put all towns with population of more than 10,000 in urban areas. According to the census classification, the line of demarcation between rural and urban areas is at 5,000 population.

The gross increase in rural saving in 1961 was placed at Rs. 736 crores. Increments in physical assets such as housing and buildings, farm investment, business investment, consumer durables, stocks, livestocks and land were valued at Rs. 766 crores. The increase in financial assets was put at Rs. 179 crores consisting of currency and coins at Rs. 70 crores, small savings at Rs. 33 crores, life insurance premia at Rs. 22 crores, commercial and cooperative bank deposits at Rs. 19 crores, provident funds at Rs. 16 crores, co-operative shares and other securities at Rs. 10 crores and chit funds etc at Rs. 9 crores. The increase in investment in gold and silver was Rs. 39 crores. On the liabilities side, there was an increase of Rs. 219 crores, while capital transfers of the order of Rs. 29 crores took place.

The rural household survey has confirmed the finding of the earlier urban household survey that practically all the new absorption of gold and silver was taking place in the rural sector. The Council has, however, not given any details under the head "liabilities" as the data are still being processed; the opinion has been given that the figure of Rs. 219 crores is, perhaps, on the higher side as a result of some over-statement of borrowing and even larger under-statement of lending. Again, a comparison with the figures collected in 1951-52 by the Reserve Bank in its rural credit survey shows that gross farm investment did not rise between 1951-52 and 1962. The Council is of the opinion that this is hardly credible and, therefore, a further probe is necessary. Because the procedures of inquiry adopted by the National Council and the Reserve Bank were different, the comparison is of a tenuous nature. The increase in currency and coins by Rs. 70 crores in one year (out of a total increase in notes in circulation and coins of Rs. 177 crores) in the hands of the rural population shows that banks have failed to mop up the increased liquid funds available to the people. A distribution of the liquid funds according to the income scale will show if all the new liquid funds are scattered in the hands of the lower income brackets in driblets or they are in the hands of a few rich people. This analysis of the data is awaited and this detailed study may become available by the middle of the current year.

INVESTORS' GUIDE

Kothari's Economic Guide and Investors' Handbook of India, 1963: Compiled and Published by Kothari and Sons; Price Rs. 50/- Pp. 2592.



The Investors' India Year-Book 1963: Compiled by Place, Siddons and Gough (Private) Ltd.; Published by Orient Longmans Ltd.; Price Rs. 25/- Pp. 400.

The 25th edition of Kothari's voluminous compilation is a comprehensive source of information regarding year-to-year performance of the corporate sector. The working results of nearly 4,000 companies have been tabulated to provide comparative figures for the last seven years up to the end of 1962 along with other information like the names of directors, registered offices, capital structure, etc. It also contains a general review of the economy and brief commentary on the performance of the public sector, the Central Budget 1963-64, the Compulsory Deposit Scheme and the Gold Control Rules. The statistical section, illustrated with graphs, contains data on the movement of share prices, foreign collaborations and licences granted.

The 49th edition of the Investors' India Year-Book has been brought up-to-date by the inclusion of facts from the latest reports issued by various companies as well as the new companies that have come into being. Facts like the capital structure and the directors associated with each company have been documented with considerable care. The section under 'Miscellaneous Companies,' which includes paper, engineering, chemicals and metals industries, is rather long. A break-up into separate sections can definitely be of added assistance to the readers. The volume contains additional information relating, for instance, to new issues offered during the year and the price movements of important shares.

World American Firm with Branches in all continents seeks contacts with important Firms specialized in precious gem-stones (emeralds, rubies, sapphires). Make written offers to **Eastern Economist, United Commercial Bank Bldg., Parliament Street, New Delhi.**

Day by day, month by month, the face of India changes fast. Mighty steel penstocks guide the rushing river waters to turn the turbines to produce electric power. Massive generators, dotted across the country, send this power vibrating along wires to turn the wheels of industry. Electric lamps are switched on in village homes. Long lines of steel pipes girdle vast stretches of land, carrying water to thirsty villages and liquid gold to refineries. Automatic signals guide rolling wheels along a criss-cross of steel tracks. Radio waves race across the skies to help mighty Jet planes land on our soil with their precious cargo. And thus a nation steps out to tomorrow.

As electrical and mechanical contractors and maintenance specialists on behalf of leading West German manufacturers, we too are contributing our bit towards building a new India.

COMPANY MEETING

THE STATE BANK OF INDIA

Speech of the Chairman, Shri B. Venkatappiah, at the Ninth Annual General Meeting of the Shareholders held in Bombay

Gentlemen,

I welcome you to this meeting and am glad of the opportunity to tell you of the progress which the State Bank of India and its Subsidiaries have made since we met a year ago. More specifically, we are concerned today with the Report of the Central Board of Directors of the State Bank of India for the year 1963, the Bank's Profit and Loss Account for the same period and the Balance Sheet as at 31st December, 1963. You have already had an opportunity of perusing these documents.

2. Last year we met under the shadow of Chinese aggression. The impact of that event on the economy of the country and, of particular relevance from our point of view, the dislocation caused to the normal operation of credit in certain sectors are no doubt still fresh in your mind. As I then told you, we immediately took several measures in collaboration with trade and industry, with the Reserve Bank of India and with Government. This was in order to ensure that credit, both medium-term and short-term, was available in appropriate form and adequate quantity in what were then regarded as the more vulnerable areas; that the distribution of foodgrains, whether by Government, Co-operatives or the trade, was suitably and promptly financed; that the manufacturers of goods and equipment for meeting the defence needs of the country were assisted with credit in all the ways open to the Bank and that such assistance was especially directed, for here the need was greatest, to small and medium entrepreneurs engaged in defence industries; that special attention was devoted to export credit with a view to stepping up exports, since, as I said last year, a new dimension of gravity had been imparted by the National Emergency to the problem of foreign exchange; that the Bank and its Subsidiaries, through every single one of their branches and offices — and these together now number 1,644 — participated in the countrywide work connected with the collection of funds, gold and valuables for the defence effort; and, last but not least, that special facilities, also on a country-wide scale, were made available to the members of the Armed Forces in the matter of maintenance of accounts and remittance of moneys to families and dependents. I am glad to be able to report to you that in all these respects we succeeded in acting promptly, helpfully and in large measure effectively. In what follows I shall tell you of our other and more usual activities, those relevant to us as the biggest commercial banking organisation in the country: one, moreover, which has been enjoined by its charter to keep in mind both its commercial character and the public interest. I shall endeavour to review briefly not only the financial results of the year's working — these are satisfactory in so far as we have more than maintained our profits — but also our total performance, firstly in relation to our normal banking activity and secondly with reference to those spheres of development which have all along claimed our special attention. Further, I shall try, in continuation of what I said last year, to indicate as succinctly as I can the progress we have made in other matters pertinent to our own growth and efficiency such as recruitment and training, premises and housing, personnel welfare and personnel relations, delegation and decentralization.

3. In comparison with 1962 we earned substantially more in 1963. Our income went up for two principal reasons. The main one of course was expansion of business. The advances touched a new peak: Rs. 309 crores in 1963 as against Rs. 289 crores in 1962. I may mention in passing that in the current busy season, that of 1964, advances have already passed the 325-crore level. The other factor which contributed to increased earnings was the modification which we effected in our lending rates from the close of business on April 5, 1963, so as to bring them into greater conformity with prevailing conditions, including the already enhanced Bank Rate, as also of course our own needs. The State Bank of India Advance Rate was accordingly raised from 5 per cent to 6 per cent. But the increases actually effected were graduated. Little or no addition was made to the higher ranges of interest rates charged by the Bank and the full rise of 1 per cent was confined to the lowest range. Moreover, certain types of advances continued to be concessionary in the matter of interest. On loans to Small Industries, for example, the rates were stepped up only marginally; and on advances to Co-operatives they were retained at broadly the same level as before. We earned more than we did in 1962 not only on interest and discount but also on commission, exchange and brokerage. It will be seen that after allowing for all the usual and necessary provisions from the resultant earnings, our income has increased by Rs. 2.79 crores to Rs. 25.37 crores in 1963.

4. I have referred to certain needs which, along with other factors, necessitated a modification of our lending rates. These were two. The first was connected with our deposits and the second with our wage bill. Our policy in regard to deposits is quite simple. We do not want to enter into undesirable competition with other banks, that is to say competition which is either unhealthy in itself or harmful to the economy. At the same time, in the important process of building up our own deposits, we propose to make every effort, along with other banks, to attract savings and bring them increasingly into the banking system. Accordingly, as one such measure, we raised the rate of interest on various categories of fixed deposits and savings deposits by ½ per cent during the course of the year. On the same date as we effected this, viz., April 1, 1963, we reduced the minimum acceptable amounts of call and short-term deposits from Rs. 1 lakh to Rs. 25,000 and introduced for the first time fixed deposits for periods of 24 and 36 months. Our deposits have increased. If demand and time deposits are taken together, there was an increase of Rs. 25 crores from Rs. 496 crores in December 1962 to Rs. 521 crores at the end of 1963. These figures however do not take into account the transfer of P.L. 480 Funds to the Reserve Bank of India. This transfer was of the order of Rs. 20 crores in 1962 and Rs. 42 crores in 1963. If P.L. 480 Funds were excluded altogether for 1962 and 1963, the increase in aggregate deposits was Rs. 69 crores in 1963. Of this, time deposits accounted for an increase of as much as Rs. 48.8 crores. The enhancement of our rates of interest on deposits, together with the larger quantum of deposits on which interest has had to be paid, accounts for an increase of about Rs. 95 lakhs in our expenditure. There is another big item of increase. I have referred to recruitment. We have a fairly large backlog to make up. Also we have a further and very considerable branch expansion programme ahead of us. We have assessed our needs and drawn up and started implementing an intensive plan of recruitment at both clerical and supervisory levels. I mentioned last year that apart from the increases

effected in the salaries and allowances of those governed by the Award, we had found it necessary to revise the pay scales and otherwise improve the emoluments of various categories of our supervisory personnel. For some of these categories, the full year's cost of such revision is reflected in the expenditure for 1963. On all these counts and others, including the increased dearness allowance payable under the Award in relation to the cost of living index, the establishment bill has gone up by Rs. 1.43 crores. In all, as compared with 1962, our expenditure has increased by Rs. 2.73 crores to Rs 22.62 crores.

5. Income being Rs. 25.37 crores and expenditure Rs. 22.62 crores, the net profit for 1963 is Rs. 2.75 crores (as against Rs. 2.69 crores for 1962). Together with the balance of Rs. 0.46 crore brought forward from last year, the sum available for appropriation to various heads, including dividend to shareholders and bonus to staff, is Rs. 3.20 crores. The dividend has been maintained at the same level as in the previous year, viz., Rs. 23 per share, subject to deduction of tax. This accounts for Rs. 1.29 crores. The bonus to staff is broadly on the same basis as last year, viz., two months' salary; the actual amount provided is however larger than last year's—Rs. 82 lakhs against Rs. 72 lakhs — because of the increase in the number of employees and the increments meanwhile earned by them. To the Reserve Fund has been added the same amount as in 1962, viz., Rs. 55 lakhs. Lastly, a sum of Rs. 5 lakhs has been transferred to the Staff Welfare Fund and an equivalent amount to the Staff Co-operative Housing Fund. These provisions too are identical with those made last year.

6. It will be convenient if I refer at this stage to our Subsidiaries. They have made progress in various directions. An outstanding measure of reorganisation, as you are aware, was the establishment on January 1, 1963, of the State Bank of Bikaner and Jaipur. This institution, which in effect combined the State Bank of Bikaner and the State Bank of Jaipur in one large unit, is now in a position to serve more effectively than before the entire State of Rajasthan. In their traditional operations no less than in the developmental sphere, the performance of the Subsidiary Banks has been a noteworthy one. The number of offices of the seven Banks together rose from 519 at the end of 1962 to 568 at the end of 1963. Also in the aggregate, their deposits rose by over Rs. 13 crores to Rs. 156 crores and their advances by about Rs. 4 crores to Rs. 75 crores. There was an increase in profits from Rs. 58.50 lakhs in 1962 to Rs. 67.97 lakhs in 1963. The State Bank of Travancore has raised the rate of dividend from 5 per cent for 1962 to 6 per cent for 1963. The State Bank of Patiala, which had not declared any dividend for 1962, has been able to declare a dividend of 5 per cent for the year under review. The State Bank of Saurashtra, while once more not declaring a dividend, has nevertheless taken opportunity to strengthen its reserves further. The other Subsidiaries maintained the same level of dividend as in the previous year.

7. I will now turn to the programme of Branch Expansion of the State Bank of India and in the same context deal with connected topics such as premises, recruitment and training. As mentioned in the Directors' Report, the Bank had 4 Local Head Offices, 733 Branches and 332 Sub-Offices in India at the end of 1963. It had besides an office each in London and Colombo and five offices in Pakistan. In all, therefore, the Bank had 1,076 offices at the close of the year which together with the 568 offices of the Subsidiaries make a total of 1,644, a figure I have already mentioned, for the entire organisation. During the course of the year the State Bank of India increased the number of its branches by 29 (of which 20 were under the Expansion Programme) and of other offices by 37. In consultation with Government and the Reserve Bank of India the Bank has now entered, as from January 1, 1964, on a new five-year phase of planned expansion comprising 75 branches (to be opened before the middle of 1965 under the previous programme) and 319 branches (to be opened before the end of 1968 under the new programme), making a total of 394 or nearly 400 for the next 5 years. This is as big a project of expansion as the State Bank had undertaken on its establishment and successfully executed during 1955-60. It is at the same time more complicated in many ways. Suitable buildings are hard to come by in the smaller towns. Personnel has to be recruited and trained. Inter-branch accounts and their reconciliation, if only because of the number of Branches and offices involved, will present further complexities. The farther the Bank goes into semi-urban and rural areas the greater will be the need for it to evolve new techniques whether for mobilisation of adequate deposits or disbursement of appropriate credit. These difficulties are real but it is my firm faith that they are not insurmountable, provided always that, in finding solutions, we are allowed a perspective that is long enough. Endeavouring to act on this assumption we have already done some planning and taken certain measures. Premises Divisions have been constituted both in the Central Office and at the Local Head Offices in order to devote special attention to finding suitable sites and buildings, constructing our own premises if needed and, incidentally, renovating existing branches wherever that may be necessary from the point of view of improved customer service or better working conditions. A Committee has recently made detailed suggestions in all these respects and the recommendations are being implemented. I have earlier referred to the larger programme of recruitment at different levels which is already in operation. Further, we have revised and expanded our scheme of training. There is now a three-level training programme for the officials and a two-level programme for the clerical staff, with special courses for different categories wherever appropriate. The three-level programme consists of a preliminary and induction course, an intermediate course and a senior course, while the two-level programme consists of an induction course and an intermediate course. We have now, apart from the Staff Training College at Hyderabad, 4 residential training schools at Patna, Indore, New Delhi and Nagapattinam, in addition to 3 training schools at Local Head Offices and 10 zonal centres. With these training facilities as also the training arrangements provided by outside agencies in India and abroad, it has already been possible to train over 1,600 clerks and about 200 officers during the year. We have taken certain steps to simplify the accounting procedures which operate in and between our branches. For devising the further measures of reform that will no doubt be called for in this context, as also for dealing in a planned manner with the long-term problems of the Bank generally, a Planning, Organisation and Methods Division has been recently constituted in the Central Office with appropriate personnel. Lastly, in regard to the mobilisation of deposits in the rural areas and elsewhere we are experimenting at several centres, keeping always in view the need, firstly, to improve customer service, secondly, to employ suitable forms and media of communication and, thirdly, to ensure that the cost is commensurate with the results. I may mention in passing, though this has specific reference to the Subsidiaries, that a Committee has been asked to investigate and report on the subject of mobilisation of rural deposits in relation to the area covered by the State Banks of Mysore, Hyderabad and Travancore. The Committee has recently submitted its report.

8. Against the background of wider economic planning, may I at this stage take the opportunity of welcoming some of the new financial institutions which have been or are about to be established? I refer to the Unit Trust in its bearing on investment, the Export Credit and Guarantee Corporation from the point of view of export trade and the Development Bank in relation to industry. These will fill existing gaps in institutional assistance and I have no doubt that, in more

than one context, the State Bank of India will be able to collaborate fruitfully with the new institutions as it does with those already in the field. It is pertinent to mention here that our advances are now increasingly industry-oriented, while at the same time there is no decrease in the quantum of the credit we make available for trade and commerce. In relation to the total advances of the Bank, industry accounted for 72.1 per cent in 1962. This percentage has increased to 75.1 in 1963. Further, about 30 per cent of the advances to the industrial sector were utilised by basic industries such as iron and steel, heavy engineering, cement, and fertilisers, and about 18 per cent by export-based industries like jute textiles. We have not of course neglected agriculture and food. Thus the jute buffer stocks financed by us accounted for more than Rs. 7 crores and the advances to State Governments for financing the distribution of foodgrains aggregated Rs. 13.5 crores. In the important sector of small-scale industry, our total credit commitments now aggregate Rs. 17.6 crores, so far as working capital is concerned. I would point out that this figure is exclusive of advances granted to small units of a traditional type such as rice and oil mills. You are aware that the facilities we now offer to small industrialists include medium-term loans and instalment credit. Further relaxations have been made in granting accommodation against supply bills drawn on the Directorate General of Supplies and Disposals. Also, where small units have secured order from Government, we are arranging to ensure, by entering into a fresh agreement with the National Small Industries Corporation, that the units can obtain further facilities from us by way of advance payment for purchase of raw materials. We are thus continuously examining the scope of increasing our assistance to small entrepreneurs and have implemented a number of measures suggested in this context by the Study Team to which I made a reference last year. Further, in this sphere of our activity even more than elsewhere, we have been laying stress on simplification and improvement of procedures, introducing flexibility in our operations in order to meet the varied requirements of the small entreprencurs, training our field staff specially for this purpose, and strengthening our staff position, in branches and Local Head Offices, so that the work is attended to with efficiency and promptitude.

9. We have made some progress in the financing of co-operatives, and the total credit limits sanctioned by the Bank to all types of co-operative institutions increased from Rs. 33.4 crores on September 30, 1962 to Rs. 45.2 crores on September 30, 1963. In addition to the several types of credit facilities already provided, we started during the year to finance primary co-operative consumers' stores through co-operative financing agencies, in addition to the wholesale consumers' co-operative stores we had already been financing. Other new measures we initiated during the year include the extension of term loan facilities to industrial co-operatives and the financing, on certain conditions, of labour contract and construction co-operatives. Advances against warehouse receipts issued by Central and State Warehousing Corporations declined to some extent in the course of the year. It may be noted in this connection that the advances had been brought within the purview of the Reserve Bank's Selective Credit Controls. It is nevertheless my belief that there is considerable scope for improvement in this business provided the warehouse receipt commands the unqualified confidence of depositors and lenders and thereby wins general acceptance and circulation as an instrument of credit. I have no doubt that the Corporations are cognizant of the steps which have to be taken in order to bring about such confidence. It goes without saying that, in the absence of such steps, the Bank itself is helpless in the matter of promoting the usefulness, much less the popularity, of warehouse receipts.

10. Last year, I referred to the need as well as scope for building up an enduring and harmonious relationship between the staff and the management. We have since taken several measures to this end. Firstly, in order that the issues might be clarified dispassionately and a programme of further steps drawn up constructively, we held in July-August 1963, with the assistance of experts on the subject, an internal seminar on Management-Staff Relations. This was attended by those in the top management and other officers who were handling staff matters. In pursuance of the discussions in the seminar we are exploring the possibility of having regular consultative meetings between management and staff at various levels, as also of evolving other relevant procedures. These matters are being discussed with the representatives of the Staff Federation and I hope that suitable arrangements will soon be agreed upon. It is needless for me to say that, important as all such procedures will be, the spirit behind them — a spirit of understanding and co-operation between Management and Staff — will be much more important. We have already made some headway in the matter of staff welfare following our discussions with the Staff Federation and the evolution of an arrangement for the utilisation of the Staff Welfare Fund. Further, we have decided to encourage the formation of consumer co-operatives at important centres so that all employees might obtain their requirements of foodgrains and consumer goods at reasonable prices. Two such consumer stores have already been started — one at Madras and the other at New Delhi — and a few more are likely to be established shortly. While the Bank will help to establish these co-operatives by providing premises and other necessary equipment and facilities, what is contemplated is assistance of such a nature as would enable the societies to develop into autonomous and truly co-operative organisations within as short a time as possible. I am glad to be able to say that appreciable progress has been made in the matter of staff co-operative housing. In all, 49 co-operative housing societies have been established at 39 centres. Buildings have been completed in 3 cases and are under construction in about 20 cases. Loans are sanctioned on concessionary terms and in suitable instalments by the Bank. The loans sanctioned amount to Rs. 68 lakhs and those already utilised to Rs. 42 lakhs. Before leaving the subject of personnel I would compliment all categories of the staff on another year's good work put in by them. I would also thank them for their devotion to the interests of the institution.

11. I should like, before I conclude, to make a brief reference to the State Bank of India (Amendment) Bill, 1963, which was introduced by the Finance Minister in the Lok Sabha on December 21, 1963. The Bill seeks to facilitate further delegation and decentralization in the State Bank. It contemplates the creation of a larger number of Local Head Offices as and when the need arises. With this possibility in view it provides for certain changes in the composition not only of Local Boards but also of the Central Board. It seeks to vest certain specific powers in the Local Boards; in addition, the Central Board may delegate other powers, but in either case the exercise of the powers is subject to any general or specific directions which the Central Board may give. As the Statement of Objects and Reasons points out, the business and activities of the State Bank of India have expanded considerably since the Bank was established on July 1, 1955, and the provisions of the Bill are designed to enable the Bank to dispose of its business efficiently and expeditiously.

12. In conclusion, both on behalf of my colleagues on the Board and myself, I would pay a tribute to the very valuable services rendered to the Bank by Prof. D. G. Karve, first as Vice-Chairman and for the last two years as a Director of the Bank. He leaves us on relinquishing his assignment as a Deputy Governor of the Reserve Bank. I welcome at the same time Shri M. R. Bhide who has taken the place of Prof. Karve both in the Reserve Bank and on the Board. I would also record our high appreciation of the services rendered to the Bank by those who, during the year, ceased to be Directors of the Central Board or Members of the Local Boards.

Balance Sheet of the State

REPORT OF THE AUDITORS

TO THE PRESIDENT OF INDIA,

We, the undersigned Auditors of the State Bank of India, appointed under Section 41(1) of the State Bank of India Act, 1955, do hereby report to the Central Government upon the Balance Sheet and Accounts of the Bank as at the 31st December, 1963.

We have examined the above Balance Sheet and the Profit and Loss Account and the Accounts relating thereto of the Central Office and the Local Head Offices at Bombay and Calcutta and the Returns submitted and certified by the Secretaries and Treasurers of the Local Head Offices at Madras and New Delhi, by the Manager, Pakistan Branches and by Branch Agents, which Returns have been incorporated in the above Balance Sheet and Accounts, and report (i) that, in our opinion, the Balance Sheet is a full and fair one, containing all the necessary particulars and properly drawn up so as to exhibit a true and correct view of the affairs of the Bank, according to the best of our information and the explanations given to us and as shown by the Books of the Bank; (ii) that where we have called for any explanation or information such explanation and information have been given to us and have been satisfactory; (iii) that the transactions of the Bank which have come to our notice have been within the powers of the Bank; (iv) that the Returns received from the Local Head Offices at Madras and New Delhi and from the Branches of the Bank have been found adequate for the purpose of our audit; (v) that the Profit and Loss Account shows a true balance of profit for the period covered by such account; (vi) that, in our opinion, the balance Sheet and Profit and Loss Account are drawn up in conformity with the law; and (vii) that, in our opinion, Books of Account have been kept by the Bank as required by law.

The audit of the Books and Accounts of the Central Office has been carried out jointly by Messrs. S. B. Billimoria & Co. and Messrs. Ray & Ray. The audit of the Books and Accounts of the Local Head Offices has been carried out at Bombay by Messrs. S. B. Billimoria & Co. and at Calcutta by Messrs Ray & Ray.

12th February, 1964.

THE UNITED COMMERCIAL BANK, LIMITED

Registered Office: 2, India Exchange Place, Calcutta-1.

To be placed before the Members at the Annual General Meeting to be held at the Registered Office of the Company at 2, India Exchange Place, Calcutta, on Wednesday, the 8th April, 1964.

Report of the Directors

The Directors have pleasure in submitting their Twenty-first Annual Report together with the Accounts of the Bank for the year ended 31st December, 1963.

The net profit for the year, after providing for taxes and for all known and anticipated charges, and including Rs. 18,992-29 brought forward from the previous account, amounts to .. .. .. Rs. 76,61,861-95

The Directors have contributed further Rs. 2,00,000 to the National Defence Fund and Rs. 25,920 to the Sydenham College of Commerce and Economics Golden Jubilee Trust Fund, transferred Rs. 17,00,000 to the Reserve Fund and Rs. 4,00,000 to the Gratuity Trust Fund and provided Rs. 19,00,000 for bonus to staff. They now recommend the payment of dividend at Rs. 6 per share subject to deduction of tax which will absorb Rs. 33,60,000 leaving an unappropriated balance of Rs. 75,941-95 to be carried forward.

The Directors consider that it is desirable to capitalise a sum of Rs. 20,00,000 out of the sum of Rs. 40,00,000 standing to the credit of the share premium account and they have accordingly applied to the Controller of Capital Issues for his consent in this behalf. The Directors now await the final outcome of this year's budget proposals relating to the taxation of bonus shares before taking further action.

During the year branches of the Bank were opened at Dum Dum and Jadavpur in Calcutta, Santa Cruz and Warden Road in Bombay, Theagaroyanagar in Madras, Shivaji Nagar in Poona, Chawri Bazar in Delhi and at Anand, Roberteganj, Jammu, Mesra, Jharia, Vasco da Gama, Aurangabad, Cambay, Mavoor, Korba and Pinjore.

The Directors are thankful to the Shareholders and the clients of the Bank for their continued support. They also express their gratitude to the Bank's Advisers and Advisory Commitees for their able help and guidance.

Mr. P. D. Himatsingka who has been a director of the Bank almost since its inception, tendered resignation of his office as a Director in order to devote more time to his duties and work as a Member of Parliament. The Board have reluctantly accepted his resignation and wish to place on record their appreciation of the very valuable guidance and counsel given by Mr. P. D. Himatsingka and his unstinted devotion to the interests and welfare of the Bank.

Under Article 86 of the Bank's Articles of Association, Mr. M. P. Birla has been appointed as a Director to fill up the vacancy caused by the resignation of Mr. P. D. Himatsingka.

Mr. G. D. Birla, Mr. I. P. Goenka, Mr. Y.N.Mafatlal and Mr. R. L. Nopany retire by rotation under Article 92 of the Bank's Articles of Association. Mr. G. D. Birla, Mr. I. P. Goenka and Mr. Y. N. Mafatlal offer themselves for re-appointment. Mr. G. D. Birla has attained the age of 69 years and special notice of a resolution for his re-appointment has been given in terms of Sections 190 and 281 of the Companies Act, 1956.

As Mr. R. L. Nopany wishes to retire from all active business he does not seek re-appointment. The Board have accepted his decision with regret and wish to place on record their appreciation of the valuable guidance and counsel given by him during the period of his office. Notice has been received from some members of their intention to propose at the forthcoming Annual General Meeting that Mr. Mohanlal Nopany be appointed as a Director in the vacancy thus caused and the Directors recommend his appointment.

The Directors have also to report to you changes in the general management of the Bank. Mr. S. T. Sadasivan will relinquish his office as General Manager on the 31st March, 1964 and the Directors have, subject to the approval of the Reserve Bank of India, appointed in his place Mr. R. B. Shah, the present Deputy General Manager. The Directors place on record their appreciation of the valuable and meritorious services rendered by Mr. S. T. Sadasivan as General Manager of the Bank and the outstanding contribution made by him to the progress of the Bank during his term of office. A resolution has been proposed to be moved at the next Annual General Meeting to appoint Mr. S. T. Sadasivan as a Director and the Board welcome this resolution so that the Bank may have the benefit of Mr. Sadasivan's vast experience in banking.

The Directors also place on record their appreciation of the services of the Officers and Staff of the Bank during the year.

The Shareholders are requested to appoint Auditors for the current year and to fix their remuneration.

On behalf of the Board,
G. D. BIRLA,
Chairman.

CALCUTTA,

Report of the Auditors

TO MEMBERS OF THE UNITED COMMERCIAL BANK LIMITED

We have audited the attached Balance-sheet of The United Commercial Bank, Limited, as at 31st December, 1963, and the Profit and Loss Account of the Bank for the year ended upon that date, annexed thereto, in which are incorporated the Branch returns audited by the Statutory or other Auditors. The reports on the accounts of the Branches audited by other Auditors have been forwarded to us and dealt with in preparing our report in the manner considered necessary by us.

We report that:

(a) we have obtained all the information and explanations which, to the best of our knowledge and belief, were necessary for the purpose of our audit and have found them to be satisfactory;

(b) the transactions of the Bank which have come to our notice have been within the powers of the Bank;

(c) in our opinion, proper books of account, as required by law, have been kept by the Bank so far as appears from our examination of those books, and proper returns adequate for the purpose of our audit have been received from the Branches of the Bank;

(d) the Bank's Balance-sheet and Profit and Loss Account, dealt with by this report, are in agreement with the books of account and the returns;

(e) in our opinion, and to the best of our information and according to the explanations given to us, the said accounts give the information required by the Companies Act, 1956, in the manner so required for banking companies and, on such basis, the said Balance-sheet gives a true and fair view of the state of the affairs of the Bank as at 31st December, 1963, and the Profit and Loss Account gives a true and fair view of the profit for the year ended upon that date.

RECORDS AND STATISTICS

Savings and Investment Habits in West Europe

There was an interesting survey in the U.S. News and World Report recently, of the saving and investment habits of people in some European countries. The survey was based on reports from the Journal's correspondents in Geneva, London, Paris, Bonn and Rome. The following are some gleanings from this survey:

The first major investment of professional and middle-class individuals in Switzerland with savings is a family home—a well-equipped, solidly-built villa. Then the Swiss investor turns to securities. Between 30 and 40 per cent of the average investor's money goes into bonds yielding about 3.5 or 4 per cent. The remainder usually goes into common stocks or certificates of investment trusts which tend to spread the risk. Yields on Swiss stocks are low, averaging 1.67 per cent in mid-1963. Yields on chemical stock average about 1.05 per cent, with yield on bank stocks averaging 1.58 per cent and on stocks of engineering and insurance companies 2 per cent. Among Swiss investors' financial stability, a high degree of self-financing and strong competitive position are regarded as very important recommendations for a company than a high yield. Besides investing in Swiss companies, the more sophisticated investors also show an interest in outstanding American, British, German, French, or Benelux shares. Investment trusts, which made their appearance in the early 1950's, have been flourishing and at the end of 1962, there were as many as 138 of them. Trusts that invest in American, Canadian and Common Market shares are very popular. Real estate trusts have also a strong following, especially among the middle class investors. Assets of these trusts have risen by 170 per cent in the past three years. There is great interest too in insurance and insurance annuities as investment. The ordinary person in Britain with savings often places funds in building societies, the soundest of which pay interest at 4¾ per cent. There has been a very sharp growth, of late, in unit trusts. Government bonds are a favourite form of investment in the case of small investors. These bonds can be bought to yield 5 per cent interest or offer the opportunity for prizes to be won in a weekly lottery. The big institutional investors—life insurance companies, in particular—have lately been increasing their holdings of interest-bearing bonds and reducing the proportion of money they have invested in common stocks. Among the individual investors, high-grade stocks offering assurance of stable dividends and some prospect for capital appreciation are favoured.

French Prescription

In France, the time-honoured prescription "1/3rd gold, 1/3rd stocks, 1/3 real estate" still seems to govern investment habits. Although the craze for gold which in days of a weak Franc stampeded the French into putting up to 50 per cent of their savings into the yellow metal, has certainly abated and the Franc is now one of the world's strong currencies, a Frenchman with a medium-sized fortune still would want to hold a minimum of 10 per cent of his fortune in gold. Common stocks have become less fashionable than they were in the earlier post-war years, but a typical French investor would nevertheless have about 40 per cent of his funds in stocks of good companies with strong dividend-paying records. A poll among the French families of the upper middle class showed recently that accumulated capital was invested in the following way: 59 per cent in real estate; 23 per cent in stocks; 11 per cent in bank accounts; 7 per cent in various types of durable goods.

In West Germany, the general preference is for solid investments of a kind that cannot be carried off by an invader or a victor in war. Title to land is valued most highly. Of all investments, bankers say, land is the one held most tenaciously. The Germans tend to invest at home and not abroad, and although many of them in post-war years have enjoyed large gains by investment in stocks of German companies that have had sensational records of growth, there is not the same confidence in investment that is found in other countries.

The report from Rome is that the Italian people at the present time are showing little confidence in any form of investment within their own country. Among reasons for this lack of confidence are fear of more inflation, fear of further nationalisation of industry, discouragement over future business prospects and high interest rates for borrowers. The Milan stock market has continued a downward trend, while prices of most other exchanges of the world have pointed upward. The perfect investment has been, and continues to be, real estate.

Broad Trends

The Journal noted the following broad trends in West European saving habits:

The popularity of common stocks among individual investors seems to be high in Switzerland and France, less keen in Germany and the U.K. and tending to decline in Italy. Bank accounts are an important outlet for private savings in Switzerland where savings of this category increased by 10 per cent in 1962. It is not uncommon for a Swiss to hold three, four or even more savings books. In Italy too, despite a recent tendency for bank deposits to edge off owing, in part, to a flight of capital, the savings bank still is the most common place for an Italian to put his money. In contrast, British investor has not taken to bank accounts in a big way. Most ordinary banks in that country are not interested in attracting savings deposit accounts and until recently there was almost no competition for such deposits.

Real estate seems to enjoy the highest rating as a form of investment in all the five countries. As a result, there is a speculative boom in land values. In Switzerland, apartment houses now yielding between 5 and 5.5 per cent are considered good place to put money, while first class mortgages, in heavy demand for investment purposes, now carry interest, probably the lowest, now subsidized, rate in the world. In Britain too investment in real property has been on a large scale, but real estate, having gone through a sharp rise in prices, does not offer any longer the same opportunity for appreciation. In France, rental incomes have been sky-rocketing with explosive effect upon real estate. A well-to-do Frenchman with, say, $200,000 of accumulated capital, probably would have around 25 per cent in real property. Germans, like most other Europeans, have invested heavily in land and owners usually are reluctant to sell even at a high profit. In Italy, in cities such as Milan or Geneva, it is common to pay $250 or more per square yard for an apartment site. In Rome, land for building can cost $50 or even $100 per square yard. Apart from the Swiss, the British investor seems to have more use for insurance as a form of investment than most other Europeans.

The French addiction to gold is, of course, notorious and it is interesting to observe that only in two other countries among the five surveyed, that is Germany and Italy, is gold of any importance as a store of popular savings. The Ger-

man use of gold for hoarding purposes, however, has not been very considerable, while in Italy gold is stated to be declining in interest because investors have been disappointed too often during recent years over failure of gold prices to be revalued upward.

The continuing search for a hedge against inflation has created a rise in market for paintings, tapestries, rare books and rare coins in all the countries surveyed. But it is probably in Britain that paintings, particularly by established modern artists, have been most fancied as a store of value. In France too art has attracted investment attention and it is not uncommon that about 10 per cent of a fortune is in the form of carefully selected paintings or sculptures.

Where, however, the French really score is in the remarkable ingenuity they are showing in exploring or exploiting investment opportunties. It is not only that the French will even buy a share in a race horse, but that renting freight-car to the French National Railways through companies set up for the purpose has come into fashion as a form of investment activity. Investors, either individually or jointly with others, could buy a freight car for about $80,000 and hire it out for a return of about 10 per cent. A French investor could also buy part of a forest and either lease it or work it himself.

The Task Before Geneva Meet

THE PROBLEMS to be discussed at the forthcoming United Nations Conference on Trade and Development have far-reaching implications for the economies of less-developed countries. While the industrialised countries have in recent years shown awareness of the urgency and importance of these problems, success will depend in no small measure on the ability of the less-developed countries themselves to evolve a common approach and to pursue it, as a group, in a spirit of unity and determination.

The following are some of the major problems which the underdeveloped countries are facing. The Geneva Conference on Trade and Development will be discussing these issues:

(i) Over the past decade, the share of the less-developed countries in the world trade has steadily declined and their trade deficit has grown. The increase in their export earnings has been far from commensurate with the requirements of their development programmes and the resources needed to service their growing external indebtedness. Since primary commodities constitute the core of the export trade of most less-developed countries, the Conference will have to give high priority to the problems relating to these commodities.

The Conference will be required to take note of the continuing restrictions on trade in primary commodities and the development of substitutes, and will have to find some basis for an international understanding to contain this grave and continuing menace to the already low standards of living in the producing countries.

Scope for Development

(2) It is equally important that the less-developed countries should have adequate scope for developing processing industries based on their own raw materials. It is essential, therefore, that both in respect of domestic production and external trade, the developed countries should pursue policies which will create wider opportunities of trade for less-developed countries in those lines of production for which these countries by virtue of their resources endowment have a decisive advantage.

(3) Inter-Governmental commodity arrangements involving regulations of imports and exports have hitherto been regarded as a suitable means of dealing with only one aspect of the commodity problems, namely, the tendency towards over-production. This ignores the fact that some of the major difficulties of less-developed countries in implementing their development plans have arisen from the cyclical swings in primary prices and the steady worsening of their terms of trade in relation to the industrialised countries. It is thought that stability of primary product prices and an improvement in the terms of trade received by less-developed countries should be among the principal objectives of international economic policy and inter-governmental commodity arrangements should be initiated with these specific objectives. It should be recognised that the primary producing countries are entitled to take suitable co-operative action to improve their terms of trade. An equally important objective to be kept in view is to enable primary producing countries to enlarge their share in the world consumption of commodities covered by the inter-governmental arrangements. The progress so far made in tackling commodity problems through such arrangements has been somewhat disappointing. Many primary commodities have yet to receive adequate attention. Inter-governmental arrangements have also an important role to play in expanding the markets for primary commodities through development of new uses and disposal of stock-piles. The discussions at the forthcoming Conference should result in a simplified procedure for the conclusion of inter-governmental commodity arrangements and widening their scope to deal more effectively with the problems confronting the primary producing countries.

162867

Export Earnings

(4) For the foreign exchange resources required for their development programmes, the less-developed countries depend partly on their export earnings and partly on inflow of capital and economic aid. Consequently, a deterioration of their terms of trade upsets the financial basis of their plans. This question has been engaging the attention of experts in U.N. and other forums and certain schemes of compensatory financing have been formulated. The practical implications of these schemes still remain to be worked out. This question will have to be viewed and studied in the context of the entire problems of financial aid for economic development.

(5) Another direction in which a joint effort by the underdeveloped countries will be needed to achieve any significant results is the pushing forward of the Action Programme adopted by the GATT Contracting Parties. Effective implementation of this Programme is bound to be of benefit to the trade of all less-developed countries regardless of whether or not they are parties to the GATT. The programme visualises action on the following lines:

(i) Removal of duties and establishment of duty free regime for tropical products and primary commodities.

(ii) Progressive and rapid removal of internal taxes and revenue duties on primary commodities as well as products wholly or mainly produced by developing countries which by increasing consumer's cost go to inhibit consumption.

(iii) Removal of quantitative and other restrictions maintained by industrialised countries on imports from less-developed countries.

(iv) Substantial reduction in customs duties imposed on imports of semi-processed and processed products exported mainly by less-developed countries.

(v) Provision of facilities by industrialised countries for

exports of manufactured articles by less-developed countries and assistance to them in diversifying their economies and to increasing their foreign exchange earnings.

The programme has still to win unqualified support from certain advanced countries. A concerted effort on the part of the less-developed countries will be called for to secure an early implementation of this programme.

Preferential Treatment

(6) On the subject of preferences, a consensus has already emerged on the need for the products exported by less-developed countries being given preferential treatment in the world markets. Such preferential treatment will help these countries to overcome their competitive disadvantage in relation to the developed countries. It will also encourage the inflow of private foreign investment into the less-developed countries to take advantage of the improved opportunities for their export trade. The manner in which this principle is to be implemented is being studied in the GATT. Such preferential treatment might be extended to the products of all less-developed countries on an equal basis. In any case, there would be serious practical difficulties in operating a system of preferences varying according to the stage of development of individual less-developed countries or the competitiveness of their export industries. A preferential tariff is only one of the ways of assisting the trade and development of less-developed countries. Other forms of assistance, such as financial or technical aid, should be used to supplement preferential tariffs.

(7) Although the trade of centrally planned economies with the less-developed countries has grown rapidly in recent years, the full scope for the expansion of this trade has yet to be realised. The centrally planned economies are singularly well placed for implementing production and trade policies favourable to the economies of less-developed countries, with definite quantitative goals, and it is necessary that the less-developed countries should be enabled to reap the fullest benefit of this position. For this purpose, the role of bilateral agreements as a means of trading with the centrally planned economies needs to be clearly recognised. Moreover, the centrally planned economies need to be pressed to assume obligations for a larger off-take of goods from the less-developed countries. There is also need for the centrally planned economies to review their internal taxes and pricing policies with a view to increasing the consumption of goods exported by the less-developed countries.

(8) The less-developed countries need technical assistance in expanding and diversifying their export trade. However, the developed countries have hitherto been reluctant to provide such assistance. Since an increase in the foreign exchange earnings of less-developed countries automatically results in an increase in their imports, it is to the advantage of the developed countries and world trade generally that the less-developed countries should receive adequate assistance in developing their export trade. It will be desirable if concrete suggestions for such assistance are formulated for consideration at the Conference.

(9) In recent years, the trend towards formation of regional economic groupings has been growing. Such groupings among the developed countries have repercussions on the trade of less-developed countries and create difficult problems of adjustment for them. The rules laid down in the GATT have proved somewhat inadequate in this context. The Conference will be required to devise arrangements to ensure that economic groupings, particularly among the developed countries, will in future follow policies which will be outward-looking and favourable to the trade of the less-developed countries.

(10) It is well known that the less-developed regions are dependent on the shipping of highly developed countries. This has a dual effect on their trade: Firstly, the element of freight is often of decisive importance in enabling a commodity to be exported in competition with other countries. It often happens that high and/or discriminatory freight rates of the Conference frustrate the export promotion efforts of less-developed countries. High freight rates on imported goods also add to the cost of developmental imports. Secondly, shipping is an invaluable foreign exchange earner and an important item of "invisible export". It is, therefore, necessary for the less-developed regions to expand their merchant fleets. This, however, takes time since acquisition of tonnage requires heavy expenditure of foreign exchange. The question which needs urgent consideration at the Conference is whether immediate steps could be taken to devise a method or machinery by which the shippers of the less-developed regions could discuss and negotiate with the ship-owners of the highly developed areas so that the export promotion angle of the developing countries is not ignored particularly in regard to sensitive commodities whose export depends upon the freight element. At the present moment since each maritime state of the less-developed area has to negotiate individually with the shipping Conferences, the latter pay little or no heed to the demands of one or two states. However, if a machinery could be set up by which the maritime states of the entire less-developed region could negotiate with the shipping Conferences, it may be possible to bring some sort of an effective pressure on the Conference to take into full consideration the requirements of the less-developed regions while increasing their freight rates or revising their freight structure in such a way as to avoid discrimination against the less-developed countries.

Industrial Licensing: Banned Items

THE UNION MINISTRY of Industry has revised the list of industries in respect of which applications for licences under the Industries (Development and Regulation) Act, 1951, may ordinarily be rejected without reference to the Licensing Committee. The new list, which will remain in force till June 30, 1964 is as follows:

A. ENGINEERING INDUSTRIES :

1. Agricultural implements (excluding Tractor drawn).
2. Air Compressors (Expansion of the existing units for compressors up to 700 cfm. will be permitted).
3. Aluminium Strips / Sheets / Circles / Sections / Foils/Rods (extruded).
4. Antimony.
5. Automobile Ancillaries* :
   - (i) Cylinder Liners.
   - (ii) Dynamos.
   - (iii) Electric Horns.
   - (iv) Fuel Injection Equipment.
   - (v) Gaskets.
   - (vi) Head/Tail and Side lamp fittings.
   - (vii) Inlet and Exhaust Valves.
   - (viii) Jacks (hydraulic, mechanical and manually operated) up to 100 tons capacity.
   - (ix) King pins.
   - (x) Leaf Springs.
   - (xi) Oil Seals.
   - (xii) Panel Instruments.

*Only expansion or diversification in the range of the same products of the existing units will be considered.

Available in Delhi at : SYLCO 11-E, Conn. Place; ORIENTAL TEXTILE CORPORATION, Madras Hotel Block, Conn. Circus; BHAGIRATHMAL & SONS, Opp. Bank of India, Ch. Chowk; RAJKAMAL EMPORIUM, 113-E, Kamla Nagar, Subzi Mandi and other leading stores.

Distributors in Delhi: SHIVLAL KANHAYALAL, Katra Nawab, Ch. Chowk; HAZURASINGH MANOHARSINGH, Katra Rathi, Nai Sarak; RUGGANMAL PURANCHAND, Katra Choban Ch. Chowk; RAKESH & RAJESH CO., Katra Rathi, Nai Sarak; ANAND SILK STORE, Katra Subhash, Ch. Chowk.

(xiii) Piston Assembly including piston rings and piston pins.
(xiv) Push Rods.
(xv) Radiators.
(xvi) Rocker Arms.
(xvii) Shackle pins.
(xviii) Spark Plugs.
(xix) Starter Motors.
(xx) Tappets.
(xxi) Thin Walled bearings.
(xxii) Valves for tyres and tubes.
(xxiii) Valve Springs.

6. Ball and Roller Bearings (except expansion schemes).
7. Barbed Wire.
8. Bare copper conductors.
9. Bare Copper strips.
10. Bicycles and Bicycle Parts (except expansion of bicycle tube valves by existing units).
11. Bifurcated rivets.
12. Bolts, nuts and rivets and H.T. bolts and nuts.
13. Brass/copper extruded pipes/tubes/rods/sections and sheets/circles/strips.
14. Calculating Machines.
15. Car Lifts.
16. C.I. Spun pipes.
17. Chaff Cutter Blades.
18. Cinema Arc Carbons.
19. Circles, sheets, rods & utensils of stainless steel.
20. Collapsible tubes & rigid containers.
21. Commercial vehicles (except expansion schemes).
22. Conductors (A.C.S.R./A.A.)
23. Conduit Pipes.
24. Conveyor Belting.
25. Copper — Virgin & wire for non-electrical purposes.
27. Crawler tractors.
26. Cotton and Hair Belting.
28. Domestic utensils.
29. Domestic Refrigerators.
30. Drawing of wire mild as well as special steel.
31. Drop Forged Tools.
32. Drums and barrels and tin containers excepting those for manufacturers' own requirements.
33. Electric Fans.
34. Expanded Metal.
35. Ferro-manganese.
36. Ferro-silicon.
37. Flash Light & Torch Containers.
38. Fork Lift Trucks and the like.
39. Heavy Earth moving equipments (only shovels).
40. Household appliances such as electric irons, heaters and the like.
41. Hurricane Lanterns.
42. H.T. Switch-gears 33 K.V. and above.
43. Jeep type vehicles and station wagons.
44. Kerbside petrol pumps.
45. Lead — virgin.
46. Meters — Single & Polyphase.
47. Miniature lamps (except automobile headlight lamps).
48. Motor Vehicles & Scooters, autocycles, mopeds & three wheelers.
49. Non-ferrous Alloys.
50. Non-ferrous Castings (including pressure die castings).
51. Pulp and Paper Making Plants — large and small scale, including wire-cloth for paper machinery.
52. Passenger cars.
53. Photoflash lamps.
54. Plates & Sheets (M.S.) — (except for main producers).
55. Railway wagons (except expansion schemes).
56. Razor blades.
57. *Refrigeration plant for industrial use.
58. Road Rollers (expansion and diversification of the existing units will be considered).
59. Rolling Shutters.
60. Room air-conditioners.
61. Rubber ply transmission belting.
62. Solvent Extraction plant.
63. Saws of all types.
64. Stationary Diesel Engines below 50 H.P. excluding marine diesel engines (except expansion schemes).
65. Steel Pipes and Tubes (welded).
66. Steel Doors & Windows.
67. Steel Sheets (Black) — galvanising and corrugation of (except for main producers).
68. Steel measuring tapes.
69. Strips Cold Rolled (M.S., Alloy Steel & Box strappings).
70. Steel — re-rolled products including wire rods.
71. Stranded Wire.
72. Sugar machinery (except milling plant and centrifugals).
73. Tea processing machinery.
74. Trailers (except expansion of existing units).
75. Tungsten carbide tips and intermediates thereof.
76. Twist Drills.
77. Vacuum Cleaners.
78. V.I.R. and P.V.C. Cables (except Power Cables).
79. Washing Machines (except industrial washing and dry cleaning machines).
80. Water Coolers.
81. Water Meters.
82. Welding Electrodes.
83. Welded Wire Mesh.
84. Wire — M.S. Med/H.C. and Special wire.
85. Wire nails.
86. Wire ropes (except expansion schemes).
87. Wood screws.
88. Zinc virgin.
89. Zinc Sheets/strips.

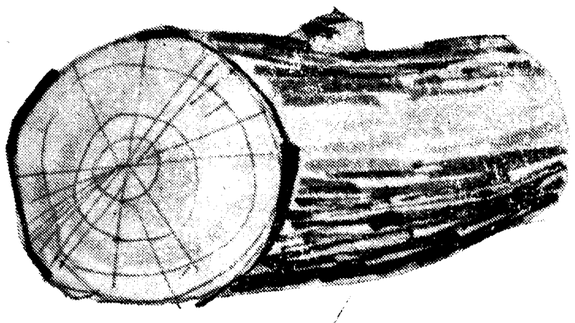
B. NON-ENGINEERING INDUSTRIES :

1. Abrasive grains including silicon carbide.
2. Acetic Acid.
3. Activated bleaching earth.
4. Alcohol — Power & Industrial.
5. Art Silk Weaving, hosiery, twisting, doubling and Synthetic yarn crimping/stretching.
6. Asbestos Cement Sheets and Pipes.

*(except in cases where manufacture of refrigerator compressor is envisaged in the very first stage and investment in plant and equipment is fully covered by foreign exchange participation on terms acceptable to Government.)

. Azo dyes.
. Barium Carbonate.
. Barium Chloride.
. Barium Nitrate.
. Barium Sulphate.
. Basic dyes.
. Beer.
. Beta Naphthylamine.
. B.H.C.
. Bichromates.
. Blanc Fixe.
. Borax and Boric acid.
. Bottles and vials (excluding Penicillin Vials).
. Calcined Petroleum Coke.
. Calcium Carbide.
. Calcium Carbonate (precipitated and activated).
. Camel Back.
. Camphor.
. Carbon Black.
. Carbon dioxide gas (other than by-product carbon dioxide).
. Carboxy Methyl Cellulose.
. Cashew Kernels (applications from new areas to be considered on merits).
. Cellulose Acetate flakes for moulding powder.
. Cellulose Film (Cellophane).
. Chip Board (Particle Board).
. Copper Sulphate.
. Cosmetics & Toileteries.
. Cotton mesh fabrics.
. D.D.T.
. Dissolved Acetylene Gas.
. Drugs & Pharmaceuticals :
  (i) Antibiotics -- Penicillin, Streptomycin & Tetracycline.
  (ii) Anti-dysentery drugs which are Quinoline derivatives).
  (iii) Bismuth Salts.
  (iv) Chloral Hydrate.
  (v) Cough Syrup.
  (vi) Empty Hard Gelatine Capsules.
  (vii) P.A.S. Acid and Salts.
  (viii) Salicylic Acid — Sodium Salicylate, Acetyl Salicylic Acid.
  (ix) Sulpha Drugs.
  (x) Surgical Adhesive Tapes.
  (xi) Synthetic Hormones and Intermediates.
  (xii) Vitamin 'A'.
  (xiii) Vitamin 'C'.
. East Indian Tanned (Semi-tanned) Kips & Skins.
. Fast Colour Bases.
. Fibre Board/Hard Board (including insultation Board).
. Fire works & Paper Caps.
. Gelatine (Edible, photographic & technical).
. Glass, Mineral wool and allied products.
. Glass fibre and products thereof.
. Glass — hollow-ware (semi-automatic).
. Glass — Table & Pressed-ware.
. Glass Tubes & Rods (Hand-made), Sheet-glass, Glass-bottles, wired/figured and rolled glass.
. Glazed Tiles.
. Graphite Electrodes.
. H.T./L.T. Insulators.
. Hoses (Vacuum brake).
52. Hoses — other types.
53. Hydrogen Peroxide.
54. Laminates (Industrial & Decorative including Malamine Laminates).
55. Lead Oxides.
56. Manganese Metal & Manganese Dioxide.
57. Match.
58. Methanol.
59. Menthol.
60. Myrobalan Extract.
61. Napthols.
*62. Newsprint.
63. Nitric Acid.
64. Organic pigments.
65. Oxygen Gas (as applied for cutting and welding of steel only).
*66. Paper and Paper Board.
67. Pesticidal formulations (except formulations based on B.H.C., Melathion, Zineb and D.D.T.).
68. P. F. Moulding Powder.
69. Phenol.
70. Photographic raw film and paper.
71. Phthalic Anhydride.
72. Plasticisers.
73. Polystyrene.
74. Polyethylene.
75. Polyvinyl Acetate.
76. Postassium Chlorate
77. Potassium Permanganate.
78. Processing (excluding printing) of cotton textiles.
79. P. V. C. resins/composition.
*80. Pulp (paper and rayon grade).
81. Rayon tyre cord yarn.
82. Reclaimer rubber.
83. Refractories.
84. Refrigeration gases.
85. Sanitary Ware.
86. Soap.
87. Sodium Bicarbonate.
88. Sodium Hydrosulphite and derivatives.
89. Sodium Sulphite, bi-sulphite and sulphide.
90. Sodium Thio Sulphate.
91. Sulphuric Acid.
92. Sulphur Black.
93. Sulphur Dioxide.
94. Sulphur Dyes — others.
95. Superphosphate (single and triple).
96. Synthetic Detergents.
97. Synthetic rubber (SBR Type).
98. Synthetic Tops.
99. Textiles made of art silk.
100. Tyres — Automobile.
101. Vacuum Flasks.
102. Vanaspati (except expansions of small and medium size units to achieve economic capacity).
103. Vat Dyes.
104. Vegetable oil other than cotton seed oil.
105. Viscose filament yarn.
106. Wool tops.
107. Woollen and shoddy yarn (except expansion schemes).
108. Woollen/worsted cloth.
109. Worsted/yarn.
110. Zinc oxide.

* Applications for substantial expansion from existing units as well as applications for setting up of new units in areas, where raw materials resources have remained untapped, would be considered on merits.



DUNLOP
HIGHWAY for highest
mileage on long heavy hauls

The Dunlop Highway Truck and Bus Tyre assures higher initial tread mileage on heavily laden long distance trucks and modern fast buses. And finally, when the tyre is worn smooth, the excellent retreadability of the casing means that it will continue to serve for many more thousands of miles.

DUNLOP HIGHWAY
for HIGHEST MILEAGE

Out of this log of wood

WESTERN INDIA PLYWOODS make the widest range of specialised plywoods and hardboards

Today modern industry and architecture demand woods in a variety of specially processed forms: aircrafts demand light yet strong plywoods; engine rooms require fireproof plywoods; radio cabinets need specially processed plywoods for resonance; building construction and coach building demand oil-tempered super hardboards. Western India Plywoods, the largest manufacturers of processed woods in India, make numerous varieties and sizes of plywoods and hardboards to meet such industrial, architectural and defence needs of our country. They are marketed under the trade names 'Westindply' for plywoods, and 'Weston' for hardboards. Other products include 'Wipex' paper laminates for table tops and dining tables, Flushdoors and Block Boards.

* * *

Chairs, table tops, panels, shelves, cup boards, flooring — Infinite is the scope of 'Westindply', 'Weston' and 'Wipex'

'Westindply' plywoods are made available in a wide variety of veneers to add charm and colour to the living room

Specially shaped compressed-wood seats—only Western India Plywoods make them in India — for railway coaches, supplied to the Integral Coach Factory, Perambur

The State of Our Defences

IN ITS ISSUE of October 4, 1963, *Eastern Economist* had the pleasure of complimenting the Defence Minister on his "two fine speeches in Parliament" on the NEFA reverses and the state of our defence preparedness then and subsequently. Those speeches were noted for their candour, realism and sincerity. These virtues were again in evidence in Mr. Chavan's reply to the debate in Lok Sabha earlier this week on the Demands for Grants for his Ministry. He emphasized the progress so far made in improving the defences of the nation. But at the same time, he did not hesitate to acknowledge shortfalls in vital areas of military preparedness.

A rough and ready yardstick of the strengthening of our national defences is, of course, the level of defence expenditure. In the Budget for 1963-64, an expenditure of Rs. 708 crores was provided on revenue account and a further sum of Rs. 159 crores on capital account, making a grand total of Rs. 867 crores. It was, however, known at that time that those amounts represented primarily the nation's desire and determination to mobilize its resources in the wake of the Chinese invasion in the closing months of 1962. It was recognized that, in practice, it might not be possible to utilise the allocations in full since the physical and organisational mobilisation might take longer to effect than the financial mobilisation. In subsequent months and by the end of 1963 it was becoming evident that the actual spending on defence would be somewhat less than the budget allocations. Consequently, it was really no surprise when in the budget for 1964-65 it was disclosed that the revised estimates for defence expenditure were Rs. 692 crores on revenue account and Rs. 116 crores on capital account. This meant that the Government would have spent in the year 1963-64 about Rs. 16 crores less on the revenue side and Rs. 43 crores less on capital account, adding up to a shortfall of Rs. 59 crores in all.

Nevertheless, both within Parliament and outside, there was a natural tendency to regard the surrender of allocations for defence as a measure of deficiency in planned preparedness. Consequently, some anxiety was voiced on this score. It is, however, necessary to realise that the merely financial *yardstick* has its limitations. For one thing as we had noted earlier the budget allocations last year were themselves symbolic to some extent. For another, it is common experience that the actual utilisation of allocations tends to be spread over a somewhat longer period than the 12 months contained in the financial year. Thus even without any particular deficiency in the defence effort, a certain extent of shortfall in actual spending in comparison with the budgetary figures is only to be expected. This apart, what is really relevant is that this country did succeed in spending in 1963-64 considerably larger sums on defence than it had done in 1962-63. Thus, on the revenue side the expenditure had gone up spectacularly from Rs. 425 crores to Rs. 692 crores, while on the capital side it had improved from Rs. 49 crores to Rs. 116 crores. Consequently, the stepping up of the defence effort achieved in the wake of the Chinese aggression cannot be unduly minimized even in financial terms.

At this stage, it ought to be more useful, therefore, to consider how effectively the money which was spent had been utilised. Here, the access which the public or even Members of Parliament have to information is necessarily limited. No useful purpose could, therefore, be served by going into secondary particulars or elaborating details. It is good to see that this principle was generally recognised in discussions in Parliament.

The tendency, wisely, was to concentrate on certain major indicators of the processes and progress of preparedness. The main questions were: Has the fire power of our ground forces been increased? Have communications in the forward areas been built up satisfactorily? Has the procurement of fighter and other aircraft of advanced design for the Indian Air Force made reasonable progress? What is the status of vital defence programmes, such as the organisation of six mountain divisions? At what stage is the work on the setting up of the six new ordnance factories? It is reassuring to find that all these important questions were asked at one time or another during the discussions in Parliament and that Mr. Chavan in his reply, made an attempt to provide honest, if not always reassuring, answers to all of them.

From the Defence Minister's reply two points of grave import became clear. One was that progress has been both below expectations and requirements in respect of the organisation of the mountain divisions, the setting up of the new ordnance factories and the acquisition of advanced aircraft for the Indian Air Force. Secondly, if progress in these vital spheres has so far not been as good as national security demands, it is largely because external assistance without which these particular resources of defence cannot be built up by this country in the short period has not been forthcoming to the needed or even to the promised extent. Thus, in the case of the mountain divisions, aid under the Nasau decision would only amount to 15 per cent of the total required for equipping six divisions. Similarly, in the case of the six new ordnance factories, it has so far been possible to process external assistance only in respect of one factory unit which is going to produce small arms and ammunition. The Defence Minister was careful not to make a complaint against any of the friendly countries which have offered assistance and he certainly took pains to express India's gratitude to such assistance as has been spontaneously offered and given when the nation was in dire need. Nevertheless, it is proper and necessary to record the fact that the Government of India does seem to have failed on the diplomatic front in acquiring to the full extent the external aid assumed in our defence programmes as basic to the fulfilment of those programmes.

This raises the important question whether the Government of India has any plan for correcting this grave lacuna or imbalance in its planning for national security. The same question applies also to the equipment of the Indian Air Force with advanced military aircraft. The Defence Minister made the reassuring declaration that a decision had been taken both on the size of the Air Force that would be required to protect national security and on a programme for building an Air Force of that size. He also made the equally important disclosure that the Government's notions of defence preparedness have swung over from the short heave to the long pull and that there is now a five-year plan for the expansion and modernization of our fighting forces and their auxiliary and ancillary services. An integral part of both decisions — that is, the decision about an adequate Air Force and the decision about a five-year defence preparedness plan — is the building up of defence industries, sufficiently varied and sufficiently sophisticated, within the country itself. All these are sensible and significant steps and it is good for national security and national morale that the Government has taken them.

But at the same time, it is necessary to ask whether our diplomatic resources would be more adequate in future than they had been in the past for the pursuit of our defence ambitions. It seems to us that it will be extremely difficult for this country to execute efficiently and reasonably quickly a programme of expanded and diversified defence production within the country without extensive external assistance in terms of capital equipment and technical skill. It belongs to the least satisfactory aspect of the Defence Minister's speech that he just did not seem to have anything at all to say about how the Government proposes to set about this question of acquiring sufficient external assistance. There was, no doubt, a reference to certain negotiations with the United Arab Republic, but we doubt that effort on this scale is proportionate to what the situation calls for. In the wake of the Chinese invasion, the United States and the United Kingdom had demonstrated a large readiness to come to our defence. In the subsequent negotiations on defence preparedness, again, there has admittedly been no unwillingness on the part of those two countries to collaborate in modernizing and expanding our defence strength for the purpose of resisting Chinese aggression. It has been conceded that the only material limitation placed on such Western assistance is that the arms and ammunition should be used only in hostilities with China. Considering that American military aid to Pakistan has been regulated on corresponding principles, this country has no ground for grievance and should, on the contrary, even find in such conditional assistance a useful safeguard of its own interests. The Government of India has shown good sense in accepting this condition. The question now remains why it has, nevertheless, been difficult for the Government of India to secure on an adequate scale the external assistance without which our defence preparedness may find it hard to get going. The Defence Minister's speech, unfortunately, did not, or could not, cover this crucial point, but it is clear that the defence debate cannot be regarded as having been truly completed until the Prime Minister or some other member of the Cabinet is in a position to stand up and say on behalf of the Government how it is proposed to deal with the diplomatic aspect of defence preparedness in a manner which is more satisfactory than has been the case so far.

Another important lacuna in the defence debate was the economic mobilisation aspect of defence preparedness. Mr. Chavan has always been insisting, and rightly too, that defence preparedness cannot be separated from the nation's economic base, from its economic capacities or technological capabilities. In his budget speech, the Finance Minister, Mr. T. T. Krishnamachari, took considerable pains to explain that a good deal of the amounts allotted for defence expenditure could be simultaneously effective in strengthening and expanding the economic and industrial structure of the nation. In the budget for 1964-65, an amount of Rs. 717 crores has been provided on the revenue side and a sum of Rs. 136 crores on the capital side for defence purposes. Although these projected expenditures are somewhat less than the budget estimates for 1963-64, they are appreciably higher than the revised estimates for that year and Mr. T. T. Krishnamachari has given the assurance to the country that, should necessity or occasion arise, the Government would move quickly to release more funds for defence.

But as we have known from our experience of 1963-64, the financial mobilization is an important but is not the most important, part of defence mobilization. What matters more than the budgetary allocations is the physical mobilization which is achieved in practice. One part of physical mobilization, viz., manpower, seems to present a satisfactory picture. It was heartening to learn from the Defence Minister that the people of this country had offered themselves in far larger numbers than are required for service in the various branches of the armed forces. The limit is not set by the patriotism of the people, but by the organisation and physical resources the Government currently commands for training or equipping the young men who have come forward to defend their country.

We wish the situation had been equally satisfactory with regard to materials as it is with regard to manpower. Unfortunately, so far as economic mobilization is concerned, the country certainly does not seem to have made the most of the past 12 months. Agricultural production is in a disheartening state. Basic foodstuffs are in short supply and rising prices are causing widespread social distress and discontent. What makes the situation particularly disturbing is that the Government does not seem to have any clear idea of how to deal with this crisis in food and agricultural production. Like a mouse in a trap, the Food and Agriculture Ministry is turning itself over and over again within the vicious circle of controls, shortages and more controls.

On the industrial front, again, the situation is hardly much better. Here too high prices are plaguing the economy, while prospects of shortages in respect of such basic articles as cloth are threatening a harassed public. Although bold words were spoken in the wake of the Chinese invasion of industry being mobilised and put to work for the defence of the country on a round-the-clock basis, there has subsequently been no adequate effort for full utilisation of installed capacity even in industries, directly or indirectly connected with defence preparedness. On the contrary, there are many industries of military significance which are working at partial capacity and there are few industries, indeed, which have been called upon to do an extra shift or even work up to the limit of normal shifts. The Defence Minister claimed that in the ordnance factories and other defence establishments there was full utilisation of capacity. This is reassuring, but since the Government sector in defence production is only a part of the total industrial apparatus of the nation which can and ought to be mobilized for defence purposes, the nation is bound to feel that so long as the vast area of civil industrial capacity remains substantially unengaged the nation's defence effort cannot be regarded as having been organised with adequate vigour or sense of urgency.

The Finance Minister has claimed that his budgetary proposals and, indeed, the Government's economic policies have been designed to promote both defence and development. The Defence Minister has emphasized that without development there can be no adequate defence. But the fact remains that the development effort has not been appreciably intensified over the last 12 months. On the contrary, there has been evidence of slackening as was conceded in the Mid-term Appraisal of the third Plan. Thus the development effort has been clearly not of the optimum order and when, as we have suggested, the diplomatic effort too has not been commensurate with the needs of our national security, is it possible for the country to feel assured and confident that the

Eastern Economist 20 Years Ago

MARCH 24, 1944

In answer to an interpellation in the Assembly, Sir Jeremy Raisman gave certain interesting figures about war prices. He said that the general index number of wholesale prices in India taking the prices prevailing on August 19, 1939, as 100 was 118.8 in March 1941 and 235.2 on March 11, 1944. The increase has therefore been 98 per cent in the last three years. The agricultural commodities price index number on March 11, 1944, was 256.7 as against the manufactured articles index number of 243.8. He further stated that the general index number of wholesale prices reached its peak in June 1943 since when the various measures taken to combat inflation have succeeded in checking the rise. The general index in June last was 244.0 and the figure on March 11 was 235.2. Another interpellation elicited from the Labour Member details of the Coal Control Scheme which the Government of India have prepared for regulating distribution and stabilizing prices. According to his statement, the intention of the scheme is to ensure that all the coal available is properly distributed at fair prices to consumers and to afford every encouragement to the maximum production of coal. There is a good deal of dissatisfaction about the composition of the Control Board which the Government of India propose to set up. It is felt that at least the Central Legislature should be given some representation on behalf of consumers in general.

defence effort is being sustained at a sufficient level? The defence debate in the Lok Sabha did throw up this question, but it has left it largely unanswered and the resultant impression on the public mind is that our programme of defence preparedness may be dangerously lacking in the stuffing of co-ordinated diplomacy or adequate economic mobilisation. The Government will certainly be failing in its duty if it does not move promptly to meet the stern challenges of national security.

A Bank of Big Ideas

THE INDUSTRIAL Development Bank of India will shortly come into existence under a proposed Act of Parliament. A Bill to this effect was introduced in the Lok Sabha on February 27. The Development Bank will be the fifth in the line of such institutions as have been established in India (excluding those that serve small industries) to provide medium or long-term financial facilities to industries. The earlier four are the Industrial Finance Corporation of India (1948), with its State versions, the National Industrial Development Corporation (1954), the Industrial Credit and Investment Corporation of India, Limited (1955) with foreign participation in capital, and the Refinance Corporation for Industry Private, Limited (1958). The first and the fourth are purely financial institutions while the other two provide, what may be called, ancillary services in addition to finance. Of the latter, the ICICI helps private industry to obtain managerial, technical and administrative advice and services, while the National Industrial Development Corporation, as the title suggests, lays emphasis on development even while it provides finance. It has organised several technical surveys and is charged with the development of key industries.

"The existing arrangements for the provision of credit for the expansion or development of industry," as the Finance Minister states in the Objects and Reasons for introducing the Bill, however, "are not adequate in relation to the needs of the various enterprises or projects." It is proposed, therefore, to establish a new institution to be known as the Industrial Development Bank of India. It will co-ordinate the activities of all the institutions which are or may be concerned with the provision of finance for industrial development. It will provide refinance and loans, and promote and develop key industries, as circumstances may require.

The Development Bank does not suffer from the limitations either on functions or on the field of operations as the other agencies do. The functions or the business of the bank include the granting of loans and advances, accepting, discounting or rediscounting bills of exchange and industrial promissory notes, participating in capital issues and debentures of approved financial institutions including Industrial Finance Corporation (and its State versions), participating in and underwriting of capital issues and debentures of incidental concerns, undertaking marketing and investment research and conducting techno-economic surveys, providing technical and administrative assistance to industrial units, planning, promoting and developing industries to fill up gaps in the industrial structure and forming or conducting of subsidiaries for carrying out its functions. This bank combines the functions of all other development banking agencies already existing in the country. While the bank is empowered to undertake development programmes, one important function is to provide finance to private industrial sector. In his Budget speech, Mr. Krishnamachari drew pointed attention to this aspect so that the private sector may play its role in the fields assigned to it. The provision of medium and long-term loans or credits should augment the internal resources of industrial concerns and give relief to commercial banks so that they may play their proper role in the short-term market. An easier condition should naturally lead to development and increased volume of operation. Dr. George Rosen of the American Investment Centre who recently made a study of industrial finance in India suggested credit rating of private industrial concerns (particularly of lesser known companies) as an adjunct to industrial financing. This is a demand from the industry. This service will help such of those concerns who while they may not ask for or receive facilities of finance from the Development Bank may yet be helped with the "Seal of Confidence" that such credit rating would mean. It will be easier for such rated companies to raise funds in the open market even though they may not be so well known. With its expert staff the bank seems to be in a position to render such service. The service could be free.

The resources of the Development Bank are mainly from its capitalisation and borrowings until such time as it will make profits. The Reserve Bank of India provides all the capital stock, of which the Development Bank is a subsidiary though quite independent in its policy and operations. The authorised capital is Rs. 50 crores, which can be raised to Rs. 100 crores in the future. Rs. 10 crores will be issued for the present. The Reserve Bank will also create a National Industrial Credit (Long-term operations) Fund, out of its earnings, and will make loans from this source in addition to normal banking accommodation and other special loan facilities. Initially, the Central Government will offer a 30-year interest free loan of Rs. 10 crores to the Development Bank. Future loans are not likely to be interest free. In addition it will make loans to a Development Assistance Fund that is to be created in the bank. The object of this fund is to help essential industrial enterprises which may not in normal circumstances receive loans to service heavy investments or where returns on capital may not normally attract loans. The bank will also raise funds from the market by sale of stocks, shares and debentures. The funds of the LIC should lend themselves better through the expert services of the bank. The supply of funds for industrial and mineral programmes of the private sector in the third Plan was estimated at Rs. 1,250 crores of which institutional agencies and the Central and State Governments were expected to provide Rs. 150 crores. These resources again could be guided into productive lending through the expert assistance of the proposed institution.

In the early years of its operation, the Industrial Finance Corporation had tended to load the sugar industry with loans and a regional imbalance was noticed in favour of Maharashtra. Such experiences must serve as a warning to the administrators of the bank. Secondly, while large-scale units usually find sufficient credits or capital, the medium-size units often experience difficulties particularly those that are less known albeit their sound position and efficient management. If the policy of the bank is directed to help these smaller units, perhaps by a system of guaranteeing loans, rediscounting, participation or underwriting, that should promote a faster pace of development. Thirdly, payments crisis is a problem of developing countries that finance imports of machinery with exports of primary products (or semi-processed goods) under adverse terms of trade. So it is imperative to expand and develop export industries. In the later years the Japan Development Bank's policy was so oriented. The details of interest-rate structure on different kinds of loans are yet to be known for any comment to be made just now. It is reasonable that a greater risk should carry a higher rate or a surcharge. That would be a normal business practice.

There are about 70 development banks in the 52 developing countries in Africa, the Americas, Asia and Europe (including Iceland) according to the World Bank. Of these, 55 serve the industrial development; a few among these are multi-purpose serving both industry and agriculture. In general they are prototypes with modifications to suit local conditions of politics, administration and needs of development. India has drawn inspiration from Canada, West Germany and Japan to give shape to her bank. Japan which has been a developing country in the post-war years now aids development elsewhere. Similar to the Industrial Development Bank of Canada (1944), India's bank is owned by the Central bank, i.e. the Reserve Bank of India. Likewise, the incumbents in the Board of Directors of the latter serve on the Development Bank's Board also. The West German Kriditanstalt and the Italian Media Credit rediscount medium and long-term loans made by other financial agencies. India's bank also will do likewise. The Bill provides for the taking over of the Refinance Corporation of India at a future date.

EASTERN ECONOMIST BUDGET NUMBER

March 6, 1964

THE BUDGET NUMBERS of "Eastern Economist" are a popular and valued annual feature of the Journal. This year's Number should be of special interest and importance in view of the complexity as well as ingenuity of the economic and fiscal policies presented through the Central Budget.

An attempt has been made in the Budget Number to analyse the various aspects of the Budget proposals and study the Budget documents with a view to bringing out the larger and deeper implications of Government policies for the future course of the national economy. The result is an objective and critical evaluation of the economic situation and outlook at a significant turn in the course of national development.

The Budget Number is illustrated with graphs and diagrams and it features a special section in which important budget documents have been reproduced for record and reference. Priced at Rs. 5 per copy, the Budget Number is available to subscribers without extra charge — a facility which new subscribers may also avail themselves of by entering, before April 10, an annual subscription for "Eastern Economist" at the usual rate of Rs. 65.

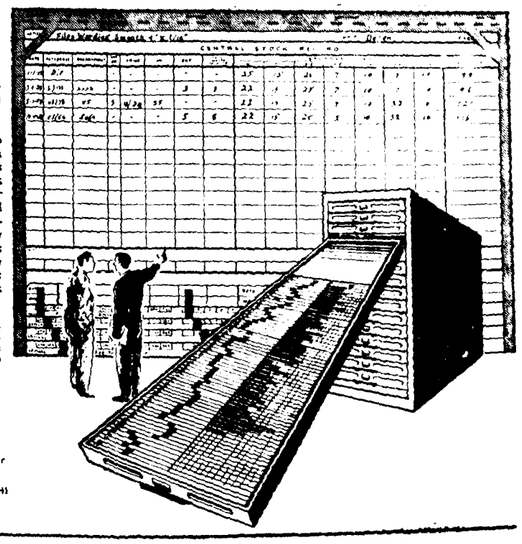
VISADEX
THE DASHBOARD OF BUSINESS



Work the VISADEX way to get the best out of your men, machines and materials.

VISADEX can tell you what you need to know at a glance. VISADEX offers you a fluent indexing system by which records are kept on cards, while colour signals spotlight what things are in stock or needed, whether production is ahead of or behind schedule, sales are increasing or decreasing, where to intensify advertising, which department requires more personnel, who owes you and how much . . . VISADEX, in short, affords greater control at less cost, besides keeping records secure.

Our VISADEX Representative will be happy to show you, without obligation, how simple VISADEX is to operate—either with Card Pockets or Brass Card-holders—and how easily it can meet your specific requirements.

Highlights of the Week

HUMBLE PETITIONER

ON MARCH 20, the U.N. Security Council, resuming its debate on Kashmir, agreed to a postponement for which this country had pleaded. The adjourned discussion is fixed for May 5. Although official sources in New Delhi were reported to have reacted to this decision with some satisfaction, it is clear that the emphasis is on the qualifying word "some." There is no point at this stage in slurring over the diplomatic setback which this country has suffered. A request for pos ponement which should normally have been granted even out of mere formal politeness was debated to a point where our country was made to appear as if it was begging for a special favour. When the adjournment was finally granted, it was done with an obvious ill-grace since to it was tacked the so-called appeal to Pakistan and India "to refrain from any action or threat that could imperil peace and international security or aggravate the problem." The Brazilian representative, Mr. Carlos Alfredo Bernardes, who sponsored this "appeal," thought it necessary also to express the lofty sentiment that India and Pakistan should use the six-week respite to seek every possibility of settling their differences peacefully. It was evident, however, that the "appeal" was really in the nature of a condition attached to the grant of the Indian request and that it was put there as a concession to Pakistan which had opposed the Indian plea for postponement, an inference which is supported further by the fact that Mr Bernardes took care to emphasize the possibility that the Council could be convened before May 5, if there were new political or military developments that might change or aggravate the situation—an assurance which certainly seemed to gladden the heart of the Pakistan delegate, Mr Bhutto.

If there was any doubt at all about the diplomatic implications of the "appeal," it should have disappeared after the way in which the various members of the Security Council reacted to the Brazilian prompting. The U.S. representative, Mr Adlai Stevenson, hastened to put on record that he was in complete accord with Brazil. Sir Patrick Dean of Britain said "ditto," and so did the delegates of France, Norway, Bolivia, Morocco and Ivory Coast. It was left to Dr. Nikolai Fedorenko of the Soviet Union to protest against the "discrimination" against India implied in the "appeal." He recalled that no conditions or reservations were attached to a similar request for postponement which Pakistan had made in February last. Prof. Hajek of Czechoslovakia expressed a doubt that the appeal was intended to improve the atmosphere. The Indian delegate, Mr B. N. Chakravarty, caught in an unenviable situation, had to make the best of a bad bargain by making a firm declaration that India did not consider itself bound to refrain from proceeding with any constitutional processes it might think necessary in a part of its own territory. This reservation was absolutely necessary since the internal politics of Kashmir are now at a stage where the Government of India has to be in constant action to ensure good government for the people of Jammu and Kashmir, help maintain political stability and law and order in that part of Indian territory and, above all, safeguard national security and territorial integrity.

Un-diplomatic Snobbery

The division of ranks in the Security Council over the Brazilian "appeal" has served to emphasize the disturbing fact that, in the matter of its dispute with Pakistan over Kashmir, this country has utterly failed to win over Western support, particularly U.S. and British sympathy, for its point of view with regard to the terms of a settlement. How far this is a consequence of Western strategic interests in the region affected and how far it is simply the result of a failure in our diplomacy is a question which, no doubt, may be argued indefinitely. At the same time, it is not good that we ourselves should be blind to the fact that our handling of the Western powers has not always been adroit. For instance, where was the need for Mr Nehru to describe in Lok Sabha on March 20, the recent presence in the Capital of Mr. Phillip Talbot, the U.S. Assistant Secretary of State, as the routine visit of a "not very important official" with whom he had only a courtesy meeting. We should have thought that Mr Nehru was incapable of such diplomatic snobbery; and that apart, on this occasion, the snobbery was certainly most undiplomatic. Surely, it is not to be expected that when there were matters of mutual interest to be discussed between the Government of India and the Government of the United States, only President Johnson, or failing him, the Secretary of State, Mr Dean Rusk, should drop in. The fact is that Mr Talbot, whatever the Government of India may think of his ranking in the U.S. official hierarchy, happens to be the U.S. Assistant Secretary of State for Near East and South Asian Affairs and his assessment of problems in the region is certainly to be expected to carry weight with the policy-makers in Washington. It is possible that Members of Parliament here and others who had been aware of Mr Talbot's meetings and talks with senior Ministers of our Government had formed exaggerated ideas of the nature or trend of the discussions. If that was the Prime Minister's feeling, he could certainly have corrected the perspective without resorting to language both unwise and unhappy which is apt to be misunderstood.

VIOLENT MEN AND MOODS

THE PRIME MINISTER has reportedly written to President Ayub Khan urging that the communal situation in the Indo-Pakistan sub-continent should not be allowed to drift towards disaster. A specific suggestion which is said to have been made in this connection is that the Home Ministers of the two countries should meet immediately to devise effective measures for preventing communal disturbances and promoting communal harmony. The Prime Minister's communication is believed to have been delivered to the President of Pakistan on Friday, March 20. Both its poignancy and urgency were underlined by the clashes which had broken out around March 19 in a number of places in eastern India. Among the places affected was the steel township of Rourkela in Orissa. Clashes were reported from other centres in the State, viz., Brajarajnagar and Rajgangapur. The saving grace was the firm action taken by the State Government to put down the disturbances and protect life and property. Troops were called in to assist the civil authorities and curfew was clamped down. The situation in Rourkela and other affected places in Orissa was claimed to have been brought completely under control by March 21 and the Rourkela steel plant was officially reported to be working at 80 per cent of capacity. Communal disturbances also befouled the name of another steel town, Jamshedpur in Bihar. There too firm action was taken to restore law and order, with the police resorting to firing on unruly mobs. Disturbances were also reported from Raigarh in Madhya Pradesh. In Calcutta also there were violent incidents. The total death toll resulting from the clashes in the four States of West Bengal, Bihar, Orissa and Madhya Pradesh is placed

at 200 lives, including those lost from police action against violent mobs.

From all these unhappy incidents three things are becoming clear. One is that the violence against Hindus in East Bengal and the resulting influx of refugees into this country is bound to have a chain reaction of retaliatory communal disturbances in this country, particularly in the eastern region. Secondly, State Governments are both willing and able to take the strictest measures of law enforcement for the protection of Muslims and the restraint or punishment of those who provoke and perpetrate communal violence. Lastly, it is being hearteningly confirmed over and over again that the great mass of the Indian people has not only kept itself aloof from the disturbers of communal harmony, but has also shown that it stands by the Muslim citizens of this country. While the last two factors are assets of great value for the nation in the critical period through which it is passing, it cannot be ignored that the hostile posturings of Pakistan along the northern and eastern borders and the raids across the cease-fire line in Kashmir are a grave and growing menace to communal peace on the sub-continent. To the extent that Pakistan's intransigence and its obvious desire to force the issue of Kashmir could be the means which the Ayub regime has chosen to exploit the desire of Britain and the United States to bring about an early settlement of the differences between India and Pakistan, it is quite obviously a responsibility of the Western powers to see that no act of commission or omission on their part could be interpreted by Rawalpindi as an encouragement of any kind. To put it differently, the continued maintenance of communal peace in this country is fast ceasing to be the sole responsibility of India or even the joint responsibility of India and Pakistan and is on the point of becoming, if it has not become already, a responsibility of the Western powers who, no doubt, from the best of intentions, have so far persisted in pressing Pakistan's claims regarding Kashmir without bothering to appreciate the sombre significance of the Indian warning that Pakistan cannot be accommodated except at the expense of the secular character of the Indian State and communal peace on the sub-continent.

AFTER BAKSHI, ABDULLAH ?

KASHMIR, it appears, has now become as much of a problem to itself as it has been to the Security Council all these years. It may still be recognized in retrospect that the "Kamarajing" of Bakshi Ghulam Mohammed was one of the less prudent acts of the Prime Minister in the implementation of that famous plan of many purposes. This is not to say that the Bakshi Government was the best that the people of Kashmir could have had. But recent events have suggested surely that it is going to be much more difficult to do without Bakshi Ghulam Mohammed than it had been to make do with him. The fond belief nursed by simple minds that once Bakshi Ghulam Mohammed could be made to quit all would be well in the Valley and a breed of perfect politicians could be found to provide good government and play fair with the people of Kashmir ought now to have gone the way of most illusions to which the human imagination is partial. But when one set of illusions goes, it is often the case, unfortunately, that another set of illusions promptly takes its place.

Currently, the assumption in exalted quarters is that only the release of Sheikh Abdullah is needed to restore normalcy in Kashmir. We wish such supposition had some substance. Not that we would not have the case of Sheikh Abdullah decided on its merits. Like every citizen of this country, he is entitled to fair judicial processes and, that apart, political decisions always have a place in any government in the consideration of cases such as that of Sheikh Abdullah. At the same time we do not believe that his release will have the magic effect of ending the factional and personal rivalries in the domestic politics of the Valley. As a matter of fact, what is more likely is that his release will import into a troubled, if not an explosive, situation yet another element of unpredictability. It must always be said to the credit of Mr Nehru that he has a better appreciation than most of us of the personal and political equations in a given situation; hence his concern for upholding Bakshi Ghulam Mohammed in Jammu and Kashmir or Mr. Pratap Singh Kairon in Punjab. Even in the United Kingdom they do not play politics as they play cricket and Mr Iain Macleod was certainly not revealing any secret when he recently gave the low-down on how Sir Alec Home was chosen to succeed Mr Macmillan as a leader of the Conservative Government.

To return to Kashmir, Mr. Ghulam Mohammed Sadiq and Bakshi Ghulam Mohammed may continue to have their differences. But the State Government must carry on—which means that money has be found for the business. In the discharge of his responsibilities in this direction, Mr Trilochan Dutta, Finance Minister of Jammu & Kashmir, recently presented his budget for 1964-65, proposing new taxes to be levied during the budget year to the extent of Rs. 75 lakhs, but prudently omitting to discuss the details of the contemplated levies. The State Government has to reckon with an overall deficit of Rs. 1.98 crores which the intended additional taxation would bridge only in part. Mr. Trilochan Dutta, therefore, consequently plans to withdraw Rs. 122.67 lakhs from the State's cash reserves to cover expenditure contemplated in the budget year.

According to the preliminary estimates, receipts have been placed at Rs. 23.85 crores, i.e., almost equal to the revised estimates for the current year. Expenditure charged to revenue account has been placed at Rs. 25.04 crores, out of which Rs. 19.18 crores are proposed to be spent on non-Plan activities and the remaining Rs. 5.86 crores on Plan expenditure. Expenditure outside the revenue account has been placed at Rs. 13.62 crores, while receipts under the capital head have been put at Rs. 13.59 crores. The budget anticipates increased receipts under land revenues, sales tax and other taxes and duties. Larger provisions have been made for education, medical and public health, agriculture, water supply schemes, industrial development, irrigation, power, public works and police, in the new budget. The Finance Minister disclosed that the State Government had undertaken to raise additional resources amounting to Rs. 8 crores during the third Plan and that by the measures already in force, the Government would be able to add over Rs. 5 crores to the State's revenues. The balance of Rs. 3 crores would have to be raised by the end of the Plan period. The Plan outlay for the next financial year is Rs. 18.82 crores. Of this, Central assistance will account for Rs. 15.12 crores.

Defence Matters to the Fore

By Our Parliamentary Correspondent

NEW DELHI :

THE LAYING down of a healthy convention about the privileges of the Members of Parliament and a lively debate on defence preparations were the two main highlights of the Lok Sabha proceedings last week. The House voted the demands for grants for four Union Ministries — the Ministries of International Trade, Information and Broadcasting, Labour and Employment and Defence.

The question of the privileges of the Members of Parliament came up before the House when a Socialist Member raised the issue of Mr. Mani Ram Bagri, another member of the Lok Sabha belonging to the Socialist Party, being prevented from entering Parliament House after 7.00 p.m. on March 17. The Speaker revealed that he himself had issued orders to the Watch and Ward staff to stop Mr. Bagri from entering Parliament House at that hour and it was within his rights to do so as the prerogative to give permission to a member to enter the House when the Lok Sabha was not in session or when the member concerned was not going there for any work connected with Parliament rested with him. Mr. Bagri was wanted by the police for alleged violation of the prohibitory orders of the Delhi District Magistrate when he had arranged a demonstration in front of Parliament House on March 13, and was said to be using the House as refuge from law. It was contended by Mr. Frank Anthony that the use of Parliament House as a sanctuary by a member alleged to have committed an offence, amounted to negation of the process of law. The ruling given by the Speaker to the effect that Parliament House could not provide shelter for fugitives from law should go a long way in removing the apprehensions in the public mind about the legislators forming a new privileged class in the country.

Lively Debate

The discussion on the demands for grants for the Ministry of Defence was not only lively but also assertive. Concern was expressed over the growing menace to the country's security from China and Pakistan and the recent mishaps to several military aircraft. Many an Opposition member also accused the Government of complacency in defence preparations after the ceasefire by China. They demanded quicker and more effective steps to strengthen defences and called for streamlining of military intelligence, especially in the border areas. It was suggested that India should follow the US and the UK patterns of defence set-up. Building up of the Indian Navy along with the Army and Air Force was also urged. The Defence Minister, Mr. Y. B. Chavan, in his reply tried to remove the apprehensions of the Opposition members and asserted that everything possible was being done to safeguard the country's territorial integrity. He pointed out that it was now possible to take a little longer view of the defence problem and work it out on a five-year plan basis. Giving as much information as he could, the Defence Minister disclosed that during the last 12 to 14 months, 300,000 other ranks and 10,000 officers had been recruited to the Defence Forces and that the ordnance factories had produced 26 new items. Decision, he said, had been taken about the size of the Air Force taking into consideration the nature of the threat the country might have to face. Naval strength, he said, was also being built up. The recent air exercises, Mr. Chavan stated, had confirmed the Government's view that supersonic fighters were necessary for defending the country against aggression from outside. He, however, did not favour unification of command and opined that the existing set-up was quite elastic and well suited to the country's requirements. Mr. Chavan also dwelt at some length on the progress made in the manufacture of MIG's and HF-24 aircraft. He announced the setting up of a committee to inquire into the recent series of air accidents.

The debate on the demands for grants for the Ministry of Labour and Employment was notable for the concern expressed by members over the deteriorating employment situation and the difficulties faced by employees in view of the rising cost of living. The need for improving the lot of agricultural labour and the conditions of work for women was also stressed. In his reply, Mr. D. Sanjivayya, the Minister for Labour and Employment, made several important announcements. He envisaged that a start would be made next year to provide pension for the families of the subscribers to provident fund; the State Governments would be asked to revise minimum wages so that these might be raised to at least Re. 1 a day; and decisions would be taken soon to set up wage boards for the engineering and chemical industries and for the port and dock workers. About the linking of dearness allowance with the cost of living, Mr. Sanjivayya said this was not a solution to the problem of rising prices and it might worsen the situation by adding to the inflationary pressures in the economy. As an alternative, the Government and the private employers, he suggested, should undertake to supply essential commodities to their employees at subsidised prices. Despite his assiduous attempts to meet the criticism about the unemployment situation with an array of statistics, Mr. Sanjivayya's defence in this regard was not very convincing. The Labour Ministry, he said, could only help people looking for work to find it; it could not provide employment opportunities. He, however, expressed his inability (for practical reasons) to extend the network of employment exchanges to rural areas. As a solution to the problem of the educated unemployed, he suggested that the facilities for imparting technical and vocational training should be increased. Mr. Sanjivayya had a jibe at the Communists who, while vociferously clamouring for bringing down prices, did not refrain from calling for strikes and agitations. Would prices come down because of this? he asked.

National Unity

In the discussion on the demands for grants for the Ministry of Information and Broadcasting, members urged that the publicity efforts of the I & B Ministry through radio, films and the Press Information Bureau should be directed towards promoting the national unity and counteracting anti-Indian propaganda by Pakistan and China. With a view to controlling the monopolistic trends in the newspaper industry, it was suggested that encouragement should be given to smaller and language newspapers. Some members urged that All-India Radio should be converted into an autonomous corporation on financial considerations. The film censorship policy also came in for criticism. Winding up the discussion, the Minister for Information and Broadcasting, Mr. Satya Narayan Sinha, stated the VOA deal had been scrapped and tenders had been invited from all the rupee-payment countries for the supply of a high-powered transmitter. He rejected the demand to convert AIR into an autonomous corporation, but hinted that setting up of a television network in the country might have to be sponsored independently. He agreed that for the growth of democracy, it was essential that small newspapers, particularly language newspapers, should be given encouragement. For checking unhealthy trends in the newspaper industry, he said that a Bill would be brought before the House soon seeking to set up a Press Council. He hoped that the Monopoly Commission announced by the Union Finance Minister would go into the question of newspaper ownership. He appealed to the critics of the film industry

not to insist on too rigorous censorship on the ground that "romance is not at all bad".

The Minister for International Trade, Mr. Manubhai Shah, received well-deserved bouquets for his efforts to step up exports. But the affairs of the State Trading Corporation and the Tea Board came in for a good deal of criticism in the debate on demands for grants for this Ministry. It was suggested that a high-powered committee should be set up to go into the working of the State Trading Corporation. Some members also dwelt on the tasks before the Geneva Conference on Trade and Development. In his reply, the Minister stressed that in the interest of boosting exports, the producers should make concerted efforts to reduce costs and improve the quality of their products. Mr. Shah disclosed that he had recently requested the Planning Commission to organise a division devoted solely to cost studies. He opined that nationalisation of the import and export trade alone could not prevent malpractices in this business and added that the Government wanted state trading in the field of international trade to be expanded, especially in the case of highly profitable and scarce commodities. He hoped that some extra incentive would be given to tea industry in the form of rebate in excise duty on additional production. Mr. Shah dwelt at length on the incentives provided to tobacco-growers and mica industry and revealed that he would soon bring forward a bill to establish a Cardamom Board. He assured the House that at the Geneva Conference, he would plead for the under-developed countries getting a bigger share in the benefits of international trade. Earlier, introducing the demands for grants for his Ministry, Mr. Shah announced the appointment of a committee to overhaul the customs tariff structure and hinted that import policy for the next year would permit slightly liberal imports of spares and machines. The small-scale industries might also get some relief as their import requirements had been drastically restricted in the past. There was, however, need to impose further cuts on imports of low-priority items. He stressed the urgency for increasing exports to Africa.

Question Hour

Petro-Chemicals: The Minister of State for Petroleum and Chemicals, Mr O. V. Alagesan, told the Lok Sabha on March 18 that India would have to go in for foreign collaboration or foreign capital to develop petro-chemical complexes. The question whether Indian private capital should also be invited for these ventures and on what terms was under the "active consideration" of the Government. The Minister further stated that there would be considerable saving in foreign exchange when the proposed petro-chemical complexes at Bombay, Barauni and Koyali were completed. The Bombay and Koyali complexes would be integrated ones, based on naphtha crackers, and would be producing a wide variety of products, particularly plastics and synthetic rubber. The Barauni complex was planned for the present to produce only aromatics — benzene and xylene. In addition to these three complexes, the Government was considering the question of setting up petro-chemical industries at Haldia and in South India also. Production of some additional petroleum products was also likely to be undertaken at Gauhati.

Answering another question on the utilisation of natural gas from Cambay, Mr Alagesan stated that the intention of the Government was to supply this gas on a priority basis to industrial units for production of electricity, fertilisers, etc. The supply for domestic uses would be given a low priority.

Alcohol Imports: Mr. Alagesan also told the Lok Sabha on March 18 that the Union Government was considering the possibility of importing some alcohol for industrial purposes. Efforts were also being made to import some quantities of polythylene to meet the shortfall in the production of this commodity indigenously, resulting from inadequate supplies of alcohol to the polyethylene producing units.

Lignite and Coal: The Union Minister for Steel, Mines and Heavy Engineering, Mr. C. Subramaniam, disclosed in the Lok Sabha on March 20 that the question of utilising the lignite resources of Rajasthan for putting up a power plant was under the examination of the Government. Replying to several other questions on coal, Mr. Subramaniam stated that the third Plan target of 97 million tonnes of coal production was being reduced as the demand for the commodity was not expected to go up as originally anticipated. He, however, did not throw any light on how much reduction there would be in the target.

The actual production of coal during the current year, Mr. Subramaniam said, was expected to be between 67 million and 69 million tonnes, as against the target of 69 million tonnes. This was more than sufficient to meet the requirements.

Mr. D Thimmiah, Parliamentary Secretary, Department of Mines, stated that the "progressive units" in the coal industry were effecting modernisation in the context of the World Bank's offer of loan. In all, 117 collieries had furnished details about the import of equipment and machinery which would help in modernisation of coal mining.

Production Bonus: Mr. Subramaniam also told the Lok Sabha on March 20 that production bonus would be paid only to those who directly contributed to production. He was unable to accept the proposition that anybody employed in a plant must automatically get incentive production bonus.

Rabi Crops: The Minister of State for Agriculture, Dr. Ram Subhag Singh, confirmed in the Lok Sabha on March 17 that the standing rabi crops in several districts of Madhya Pradesh, Rajasthan, Punjab and Uttar Pradesh had suffered considerable damage because of the cold wave conditions in January. Despite this, however, the overall prospects of food output in 1963-64, appeared to be satisfactory as rabi sowings had been very good. Paddy yield, the Minister stated, was estimaed at 32 million tonnes.

Sugar Exports: The Minister of State for Food, Mr. A. M. Thomas, revealed in the Lok Sabha on March 17 that the Government would take precautions to export less sugar this year in view of the shortage of the commodity within the country. Contracts had been signed so far for export of only 200,000 tonnes of sugar.

Price Stabilization: The Deputy Minister for Community Development, Mr. S. D. Mishra, told the Lok Sabha on March 17 that the Government was considering a scheme for the creation of a Special Price Fluctuation Fund. He gave the following details about this scheme: (1) the marketing societies selected to make outright purchases should allocate 10 per cent of their annual net profits towards the Price Fluctuation Fund; (2) the Government should contribute each year to the Fund at the rate of 2 per cent of the total value of the produce purchased from the grower-members; and (3) all losses sustained by a society on account of outright purchases of agricultural produce under the scheme should be met from this special Fund; but if losses exceed the amount available in the Fund, the excess should be made good from the owned funds of the society.

More Hotels: The Minister for Transport, Mr. Raj Bahadur, revealed in the Lok Sabha on March 17 that the Government was studying a proposal received recently from the Hilton's Hotels International (U.S.A.) for starting one hotel each at Delhi, Bombay and Calcutta. There was no proposal at present to take U.S. assistance for the State sector in the hotel industry.

Our Population Problem—I

R. CHOPRA

This is the first of a series of articles in the course of which a systematic attempt is being made to determine the nature and dimensions of our population problem and to suggest an adequate programme for dealing with this problem in a realistic manner.

IN THE introduction to a study, recently published by the US National Academy of Sciences, called "The Growth of World Population", the President of the Academy writes: "The problem of uncontrolled population growth emerges as one of the most critical issues of our time since it influences the welfare and happiness of all the world's citizens. It commands the attention of every nation and society; the problem is no less grave for the technically advanced nations than for the less developed."

Elsewhere in the same report, it is stated: "If the birth rate in India is not reduced, its population will probably double in the next 25 or 30 years, increasing from about 450 million to about 900 million. Agricultural experts consider it feasible within achievable limits of capital investment to accomplish a doubling of Indian agricultural output within the next 20 to 25 years. In the same period the output of the non-agricultural part of the Indian economy probably would be slightly more than doubled if the birth rate remained unchanged. For a generation at least, then, India's economic output probably can stay ahead of its maximum rate of population increase. This bare excess over the increase in population, however, is scarcely a satisfactory outcome of India's struggle to achieve economic betterment. The real question is: Could India and other less developed areas of the world do substantially better if birth rates and thus their population growth rates were reduced. Economic analysis clearly indicates that the answer is yes."

Minimum Economic Base

Lest the seriousness of the problem is still doubted by some, I would like to make a mention about what constitutes a decent standard of living and what we in India expect to achieve by 1975-76 (end of fifth Plan).

Mr. V. T. Krishnamachari writes in the Preface to his book "Planning in India": "It is widely recognized that a minimum economic base is necessary in modern societies for the effective functioning of democratic institutions and the creation of conditions in which men and women can have opportunities for rising to their full stature. Obviously this minimum should vary from country to country depending on its history and traditions." Mr John Strachey in his "Contemporary Socialism" expresses the view that "Italy as a whole represents a sort of borderland case of a country which is at or about the indispensable level." The per capita national income of Italy in 1955 was $306 (about Rs. 1,500) according to "The Income of Nations" by Dr. Paul Sterdenski. The same authority (Dr. Sterdenski) defines 'low per capita income countries' as those having per capita incomes below $150 (about Rs. 750). Viewed in the context of criteria like these, the objective we have placed before the country of raising per capita income from Rs. 282 in 1955-56 to Rs. 520 in 1975-76 (or 1973-74 if possible) is very modest.

Elsewhere in the same book, the rate of development envisaged by Mr. Krishnamachari in the next twenty years can be seen in broad outline in Table I.

Recent studies of the rate of increase of population, however, indicate that it is expected to touch the 625 million mark instead of the estimated 568 million i.e., an extra unestimated increase of nearly 57 million. If we take the generally accepted capital output ratio of three, i.e., three units of capital required to produce one unit of income, then to assure per capita income of Rs. 520 to the 57 million extra people would entail a net additional investment of Rs. 8,892 crores. Where is this money to come from? (On the other hand, the Central Minister for Planning stated that due to our population increasing at the rate of 2.4 per cent instead of 2.0 to 2.2 per cent estimated earlier, the 3rd Plan, which is already pruned down to its core, will be implemented only 90 per cent. The Prime Minister says that prices of foodstuff have gone up not because agricultural output has not increased, but due to the fantastic increase in population. Is the seriousness of the problem still doubted? Haven't we enough indications already in our daily lives that, despite such austere measures, living standards are perceptibly deteriorating?)

Another study regarding the economic implications of population growth indicates that in India around 1918 and with a population of about 315 million, the average daily quantity of foodgrains available was about 20 ounces per capita. In 1945, with a population of about 400 millions, per capita foodgrain availability had fallen to about 15 ounces. After 1945, the situation further worsened and per capita food supply diminished substantially between 1945 and 1952. (It should be kept in mind that foodgrains constitute at least 75 per cent of the calorie intake in India). Mr V. T. Krishnamachari in his, "Planning in India", also mentioned that per capita availability was 13 ounces in 1951. Since then, of course, massive investment in agricultural development has stopped the further worsening of the situation and, in fact, increased availability to 15.4 ounces in 1960, which figure, incidentally is still substantially below the 1918 figure. (The figure of 1960 is, however, based on the population estimate of 423 million which turned out to be an underestimation as shown in the 1961 population census).

The above figures prove that despite Herculean effort being put into the various plans, our achievements would still be modest. Further, even these targets may be diffi-

TABLE I.

Item	First Plan 1951-56	2nd Plan 1956-61	3rd Plan 1961-66	4th Plan 1966-71	5th Plan 1971-76
2. Net investment over plan period (Rs. crores)	3,160	6,550	10,000	15,410	22,550
6. Population at the end of the period (in millions)	391	431	480	528	568
8. Per capita income at the end of the Plan period (in Rs.)	309	357	422	522	520

cult to achieve in full unless substantially heavier capital investments are made in the future.

What are we to do? Obviously the solution lies in either a massive increase in the rate of economic growth to absorb the increase in population or a substantial decrease in the rate of growth of population. A study of any of the reports mentioned in the foregoing would show that the former alternative will not hold good for long. A stage would reach when any further economic progress will stop and deterioration of the standards achieved would set in.

The latter alternative appears a better solution both in the short and in the long run. As an example of economic growth as effected by the population increase, it is estimated that with the present rate of economic progress, the per capita income could have become nearly Rs. 800.00 in 1976 instead of Rs. 520.00 if the population had remained stable at the 1955 level. This is not all. Our economy would have reached the "take off" stage before 1970 and a majority of us now in late 'thirties or early 'forties would have enjoyed, within our lifetime, the luxuries and conveniences of modern living which at present seem to be the exclusive right of the western countries.

The question is: Is the goal of prosperity with security and dignity for all, **within our lifetime,** worth striving for and achieving? In my opinion, the answer is "Yes"—a resounding, unanimous "Yes". In fact there can be no difference of opinion on this point.

Natural Decrease

An attempt will be made here to trace the pattern of growth of population in India vis-a-vis the population of affluent countries. It will also be shown that, whereas in the western countries the population has become somewhat stabilized by the natural decrease in the birth rate consequent upon the economic betterment of the people, why cannot we, in India, depend upon this natural reduction in births?

The population of the world is, at present, slightly more than 3 billion (3,000 million) persons. At the present rate of growth of about 2 per cent, it will become 6 billion in 35 years and if the same rate of growth continues, the population will keep on doubling every 35 years. Moreover, it is estimated that even this high rate of growth is on the increase.

Of course, the rate of growth cannot increase indefinitely. Nor, for that matter, can the population. If, however, it were to continue to increase at the present rate for two centuries more, there will be more than 150 billion (15,000 crores) people. A simple example will show that such an increase is just not possible. Had this rate existed from the beginning of the Christian era till the present, the world's population would have increased in this period by a factor of about 7×10^{16} (70,000,000,000,000,000) from the population at that time. In other words, there would be about 20 million people in place of each person now alive or 100 people to each square foot or 2,787,840,000 people to each square mile (India's density per square mile was 370 in 1961)! Calculations of this sort demonstrate the absurdity of such an increase over a long period. There is no doubt whatsoever that India's (and the world's) rate of increase of population will decrease. Either the birth rate will come down or the death rate will go up.

Confining our attention to India's population, it is interesting to note that the rapid increase started as short a while ago as 1921. For this reason, 1921 is known as the "Great Divide". Table II below details the total population and decennial per cent narration for the period 1901-61.

TABLE II.

Year	Population	Decennial per cent increase
1901	236,281,245	——
1911	252,122,410	+ 5.75
1921	251,352,261	— 0.31
1931	279,015,498	+ 11.01
1941	318,701,012	+ 14.22
1951	361,129,622	+ 13.31
1961	439,235,062	+ 21.50

(As the "Census of India — 1961" puts it: One is put in a mood to appreciate the magnitude of the increase in the last decade when one reflects that, with more than 365,000 square miles less of territory as a result of partition, India more than made up for the population of Pakistan (75.8 million in 1951, three years and a half after August, 1947) which she had lost on the eve of her independence. One also notes that what is impressive is not so much the rate of increase which up till now has never been inordinately high and for past decades even quite low, but large absolute increments. The Census Commission for 1951 aptly called 1921 the Great Divide, while the last decade may be viewed as a Great Leap Forward. For the actual count in 1961 surpassed even the most generous of expectations having exceeded by more than eight millions the highest estimate ever made before the census! The Registrar General in 1951 had forecast an upper limit of 407 millions, Kingsley Davis 402, Coale & Hoover and T. Chellaswami 424 and the Planning Commission Expert Committee 431).

The reason for the slow increase before 1921 is not hard to find. Demographers tell us that in agricultural societies, without the benefits of modern medicine, transport and communications, the slow increase (and sometimes even decrease) was generally due to a high and highly fluctuating death-rate that balanced a high but more stable birth-rate: the death-rate was normally lower than the birth-rate and the population tended to increase but eventually an abnormal "peak" of the death-rate wiped out the "surplus" population. The abnormal peak of the death-rate was due to epidemics, famines, wars etc. Then the cycle started again. Such a balance between births and deaths, however, shows that people had no control over environment.

Changed Picture

Since 1921, the picture has slowly changed. Famines and epidemics on the scale known in earlier decades, have been practically wiped out. Infant mortality which took a toll of nearly 50 per cent of all the babies before they were one year old, has been drastically reduced. Average expectations of life and the death-rate have changed considerably as shown in Table III.

Table IV covers the period 1891 to 1961 and shows the absolute increase in population per 1000 population. The figures appear in the Official Report of the 1961 Census of India.

The death-rate figure of 1961 is slightly less than 35 per cent that of 1921. The birth-rate, on the other hand, has remained consistently high. Although it has fallen from 49.2 in 1921 to an estimated 40.0 in 1961, the surplus of births over deaths has increased tremendously. And studies show that the gap between births and deaths is even more. The task of feeding alone this vast multitude staggers the mind.

TABLE III.

Year	Expectation of life: Male	Expectation of life: Female	Mortality rates: Year	Mortality rates: Infant mortality rate per 1000 live births.
1881	23.67	25.58	1939	156
1891	24.59	25.54	1941	158
1901	23.63	23.96	1944	169
1911	22.59	23.31	1947	146
1921	19.42	20.91	1950	133
1931	26.91	26.56	1955	103
1941	32.09	31.37	1960	91
1951	32.45	31.66		
1961*	47.00	46.33

(To be continued)

WINDOW ON THE WORLD

Geneva Trade Conference

From our Special Correspondent

PARIS:

AS THE CURTAIN goes up in Geneva for the UN conference on international trade it reveals the Western industrialised nations at loggerheads about how they should reply to the indictment of their trade and aid policies by the Communist and developing countries who are responsible for calling this meeting. Such disagreement is, in one sense, a good sign because it is sure that if the Western nations had been able to find a common stand it would have been based on the lowest common denominator of their various conceptions; a joint programme would have been a minimum programme, making the fewest concesssions possible to their accusers. As it is, what divides the Western capitals is that each admits the validity of one or other complaint from the developing world and each offers a generous remedy — but their generosity takes different directions and in fact their offers are sometimes radically incompatible.

Thus Britain offers a big reduction of Western import tariffs on all the exports of the developing nations without discrimination. France suggests a scheme of commodity-price stabilisation and a world food pool that would be something like Food for Peace generalised to a global scale. The USA, the Common Market Commission and GATT will be making similarly lavish proposals, but again all in different directions. These various notions of generosity happen to be inconsistent, and it is foreseeable that, for example, the clash between the British and French plans will be as spectacular as any brush between the two blocs of industrialised and developing nations. The British proposal cuts across the policy of the Six to award discriminatory preferences to certain poor countries (their "associates") and, much more seriously, it encounters the opposition of both American and Continental industries to opening up their domestic markets to an uncontrolled flow of Asian imports. The French plan, on the contrary, is totally unacceptable to countries like Britain, which would be obliged to pay more for their imported food and raw materials.

At Neighbour's Expense

Obviously, the generosity in each case is calculated to be at the expense of neighbouring Western nations, rather than at the expense of the proposer. Commonwealth preferences already expose Britain to the export competition of the few developing nations that possess notable secondary industries, because they happen to be in the Commonwealth, like India and Pakistan. To abolish this discriminatory preference in favour of the whole developing world would not, then, notably worsen Britain's situation. It would, on the other hand, make quite a difference to the Common Market, whose favoured associates do not have any such secondary industry. Similarly with the French food plan, it would not increase the cost of food in this country (already paid for at the high, and rising, Common Market price) but it would make it impossible for Britain to secure her provisions on an international market where prices are depressed by dumping. So, too, with the free-trade proposals of the Americans: it is reckoned that West Europe would bear the brunt of them without the US market being seriously inconvenienced.

It would be natural if it occurred to some of the developing nations present in Geneva to take each of the Western delegations at its most generous word, in the hope of adding up their various concessions in order to get the best of both worlds. Unfortunately, this will be impossible, and not only for the reason just indicated, that these plans are inconsistent in details. It will be impossible because the total cost of such concessions is quite beyond the means of the industrialised world. This is true not merely of the concessions offered in disorder by the West; it is even more true of the demands tabled by the Communist and developing nations this month in Geneva. They add up to an effort that no Western nation, nor all the Western nations together, could afford to make. It is good bargaining to ask for more than one hopes to get, but it is also simple realism to know when one is asking the impossible.

Excessive Demands

To summarise in a nutshell an impressive string of requests, the developing countries are demanding in Geneva that the West assure them larger and larger markets (preferably without the seller being required to make any sales effort) both for raw materials and manufactures, at prices that are stable in the special sense that they must go on rising but never fall, and at the same time that the West extend more and more abundant credits at lower rates of interest and for ever-longer periods. This is no parody of the demands tabled this month at the UN conference, but their factual total. You will not find them all put together in one omnibus sentence like this, no doubt because everyone would then see that they add up to an economic, monetary and commercial impossibility; but you will find them scattered throughout the conference documents.

One must expect to see this set of demands rejected because it tots up to a bill that the West cannot foot. By attempting something considerably less ambitious, the greatest economic power on earth has undermined its currency, incurred a chronic payments deficit and incidentally seen its sphere of influence contract in the developing world– without touching off a development miracle in any part of the globe outside West Europe. As for that latter region, its heartland, the Common Market, made much more timid concessions to trade liberalism last year, and at once saw its global commercial deficit double to the figure of $2,800 million, a drain it cannot afford for much longer. The one method of closing the gap between rich and poor nations that the former do not, in any eventuality, contemplate is downgrading their own economies by courting bankruptcy. And they would do just that if they consented to pay more for their food and raw materials while throwing their markets open to cheaper industrial imports and maintaining the expansion of foreign credits whose quality was deteriorating. One may find it egoistic in them that they shrink from these sacrifices, but it is as well to be clear on the fact that they do; and the Geneva conference will produce little but hot air if that fact is overlooked.

To say this, is not to chide the demanders at Geneva for asking too much; as noted, none of them does ask all this in one breath. One is rather exposing the political irresponsibility of the Western nations in putting forward competitive schemes, each of which is bound to arouse expectations but whose sum total is well beyond their combined means. Western solidarity, implied in descriptions of GATT as a rich nations' club, is not worth much when it allows, for example, Britain and France to lay before a receptive audience grandiose schemes whose simultaneous adoption would lead to the common ruination of the British and French economies, or at the very least to grave social and political stress. Happily the Geneva meeting is not intended to take any decisions but to confront ideas, so it will not be a failure if it leads to no more than realisation on all hands that nothing will be achieved by excessive demands and impossibly generous promises.

Such a recall to a more sober estimate of the possibilities in international co-operation is inevitable. How public opinion in the developing countries will react remains to be seen. The reaction in several Western countries is already evident for there has been recently a new outburst of nationalist economic egoism inside some of the nations that make the most substantial effort in favour of development abroad. To call this "egoism" is not to say that such feelings are not respectable: one has only to read the depiction of poverty in the USA lately made by President Johnson to realise what arguments can be invoked by people who think that their governments are doing too much for development abroad and not enough for their own under-privileged citizens. In France this sentiment is called Cartierism, a name that does altogether too much honour to a brilliant but wrong-headed colleague, Raymond Cartier, whose sensational articles comparing "wasted" aid with "neglected" French deficiencies have aroused the indignation of large parts of the peasantry and working class. While both sides juggle with astronomical figures in Geneva, a movement of opposition to generous assistance is swelling behind their backs in West Europe and North America. (It was already well established in West Germany and Switzerland, where scepticism about development aid is traditional and widespread.) It could explode into a force to reckon with if excessive requests were pressed with too much zeal in Geneva, or if Western Governments were tempted to make expensive concessions at the cost of their consumers or of sensitive industries (like textiles). Indeed, the braking effect this campaign is having on Western aid can be seen already in the lengthening list of conditions attached to US assistance to Latin America, as well as in the recasting of French aid on a new and more businesslike basis.

Needless to say, this campaign (whose progress is directly connected with the publicity given to the Geneva conference) is not going unanswered. The case for continued, indeed increased, Western aid and trade liberalism is being argued constantly by responsible authorities. Yet, a change of tone is noticeable there too: it is being emphasised that Western countries are not indulging in reckless give-away programmes for the reason that, even if they could afford to do so, that sort of aid would not stimulate development to any great extent. In other words, to Raymond Cartier and his like the official answer now is: We have not been as open-fisted as you say in dealing with development aid, but we admit that the large volume of assistance we have given has had disappointing results, so from here on our aid will be closely tied to our own exports and it will be technical, educational, intellectual rather than financial. This better reflects current thinking in the West than the grandiose plans that are being discussed just now in Geneva, and discussed with all the more eloquence because no one expects to see them put into practice.

The End of "Butskellism"?

JOSSLEYN HENNESSY

LONDON:

WHO WILL win the next U.K. election? Nobody knows, but a study of electoral statistics reveals some startling possibilities.

At the height of the Conservative government's difficulties last year, the public opinion gave Labour a 12 per cent lead. That lead has since fallen and has hovered around 5 per cent in recent weeks. It has been calculated that a 5 per cent lead in votes would give Labour a majority of 55 in the House of Commons. There is a 1½ per cent bias in favour of the Conservatives, owing to geographical distribution of seats and population. This bias is accidental, because the constituencies are periodically re-shaped by a commission, to allow for population changes. Allowing for this, however, the likely relation between the lead in votes has been estimated thus (allowing for 6 Liberal M.Ps.):

PARTY MAJORITIES

VOTES		SEATS
Lab. 10 p.c.	..	Lab. 140
Lab. 5 p.c.	..	Lab. 55
Lab. 4 p.c.	..	Lab. 43
Lab. 3 p.c.	.	Lab. 28
Lab. 2 p.c.		Lab. 9
Lab. 1 p.c.	..	Con. 7
Parties Level	.	Con. 22
Con. 1 p.c.	..	Con. 37
Con. 2 p.c.	..	Con. 55
Con. 5 p.c.	..	Con. 92

From which it appears that if the Labour lead falls to within one or two per cent, we risk having a government, of whatever party, without a working majority.

There are about 95 so-called "marginal" seats, held by Conservative majorities of 5,000 or less. Assuming that the recent public opinion poll trend continues, and that Labour comes in with a majority of around 50, it is thought that this would probably mean a loss of some 75 of the Conservative marginal seats. The significance of this is much greater than the mere substitution of 75 Labour members for 75 Conservatives.

The strongly flowing tide of Conservativism in the 1955 and 1959 elections brought in a large number of younger Tory members, liberal-minded and progressive. Most of them got in on marginal seats, because the "safe" seats are normally reserved for the orthodox party stalwarts. The bright young candidate has to take his chance in a marginal constituency. It follows that if Labour win with a majority of fifty, Sir Alec Douglas-Home will find himself leading an Opposition much more to the Right than the party's present composition in the House.

The opposite would be true for Mr. Wilson. He would find himself leading a government much more to the Left than Labour's present composition in the House. This is because the party is being led from right of centre, so that candidates of this persuasion find it easy to get nominated for "safe" seats, while the out and out supporters of Clause 4 of the party's constitution, which proclaims the need to nationalise the means of production and distribution, tend to be pushed out to fight the marginal seats.

What emerges from these facts is that the kind of middle of the road policies (popularly named Butskellism), hitherto

favoured by both Conservatives and Labour, have been possible largely because, on the one hand, the Conservatives included in their majority a substantial number of progressive younger men, while, on the other, Labour's leaders have felt that, in the face of repeated Conservative victories, their only hope of reversing the tide was to create an image of themselves as moderate men of the centre, and to back away from nationalisation, Clause 4, and orthodox Socialism.

If Labour wins, the opinion polls show that it will do so because the electors are tired of the Conservatives, not of Conservatism: they want new faces, not new policies. The irony of it is, however, that if my diagnosis is correct, a Labour victory will send both parties scuttling from Butskellism's middle of the road into the entrenched ditches of doctrinaire Socialism and reactionary Conservativism — the exact opposite of what the record, since last Labour government was defeated in 1951, suggests that the electors want.

An old song sums the position up:

"When you've got what you want
You don't want what you've got."

★★

I imagine that the bill of Mr. Edward Heath, President of the Board of Trade, to abolish re-sale price maintenance will eventually become law, but it looks as though it may be watered down to placate the Tory back benches.

Of expenditure on consumer goods, about 45 per cent is spent on items subject to re-sale maintenance, mos ly branded goods, including bread, cereals, cigarettes, confectionery, motor cars, radios, electrical goods, beer, wines, soap etc., which all shops sell at the price set by the manufacturers. The smaller shops like this because it widens their profit margins, and prevents competition in the sale of the items affected, so that consumers pay (often substantially) higher prices than they would if retailers were free to compete with each other by accepting smaller profit margins. There is no doubt that there are far too many uneconomic small shops and that lower prices would come from competition between fewer and bigger shops. The trouble is that small shop keepers are among the Conservative party's staunchest supporters. Hence these tears.

Cast-Iron Case

The economic case for the abolition of RPM is cast iron, and it reflects the courage and leadership of Sir Alec Douglas-Home and Mr. Heath that they have launched this measure, which should promote one of the U.K.'s most obvious needs — greater competitiveness.

What the bill has come up against has been well described in an issue of "Encounter", in which it was said that everybody pays lip service to the need for "growth" and "change", but is reluctant to accept the price. "The essence of growth is that it upsets the existing structure .... But this is precisely that the British in their present mood find hard to accept .... It is impossible to achieve a more rational distribution of labour because to do so would involve interference with traditional collective bargaining practices .... The issues that really arouse the British people are not issues of national efficiency but of 'social justice' and 'fair play'. We are unwilling to advance if it means that anyone is going to get hurt. That means, of course, that social justice has to be defined almost exclusively in terms of the past. Each section of the community stakes its appeal by reference to what it has traditionally expected and enjoyed." Who said this? Some crusted Tory reactionary? No, Mr. Michael Shanks, a Fabian socialist.

In the same issue of "Encounter" Mr. John Cole, Labour correspondent of the "Manchester Guardian" forthrightly attacked the trade unions for their "Maginot outlook" — an "inbred conservatism that makes all change an anguishing process .... The real concern should be over strikes which take place because some board of directors, frightened by a long and expensive quarrel with the unions in another company, funks the decisions to instal a new machine or adopt a new process .... No board of directors which misses a chance to make a really major improvement in efficiency by the introduction of new methods is fit to hold office ...."

The Left wing "Observer" recently editorialised similarly: "Unfortunately talk about changes in the structure of industry is too often just talk. As soon as anything actually happens which will affect existing methods and interests, an outcry is raised. Some of the very people who cry out most glibly for modernisation were the first to object to the abolition of RPM. This is just one example. There are many more ...." Subsidies to farmers are regarded as politically untouchable. Aircraft, nuclear power, and space are treated as matters not of making profits but of maintaining prestige.

Protest Voices

Fortunately, more and more voices, on the Left as much as on the Right, are being raised in protest against restrictive practices, whether by employers or by the unions, and a movement towards reform seems to be piling up. One example of this is a pamplet "Trade Unions and the Law", just published (Price 4 sh) by PEP (12, Upper Belgrave St., London S.W.1.), the independent non-political research organisation. PEP urges the unions to put their own houses in order voluntarily rather than wait to be forced to submit to legislation

In the U.K., a worker has no legal right to join a union, so that a union's refusal to accept him may mean that he cannot earn his living in the way that he wants to. A big factor slowing up modernisation is that the unions insist on five years of apprenticeship before admitting a worker to membership, whereas European industry trains men successfully in three years. Moreover, the unions refuse to impose any authorised tests of efficiency to enable a man to call himself "skilled". On this, the Socialist commentator Andrew Shonfield observed: "If any man who was able to prove ability could take employment in a skilled occupation, the present system of self-contained and all-powerful trade union fiefs would soon collapse".

PEP's pamphlet concludes with these significant words: "It is in the trade union movement's interest, as well as the public's that no individual should feel oppressed by its actions and that elections should truly reflect the intentions of the voting members. The actions which directly affect the com-

munity, and which may threaten the success of economic planning for industry, are unofficial strikes. Public opinion has been disturbed by their incidence and the trade unions cannot afford to ignore the force of this opinion. To do so may invite a greaater regulation of their affairs than there is now. It is eminently desirably that the trades unions themselves should effect whatever changes are necessary to demonstrate that they recognise that the public interest has a right to be considered in their activity."

Such are the straws currently blowing before the wind of reform in the U.K.

A Common Market for Africa

MADAN M. SAULDIE

THE SIXTH annual session of the U.N. Economic Commission for Africa concluded in Addis Ababa earlier this month, after a fortnight's crowded deliberations. The session which came only 10 months after the Charter of OAU was signed, brought to completion the first five years of ECA's efforts at an integrated economic growth on the African continent. The businesslike manner in which the proceedings were conducted and the amicability demonstrated by the representatives of 34 independent African countries, mirrors the Africans' genuine anxiety to solve their economic and social problems on a coordinated level. The Commission is saddled with a task which is immense and urgent, for it is to this agency of the U.N. that African nations hope to look for advice and assistance in training the technical personnel and proper exploitation of the continent's material and human resources. Wastes and duplications need to be avoided if way is to be opened for healthy economic growth.

As stated by the Commission's Executive Secretary in the inaugural speech, ever since its inception in 1958 the Commission has been primarily concentrating on building of institutions; training of personnel to run such institutions; advising the governments in drawing up and execution of their development programmes; and conducting investigations at the request of individual Governments.

Infrastructure of Programme

Three main institutions — Conference of African Statisticians, African Institute of Development and Planning and the African Development Bank — have been established through which the Commission intends to create an infrastructure on which to lay the foundation of co-ordinated programmes of African development and the meaningful African common market.

The Conference of Statisticians helps in establishing statistical bureaux, training of middle grade and professional personnel and suggesting methodology in conducting surveys which would be useful in drawing up realistic plans for agriculture, industry and social services on a continental basis. The Development and Planning Institute maintains for the time being a team of 9 experts under whose guidance at least 25 students are being trained. More and more students may be coming up for training every year as the Institute gets the necessary publicity it so far lacks. The Institute, drawing as it does upon the experts' advice from France, U.K., U.S.A., the U.S.S.R. and Poland, would serve as an international centre for the study of Africa's economic problems — problems concerned with the agro-industrial and rural-urban imbalance, the developing role of key agrarian reforms and the training of necessary personnel for the introduction of such reforms.

The third institution, the African Development Bank, agreement of which had been signed by 32 countries, will provide facilities for aiding multi-national projects and attracting additional capital for investment in economic development. Beyond the expected scope of making investments out of its limited resources, thus, the bank would also strive to stimulate investment. It is this principle of "additionality" that projects the bank to a position where it could assiduously direct the flow of capital to finance economic and social development on the continent. To start with, the bank requires an initial capital of $250 million i.e. 65 per cent of the total capital stock to be subscribed. Ratifications of the agreement are being received in the ECA's secretariat and it is hoped that all subscriptions would be paid up during this year and the bank would start working actively from next year.

Improving Living Standards

Agriculture and industry figure prominently on the ECA's calendar of activities. The Commission's ECA/FAO Joint Agricultural Division encompasses all aspects of African agriculture and aims at improving the living standards of the African farmer "within the context of a balanced economic growth". A special fund has been created which would provide $60 million for financing agricultural projects. The International Bank of Reconstruction and Development has also promised to advance a $500 million assistance for improving irrigation, combating hazards like floods and crop diseases, and land reclamation and land settlement. The Community Development and Co-operative movements in Africa are also receiving serious attention of the Commission. The proposed land reforms institute and land reforms bank when established would set the pace for long-awaited agrarian reforms on the continent.

In the field of industry, the ECA feels that some African countries being too small to introduce modern industrialization, pooling of resources and co-ordinated larger markets on sub-regional basis, may enable these countries to start import-substituting industries. The idea behind sub-regional industrial growth is that as industrialization takes place in each country and on sub-regional level, more intra-African trade will take place; and, by and by, the country and sub-regional boundaries will cease to be barriers to economic development and the goal of African common market will have been achieved. Intra-African trade is essential also in order to restrict the flow of natural wealth to Paris which the association of 18 French-speaking territories with the ECM has made possible.

The identity of interests existing between the ECA, the OAU and the U.N. Development Decade, is a strong instrument in the hands of African nations to integrate their economic and social programmes. Plans are afoot for the creation of an African Monetary Council which would function in collaboration with I.M.F. and IBRD.

Stimulated thus by the ECA's recent deliberations, the Africans are expected to create a common African front at the U.N. Conference on Trade and Development at Geneva. Their's would be a two-pronged attack: To break the trade barriers inherited by them from their colonial rulers and to tackle the problems of land-locked up-country territories which have resulted in much higher prices per ton for imported goods than those paid by coastal countries.

LISTENING POSTS

Streamlining Import Procedures

By Our Special Correspondent

NEW DELHI:

IN ITS final report submitted to the Government a few days ago, the Swaminathan Panel, set up last year for recommending measures for simplification and speeding up of administrative procedures relating to industrial licensing, is understood to have highlighted the need for ensuring regular supply of raw materials and components to industrial undertakings. It is believed to have suggested that import licences for raw materials and components should be issued to industrial units within three months of the commencement of each licensing period. In case this is not possible for any reason, the Government should issue ad hoc licences equal to 50 per cent of the value of the licences issued for the first half of the previous licensing year. In regard to import entitlements for the second half of a licensing year, the Panel is said to have recommended that the industrial undertakings should be authorised to utilise at least 50 per cent of the value of the licences for this half pending final announcement of the policy. At present 50 per cent of the value of the licences given on annual basis can be made use of by an industrial unit during the first half of the licensing year and further instructions have to be awaited from the Government for utilising the remaining 50 per cent in the second half. The revision that the Swaminathan Panel has suggested in the import policy will not only ensure adequate supply of raw materials and components to industrial undertakings, but should also help in making arrangements for bulk purchases at concessional rates.

Discretion to Licensee

The Panel also thinks that import limitations on licences should be value-wise and not quantity-wise. This will give some discretion to the licensees to adjust their import programmes and bring in the permissible items listed in the licences in the proportions they deem fit. In respect of spare parts, the Panel is said to have recommended that in cases in which imports are effected to a quantity less than that stipulated in a licence and damage is done to a consignment in transit, fresh import licences to the requisite value may be issued without delay, provided the supplier is agreeable to meet the cost of the damaged spare parts.

The Panel in its final report is also understood to have recommended that the list of the key industries for which it had suggested expeditious licensing procedures in its interim report, should be enlarged to include import-saving and export-oriented industries, such as industrial chains, insulating paper, high tensile galvanized steel wires, transformer oil, synthetic fibres and caprolactum. Accelerated licensing procedures may as well be applied by the Government to any other industries which help in earning foreign exchange. Extension of the streamlined licensing procedures, however, has not been favoured for the low or non-priority industries because of practical difficulties and foreign exchange shortage. This is also not considered desirable in the interest of giving a definite direction to the industrial development of the country.

In the case of industries put on priority list for expeditious clearance of industrial licences, the Panel is understood to have recommended that capital goods requirements of the licensees should also be met expeditiously. The same treatment may be accorded to other industries provided they contemplate use of indigenous raw materials only.

In view of the measures being taken to tighten the tax collection machinery, the Panel opines that submission of income-tax clearance certificates along with the applications for industrial licences may not be insisted.

The Panel is said to have noted with satisfaction that the IFC and the ICICI are prepared to consider loan applications in the case of key industries immediately after the issue of letters of intent. It, however, opines that the final approval of these loans should be subject to clearance of the schemes by the Capital Goods Committee.

A fair trial has been recommended for the various suggestions made by the Panel. The position may again be reviewed next year in the light of the experience gained during the trial period.

The Panel's recommendations are understood to be under the active consideration of the Government. Decisions are expected to be made known shortly. Indications are that most of the proposals, particularly those relating to ensuring of regular supplies of imported raw materials and components and extension of accelerated licensing procedures to import-saving and export-oriented industries, will be accepted.

★★

The satisfaction expressed in New Delhi over the last week's deliberations of the Aid-India Consortium evokes optimism about our succeeding in securing from this source approximately Rs. 525 crores financial assistance sought for the fourth year of our current Plan. It is particularly gratifying that the candid appraisal of the third Plan's progress undertaken by the Planning Commission last year and the measures designed by the Union Government for fostering economic growth and attracting foreign private investments have been appreciated by the Consortium. Reports from Paris suggest that these two facts, along with the improvement in our balance of payments position in 1963-64, went a long way in allaying the fears that had come to be entertained recently by some members of the Consortium about the aid provided by them being put to effective use.

It is significant that we have not sought from the Consortium much larger aid for 1964-65 than what was provided by it during 1963-64. This is due to the fact that the interest and external debt repayment liabilities already incurred by us for the fourth Plan period are of a high magnitude. The plea that the Union Government is stated to have made before the Consortium for liberalisation of the terms of the credits to be supplied during 1964-65, thus assumes significance. It has been urged that in regard to the new loans, the members of the Consortium should not insist on principal repayments before 1970. Although the Consortium had been receptive to such requests in the past, in actual practice some of its members have not been able to liberalise their loan terms by any appreciable degree. It is hoped that the credits to be made available in future will be on much easier conditions.

The same applies to the request made again by India for making available most of the Consortium assistance in the untied form. This, it has been impressed, would contribute greatly to the smooth and rapid growth of the Indian economy when the shortfall in agricultural output for the third year in succession, due to adverse weather conditions, is having repercussions on a wide front. The third point that has been stressed is that besides pledging assistance for 1964-65, the Consortium should take a longer view of the Indian economy and indicate what could be expected from it in 1965-66 and 1966-67. A tentative idea has been given to the Consortium of the development programmes planned for these two years.

The Consortium will be meeting again in Washington on May 24 when the members will make specific pledges of aid for 1964-65. In 1963-64, the Consortium made available $1,052 million (Rs. 500.8 crores) assistance. This brought the total aid provided by this source during the first three years of the third Plan to $3,417 million (Rs. 1,626.5 crores).

★★

The U.S. collaboration in Indian industries should get a fillip as a sequel to the visit here next month of the top ranking executives of about thirty prominent American industrial corporations. The visit has been sponsored by the Indian Investment Centre through the Business Council for International Understanding, New York.

Priority List

The corporations invited to send their representatives are principally those that manufacture items on the priority list of the Government of India under the third Plan. These include producers of tool and alloy steel, industrial equipment, machinery and equipment for heavy industries, petro-chemicals, etc. Some representatives of the major hotel and motel chains are also likely to be there among these visiting dignitaries. The following companies have already agreed to participate in this tour programme: (1) Allied Chemical Corporation, (2) Westinghouse International, (3) Standard Oil of N.J., (4) Goodrich Gulf Chemical, (5) Boise-Cascade, (6) Abbey Etna Machine Company, (7) International Minerals & Chemicals, (8) Van Camp Seafoods, (9) Farrel Birmingham, (10) American Cement, (11) Kerr-McGee, (12) International Telephone and Telegraph, (13) Dow Chemicals, (14) Arwood Corporation, (15) Union Carbide, (16) Koppers, (17) Brown & Sharpe, (18) Ferro, (19) Baldwin-Lima-Hamilton, (20) Deere & Company, (21) California Chemicals and (22) International General Electric.

The main object with which the visit has been arranged is to provide an opportunity to the U.S. entrepreneurs to study at first hand the investment climate in India and the opportunities offered by this country to foreign private capital. It is expected that the group will remain in Delhi for about a week from April 13 to 21 holding informal meetings with the authorities and later on visit select industrial units.

★★

In a bid to stabilise wheat prices at reasonable levels, the Union Government has decided to constitute nine wheat zones in the country. Export of wheat and wheat products from, and import into, each of these zones will be prohibited except under permits to be issued by the State Governments with the concurrence of the Centre. It is intended that these permits should not be normally granted on private trade account. The inter-zone movement of wheat is proposed to be restricted to the Government and State sponsored accounts.

The nine zones which are being formed with immediate effect are: (1) Punjab, Delhi and Himachal Pradesh, (2) Uttar Pradesh, (3) Rajasthan, (4) Madhya Pradesh, (5) Bihar, (6) Maharashtra, (7) Gujarat, (8) Andhra Pradesh, Madras, Mysore, Kerala and Pondicherry and (9) West Bengal, Orissa, Assam, Nagaland, Tripura and Manipur. Exports from the Punjab zone would be permitted to Jammu and Kashmir. Similarly, supplies to Goa would be allowed from the Maharashtra zone.

The reconstitution of wheat zones on a more stringent scale than ever done in the past is indicative of the serious concern with which the Union Government views exploitation of the indigenous wheat shortage by the trade. With a view to easing the supply position of wheat, the Union Government has also planned to import larger quantities of this commodity from the United States under P.L. 480. Nearly 500,000 tonnes of wheat may be imported from the U.S. this year as against about 400,000 tonnes imported last year.

For checking undue rise in rice prices during the off-season, the Union Government plans to build up adequate buffer stocks through procurement within the country. Procurement prices of rice have been raised in the five surplus States. The new prices (per maund) fixed for the common varieties of rice in these States (the prices prevailing before the revision are given in brackets) are: Andhra Pradesh — Akkullu — Rs. 19.50 (Rs. 17.50); Madras — Kattai Samba — Rs. 19.25 (Rs. 17.25); Madhya Pradesh — Gurmatia — Rs. 17.00 (Rs. 16.00); Assam — Coarse —Rs 19..39 to Rs. 20.59 (Rs. 18.39 to Rs. 19.59); and Uttar Pradesh — Gadre (Grade IV) — Rs. 17.00 (Rs. 16.00). Corresponding changes have been made in the prices of other varieties of rice on the basis of existing differentials.

The Union Food and Agriculture Minister, Mr. Swaran Singh, has also indicated that the Government might fix ceiling prices of rice and wheat if the circumstances required. Meanwhile, with a view to stepping up agricultural output during 1964-65, foreign exchange allocation for the import of fertilisers, pesticides and equipment for boring and for the execution of the planned programmes for fisheries and dairy products is being stepped up by about Rs. 5 crores over and above the Rs. 36.8 crores allocation made recently.

★★

Inaugurating the eighth annual general meeting of the Delhi Management Association here this week, the former Governor of the Reserve Bank, Mr. H. V. R. Iengar, said that the overall atmosphere in which the private industry had to operate had become worse as a result of the budgetary and fiscal measures proposed in the 1964-65 Central Budget. The concessions given to a few industries of national importance, he opined, were not enough to stimulate the economy as a whole. He added that steep increases in the rates of estate duty and gift tax and the imposition of taxes on dividend payments and bonus shares were impediments in the way of capital formation. The depression on the stock exchanges, Mr. Iengar argued, clearly indicated the lack of interest in investment. He thought that the steps taken to revive the stock markets were too inadequate. Mr. Iengar further stated that the Government would not be able to step up the rate of capital formation in the country through large number of industrial credit institutions it had set up. On the contrary with the esablishment of these financial institutions, the private investors, who had hitherto been an important source of capital to industry, were going out of the picture. He feared that the various credit institutions set up by the Government may give the Government indirect control over private companies.

Accountable to Parliament

Coming to the management aspects of business enterprises, Mr. Iengar said that the only difference between the management executives in the private and the public sectors, was that the mistakes of those working in the public sector were magnified because of their accountability to Parliament and the public.

In his presidential address, Mr. R. L. Tuli, General Manager, Punjab National Bank, referred to Mr. T. T. Krishnamachari's budget speech which recognised management as a professional and technical job. He suggested that the Government should render greater help in instituting intensive training programmes for ensuring increased availability of professional managers. He also commended that the All-India Management Association should take note of the Finance Minister's statement and make plans for broadening the scope and pattern of growth of managerial skills with Government's assistance. Referring to the Finance Minister's proposal to limit the amount of deduction admissible to companies for expenditure incurred by them on provision of perquisites to their employees, to an amount of 20 per cent of the salary of

Acropolis, Athens

Here's how on your next trip to Europe or North America, you can avail of reliable KLM's jet services and see Athens on your way, at no extra fare!

Athens, one of the 44 key cities covered by KLM's network of air routes in Europe, is now served direct by both the KLM's flights from India. A nice opportunity to visit this increasingly popular city for a while, before continuing your journey. Read on for more interesting KLM facts...

1. A KLM DC-8 jet leaves for Europe on Saturdays from Calcutta, on Tuesdays from Delhi and on Mondays, Tuesdays, Thursdays, Fridays, and Saturdays from Karachi.

2. KLM's flight from Calcutta leaves on Saturday at 20.30 hrs., arriving Athens on Sunday 05.30 hrs.

3. From Athens, this flight goes to Zurich on its way to Amsterdam, providing you with yet another attractive possibility! Arrival: Zurich Sunday at 08.00 hrs. Arrival: Amsterdam Sunday 09.55 hrs.

4. KLM's flight from Delhi to Amsterdam leaves on Tuesday at 21.55 hrs., arriving Athens on Wednesday at 05.55 hrs. Arrival: Amsterdam (via Frankfurt) Wednesday at 10.05 hrs.

5. Both these KLM flights from India can easily be connected at Karachi by passengers from Bombay and also from Delhi and Calcutta.

6. In Amsterdam, these services link up with daily non-stop KLM flights to New York and with frequent flights to Houston, Montreal and Mexico city.

7. On the Amsterdam-New York route, KLM will have 24 DC-8 jet flights a week during the peak season – 17 non-stop, 5 via Glasgow and 2 via Shannon.

8. Between Amsterdam and Montreal, KLM operates five/six DC-8 jet flights a week, with three of them continuing to Houston and Mexico City.

Attractive KLM facilities

9. KLM has its own air-conditioned resthouse at Karachi airport, called "Midway House". It has spacious, comfortable rooms with shower baths and provides many facilities such as a supervised nursery, a barber shop, a souvenir and carpet shop and a floodlit tennis court. The service there matches the standards of a good European hotel.

10. KLM offers many interesting side-trip possibilities. For example, on the normal round-trip fare from Calcutta, Delhi or Bombay to London, you can enjoy a side-trip to Copenhagen or Paris, Frankfurt, Dusseldorf, Brussels, Paris, London, Amsterdam – all for the price of your ticket to New York. Ask KLM for details of other stopover possibilities.

ATHENS— KLM's new gateway to Europe

Things to do in Athens: See the Acropolis by moonlight (a thrilling experience!); the Benaki Museum by daylight; go to a "taverna" (small typically Greek restaurant), try "Cocoretsi" (Greek speciality) or crisp "Kalamarakia" (fried squid), drink 'ouzo' (aniseed flavoured Greek apertif); take a stroll during a cool summer evening throughout the picturesque winding streets of the old Plaka quarter and if you happen to be there during August/September, in time for the Festival of Athens, attend the remarkable performances of ancient drama, concerts and ballets.

11. Make your choice of a number of attractive organised tours, planned to provide visitors to Greece with comfortable and easy means of access to every point of interest in the country. Contact KLM for full particulars regarding the number of days involved and the routing.

12. From Athens, many important cities in Europe and North America are served direct. For example, London, Madrid, Paris, Rome, Vienna, Zurich, Frankfurt, Brussels, Geneva, Copenhagen, Milan, Munich, Amsterdam, New York, Detroit, Chicago etc.

13. KLM's multi-stopover plan lets you make more than one stop en route your final destination at no extra fare. For instance, if you are flying from Delhi to New York, you can visit Rome,

14. When flying via Amsterdam, you can do a lot of interesting things at the airport. Shop for luxury bargains at the Tax-Free Shopping Centre. Buy a tax-free car at ShipSide Showroom. Take a Minitour of Amsterdam. Visit the airport's fascinating aeronautical museum.

15. All KLM flights to Europe from Calcutta, Delhi and Karachi arrive in Amsterdam next morning, offering immediate connections to London, Paris, Brussels, Geneva, Hamburg, and many other cities in Europe and also to New York.

16. Your Travel Agent will tell you more about the advantages of flying KLM. Get in touch with him or contact the nearest KLM Office. Calcutta – 7, Chowringhee Road; Delhi – 9A, Connaught Place; Bombay – Taj Mahal Hotel.

Free Travel Information

For free travel information on Athens, Zurich, Frankfurt, Amsterdam, New York or any of the 104 cities served by KLM in 68 countries, write to KLM, Calcutta.

KLM

an employee, Mr. Tuli said, it appeared to be unrealistic in the light of the extremely high rents that had to be paid in cities and big towns for securing even very modest accommodation for employees. He urged that house rent should not be included in this limit in case the proposal could not be dropped altogether.

Mr. Tuli also referred to that part of the Finance Minister's budget speech, where he had remarked that the provisions of the Income-Tax Act allowing deductible expenditure on amounts spent wholly and exclusively for the purpose of business, were being abused in respect of certain types of expenditure, such as expenditure on daily allowances, on unnecessary bookings on planes and trains, on the maintenance of guest houses and suits of rooms in hotels, on providing conveyance etc., for their officers and directors. He suggested that the rule-making authorities should attempt to prevent misuse rather than ruthlessly curtail such expenditure. They may bear in mind that undue curtailment of such expenditures was likely to affect business of companies and also the efficiency and competence of the professional managers who carried heavy burdens of managing concerns under numerous stresses and strains.

**

Three public sector undertakings — Hindustan Cables, National Newsprint and Paper Mills and National Instruments Limited — have made proposals to the Union Government for expansion of their capacities. Hindustan Cables has proposed to set up plants for the manufacture of aluminium sheathed telecommunication cables with a capacity of 600 miles per annum, and special grade paper for telecommunication cables with a capacity of 4,000 tons a year. The National Newsprint and Paper Mills propose to expand the production capacity of its factory to 250 tons per day from the present 100 tonnes per day. The National Instruments Limited wants to go in for the manufacture of various new items, such as students' microscopes, clinical thermometers, mechanical comparators and dial air gauges, ophthalmoscopes, blood pressure measuring instruments, thickness measuring instruments for mica, cameras, etc. The proposals, it is stated, are receiving the attention of the Government.

**

The two-day conference of the Indian National Commission for Co-operation with UNESCO, held here last week, discussed the projects drafted for abolishing illiteracy in various regions in the world. It urged that UNESCO, at its next general conference in October, should take up these issues more seriously. The Commission expressed concern over a large proportion of UNESCO's funds being directed towards meeting administrative costs of the organisation and the concentration of efforts at the headquarters at Paris.

The Commission stressed the need for increasing supplies of teaching aids and materials and the development of curricula in the fields of scientific education and education for international understanding. It recommended that a much larger allocation of funds should be made in the foreseeable future for extending the programmes of education for international understanding to all secondary schools and colleges in India. It as well pleaded for the setting up of a cultural external publicity unit under the Commission for selecting or preparing suitable publicity material in collaboration with the Films Division, A.I.R. and other similar bodies.

Continuing Crisis in Cotton

From Our Correspondent

BOMBAY:

COTTON PROBLEMS came in for a comprehensive and detailed review at the inauguration of the 89th meeting of the Indian Central Cotton Committee by Mr. Swaran Singh, Union Minister for Food and Agriculture. The impression one gained was that, even a century of progress in cotton production has not been adequate to meet the increasing requirements of a country still dependent, to a large extent, on the traditional industry of textiles, for its exports no less than for its growth. The Cotton Package Plan, on which Government had pinned high hopes for bringing about an increase in production of the fibre may not be a success, according to the Minister, on account of the unsatisfactory implementation of the programme by the States. This highlights the need for coordination in the sphere of implementation of the Plan, particularly in the primary sector of agriculture, which has to give the support to industrial development. In fact, the Minister observed that in the absence of any marked progress in the last three years, there was little prospect of reaching the third Plan target of 70 lakh bales, unless extraordinary and unrelenting efforts were made by all concerned.

Reviewing the pace of cotton development in the post-independence era, he pointed out that a major part of production programmes was based on the 'grow-more-cotton' campaign and nearly 80 per cent increase in production was achieved after 1962-63. While this was creditable, certain undesirable trends have developed. There had been no steady tempo in cotton production from year to year. Wide swings in crop yields created difficulties in the planning of the manufacturing targets of the industry. Stability in prices could not also be maintained; imports had to be arranged at great cost. The most important feature was the widely fluctuating production levels in different regions and this called for a close study of the natural hazards and other factors which limited the production potential and which could be brought under control. In this connection, the Minister referred to the newly constituted Agricultural Production Board at the Centre and hoped that the State Governments who have all agreed to re-organise the administrative machinery with a view to securing efficient execution and maximum co-ordination would show better performance in the future.

Referring to the most controversial problem of cotton prices, Mr. Swaran Singh did not indicate a definite policy in favour of raising the ceiling prices. His clarification of the position that those who advocated further increase in the ceiling prices of cotton did not take note of the existing disparity between the world prices of cotton and those of Indian cotton, shows that perhaps he is not in favour of such a step. However, it was his view that adequate incentives to the cotton grower could be provided even on the basis of the existing maxima and minima, if the floor and ceiling prices of various qualities of cotton were determined with preference to the technical considerations such as spinning capacity and other quality factors rather than on mere staple length of the so-called trade practices. He said that any changes in price structure which may be justified, would be enforced with effect from the cotton season, 1964-65.

In the scheme of ensuring a satisfactory cotton supply position, the Minister referred to the need for focussing greater attention to the improvement of cotton marketing system so that the cultivator could be enabled to realise the maximum share of the rupee paid by the mills and that the lags in the movement of cotton may be avoided. The studies undertaken by the Directorate of Marketing and Inspection to find out

the price-spread of cotton from the grower to the mill should throw light on the weak points in the existing link and the remedial measures that could be taken to rationalise the system. The Minister was also of the view that it was of utmost importance to make all-out efforts to establish co-operative societies of cotton growers for the marketing, including processing, of cotton on a much wider scale, so that cotton in pressed bales could be sold by the societies direct to the mills.

Earlier, welcoming the Minister, Mr. A. D. Pandit, President of the Committee, among other points touched by him, emphasised that as far as cotton was concerned the main objective in India was to fulfil the industries' growing demand for medium and long staple cotton. There was also the additional problem of providing extra long staple cotton for which the country had been depending on imports right from the beginning of the manufacturing of super-fine and fine cloth in this country. This needed intensive research, and while there was no dearth of knowledge of agronomy, soil chemistry, irrigation etc. what was lacking was a proper organisation to make adequate use of the available knowledge. It was, therefore, necessary to intensify the research programmes with a view to over-coming some of the shortcomings inherent in the present cotton economy. The problem was indeed complex. Even in the agriculturally advanced countries, research was directed towards increasing investment from outside the farm and raising the production per acre. It was only later that the research took a more sophisticated line with the accent of increasing the yield per unit of investment. It is therefore necessary that the farmer obtained a price that was in proportion to the real value of the produce. Much ground has been covered at the meeting in the diagnosis of the problems and steps that are necessary to improve the situation. It remains to be seen how far the hopes of the Minister would materialise in the States co-operating effectively in raising the output of cotton as also its per acre yield.

★★

Addressing the Annual General Meeting of the Bombay Chamber of Commerce and Industry, Mr. V. P. Naik, Chief Minister of Maharashtra State, stated that a reconstituted committee headed by Mr. S. G. Barve, Minister for Industry will be shortly announced to look into the multifarious problems confronting the growing city of Bombay. Among the various problems, the water problem in the City requires urgent solution and the authorities would soon indicate the sources of water and the long and short term schemes to be devised for augmenting the supplies. Another ticklish problem was that of unauthorised occupation of the land by the immigrants into the City, and the slums springing up from the unauthorised structures. The Government was thinking in the direction in which suitable areas could be demarcated for rehabilitation of the immigrants. He said that Government would spare no efforts in ensuring the City's proper development, though the problems appear to be of a stupendous nature. Mr. Akbar Hydari, President of the Chamber, in his speech suggested that the solution to the problems of Bombay would lie in the setting up of a high powered co-ordinating authority and entrusting it with the task of integrated perspective planning. Such a body will have to be invested with overriding powers and should be in a position to co-ordinate the activities of the various agencies concerned — Central and State Governments as well as the municipal authorities — and to secure public co-operation.

Businessmen in Conference

From Our Correspondent

CALCUTTA:

THE SECOND West Bengal Business Convention, held in March, was a great success, judging at least from the huge attendance one saw on the opening day. And because of the objectives which the Convention seeks to promote, attendance should be the yardstick of judging its success. The idea with which the Convention was first held in 1959 was to spread business entrepreneurship as widely as possible among the middle classes of the State and thus help solve the serious problem of unemployment, at least among the educated; to encourage the development of trade and industry in parts other than the Calcutta area where there has already been a suffocating concentration of people; and to help organise associations of traders and small industrialists in the muffosil areas. (Three leading chambers of commerce of Calcutta have been the joint sponsors of these conventions.) The idea obviously has proved very popular. The first convention was attended by as many as 5,000 business men from all over the State, and the second drew a much larger gathering. Encouraged by the success of the move from the very beginning, the sponsoring chambers have set up a permanent organisation styled "the West Bengal Business Convention", which during the subsequent five years has done much useful work. It has strengthened trade associations and helped form new ones where none existed before; it has rendered some technical assistance to new entrepreneurs in establishing or expanding industries and has given guidance to business men concerning the availability of finance and other facilities for new enterprises. Zonal conferences have also been held in different trading centres of West Bengal in order to ensure as wide a participation of the business classes in the activities of the Convention as possible.

Mr. K. K. Birla, who presided over the second Convention, was happy that the organisation has been succeeding in its objectives, but the success of a new, enterprise, especially one promoted by people of small means, depends not only on the skill and acumen of the entrepreneur but on his ability to comply with the various regulations of the Government not all of which are free from frustrating anomalies. Mr. Birla in particular referred to the administration of sales tax. Business men generally, he said, have experienced very serious difficulties in regard to the administration of sales tax. This has led to much harassment and dislocation of normal functioning of business firms. There are others like the Shops and Establishments Act and the Prevention of Food Adulteration Act, which, despite the very good intentions underlying these measures, are so imperfectly worded that small business men are usually hard put to it in complying with their provisions. These harassments are avoidable by a more realistic interpretation of the rules concerned.

A statement of Mr. Birla, which struck a responsive chord in the heart of Mr. Asoka Mehta, Deputy Chairman of the Planning Commission who inaugurated the Convention, is that all business men, big or small, should exchange ideas so that it may be possible for the larger industries to help the smaller ones. This fitted in well with Mr. Mehta's idea of "deconcentration," not only of industries but also of ownership. There is a large field in West Bengal, Mr. Birla pointed out, for developing modern small-scale industries as feeder and ancillary industries to the large-scale enterprises. The Convention has started some work in this direction and it has been able to obtain some assistance of large-scale industries in this matter. "But in this field there is much scope and as the economy progresses further, we should be able to set up numerous small-scale industries throughout the State provided there is better understanding and co-operation between all sections of industry as also between industry and Government," Mr. Birla added.

The economy of West Bengal itself needs a lot of help. Mr. Birla's speech provided an excellent analysis of the State's economic problems. Under the growing pressure of population which increases steadily on account of the influx of people from outside and the refugees from East Pakistan, the State's economy has been strained to breaking point. Mr. Birla reminded his audience that while West Bengal once held a pre-eminent position in the industrial map of the country, lately, due to the more rapid industrial growth in other States and some of the difficulties in the way of industrial expansion in the State itself, West Bengal is tending to lose ground. In 1957-58, this State had the largest number of new company registrations of any State in India. It still has a leading position in this matter, but the rate of increase in new company registrations in other States such as Bombay and Madras has been much higher in subsequent years. The major industries of the State — jute, tea and engineering — have been having to face many difficult problems. Jute and tea are the biggest foreign exchange earners, but the production of tea is tending to fall, while tea production in the world as a whole is going up. Mr. Birla emphasised that the future of tea would depend upon the increase in its production and the ability of the gardens to expand and replace the worn-out areas by new plantations.

Pakistan Threat

The jute industry is doing well at the moment, but Pakistan has begun to pose a serious threat. That country has not only a higher yield in raw jute, but the quality of the fibre is much better. Besides, the industry there has the latest machinery which gives it an edge over India. It is time India realised this danger and took steps to strengthen the economic base of her own jute industry by paying greater attention to production of better quality jute. As for engineering — the third major industry of West Bengal —, it has been facing a serious raw material problem. Shortages of raw materials as well as of power have been so acute that a large part of the installed capacity has had to be idle. This industry has a crucial role to play in the economic development of the country, yet official steps to help the industry out of the difficulties have been so inadequate that many in the industry have begun to feel helpless. Mr. Birla has urged that the Governments, both at the Centre and the State, should give due attention to West Bengal's economic problems, which in a way affect the country as a whole since West Bengal not only occupies a key place in the national economy and foreign trade of India, but is strategically very important as well.

In this connection, Mr. Birla mentioned two factors — power and transport — which cry out for urgent attention. These are essential for rapid growth of industry and trade, but the authorities have always erred on the side of underestimation in providing for these basic facilities in their plans. Mr. Birla felt that it was better to have an excess of power rather than to have less of it. The coal transport position at the moment is easier due to the slackening in the tempo of economic development, but once the economy picks up again, the pressure on transport will be accentuated. It is, therefore, very important to lay a great emphasis on road transport and development of a network of roads throughout the region. Mr. Birla gave two examples of grand planning and half-hearted measures to implement the schemes. "We have been thinking in terms of an express highway from Calcutta to Durgapur for several years. This has not been realised. Similar is the case with the road from Calcutta to the Dum Dum airport". Apart from these, a number of regions in the State are still inaccessible, as the roads are not there and where they are, the roads are not in a good condition.

Food Problem

Finally, West Bengal's problem of problems — food. The State has never had enough of it. Zonal restrictions have made the problem of securing supplies from surplus States, more difficult than it should be. The problem, as Mr. Birla rightly sees it, is of more intensive cultivation and better facilities to agriculturists to increase the yield of the food crops in the State. Unfortunately, it is the traders who are being blamed for the food problem rather than the authorities whose responsibility it is to ensure adequate supplies. During the recent past, when there was a shortage of foodgrains in the State, the trade was being blamed and there was more emphasis on distribution controls and nationalisation of rice mills rather than a concerted effort to increase food production. Mr. Birla said to declare emphatically: "After all, nationalisation of production or of distribution does not add to or create new wealth. I do not see what advantage could be had if all the rice mills were nationalised in the State. As is well known, during recent months the rice millers were not able to obtain sufficient supplies of paddy at a reasonable price. It is too much to expect that once the rice mills are nationalised all shortages will disappear and there will be plenty of rice for every one. On the other hand, it will drive out of employment millions of small traders and business men who have been in this line for generations. We have yet to find an instance where as a result of State trading, prices have actually gone down.... These problems need to be realistically assessed by Government and the emphasis has to be on increasing production all round rather than on nationalisation of distribution or production which will only create new problems for the State without helping the consumer."

Mr. Asoka Mehta held a different view. He saw the rationale of the nationalisation demand in terms of helping the producer through co-operative processing and marketing of the produce. The Deputy Chairman of the Planning Commission was, however, as unconvincing on this point as the advocates of nationalisation have been. The food shortage has been mainly on account of insufficient production, but the Government's inability to ensure efficient procurement from farmers who are known to hoard stocks has aggravated the shortage. For example, rice millers in West Bengal were recently unable to get paddy at the prices fixed by the Government from the farmers, yet the Government could do nothing to compel the latter to part with their stocks. Would the farmers have been willing to sell paddy at prices lower than what they consider reasonable, had the rice mills been owned by the State? And Mr. Mehta should know that the marketing and processing aspects of the co-operative movement in India have not exactly been a thundering success.

Challenge of Synthetic Rubber

From Our Correspondent

MADRAS:

AN INTERESTING controversy is going on at the present moment about how the efforts to produce synthetic rubber within the country will affect adversely the growth of rubber plantations. It is only latterly that the need to maximise output of natural rubber has been realised and following the lifting of control over price and distribution of this product, there is greater anxiety to push through the replantation programme. With intensive tapping of existing trees and some replanted area coming into the yielding stage, the output of natural rubber has increased significantly in the last three years. Indeed, it is expected that it might even be 46,000 tons during the current year though conservative estimates do not place the figure at more than 40,000 tons. Even so, it would

be necessary to permit imports of natural rubber in fairly large quantities as it will take some time to use synthetic rubber in larger proportions.

The rubber growers are suspicious of the move of the manufacturing interests to install additional capacity for producing synthetic rubber from the by-products of oil refineries. According to them, the large unit at Bareilly has already damaged their interests while the consumers have been unnecessarily penalised and the manufacturers of tyres and various products are finding it difficult to use in greater proportion the indigenous synthetic product.

Replantation Programme

So far as the plantation industry is concerned, there is no danger of further development being checked as the consumption of rubber of various kinds is estimated to grow at a fast rate and the output of natural rubber will always be easily absorbed. It is even argued that there was a certain amount of compulsion to de-control price of natural rubber because of the high cost of the synthetic product. The higher prices for natural rubber, consequent on the reduction in imports and the high cost of indigenous synthetic rubber, should encourage to a great extent the replantation programme as also bring about a larger acreage under this valuable crop. There will be no difficulty in selling even a larger output of natural rubber secured from Kerala and elsewhere especially as the manufacturers of truck tyres would prefer to use as high a proportion of natural rubber as possible in the heavier duty types particularly. As there is also the price advantage at the present moment, it is feared that there will be serious competition for available supplies and after sometime prices for natural rubber might be marked higher.

Under these circumstances the policy of the Government in compelling the use of indigenous synthetic rubber has come in for criticism as it is now being suggested that import licence will be granted for purchasing natural rubber only if a similar quantity of indigenous synthetic rubber was used. This might be said to bring about indirectly a reduction in the average cost. But it is feared that it would be sometime before the synthetic rubber can be easily used as the proportion would go up sharply with the restriction on imports of natural rubber.

Whatever may be the controversy about the high cost of synthetic rubber based on alcohol, ways and means have got to be found to use this product as foreign exchange has to be saved by eliminating avoidable imports. Also, considerable expenditure has been incurred on the installation of costly plant and machinery and the capacity for production has also been increased to 30,000 tons annually. It will take some time for the consumers to get themselves adjusted to the new conditions especially as the delivered price of the indigenous synthetic products is twice the landed cost of similar synthetic rubber. The tyre industry will no doubt be obliged to suffer an increase in cost on account of various factors and particularly the high cost of synthetic rubber. But it is really the consumer that is penalised in the process as the cumulative effect of higher prices for indigenous raw materials and the ad valorem duty has been to inflate the cost of the final product by anything upto 35 per cent. The tyre consumers alone will be obliged to pay about Rs. 5 crores on account of the higher price of synthetic rubber though it might be argued that there will be greater scope for achieving economies in the use of rubber chemicals or other components. Ways and means have to be devised to get costs under control and the Government have a duty to examine, while compelling the use of the synthetic product, whether there is scope for reducing the manufacturing cost of synthetic rubber. It has been complained by the producers of this product that benzene obtained from Government sources is unduly costly while there is a needless levy of excise duty on alcohol. This duty can be removed even though there may be some loss of revenue, especially as the output of alcohol has increased sharply and this essential raw material is required for other purposes also. There should be no hesitation in giving the maximum help to an industry which is operating under great disadvantage. If need be, a special development rebate should be granted as also a rebate in railway freight charges. Above all, it has been suggested that the manufacturers can adopt the straight line method for depreciation purposes instead of the written-down value.

**

While the importance of Tuticorin port might be minimised to a certain extent by the decision of the Central Government to locate the oil refinery, as also the petro-chemical complex, near Madras, it is encouraging to note that the Sethusamudram project is taking shape and there is every prospect of its being included in the fourth Plan. It is stated that the decision to locate the refinery in Madras was taken because of the difficulties involved in providing the necessary railway transport facilities in moving large quantities of petroleum products and fertilizers. Besides, there is a ready market in the Madras District and neighbouring areas while the erection of the refinery as such need not await the completion of harbour or other transport facilities. The work on construction of the Tuticorin port is, however, expected to continue vigorously and there are indications that the hinterland of Tuticorin port will develop in a big way in the coming years. With the completion of the Sethusamudram project, Tuticorin will thus assume greater importance as a port of call for foreign ships bound for the East.

Technical Aspects

It was indicated in the Madras Assembly, a few days back that the technical aspects of the project would be closely examined as the coral reefs have to be blasted and a canal of suitable depth and width constructed in order that ships can pass through the Palk Straits without any difficulty. As the scheme will be self-financing in character, over a period, and has also considerable strategic importance, it is confidently felt by the State Government that the work on this project would be taken up in the next Plan.

As for the oil refinery in Madras, an early decision is awaited. But it has been argued that a large fertilizer factory will have to be erected near the refinery area as it is proposed to produce ammonia based on naphtha by the refinery itself and the promoters will not have much difficulty in producing nitrogenous fertilizers based on ammonia. Kothari and Sons, who had a licence for starting a huge fertiliser factory at Tuticorin, have asked for a change of location of the factory to Madras in view of the developments in recent months. The proposition is considered more attractive in the altered scene though it is emphasised that conditions in the capital market will have to be vastly different if the requisite capital has to be raised. In fact, it is feared that Coramandel Fertilizers Limited, which has a programme for starting a big fertilizer factory at Visakhapatnam in collaboration with American interests, may not be able to raise the required rupee resources from the open market, if the present conditions continue to prevail in the stock markets. The underwriters probably would be obliged to take up large parcels in the absence of any enthusiastic response from the Indian investors.

The moving finger writes

WHERE ANGELS fear to tread, etc., etc., etc. — but I must confess that I cannot resist the temptation of suggesting that Agra, instead of Lucknow, should be made the capital of Uttar Pradesh. Surely the rate at which everybody who is anybody in that interesting State is trying to haul up for contempt and put behind bars everybody else who is somebody at all, also in that interesting State, if allowed to continue, must soon change the status of Uttar Pradesh from a State which has been mis-governed all along to a State which is not being governed at all any more. At this point, perhaps, I ought to take no further risk and must pass on to safer subjects.

**

We are egalitarians all these days — particularly in our Government; but, are we not being a little too slow on the uptake? It seems to me that the mighty blow which the Finance Minister is striking for egalitarianism through his budget proposals is really not so impressive after all, considering that Mr. Khrushchev, of all persons, has lately been advising his fellow citizens in the Communist fatherland that they "must fight against egalitarianism, and for the principle of pay according to work". Evidence of similar kind that the Russians are beginning to give up pseudo-Marxist shibboleths at a time when more naive people in less wary lands are beginning to take to them is available from an article in 'Pravda' by a Soviet economist. What academician Anashuvan Arzumanyan has to say is so relevant to our situation that I take the liberty of reproducing in full the following extract captioned "Soviet Capitalism?" from 'New Statesman' of March 13, in the hope that this piracy will be condoned:

"The interests of Soviet man as a consumer have found a powerful advocate in the person of the eminent economist academician Anashuvan Arzumanyan, who in a 10,000-word article in 'Pravda' recently launched an authoritative attack on many of the principal tenets of Marxism as applied for many years in the Soviet Union. He calls for a new approach to planning and a thorough improvement in the structural pattern of the national economy. The time has come, he argues, for Soviet planners to stop equating progress with the expansion of heavy industry (Group 'A') and to follow the American example of setting a faster pace of growth for consumer goods (Group 'B') than for heavy industry.

"By a dogmatic approach to the principle of priority for heavy industry, many deficiencies in the Soviet economy had been concealed, Arzumanyan argues. Traditional industries had been encouraged by an arithmetically applied capital investment plan to produce obsolete machines; the more progressive industries had been neglected and their growth retarded. The country's fuel balance was oriented on coal, while oil and gas output was artificially held back; the building industry on bricks and manual labour at the expense of reinforced concrete and mechanisation; transport on the steam engine as against diesel and electric traction. And agriculture, the most neglected branch of the national economy, had been deprived of fertilisers and efficient machines.

"The time had come, wrote Arzumanyan, when Soviet planners should thoroughly examine the capital investment programme. In the first place, attention should be paid to giving priority to the most progressive branches of industry, those in which the lessons of modern science and technology are most successfully applied. Secondly, the fetish of continuous material expansion should be cast away. There was a time when acute shortages had forced the planners to undertake the 'definite economic manoeuvre' of bringing the virgin lands under cultivation and of dissipating its capital resources in building new factory space. But now the time had come for creating an intensive agriculture and for re-equipping existing factories and reducing both the cost and the time spent in construction of new ones.

"Turning to the question of consumer goods, the Soviet economist charged that up to the present day the definition of the correct proportion between Groups 'A' and 'B' in industry was hampered by 'certain theoretical vestiges engendered by Stalin's erroneous dogmas', one of which was the neglect of personal consumption as a component part of reproduction. There were still a number of economists who made the law of the priority of the growth of heavy industry an aim in itself. It should be borne in mind (and in this context the experience of America was very instructive) that the scientific and technological revolution had resulted in a sharp reduction in capital expenditure (capital-output ratio) and material expenditure per unit of output. In American industry the effectiveness of fixed capital had grown nearly 70 per cent in the last 35 years. There had been a one-third reduction in the outlay of raw materials per unit of social product during the same period.

"In short, technical progress did not necessarily result in an increasing proportion of material expenditure in the cost of the finished commodity. 'We need accurate accounting instead of postulating dogmas', concluded Arzumanyan. Production factors should never be viewed metaphysically; they were always changing. 'We need efficient industrial management.'

"This article is the most cogent argument in favour of simultaneous expansion of light and heavy industry in Soviet economy that has appeared in 'Pravda' since the question was debated in a very different atmosphere in the early years of Stalin's ascent to power."

All that I have to add is that Mr. Krishnamachari needs must think again on his classification of industries into those which are entitled to preferential fiscal treatment and those which are not. As a matter of fact I would suggest that this business of classification should be given up altogether and that there should instead be a sensible tax system for all industries for the simple reason that all industries are important in their different ways for meeting the varied needs of Man as he pursues his economic betterment. I would also suggest that it is futile for the Finance Minister or for that matter anybody else to try to hold the price line so long as the production of consumer goods is not given its due importance in the economy of the nation. Napolean said long ago that an army marches on its stomach. That holds true not merely in a military sense.

Trade Winds

EXPORT CREDIT INSURANCE

PERHAPS THE least publicised export promotion effort, although the most effective, is the solid work of the Export Risks Insurance Corporation (ERIC) which has since been converted into the Export Credit and Guarantee Corporation (ECGC). This change, it may be noted, followed the recommendations of the Mathrani Study Group, which emphasised that inasmuch as Indian exporters have to fight international competition on equal terms, they require to be provided with similar organizational facilities as enjoyed by their competitors. It is common knowledge that in the leading export countries of the West and in Japan today hardly any exporter ever does business with an overseas buyer or a bank advances credit to an exporter unless the payments are secured either by letters of credit or by policies of export risks insurance. The purpose of the ECGC is to take the risk-load off the Indian exporter by carrying the main burden on its own shoulders —80 per cent in the case of commercial risks such as default or insolvency of the foreign buyer and 85 per cent in the case of political risks arising from insurrection or war, unforeseen import restrictions, embargoes on transfer of funds into buyer's country and other similar causes.

Dr. S. P. Chablani, Managing Director of the ECGC, told a Press Conference, the other day, that the exporting community in this country has not fully grasped the significance of export risks insurance. This is clearly reflected in the value of risks covered during the last year. Although the highest since the establishment of the ERIC, this figure was not even Rs. 30 crores which forms only about four per cent of our total exports. Of the country's total innumerable export credit risks, the coverage of ERIC is still only around 15 per cent. Although this compares favourably with the record of its counterparts of equal standing in other countries, the fact remains that much leeway has yet to be covered. Because over 60 per cent of India's exports comprise traditional items, the exporters have old and established connections in respect of this business. But in a world where competition is increasingly becoming of the cut-throat type, it is imperative for the Indian exporters to seek the shelter and guidance of such institutions as the ECGC, even if to retain, let alone increase, our share of the world's export trade. Dr. Chablani suggested in this connection that intensive educational campaign should be launched to better inform the Indian exporters and bankers of the increasingly useful activities of the ECGC. Once they become familiar with and are convinced of the extent of protection they can expect to receive from ECGC, they will not only be able to plan their export programmes with greater confidence, but also to make a more worthwhile contribution than heretofore to the growth of the export trade.

Besides ERIC's services in the fields of guarantees to banks, 'Packing Credit Policy' and other services, the Corporation, in its changed role as ECGC, has substantially enlarged the scope of its usefulness. Two new covers, 'The Export Finance Guarantee' and the 'Post-Shipment Export Credit Guarantee', have been evolved. By means of these covers, the ECGC is in a position to provide substantial guarantee to banks in respect of their advances right from the date of availing of credit by an exporter and the due date of payment, and enable the banks even to discount bills, unlike in the past, to the extent of as much as 125 per cent of the value of shipping documents, in certain cases. The new scheme also extends the benefits of credit facilities under the 'Packing Credit Policy', even during the post-shipment stage. With these additional features, the ECGC policies will now be more than mere collaterals to the banks; they will rather be in the nature of gilt-edged securities.

The ECGC also endeavours to examine the probity and financial status of every overseas buyer on its record, with a view to improving the quality of its own risks and, at the same time, offering its policy-holders an insight into the standing and creditworthiness of their clients. The Corporation has built a library of credit information on as many as 15,000 overseas buyers — and this reference is being constantly improved and enlarged. Another attraction offered by the ECGC is the reduction in the waiting period in the settlement of claims from six months to four months in specified cases and also under the two new guarantee schemes of 'Export Finance Guarantee' and 'Post-Shipment Export Credit Guarantee'.

CONSUMER PRODUCTS

Inaugurating the Consumer Products Division Council of the Indian Standards Institution in New Delhi recently, the Union Minister of Industry, Mr. Nityanand Kanungo, who is also the President of the I.S.I., referred to the fact that the Institution's work had so far been divided among only seven Division Councils, namely, (i) Agricultural and Food Products; (ii) Building, (iii) Chemicals, (iv) Electro-technical, (v) Engineering, (vi) Structural and Metals and (vii) Textiles. Several of the Committees working under these Division Councils had been formulating standards for certain consumer products which fell within their own specialized fields of work. But there had been no specific section of the Institution devoted to looking after the consumer products standards as such. It was but logical, therefore, that a separate division be created to deal exclusively with consumer items.

Some of the subjects for which the newly formed Consumer Products Division will formulate standards relate to well established industries which have considerable export potential. For example, in 1963, India exported Rs. 112 lakhs worth of utensils of various categories, Rs. 65 lakhs worth of sports goods, and Rs. 31 lakhs worth of umbrellas and components. Our export markets for Hurricane lanterns, pressure stoves, pressure lanterns and cutlery are being steadily built up. In the context of our drive for expansion and diversification of exports, standards on such consumer products will have an important role to play. In order that we may maintain and expand our markets abroad, Indian exporters will have to depend largely on the consistency of the quality of our goods and their reliability. Building up a reputation for quality goods is a painfully slow process, but any effort in this direction would be well worthwhile.

In industrially advanced countries such as the USA and the UK, the consumer movement, for the purpose of improving the quality of consumer products, has registered a phenomenal growth in recent years. Thoroughly confused by the available information on the products sold in shops and often frustrated by not getting a fair value for money, increasing numbers of consumers have been organizing and pooling their resources for setting up consumer-testing facilities and reporting the results. These are democratic institutions financed and controlled by consumers. These organisations compare the quality, performance and value for money of the goods and services offered to the consumer and publish frank reports on the results of these comparisons, together with the names and brands of the products tested. There are about 30 such consumer bodies and associations in different parts of the world, with their activities co-ordinated and reinforced by the International Office of Consumers Unions. Some of these associations, such as those in the UK, USA and Holland, are dependent entirely on individual members, while others, such as those in Denmark, Norway and Sweden, are supported to some extent by their Governments. The membership of some of the associations runs into several hundred thousands.

In the USA, for example, the total membership of the consumer organisations has exceeded 1.5 million, while in the UK, the Consumers Association has a membership of over 3,33,000, with an annual income of £500,000, which comes entirely from its members. Compared to these efforts in other countries, the attempts in India have been feeble indeed. As a result of a proposal in the 1958 ISI Convention in New Delhi where consumer standards and certification had been discussed, a Consumers' Association of India came into being in 1959. It received a good deal of publicity and even organised a seminar with financial help from the Planning Commission. But no consumer goods testing was initiated and the Association could never find its footing.

ISI TRAINS FOREIGNERS

In his capacity as the President of the Indian Standards Institution, the Union Minister of Industry, Mr. Nityanand Kanungo, while reviewing the activities of the Institution for the year 1963-64, said that the Indian Standards Institution's training programme to start from August next, will accommodate five to ten trainees from other developing countries of Asia, Africa and Latin America. The programme is being sponsored under the joint auspices of the Technical Assistance Programme of the Colombo Plan and the Special Commonwealth African Assistance Programme.

The ISI will also act as host to the triennial meetings of the General Assembly of the International Standards Organisation, to be held in New Delhi in November, 1964. About 400 delegates from the 49 member countries are expected to participate, while about another 300 delegates are expected to represent various Indian interests. The programme includes besides holding about 40 technical and administrative committee meetings, local visits, social functions and an all-India tour to industrial and cultural centres of India. On the occasion of this International Conference, besides publishing a brochure containing topical articles on standardisation, the ISI plans to issue an illustrated booklet, featuring industrial development in India and her export possibilities, with special reference to standardisation and quality control activities of the ISI, indicating to overseas buyers that India has a well-organized complex of large-scale and small-scale industries and that their products conform to highest standards of quality. This booklet will also be made available for distribution in the New York World Fair. It is further planned to distribute it widely in overseas countries through our Trade Commissioners and National Standards Bodies, as part of India's export drive.

In addition to the setting up of a separate Consumer Products Division, during 1963-64, the ISI has also broken new ground in the direction of marine engineering. At the request of the Ministry of Transport, a separate Marine Engineering Section has been created under the existing Mechanical Engineering Division. Many of the existing Indian Standards, though originally intended for other industries, can now be made available to the shipping industry as well. A number of Indian industries will thus be in a position to manufacture, to the prescribed standards, quite a large number of items required by shipyards and gradually do away with our dependence on overseas supplies for such items.

THE CORPORATE SECTOR

The annual report on the working and administration of the Companies Act, 1956, for the year ended March 31, 1963, laid on the table of the Lok Sabha recently, provides a comprehensive review of the new additions to the corporate sector. It indicates that during the year as many as 1497 companies were formed and this number was lesser than that of the previous year by nearly 115. If the total number of new company formations declined, a steady uptrend in the formation of public limited companies, which was noticed in 1959-60, was apparent this year too. In fact, the number of public limited registrations during the year at 227 was the largest during the last decade. With these floatations, the total number of companies at work as on March 31, 1963, was 25,524 with a total paid-up capital of Rs. 2,185 crores. This comprised 5,994 public limited companies accounting for an aggregate paid-up capital of Rs. 1087 crores and 19,530 private limited companies with paid-up capital of Rs. 1098 crores. The paid-up capital of all the companies at work, more than doubled between 1955-56 and 1962-63: It increased from Rs. 1024 crores to Rs. 2185 crores. During 1962-63 alone, it increased by Rs. 211 crores.

The report brings to light the pattern of location of new company formations and it indicates that the three major States of West Bengal, Maharashtra and Madras along with the Union Territory of Delhi continued to account for the bulk of the new registrations. The number of new companies that came into existence in these three States and the Union Territory of Delhi put together was 1,110, which meant nearly 74 per cent of the total new registrations for the year under review. On a regional basis, the Southern region comprising Madras, Andhra Pradesh, Mysore and Kerala, surpassed all the other three regions in having the largest number of companies at 395 as against 388, 371 and 343 companies registered in the Eastern, Western and Northern regions respectively.

The public sector also made substantial advances during the year under review and eight Government-sponsored companies, with the total authorised capital of Rs. 25.5 crores, came into being. This, however, cannot be taken to represent any trend because only last year 18 companies with a total authorised capital of Rs. 122.7 crores, were registered. Of the eight new public sector companies, National Seeds Corporation Ltd. was set up in the Union Territory of Delhi by the Central Government and the remaining seven companies were floated by the State Governments — three in Orissa, two in Maharashtra and one each in Kerala and Rajasthan.

FOREIGN INVESTMENT INFORMATION

With a view to enabling the intending private foreign investors in India as well as the Indian investors seeking foreign private investment to have speedy information and guidance on matters of interest to them such as the fields open for investment, broad principles on which Government would agree to the investment etc., the Government of India have appointed Mr. K. J. George, in the Ministry of Industry, as Special Officer, to serve as a focal point for all enquiries concerning foreign investments in India.

DEALS AT LEIPZIG FAIR

India's participation in the Leipzig Fair this month has resulted in the transaction of business worth more than Rs. 100 lakhs so far. This covers diverse commodities, especially engineering and non-traditional items, introduced for the first time in the German Democratic Republic. The commodities for which deals were made included storage batteries, electric motors, air conditioners, surgical instruments, chemicals, tinned food, cigarettes and alcoholic and non-alcoholic drinks, linoleum, handicrafts, coir products and cotton and handloom textiles. More contracts are under negotiation in Leipzig and will cover duplicating machines, refrigerators, drilling machines, etc. The Indo-GDR trade, which has been progressively expanding since 1959, was of the order of about Rs. 9 crores each way during 1963. In 1964, it is likely to be of the order of Rs. 16.5 crores each way.

Company Affairs

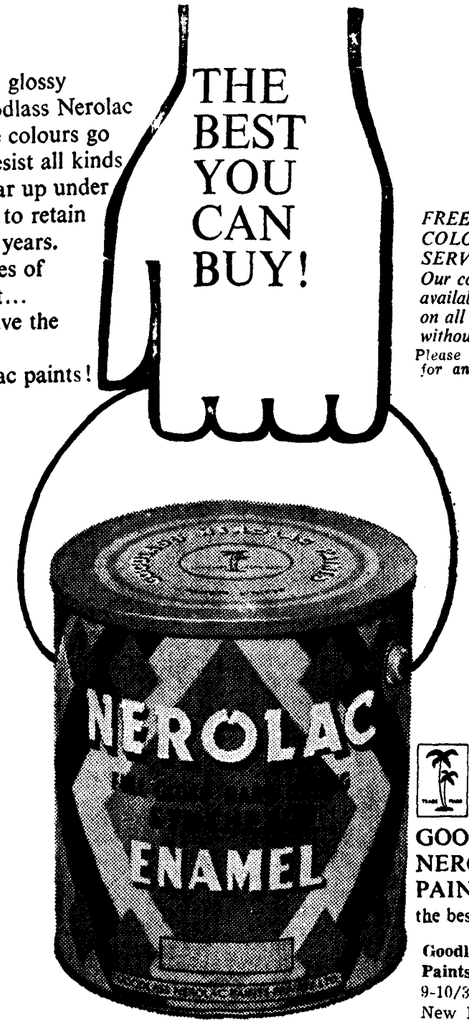
THE STATE BANK OF INDIA

THE CLAIM made by Mr. B. Venkatappiah, Chairman of the State Bank of India, that not only the financial results but also the total performance of the Bank in 1963 were satisfactory is fully corroborated by the latest annual report on the working of the Bank and the Chairman's speech circulated to shareholders. This is creditable, considering the rather unenviable position of the Bank as being at once in both the public and the private sectors. If the State Bank of India enjoys the reputation of being the biggest commercial banking organisation in the country, it has also to keep in mind always the public interest, in that it has to implement the decisions of the Government of India affecting different spheres of economic activity. This responsibility became particularly marked in 1963 due to the impact of the Chinese aggression and the dislocation caused by it to the normal operation of credit institutions. Indeed, the resulting national emergency imparted a new dimension of both gravity and responsibility, wherefore it is heartening to be told that the State Bank of India was able to meet the situation "promptly, helpfully and effectively." The Bank has not only recorded higher profits but has also shown commendable results in normal banking activity as well as in development sphere. Also, in keeping with the ambitious expansion programme ahead of it, progress has been achieved in matters pertaining to growth and efficiency, such as recruitment and training, delegation and decentralisation and personnel relations and welfare.

The relevent statistics make good showing. The rate of progress in the growth of both deposits and advances was more than maintained. At Rs. 521.61 crores (as on Dec. 27, 1963), total deposits were the highest since 1960 and this, the Chairman claims, has been achieved without entering into undesirable competition with other banks. Without indulging in unhealthy competition or competition that is harmful to the economy, the Bank, according to its chairman, proposes to make every effort to attract savings and bring them increasingly into the banking system. Among the steps taken in this behalf in 1963, mention may be made of the increase in the rate of interest on deposits (fixed and savings) by half a per cent, reduction of the minimum acceptable amounts for call and short-term deposits (from Rs. 1 lakh to Rs. 25,000), and acceptance of fixed deposits for two and three years. The cumulative effect of all these measures was an increase of Rs. 25 crores in total deposits over the year, exclusive of the transfer of PL 480 funds to the Reserve Bank. If comparable figures for the last two years, i.e. without taking into account the PL 480 funds in both the years, are considered, the aggregate increase in deposits works out to Rs. 69 crores, of which, it is noteworthy, time deposits accounted for an increase of nearly Rs. 49 crores. This is a particularly welcome trend during an inflationary era. As regards advances, every year has been witnessing a new peak these few years past. Even if we ignore the peak figure in the busy season which has already crossed the Rs. 300-crore level, the increase from Rs. 82 crores in July, 1955 to over Rs. 254 crores towards the end of 1963 makes an impressive rise. Similarly, total credit of the State Bank of India alone stood as high as Rs. 274 crores at the end of December last. During the year under review, there were increases in rates of interest both on deposits and on advances. But the discriminating manner in which the State Bank of India raised its advance rate deserves to be noted. The increases were not uniform in all cases; they were graduated, depending upon the nature of advances. On loans to small industries, for example, the rate were stepped up only marginally; those in respect of co-operatives were retained at broadly the same level as before, and, in certain other cases, the rates were concessionary. Along with the State Bank, the subsidiary banks also fared well during 1963, there being all round improvement in deposits, advances, and profits.

A particularly notable feature of the State Bank of India's progress is its programme of branch expansion. At the end of 1963, the Bank had four local head offices (this number bids fair to increase with the proposed amendment to the State Bank of India Act), 733 branches and 332 sub-offices, besides an office each in London and Colombo, and five offices in Pakistan. During 1963 alone, the Bank increased the number of its branches by 29 and of other offices by 37. It has since launched a new five-year planned branch expansion programme which will add nearly 400 more units over the next five years.

INDIA SUGARS



Mr. Rajeshwara Patel, M.P., Chairman, the India Sugars and Refineries Ltd., in his address at the annual general meeting held recently, highlighted the fact that prices of sugar in various factories were different and in this process some companies were at a disadvantage. He quoted a few instances such as Daurala Sugar Works, Daurala, District Meerut and Modi Sugar Mills Ltd., Modinagar, Meerut, where the cane price fixed payable by these factories was Rs. 46.90 and Rs. 48.50 per ton respectively and ex-factory controlled sugar price of these factories was fixed at Rs. 116.50 per quintal. As against this, the sugarcane price fixed by the Government for the India Sugars was Rs. 53.30 and the ex-factory controlled sugar price was fixed at Rs. 115.0 per quintal. This is a clear case of discrimination against the Southern factories. The reason given for this disparity, according to the Chairman, was the freight advantage of the factories in the South because the producers in the North had to transport their sugar to deficit States in the South. He, however, added that when wages were rationalised by the Sugar Wage Board, higher wages were fixed for factories operating in the South in comparison with those of the North and one of the considerations in so fixing higher wages was that the factories in the South were getting better realisation of sugar due to freight advantage. Thus, apparently, the factories in South were discriminated against twice over for a single gain in terms of location. This is an instance which calls for a fresh review in the light of the arguments put forward by Mr. Rajeshwara Patel.

The Chairman pointed out that the expansion scheme for increasing the crushing capacity of the factory to 1,250 tons a day is well underway and it is expected to be implemented during the coming season. The increased capacity would take care of all the cane in the area and would also achieve the economy of scale and consequently bring down the cost of production. He, however, added that the sponsors of a sugar factory in the Co-operative sector have been trying to get another sugar factory established in the Kamalapur area within about six miles of this factory. After the expansion of this factory and that of its subsidiary, the Salar Jung Sugar Mills Ltd., Munirabad, which has also been licensed to increase its crushing capacity, the cane available in the entire area would hardly be enough to feed these two factories. Even if a possible improvement in yields per acre is considered as a result of improved manuring and methods of cultivation, there is no justification for a third sugar factory to be established in such close proximity. The company has made suitable representation to the Government of Mysore and the Central Government wherein it has requested that the licence for the establishment of another sugar factory should not be granted. The demand of the factory is quite reasonable in the sense that unplanned establishment of such industrial undertakings

Goodlass NEROLAC Paints

What a smooth, glossy appearance Goodlass Nerolac paints give! The colours go on so easily...resist all kinds of weather...bear up under wear and tear...to retain their beauty for years. It's taken decades of research to do it... and now you have the perfect paints... Goodlass Nerolac paints!

THE BEST YOU CAN BUY!

will only tend to raise the cost of production and there are certain other regions in the country where it would be advisable to locate new sugar factories.

BANK OF BARODA

The Bank of Baroda Ltd. achieved remarkable progress during the year ended December 31, 1963, when its deposits touched a figure of Rs. 140.17 crores as against the deposits at the end of the last year at Rs. 113.96 crores. This nearly 23 per cent increase in one year was achieved in all types of deposits but it was most marked in the case of fixed deposits which increased to Rs. 77.70 crores against Rs. 62.19 crores last year. The advances of the bank crossed the Rs. 100 crore mark and stood towards the end of the year at Rs. 105 81 crores against Rs. 84.78 crores a year before. Consequently, the net profit was also higher at Rs. 78.47 lakhs after the payment of taxes, depreciation, etc., as against last year's figure of Rs. 66.22 lakhs. An interim dividend at the rate of 16 per cent per annum subject to deduction of income tax was paid for the half year ended June 30, 1963, which absorbed Rs. 16 lakhs. A sum of Rs. 15.50 lakhs is proposed to be transferred to reserve fund, Rs. 20 lakhs to special reserve and Rs. 24 lakhs for bonus to staff. The directors have now recommended the payment of a final dividend at the rate of 20 per cent per annum per equity share for the half year December 31, 1963, which is to be paid out of special reserve and which will absorb Rs. 20 lakhs. In this manner a total dividend of 18 per cent per annum has been paid. The directors have distributed dividend at the rate of 16 per cent per annum subject to deduction of tax on the entire new issue of 100,000 equity shares for the half year ended December 31, 1962, which absorbed an additional amount of Rs. 70.000 over the amount recommended in the last report.

The expansion of the bank was witnessed in terms of the number of its branches too. During 1963, alone, the bank opened as many as 33 new branches — 18 in Gujarat, eight in Maharashtra, two each in Rajasthan and West Bengal and one each in Uttar Pradesh, Goa and Fiji Islands. In this manner the bank had at the end of the year 189 branches in India and 15 branches in foreign countries. The board of directors decided to take over the banking business of the Umbergaon People's Bank (Private) Ltd., Umbergaon. Accordingly, after the due examination and valuation, its banking business was taken over from January 1, 1964, and its offices in Umbergaon and Sanjan have commenced functioning as branches of this bank from that date

BLUE STAR-WORTHINGTON ISSUE

Blue Star-Worthington Ltd. is likely to enter the capital market in the near future with an issue of capital worth Rs. 25 lakhs. It has been sponsored for the manufacture of a wide range of industrial refrigeration and air-conditioning equipment in collaboration with Worthington Corporation of the United States, a company with an experience of more than 70 years in this field. Worthington Corporation has manufacturing plants in the USA, Japan, Europe and Latin America. The unit in India is proposed to be located in Thana in the Blue Star Industrial Estate, where construction of the building will start within the next few months. It has already been granted an industrial licence for Rs. 14 43 lakhs to import plant and machinery. Blue Star-Worthington Ltd. was registered as a private company with Worthington Corporation taking up 51 per cent of the shares and the Blue Star Engineering Company (Bombay) Private Ltd. the balance of 49 per cent. In line with the Government policy to promote public participation in new ventures, the directors have now decided to suitably amend the company's articles. Out of the initial issue of Rs. 25 lakhs foreign collaborators will invest nearly Rs. 12.8 lakhs. Blue Star and its directors, employees and friends will take up approximately Rs. 6 lakhs and the balance will be offered to the public.

DUNLOP RUBBER ISSUE

The Dunlop Rubber Company (India) Ltd. proposes to raise the authorised capital from Rs. 7.50 crores to Rs. 12.50 crores by the creation of 5,000,000 unclassified shares of Rs. 10 each which would be issued as ordinary shares or with such rights as might be thought fit. The company has raised the ordinary dividend from 15 to 17.5 per cent, less tax, for 1963.

AHMEDABAD NEW CAPTAL ISSUE

The Ahmedabad New Cotton Mills Ltd. has reported satisfactory results for 1963 with gross profit at Rs. 21.82 lakhs against Rs. 19.85 lakhs last year. Its sales, however, declined marginally from Rs. 2.08 crores to Rs. 2.03 crores. The directors have maintained the distribution at Rs. 20 per share, less tax. They have also decided to issue rights shares to the existing shareholders in the ratio of one share for every two held. It has provided Rs. 14.88 lakhs for depreciation and Rs. 5.90 lakhs for development reserve. It has withdrawn Rs. 5.10 lakhs from general reserve for the payment of dividend.

T. MANEKLAL ISSUE

The directors of T. Maneklal Manufacturing Company Ltd. have decided to withdraw the issue of bonus shares. They had proposed a one-for-five bonus issue and a dividend of 6 per cent for the year ended May 31, 1963. The proposal was approved by the shareholders at the annual general meeting held on November 27, 1963. Following the levy of the capital gains tax on bonus shares in the Union Budget proposals, the directors have desired to withdraw the application for the bonus issue made to the Controller of Capital Issues and will seek the approval of the shareholders to do so at an extraordinary general meeting to be held shortly.

TATA LOCO

The board of directors of Tata Engineering and Locomotive Company Ltd. have decided to waive with effect from April 1, the fees hitherto charged by the company for the transfer or transmission of shares. The company was charging so far a fee of 25 nP. per share in respect of transfer or transmission of shares subject to a maximum of Rs. 500 for every one transfer deal.

CAPITAL ISSUES

Five companies have been authorised to raise fresh capital exceeding Rs. 2.33 crores. Of these, two are issuing bonus capital to the existing equity shareholders in proportion of one bonus for every five shares held. One company is floating debentures, another equity shares and the fifth equities plus preference shares. The debentures will be offered to the public for cash at par. One of the companies is a Central Government Undertaking. The consent of the Controller of Capital Issues is valid for 12 months in all cases.

Century Spinning & Manufacturing Company Limited, Bombay, is to issue Rs. 50,93,200 bonus capital in 50,932 equity shares of Rs. 100 each on capitalisation of company's reserves to a like extent. The bonus shares will be allotted to the existing equity shareholders in proportion of one bonus for every five shares held.

Bachhraj Factories Private Limited, Bombay, is to issue further capital of Rs. 3 lakhs in 600 equity shares of Rs. 500 each, as bonus shares on capitalisation of reserves. The shares will be issued in the proportion of one for every five equity shares held.

Indian Drugs & Pharmaceuticals Limited, Delhi, a Central Government Undertaking, will be issuing further capital of Rs. 1 crore divided into 10,000 equity shares of Rs. 1,000 each for cash at par. The money will be utilised for financing the Drugs & Surgical Instruments Plants.

Dishergarh Power Supply Company Limited will be issuing Rs. 30 lakhs debenture stock in units of Rs. 1,000 each carrying 7 per cent rate of interest and redeemable in 1976. All the debentures will be offered to the public for cash at par. The capital will be utilised for the extension and augmentation programme of generating station and distribution system.

Gujarat Insulators & Ceramics Limited are to issue Rs. 50 lakhs capital in 4 lakhs equity and 1 lakh preference shares of Rs. 10 each. All the shares will be issued for cash at par. The money will be utilised on the company's project for the manufacture of HT and LT insulators.

LICENCES ISSUED

The following licences were issued under the Industries (Development and Regulation) Act, 1951 — during the week ending 14th March, 1964. The list contains the names and address of the licensees, the items of manufacture and annual installed capacities.

COAL

Kumar K. N. Malliah, Managing Director, Nirsha Khas Colliery (P) Ltd., P. O. Searsol, Rajbari, Distt. Burdwan, (Dhanbad), Bihar) — Coal — 79,000 tonnes. M/s. National Coal Development Corporation Ltd., Darbhanga House, Ranchi. (Tehsil Sooner, Nagpur, Maharashtra) — Coal — 63,000 tonnes. M/s. Samla Collieries Ltd., 33, Netaji Subhash Road, Calcutat-1. (West Bengal) — Coal — 1964 — 1,60,000 tonnes; 1965 — 2,00,000 tonnes.

TYPEWRITERS

J. K. Business Machines Ltd., 2, Mango Lane, Calcutta-1. (West Bengal) — (i) Standard typewriters, (ii) Portable typewriters 25,000.

INDICATING INSTRUMENTS

Industrial Meters Private Ltd., Choksi Chambers, Javeri Bazar, Bombay-2. (Bombay, Maharashtra) — (i) Moving Iron Type Volt and Ammeters — 18,000 Nos. (ii) Moving Coil Type Volt and Ammeters — 4,500 Nos. (iii) Watt Meters 2,250 Nos. (iv) Power Factor Meters 900 Nos. (v) Frequency Meters — 900 Nos. (vi) Synchronoscopes — 900 Nos. (vii) Current Transformers — 12,900 Nos. (viii) Variable Voltage Transformers — 3,900 Nos. (ix) Meter Shunts — 9,000 Nos. (x) Resistance Boxes — 3,600 Nos.

DRUGS AND PHARMACEUTICALS

Cyanamid India Limited, 18, Queen's Road, P. O. Box No. 1994, Bombay-1. (Gujarat) — (i) Sulmet sulfadimethylpyrimidine oblets 2.5 gm. — 500,400 oblets. (ii) Sulmet sodium sulfadimethylpyrimidine drinking water solution 12.5 per cent (veterinary) — 16,800 litres. (iii) Sulmet sodium sulfadimethylpyrimidine injectable solution 25 per cent (Veterinary) — 2,040 litres. (iv) Aureomycin soluble powder tinted (Veterinary) — 3,600 kilos. (v) Verban piperazine soluble powder 25 per cent (Veterinary) — 1,500 kilos. Cyanamid India Ltd., The International, 16, Queen's Road, Bombay-1. (Gujarat) — Ferro-Mandets — 50,40,000 tablets.

COTTON TEXTILES

Kohinoor Mills Co. Ltd., Killick House, Home Street, Fort. Bombay-1. (Maharashtra) — 25,000 spindles for the manufacture of cotton yarn. Sudarsanam Spinning Mills, P.B. No. 2, Rajapalayam. (Madras) — 6,000 spindles for the manufacture of cotton yarn. Venkatalakshmi Mills Ltd., B-1-7, Saifabad, Hyderabad. (Andhra Pradesh) — 13,000 spindles for the manufacture of cotton yarn. Karur Mills Ltd., Thanthonimalai P.O., Karur. (Madras) — 11,336 spindles for the manufacture of cotton yarn. Sree Rajendra Mills Ltd., ('B' Mills), P.B. No. 201, Salem-2. (Madras) — 11,800 spindles for the manufacture of cotton yarn. Kishnaveni Textiles Ltd., Trichy Road, Uppilipalayam, Singanallur, Coimbatore-6. (Madras) — 12,000 spindles for the manufacture of cotton yarn. Sree Siddeswara Textile Mills (P) Ltd., 591, Mandipeth, Davanagere City. (Mysore) — 100 automatic looms for the manufacture of cotton cloth. Sree Karpagambal Mills Ltd., Solapuram P.O., Rajapalayam,. (Rajapalayam, Madras) — 12,680 spindles for the manufacture of cotton yarn. The Yemmiganur Spinning Mills Ltd., Door No. 326/1, Yemmiganur, P.O. Kurnool Distt. (Andhra Pradesh) — 12,704 spindles for the maufacture of cotton yarn. Shri Ramnarayan Mills Ltd., 5-52, Grey Town, Coimbatore. (Madras) — 12,616 spindles for the manufacture of cotton yarn. Kwality Spinning Mills Private Ltd., P.B. No. 27, Udamalpet Road, Pollachi. (Madras) — 100 automatic looms for the manufacture of cotton cloth. Sree Akkamamba Textiles Ltd., Venkatarayapuram, Tanuku. (Andhra Pradesh) — 100 automatic looms for the manufacture of cotton cloth. The Narasimha Mills Ltd., 1, V. Palaniswamy Naidu Street, Avanashi Road, Coimbatore-1. (Madras) — 100 automatic looms for the manufacture of cotton cloth. Sarvaraya Textiles Ltd., Beach Road, Kakinada. (Andhra Pradesh) — 100 automatic looms for the manufacture of cotton cloth. Sri Annapurna Cotton Mills Ltd., P-10, New Howrah Bridge, Approach Road, Calcutta-1. (West Bengal) — 5,000 spindles for the manufacture of cotton yarn. Thanjavur Textiles Ltd., Vallam One Road, Thanjavur-4. (Madras) — 12,096 spindles for the manufacture of cotton yarn. The Southern Textiles Ltd., Kannampalayam, Salur P.O., Coimbatore Distt. (Madras) — 100 automatic looms for the manufacture of cotton cloth. Ananda Kumar Mills Ltd., Siravampatti P.O., Coimbatore-6. (Madras) — 100 automatic looms for the manufacture of cotton cloth. D. P. F. Textiles Private Ltd., Mettupalayam Road, G. N. Mills P.O., Coimbatore-11. (Madras) — 100 automatic looms for the manufacture of cotton cloth. The Premier Mills (Cbe) Ltd., Pulankinar P.O., Udamalpet, Coimbatore Distt. (Madras) — 100 automatic looms for the manufacture of cotton cloth. Annamalaiar Mills Private Ltd., Dindigul. (Madras) — 3,000 spindles for the manufacture of cotton yarn. Sri Bhaghawathi Textiles Private Ltd., Chittur. (Kerala) — 13,000 spindles for the manufacture of cotton yarn. Shri Ramalingam Mills (P) Ltd., 53, Great Cotton Road, Aruppukottai. (Madras) — 12,096 spindles for the manufacture of cotton yarn. Premier Cotton Spinning Mills Ltd., Kanjikode Village, Palghat Distt. (Kerala). — 13,000 spindles for the manufacture of cotton yarn. Premier Cotton Mills Ltd., Kanjikode Village, Palghat Distt. (Kerala) — 13,000 spindles for the manufacture of cotton yarn.

WOOLLEN TEXTILES

The Oriental Carpet Manufacturers (India) Private Ltd., P. B. No. 34, Amritsar. (Chheharta, Punjab) — 24 automatic looms for the manufacture of blankets and woollen fabrics. Authur Import Export Co., 166, Dadabhai Naoroji, Road, Fort, Bombay-1. (Maharashtra). Proposed name: Shree Krishna Woollen Mills Private Ltd., 24, automatic looms for the manufacture of barrack blankets and woollen fabrics.

SYNTHETIC YARN

J. K. Synthetics Ltd., (Synthetic Fibres Division) Kamla Tower, Kanpur. (Kotah, Rajasthan) — Kanekalon Acrylic Fibre — 4 (four) million kgs.

VEGETABLE OILS

Col. His Highness Raja Sir Harindar Singh, Brar Bans Bahadur of Faridkot State, Faridkot (Kotkapura, Punjab) — Cotton-seed Oil — 15,000 tons of cotton-seed.

LICENCES REVOKED OR SURRENDERED

(During the week ended 14th March, 1964)

(Information pertains to particular licences only)

M/s. Rohtas Industries Ltd., Dalmianagar. — newsprint.

CHANGE IN NAMES (Owners or Undertakings)

BOOKS BRIEFLY

Face-lift for a Theory

International Trade Theory in a Developing World: Edited by Sir Roy Harrod assisted by Douglas Hague; Macmillan, London. 1963; Pp. xv+571; 70sh.

Reviewed by D. KRISHNASWAMI RAO

THE STUDY of the implications of Development has given a new dimension to thinking in practically every field of economic science. This book which records the Papers and proceedings of the 1961 conference of the International Economic Association marks an attempt to orient the theory of international trade with the theory of economic development. It is valuable as providing a groundwork of analysis for the practical problems of international trade and investment that are so much to the fore today and is therefore well worth the effort of studying it — for it is definitely not easy reading.

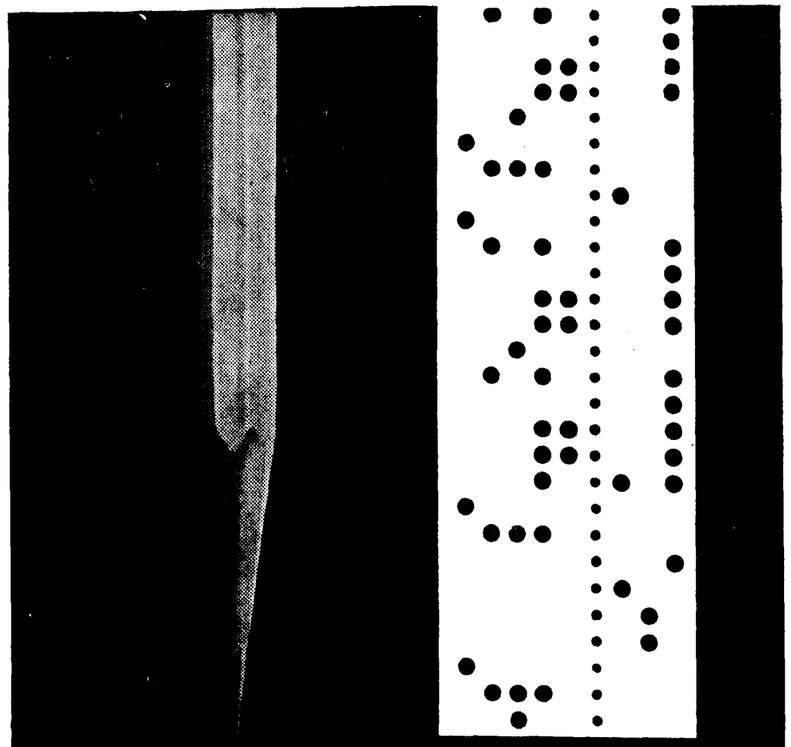
The Paper on 'Recent Trends in World Trade' by Mr. A. Maizels takes us over the major trends in the pattern of world trade in the 1950's, highlighting in particular the trading relationships between the industrial and the primary-producing countries and the difficulties of the latter arising from the relative stagnation of their exports. The causes of this phenomenon are carefully considered for this is something which has imposed a limitation on the rate of economic growth of the primary-producing countries that cannot be offset by international assistance. Professor T. Morgan follows with a Paper on a related theme, 'Trends in Terms of Trade, and their Repercussions on Primary Producers.' It is his finding that generalizations regarding the trend to a worsening of the terms of trade for primary producers are not substantiated by the data.

Professor H. G. Johnson considers the effects of technical change on comparative costs and on international trade in a developing world wherein advances in technology are the spearhead of economic progress. He shows how technical change in the industries producing goods that are otherwise mainly imported may lead to a reversal of the directions of international specialisation. But he is also aware that in the context of development the influence of technical change on trade is not limited to its direct effects on comparative costs but makes itself felt through its contribution to the growth of a country or a region. International trade theory would thus have to be broadened from the classical analysis that was based on the comparative cost differences of unchanging national economies to take account of the dynamics of technical progress in various parts of the world economy.

Sir Roy Herrod takes up another important subject, 'International Movements of Capital in relation to Growth,' on which he has certain significant points to make. Thus he points out that the rate of expansion of the various cadres of technicians must keep pace with the availability of capital if the developing countries are to step up their rates of growth. He also argues that national planning should be corrected by international planning if a larger flow of foreign investment is not to result in increasing the production of the same commodity in a number of developing countries which together countribute a large proportion of the world's supply of it. Contrary to prevailing pre-conceptions, he suggests that further investment in these countries should be directed more to industries producing such exportable goods as they have a natural advantage for than to those which provide high-cost substitutes for imports. He argues, however, that provided the recipient country can put forth an adequte supply of the other factors of production, a larger supply of foreign capital at the outset and a more intensive programme of investment will produce better results than a tardy flow.

Dr. H. Myint surveys the arguments for protection which are currently put forward in connection with the economic development of the under-developed countries in place of the *older infant industry* argument. Of particular interest is his discussion of the argument that as the stagnancy of internal demand in the poorer countries is a great hindrance to "natural" industrial development, a general policy of protection for the *manufacturing sector* is called for to create "at once" a sizable internal demand for its products. The warnings that he gives regarding the care to be taken in pursuing a policy of protectionism in the present setting of the under-developed countries if it is to help in the attainment of their objectives are salutary.

One turns with some expectations to the Paper on 'Forms of International Economic Relations' by the Soviet economist, Professor A. Bechin. But unfortunately Mr. Bechin speaks only the language of Marxian 'political' economy though the forum is one of academic economists keen on eschewing political and ideological controversies. His confrere Dr. V. P. Sergeyev's Paper on the 'Principles of Trade between the Communist States' is more useful because, although frankly propagandist, it contains fewer deprecatory references to other countries.



Dr. K. M. Savosnick presents an analysis in theoretical terms of balance of payments problems involved in economic growth. It is in Dr. I. G. Patel's Paper on 'Trade and Payments Policy for a Developing Economy' that we find a discussion of this important problem in realistic terms based on the experience of countries like ours. Dr. Patel explains the logic of the policy of import restriction in developing economies, showing that if it is to attain the objective in view it should be supplemented by conscious measures to step up domestic savings. As regards the question of increasing the export earnings of the developing countries, he pleads that the advanced countries should not only remove the obstacles which they place at present in the way of imports from the developing countries but also adopt a programme of increased absorption of such imports as a continuing act of international co-operation.

The last Paper in the volume, Professor C. P. Kindleberger's on 'International Liquidity', is sceptical about the existence of a 'world' liquidity problem (as distinguished from the balance of payments problems of individual countries) and upholds the present practice of holding a few leading national — "key" — currencies as international reserves. It is to be doubted that international monetary experience since this Paper was presented (September 1961) lends any support to these views. His reasoning that greater domestic monetary discipline should be insisted upon before world liquidity is expanded is, however, unexceptionable.

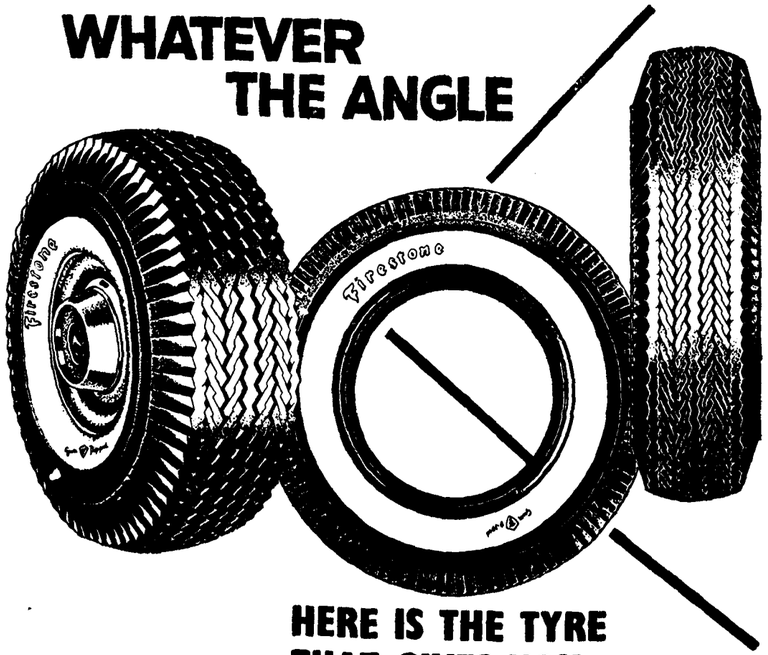
Whether you keep records with this... or this...

you can cut maintenance costs up to 15% or more with Caltex "Stop Loss" Programme

Here's one plan for reducing major overhead costs that puts no premium on your record-keeping methods.

Whether you use a clerk or a computer, you can count on a Caltex "Stop Loss" Programme for substantial savings in maintenance expense... savings that can reduce costs up to 15% or more.

The key to this plant management plan for cost control is our exclusive Lubrication Control System. This flexible blueprint for economy helps slash costs in the primary areas of production and maintenance. It eliminates the high price that companies pay for unnecessary shutdowns. It extends machine life, reduces maintenance time and labour costs, and increases unit output.



Company executives can obtain a free copy of this booklet by writing on their official letterhead to their nearest Caltex office.

COMPANY MEETING

THE INDIA SUGARS AND REFINERIES LIMITED

Addressing the Members at the Thirtieth Annual General Meeting of the Company held at Hospet on 16th March 1964, the Chairman, Shri Rajeshwara Patel, M.P., spoke as follows:

Gentlemen,

Let me extend to you all a cordial welcome to this, the Thirtieth Annual General Meeting of this Company. The Directors' Report, the audited Balance Sheet as at, and the Profit and Loss Account for the year ended 30th September, 1963 have been in your hands for sometime and, with your permission, I shall take them as read.

2. The results of the working for the year ended 30th September, 1963 show considerable improvement as compared to the results of the past year. The improvement would have been greater still but for the rise in the taxation provision. The net surplus available for distribution, as you would observe, was just enough to recommend a dividend as per last year and no more.

3. In my speech at the last Annual General Meeting I had voiced anxiety about the accumulation of sugar on one hand and introduction of control on the other; the immediate re-action to this policy was a fall in prices. I am glad to be able to report that the accumulated stocks had been liquidated and there has not been any further fall in prices. The sugar production economy in the country is often disturbed by imposition and removal of controls. In a poor country like ours, sugar is sometimes termed as an item of luxury. The demand is highly elastic and is related to some extent with the per capita earning of the people. The demand increases as the standard of living of people improves. It follows, therefore, that prices of sugar cannot remain too high too long because the producers are under constant temptation to increase the production and take advantage of the potential demand which multiplies at lower level of prices. It is my sincere opinion, if the industry is left alone without Government interference for some reasonable period of time, both production and prices are bound to adjust themselves in the interest of consumers. I would go still further and say that 'Control' only hampers production. A review of the sugar industry during last fifteen years would prove that production has tended to decline whenever 'controls' are brought in and to rise once controls are withdrawn.

4. The strange phenomenon of controls imposed during the last year simply baffles me. Different ex-factory control prices have been fixed for different sugar factory units in the country. It is said that one of the criteria for fixing such diverse prices is that it has got to be related to the price of cane that unit is made to pay. The price of cane, it was argued, could not be uniformly fixed because of competition from jaggery manufacturers in certain areas. On careful examination of the prices for various factories, it would be observed that it is not so. To quote a few instances I would mention :

(1) Daurala Sugar Works, Daurala, Distt. Meerut and
(2) Modi Sugar Mills Ltd., Modinagar, Distt. Meerut,

where the cane prices fixed payable by these factories are Rs. 46-90 nP. and Rs. 48-50 nP. per ton respectively and the ex-factory control sugar price which these factories are entitled to is Rs. 116-50 nP. per quintal. Comparing these figures with that of our factory, you will see that the sugarcane price fixed by the Government as payable by us is Rs. 53-30 and the ex-factory control sugar price is fixed at Rs. 115-00 nP. per quintal. The Government may have had their own reasons for making this disparity but I am unable to appreciate the real purpose for such discriminations. Again in the earlier years whenever controls were imposed on the price and distribution of sugar, the factories in the South including our factory always got slightly higher price than the ex-factory prices prevailing in the North. The reason was the freight advantage. The authorities took into consideration the fact that if sugar is transported from the North to the South certain freight would be incurred. Southern States being deficit in sugar production, some sugar is bound to be transported. Therefore they used to include a portion of the freight which would have been payable, while fixing ex-mill control price of South Indian Factories. It may be pertinent to mention here, that when wages were rationalised by the Sugar Wage Board, higher wages were fixed for factories operating in the South in comparison with those of the North and one of the considerations in so fixing higher wages was, that factories in the South were getting better realisation of sugar due to freight advantage.

5. I have stated earlier that on account of control, prices were steady. No doubt this is true but as explained above the prices fixed are not commensurate with the production costs and certainly are discriminatory between prices fixed for the factories in North India and factories in South India. Representations were made to the Government by the South Indian Sugar Mills' Association repeatedly about the grave injustice done to the factories in the South, by fixing very low prices but I regret to say that they have not given any thought to these representations although we have driven home our point with facts and figures of actual working costs and proved that even if we are given the same treatment as is given to the factories in U.P. and Bihar, the ex-factory price should not be less than Rs. 118 per quintal.

6. Another important factor that influences the judgment of the Government from time to time is the unfortunate tendency of the cane growers to keep on demanding higher and higher price for cane; in spite of the fact that Agriculturists growing sugarcane compared to others engaged in the production of other crops, are even now very favourably placed. On one hand the policy of the Government seems to please the sugarcane growers even at the risk of causing unjustifiably high rise in the price of such important a commodity as sugar and on the other it refuses to appreciate the steep rise in the manufacturing costs. If this policy of the Government continues, I am afraid the out-look for the industry cannot be considered too bright. Even at the risk of incurring displeasure of many, both from the Industrialists and Agriculturalists classes, I wish to express my sincere opinion that the pampering of the grower must cease and reasonable margin to the producer be left if the industry is to progress with enthusiasm and confidence. The policy of punishing the industrial efficiency and quality should also like-wise stop.

7. As you have read in the Directors' Report the expan-

sion scheme for increasing the crushing capacity of our factory to 1250 tons a day is well under way and it is hoped, it would be implemented during the ensuing season. The increased capacity would take care of all the cane in the area and I hope would help in some measure to bring about the economical working and bring down the pro-rata manufacturing costs too.

8. For some time past the sponsors of a sugar factory in the Co-operative Sector have been once again trying to get another sugar factory established in the Kamalapur area within about six miles of our factory. After the expansion of our factory and that of our subsidiary the Salar Jung Sugar Mills Ltd., Munirabad which has also been licenced to increase its crushing capacity, the total cane available in the entire area would hardly be enough for feeding these two factories. It has been thoroughly examined satisfactorily that even assuming that per acre yield is considerably improved due to better manuring and better cultivation methods, the resultant cane production would just be sufficient to meet the enhanced requirements of our two factories. There is, therefore, no justification whatsoever for a third sugar factory in the Co-operative or any other sector to be established in Kamalapur. We have made suitable representations to the Government of Mysore and the Government of India and have requested them that the licence for establishing another sugar factory in Kamalapur should not be granted because the un-planned establishment of any industrial undertakings bring all the factories to grief as was the case of several factories in U.P. and Bihar where enough cane is not available for a number of factories only because the initial choice about siting of the factory was not prudently planned.

9. I am extremely sorry to report the growing tendency of indiscipline among the Labour and Employees. A very undesirable step taken by the labour in resorting to Go Slow strike in the month of December this season brought the production to almost a Stand Still for a few days and resulted in a huge loss. While we certainly do not deny the rights of the labour to have an increasing share in the growing prosperity of the company they serve in the form of better wages and bonus etc., there are several constitutional methods for resolving any dispute but such ill-advised desperate action taken by the labour as resorting to the Go-Slow tactics amounts only to sabotage of production of an essential commodity. It is obvious, it serves no interest not even the interest of the labour. I am sure you will agree with me that in the hour of emergency, nobody would approve of such a deliberate act of gross indiscipline and sabotage.

10. As has been mentioned in the Directors' Report, the dispute about the Bonus for 1960-61 is pending before the Industrial Tribunal, Bangalore and for the two subsequent years i.e. 1961-62 and 1962-63, they have been referred to Arbitration. The report of the Bonus Commission has now been published. Some of their recommendations, to say the the least, besides being highly unreasonable, are extremely detrimental to the proper growth of the industry and fostering healthy relations between the labour and management.

The recommendations of the Bonus Commission, particularly to award Bonus, even by the industries which are running into loss or are uneconomically working, of a minimum of 4 per cent of their total annual earnings, is to my mind an unreasonable and unjust infliction on the industry. Bonus, as we all know, normally could only mean a share of the labour in the prosperity of the concern. The scheme followed by the Bonus Commission is opposed to this basic principle. The matter is still under consideration of the Central Government and I hope the recommendations of the Bonus Commission would not be accepted by the Government, in its present form.

11. The taxation policy of the Government of India, as announced by the Finance Minister in his Budget Proposals in the Parliament on the 29th ultimo is yet another step of disincentive to the growth of this industry. Wide powers are sought to be given to Government Officers. If unrestricted powers to the taxation authorities are given, who as experience shows, do not always use the discretion judiciously and coupled with the understandable temptation of the people taxed, the natural desire to protect oneself from the blackmailers and the human instinct of saving as much money for one's children, and in view of the ever-increasing tendency of corruption at all levels, a situation would soon come when a very large number of tax payers and tax collectors may become liable to be prosecuted for breach of law in one form or the other. I very much doubt whether the principles enunciated are capable of achieving the real objective. To quote one instance, I would mention that if the Income returned by the assessee is less than 90 per cent of actually assessed one by the Income-tax Officer, the assessee would be deemed to have concealed his income deliberately and would be punished with rigorous imprisonment up to two years. Experience shows that uptil now the difference between the returned income and assessed income of business houses, industrial units and individuals doing business vary more than 50 per cent in majority of the cases and it is also a fact that the mistake of the Income-tax Department has been in the past, far in excess to the mistakes of the assessees The Budget proposals seem to presume that the Income-tax Officers are invariably infallible men. The Finance Minister is certainly welcome to this opinion about his officers. But would that justify to condemn every mistake on the part of the assessees to be only malafide and criminal in its intent? The age long dictum that "EVERYBODY IS INNOCENT UNLESS OTHERWISE PROVED" is sought to be given a go-bye and here-after the opposite of it seems to be propounded, namely, that you would be considered guilty unless you prove your innocence.

Another very objectionable feature is the removal of Secrecy Clauses from the Taxation Statute. I say that this step would completely demoralize the character of the people and will be a most welcome and potent weapon in the hands of black-mailers and society pirates. The proposal to increase 10 per cent in Super-tax on companies falling under Section 104 of the Income-tax Act, under which category come most of the sugar mills, is indeed a very hard measure. Therefore, although the Finance Minister in his speech, has suggested that he has given relief to the Corporate Sector and encouragement to the growth of industry, I say that his proposals would on the whole hit most of the Companies and majority of them would be liable to pay larger taxes than they were paying in the previous year and thereby they would be discouraged in putting up new industries.

12. This is not the time nor the forum to express my views on the Budget Proposals and therefore I would content myself by mentioning that it is my sincere hope that the Finance Minister would give his second thought on the points mentioned above.

13. As indicated in my last year's speech the Plant and Machinery of Manjula Confectionery Ltd., have been sold to M/s. Parry's Confectionery Ltd. We feel the price at which the Machinery has been sold is reasonable. The Directors of Manjula Confectionery Ltd., are now taking steps to continue the manufacture of Confectionery by indigenous machinery and manual operation. Besides, it would continue to operate its business of petrol pump and allied activities.

14. Now Gentlemen, with your permission, I shall proceed with other business of the meeting of the day.

NOTE: This does not purport to be the Proceedings of the Annual General Meeting.

THE BANK OF BARODA LIMITED

(Registered Office: Mandvi, Baroda)

Directors' Report

The Directors have pleasure in submitting this Fifty-Fifth Annual Report together with the audited statement of accounts for the year ended 31st December, 1963.

	This Year Rupees	Previous Year Rupees
The net profit for the year 1963 after providing for taxes, including Rs. 3,46,722.36 brought forward and after taking Rs. 14,70,408.19 nP. towards depreciation on buildings and furniture amounts to	78,46,969.92	66,21,722.36
An ad-interim dividend at the rate of 16% per annum, subject to deduction of income-tax at the appropriate rates was paid for the half-year ended 30th June, 1963 which absorbed	16,00,000.00	12,00,000.00
Amount transferred to Reserve Fund	15,50,000.00	12,75,000.00
Amount transferred to Special Reserve	20,00,000.00	
Provision for Bonus to staff	24,00,000.00	22,00,000.00
..	75,50,000.00	46,75,000.00
		*16,00,000.00
Balance of profit to be carried forward to next year's account	2,96,969.92	3,46,722.36
..	78,46,969.92	66,21,722.36

*Final dividend at 16% p.a.

The Directors recommend to the shareholders payment of a final dividend at the rate of 20% per annum per equity share (making 18% per annum for the year) subject to deduction of tax at the appropriate rates for the half-year ended 31st December, 1963 to be paid out of the Special Reserve and which will absorb Rs. 20,00,000.

In terms of the Resolution No. 2(b) passed by the shareholders at the Annual General Meeting held on 8th April, 1963 your Directors have distributed dividend at the rate of 16% per annum subject to deduction of tax at the appropriate rates on the entire new issue of 1,00,000 equity shares for the half-year ended 31st December, 1962 which absorbed an additional sum of Rs. 70,000 over the amount recommended in the last report, leaving a balance of profit of Rs. 3,46,722.36 nP. to be carried forward to the account of the year under report.

The business of the Bank during the year under review continued to be satisfactory.

The Reserve Bank of India Rate remained unchanged at 4½% per annum since 3rd January, 1963.

The Bank opened during the year 1963, 33 new branches as under:

Gujarat	18
Maharashtra	8
Rajasthan	2
Uttar Pradesh	1
West Bengal	2
Goa	1
Fiji Islands	1

making a total of 189 branches in India and 15 branches in foreign countries.

The Board of Directors decided to take over the banking business of the Umbergaon People's Bank (Private) Ltd., Umbergaon. Accordingly after due examination and valuation, the banking business of the Bank has been taken over from 1st January, 1964, and its two offices at Umbergaon and Sanjan have commenced functioning as branches of this Bank from that date.

The Bank had in all 205 offices as at 31st December, 1963. It has applied for exemption from audit under Section 228 of the Companies Act, 1956 in respect of 88 branches for the year 1963. Out of the remaining 116 branches (excluding Head Office), 101 branches in India have been either audited by the Bank's statutory auditors or by firms of Chartered Accountants entrusted with the audit in consultation with the statutory auditors. All the Bank's branches outside India numbering 15 have been audited by Chartered Accountants who have been competent to act as Company Auditors under the laws of the respective countries and who have been approved by the Bank's Auditors.

In accordance with Article 145 of the Articles of Association of the Bank, five Directors: (1) Shri R. D. Birla, (2) Shri Chinubhai Chimanbhai, (3) Shri K. P. Goenka, (4) Shri N. D. Bangur and (5) Shri Rasesh Navinchandra Mafatlal — retire by rotation and being eligible, offer themselves for re-election.

The shareholders are requested to appoint auditors to hold office from the conclusion of this Meeting until the conclusion of the next Annual General Meeting and to fix their remuneration.

BOMBAY,
Dated 27th February, 1964.

For and on behalf of the Board,
TULSIDAS KILACHAND
Chairman

Report of the Auditors to the Shareholders

WE have audited the foregoing Balance Sheet of THE BANK OF BARODA LTD., as at 31st December, 1963, and also the foregoing Profit and Loss Account of the Bank for the year ended upon that date, in which are incorporated the returns from 53 Branches audited by us, 63 Branches audited by Branch Auditors and unaudited returns from 88 Branches for which exemption from the provisions of Section 228 of Companies Act, 1956 has been obtained from the Central Government under Rule 4 clauses (a) and (b) of the Companies (Branch Audit Exemption) Rules, 1961.

We report that:

(a) We have obtained all the information and explanations which to the best of our knowledge and belief, were necessary for the purpose of our audit and have found them to be satisfactory;
(b) the transactions of the Bank which have come to our notice have been within the powers of the Bank;
(c) in our opinion, proper books of account as required by law have been kept by the Bank, so far as appears from our examination of those books and proper returns adequate for the purpose of our audit have been received from the Branches of the Bank not visited by us;
(d) the Bank's Balance Sheet and Profit and Loss Account dealt with by this report are in agreement with the books of account and the returns;
(e) the reports on the accounts of the Branches audited by Branch Auditors have been forwarded to us and the same have been considered by us in preparing our report;
(f) in our opinion and to the best of our information and according to the explanations given to us, the said accounts, together with the notes thereon, give the information required by the Companies Act, 1956, in the manner so required for banking companies and on such basis the said Balance Sheet gives a true and fair view of the state of the affairs of the Bank as at 31st December, 1963, and the Profit and Loss Account gives a true and fair view of the profit for the year ended upon that date.

RECORDS AND STATISTICS

Industrial Progress in 1963

THE YEAR 1963 witnessed further steady progress in the industrial field in India. The Index of Industrial Production, with 1956 as base, touched an average of 161.4 during January-October, 1963, showing an increase of 8.9 per cent over the corresponding period of the preceding year.

Remarkable increases in production were recorded in aluminium and domestic refrigerator industries. The output of various other items such as weighing machinery, machine tools, aluminium conductors, paper and paper boards also went up substantially — about 30 to 40 per cent over the previous year. An increase of 10 to 30 per cent was recorded in the production of steel castings, power driven pumps, electric motors, electric lamps, radio receivers, aluminium conductors, winding wires, paper insulated cables, tyres and tubes (automobile), bicycle tyres, leather footwear, tanned hides, cement and asbestos, and cement sheets.

Substantial additions to capacity were made in a number of industries. The prominent among these were the sewing machines, electric fans and aluminium power transformer industries. There was a considerable improvement in the working of the jute industry. In the case of cotton industry, while the ouput of yarn registered a slight improvement, production of cloth recorded a slight decline.

Fall in production was witnessed in the case of coated abrasives, room-airconditioners, cotton and hair belting, incandescent lamps, gramophone needles, steel belt lacing, stoves, building hardware, bolts and nuts,clocks, expanded metal, hurricane lanterns, machine screws, wood screws, wire products, phosphorous trichloride, sodium bicarbonate, sodium bisulphite, copper sulphate, sodium sulphide, polythelene, ceramic insulators (LT), sanitarywares, refractories, pencils, glue, etc. The lower output of these items was due to reasons such as shortage of raw materials, dislocations caused by expansion programmes, lack of adequate demand and temporary suspension of work due to labour trouble or power breakdown.

The following tables give details about the installed capacity and production in 1962 and 1963 of the industries under the control of the Union Ministry of Industry:

INDUSTRIAL CAPACITY AND PRODUCTION IN 1962 AND 63

Sl. No.	Name of the Industry and Unit	1962 No. of Units	1962 Installed Capacity	1962 Actual Production	1963 No. of Units	1963 Installed Capacity	1963 @Estimated Production

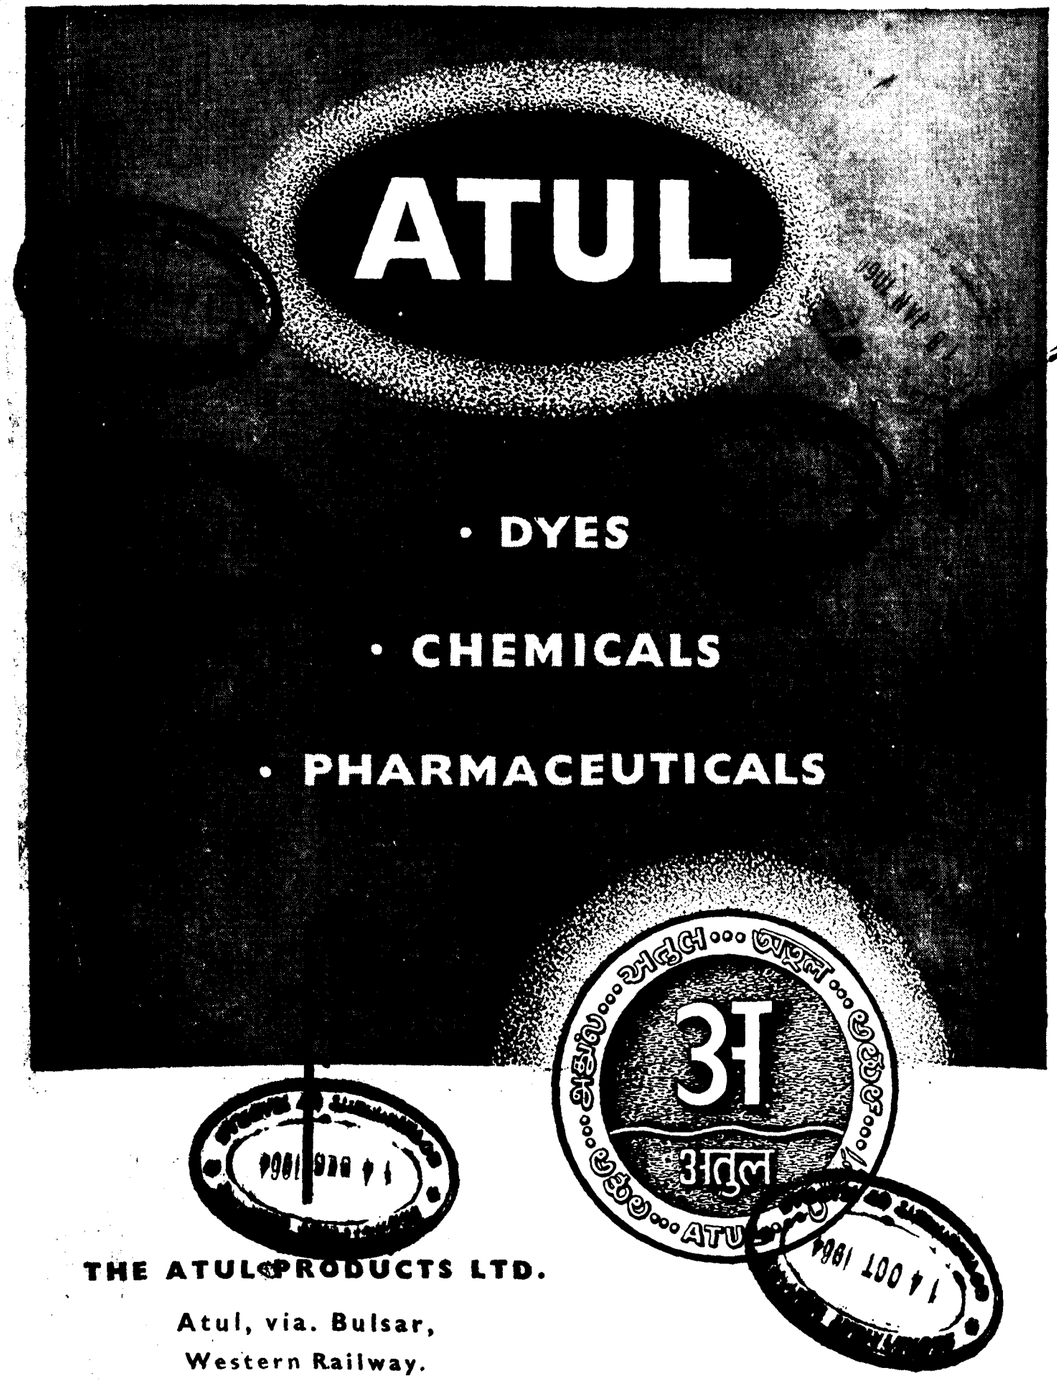
11.	Waterproof Fabrics (Mill. Metres)	11	5.2	4.2	11	5.2	6.4)

@Based on actual for the first 9 months and estimated production for October, November and December. †Relates to precipitated variety only. *Does not include production of DGOF factories.



**The consumption of raw and general purpose synthetic rubber including reclaim rubber by the Rubber Goods Manufacturing Industry during 1962 was of the order of 65,000 tonnes. As against this the consumption of Raw Reclaim and General purposes Synthetic Rubber during January-December, 1963 would be 67,000 tonnes approximately. It may thus be seen that there is an overall increase in the production of various items.

††The units are however permitted to manufacture 18.68 Mill. Sq. Mtrs. of Teachest Plywood and 14.14 Mill. Sq. Mtrs. of Commercial Plywood on multiple shift basis.

Available in Delhi at : **SYLCO 11-E, Conn. Place; ORIENTAL TEXTILE CORPORATION, Madras Hotel Block, Conn. Circus; BHAGIRATHMAL & SONS, Opp. Bank of India, Ch. Chowk; RAJKAMAL EMPORIUM, 113-E, Kamla Nagar, Subzi Mandi and other leading stores.**

Distributors in Delhi : **SHIVLAL KANHAYALAL, Katra Nawab. Ch. Chowk; HAZURASINGH MANOHARSINGH, Katra Rathi, Nai Sarak; RUGGANMAL PURANCHAND, Katra Choban Ch. Chowk; RAKESH & RAJESH CO., Katra Rathi, Nai Sarak; ANAND SILK STORE, Katra Subhash, Ch. Chowk.**

DUNLOP

HIGHWAY for highest mileage on long heavy hauls

The Dunlop Highway Truck and Bus Tyre assures higher initial tread mileage on heavily laden long distance trucks and modern fast buses. And finally, when the tyre is worn smooth, the excellent retreadability of the casing means that it will continue to serve for many more thousands of miles.

The Case for the Corporate Sector

THE CENTRAL Budget for 1964-65 has been before the public for some five weeks now. During this period it has attracted extensive notice, mostly critical. Some of the strongest criticism has perhaps been expressed in the columns of this Journal. This has been done without pleasure because this surely was a budget of great expectations. In the circumstances, there is near-tragic irony in the fact that the kindest words we have heard said about the Finance Minister's tax proposals are that "in the context of the Bhubaneswar resolutions, he has, with the possible exception of the inheritance tax, done the best possible job that was possible in the circumstances". This quotation is an actual comment made by a foreign national holding a high executive position in a business concern in southern India. Mr. Krishnamachari is welcome to such satisfaction as he may be able to derive from this rather dubious and possibly double-edged compliment.

For our part, we would continue to suggest that the Finance Minister can really have no reason to congratulate himself on a budget which has apparently had reactions contrary to what he himself claimed to be after. We would recall that in his budget speech he categorically stated that "the direct taxes proposed .... are aimed at infusing confidence in the capital market, providing a stimulus for the development of the basic industries and promoting the building up of reserves in industry and the growth of personal savings". The Finance Minister is a man of rare courage and conviction, but we doubt that even he would today claim that his budget proposals have succeeded or are likely to succeed in realizing the purposes he has charged them with. Throughout the month of March, the Stock Exchanges have regressed through successive stages of disappointment, doubt, dismay and despair. Surely this does not suggest that confidence has been infused into the capital market. What has actually happened is that instead of confidence having been restored or revived, the prevailing mood of depression has been confirmed by all hopes having been frustrated.

The Desai budget of last year was bad enough and in the shadow of it the capital market had been marking time and living on what has now turned out to be wishful thinking. It was being generally assumed that the then Finance Minister had at least been privately convinced that the super profits tax had been a grievous blunder and that it should be undone on the next occasion. Indeed, even as early as in April, 1963, Mr. Desai found it necessary to give the assurance that "if the effect of super profits tax is to retard development and the growth of the corporate sector, which is a surer source of revenue than an increase of rate of tax on it, then the measure would not be justified and I would be the first person to ask the House for a repeal of the provision". It is true that there was no need even then for any "if" or "but". The super profits tax was patently a levy which was bound to retard development and the growth of the corporate sector and Mr. Desai, consequently, did not really have to look for guidance from the stars of the future. But then he chose to do so which was bad enough. What is worse is that his successor, after having realized and stated in so many words even in his budget speech that the net result of the super profits tax "has been that it has produced a psychological resistance and has, to some extent, affected industrial growth", could still find it sensible and consistent to retain that tax under a different name.

In other words, if Mr. Desai had no justification for imposing the super profits tax, Mr. Krishnamachari has even less justifica-

tion for continuing it in the guise of surtax. There has been some splitting of hairs over the relative burdens arising out of the super profits tax and the surtax. As we have been urging in these columns, this debate is of secondary importance. What is in issue is the principle of such extraordinary taxation. We have no doubt in our mind that the proposed surtax is as unsound as the super profits tax is, so far as the basic fiscal principles are concerned. Both taxes seek to apply the principle of progression to the taxation of corporate earnings, thereby grossly violating those very considerations of equity which are held to justify the traditional and established relevance of progression to the taxation of individual wealth or incomes. Secondly, the surtax, even as the super profits tax, makes no allowance to the factors of risk, efficiency, productivity and such other elements which differentiate one unit from another and influence the varying profit-making records or experiences of different enterprises. An attempt has been made either deliberately or otherwise to mix up the super profits tax or surtax with an excess profits tax, but it is significant that the element of alleged "excess" has been sought to be related not to normal profits in any particular preceding period but to a notional concept of what is a normal rate of return on the capital employed in the business. As has been pointed out already, such a definition of excess element in profits is inequitable to individual shareholders while being economically unsound and injurious through penalizing the more efficient utilisation or the more honest management of capital. We would, therefore, urge that the Finande Minister should give up the misguided attempt to make this extraordinary measure of corporate taxation, whatever may be the name currently given to it, a normal feature of the fiscal structure in our country. Unless he does so, it would be idle to expect a normal state of confidence or a disposition towards a constructive evaluation of the future to return to the capital market.

While the surtax has at least the excuse that it replaces the super profits tax, the equity dividend tax and the extension of the capital gains tax to the entire value of bonus shares, irrespective of whether these shares are sold or transferred or not, are wholly new impositions of a thoroughly objectionable nature and are consequently without any saving grace whatsoever. The Finance Minister has defended the equity dividends tax on the ground that "it is necessary to discourage companies from frittering away profits by large distribution of dividends under equity capital and to induce them to build up reserves for meeting their developmental needs in the future". It is strange that the Finance Minister's concern for developmental reserves had not prompted him to be content with normal corporate taxation. And it is certainly cruel that having taken care to appropriate a further amount of company earnings to the Government through the surtax, he should be talking of the need to discourage companies from frittering away profits by large distribution of dividends on their equity capital. This is the kind of language which ought to make us regret that the Finance Minister should not have kept in mind what the Duchess said to Alice, viz., "The more there is of mine, the less there is of yours". Once the Government has taken away more by way of surtax there is surely less for company and shareholder alike, whether for reserves or for dividends. And in any case, it is clearly an odd way of attempting to stimulate personal savings or the investment climate by putting special restrictions on dividends.

In an admirable analysis, the Bombay Stock Exchange has clearly established that there is no warrant for the fact that excessively large dividends would be declared in the absence of a dividend tax. Examining the data provided by Reserve Bank studies relating to the working of 750, 1001 and 1333 public limited joint stock companies operating in the country in the period 1951-55, 1956-60 and 1961 respectively and representing two-thirds, three-fourths and 87 per cent respectively of the total paid-up capital of all such companies at the various relevant periods, this analysis arrives at the finding that in the case of all industries the percentage of dividends to net worth (i.e., capital plus reserves) ranges between four per cent and seven per cent giving an average of six per cent while the percentage of dividends to paid-up capital varies from seven per cent to 12 per cent yielding an average of 11 per cent. The same data also points to the conclusion that the amount retained in the business for the growth and expansion has averaged four per cent of the net worth and six per cent of the paid-up capital. Finally, the apprehension that the corporate sector is apt to dissipate its earnings without making adequate provision for expansion is shown to be unfounded in that internal resources had accounted for about 80 per cent of the total gross capital formation of about Rs. 1150 crores between 1951 and 1961 in respect of companies covered by the Reserve Bank Survey.

The Memorandum of the Bombay Stock Exchange argues with telling effect that when the current rate of bank borrowing is from seven per cent to eight per cent and when debenture and preference capital cannot be easily raised even at rates of nine per cent or 10 per cent, equity dividends of six per cent on the net worth and 11 per cent on the paid-up capital can by no stretch of imagination be regarded as excessive or extravagant. We are particularly glad that the Bombay Stock Exchange has recalled in this context the late Dr. Dalton's classic condemnation of the dividend tax in the following terms: "It discriminates against a particular class of property owners, namely, the ordinary shareholders in joint stock companies, as compared with all other classes, including debenture holders and the holders of war loan and other gilt-edged securities. It is, therefore, in effect a tax on risk-bearing and tends to divert the flow of capital from risk to comparatively safe investments. But in view of the need that risks should be taken and the reluctance of many investors to take them, this is a harmful diversion."

Mr. Krishnamachari has put up defence of a kind for his various tax proposals. But his advocacy surely is at its weakest in the case of his decision to extend the capital gains tax to the entire value of bonus shares irrespective of whether those shares are sold or transferred or not. The Bombay Stock Exchange, again, has clearly brought out the illogical and inequitable nature of this imposition. The ostensible object of the seven per cent equity dividend tax is "to build up the reserves" and "to augment the capacity of the corporate sector to develop". "Paradoxically", the memorandum proceeds, "when these reserves are crystallized by companies in the form of bonus shares and converted into a permanent part of its capital structure, the company is required to pay, even at present, a tax of 12½ per cent on the amount capitalized. This tax is levied in spite of the fact that the reserves mainly represent accumulated profits which have already borne a full tax. It is now proposed that the reserves be taxed a third time by providing that the bonus shares in the hands of shareholders be treated, in their entirety, as capital gains and made subject to a capital gains tax irrespective of whether they are sold or transferred or not. Nothing could more effectively discourage the building up of company reserves which is stated to be one of the larger objectives in view."

On the question of facts whether a bonus share in its entirety is, as is claimed by the Finance Minister, "an immediate and definite accretion to the share capital", the Memorandum of the Bombay Stock Exchange has marshalled effective evidence to disprove Mr. Krishnamachari's thesis. After quoting high judicial authority to the effect that a bonus issue takes nothing out of the company's coffers and puts nothing into the shareholder's pockets but is only a "bare machinery" for capitalizing profits, the Memorandum explains that the "machinery" at work is a simple "splitting" operation and bonus shares are nothing but "splits", which is how they are popularly known in the United States.

Addressing itself to the factual question whether bonus issues have brought immediate and definite accretions to the wealth of shareholders, the Bombay Stock Exchange has looked into the record of bonus issues made during the last decade in respect of shares quoted on the Stock Exchange in Bombay. The resultant findings are:

"(a) that, after the bonus issue, prices have moved both ways, up as well as down;
(b) that in 38 out of 70, that is, 54 per cent of the cases, prices have gone up;
(c) that of the remaining 32, that is, 46 per cent of the cases, in 3 cases prices have remained stationary and in the other 29 cases prices have gone down;
(d) that, by and large, the percentage variation in price in either direction has been small;
(e) that in the few cases where the percentage increase or decrease in value is large, the variation is exaggerated by exceptional factors other than bonus issue, principally because the shares in question have an extremely narrow and restricted market in which buyers and sellers are so few that transactions barely take place once a month or once in even two or three months; and
(f) that, eliminating these few exceptional items, the variation in price is relatively small in either direction, indicating that the price variation following a bonus issue has no special significance but merely represents the normal fluctuation that takes place between any two dates in the price of any share irrespective of whether there is a bonus issue attached to it or not."

On the basis of this analysis, the Memorandum establishes the following propositions:

"(a) A bonus issue capitalises the reserves, that is, a book entry is passed whereby the amount of undistributed profits previously standing under the head 'reserves' appears in the balance sheet under the head 'capital' — which represents a change in form but not in substance as the assets continue to remain with the Company.
(b) Accordingly, a bonus issue makes no inevitable addition to the intrinsic value of the shares to which it is attached nor does it confer on shareholders any special price advantage which they do not otherwise have in respect of shares not carrying a bonus issue. In actual fact, it is the experience that prices go down as often as they go up after a bonus issue exactly in the same manner as prices of shares not carrying a bonus issue, the movement in either direction depending on the state of the economy and the complex of long, medium and short term factors that are constantly at work on the Stock Exchange.
(c) Similarly, a bonus issue confers on shareholders no special dividend advantage which they do not otherwise have in respect of shares not carrying a bonus issue. As in the case of prices, it is the experience in actual fact that dividends go down as often as they go up after a bonus issue exactly in the same manner as dividends on shares not carrying a bonus issue, the movement in either direction depending on innumerable factors comprising the state of the economy, the profitability of industry, the earnings of the particular concern, and the like.
(d) From the legal point of view, a bonus

does not so much create a new right as it puts the seal on the legal title of the shareholders to assets to which they are fully entitled in equity. The bonus issue, however, does entail a measure of restriction on shareholders in that the reserves once crystallised as capital cease to be available for dividend distribution in future years because in law capital cannot be reduced or drawn upon for paying dividends.

(9) Lastly, from the point of view of marketability, a bonus issue does not confer any special advantage on a shareholder in the matter of enabling him to dispose of a part of his holding without disposing of his entire holding in the Company. As is well known, this facility is always available on the Stock Exchange to all shareholders at all times in respect of all shares irrespective of whether they carry a bonus issue or not.

(10) It follows that there is no determined or ascertainable gain or unearned increment in price and/or dividend that bonus shares deliver to equity-holders automatically and inevitably, which could be made the subject matter of a special tax except on a fictitious and entirely arbitrary basis.

(11) It may be therefore concluded that a tax on bonus issue would be a tax not on income, nor again a tax on capital gains or profits, but a tax on capital itself, a tax on capital formed out of profits which themselves have been regularly taxed from year to year at the full rate of income-tax plus super-tax, a capital tax besides not levied generally but in unwarranted discrimination against a small group of investors who have employed their savings gainfully in joint stock enterprise."

We are convinced that the position taken by the Finance Minister on this issue is subjective and arbitrary and that any reasonable consideration ought to call him to abandon the proposal to tax bonus issue as notional capital gains. Here, we would like to point out that while the specific economic or technical arguments against each of the three tax proposals discussed in this article are conclusive in their contexts, what is perhaps even more significant is the basic and general impact of fiscal policies reflected in these taxes on the economy of the country. As we had said at the beginning, if this is a budget designed to stimulate the capital market, it has sadly misjudged its means. It is a primary economic truth that if a community needs more risk capital and desires to attract it, it should endeavour to the utmost to secure favourable tax treatment for that capital. The common sin of the three tax proposals we have examined here is that they violate this essential canon of taxation in a developing economy where risk capital is scarce while the hunger for it is enormous. The consequence of the surtax would be to take away from corporate funds left after the normal taxes have been paid, a further sum for the public exchequer and thereby reduce the amount of finance available to the company whether for building up reserves or for meeting its other obligations. The consequence of the equity dividend tax is that it would either help to deplete company reserves or it would discourage new investment by individuals in corporate shares; the former would be the result where the company concerned decides to maintain its rate of dividend even if it involves the tax being paid out of retained profits, and the latter would be the case where the company decides to reduce the dividend to the extent of the tax.

As for the capital gains tax, the tendency would be for new investments to be discouraged as well as for existing holdings of investments in shares to be liquidated so that money might be found to pay the capital gains tax on bonus shares. In both ways, investors' support to the capital market is liable to be undermined. We would, therefore, urge again that, if

Eastern Economist 20 Years Ago

MARCH 31, 1944

We are glad to learn that the criticisms of the 'Economist' on the Bombay Plan were based on inadequate data. Writing in its issue of March 25, the 'Economist' apologies to the Indian planners saying that its former criticism was based on inadequate cabled summaries, and that the full text showed that "the authors were far from ignoring farming's fundamental position'.' It also recognises that the Plan puts first things first: Power transport equipment, fertilisers and necessary consumption goods. Having criticised the 'Economist' strongly in our previous issue, we owe it to ourselves to make a reference to its revised comments which show a truer and juster appreciation of the nature of the Plan. If a journal of the reputation of the 'Economist' fails to reflect impartial and considered opinion there can be little hope of economic justice and fairplay in the world. We are, therefore, gratified to note that its unjust criticism was only based on ignorance.

The further criticisms which the journal makes are again based on an inadequate appreciation of the assumption of the Plans. According to the 'Economist' "the authors are disinclined on political grounds to permit India to participate to its greatest advantage in international division of labour." It would be a mis-reading of the Plan to say that India would be against international division of labour. But surely the raison de etre of any plan is to decide how and in what degree a country should participate in international division of labour. If an economist of the eminence of Sir William Beveridge can declare that "no country can afford to make trading and exchange arrangements with another country without considering whether the latter is likely to have a stable system of employment or not," India may be excused if she decides that her plan should not be imperilled by the ignorant or mischievous actions of other countries. Even international division of labour, the economic mantra of the liberal school, is not an end in itself, it is only a means to an end, which is full employment and high standard of living.

the purpose of the budget really is to restore confidence in the capital market, strengthen company reserves and stimulate new investments, the Government really has no alternative to the abandonment of the intended levies. These tax proposals will not be, and ought not to be, accepted as the normal features of a sound and dynamic fiscal policy. It is, therefore, the duty of all of us who are keen on the Government's economic policies functioning as a boost to the economy rather than as a drag on it, to continue to agitate for the abandonment of these tax decisions. Some of us, however, would no doubt be also anxious to secure, as an interim relief, some modification of the proposed impositions. Any such plea for modifications ought not to be misconstrued or exploited as the tacit acceptance of the validity of the new tax proposals. On this clear understanding, we would extend our support to certain suggestions made for mitigating the mischief of the proposed levies, while reiterating the firm belief that the pace of economic expansion is bound to suffer immediately and even more so in the long run so long as such measures of taxation remain operative in any from whatsoever.

As for the recommended modifications, it is evident that if the Finance Minister's claim that the surtax is a more modest levy than the super profits tax is to be substantially justified, at least two changes will have to be made in the surtax structure: first, the exemption granted in the super profits tax for the first 10 per cent of gross profits before tax should also be incorporated in the surtax and, secondly, as in the super profits tax, there should be provision for carryforward and set-off of deficiency in taxable profits. In the case of the equity dividends, instead of the tax being made applicable to the entire amount distributed, it could be made to apply only to such portions as may be in excess of a reasonable datum line, such as the highest dividend in the last three years or 12 per cent of the net worth (i.e., capital plus reserves), whichever of the two is higher. It is also necessary that the dividend tax should be made applicable only to dividends declared after the budget date, i.e., February 29, 1964.

In the case of the capital gains tax on bonus shares, the Finance Minister has already given indications which would point in the direction of exemption of bonus shares issued out of share premium account or out of capital redemption reserves which, under Section 80 of the Companies Act, are treated as paid-up capital and cannot be used for purposes other than the issue of bonus shares. Among other concessions which have been urged for his consideration are that the tax should only apply when the bonus shares are transferred or sold, that in the event of the tax, however, being finally based on notional capital gains, the gain should at least be deemed as a long-term and not a short-term gain and that in any event the tax should not apply to bonus issues approved by the Controller of Capital Issues before February 29, 1964. What the fate of these or other proposals for modifying the tax measures would be it is difficult to anticipate. Mr. Krishnamachari, in his reply to the budget debates in the two Houses of Parliament, certainly did not reveal himself to be in a mood for substantial or extensive modifications. But it is just possible that his attitudes might have softened to some extent subsequently in the light of the objective evidence of the demoralization in the stock exchanges and the capital market generally. We, for our part, have always believed, and we would continue to believe, that the Finance Minister is sincerely dedicated to the cause of economic dynamism and that he is enough of an empiricist to be able to adjust or readjust his policies to responses and reactions in the national economy.

Towards "Realistic Rates"?

WHETHER IN this country or in the UK — and we still seem to follow broadly, if not blindly, in the footsteps of British Banking — decisions affecting credit always seem to come either belatedly or in inadequate doses, or both when, for instance, Britain recently raised the Bank Rate, the criticisms there was that the relevant announcement (by the Bank of England) came at least a week too late. Perhaps the same comment would be repeated by financial circles here if and when a similar announcement is made by the Reserve Bank of India. That such an announcement is bound to come sooner than later is taken for granted, at any rate in certain circles, especially since the reference to "realistic rates" in the Economic Survey and the latest budget speech of the Union Finance Minister. Some go so far as to see an earnest of it in the latest credit squeeze which was not just a tightening of credit as such but also a slight levering up of interest rates. In fact, scheduled banks have now to pay at least 5.25 per cent on borrowings up to 100 per cent of their total statutory reserves with the Reserve Bank, as against only 4.87 per cent until March 11.

No one seems to be sure of when precisely the Government of India would raise the Bank Rate. One school believes that the time would be after the next slack season, but even this school qualifies its belief by adding that the rise in bank rate would eventuate only if the extent of the return of funds then turns out to be less than during the last slack season. All these speculations only go to show how complex the problem is. In a dynamic economy, the imponderables are so many and so varied that what may meet a situation at a given time, or in one context, may prove wholly unsuitable or inadequate at another time or in a different context. Here probably is an explanation for the

rather sudden reversal of monetary policy within so short a period — between October last, when the Finance Minister himself was talking of liberalising credit to pump-prime the slackening pace of our economic growth and the second week of March, when the busy season was still on, when the credit squeeze came. In fairness to the authorities, it must be noted that, in the interval, there were certainly some unforeseen developments. In the first place, there was a sizable spurt in both money supply and bank credit. The increase in money supply in 1963, for instance, was higher than in either of the two preceding years. Similarly, between October 25, 1963 and March 13, 1964, the increase in bank credit was over Rs. 300 crores, as against an increase of only about Rs. 165 crores for the corresponding busy season period of 1962-63. Secondly, production, both agricultural and industrial, did not keep pace with this increase; on the contrary — and more particularly under agriculture (especially in foodgrains) there was a more-than-anticipatable fall in output. At any rate, the sharp extent of the actual fall was not, and could not have been, expected. The gravity of the resulting situation would be appreciated if it is recalled that, even in 1962-63, there had already been a fall of 3.3 per cent over the previous year. And to make matters worse, in both 1962-63 and 1963-64, there was no retarding of the rate of growth of our population which still continues to be more a pious hope than a positive programme.

What are the objectives of the latest credit squeeze and how far are these objectives likely to be achieved?

The two objectives indicated are (i) to discourage the flow of credit for hoarding and speculation and (ii) to channel credit along desired and productive lines. To the extent that margins, placed or raised on bank advances against commodities in which there are reasons to suspect the existence of undue hoarding or unabashed speculation, or both, can prove effective — and this presupposes that it is mainly bank advances that are employed for hoarding and speculation purposes (which does not appear to be the case) — the first objective may be partially achieved, as, for example, in respect of margins on bank advances against groundnut. But the objective of channelling credit along specific lines, however desirable and imperative, seems more difficult of achievement. It involves not only the calling back of advances already made to long-standing clients at highly profitable rates, but also of making advances to parties or for purposes which, though productive, may not be even correspondingly let alone more profitable than the existing lines of advances. This task becomes all the more difficult when not all the banks in the country are disposed to offer higher interest rates on deposits, notwithstanding the Reserve Bank's advice to them to do so. Whether some banks are or are not well-advised to be reluctant thus to raise interest rates on deposits now when they are encouraged to do so, in preference to postponing the evil day and being left without any choice but to do so later (as when the Bank Rate is raised) is a different matter into which we need not enter now or here. We must await the outcome of the meetings that have been going on between the Reserve Bank and bankers.

EASTERN ECONOMIST BUDGET NUMBER

March 6, 1964

THE BUDGET NUMBERS of "Eastern Economist" are a popular and valued annual feature of the Journal. This year's Number should be of special interest and importance in view of the complexity as well as ingenuity of the economic and fiscal policies presented through the Central Budget.

An attempt has been made in the Budget Number to analyse the various aspects of the Budget proposals and study the Budget documents with a view to bringing out the larger and deeper implications of Government policies for the future course of the national economy. The result is an objective and critical evaluation of the economic situation and outlook at a significant turn in the course of national development.

The Budget Number is illustrated with graphs and diagrams and it features a special section in which important budget documents have been reproduced for record and reference. Priced at Rs. 5 per copy, the Budget Number is available to subscribers without extra charge — a facility which new subscribers may also avail themselves of by entering, before April 10, an annual subscription for "Eastern Economist" at the usual rate of Rs. 65.

Highlights of the Week

AND STILL THEY COME

THE HARASSED religious minorities in East Pakistan continue to cross over into this country and the arrivals are conservatively estimated at between 3,000 and 4,000 persons per day. How many in all have so far sought refuge in India in the course of the current exodus it is difficult to assess. But it is generally agreed that the figure should be well over 100,000, of whom a third might be Christians. What is perhaps even more disturbing is that if the exodus continues, India must reconcile itself to accommodate, in due course, within its strained economy at least two million more refugees from East Pakistan in addition to the four million who had been received in spells and stages and rehabilitated after a fashion in the 16 years since partition. Even then East Pakistan would not have completely solved its problem of minorities even to its own satisfaction for its present population of Hindus is still of the order of some 9 millions. Assuming that this number is substantially reduced before the current exodus stops, East Pakistan will still have to reckon with the residual presence of several millions of Hindus. Along with the grim probability that periodical revival of bouts of oppression, compelling the minority community to seek safety by fleeing to this country, could well be adopted as a policy by the rulers of Pakistan for reducing still further the size of their minority population, there is also the likelihood of a steady conversion of desperate Hindus to the religion of the majority community. Meanwhile, it is only to be hoped that the rulers of Pakistan will not be tempted to exercise their ingenuity in finding additional ways of extinguishing the presence of minorities in that country. This thought is prompted by allegations heard in Lok Sabha earlier this week that Hindu girls were being abducted and shipped for sale in West Asian countries.

Home Ministers to Meet

Tragic as the fate of the refugees is and urgent their cry for succour, the people and the Government of this country have also to deal simultaneously with the problem, no less grave, of maintaining communal harmony in this land, ensuring the safety of Muslim citizens here and defending the secular character of our State in the face of the violent attitudes aroused in some areas of this country as a result of the influx of refugees. Indeed, the Prime Minister, making his first broadcast to the nation since his recent illness, described this task of maintaining communal harmony in this country as "more important than anything else". Mr. Nehru, who went on the air on March 26, made the point that, while Pakistan had come into existence on the basis of hatred and violence, it would be fatal to the high purposes of our own nation and contrary to its culture if we reacted to happenings in the neighbouring country in a spirit of revenge or retaliation. The Prime Minister disclosed that there was still some hope that Pakistan might find it possible to co-operate with this country in bringing to an early end the current phase of communal tension and hostility. President Ayub Khan, Mr. Nehru said, had found it possible after all to agree to the suggestion which Mr. Nehru had made to him a few days earlier that the Home Ministers of the two Governments should meet early to construct measures for restoring normal conditions. The conference is scheduled to be held on April 7.

Meanwhile, the Government of India as well as the State Governments concerned could derive sombre satisfaction from the fact that the police measures taken by them have succeeded in bringing under control the law and order situation in the various centres where communal trouble had flared up. At a conference of the Chief Ministers of Madhya Pradesh, West Bengal, Bihar and Orissa, which was convened by the Union Home Minister, Mr. Gulzarilal Nanda, several important decisions were taken for dealing effectively with threatened or incipient communal disturbances, particularly, in industrial centres some of which had figured, unhappily, in the recent outbreaks of violence. The conference decided to amend the Trade Unions Act in order to provide that workers in large industrial establishments were not permitted to have anything to do with trade unions other than their own associations. Another important decision reached was that there should be a Central industrial security force. The strengthening of the intelligence service and the improvement of the communication system through the provision of mobile units and wireless equipment were also approved.

Here it is relevant to mention that, while it has been established that the tribal communities in Rourkela and Jamshedpur were mainly responsible for the violence done against the Muslims in those areas, the Government of India does not seem to have any very clear notion on the nature of the trouble-making machinery. While it is contended that the tribal people had reacted violently to the large-scale influx of Christians into the Garo Hills from East Pakistan, it is also being maintained that infiltrators from Pakistan had been responsible for inflaming passions. Communal organisations have also been suspected of fishing in troubled waters and the leader of one such organization has been taken into custody today. In some quarters it is being suggested that the role of Communists or fellow-travellers is also worth examining. When there is so much speculation on an important issue like this, it is clearly necessary that the Government of India should set up an appropriate investigating machinery to make a quick probe and put the public wise as to where the guilt or responsibility might lie. It is evident that this information must be secured and given to the public if its co-operation is to be forthcoming freely for preventing communal disturbances as well as for promoting communal harmony. Otherwise, there is bound to persist an atmosphere of doubt and suspicion, of charges and counter-charges and political propaganda, all of which must come in the way of public collaboration with the Administration in this vital area of national security.

END OR BEGINNING?

IT WOULD be recalled that the UN Security Council at its last meeting, while agreeing to postpone the discussion on Kashmir, appealed to India and Pakistan to refrain from any action that could aggravate the problem. It is a safe bet, however, that even that august body is unlikely to object to the decision taken by the Kashmir Government to withdraw the conspiracy case pending against Sheikh Abdullah and grant him unconditional release from custody at an early date. This is not to say that the impending release of the former premier of Kashmir may not spark off a chain of events which could make the Kashmir confusion worse confounded. Sheikh Abdullah, of course, has himself been a problem within the larger problems of Kashmir. On April 1, in the Lok Sabha, Mr. Lal Bahadur disclosed, for instance, that the question of releasing Sheikh Abdullah had been under consideration at one time or the other during the last 18 months. If it had been left to the recently reorganised Government in the State to take the plunge, it is less because it is no long-

possible to avoid making a virtue of necessity than because a gamble on Sheikh Abdullah's good sense is now considered to be worth the risk. Mr. Lal Bahadur assured the Lok Sabha in categorical terms that, although the timing of the announcement by the State Government regarding the release of Sheikh Abdullah had not been made known in advance to the Central Government, there had been both consultations and agreement between the Government of India and the State Government so far as the decision itself was concerned.

Kashmir has certainly gone through an exciting period in the last 16 years, but the guess can be hazarded that the next few weeks will be as interesting as any earlier period in the history of the State. The million-dollar question now is whether Sheikh Abdullah will return to the politics of the Valley from his long long period of confinement as an embittered exile or with a recovered faith in the destiny of Kashmir as an integral part of the territory of the Indian Republic. *The Security Council is to discuss Kashmir again on May 5.* It is evident that what Sheikh Abdullah may have to say before then to the people of Kashmir and how they receive his words will be much more important than any brief that the Government of India may have prepared for Mr. Chagla or anybody else who may be chosen as the Indian delegate to the Security Council meet.

PRESIDENT AREF IN INDIA

THE VISIT of Field Marshal Abdul Salam Mohammed Aref, President of Iraq, on a week's tour of the country, has come off at a time when India is passing through an experience of great international significance. Pakistan, as is only to be expected, is working its propaganda mills overtime to magnify the communal disturbances in India and advertise them to the world as a colossal failure of the Government of India to maintain communal harmony or the secular character of the State. The President of Iraq had an opportunity to see personally what indeed have been, or are, the actual substances. We are sure that he would not have failed to note the heroic — and what is more to the point — the strikingly successful effort made by the State Governments as well as the Central Government to restore law and order in the troubled areas, protect threatened lives and properties and punish those sinning against communal peace and harmony. He would also have an occasion to ascertain, at first hand, the magnitude of the refugee problem created for this country by the thousands of Hindus and Christians fleeing East Pakistan where the authorities had been both unwilling and unable to assure them security against mob and violence.

During his presence in this country, President Aref was visited by a large number of Indians belonging to all communities. He received, for instance, a deputation of Muslims led by Mufti Atiq-ur-Rehman, the President of Jamiatul Ulema-i-Hind, who informed him about the Pakistan atrocities on Hindu and Christian minorities. He was told that a visit to Mana, a camp where the East Pakistan refugees were housed, could provide a much stronger proof of these atrocities. But the Indian Government did not yield to such acts of propaganda as Pakistan did. Before visiting India, President Aref was taken to Jessore in East Pakistan where infiltrators evicted from India were presented as refugees and got a donation for their relief from the visiting dignitary.

In spite of the unbiased attitude adopted by the Indian Government, the Mayor of Delhi, Mr. Nur-ud-Din Ahmed, was tempted to depart from the text of the welcome address and raised the question of Indian Muslims vis-a-vis Pakistan. Speaking in an emotional strain, Mr Ahmed told the distinguished guest not to forget that like the Arab world, India too was divided into two parts in an un-Islamic way as a result of "imperialist conspiracy". There were 50 million Muslims in India and they chose to stay here while Pakistan Muslims separated themselves. The Mayor, therefore, questioned the right of Pakistan leaders to represent the Indian Muslims and appealed to the visiting President not to be misled by foreign propaganda but to draw conclusions from his own study of the situation.

ONLY FOOLS FLY?

THE THIRTY-FIRST Anniversary of the Indian Air Force, which fell on April 1, was celebrated, though on a restricted — Emergency — scale, by Air Force units and establishments all over the country and, in the Capital, an investiture parade was held at the Palam Air Force Station where the Chief of the Air Staff presented 13 Vayu Sena Medals and seven Vishisht Seva Medals Class III, to Air Force personnel for distinguished service. There has been many a quip about the Air Force Day falling on All Fools' Day and an oft-repeated saying is that "only birds and fools fly". But, seriously, the nation has every reason to be proud of the Air Arm of its Defence Services, which had given so gallant an account of itself in the critical days of the Chinese invasion. That achievement, of course, was no accident, but the normal result of years of dedicated leadership and organisation.

The saga of progress from 'Westland Wapitis' to the Supersonic 'Mig 21's' in three decades, is all too well-known. The advance in the transport and helicopter fields is also often mentioned. But what, perhaps, is not as widely known, is the calibre of the 'fools' who have taken to the air in India's defence. It is, indeed, a matter of pride that all IAF pilots sent abroad for specialized courses in Instructional Flying and Gunnery and to the Test Pilots' School in the UK, the only one of its kind in Western world, have distinguished themselves and, more often than not, have been placed among the top men in the list of the passing out cadets. The opening up of the Himalayan regions of our country to the transport and helicopter aerial traffic was an event which will find a unique place in the history of aviation. It required not only mental and physical courage, but also imagination, self-confidence, meticulous planning and the zeal to meet the challenge that made the logistics support of our army, both during the Kashmir Operations and the Chinese invasion, at all possible. It surely needed the mastery of the spirit of man over mind and machine to bring airfields as high as 16,500 feet within the reach of transport planes and helicopters which were never meant for such tasks by their designers. All this has been possible due to as fine a body of men as is to be found anywhere in the world, who have made it the business, the passion and the glory of their lives to live up to the motto of their service — "Nabham Sparsham Dipt tam", i.e. "Touching the Sky with Glory".

Food Policy Under Fire

By Our Parliamentary Correspondent

NEW DELHI:

THE LOK Sabha this week voted the demands for grants for three more Ministries — the Ministries of Food and Agriculture; Law, Posts and Telegraphs; and Transport and Communications. The other highlight of the proceedings was the presentation by Mr. S. V. Krishnamoorthy Rao of the report of the Joint Committee on the 17th Constitution (Amendment) Bill, which seeks to provide constitutional protection to the land reform enactments covering ryotwari settlements. The House, of course, continued to be agitated over the communal disturbances in East Pakistan and some parts of India.

Although all the members who participated in the discussion on the demands for grants for the Ministry of Food and Agriculture expressed deep concern over the declining trend in agricultural production and rising food prices, the suggestions they put forth for remedying the situation did not throw up any new idea. It was, indeed, surprising that barring one member who obliquely pleaded for setting up large-scale farms in the interest of mechanisation of farming, no voice was heard in favour of establishment of large farms even in the public sector. This device needs to be tried now for stepping up agricultural output in the country.

The food policy of the Government came under fire on the ground that it was becoming more and more foreign-oriented instead of farmer-oriented. State Trading in foodgrains also figured prominently in the debate. While the leftist members, particularly the Communists, pleaded for State trading on a large scale, many others, including the former Minister of State for Agriculture, Dr. Punjabrao Deshmukh, vehemently opposed it. There was general agreement that the farmers should be given adequate inducements for raising agricultural production and that land reform measures should be pushed through vigorously. The need for providing fertilizers, electricity, seeds and irrigation water to the agriculturists at cheap rates was stressed vociferously by many. A lone voice pleaded for cordoning of big cities with a view to bringing down foodgrains prices. The sugar policy of the Government also came in for severe criticism. Many a member took the sugar mills to task for not making prompt payments for cane supplies.

Conflicting Estimates

The Minister for Food and Agriculture, Mr. Swaran Singh, and his colleagues, Mr. A. M. Thomas, Dr. Ram Subhag Singh and Mr. A. S. Shinde, made assiduous attempts to allay the fears that the country was in for a difficult period on the food front due to shortfall in agricultural production in the third successive year. But they obviously failed to create a feeling of confidence. Partly, this was due to the conflicting assessment put forth by them before the House about foodgrains output in 1963-64. Mr. Swaran Singh stated that rice production this year was estimated at 36.4 million tonnes — 400,000 tonnes more than the figure furnished by Mr. A. M. Thomas only two days earlier. Again, while the Food and Agriculture Minister refrained from giving any estimate of wheat production, the Minister of State for Food stated that the output of this commodity was expected around 11 million tonnes. Replying to supplementaries in the Lok Sabha a few days ago, the Minister of State for Agriculture, Dr. Ram Subhag Singh, had stated that an estimate of this year's wheat crop would be available only in May or June next. He had admitted that the cold wave in January last had done sizable damage to the wheat crop in various parts of North India. This suggested that the wheat crop this year would not be 11 million tonnes.

The official spokesmen, however, expressed the hope that as a result of the steps being taken by the Government to check rise in foodgrain prices and with the coming in of new crop, the situation would ease considerably. Mr. Swaran Singh reiterated that the Government would not hesitate to introduce controls at strategic points in the interest of keeping food prices in check. He indicated that the resolution passed at the Bhubaneswar Session of the Congress on taking over of rice mills would be implemented shortly.

From the figures supplied by Mr. Swaran Singh in regard to supply of and demand for sugar, it was evident that the Food Ministry will have to do tightrope dancing if it wanted to meet the situation on the sugar front squarely. The Food and Agriculture Minister estimated that sugar production this year would go up to 2.6/2.7 million tonnes. Adding the 170,000 tonnes carryforward from the previous year, the total availability of sugar this year came to about 2.82 million tonnes. He expected the domestic consumption to be in the neighbourhood of 2.34 million tonnes. Another 0.25 million tonnes, he said, would suffice for exports. Reserving 80,000 tonnes for meeting defence requirements and another 80,000 tonnes for festivals, the varry-over to the next year was estimated at the precariously low level of about 100,000 tonnes. All the calculations of the Food Ministry about sugar, thus, have gone wrong.

Uneconomic Mills

Mr. Swaran Singh hinted that the Government might take over uneconomic sugar mills if the Experts Committee, now studying this question, recommended that the change of management would be a better way of rehabilitating these units than the grant of heavy loans. He also announced that the co-operative sector in the sugar industry, which had been doing well, would be granted additional crushing capacity. He declined to accede to the demand that movement restrictions on gur and khandsari should be removed. Mr. Shinde revealed in the House, amidst cheers, that the Coimbatore Sugar Research Station had evolved a new variety of sugarcane which would revolutionise cane cultivation in India. This variety, known as 740, had yielded as high a cane crop as 238 tons per acre. The sucrose content in the 740 variety, Mr. Shinde said, was between 11 and 13 per cent.

The debate on the demands for grants for the Ministry of Law was notable for the concern expressed by members over mounting costs of elections, Government's failure to effect separation of judiciary from the executive, inordinate delays occurring in dispensation of justice and prevalance of corruption among the lower officials in courts. The unfortunate conflict in U.P. between the judiciary and the State Legislature also figured prominently in the debate. A plea was also made for making the Muslim Law up-to-date and for appointment of High Court Judges and heads of labour tribunals and labour courts on merit. The institution of Nagpur Panchayats was characterised by one member as a "perverse system of administration of law in villages". For bringing down election costs, it was suggested that the Election Law should be radically changed. Simplification of law procedures was urged in the interest of quick dispensation of justice and

at lower cost. Setting up of an All-India Commission was demanded for this purpose.

In his reply, the Law Minister, Mr. A. K. Sen, disclosed that the Chief Election Commissioner had been asked to suggest changes in the Election Law for making it a simpler legislation. He informed the House that eight States had separated judiciary from the executive and expressed the hope that the remaining ones would expedite this process. He regretted that the scheme for providing legal assistance to poor litigants had foundered because the State Governments were not prepared to finance it. Only the Kerala Government, he said, had implemented this scheme and that too partially. For expeditious disposal of court cases, the Minister said, measures were being taken to increase the number of judges and for simplification of legal procedures. Mr. Sen refuted the charge made by a Socialist Member that minorities were not being provided full protection under the law. The Constitution, he pointed, did not recognise any majority or minority and gave equal rights to all citizens. Briefly referring to the conflict in U.P. between the Legislature and the Judiciary, Mr. Sen opined that the various organs — the Executive, the Judiciary and the Legislature — should keep to their own spheres and not infringe upon the domain of others. Only this way, he said, a delicate balance could be preserved in our system wherein authority was divided.

P & T Board

The discussion on the demands for grants for the Department of Posts and Telegraphs was significant for the plea made by various members for raising the status of the P & T Board to that of the Railway Board. The Members generally congratulated the Department for its working, but some voices, though feeble, were also heard alleging deterioration in the Department's efficiency. It urged that in view of the long waiting list for telephone connections, another telephone equipment manufacturing unit be set up. The collaboration arrangement between the Indian Telephone Industries and the Belgian firm, Bell Telephones, for the manufacture of cross-bar type telephone equipment and supply of certain stores came in for vehement criticism on the ground that the French subsidiary of the Belgian firm had been alleged to be indulging in espionage activities in Tunisia. The Minister, Mr. A. K. Sen, however, stoutly defended this deal and pointed out that all the facts about it had been placed before the Cabinet which took a decision on the matter. About the alleged espionage activities of the associates of Bell Telephones in Tunisia, he said, that they had supplied only the equipment and the secret tapping of telephone messages in Tunisia had been done by some French employees engaged by the French-managed Telephone Corporation there. It had been confirmed that the French subsidiary of Bell or any of its employees was never accused of espionage

Intervening in the debate earlier, Mr. B. Bhagwati, Deputy Minister for Communications, told the House that the P & T Department would reach the targets set under the third Plan and even exceed the physical targets in certain spheres. By the end of the third Plan, he said, there would be about 100,000 post offices functioning in the country. All the headquarters of Panchayats, National Development Blocks and Community Development areas would be provided with post office savings bank facilities. The number of telephone connections would go up to 800,000. Mr. Bhagwati further stated that the plans being carried out for introducing coaxial system, micro-wave system and carriers would make possible introduction of subscriber dialing of telephones between the important cities in the country.

During the debate on the demands for grants for the Ministry of Transport, the members called for greater attention to be paid to the development of roads and inland waterways and improvement of the facilities for foreign tourists. Replying to the debate, the Minister for Transport, Mr. Raj Bahadur, presented a reassuring picture of Indian shipping. The original third Plan target of raising the shipping tonnage of the country to 1.1 million GRT, Mr. Raj Bahadur said, had been achieved 2½ years in advance; by November last, the shipping tonnage of India had gone up to 1.213 million GRT. With the proposed acquisition of 19 more bulk-carriers for overseas trade, the Indian shipping, he added, would be in a position to get a much greater share in the haulage of the country's foreign trade. He announced that an official team would visit Japan in the middle of April to conclude an agreement with Mitsubishi for the construction of the second shipyard at Cochin. All the hurdles to the agreement with the Japanese firm, he said, had been cleared.

About development of inland water transport, Mr. Raj Bahadur stated that the Government had decided to set up a separate directorate to plan and design full utilisation of the river potential in the country. In regard to development of roads, he disclosed that the Rs. 100 crore scheme for the construction of a road from Bareilly (U.P.) to Amingaon (Assam) along the Himalayan tarai belt, had been approved. This road would greatly facilitate the economic development of U.P. Bihar, West Bengal and Assam. Efforts, the Minister added, were also being made to include in the fourth Plan the scheme for the construction of the East Coast road in Madras. Attention was also being paid to constructing a coastal road in Gujarat. In regard to tourism, Mr. Raj Bahadur stated that about 40 main recommendations of the Jha Committee had already been implemented and the remaining ones were receiving the attention of the Government. It had been decided, he said, to set up a corporation to build hotels in the public sector. This would help in providing more hotel accommodation in the country for foreign tourists.

Working of Airlines

The Deputy Minister for Transport, Mr. Ahmed Mohiuddin, dwelt at length on the working of the Air-India and the Indian Airlines Corporation and disclosed that the IAC had decided to purchase Avro-748 (Series II) aircraft from the Kanpur Defence Depot. He assured the House that effective steps were being taken to improve and strengthen the Indian airports in the light of the modern trends in civil aviation.

The Joint Committee of Parliament on the 17th Constitution (Amendment) Bill has recommended that the lands which are personally cultivated and are within the ceiling limits should not be acquired unless the law relating to the acquisition of such lands provides for payment of compensation. Compensation, it has further suggested, should not be less than the market value of such lands and should cover not only the land acquired but also the buildings and other structures standing on it.

Out of 124 State enactments, which were originally proposed to be added by this Constitution (Amendment) bill to the existing list of 20 protected land laws in the 9th Schedule, the Commitee has selected only 36 Acts. The other 88 Acts, it says, should not be included in the 9th Schedule to the Constitution because they have been either already implemented without being challenged or they have stood the test of challenge in courts.

The Committee, however, has added another eight enactments to the 9th Schedule. These are: (1) Kerala's Jenmikaram Payment (Abolition) Act, 1960; (2) The Kerala Land Tax Act, 1961; (3) The Gujarat Surviving Alienations Abolition Act, 1963; (4) the Kerala Land Reforms Act, 1963; (5) The Orissa Merged Territories (Village Offices Abolition) Act. 1963; (6) The Andhra Pradesh (Talangana Area) Tenancy and Agricultural Lands (Validation) Act, 1961; (7) The

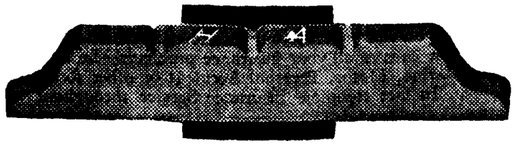
ANNOUNCEMENT



HINDUSTAN ALUMINIUM CORPORATION LIMITED has pleasure to announce that its Rolling Mill and Extrusion Press are in the process of installation at Renukoot (Dt. Mirzapur) Uttar Pradesh and will soon come into production.

Enquiries from all interested parties for Plain and Corrugated Aluminium Sheets, Circles, Coils, Plates and extruded sections are solicited.

Parties located in Maharashtra, Madhya Pradesh and Gujarat may write direct to our Bombay office.

Parties anxious to work as our stockists should contact our Calcutta Office for terms & conditions furnishing full details about themselves.

Hindalco is also happy to announce that its alloy ingots of various specifications will be available from March/April, 1964. Enquiries from interested parties solicited.

HINDUSTAN ALUMINIUM CORPORATION LTD.

CALCUTTA SALES OFFICE . 5, CLIVE ROW, CALCUTTA-1 (PHONES : 22-8616/8617/8618 GRAM : HINDALCORP)

PSHNC-2/64.

Hyderabad Tenancy and Agricultural Lands (Re-enactment, Validation and Further Amendment) Act, 1961; and (8) The Hyderabad Tenancy and Agricultural Lands (Validation) Act, 1961.

The Committee has further recommended that the Rajasthan Tenancy Act, 1955, should be included in the list of protected laws only on the condition that no land is acquired under it without payment of compensation under the formula proposed by the Committee. In regard to the Bihar Land Reforms (Fixation of Ceiling Area and Acquisition of Surplus Land) Act, 1961, the Committee has recommended its inclusion in the 9th Schedule with the exclusion of Section 28.

The report of the Committee is not a unanimous one. Five minutes of dissent have been attached to it. Mr. S. D. Patil in his minute of dissent has opposed additions to the list of protected laws on the ground that it was not safe to ask Parliament to pass these enactments. They should stand the scrutiny of competent judiciary. In the second minute of dissent, Mr. P. R. Patel has said that the amending Bill should have had a provision requiring the States to exempt certain types of plantations from the purview of the land ceilings legislation. It is also unconstitutional, he suggests, to validate, as proposed by the Committee, some of the enactments which, in his view were passed by State Legislatures trangressing their jurisdiction and legal bounds. In the third minute of dissent, appended by Mr. Kashi Ram Gupta, Mr. Ram Savak Yadev and Dr. L. M. Singhvi, it has been suggested that the Constitution amendment should have been phased as to make clear that the ownership of the lands and buildings acquired would be transferred to the tillers of the soil, agricultural labourers or artisans. Dr. Singhvi has added another separate minute to the dissent wherein he withholds his support to the Bill as amended by the Joint Committee, on the ground that some of the inherent deficiencies of the original Bill had not been removed. Mr. P. Ramamurti and Mr. A. V. Raghavan have dissented from the Joint Committee on the inclusion of the Kerala Land Reforms Act, 1963, in the 9th schedule.

Question Hour

Foreign Credits: The Union Finance Minister, Mr. T. T. Krishnamachari, revealed in the Lok Sabha on March 26 that the Government of Japan was considering the question of extending to India suppliers' credit to the tune of $ 15 million (about Rs. 7 crores) for purchase of textile machinery. It was difficult to indicate at this stage how much of this credit would be available to the new textile units and how much to the existing ones, he added. The loan, however, would cover only a small portion of the Indian textile industry's needs which for the current Plan period were estimated at Rs. 320 crores.

The Finance Minister also indicated that the German Democratic Republic was willing to discuss with the Government of India projects needing long-term aid. The proposal was under the consideration of the Union Government.

HEL's Expansion: The Union Minister for Steel, Mines and Heavy Engineering, Mr. C. Subramaniam, told the Lok Sabha on March 28 that the Government had approved the expansion of Bhopal Heavy Electricals for the manufacture of steam turbines and turbo-alternators to 600,000 KW per annum capacity. The present British collaborators of this public sector undertaking would be assisting in this expansion programme. During the fourth Plan period, Mr. Subramaniam said, the annual power production programme was expeced to be 2 million KW.. Fifty per cent of this might come from hydro-electric projects and the remaining 50 per cent from steam turbines projects.

Mineral Deposits: Mr. Subramaniam also told the Lok Sabha on March 28 that deposits of gold, iron ore and limestone were known to occur in Kerala. No deposits of lead ore, however, had been located in this State. Geological mapping of the gold belt in this area—Wynaad goldfield—had been originally undertaken at its Madras end. It has now been extended to Kerala. It was too early to comment on the possible outcome. The reserves of iron ore, with 32 to 38 per cent iron content, at Ettakkad, Kachcheri, Malapuram Madhuvallur, Nelambur and other places in the Kozhikode and Palghat districts had been estimated around 17 million tonnes. The limestone deposits were reported in Pandaretu Chemmanthimalai, Nettuvangai and Vembanad Lake areas.

Development of Collieries: The Deputy Minister of Steel Mines and Heavy Engineering, Mr. P. C. Sethi, revealed in the Lok Sabha on March 28 that owing to the delay in the utilisation of the World Bank credit by the private sector coal mines, the programme of modernisation of colleries had slowed down. Even if the entire loan was now utilised by the revised target date of September 30, 1965, the benefits resulting from modernisation could be derived only during the fourth Plan period. Mr. Subramaniam added that wherever amalgamation of collieries had taken place, the situation had improved. The progress recorded in regard to amalgamation of coal mines, however, had been very little because amalgamation at present was done on a voluntary basis.

STC's Expansion: The Minister for Industries, Mr. Nityanand Kanungo, denied in the Lok Sabha on March 27 that the State Trading Corporation was hesitating to extend its activities because of representations received from the private sector. The objection from certain quarters in the private sector to the operations of the STC was well-known and constant, but the reason why the STC was not taking over more products under its umbrella was that its hands were already full. The Memorandum of Association of the STC, the Minister stated, specified no limitation to its scope. No immediate programme for further expansion of the activities of the STC, however, was under the consideration of the Government.

Mr. Kanungo gave the following other informations to the House on March 27 and 28.

Tea Exports: The Swiss Government had recently abolished customs duty on Indian tea and the Tea Board had undertaken a pilot campaign to promote Indian tea in that country. It was done through sampling at the consumer level. Switzerland imported larger quantities of tea from India in 1963. The quota of Indian tea imported by Switzerland improved from 24 per cent in 1962 to 30 per cent in 1963.

Social Security: Mr. T. T. Krishnamachari told the Lok Sabha on March 26 that the Government proposed to tackle the problem of social security sector by sector. Provision for social security for the country's entire population, the Finance Minister said, was a big problem, but "we are not going to be frightened by it.' Every assistance would be given to the Labour Ministry to undertake this programme.

The Deputy Minister for Finance, Mrs. Tarakeshwari Sinha, stated that the Government was actively considering a pension scheme for the aged. A committee of officials had been set up to go into matters relating to formation of social security measures for Government servants (both belonging to the Centre and the States) and generally for all employed persons in regard to pensions and allied benefits to the family, educational facilities for the children of the employees, housing and medical facilities etc.

OUR POPULATION PROBLEM—II

Can the Birth Rate Look After Itself?

R. CHOPRA

PERHAPS IT may not be out of place to mention that that the Registrar-General predicted in 1951 that taking into consideration all possible methods of increase agricultural production, i.e., irrigation, increase of acreage under crops and other methods, the effort to keep pace with the unchecked growth of population was bound to fail after the 450 million mark had been passed—which has incidentally happened. It be also his substantiated opinion that industrialisation is not the answer to the food problem.

Many would dispute the Registrar-General's opinion, but its significance lies in the fact that the land is not inexhaustible. Even if the "point of no-return" is not reached with a population of 450 million, it may not be very far from it.

Let us now consider the population at the world level. The rate of growth is not the same everywhere. Generally speaking, one group of industrialised countries consisting of Japan and most of the European countries will double their population in 50 to 100 years. Another group of industrialised countries consisting of the USA, USSR, Australia, New Zealand, Canada etc. (relatively sparsely populated at present) are doubling their populations in 30 to 40 years. The rest, that is the under-developed countries of the world containing two-thirds of the total population, are growing at the rate which will double their populations in 20 to 40 years. India's population as mentioned elsewhere will increase from 450 to 900 million in 35 years.

European Example

What are the prospects of the birth-rate in India falling to the level prevailing in, say, Europe at present? And when? Let us study the case of western Europe which was the first to feel the impact of the industrial revolution, increase in education, standards of living etc.

Most of the industrialised countries of the world have gone through :

(a) a period of high birth and death-rates; (b) followed by a period of high birth-rate and low death-rate and eventually (c) the period, which is at present, of low birth and death-rates.

India is at present passing through the second stage i.e. high birth-rate and low death-rate*. When will we reach the third stage i.e. of low birth and death-rates? Let us compare our position with that of those of the western countries where the birth-rate is very low to see how and when will our present rate of growth decrease by itself i.e. natural decrease.

Before the Industrial Revolution there was a balance, more or less, between the birth-rate and the death-rate in Europe. This uneasy balance, however, was upset with the advent of the Industrial Revolution which led to a substantial reduction of the death-rate. This was partly because of better transport and communications, wider markets and greater productivity but more directly because of the development of sanitation and, later, modern medicine.

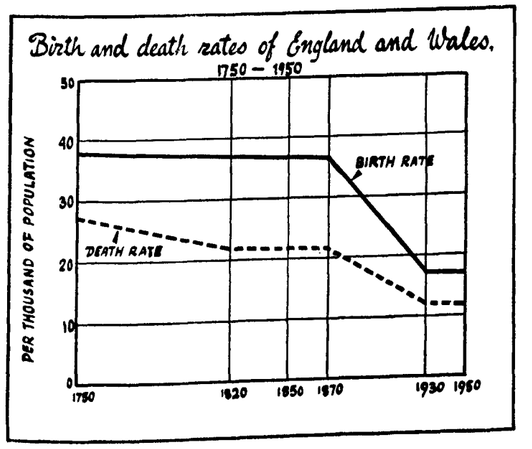
The immediate result was a huge increase in population. Estimates show that between 1750 and 1900 the population of Europe with its overseas offshoots increased nearly four times. This spurt in the growth was finally checked when Europe reached the third stage i.e. low birth and death-rates. In some countries, the trend began early in the nineteenth century but in most of the countries of Europe the birth-rate, generally speaking, dropped significantly during the later part of the last century.

All experts agree that 'the main cause of the decline in the birth-rate was the deliberate and conscious increase in the practice of avoiding conception by the adult population.' Since the rapid decline took place in the days when artificial contraceptives were crude and supplies inadequate, it can be said that the birth-rate fell due to the change in people's attitude towards producing children, brought about by the industrialisation and modernisation of western Europe. Large families were no longer thought necessary as in agricultural societies (more hands to work, more wealth) or where the rate of survival is low. Material comforts for the family and better educational upbringing of the children was considered more desirable. Who has not heard of the dilemma of the newly-married couple in a wealthy country who could not decide between having a baby or buying a car? Or of parents who limit their families to send their children to college?

The decline in the birth-rate continued till in the early 1930's; the birth-rate was only slightly more than the death-rate.

Baby-Boom

In the 1930's there was, however, a revival in the birth-rate in some countries but the increase lasted for a few years only. It should be remembered that even this increase was much lower than the birth-rates in the under-developed countries including India. For example, in 1947 while the so-called "baby-boom" was going in Europe, the USA etc., the average annual birth-rate was about 24 per 1000 population and the death-rate was 14. In other words, the population was increasing at the rate of 1 per cent per annum which is substantially below India's current rate i.e. nearly 2.4 per cent. The boom lasted a short while and the birth-rate has since fallen.



The transition period from the second stage i.e. high birth-rates and low death-rates, to the third stage i.e. low birth and death-rates lasted nearly 70-100 years. The graph (page 781) clearly show the birth and death-rates of England and Wales for the period 1750-1950).

In India, the birth and the death rates were both high prior and up to 1921. The death rate started declining after 1921 till in 1961 it was slightly more than one-third that in 1921. In the period 1951-61, it fell by over 10 points. The birth-rate, on the other hand, fell slowly from 49.2 in 1921 to around 40 in 1961. It has been more or less stationary in the period

*As Helleiner, in his "The Vital Revolution Reconsidered" says: A good illustration is offered by contemporary India. Between 1891 and 1921 a high and nearly constant level of fertility was combined with relatively high but fluctuating death-rates. Death-rates fluctuated in response to famines induced by crop failures and to the incidence of major famines. The result was a very slight rise in population. Over the interval 1891 to 1921, the total growth was little more than 5 per cent or an average of less than one-six th of one per cent per annum. After 1921, while the level of fertility and that of "normal" death remained constant, the sudden and violent peaks of the death-rate due to epidemics and famines disappeared. The absence of major calamities of this sort since 1921 has produced a growth rate that over the period 1921-1951 has exceeded one per cent per annum.

1951-61 with a tendency for a slight rise. This has resulted in the rate of population increase going up from 1-1.5 per cent in the period 1921-51 to 2.4 per cent in 1961. It is estimated that this rate will continue for some time to come.

While making a comparison with western Europe several important differences must be kept in mind. First, the birth-rate in India has been consistently above 40 whereas in Europe it was around 35-37 during the high birth-rate period. Secondly, thanks to the low-cost, highly-developed health techniques, the death-rate, in India, fell sharply and over a relatively smaller period whereas the decline was very gradual in Europe. Thirdly, India was already a very densely populated country

compared to Europe at the beginning of the Industrial Revolution. And last, but not least, India and the other densely populated countries do not have any empty continents to fill with their surplus populations which Europe could. In fact, immigration which was a major check to the pressure of population in Europe is absolutely out of the question for India and other Asian countries.

So, we are now armed with the fact that India will also reach a stage when there will be a natural decline in the rate of increase of population. We know that the death-rate will continue to fall though not so rapidly as in the decade 1951-61. The birth-rate has been stationary for some time and may, perhaps, show a very slight decrease in the near future. But the surplus of births over deaths will NOT decrease or decrease significantly for at least a few decades. As mentioned earlier, it may even show a slight increase over the next few years.

If India is to follow the trend of Europe, it can be roughly estimated that there will be no significant reduction in the birth-rate for another 20-25 years followed by a gradual decrease. This means that we shall pass the 1000 million mark during this century. Even the most optimistic planner in the country would get discouraged when faced with this population figure!

What the 1000 million population will do to our standard of living is best left unsaid. Obviously, therefore, if we let the population grow uncontrolled, hoping that as in western Europe, improved living conditions would bring about a natural decline in the rate of increase, we may be quite sure that the rapidly growing population would itself prevent the achievement of modernisation (and thus material improvement), we are depending upon to bring the birth-rate down.

It would be worthwhile to clinch this point by quoting from an article on Population by Joseph M. Jones, which appeared in the Supplement to the 'American Review' in July, 1963 :

> "In addition to widely prevalent hunger and malnutrition, under-developed countries have many conditions in common, including (1) low per capita income, (2) a low rate of savings and investment, (3) high illiteracy, (4) a high proportion of the labour force engaged in agriculture, (5) a high percentage of dependent children, (6) low industrial output, (7) poor roads and communications and (8) a high incidence of disease which depletes the energy of the workers. They also have in common (9) very high birth rates.
>
> **"If birth rates were reduced, all the other conditions here mentioned could be much more easily improved, and this would speed up economic development and increase levels of living.**
>
> "Economic development requires greater investment — in agricultural industry, in public health, in education—and increased expenditures for public services and more efficient government administration. Increased investment requires greater savings. High birth rates operate to reduce savings: they increase the burden of mere subsistence in relation to income; they produce high percentage of dependent children; they increase the burden of education and other public services; they increase pressures on already densely settled land; and they create overcrowding, undermine health, and reduce productivity."

Do we need more convincing?

WINDOW ON THE WORLD

More Gold from Russia

PAUL BAREAU

LONDON :

ONE OF THE many projects that will be debated by the United Nations Conference on Trade and Development which opened in Geneva on the 23rd March, is the future and possible improvement of the international monetary system. The 1,500 delegates representing 122 countries may find in this a tempting but dangerous diversion from subjects which would be more appropriate to their discussions. The international monetary system and the adequacy of international reserves is admittedly of prime importance to the future growth of world trade and to the interests of developing nations which are the immediate objective of the Geneva conference. But that conference, unfortunately will have no executive powers. It will talk and influence opinions but it cannot act, except indirectly by making some impact on policy makers.

In the realm of trade policy, tariffs, quotas and the rest, the executive arm will remain the General Agreement on Tariffs and Trade (GATT) whose discussions on the Kennedy round of tariff reductions are due to start, also in Geneva, on May 4th when the UN Conference should still be in full cry. On monetary policy and the improvement of the international payments system, the executive arm must be the International Monetary Fund whose experts are deeply involved in the study of new projects for improving world liquidity. Their work is being paralleled by meetings in Paris of a working party of the ten most important industrial countries. The debate on this subject at the Geneva UN Conference may be highly sophisticated, but it will be necessarily arid since it will be held in an operative vacuum.

Russian Contribution

Turning from the debate on this subject to action, it is somewhat paradoxical to note that the most positive contribution to the problem of world liquidity and to easing the strain on the two reserve currencies, sterling and the dollar, has recently been made by Soviet Russia. This it has done through large sales of gold. It is estimated that in 1963 sales of Soviet gold amounted to between $500 and $600 million. These operations are by no means over. The 1964 selling campaign has just begun with a batch of sales valued at about $45 million. This gold is being sold in order to provide the currencies required to pay for the substantial imports of wheat and other cereals which Russia and other Soviet bloc countries are being compelled to make. The Soviet authorities appear to be determined to pay cash for the bulk of these purchases. Credit terms offered to them have been spurned though, it should be added that the Soviet government is showing intense interest in long-term credit to finance its purchases of capital goods in Western countries. When it comes to short-term credit facilities to finance the movement of consumer goods, the Russians take another view of the problem, recall the Marxist aversion to usury and decide to pay cash.

This is very welcome to the Western countries at the moment and there are great hopes that the procedure will continue. It should continue in the first place because further substantial purchases of grains will have to be made by the Soviet agencies between now and the next harvest, and secondly because there appears to be plenty of gold left in Russian reserves. The leading bullion house in London, Samuel Montagu & Co., estimate in their recently published Bullion Review, that current gold production in the USSR is well in excess of $200 million a year and that Soviet gold reserves are substantially over $2,000 million.

Most of the Russian gold sold during the past year was thankfully absorbed by the international gold pool whose mysteries were recently unmasked by the Bank of England in the Quarterly Bulletin for March 1964. This pool is described by the Bank of England as "a kind of gentlemen's agreement, evolved over the past two or three years with the aim of co-ordinating the gold operations in London of certain European central banks and of the Federal Reserve Bank of New York." It came into being as a result of the dollar scare of October 1960 when the free market price of gold rose to over $40 per ounce. This convinced the US authorities that measures would have to be taken to stabilise this market if the whole structure of exchange rates, including that of the dollar, was not to be threatened. The pool was thus formed, the United States taking a 50 per cent share in the consortium, with the balance provided by the central banks of Belgium, France, Italy, the Netherlands, Switzerland, Western Germany and the United Kingdom.

Gold Pool's Objective

The pool now works both as a buyer and a seller and with the objective of minimising the fluctuation in the price of gold. In 1962, at the time of the Cuba crisis, it had to make substantial sales but by the end of the year the losses had been completely recovered. During 1963 no contributions whatsoever had to be made by the participants to support the market, i.e. to prevent gold rising in price. On the contrary, rather more than $600 million was brought and shared out among the participating central banks. The figure in fact approximately corresponds to the amount of Russian sales, and the distribution of this "red" gold has helped to fortify both US and UK gold reserves during the year.

This tale is likely to be repeated in 1964. At the first hint that the Soviet authorities were in the market as sellers of gold, every potential buyer of the metal disappeared from sight. The price which had been held at $35.10 promptly fell to $35.06 and the bulk of the gold on offer was taken up by the authorities, no doubt acting once again for account of the international pool. The operations of this pool and the fact that the central banks no longer deal in the London free market for their own individual account, have involved a considerable loss of business for the main bullion dealers.

Another factor which has tended to diminish the turnover of the market has been the substantial curtailment of sales to the Middle East for ultimate destination to India On this particular subject Messrs. Samuel Montagu point out that following the coming into effect of the regulations of January 1963, abolishing the free internal market for gold, there was a period of some months during which there was a drastic curtailment in the demand for gold from those Middle East centres which were known to be the source of supply in the Indian market. In the latter part of the year, however, this demand again became quite large and this firm concludes that "it would appear that the attraction of a price roughly double that of the international market, has been sufficient incentive for the smugglers to enable them to find means of circumventing, at least to a certain extent, the restrictions on their activities".

In a subsequent part of their report, Samuel Montagu wonder whether reliance on various forms of international credit may not diminish the role to be played by gold in the settlement of international payments. But given what happens to the price of gold when the freedom of the market is tampered with, one must agree with them when they write "it is difficult to believe that the world could turn its back altogether on gold". This will surely rank as one of the great understatements of the century.

First Round in Geneva

From Our Special Correspondent

PARIS:

THE OPENING speeches at the Geneva world trade conference may not have set the tone for the whole of this long meeting; it is due to last almost three months and could take an unexpected turn. But they showed that two of the protagonists — the Common Market, and the spokesmen of the developing countries—approached the marathon in a fairly conciliatory mood. The representative of the European Economic Community opened with a defence of that organisation, citing figures on its trade with developing countries which cannot have failed to convince, or which, at the very least, will make it difficult for later orators to stigmatise its "protectionism". From the other side, the Argentine economist Raul Prebisch who is secretary-general of the conference, made it clear that the developing countries were not going to concentrate their fire on the Common Market; they had other targets for attack no less interesting. A head-on collision between these two groups having thus been avoided at the outset (which does not mean that it cannot occur later), there was time to see that there were many points of concord between the "plans" put forward by each of them. There were points of discord too; specifically, issues on which the developing countries will quote the practice and the precept of Britain against the Common Market Six. Yet, having begun by noting points of agreement, the two parties should be able to discuss their differences more calmly later.

Principal Customer

It was M. Brasseur of Belgium who cited on behalf of the Six their trade record. Their imports from developing countries were $ 7,119 million in 1957 (before the Common Market existed), but they rose to $ 9,000 million last year, an increase of just over 25 per cent. No other importer has increased its purchases from that source so fast, and the Common Market has become the principal customer of the developing nations. It buys from them twice as much as Britain or the USA (it buys as much as those two countries combined), and ten times as much as Russia. While its imports from all developing countries were rising 25 per cent, its purchases from its "associates" in Africa rose only 12 per cent, which indicates that the Euro-African association has not damaged the commerce of outsiders.

Mr. Prebisch presumably knew all this and, in commenting on his report on trade and development which serves as basic document for the conference, he was quick to say that the developing countries did not incriminate the Common Market alone. He cited a calculation to the effect that if the USA followed a more liberal policy in importing raw materials, the exporters of those commodities could earn $800 million yearly more than they now do. More than that, he had a surprise for the instigators of the UN trade conference—the Soviet bloc — for he revealed that its inadequate imports from the developing world were going to be one of the main subjects of complaint. In 1962, he said, Western countries bought $21,030 million worth from developing nations, whereas the European Communist countries bought a mere $1,420 million There were, of course, many reasons other than Communist protectionism for this discrepancy, but Mr. Prebisch was sure that the markets of the Communist bloc constituted an "immense potential" for the developing world, and one of the aims of the conference should be to see that it was used.

Passing to the points of agreement between the arguments of the developing nations and the Six (or some of them at least, notably France and Belgium), there was concordance in their opening emphasis on the necessity to organise markets rather than to let the free market sort matters out. U Thant and Mr. Prebisch were as definite about this fundamental opinion as the British were insistent on their opposition to any scheme that would make raw materials more expensive. Presenting the French case for organised markets, M. Giscard d'Estaing was careful to avoid open challenge to the contrary British view, but quite definite in stating his belief in schemes to "regularise" commerce, "moderate fluctuations in commodity prices" and raise the price of temperate-zone foodstuffs. Aware that the French memorandum on this subject had aroused interest in India, he extended his projects to include world trade pacts on tea and certain other tropical products.

Synthesis of Views

Mr. Prebisch, then, was able to quote the French document approvingly. But he also took up the points that attract the developing nations in the liberal case of the Anglo-Saxons. In fact his report is a synthesis of the free-trade and organised-market viewpoints, so much so that one is entitled to recall the argument set out on this page last week: by trying to get the best of both worlds, to extract concessions from two Western camps whose trade philosophies are incompatible, the developing nations run the risk of asking the impossible and of discrediting all plans to reform world trade. It might be tempting to add up the gains the developing nations would make if the Common Market and the USA started importing as many Asian manufactures as Britain does, if the Six and the Americans started buying as much food abroad as Britain but if all of them paid the high prices suggested in the French food plan, if all the industrialised nations were to buy more commodities and simultaneously iron out fluctuations in their price, and if — to boot — the Communist bloc were to buy more. But it would not be realistic. To pick the plums out of the rival puddings would be to ruin all the cooks.

There is similar contradiction underneath another point on which Mr. Prebisch, on behalf of the developing nations, endorsed a suggestion in the French plan. This concerns regional groupings between developing economies, such that they could grant each other mutual preferences without, for all that, being obliged to constitute a common market or free-trade zone as these are defined in GATT's strict rules. The virtues of such regionalisation, at the expense of the "most-favoured nation" clause, are urged both by the Franco-Belgians and the developing countries. Yet at the same time the latter take up the British plan for a preference to be granted by industrialised countries to the industrial exports of all developing nations without distinction. This is an anti-regional plan; one of its first implications, of course, is liquidation of the system of Commonwealth preferences. In contrast, the

Franco-Belgian plan named after M. Brasseur foresees that industrialisaed powers would grant selective preferences to certain developing countries, and for certain products; it is understood that the selection would be related to the formation of regional groups within the developing world. Once again, one suspects that by picking out attractive features of inconsistent plans some spokesmen of the developing world are trying to have it both ways. The suggestion for universal, non-discriminatory preferences in favour of all developing countries is a free-trade doctrine; the plans for regional groups is an organised-market doctrine. They cannot be married at will.

Agreement, real or apparent, between the Continental and developing-nation cases gives way to opposition when the matter of trade in manufactures is taken up. The Brasseur plan, since adopted by Paris, does indeed foresee some increase of imports of Asian manufactures into the West, but on a carefully regulated basis that appears frankly stingey to such as Mr. Prebisch. The import liberalism of the Common Market, shown by the figures cited above, does not extend to manufactures: whereas some 13 per cent of all British imports of industrial goods comes from the developing world, this figure is only 8.8 per cent for the USA and somewhere between 1 and 4 per cent for the Six. Mr. Prebisch believes that this unwillingness to open the taps wider stems from an exaggerated idea of the threat that such "cheap" imports represent for Continental industries. His argument on this point is worth citing.

"In 1961 the exports of manufactures from developing countries were worth only $2,000 million. Suppose that they increased to $10,000 million by 1970 (which is extremely optimistic), this would wipe out half the trade deficit of the developing world expected at that date ($20,000 million). But that figure would still amount to a mere 4 or 5 per cent of the increase in consumption of manufactures inside industrialised nations in the period 1961-70." In other words, there is room for a notable increase in imports of Asian manufactures into the West; the "flood" of cheap industrial goods would be a mere trickle that would be lost in the upsurge of Western consumption in this decade.

This argument has yet to be answered in Geneva. No doubt these global figures would have to be broken down so that one could see if they were in reality likely to be concentrated on certain products (so that there was a danger of annihilation of single industries like textiles), or to impinge on the trade balances of certain countries that already run a deficit. But it is clear that this sort of abstract reasoning cannot be combined with plans to combine such concessions on manufactures with equally costly concessions on food and raw material prices. In sum, various plans have been tabled in Geneva and much of the rest of the conference will be concerned with choosing between them, once it is admitted that they cannot be combined.

Imports Tuned to Development

By Our Special Correspondent

NEW DELHI:

DESPITE A substantial improvement in export earnings in 1963-64, the import policy for 1964-65, announced on March 31, continues to be restrictive except in respect of imports to meet the requirements of defence, the small-scale sector and export-oriented industries. The overall import bill of the established importers and actual users is proposed to be maintained approximately at the 1963-64 level. Within this ceiling, an attempt has been made to adjust import quotas with a view to ensuring all round increase in production.

The new policy, however, is a substantial improvement over the one followed hitherto inasmuch as it seeks to expedite issue of import licences. The last date for the submission of applications for import licences has been advanced by 45 days. A provision has also been made to allow utilization of import entitlements for the second half of the annual licensing period immediately after October 1, 1964 instead of after six months of the date of issue of import licences. Import procedures are likely to be streamlined further in another week or so when the Union Government takes decisions on the final report of the Swaminathan Committee.

One more outstanding feature of the new import policy is that all export incentive schemes have been brought within its orbit for the first time even though import entitlements under these will continue to be proportionate to the f.o.b. value of exports.

Quotas Slashed

Import quotas for twelve low priority items have been slashed by 10 to 50 per cent. The commodities affected are: (1) Polished zinc sheets; (2) Component parts of knitting machines, hosiery machines and embroidery machines; (3) Dental surgical instruments, apparatus and appliances; (4) Filter paper; (5) Motor vehicle parts viz., filter-cleaner assembly, etc; (6) Carbon brushes; (7) Dash board instruments; (8) Speedometer cables; (9) Nickel catalyst; (10) Silk or artificial silk goods used or required for medical purposes; (11) Oxalic acid; and (12) Rubber chemicals.

Increases in quotas, ranging from 1¼ per cent to 100 per cent, have been announced for a number of items. These include: Steel belt lacing (other than alligator type); Drugs and medicines (bottled penicillin and its preparations); Anhydros dextrose, excluding preparations; Homoeopathic medicines; Liquid paraffin; Machine cloth; Grinding rollers (dead or traverse); Surgical instruments, apparatus and appliances (not made mainly of rubber and also not made mainly of glass); Arms and ammunition; Cartridge cases (filled or empty); Motor vehicle parts (shock absorbers, etc.); Thin-walled bearings, etc. The basic period in respect of a few items such as motor vehicle parts, rubber blankets and spare parts of agricultural tractors and/or tractor-drawn agricultural implements has also been extended.

A few new items have been added to the import list of actual users with a view to meeting their import requirements better. These include: Asbestos manufactures; Steam, pneumatic and hydraulic packing for all machinery. Ready-made boiler packing; Ring travellers; Machine cloth; Sperm oil; Blanc fixe; Rubber blankets; Diamonds industrial, natural and synthetic in all forms including diamond grit and powder; Carbon black; Vanadium pentoxide catalyst; Packing engines and boilers.

The new policy also contains a provision to the effect that actual user licences for import of motor vehicle parts will, in future, be given also to industries and institutions which own a fleet of 25 vehicles or more for transport of their goods. Hitherto, such licences were issued only to fleet-owners having a fleet of 25 vehicles or more, provided these vehicles were used for public transport purposes

The liberalisation effected in the import policy for the small-scale sector of industry restores the position which prevailed before severe cuts were imposed on imports of this sector two years ago. The small-scale industries have now been allowed larger import of both raw materials and components.

The new Red Book applies to importers in Goa, Daman and Diu also, subject to such changes as may be separately announced.

Annual Basis

Licensing of all imports will be done on a yearly basis, subject to the condition that during the first six months of the validity period of a licence, the licensee shall be entitled to order shipment of the goods to the extent of only 50 per cent of the value of the licence. Remittances will also be limited to that extent. The balance 50 per cent of the value of a licence can be utilised only after the commencement of the second half-year and after endorsement by the licensing authority. This utilisation will be subject to such changes in value as may be decided upon by the Government. In the case of items imports of which are restricted to a certain percentage of the face value of a licence, it shall be open to the licensee to import such restricted items by applying the face value restriction only to half of the value of the licence, while utilising the 50 per cent of the value of the annual licence. In cases where licensing to actual users is not to be done on an annual basis, licences covering the first half-yearly entitlements will be issued as first instalment and supplementary licences covering the second half-yearly entitlements will be issued in the second half-year, subject to such cuts as may be decided upon having regard to foreign exchange availability and other factors. Actual users who are issued annual import licences up to the value of Rs. 5,000, however, will be allowed to effect imports immediately in one lot.

A small procedural change has been made in the case of imports by consumer co-operative societies. Under the new scheme, imports of a few selected consumer goods will be allowed during April 1964 - March 1965, within a limited ceiling, through wholesale/central stores, recognized by the Ministry of Community Development and Co-operation, for distribution by such wholesale/central stores to consumer co-operative stores.

The new import policy, coupled with larger maintenance imports as a sequel to increase in non-project aid this year, is expected to enable better utilisation of the installed industrial capacity in the country.

★★

In a bid to achieve the third Plan targets of adding 4 million spindles and 25,000 automatic looms to the 1960-61 installed capacity of the cotton mill industry, the Union Government is understood to have permitted some expansion to all the existing units. All mills have been allowed to expand their spindleage by 7½ to 10 per cent. The composite mills have been authorised to install 10 per cent additional automatic looms. All spinning mills have been permitted to have 100 automatic looms each.

This step, it is learnt, has been taken in view of the fact that progress achieved during the last three years has been

far below expectations. Although licences had been issued for installing as many as 4,602,937 new spindles, the total number of spindles actually put up upto February 29, 1964, came to only 242,568. Of these, the new units accounted for barely 9,440 spindles. They had been licensed to set up as many as 2,944,896 spindles. Licences for 274,000 spindles had to be revoked in the case of new units. Similarly, although allotments had been made for installing 8,000 automatic looms on the condition that 50 per cent of the cloth produced on these looms would be exported for a period of five years, only 289 looms had been actually installed up to February 29, 1964.

Steps are also being taken to augment the supply of raw cotton during the current year. Efforts are being made to advance the import of this commodity from the United States under the barter agreement concluded in June last between the Commodity Credit Corporation of the US and the State Trading Corporation of India. It is expected that total imports of cotton this year will be of the order of 1.2 million bales — the highest since 1952-53.

**

According to a recent assessment made by the Union Department of Steel, only four schemes for the manufacture of alloy and special steels, out of the fifteen on which work has been initiated by the licensees, are expected to bear fruit by 1965-66. The Rourkela Steelworks will have by the end of the current Plan period an installed capacity to produce electrical steel to the tune of 50,000 tonnes per annum. Globe Motors, Ballabhgarh, already in production, will be turning out spring steel to a capacity of 6,000 tonnes a year. The Durgapur Alloy and Special Steels project will go on stream with an annual capacity to manufacture 14,500 tonnes of high speed, tool and die steels, 27,500 tonnes of alloy constructional steel and 18,000 tonnes of stainless steel. The fourth scheme expected to materialise by 1965-66 is that of Canara Workshops, Nagpur. Its plant, designed to produce 9,600 tonnes of spring steel per year, is under erection. One of the remaining eleven schemes, that of Mahindras, Bombay, is anticipated to fructify in 1966-67. This unit will be capable of producing 18,000 tonnes of alloy constructional steel.

Possibility of Improvement

The supply position of alloy and special steels from indigenous sources, however, should improve considerably in 1967-68 when nine other projects go into production. These are: Mysore Iron & Steel Works, Bhadravati (capacity: 30,000 tonnes free-cutting steel; 12,300 high speed, tool and die steels, and 31,700 alloy constructional steel); Guest Keen and William, Calcutta (45,000 tonnes spring steel); I. M. Pai, Bombay (300 tonnes high speed tool and die steels and 300 tonnes alloy constructional steel); V. Pandurangiah, Madras (1,000 tonnes free-cutting steel, 6,000 tonnes high speed, tool and alloy steels and 7,000 tonnes stainless steel); D. Balasundaram, Salem (2,000 tonnes high speed, tool and die steel and 8,000 tonnes alloy constructional steel); Taxmaco, Calcutta (25,000 tonnes alloy constructional steel); G. Baijnath Kanpur (19,800 tonnes alloy constructional steel); V. M. Shah, Ahmedabad (20,000 tonnes stainless steel); K. T. Rolling Mills (3,400 high speed, tool and die steels and 5,000 alloy constructional steel). The capital goods requirements of the fifteenth scheme, that of Man Industrial Corporation, Jaipur, have been cleared only recently. No firm date for starting production has been given as yet by this unit.

When all fifteen schemes go into full production in the latter half of the fourth Plan period, the total availability of alloy and special steels from indigenous sources is expected to go up to 464,400 tonnes. Category wise, the availability will be as follows: spring steel — 84,600 tonnes; free-cutting steel — 31,000 tonnes; high speed, tool and die steels — 38,500 tonnes; alloy constructional steel — 135,300 tonnes; stainless steel — 45,000 tonnes and electrical steel — 130,000 tonnes. The demand for the various types of alloy and special steels is expected to increase in the following manner: spring steel — 133,000 tonnes; free-cutting steel — 200,000 tonnes; high speed, tool and die steels — 86,000 tonnes; alloy constructional steel — 250,000 tonnes; stainless steel — 80,000 tonnes, electrical steel — 180,000 tonnes; total — 929,000 tonnes.

In view of the drain on foreign exchange resources, the Union Government is anxious that not only all these schemes should be completed according to their revised schedules, but new entrepreneurs from the private sector should also come forward to undertake the manufacture of alloy and special steels.

**

The Union Government has announced the first instalment of its current year's market borrowing programme. It is floating on April 15, two high-yield loans — 4 per cent Loan, 1970, and 4½ per cent Loan, 1989 — to provide facilities to the holders of the maturing 3½ per cent National Plan Loan, 1964, and 3 per cent Loan, 1964, to convert their holdings. The outstandings against the two maturing loans amount to Rs. 188.51 crores.

The new 1970 loan is to be issued at Rs. 99 per cent and the 1989 loan at Rs. 100 per cent. The subscription lists for both the loans will close on April 22.

Since the gross borrowing target of the Central Government as laid down in the 1964-65 budget is Rs. 295 crores, the Union Government will have to enter the market again to raise approximately Rs. 107 crores. This probably will be done during the slack season.

The market circles attach great significance to the fact that the redemption yields of the two new loans are higher than those of the comparable loans floated in the past. Does it indicate that the Bank Rate will be raised in the near future?

**

The Union Government has taken a number of decisions to promote tourism in India. It has accepted, in principle, the recommendation of the Jha Committee that one or more undertakings should be set up in the public sector to handle activities of commercial character connected with the promotion of tourism. A start is proposed to be made shortly by setting up two undertakings to provide hotel and road transport facilities for tourists. The incentives being given for the growth of tourists facilities in the private sector are to be continued. Legislative measures are intended to be introduced in the near future in respect of travel agencies, hotels and guides with a view to ensuring healthy growth of the tourism industry.

A Special Fund is being created in order to give subventions to the Indian Airlines Corporation for providing air services to out-of-the-way tourist centres. A large number of IAC stations are proposed to be linked by teleprinter lines so that confirmation of bookings may be made easier. Measures have already been initiated for effecting improvements in the terminal buildings at the principal airports in the country.

Almost all the measures recommended by the Jha Committee for simplication of immigration and customs regulations applicable to tourists have been accepted by the Government. The possibilities of simplifying customs rules further are being explored. It has been decided to constitute an Air Customs Pool of Officers specially trained to handle the present-day fast moving tourist traffic. The question of creating a Central Cadre of immigration staff is also being considered.

Special arrangements are proposed to be made to ensure that foreign tourists are able to obtain liquor permits, with all-India validity, immediately on their arrival in the country. The Government is also examining further simplification of prohibition procedures applicable to foreign visitors.

Master plans are being prepared for the development of certain tourist areas. Two new tourist offices — one at Tokyo and the other at Chicago — will be opened during the current financial year as a measure to step up tourist publicity efforts abroad. A Standing Committee of the main departments concerned with the problems connected with tourism is to be set up to review the inadequacy in facilities and arrangements and to examine the complaints brought to the notice of the department of tourism.

**

The Union Minister for Steel, Mines and Heavy Engineering, Mr. C. Subramaniam, deserves compliments for the firm stand he has taken to check the growing indiscipline at the Rs. 100 crore Heavy Electricals Plant at Bhopal. Serious note needs to be taken of the disclosure he has made in the Lok Sabha about the labour trouble at this key national undertaking being Communist-inspired. It exposes the CPI's professions that Communists are lending whole-hearted support to the building up of the defences of the country against Chinese aggression.

Following labour trouble, the Bhopal Plant had to be shut down on March 30. The daily loss of production is estimated at Rs. 3 lakhs. The repercussions that the closure of this factory for any long period will have on the economy as a whole can well be imagined. This is the only unit in the country producing heavy electrical equipment at present.

**

Mr. F. Ruzicka, Czechoslovakia's Vice-Minister for Internal Trade and Leader of a Czech purchasing mission visiting India for the last 20 days, pointed out at a Press Conference here this week that his country was interested in buying Indian socks, knitted woollen wear, woollen and cotton underwears, woollen knitting yarn, handkerchiefs, handicrafts, ladies' shoes, razor blades and other consumer goods. He was of the opinion that the prices of some of the Indian consumer goods were higher than the prevailing international prices, but by and large it would be possible for Czechoslovakia to buy these goods from India. The Mission would also consider the possibility of buying from here poplins, artificial fibres, flannels, silks, juices and squashes, sardines, crab meat, spices, sports goods, refrigerators and portable transistor radio sets. Mr. Ruzicka expressed considerable satisfaction over the performance of the refrigerator and transistor radio factories he had visited in India and was of the opinion that they easily matched the international standards of efficiency.

To popularise Indian goods in the Czechoslovak market, Mr. Ruzicka stated that his country had requested the Government of India to organise an exhibition of engineering and consumer goods in Czechoslovakia in 1965.

A Big Hand for Handlooms

From Our Correspondent

BOMBAY:

THE ONSET of the hot season in the City has not in any way affected the tempo of meetings and conferences. The relaxation of the Prohibition rules has also been a factor of fresh excitement among sections who are rushing to receive the permits. The most significant meeting of the week was the first technical Seminar organised by the Weavers' Service Centre of the All India Handloom Board. Mr. Nityanand Kanungo, Union Minister for Industries, inaugurated the Seminar and in his address dealt comprehensively with the problems of the handloom sector in the industrial set-up of the country.

It is needless to say that the handloom industry has been an important part of India's economy from the beginning of recorded history. While, no doubt, the advent of power spinning and weaving machines affected the prosperity of the handloom weavers, the industry has continued to occupy a prominent place in the national economy as the largest single cottage industry sustaining millions of people engaged in it. There are nearly 2.7 million handlooms in existence today accounting for nearly one-third of the total production of cloth. About 10 million families depend for their livelihood on handlooms. The fact that this industry has to survive under severe competition from the growing organised textile industry shows the vitality and resilience of the sector. However, the very importance of the industry, the employment potential that it provides and the reputation which the handloom goods have in foreign markets — all point out to the urgent need for a practical approach to the problems of the handloom industry, from the point of view of modernising the industry and also making it a complementary part in the industrial sector.

It is from this point of view that Mr. Kanungo emphasised that there was need for encouraging the weavers to keep pace with the latest developments and growing demand for the most fastidious tastes. He observed that it would be very difficult to continue its existence in the face of the organised rivals unless a sustained and vigorous drive is made to cater for sophisticated consumers. It was essential that all efforts were directed towards the rehabilitation and development of the industry on a firm footing so that millions of people depending upon this industry are able to progress with the development in the economy. Though the assistance in the form of loans and grants to State Governments in order to rehabilitate the industry has amounted to over Rs. 35 crores, the industry, as the Chairman of the Handloom Board pointed out, is faced with the basic questions of full utilisation of equipment provided to it, the financial resources for the pilot centres and the need for ensuring quality standards with particular reference to export fabrics.

In regard to export prospects of our handlooms, the Executive Director of the Handloom Export Corporation revealed at a Press conference last week that India will put on sale about Rs. 50 lakhs worth of handloom fabrics and handicraft products at the New York Fair to be inaugurated by President Johnson on April 22. The United States today consumed Rs. 5 crores worth of handlooms against Rs. 30 lakhs in 1958, according to the data which he supplied. In the last one year, the value of the total exports of handlooms had improved from Rs. 9.5 crores to Rs. 13.5 crores. In order to fulfil the export targets of Rs. 20 crores annually, by the end of the fourth Plan, the Export Corporation is making strenuous efforts to capture the European and Australian markets; the main competitor in Europe is China, which is reported to be selling silk at below the cost price. This would therefore require the streamlining of the processing techniques in India with a view to converting the type of fabrics produced in Orissa and Madhya Pradesh as a substitute for the Chinese silk. With the extension of the quality control schemes to the different types of fabrics, it is expected that the volume of handloom fabrics exported to the Continent and Australia can be substantially stepped up in future. All these would require an integrated and co-ordinated approach both at the Government level and at the level of the organisation of the weavers. The Seminar has provided a forum for discussion of these vital problems.

**

Maharashtra State contains a large area where raw materials for production of paper are available in adequate quantities.

Mr. S. G. Barve, State Minister for Industries, therefore, appropriately touched on this facility and advised the paper traders to turn their resources and enterprise to the field of production, if the import restrictions had rendered the trade less profitable. He was inaugurating the 23rd annual general meeting of the Paper Traders' Association. In his view, the need to step up production of paper was very urgent. The demand was bound to be doubled in another five years and the restrictions on imports would have also inevitably to continue in future. Referring to the facilities which the Government can provide, he assured that he would look into the position and provide all possible help for those who intended to establish paper mills in the State. There were exceptionally favourable locations for such factories in the State. While reviewing the practical difficulties of the traders as dealt with by the President of the Association, he expressed that it might not be possible to accept the trade's request of replacing sales-tax on paper items by additional levy of excise duty. In such case, he said, the State would stand to lose its revenue. Earlier, the President of the Association pleaded for the restoration of the 50 per cent blanket cut imposed on established importers of paper items and also the urgent need for an equitable distribution in the allocation of foreign exchange for paper items between the established importers and other categories. He appealed to the mills to broad-base their distribution system as per the recommendation of the Tariff Commission and to dispense with the practice of demanding huge deposits, to standardise the qualities of products and to follow rational paper trade rules.

★★

The Kirloskar Industries in Maharashtra have been playing a prominent part in promoting the industrialisation of the under-developed parts of the region. The new venture sponsored by this House is the Kirloskar Cummins Limited with US collaboration for manufacturing high powered diesels in the range of 60 to 800 h.p., with an authorised capital of Rs. 3 crores and issued capital of Rs. 1.5 crores, besides paid-up share capital of Rs. 1.2 crores and AID loan of Rs. 33 crores. It is a major industrial unit near Poona at Kotharud and is spread over 90 acres. The new factory was declared open at the week-end by the Union Defence Minister, Mr. Y. B. Chavan, who congratulated Kirloskars for this magnificent addition to the industrial face of Maharashtra.

Mr. S. L. Kirloskar, chairman of the group, observed that the new venture was meant to demonstrate that high horsepower lightweight diesels can be widely versatile in their use and the infinite usefulness and desirability of collaborations for the industrialisation of our country. These diesels would be useful to the manufacturers of excavators, air compressors, bulldozers, road graders, industrial pumps, shunting locomotives, work and fishing boats, electric power generators. It is also expected that such indigenous diesels will provide great incentive to new industries to manufacture construction, industrial and mining equipment. It will thus help save considerable foreign exchange. The Defence Minister admitted that the production would be of great use to defence needs, besides the needs of industries in general. The company expects to attain the installed capacity by 1965-66. The indigenous content of 28 per cent, to start with, will increase to 73, 90 and 100 per cent in the next three years. A significant feature of the venture is that all components of the new engine would be completely inter-changeable with those produced by the collaborators themselves due to special standardisation. There is no doubt that the industrial importance of Poona will be enhanced by this large-scale industrial unit of the Kirloskars.

★★

In the industrial complex of Maharashtra, refrigeration industry is occupying an important place and in the future also there are immense possibilities of its development. In order to focus the importance of the industry as also the problems for future development, a Refrigeration and Air-conditioning exhibition has been organised by the Refrigeration and Air conditioning Trades Association. The President of the Association hoped that the exhibition would spot-light the role of the industry in the developing national economy. He said that in the highly industrialised countries, 85 per cent of refrigeration and air conditioning are for industrial uses. With the growing tempo of industrialisation in India also, the industry had made phenomenal progress. Refrigeration and air conditioning embrace a wide field of industrial activity, from preservation of foodstuffs to production of gases in fluid state, storage of furs and control of temperature to ensure clear reproduction in printing. They have much today to do in the manufacturing processes of chemicals, pharmaceuticals, ammunition, dam building, coal bye-products, atomic power, aircraft manufacture and the preservation of antibiotics.

Mr. S. G. Barve, State Minister for Industries, while formally opening the exhibition gave an assurance that the Government of Maharashtra would attend to the problems of the industry and do what it could to remove the difficulties. He also revealed that the Maharashtra Government itself had plans to open cold storage plants and to promote co-operative societies for providing refrigeration facilities in rural and other areas. He stressed that refrigeration played a vital role not only in industry but also in agriculture, particularly in preserving supplies that came to cities from outlying areas. Further, refrigeration industry was export-oriented and could contribute substantially to the export drive which was so essential for augmenting our financial resources for the development of the country. It makes possible the export of fish, frog legs and other perishables to earn foreign exchange worth Rs. 5 crores annually. While he was not certain about the percentage of indigenous content in the equipment manufactured in this country, he hoped that the indigenous content would increase gradually till the industry was fully self-reliant.

★★

Speaking at an informal meeting held in his honour by the Indian Merchants' Chamber, Bombay, the President of the Czechoslovak Chamber of Commerce, Mr. Josef Harn, said that the Indian exporters should try to export more consumer and semi-manufactured goods to his country. He added that nearly 50 per cent of the Czechoslovak exports went to the private sector in India. The Indian exporter, he felt, had not yet made good attempts to explore the market in his country. He disclosed that a purchasing mission of Czechoslovakia would be in this country very soon and that it was open to the Indian commercial community to put attractive proposals to them. Mr. Horn opined that the unfavourable balance of trade which India had with Czechoslovakia could be set right if exports of Indian textiles, shoes and semi-manufactures were stepped up.

Replying to some of the questions, Mr. Horn said that he would do his best to establish an arbitration machinery between his Chamber and the Federation of Indian Chambers of Commerce and Industry for settling disputes between importers and exporters. At present such machinery does not exist and the Indian exporters have to go to Czechoslovakia to settle disputes. Mr. P. A. Narielwala, Vice-President of the Indian Merchants Chamber, said that the latest trade agreement signed between the two countries provided for exchange of goods each way to the tune of Rs. 24.50 crores by 1966. Provision had been made in this agreement for exporting new Indian manufactures in addition to traditional items.

A Body-Blow to Share Values

From Our Correspondent

CALCUTTA :

IN CONTRAST to its pre-Budget buoyancy, the Calcutta Stock Exchange is now showing signs of increasing despair. There has been a steady erosion of share values since Mr. T. T. Krishnamachari presented his Budget for 1964 65. The brief flicker of recovery which took place subsequently was more in the nature of a technical correction than because of buying by the L.I.C. and the Unit Trust. Even those among the stock market operators who once saw some "improvement" in Mr. Krishnamachari's Budget over that presented by Mr. Desai in the previous year, are now convinced that at least as far as the corporate sector is concerned, the former has given nothing away and, in fact, the corporate sector may be worse off as a result of the "regrading" of the country's taxation structure. No equity investor feels that the dividend tax and the subjecting of bonus issues to capital gains tax are exactly calculated to promote his interests, and few companies have any illusions about the surtax being a less penal levy than the super profits tax which the former is meant to replace. Even those companies which escaped the super profits tax net because of the 10 per cent deduction will now be hooked in by Mr. Krishnamachari's new fiscal device.

Reflecting the investor's despair, therefore, most of the leading scrips of the Calcutta stock market showed fall in their prices between 1st March and 26th March (all closing prices) :

	1st March	26th March
Indian Iron	Rs. 25.60	Rs. 24.60
Birla Jute	Rs. 35.00	Rs. 33.00
Textile Machinery	Rs. 28.50	Rs. 28.00
Dunlop Rubber	Rs. 39.00	Rs. 36.50
Guest, Keen, Williams	Rs. 27.50	Rs. 25.12
Indian Copper	Rs. 3.70	Rs. 3.50
Hindustan Motor	Rs. 19.69	Rs. 18.31
Kesoram Industries	Rs. 28.50	Rs. 26.52
Rohtas Industries	Rs. 12.75	Rs. 11.94

New issues have particularly suffered because of the uncertain outlook for the equities. The bulk of them now quote below par, while not long before the Budget they were commanding substantial premiums. What is remarkable is that even for shares belonging to the class of industries which Mr. Krishnamachari has picked for special tax concessions in recognition of their importance to the economy, the quotations have declined in line with the rest of the new issues market. As for bonus share issues, it is unlikely that there will be many during the current year. Already two leading companies, Elgin Mills and T. Maneklal, have decided to drop their proposals for issuing bonus shares and many more may follow. Capital appreciation and growth prospects are among the criteria by which an investor judges the value of his investment in an equity share. They rank with a reasonable return in his scale of values. By denying the investor the full benefit of capital appreciation of his investments, the Finance Minister has made equity shares an unattractive proposition for the investing classes, and has thus made it difficult for companies to raise fresh market capital for their expansion programmes.

Speaking, last week, at the annual general meeting of the Calcutta Stock Exchange Association, its President, Mr. C. L. Jhunjhunwala, once again asserted that the new impositions like the 7½ per cent tax on equity dividends and the extension of the capital gains tax to bonus issues had put the stock markets of the country in a moribund condition. The proposals as a whole have brought a fresh wave of despair and disappointment, because the Finance Minister not only makes equities an unattractive proposition for the investor, but he also strikes at the traditional classes who go in for this investment. As Mr. Jhunjhunwala analysed, the revival of the expenditure tax, the stepping up of the estate duty rates, the reduction in the exemption level for purposes of the gifts tax and the forced savings in the shape of annuity deposits, are measures to be deplored, because they would not promote the growth of the economy. Mr. Jhunjhunwala pointed out that the super profits tax would be continued under the new label of the surtax. Although at first hand, the latter might appear to lighten the burden imposed by the former levy, on a closer scrutiny it becomes clear, however, that the relief, if any, will be of a very minor character, while for some companies, it will mean a more onerous burden than the super profits tax. Finally, Mr. Jhunjhunwala reminded the Finance Minister of a simple and common sense, but universally valid, proposition that people make big efforts and take big risks only when they see the prospect of big rewards.

★★

Speaking at a reception at the Calcutta Stock Exchange, the Chairman of the Unit Trust Ltd., Mr. R. S. Bhatt, said that the Trust had already started investing in securities on a modest scale. Mr. Bhatt added that the Unit Trust would initially commence operations with Rs. 5 crores to be obtained from the Reserve Bank, the State Bank, the Life Insurance Corporation and some scheduled banks.

At the party, the Unit Trust officials exchanged views with the Committee of the Calcutta Stock Exchange and the record of the talks would be sent by the Committee afterwards to the UTL in the form of a memorandum. Mr. Bhatt invited the members of the Calcutta Stock Exchange to make offers to the UTL of good securities and informed them that like the LIC, the UTL would also purchase shares of those companies which held good record of paying dividends. The details of its methods of operation were being formulated and for that purpose, Mr. Pendharkar, Executive Trustee of the UTL, had gone to the U.K to study the methods of working of the Unit Trust in that country.

★★

Dr. A. N. Khosla, Governor of Orissa, delivered the Sixth Sir Mokshagundam Visvesvaraya lecture in Bangalore some time ago, the theme of his address being "Orissa's Decade of Destiny; 1963-73". In the course of the lecture Dr. Khosla outlined a plan for the integrated development of the river basins of Orissa. The controversial Tikerpera project, against which Mr. Harekrushna Mahtab, a former Chief Minister of the State is leading a compaign, forms the core of this plan. (It is a master plan which presumably has been drawn up by Dr. Khosla himself. He has considerable knowledge of the State's economy. He was associated with flood control plans in early thirties and now as the Governor of the State. Dr. Khosla naturally takes a close interest in its development). The plan, or the master plan, it is seen, is not only meant for Orissa but for a number of neighbouring States as well. Dr. Khosla calls it a multi-State plan for the six eastern States of India. In respect of power, it is a plan for the eastern region comprising Orissa, West Bengal, Bihar, Madhya Pradesh, Andhra Pradesh,

Uttar Pradesh (and possibly also Maharashtra). In respect of irrigation, it is a plan for Orissa, West Bengal and Andhra. The pace and pattern of power development in the plan will be determined, besides the needs of Orissa, by the combined needs of the region as a whole, and also by consideration, at each stage, of the relative proportions of hydro and thermal power generation to ensure maximum utilisation of installed capacity, (both hydro and thermal) and to ensure the minimum unit generation cost. As regards irrigation, Dr. Khosla thinks it is possible to extend irrigation from the Mahanadi water stored at the Tikerpara dam to a million or more acres of land in Midnapur district in West Bengal, extending from the Orissa border to the Rupnarain river and Haldia port, and to a similar acreage (if physically within limits of command) in Andhra Pradesh extending from the Orissa border to Visakhapatnam port.

The cost of the master plan is estimated at Rs. 1,621 crores, spread over the next three or four five-year Plans, and its implementation naturally will depend on the co-operation and financial participation in the Tikerpara project (which will provide for the requisite hydro-electric power and create the necessary irrigation potential) of the States, for whose collective benefit Dr. Khosla has drawn it up. It also follows that if the co-operation and financial participation from other States do not come forth, then the plan does not have much chance of realisation in the shape in which it has been drawn up. Anticipating these difficulties, Dr. Khosla has mapped out the plan in suitable phases. For example, the Tikerpara project which, for all practical purposes, is the key scheme in Dr. Khosla's grand project, can be implemented in two phases — first, power; and second, irrigation and flood control. Power has been given priority in order to make it a revenue-earning project from the very first stage. To begin with, the power plant will be producing 288 MW of power, that is, some time within the "decade of destiny" of 1963-73, and in the second stage coming after this period, power generation (firm power at 100 per cent load factor) will go up to 825 MW. A potential of 3,000 MW can be eventually built up.

Dr. Khosla has worked out the unit cost of power produced from the Tikerpara hydro project with that of the thermal power project at Talcher (also in Orissa, based on the non-coking coal reserves in the area as well as middlings from coal washeries in Bengal and Bihar), and confidently predicts that the cost of the former will be substantially cheaper. In fact, because of the likely cheap cost and the enormous potential for power generation, Tikerpara, he advocates, should be treated as a national project. Whether it will in fact be so treated is not certain at present, but there need be no doubt about the great value of this project to the future of Orissa. Lack of power has been one of the main bottlenecks to Orissa's industrial development, although this State has a major share (almost 50 per cent) of India's mineral resources. Her economy has a poor agricultural base and she has the lowest per capita income of all States in India. The blessings of Tikerpara will not only give a fillip to industrialisation of the State, they will also minimise the havoc which the floods of the Mahanadi play year after year, and the irrigation facilities are bound to lead to greater agricultural production. The State Government of Orissa is determined to take up the project, but it lacks the funds to implement so expensive a scheme by itself alone. Consequently, it has entered the "race for securing funds from the Centre", which was marked by Mr. Biju Patnaik's manoeuvre to get the Prime Minister to "lay the foundation stone" for the project, the work on which has not yet started. However, the Centre should take a long-term view of the power needs not only of Orissa, but of the eastern region as a whole, and should extend generous assistance to the Tikerpara hydro-electric scheme and the Talcher thermal project, which promise to become great centres of power production within the next 20 years or so.

Dear Money in a Hurry?

From Our Correspondent

MADRAS:

FOLLOWING THE imposition of new credit restrictions by the Reserve Bank, interesting developments have been taking place in the money market. It is not clear whether the central banking institution got alarmed over the spectacular increase in advances as the higher level of prices had a distorting effect and many industrial units had also to borrow heavily in order to make tax payments. The increase in advances of scheduled banks by over Rs. 300 crores had no doubt exceeded expectations, but on a modest estimate it is reckoned that tax payments alone accounted for about Rs. 50 crores of bank finance and that the Central Government is to a certain extent responsible for the squeeze in the money market noticeable for some time now. The Income-tax Department has been unusually busy and it is reported that many companies have been obliged to pay taxes for two years within a short period. As a result, the availability of internal resources for working capital purposes has been seriously affected.

It has, therefore, been argued that the Reserve Bank need not have been in a hurry to modify the two-tier system and reduce the quotas of member banks for borrowing purposes. The direct effect of the new restrictions has been reflected in a higher inter-bank call rate while some banks, particularly medium-sized institutions, have been encouraged to raise their lending rates. A leading bank in Madras State has raised its rates on advances by ½ per cent all-round. As penal rates have had to be paid by the scheduled banks in respect of borrowings in excess of the revised quotas, an attempt has been made to pass on the increase in interest charges to the constituents. As it is generally felt that the penal rates will be operative only till such time borrowings were in excess of the quotas, there is no justification for a fresh increase in lending rates by many institutions especially as it has not been made clear that the higher rates would be operative only on that portion of borrowing which had been specially arranged during the busy season and that it would not be necessary to pay such rates after the lending bank had been able to reduce its borrowings from the central banking institution. The bigger banks have not followed suit so far. But it is apprehended that there will be a greater tendency henceforth to quote differential rates on a slab basis, where the limits had been raised, so that it can be argued that the constituents were being discouraged to reduce their borrowings and that an unexpected increase in advances was being met only with borrowings from outside sources on a higher interest basis.

The medium-sized banks in this part of the country are expected to raise lending rates wherever possible though in some cases they are already unduly high. At the same time, there are indications that some banks are eager to revise their deposit rates. There is a feeling that, in respect of funds placed with institutions for periods exceeding two years, higher interest rates would be more rewarding. It may be remembered that there was a near crisis in 1962 when the question of deposit rates, as they related to the various classes of banks, was discussed and the bigger institutions were not inclined to allow the medium-sized banks to charge higher interest rates as they feared there would be fresh complications. Eventually, an acceptable formula was devised and the inter-bank agreement on deposit rates was renewed.

The question of adjustment of deposit rates, in the light of the suggestion made by the Reserve Bank, was considered at a meeting of the members of the Indian Banks' Association in Bombay recently. But no decision was taken as opinion was divided and it was not also clear whether higher deposit rates would help bring about an increase in deposits. While it is difficult to say at this stage what exactly will be the final decision of the Indian Banks' Association, the view is held in particular quarters that the agreement on deposit rates has been honoured more in its breach than its observance and that many undesirable practices are being followed by some institutions. In order to put an end to these anomalies, it has been suggested that deposits rates should be revised upward wherever necessary and that there should be a direct relationship between deposit rates and lending rates for different types of advances. The banking system is passing through an interesting phase and it is significant to note that the authorities themselves are not having any definite view about the utility of a dearer money policy. The industrial sector will be greatly hit by a fresh increase in lending rates as there is heavy reliance on bank finance for meeting the requirements of working capital and even expansion to some extent. Thus, while there will be force in the view put forward by some major banks there should not be any hurry to raise deposit rates or lending rates without justification.

★★

The Madras Government is making a serious bid to bring down prices for rice by regulating business transacted by wholesale dealers and millers. It has "also been announced that exports to Kerala would be permitted only if a clearance certificate was given by a competent authority that the quotas under the levy system had been fulfilled. As rice imports from Andhra Pradesh have not been coming in freely and it is apprehended that availability within the State will not be satisfactory, if exports to Kerala were not regulated, a careful watch is being maintained on the utilisation of available stocks.

The wholesale dealers and millers did not like the original proposals for payment of licence fees and regulation of business. There has been some modification since in the amount of fees to be paid by the various classes of dealers while the Central Government has agreed to the suggestion of the State Government for increasing procurement prices by Rs. 2 per maund. It is felt that by the adoption of these measures, procurement of rice would be rendered much easier while the wholesalers would not try to exploit the present situation. How far the new measures will succeed in their objective is difficult to anticipate at this stage. But heavy sales through fair price shops have relieved, to some extent, the hardships endured by the lower income groups. However, it is an ordeal to secure cheaper rice from the fair price shops on account of the long queues and limited sales. There is no doubt that the supply situation is difficult and there can be no real improvement without a larger harvest in Andhra Pradesh in the next season. In Madras, it has been confidently asserted that the difficulties are mainly due to the exports to neighbouring areas and that the State is self-sufficient so far as its requirements are concerned, with even a slight marginal surplus. It is rather unfortunate that the difficulties endured by rice consumers have coincided with a short wheat crop and high prices for this cereal as well.

In regard to sugar also a difficult situation is developing. In spite of the fact that U.P., Bihar, and Maharashtra are not expected to do so well as anticipated earlier, sugar mills in Madras, Mysore and Andhra Pradesh will be able to increase their output significantly except in some areas where there has been some competition for available supplies from producers of jaggery. The output of other units will be according to expectations. But since it is now estimated that the total output for the current season will not be even 26 lakh metric tons, the quotas to various States have been reduced. Already there is acute scarcity in the rural areas and the consumers are paying high prices in the black market. It is, therefore, pointed out that unless a definite bid was made to increase the output of sugar in this special season in the South, through fresh incentives, a very difficult situation might arise in the closing months of the current season.

★★

In the Madras Stock Market, investors and operators are awaiting a fresh lead from the Union Finance Minister. Advices from Bombay and Calcutta have been discouraging and business passing is on a very restricted basis. There was, no doubt, a slight improvement in prices for a short while on account of buying by the Life Insurance Corporation and the Unit Trust of India. But in the absence of fresh investment buying the gains have not been fully held.

But for the fact that the bigger investors are sullen over the steep increase in estate duties and Gifts tax, the encouraging dividend declarations by some companies should have had an encouraging effect. It is now expected that many companies, particularly units belonging to the special group of industries, would benefit by the latest budget proposals. Where the liability in regard to the Super Profits Tax was heavy, there would be a substantial saving. The higher dividend declarations by such companies like Dunlop Rubber and Hindustan Lever, as a result of reduced tax liability, is stated as instances in favour. In the Madras Market there are some counters which are favourably affected. Mettur Chemical and Industrial Corporation is reported to be doing very well and the interim dividend for 1963-64 has been mentioned on the increased capital. It is expected that, as a result of increased production, there will be a significant improvement in earnings. Aluminium Industries Limited has benefited not only by a reduction in tax liability but also by an expanding volume of business. Reliable reports suggest that even the earnings for the first half of 1963-64, after providing for taxation on the amended basis, were equal to the earnings for the whole of 1962-63 and that it would be possible for the company to pay a dividend of 18 per cent, on the increased capital taxable, against 15 per cent, taxable, declared for 1962-63. Only a few days back, the interim dividend was maintained at 9 per cent, taxable, on old shares while the new shares will be eligible for a proportionate dividend. There has been a substantial rise in the profits of Bangalore Woollen Cotton and Silk Mills Company Limited, perhaps due to the execution of large orders for the Defence Services. The woollen products produced by this company have a good reputation. In spite of the fact that the company is obliged to bear a heavy tax burden, on account of the tax rates under section 23(A) of the Companies Act, it has been possible to double nearly the allocation to reserves besides increasing the dividend on equity capital to 24 per cent, taxable, from 18 per cent, taxable, in 1962. Buckingham and Carnatic Mills Company Limited, however, has not been able to report any significant increase in its earnings for 1963 and the dividend on equity capital has been only maintained at 18 per cent, taxable. Dalmia Cement (Bharat) Limited has again reported satisfactory results. Even though there was a substantial reduction in the burden for taxation the Directors have thought it advisable to transfer larger sums to reserves and maintain only the dividend on equity capital at 12 per cent, taxable, and on deferred shares also at 12 per cent, taxable.

The moving finger writes

AT A LUNCHEON meeting of the local Press Club on Saturday, March 28, Mr. Lal Bahadur, when asked what his reaction was to the proposal that there should be a Deputy Prime Minister, quipped that a "small" man should be chosen. This is perhaps as near to declaring his candidature as Mr. Lal Bahadur is ever likely to come. Not that the question of a Deputy Prime Minister is in any sense a live one now. This is so partly because of the welcome recovery of health by Mr. Nehru who is, indeed, now so confident of restored physical normalcy that he has decided to attend the Commonwealth Prime Ministers' Conference to be held in London in July.

Mr. Nehru now seems to have come to the firm conclusion that he is able to continue to shoulder actively and to the full not only the broad responsibilities but also the daily chores of leadership of the government. This much, and perhaps even more, was evident from his rejoinder in the Lok Sabha on Monday, March 30, to a remark about the possibilities of a Deputy being appointed. Mr. Nehru said promptly that "the question does not arise". His remark has given rise to some variety in interpretation. It has been argued, for instance, that Mr. Nehru's purpose was to drop a gentle hint to the nation generally, and to possible aspirants in particular, that he himself does not consider anybody in sight to be good enough to be nominated as Deputy Prime Minister and thereby virtually designated as his prospective successor. As against this, there is also the somewhat less charitable suggestion that Mr. Nehru, in fact, has his own ideas on who should succeed him, but would like to leave the issue open since he is not yet sure that the individual he favours is himself (or, is it herself?) ready or will be readily acceptable. This kind of speculation naturally could be made as interesting as one might wish to make it and it could, and evidently would, go on and on indefinitely. Meanwhile, I have been often wondering lately whether "the succession" is after all a prize to be coveted. The country is in a mess in many ways and Kashmir is messier still, also in many ways. I am beginning to think that if the Prime Minister persists in believing that, well or ill, he alone could handle the situation, we on our part should admire his dedication rather than blame his judgment.

**

Talking of Kashmir, Mr. Lal Bahadur's elucidation, or more correctly, explanation, (such as it was) in Lok Sabha of the Government of India's role in or reaction to the announcement by Premier G. M. Sadiq of the State Government's decision to effect the release of Sheikh Abdullah within the next few days, was certainly not successful in reassuring public opinion which is agitated over the implications of this development. The attempt by the Minister without Portfolio to make it appear that the release of Sheikh Abdullah would be more or less in the nature of a law and order decision which fell within the competence of the State Government did not deserve to be and was not taken seriously by any section of the House. It is true, of course, that, while the Jan Sangh and the Hindu Mahasabha members and a few Independents protested by crying "shame, shame", other sections of the House comprising the Swatantra and PSP groups as well as a number of Congress men, cheered Mr. Lal Bahadur when he confirmed Mr. G. M. Sadiq's announcement about Sheikh Abdullah's forthcoming release. But even those who were in favour of the step taken were clearly interested not so much with the release of Sheikh Abdullah as such, as with the possible implications of this decision in terms of a new turn to the Government of India's Kashmir policy, or perhaps even a new Kashmir policy. The truth is that, whether the Government of India likes it or not, the public is now bound to feel that important shifts in New Delhi's thinking on the future of Kashmir are bound to take place if they have not taken place already. In the circumstances it is only fair that the Prime Minister should not only arrange to take Parliament into confidence as early as possible but also give the two Houses an opportunity for a full debate.

**

A short visit to Bombay last week was most rewarding. The occasion was a seminar organised by a number of trade associations in Bombay, headed by the Indian Merchants' Chamber. The seminar had the advantage of an admirably lucid and crisp note prepared by Mr. Palkhivala on the economic, legal, administrative and other implications of the budget proposals relating to corporate and personal taxation. I was impressed, in particular, by Mr. Palkhivala's firm and sound conclusion that, while there may be some practical convenience in regarding corporate taxation and the taxation of personal incomes derived as dividends from corporate sources as two different entities, what is really of the essence is the totality of the tax burden which the individual has to bear, first at the level of the corporate assessee, secondly, when the receipts are taxed in his hands. I endorse, without any hesitation, Mr. Palkhivala's thesis that it is the total burden of all forms of taxation on the individual assessee receiving a dividend income from corporate earnings which is the grim economic reality bearing on the investment climate and the flow of the savings of the community into industrial expansion and economic progress. Reckoned in this manner, it can hardly be denied that providing risk capital to industry has become a mugs' game in this country.

Incidentally, my discussions in Bombay served to give me new knowledge of the numerous anomalies which are bound to result from excessive experimentation in the fiscal field. One of the major sins of the SPT is its unevenness and arbitrariness. The present Finance Minister has readily conceded this, but ironically enough, his own proposal of a surtax does not seem to be appreciably more virtuous. I may point out one anomaly. Burmah-Shell, I understand, will get a relief of about Rs. 70 lakhs in taxation due to the replacement of the SPT by the surtax. Now, I have nothing against Burmah-Shell. On the contrary, I fill up at their service stations and in our house we burn burshane. But that has nothing to do with the fact that I just am not able to appreciate why a company should profit merely because it has a large debenture base, while another company or other companies in the same industry, operating in more or less similar conditions should fail to fare as well simply because their capital schemes are structured in a different way. I may perhaps add that ESSO, which has provided for some Indian participation in the form of preference shares, is stated to be less advantageously positioned with regard to its tax liability than Burmah-Shell. My point in mentioning all this is only to emphasize that it is virtually impossible to keep clear of anomalies once a tax has been permitted to base itself on unsound principles or assumptions.

SEARCH FOR TALENT

DELIVERING HIS presidential address at the Fourth General Assembly of the Indian Institute of Science, Mr. J. R. D. Tata said that, in one form or another, a talent search was on in the country and in this the Union Government, State Governments and private agencies were all playing their part. In this connection he referred to the 'Grandes Ecoles' of France and the possibility of developing in India a similar institution. From the early days of the French Revolution, Napolean and his advisers conceived of a centralised administration and a state system of education that would not only put France on her feet again, but raise her to the foremost position in the counsels of Europe. While in Britain and the United States schools and universities were largely left to grow up on their own, in France, under a centralised educational system, more deliberate steps were taken to train an elite for the public services, quite apart from the work of the universities. This was done through a group of institutions for higher education known as the 'Grandes Ecoles' which simply mean the 'Great Schools'. Three of such schools where competition for entry is the stiffest and the training most rigorous, deserve mention. Two of them, the 'Ecole Polytechnique' and the 'Ecole Normale Superieure', go back to Napoleon's days; the latter provides France with many of her best teachers and thinkers, and the former has given her many of her great military commanders, scientists and leaders in industry. The third is the new 'Ecole Nationale d'Administration' (ENA) which General de Gaulle established in 1945 for the express purpose of training an elite for the public services. The tremendous prestige of these three institutions attracts the most gifted, and only the most gifted can succeed in the fierce competition for entry.

Clarifying his statement, Mr. Tata said that his objective in referring to the French system was to stress the point that, while the duty of the State was to spread education as widely as possible, there was also a compelling need to train to the highest level a select few. Though the democratic process would, no doubt, throw up leadership from many walks of life, the progress of the country would greatly depend on the creative and constructive abilities of an elite of brilliant administrators, managers, scientists and innovators whose example and leadership would inspire others. He suggested that in view of this a central agency should be created to conduct vigorous search for the best talent in our schools and colleges, followed by special facilities for intensive training for the most promising so that they may enter stiff competitive examinations. He added that as a result of such examinations only the ablest, a number not exceeding 500 at the outset, should be trained in three or four 'career' institutions for a period of two or three years. These institutions should not be inhibited by traditional concepts and courses of study and be free to innovate and experiment. The ratio of teachers and students and their quality and inter-action should be such as to stimulate the intellect, sharpen the faculty for thought and arouse the spirit of enquiry. Men thus rigorously selected and finally tempered in the furnace of exacting disciplines would, Mr. Tata opined, bring creative vigour and brilliance to many facets of the nation's life.

Talking about scientists and engineers in particular, Mr. Tata observed that the one outstanding quality they needed most in our country today, was imagination — a leap of the mind that takes men beyond the boundaries of one science into another, or in other words, a pursuit of new knowledge in the spirit of untrammelled inquiry, harking back to the social purpose that must often condition and even dominate the quest.

STATE TRADING

According to the Estimates Committee Report presented to the Lok Sabha by the Committee Chairman, Mr. A. C. Guha, it has to be realised that State trading, which is not universally supported, has to create a good image of its working in the public mind and that the benefit it brings to the consumer is the measure of its success. The Committee has reported to the Lok Sabha that the canalisation of imports of certain commodities wholly through the STC has not benefited actual users or general consumers in the matter of price. It has also suggested that the role and functions of the Corporation should be more specifically stated in order to remove the prevailing uncertainty and avoid unnecessary criticism. The Committee has stressed the need for a clearer indication of the commodities which will be handled by the Corporation, as also the principles governing their selection. It has been suggested that the Government should periodically review the effect of the Corporation's entry in the trade of various commodities so that the original purpose of such an entry is constantly kept in view. While agreeing that there should be a Government agency like the STC to undertake exports of certain commodities, even though such exports may entail a loss, the Committee is of the opinion that the question of loss of Rs. 2.13 crores incurred by the Corporation in respect of groundnut oil requires a thorough investigation.

The Committee has stated in its report that while there had been a reduction in the purchase price of some commodities by the Corporation, the resultant benefit had not been passed on to the consumer. In respect of certain commodities like camphor, mercury, coconut oil, betelnuts, cloves, etc., the Corporation's margin of profit varied from 100 per cent to 200 per cent. The reason offered for charging such a high margin of profit, namely, to counteract speculative tendencies and unhealthy practices, has not been found satisfactory by the Committee and it has suggested that suitable measures should be devised immediately.

Referring to international trade in cement, the Report says that there has been considerable overlapping between the functions of STC and those of selling agents and stockists. Nearly Rs. 2 crores are being spent annually on fees and remuneration to various agencies employed in the distribution of cement. The Committee feels that selling agents who are nominees of factories do not serve any vital and useful function and that the STC can take over their functions and thereby save Rs. 2 crores. Referring to STC's role in buffer stock operations, the Committee points out that this does not normally fall within its functions. The Corporation had undertaken buffer stock operations as a measure of price support, but if the objective is to be achieved, the first step to be taken is to ensure that all primary producers of the commodities concerned are covered by such operation.

The Committee has expressed its dissatisfaction at the bifurcation of the STC into two independent Corporations because, in its opinion, the purpose of handling additional business could have been well served by setting up two units with separate General Managers under the same management instead of two independent Corporations. The Committee has also observed that the STC's efforts to handle and expand export of difficult-to-sell items have not so far met with any

great success. In regard to the import of non-canalized items, it says that the ruling prices in the market are higher than the selling prices of STC and, therefore, to maintain a balance, it is necessary to seek the co-operation of other importers so that the commodities can be made available to consumers at a fixed price.

The report states that since iron ore is an important foreign exchange earner, there is a need to reduce its cost of production with a view to not only retaining but improving the competitive strength of Indian ore in the international market. It recommends that a study of the cost structure of iron ore should be undertaken immediately and that the desirability and possibility of arriving at an understanding regarding prices with other iron producing countries should be explored.

WORLD SHORTAGE OF FERTILIZERS

In view of the fact that the world is currently passing through a shortage of fertilisers, India is likely to be affected in respect of her import plans drawn up to take care of shortfalls in internal production of fertilisers which are badly needed to improve upon our agricultural performance. In this connection, the findings of Mr. B. P. Patel, Chairman of the State Trading Corporation of India, who has returned after a tour of German Democratic Republic, Czechoslovakia and the U.S.S.R., are noteworthy. Addressing a press conference, Mr. Patel disclosed that it would be possible to import only one lakh tonnes of ammonium sulphate from Russia this year against the original import possibility of 1.5 lakh tons. He also revealed that Russia might supply the same quantities of nitrogenous fertilisers as last year. He further disclosed that he had entered into an agreement with the East German Government for the import of 1,10,000 tons of nitrogenous and potassium fertilisers and 10,000 tons of sodium sulphate valued at Rs. 2.65 crores.

During his visit to Moscow, Mr. Patel also concluded contracts for the export of 10 million metres of cotton textiles (against 2.1 million metres last year) and 4 lakh metres of woollen fabrics worth about Rs. two crores. Export to the Soviet Union of opium worth about Rs. 62 lakhs and tobacco worth Rs. 45 lakhs were also contracted for by Mr. Patel. He further stated that export possibilities of chemicals, grinding and gear cutting machines, leather goods, handicrafts and fruits and juice were also discussed and that the contracts regarding exports of these items would be signed soon. Mr. Patel also revealed in his statement that an agreement had been reached with the U.S.S.R. for the import of 15,000 tons of wood pulp worth Rs. 93 lakhs.

Regarding exports to the USSR, Mr. Patel said that apart from traditional commodities like jute manufactures, tea, coffee, cotton textiles and tobacco, there was a large scope for the export of leather-ware, consumer goods like ready-made garments, knitwear, tinned fish, fruit juices, bananas; oranges etc., and light engineering goods. He pointed out that so far as textiles exports to the Soviet Union were concerned, there was a big rise and added that during the last seven years Indo-Soviet trade grew ten-fold, rising from Rs. 9.5 crores in 1955-56 to about Rs. 95 crores in 1962-63. During 1964, a further increase of 25 per cent was envisaged. During the last seven years, the Indo-G.D.R. trade had also increased from Rs. 18 lakhs to Rs. 16.4 crores in 1962-63.

DGS & D TERMS LIBERALISED

The terms of payment against suppliers' bills have been liberalised by the Directorate General of Supplies and Disposals. This assurance was given at a recent meeting of one of the Purchase Advisory Councils of the D.G.S. and D. It was also stated that the number of items reserved exclusively for purchase from the small-scale sector had been increased to 70. A suggestion was made at the meeting for the setting up of centres for distribution of raw materials to contractors. The Government representative replied that it would not be possible for the D.G.S. and D. to assure contractors of availability of raw materials. It was, however, assured by him that in individual cases where difficulties were experienced by the suppliers, D.G.S. and D. would examine the question of issuing raw materials on merits.

According to the suppliers' representatives, it would facilitate the trade and industry to develop sources of supply if the list of items which were not indigenously manufactured was widely circulated either to the advisory panels or to the members of the regional councils of the advisory body. The Government representative stated in his reply that the D.G.S. and D. was unable to do anything in the matter since it was merely a purchasing agency. Still an assurance was given that the D.G.S. and D. would endeavour to ascertain from indenting departments the likely forecast of certain items of stores provided the members furnished details of items which were now being imported and were purchased by the D.G.S. and D. Referring to suggestions regarding non-participation in tenders by the small-scale units, owing to non-availability of raw materials, it was stated from the Government side that the purchase organisations could not undertake the responsibility for stocking raw materials and making them available to the prospective buyers.

CENTRE FOR TRADE INFORMATION

The 61 member States of the GATT have agreed to set up a Centre for Trade Information Services and Trade Promotion Advisory Services for developing countries. The decision is based on the recommendation of a group of experts which met in Geneva last month. The Centre, which is the first of its kind to be set up as an inter-governmental organisation, is expected to start operations by June, 1964.

JAPANESE METHOD OF STEEL PRODUCTION

According to the Indian Steel Delegation which visited Japan recently, some of the techniques and production methods employed by the Japanese steel industry can be adopted with advantage both by public and the private sector steel plants in India. The delegation will shortly submit a detailed report to the Government indicating which techniques and production methods can be followed here. Even after the application of the Japanese methods, which will take some time, it is not known whether the actual cost of production of steel in India, which has been going up, can be brought down. The Delegation feels that it is too early to see whether any reduction can be achieved.

The Delegation was greatly impressed by the progress and the performance of the Japanese steel industry whose output had gone up to 31 million tons, compared to only one million tons soon after World War II. Investment in Japan per ton of steel is stated to be much lower than that in India. The Japanese are also stated to have turned to great advantage the absence of main raw materials for their steel plants by importing the best quality iron ore and coal from abroad and by setting up their steel plants very near the ports.

OSAKA TRADE FAIR

The Sixth International Trade Fair will open in Japan on 9th April, 1964. The Fair will last for three weeks and is claimed to be the biggest fair East of Suez. Thirty-five nations will be participating in the Fair and will try to sell to the Japanese markets a wide variety of goods ranging from ultra-modern machinery to cut-glass and diamonds. Machinery for the rapidly expanding Japanese industries is expected to dominate the Fair, though some consumer goods such as foodstuffs, cosmetics, quality textiles and sundry goods are also expected to attract wide attention because their imports into Japan are being increasingly liberalised. According to the Fair Secretariat officials, the European Common Market nations are showing particularly active interest in the Japanese markets.

TEXTILE EXPORTS TO U.S.

The procedure for submitting applications for the export of restricted varieties of cotton textiles to the United States during the year April 17, 1964, to April 16, 1965, has been announced. Reserved quotas will be issued by the Cotton Textiles Export Promotion Council on recommendations made by the U.S. Textiles Licensing Advisory Committee on the basis of the average quantity shipped by each exporter during the basic year 1960, 1961 and 1962. This will cover categories 009 and 019 each 40 per cent of the average quantity shipped. Categories 022 and 026 each 50 per cent of the average quantities shipped with the condition that not more than a third of the quota should be utilised by the established exporters to export cloth, realising prices as follows: 50 nP. per sq. yard in category 009; 50 nP. per sq. yard in category 019; 60 nP. per sq. yard in category 022 and 75 nP. per sq. yard in category 026. Unreserved quotas will be issued in respect of categories 022 and 026 only for a maximum of 2,50,000 sq. yards each to the applicants during the first three months of the licensing period on the basis of the contracts established and supported by letters of credit on the condition that the minimum price realisation is Re. 1 and Rs. 1.25 per sq. yard f.o.b. in the two categories respectively. The quotas will be granted on first-come-first served basis.

INDO-POLISH TECHNICAL AGREEMENT

Poland has agreed to assist India in the development of mining industry, particularly coal mining in which it has made great progress. Polish assistance will be made available under an agreement that has been signed for scientific, technological and cultural co-operation for the next two years. The agreement envisages the setting up of a Chair for mining in the Indian School of Mines, Dhanbad, and training of 10 to 20 Indian engineers in Poland. Besides training in mining, Poland will also receive a number of Indian engineers to be trained in the construction of power plants, electric motors and textile machinery. According to the Polish Minister, Mr. T. Galinski, there was no limitation to the choice of fields for technical co-operation between the two countries. In India desired training facilities in certain specific industries such as shipbuilding, which were not mentioned in the present agreement, would be arranged. Poland is already constructing nine deep coal mines in this country under the economic assistance programme. Work on such mines has been started recently.

CLOTH EXPORTS

The country's foreign exchange earnings from cotton textiles exports increased by over Rs. seven crores in 1963. The total foreign exchange earnings from textile exports amounted in 1963 to Rs. 63.49 crores against Rs. 55.86 crores in 1962. The extra earnings of Rs. seven crores, despite slight fall in the value per unit, was due entirely to the increase in the volume of yarn and cloth exports. The realisation per unit in respect of both cloth and yarn declined in 1963 compared to 1962 mainly because of fierce competition in world markets which have lately been shrinking. Exports of yarn totalled nearly 30 million lbs. in 1963 against 23 million lbs. in 1962. The price realised per lb., however, dropped from Rs. 2.30 in 1962 to Rs. 2.07 in 1963. Similarly, the price realisation in case of mill-made cloth fell from Re. 0.79 per yard to Re. 0.77 per yard.

GERMAN INVESTMENT IN INDIA

Addressing the Indo-German Cultural Society in Bombay, Mr P. A. Menon, India's Ambassador in Bonn, said that one of the hurdles in the way of increased West German investment in India was the provision in our Constitution empowering the Government to acquire an industry, the quantum of compensation being decided by the Executive authorities against which there was no appeal to the court. He, however, added that an appreciable increase in West German investments in Indian industries could be expected if the present talks on the question of payment of compensation and repatriation of capital against nationalisation resulted in an agreement. He said that the differences between the West German Government and the Government of India on this question had narrowed considerably and that an agreement may be finalised soon.

INDIA'S NATIONAL DEBT

The National Debt of India was Rs. 7,621 crores on March 31, 1963, including market borrowings totalling Rs. 2,371 crores. Giving the debt figures in its latest report, the Lok Sabha's Public Accounts Committee has pleaded for the second year in succession that the Union Finance Ministry, should make a study of the procedure followed in various democratic countries and obtain Parliamentary approval for Government borrowings. The Committee favours an Act of Parliament to fix a limit on Government borrowings.

PULP & PAPER CONVENTION

Addressing a Press Conference on Wednesday, the President of the Indian Pulp and Paper Technical Association, Mr. V. Podder, disclosed that the inaugural convention of the Association would be held in New Delhi on April 11 and 12. Mr. Asoka Mehta, Deputy Chairman of the Planning Commission, will open the convention.

An International Seminar on "Raw Materials for More Paper" and an exhibition of pulp, paper and paper products, including inks, chemicals, dyes, felts, wires and paper machinery, are being organised on this occasion. The convention will be attended by delegates from all over India. Representatives from several foreign firms, which are pioneers in different processes of pulp and paper manufacture, are expected to participate in the Seminar.

EXCISE ON SODIUM SILICATE

An excise duty at the rate of Rs. 4 per quintal has been levied on sodium silicate with effect from March 1, 1964. The duty is payable on quantities of sodium silicate manufactured on or after this date. It is to be paid before the goods are cleared from the factory. Desides paying duty, the manufacturers have to take out a Central Excise licence and observe certain other incidental formalities such as the maintenance of accounts, submission of monthly returns, etc.

ALCOHOL AND MOLASSES EXPORTS

Considerable shortage of alcohol for industrial purposes is being experienced at the moment and it is estimated that the deficit during the year 1964 might be of the order of about 20 per cent of the demand. In order to evolve measures to tide over this difficulty, the Minister for Petroleum and Chemicals, Mr. Humayun Kabir, recently convened a conference of the State Excise Ministers. As a result of this conference, Government of India have restricted, with immediate effect, the exports of molasses and alcohol and in future, no such exports shall take place without specific sanction of the Central Government in each case.

Company Affairs

UNITED BANK OF INDIA

Dr. N. N. Law, Chairman, United Bank of India Ltd., while addressing the annual general meeting held recently highlighted the progress achieved by the bank during 1963. Its profit increased by nearly 25 per cent and deposits increased by over 12 per cent. It opened seven new branches during the year and acquired site for Head Office building at Court House Street in Calcutta. The Chairman indicated that this impressive performance should not lead the bank to complacency because a great responsibility has devolved on all the banks in the face of mounting operating costs. The bank aims, therefore, at the achievement of a deposit level of Rs. 100 crores within the next two years and carry through a process of wider decentralisation to provide banking services to the largest population. Another important task before the bank today, he added, was to meet the growing burden of interest on deposits. It appeared that a further rise may be effected in the rates of interest on deposits to attract more funds but such a step would add to the already high operating cost and, consequently, would tend to step up the lending rates. Dr. Law, therefore, was against such a rise. In fact he advised the larger banks in the country to rationalise their lending rates which would bear a reasonable relation with the pattern of the largest bank in the country. It should, at the same time, be their aim to remain free from anxiety concerning liquidity. An important method for achieving these ends was to make concentrated efforts to increase deposits resources through means other than that of raising the interest rates.

Dr. Law expressed satisfaction over the headway made by the bank in the matter of providing facilities to the small-scale industries. A separate section was set up by the bank two years ago with a view to processing with special care such proposals from small-scale industrial units as could not be considered straightaway in normal course by the advances department. The bank has made tangible progress in this direction. The recent experience has proved that the small entrepreneurs are faced with problems other than financial such as marketing, raw materials, power, land, technical know-how, etc. In many cases it was possible for the bank to advise the concerned unit to solve these problems.

The issue of nationalisation of banks also was taken up by the Chairman. He indicated that the charges levelled by the protagonists of nationalisation such as concentration of power, diversion of resources to big industries and failure to spread into rural areas, were quite baseless. With the recent amendment of the Banking Companies Act, the already substantial powers of the Reserve Bank of India have been further expanded. Moreover, the Reserve Bank has extensive powers in the matter of making advances, including the maximum amount that could be advanced to an individual borrower. As for the question of expansion to the rural areas, Dr. Law indicated that this could not be undertaken indiscriminately. The branches in rural areas and semi-rural areas incurred losses for a number of years and for any economic unit, balance had to be struck between that part of its operation which was already economic and that which was for some time likely to remain uneconomic. Moreover, the number of branches opened by the United Bank of India and many other banks in smaller towns recently made this charge also look equally baseless.

MADURA MILLS

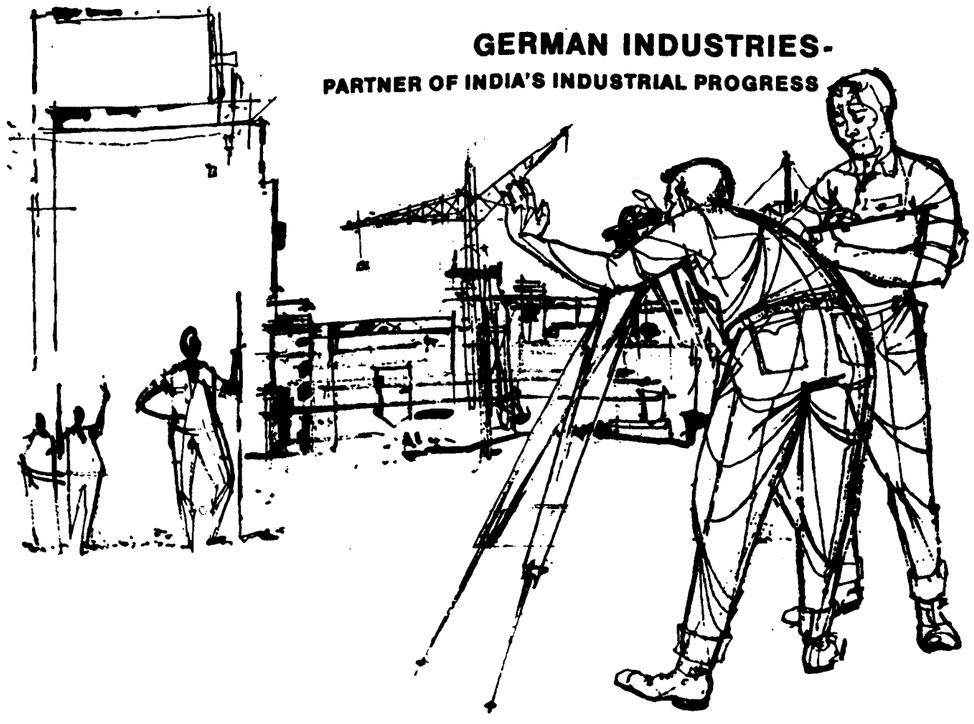
Madura Mills Company Ltd. carried through successfully its plans for modernisation and expansion during 1963. This was revealed by the Chairman, Dr. M. A. Muthiah Chettiar, while addressing the annual general meeting of the company held recently. The year 1963 saw the establishment of the first phase of its weaving project and 456 looms were installed. Its target for the present is 950 looms out of which 850 will be erected at Ambasamudram where an up-to-date weaving shed is under construction. It is placing orders with Picanols, Belgium for the additional 500 looms against the Belgian credit negotiated by the Government of India. The addition of bleaching, dyeing and finishing plants has also been taken up and its application, recommended by the Textile Commissioner, is being considered by the Government of India. There has been consequently a marked improvement in the company's performance during the year 1963 when its net profit increased to Rs. 42.79 lakhs against last year's figure of Rs. 31.81 lakhs. This is all the more appreciable as this increase was achieved after providing higher depreciation charges and higher development rebate reserve. It is evident that modernisation and nationalisation are beginning to show their beneficial results.

The Chairman indicated that the export performance of the company during the year, although satisfactory, showed a slight fall over the previous year. This was mainly due to increase in competition in all overseas markets. There has been however, an encouraging trend in recent months and the performance during 1964 was expected to be better.

SEN-RALEIGH

A chronic shortage of raw materials which forced certain sections of Sen-Raleigh factory producing bicycles to be laid off for periods extending upto two to three months at a time, resulted in disappointing performance during the year ended September, 1963. Mr. Abhijit Sen, Chairman, Sen-Raleigh Ltd., in his statement appended to the annual report of the company, indicated that as a consequence the directors have been unable to recommend the payment of dividend on ordinary share capital of the company. This conservation of resources was also necessary in view of the expansion scheme which was being implemented. It was not till the end of 1963 that the company was satisfied that the raw materials required for such expanded production would be available. Now that the expansion plan has been taken up, increased scale of output will definitely lead to some economies which are so necessary in the face of increasing prices of raw materials and services. The Chairman referred to the increased demand for certain components and indicated that towards the middle of 1964 — immediately after the cycle expansion was in full operation — the company would concentrate on plans for expanding component production.

Referring to the export performance of the bicycle industry, Mr. Abhijit Sen pointed out that appreciable orders were now flowing for the Balaka bicycle which was introduced in the African and Middle Eastern markets during the year. He, however, mentioned an extremely disquieting feature of exports, particularly exports from Calcutta, where consignments sent out seemed to have suffered pilferage which has left a very bad image of Indian manufacturers abroad. No dealer in a competitive market can risk such a damage to his reputation and this matter deserves the serious attention of the Ministry of International Trade. The Chairman also referred to the Government's recent scheme under which any manufacturer who is not a member of the Bicycle Manufacturers' Association, can draw a direct subsidy on its products. This is unfair because each member of the Association contributes to a pool on the basis of production and naturally the



TECHNOLOGISTS

mean more rapid progress,
especially in an economy like India's.

Large projects must be carried out, industries must develop fast—for the speedy economic growth India needs.

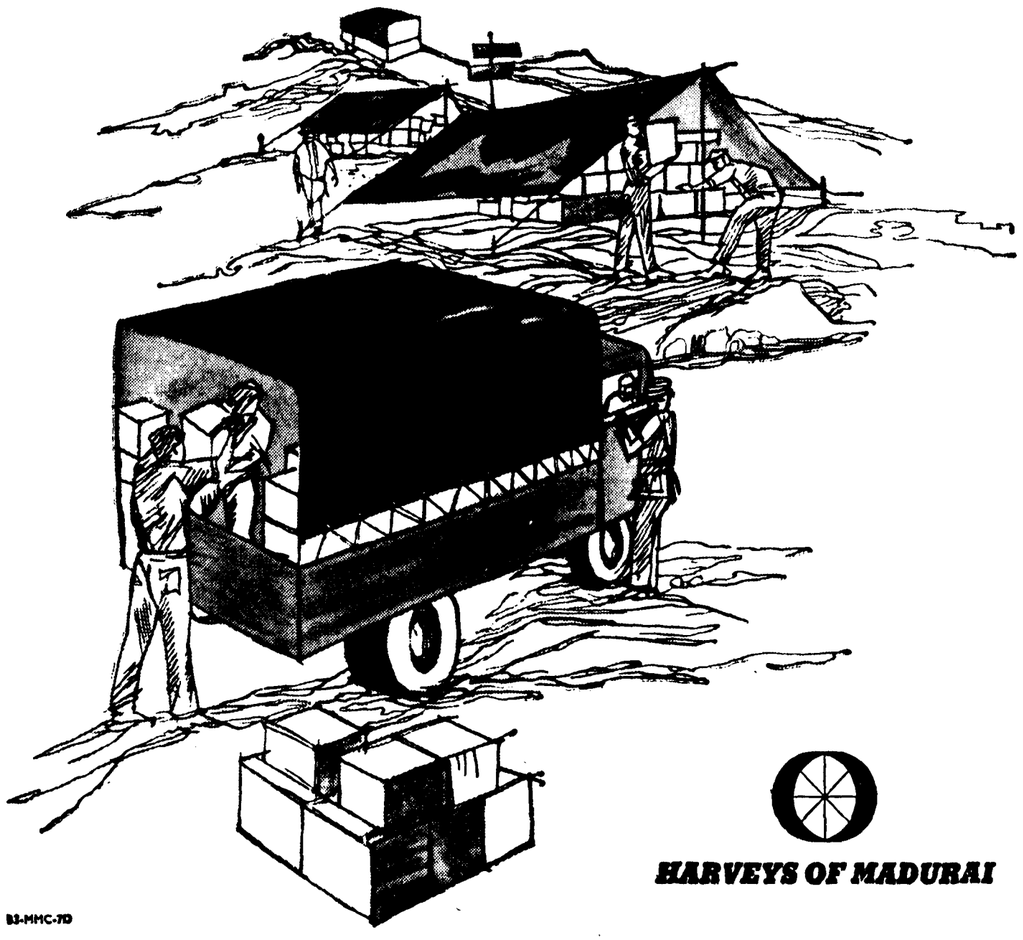
This means there must be more qualified men.
Men with training and experience in technology.
Men who are experts in their field.

Since 1948 about 1,600 Indians have studied in German Colleges of Technology and thousands of Indians have received thorough practical training in many German industrial enterprises.

GERMAN INDUSTRIES-
PARTNER OF INDIA'S INDUSTRIAL PROGRESS

EXCELLENT COVERAGE!

HARVEY CANVASES



provide the finest, surest protection for men and material

When the safety and protection of men and vital materials **are at stake, one can't afford to take risks.** Nothing but the finest **coverage** material will do! That's why top-ranking manufacturers **insist on Harvey Canvases — the strongest** and most **reliable fabrics** for making superior quality tarpaulins, tent canvases, **etc.**

Harveys' Madura Mills are today India's largest producers of industrial fabrics. **Through the years** they have built up **a world-wide** reputation for consistently high quality. They have the men, machines and knowhow to produce a wide range of industrial fabrics such as Tyre Cords, Belting Ducks, Jacket Ducks, Light and Heavy Canvases.

What's more, Harveys can weave industrial fabrics to your specifications — however rigid. Recent expansion at Madura Mills, with the installation of up-to-date high-speed looms and precision machinery, has further increased Harveys' weaving capacity. They can now meet all your requirements in industrial fabrics — to your complete satisfaction.

members of the Bicycle Manufacturers' Association would resent if any non-member was given subsidy without having to contribute towards the pool. This mater should also receive serious consideration of the Ministry of International Trade.

JAY SHREE TEXTILES

Jay Shree Textiles & Industries Ltd. has recorded a substantial progress during the year ended March 31, 1963. According to preliminary report, net sales have increased by about 35 per cent from Rs. 220 lakhs to Rs. 297 lakhs while the gross profit amounts to Rs. 55.97 lakhs against Rs. 43.00 lakhs last year. After providing Rs. 9.49 lakhs for depreciation, Rs. 20 lakhs for taxation and Rs. 2.69 lakhs for development rebate reserve, there is a net profit of Rs. 20.53 lakhs. Adding the unclaimed dividend and the amount brought forward, there is an available sum of Rs. 20.3 lakhs out of which the directors have allocated Rs. 13.25 lakhs to reserve fund. They have recommended the payment of a dividend at the rate of Re. 1 per share (taxable), same as last year.

INDIAN OVERSEAS BANK

The Indian Overseas Bank Ltd. during the year ended December 31, 1963, registered an impressive performance. Its deposits increased to Rs. 42.12 crores against Rs. 37.13 crores a year before and advances increased to Rs. 27.53 crores against Rs. 24.42 crores on December 31, 1962. Borrowings from other banks declined to Rs. 91.76 lakhs as against Rs. 136.25 lakhs. This improvement in working was reflected in earnings on interest and discount which advanced to Rs. 189.63 lakhs against the corresponding figure of Rs. 163.24 lakhs a year before. Earnings on commission, exchange and brokerage also were higher at Rs. 72.43 lakhs against Rs. 67.81 lakhs a year before. Net profit for the year came to Rs. 16.23 lakhs and the directors propose to transfer Rs. 8.70 lakhs from pension and gratuity funds account. A sum of Rs. 6.75 lakhs has been transferred to reserve fund and Rs. 6 lakhs towards provision for bonus. The directors recommend the payment of dividend at the rate of 14 per cent per annum subject to tax as against 12 per cent last year. During the year nine branches were opened and the bank took over assets and liabilities of the Coimbatore Standard Bank Ltd., Coimbatore with its R. S. Puram branch and also Nanjinad Bank Ltd., Nagarcoil with its branches at Eraniel and Thittuvilai. Subsequent to the date of the balance sheet, the Bank has also taken over the selective assets and liabilities of the Coimbatore Vasunthara Bank Ltd., Coimbatore, Satyamangalam, Puliampatti and Kaniyur.

SYNDICATE BANK

Syndicate Bank Ltd. recorded substantial increase in its deposits — from Rs. 32.65 crores to Rs. 45.49 crores — during the year ended December 31, 1963. Advances also increased from Rs. 18.27 crores to Rs. 27.83 crores at the end of the year. This improvement in its functioning was reflected in profits too which came to around Rs. 39.92 lakhs as against Rs. 30.33 lakhs. After providing Rs. 9 lakhs to statutory reserve fund, the directors propose the payment of a dividend at the rate of 20 per cent per annum on A, B and C equity shares, which will absorb Rs. 9.83 lakhs. Dividend on cumulative preference shares will absorb Rs. 1.84 lakhs. A sum of Rs. 14.78 lakhs is provided for taxation and Rs. 5 lakhs for bonus to staff.

During the year under review, the bank took over three banks under the scheme of transfer of assets and liabilities — The Citizens Bank Ltd., Robertsonpet, The Pollachi Town Bank Ltd., Pollachi and The Coimbatore Sri Kannikaparameshwari Bank Ltd., Coimbatore. These banks have had three branches in their respective places and 13 other branches were opened during the year so that the bank has nearly 190 branches today. It has several distinctive features like women's branches, ladies counters at several other branches and students' and children's accounts which have positively helped in the extension of banking habit among new clients.

ATUL PRODUCTS

Atul Products Ltd. recorded a higher turnover from Rs. 4.73 crores last year to Rs. 4.83 crores during 1963. The gross profits, however, was lower, but even then the directors have decided to maintain the distribution for the year at Rs. 12 a share less tax. The gross profit was around Rs. 97.83 lakhs against Rs. 124.44 lakhs. A sum of Rs. 34.26 lakhs was provided for depreciation as against Rs. 26.24 lakhs last year. The Directors have been obliged to draw upon the general reserve to the tune of Rs. 3 lakhs to meet part of the distribution, The set-back in earnings is attributed to an increase in the cost of raw materials which continued to be in short supply. The expansion of sulphuric acid plant is under way. The caustic soda plant is expected to attain full capacity shortly and the erection of the plant for the manufacture of naphthelene intermediaries is expected to commence next month.

HINDUSTAN LEVER

The turnover of Hindustan Lever for the year 1963 has touched a new high of Rs. 59.55 crores — an increase of over 10 per cent over the last year's performance. A part of the rise has stemmed from the sharp increase in company's exports to Rs. 5.12 crores against Rs 2.01 crores last year. The directors have declared a higher final dividend of 80 nP. per share against 60 nP., thus raising the total distribution to Rs. 1.40 or 14 per cent for the year as against 12 per cent last year. The pre-tax profit of the company was around Rs. 4.31 crores. Directors have indicated that the profits was slightly lower than the last year because of an increase in the cost of raw materials and the fact that the prices of two important products — washing soap and vanaspati — remained under price control for greater part of the year. The directors have set aside Rs. 56.5 lakhs for taxes. The dividend distribution will involve Rs. 115.4 lakhs.

RAYMOND WOOLLEN DIVERSIFICATION

The Raymond Woollen Mills Ltd. proposes to manufacture certain organic chemicals and chemical compounds such as resorcinol and its derivatives, vinyl pyrrolidones etc. in collaboration with Helene Curtis Industries Inc., Chicago, USA. For this purpose a private company, J.K. Helene Curtis (Private) Ltd., with a capital of Rs. 5 lakhs divided into 50,000 equity shares of Rs. 10 each has been formed. The technical know-how and assistance will be provided free of charge by the collaborators. It proposes to subscribe for 25,500 equity shares representing 51 per cent of the issued capital of the new company. The collaborators will subscribe the balance of 24,500 equity shares of Rs. 10 each.

VIBGYOR LTD.

Vibgyor Ltd. will enter the capital market shortly to raise Rs. 15 lakhs from the public to finance the establishment of a steel fabrication unit and an engineering division at an estimated cost of Rs. 26.50 lakhs. The authorised capital of the company is Rs. 50 lakhs of which Rs. 15 lakhs in equity shares of Rs. 100 each have been issued and subscribed. The company proposes to offer an additional Rs. 15 lakhs in 15,000 equity shares of Rs. 100 each at par for public subscription. The entire public issue is underwritten. The company is engaged in the distribution of paints and allied products, civil and construction engineering work and in painting and decoration. It proposes to establish a fully equipped unit for steel fabrication plant at Thana, Bombay, to become self-sufficient

in steel structurals and manufacture of ancillary engineering equipment and appliances. It has made arrangements for technical collaboration with Hawke Engineers, San Francisco, California, for know-how and specialized civil engineering job and with Charles Maesner Inc., New York, for construction of multi-storey building and with J. Rich Steers Inc., New York, for docks, jetties etc.

CAPITAL ISSUES

Nine companies have been authorised to raise fresh capital exceeding Rs. 7.87 crores. Of these, six are issuing bonus shares and three equities. Two companies are Central Government Undertakings. One company involves foreign collaboration and is offering part of its equities to the public. The consent of the Controller of Capital Issues is valid for 12 months in all cases.

Indian Tool Manufacturers Ltd., Bombay, is to issue Rs. 10 lakhs bonus capital in equity shares of Rs. 100 each, on capitalisation of the General Reserves to a like extent. The bonus shares will be issued in the proportion of two for every five shares held.

Nikhil Jute Baling Company Private Ltd., Calcutta, will be issuing bonus shares of Rs. 5 lakhs divided into 50,000 equity shares of Rs. 10 each on capitalisation of its reserves to a like extent in the ratio of one bonus share for every two equity shares held.

G. Das (Jute & Gunny) Ltd., Calcutta, is to issue bonus shares of Rs. 3,00,000 divided into 30,000 equity shares of Rs. 10 each on capitalisation of its general reserves to a like extent. The shares will be offered in the ratio of 3 bonus shares for one equity share held.

Shree Bhawani Cotton Mills Ltd., Calcutta, is to issue bonus shares of Rs. 7,50,000 divided into 75,000 equity shares of Rs. 10 each on capitalisation of its free reserves to a like extent in the ratio of 3 bonus shares for 7 ordinary shares held.

Garware Plastics Private Ltd., Bombay, is to issue bonus shares of Rs. 3 lakhs divided into 3,000 equity shares of Rs. 100 each on capitalisation of the company's General Reserves to a like extent.

The South Indian Concerns Ltd., a company incorporated in Bombay, is to issue 800 equity shares of Rs. 20 as fully paid up bonus shares on capitalisation of reserves.

Hindustan Photo Films Manufacturing Co., Ltd., Ootacamund, a Central Government Company, will be issuing further capital of Rs. 60 lakhs, divided into 6,000 equity shares of Rs. 1,000 each for cash at par. The money will be utilised for the manufacture of raw films for cinema industry, x-ray, roll films and photographic papers.

Heavy Engineering Corporation Ltd., Ranchi, a Central Government Undertaking, is to issue further capital of Rs. 6.35 crores divided into 63,500 equity shares of Rs. 1,000 each for cash at par. The capital will be utilised for financing the Heavy Machine Building, Foundry Forge and Heavy Machines Tools plants at Ranchi, and Coal Mining Machinery Plants at Durgapur.

Scottish Indian Machine Tools Ltd., Bombay, is to issue Rs. 64 lakhs in equity shares of Rs. 100 each, for cash at par, out of which 40 per cent capital will be subscribed by Scottish Machine Tool Corporation Ltd., U.K. or Scottish Machine Tool Overseas Ltd., and the share money utilised in the import of plant and machinery, 30 per cent will be offered to the public and the remaining 30 per cent will be subscribed privately. The money will be utilised in the manufacture of Guillotine Shear etc.

LICENCES ISSUED

The following licences were issued under the Industries (Development and Regulation) Act, 1951 — during the week ending 21st March, 1964. The list contains the names and addresses of the licensees, the articles of manufacture and annual installed capacity.

IRON AND STEEL

M/s. Godrej & Boyce Mfg. Co. Private Ltd., Lalbaug, Parel, Bombay-12 (Maharashtra) — Steel Castings — 4,500 tons. M/s. Marikar Industries Ltd., 'Marikar Buildings', Main Road, Trivandrum-1. (Kerala State.) (Mamala, Ernakulam, Distt. Kerala) — Automobile leaf springs. (Shifting). (Change of location from Palghat Distt to Ernakulam, Distt. in Kerala State).

COAL

M/s. The Bhulanbararee Coal Company Ltd., 4. Clive Row, Calcutta. (Bihar) — Coal — 1963-64 — 1,20,000 tonnes; 1964-65 — 1,80,000 tonnes; 1965-66 — 2,40,000 tonnes; 1966-67 — 3,00,000 tonnes. Shri Debi Prasad Marwary, At & P.O. Mahagama, Distt. Santal Parganas. (Bihar-Santal Parganas) — Coal — 8.000 tonnes. M/s. Hind Shippers Private Ltd., 135, Canning Street, Calcutta-1. (Distt. Dhanbad, Bihar) — Coal — 1,92,000 tonnes. M/s. Nag's Kajora Jambad Colliery, 4, Mandeville Gardens, Calcutta-19. (P.O. Ukhra, Distt. Burdwan, West Bengal) — Coal — 2,00,000 tonnes. M/s. Samla Collieries Ltd., 33, Netaji Subhas Road, Calcutta-1. (P.O. Pandaveswar, Distt. Burdwan, West Bengal) — Coal — 1964 — 1,30,000 tonnes; 1965 — 1,38,000 tonnes; 1966 — 1,38,000 tonnes; 1967 — 1,38,000 tonnes. M/s. Shyama Coal Co., Diamond Phularitand Colliery, P.O. Kharkharee, Distt. Dhanbad (Bihar). (P.O. Kharkharee, Distt. Dhanbad, Bihar) — Coal — 12.000 tonnes.

TEXTILE MACHINERY

M/s. Marsden Spinning & Manufacturing Co. Ltd., Ahmedabad (Gujarat State). (Ahmedabad, Gujarat) — (i) Pneumaclear Cleaning Plants for draw frames — 420 units. (ii) Pneumastop for roving frames — 240 units. Shri K. Devadas, 7/9, A. T. T. Colony, Coimbatore-1. (Coimbatore, Madras) — (1) Bare Cylinder Grinders for 40" — 60 Nos. (2) Card Mounting Machine 40" with mounting units, Brusher, Double Purchase Jack — 40 Nos. (3) Automatic Top Clipping Machine — 40 Nos. (4) Flat Clipping Machine — 20 Nos. (5) Automatic 3-Flat Grinding Machines — 60 Nos. (6) Traverse Wheel Grinders — 400 Nos. (7) Long Grinding Rollers — 400 Nos. (8) Portable Flat Cleaners — 40 Nos. (9) Lickerin Teeth Roller Wire Recovering, Grinding, Dressing and Burnishing Machines — 20 Nos. (10) Rubber Roller Grinding Machine suitable for cotton and worsted spinning frame rollers — 20 Nos. (11) Pneumatic Assembly Machine — 20 Nos. (12) Roller Deflection Testors — 60 Nos. (13) Roller Testers — 60 Nos.

SUGAR MACHINERY

M/s. Utkal Machinery Limited, Kansbahal, Near Rourkela, P.O. Box 47, Rourkela-1. (Kansbahal, Orissa) — (i) Battery of H. S. Sugar Centrifugals — 40 Nos. (ii) Complete Milling Plants (30" X 60") — 2 Nos. M/s. Textile Machinery Corporation Limited, Post Office Belgharia, 24, Parganas, West Bengal. (Belgharia, W. Bengal) (i) Centrifugal Machines (long cycle and short cycle). (ii) Massecuite Heat Treating Equipment — Valued at Rs. 27 lakhs.

CONVEYING EQUIPMENT

M/s. Kirloskar Asea Ltd., C/O Kirloskar Electric Co. Ltd., Post Box No. 1017, Bangalore-3. (Hebbal, Bangalore. Mysore) — (1) Chain Hoists upto 500 Kg. — 1,000 Nos. (2) Wire Rope Hoists upto 6,000 Kg. — 350 Nos. (3) Crane Crabs upto 12,500 Kg. — 100 Nos.

BALL BEARINGS

M/s. Andhra Pradesh Industrial Development Corporation Ltd., B-1-174, Fateh Maidan Road, Post Box No. 13, Hyderabad-4. **Name and style of:** Andhra Pradesh Ball Bearings Works Ltd. (Hyderabad, Andhra Pradesh) — (1) Ball Bearings 15-45 mm bore — 6.00,000 Nos. (2) Tapered Roller Bearings 20-60 mm bore — 6,00,000 Nos. (3) Cylindical Roller Bearings 17-50 mm. bore — 2,40,000 Nos. (4) Journal Bearings 120 mm. bore — 24,000 Nos.

MACHINE TOOLS

M/s. New Standard Engineering Co. Ltd., Carroll Road, Bombay13. (Bombay, Maharashtra) — Hot Blast Cupolas — 6 Nos. M/s. Hindustan Machine Tools Ltd., P.O. Jalahalli, Bangalore. (Kalamassery, Ernakulam, Distt. Kerala) — (i) Centre lathes of all types and sizes. (ii) Turrets both hexagonal and drum types. (iii) Single and multispindle automatics and other turning machines — First phase 1,200 Nos. Second phase 2,400 Nos. M/s New Standard Engineering Co. Ltd., Carroll Road, Bombay-13. (Maharashtra) — Trimming Presses (upto 200 tonnes capacity) — 36 Nos. M/s. Saran Engineering Company Ltd., Marhowrah Works Branch, Marhowrah — District Saran, Binar. (Marhowrah Saran Distt. Bihar) — Pneumatic Power Hammers — 120 Nos.

HAND TOOLS

Shri P. Kumar, Industrial Estate, Lalbaug, Bombay-12 (Poona, Maharashtra) — Milling Cutters of various types — 31,500 Nos. worth rupees 30 lakhs.

INDICATING DEVICES

The Managing Director, National Instruments Ltd., Jadavpur, Calcutta-32. (West Bengal) — (1) H. P. Dial Air Gauges — 150 Nos. (2) Vertical Mechanical Comparator — 200 Nos.

ORGANIC HEAVY CHEMICALS

M/s. The Atul Products Ltd., Atul Post via Bulsar, Distt. Surat (Gujarat State). (Atul, Gujarat) — Phosgene — 660 tonnes.

MISCELLANEOUS CHEMICALS

M/s. J. B. Advani — Oerlikon Electrodes (Private) Ltd., Radia House, 6, Rampart Row, Fort, Bombay-1. (Bhandup, Bombay, Maharashtra) — Fluxes for submerged Arc Welding — 1,200 tonnes.

DRUGS AND PHARMACEUTICALS

M/s. Bengal Chemicals Pharmaceutical Works Ltd., 6, Ganesh Chunder Avenue, Calcutta-13. (West Bengal) — Kaolin Pectin Mixture N.F. — 7,200 litres.

COTTON MANUFACTURES

M/s. Shree Ganesar Textile Mills Ltd., 591, Mandipet, Devangere City. (Mysore) — 100 automatic looms for the manufacture of cotton cloth. M/s. The Kadri Mills (CBE) Ltd., Oddarpalayam, P.B. No. 19, Ondipudur P.O., Coimbatore. (Madras) — 100 automatic looms for the manufacture of cotton cloth. Shree Bhawani Cotton Mills Ltd., 2, Brabourne Road, Calcutta. (Abohar, Punjab) — 100 automatic looms for the manufacture of cotton cloth. The General Industrial Society Ltd., 15, India Exchange Place, Calcutta-1. (Distt. Hooghly, West Bengal) — 6,872 spindles for the manufacture of cotton yarn. M/s. Suraj Textiles Mills Ltd., Malout Mandi, District Ferozepur. (Punjab) — 13,200 spindles for the manufacture of cotton yarn. M/s. Sundaram Spinning Mills, Komarapalayam P.O., (Via) Erode, Salem Distt. (Madras) — 12,680 spindles for the manufacture of cotton yarn. M/s. The Rajkot Spinning and Weaving Mills Ltd., Karansinhji Cross Road, Rajkot (Gujarat). (Gujarat) — 6,000 spindles for the manufacture of cotton yarn. M/s. The Madhya Pradesh State, Industries Corporation Ltd., Industrial Estate, Pologround, Indore City (Madhya Pradesh). (Sanawad, Madhya Pradesh) — 12,500 spindles for the manufacture of cotton yarn. M/s. The Mahendra Mills Ltd., Mahendra Bhuvan, Opp: Gandhi Crossing, Navarangpura, Ahmedabad-9. (Gujarat) — 100 automatic looms for the manufacture of cotton cloth. M/s. Bhiwandi Weavers' Co-operative Society Ltd., Bhiwandi, District Thana, Maharashtra. (Bhiwandi, Distt. Thana, Manarashtra) — 25,000 spindles for the manufacture of cotton yarn. M/s. Belary Spinning and Weaving Company Ltd., 7, Balaji Rao Road, Bellary-2. (Mysore) — 12,680 spindles for the manufacture of cotton yarn. M/s. The Calicut Modern Spinning and Weaving Mills Ltd., 10/64, Somasundaram Mills Road, Coimbatore-1. (Kozhikode, Kerala) — 13,000 spindles for manufacture of cotton yarn. M/s. The Asok Textiles Private Ltd., Asokapuram, Alwaye. (Kerala State) — 9,444 spindles for the manufacture of cotton yarn. M/s. Vijayeswari Textiles Ltd., Puliampatti (Via) Pollachi, Coimbatore District. (Pollachi, Coimbatore District. Madras State) — 100 automatic looms for the manufacture of cotton cloth. M/s. G. T. N. Textiles Ltd., Soundararajapuram, Erumathala Post, Alwaye (Kerala State). (Alwaye, Kerala) — 13,000 spindles for the manufacture of cotton yarn. M/s. Prabhuram Mills Private Ltd., 5, Shanmuga Mudali Street, Royapettah, Madras-14. (Alleppy, Kerala) — 13,000 spindles for the manufacture of cotton yarn. M/s. The Rajalakshmi Mills Ltd., Singanallur Post, Coimbatore-5. (Madras)—100 automatic looms for the manufacture of cotton cloth. M/s. Sree Sabari Mills (Private) Ltd., Lakshmi Vilas, 5, South Bank Road, Raja Annamalaipuram, Madras-28. (K. Sathanur, Madras) — 12,000 spindles for the manufacture of cotton yarn (shifting from Thiruchirapalli to K. Sathanur in Madras State). M/s. Super Spinning Mills Limited, R.P.G.T. Colony, Hindupur. Anantapur District. (Andhra Pradesh) — 6,000 spindles for the manufacture of cotton yarn. M/s. The General Industrial Society Ltd., 15, India Exchange Place, Calcutta-1. (West Bengal). — 100 automatic looms for the manufacture of cotton cloth.

WOOLLEN MANUFACTURES

M/s. The Punjab Woollen Textiles Mills, G. T. Road, Chheharta, Punjab. (Chheharta, Amritsar, Punjab) — 18, power-looms for the manufacture of worsted woollen fabrics.

SYNTHETIC YARN MANUFACTURES

M/s. Century Spg. and Mfg. Co. Ltd., Industry House, 159, Churchgate Reclamation, Bombay-1. (Maharashtra) — Rayon Tyre Cord — 2.3 million Kgs. M/s. Fancy Corporation Ltd., Sir Vithaldas Chambers, 16, Apollo Street, Fort, Bombay. (Maharashtra) — Embroidery piecegoods — 4 embroidery machines for producing 1,40,000 yards per month.

PAPER

M/s. T. R. S. Ramanatha Iyer & Brothers, Bankers, Coimbatore and Palghat-4. (Palghat, Kerala State) — (i) Paper — 3,000 tonnes; (ii) Pulp — 3,000 tonnes. M/s. Krishna Flour Mills, Post Box No. 575, Old Tharagupet, Bangalore-2. (Ghataprabha Distt. Mysore) — Writing and printing paper — 6,000 tonnes. Pulp — 6.000 tonnes.

FLOUR

M/s. The South India Flour Mills Pvt. Ltd., 1-2, Rayapuram Beach Road, Madras-13. Name and style of: M/s. The South India Flour Mills Pvt. Ltd., Madras. (Madras) — Atta, Maida, Suji and Bran — 1,320 tons per month (in terms of wheat). M/s. The Balaji & Maharani Flour Mills, 300, Duncan Road, Bombay-4. Under the name and Style of: The Balaji & Maharani Flour Mills. (Maharashtra) — Wheat Products — 1,200 tons or 1,219 Metric tonnes per month (in terms of wheat).

VEGETABLE OILS

M/s. Hanuman Oil Mills. Shreeniketan, 99. Marine Drive, Bombay-2. (Khamgaon, Maharashtra) — Cotton seed oil (monthly capacity) — 300 tons. (Monthly capacity after expansion) 600 tons or (60,000 tons p.a. in terms of cottonseed).

LICENCES REVOKED OR SURRENDERED

(During the week ending 21st March, 1964).

(Information pertains to particular licences only).

M/s. Chamanlal & Brothers, Bombay — Jest system of Dyers and accessories for processing fabrics and paper coating, dyeing impregnating, etc. M/s. Jagmohan Silk Mills, Bombay — Textiles made of art silk including artificial silk yarn. M/s. West Coast Paper Mills Ltd., Bombay — Rayon grade pulp and paper out of grade pulp. M/s. Modi Vanaspati Manufacturing Co., Modinagar. Vanaspati. Shri Bhailalbhai, S. Patel, Bakrol via Anand, District Kaira — Penicillin vials and Heat Resistant Pressure ware, etc.

BOOKS BRIEFLY

Water is Good

Effects of Bhakra Dam Irrigation on the Economy of the Barani Villages in the Hissar District: 1960-61: Published by Economic and Statistical Organisation, Punjab Government, Chandigarh; Price Rs. 14.

Reviewed by T. P. MANI

THIS REPORT (for the year 1960-61), is the Ninth one in the series initiated by the Board of Economic Inquiry, Punjab and the object of it is, to study, analytically the impact of the Bhakra Nangal Project on the economy of the Barani villages in the Hissar district.

For the sake of analysis, the sample villages are grouped under three categories, viz., B.D. (Bhakra Dam irrigated), P.I. (previously irrigated) and Barani (completely rain-fed) The volatile fluctuations in the intensity of cropping during the years 1950-51 to 1960-61 has been well explained by linking it with the presence of a large percentage of Barani areas in the BD and PI villages. The unsteadiness, in the percentage distribution of area under Kharif and Rabi crops in the BD villages, has been accounted for by the uncertainty and inadequacy of the canal water supply. It is shown that the maturity of crop is higher in the irrigated areas as compared to the completely rain-fed category.

As regards cropping pattern "irrigation seems to have resulted in lowering the percentage area under bajra and gram and increasing the area under other crops which include cotton, sugarcane, vegetables, fodders, etc." The analysis of the value of production per acre held and the effect of irrigation on production are vague. The existence of higher levels of indebtedness and the higher redemption level in the BD and PI villages relatively to that in the Barani villages is an interesting point. Based on the arrivals of crops such as cotton, maize and chillies which are exclusively from irrigated areas it is concluded that the marketed surplus has a tendency to increase with the increase in irrigation facilities.

The analysis in Chapter IV of the Farm Accounts of the five selected holdings corroborates the conclusions drawn earlier regarding intensity of cropping and the cropping pattern. It is also shown that the output per acre of each crop has an increasing trend. It is rightly accounted that the remarkably high rate of yield in 1960-61 was due to favourable weather conditions during that year. From the analysis of gross income per acre from different crops no revealing conclusions have been arrived at. The analysis of net income, from farming is unnecessarily complicated. With the data on return per worker no interpretation has been attempted.

The study in Chapter V, on Family Budget of the five selected households, brings out the obvious fact, that farm, is the chief source of food supply of the families. As compared to the year-end budgetary position of the year 1959-60 which showed a deficit of Rs. 345.48 per family, that of 1960-61 discloses a surplus of Rs. 391.63 per family.

Thus, but for certain broad conclusions regarding intensity of cropping, maturity of crop and the cropping pattern, the Report does not bring out other aspects of the impact of the project. In arid lands irrigation may lead to progressively increasing degree of alkalisation. There is also the possibility of water logging due to a rise in the level of the sub-soil water. Lastly, there is the long-run problem of wastage of water due to seepage. No mention of these problems has been made. The result is that, despite its obvious good intentions, the survey fails to convey adequately a sense of the possible impact which this gigantic project may be expected to have made.

UNDER-DEVELOPED ECONOMIES

Essays on Planning and Economic Development: Centre of Research on Under-Developed Economies; P.W.N.-Polish Scientific Publishers, Warsaw.

Essays on Planning and Economic Development is the first in a series of studies on developing countries planned to be brought out from time to time by the Polish Centre of Research on under-developed economies. There are four contributions in this booklet by eminent Polish economists. The first paper by Mr. M. Kalecki deals with methods of constructing a perspective plan. This paper is based on Polish experience and was originally presented by its author to the UNESCO Seminar on the programming of economic development held in January, 1963, in Sao Paulo.

The choice of techniques has been baffling many under-developed countries. Mr. Zofia Dobrska quoting profusely from Prof. A. K. Sen's celebrated volume 'Choice of Techniques' makes some concrete suggestions with regard to the choice of planning techniques in various existing economic conditions in developing economies. Dr. Ignacy Sach and Mr. Jerzy Tepicht have chosen no less important subjects. Dr. Sach deals with planning in an import-sensitive economy. He suggests that while no fixed rules can be drawn .... an import-substituting scheme should be preferred to an export-oriented one, as it strengthens the economic independence of the country.

Mr. Tepicht's paper on agrarian relations and the growth of agricultural production has much to do with Indian experience. He suggests that "until the development of industry enables it to take over surplus labour from agriculture and to provide the remaining rural population with modern means of production, we should not make a fetish out of the technical productivity of labour, but on the contrary we should try to get out of agriculture those specific reserves for increasing output that can be put in motion by a consistently designed agrarian reform".

FERTILIZERS

Fertilizer Statistics, 1962-63: Issued by the Fertilizer Association of India, 85, Sundar Nagar, New Delhi; Pages 300; Price Rs. 10.

During the last eight years the Fertilizer Association of India has been bringing out regularly this annual publication on fertilizer statistics, but this year it has brought out two editions, one in February and the other in November. Broadly, the statistical study is divided into two parts. The first part, covering a little more than half, concentrates attention on the present installed capacity of plants producing different kinds of fertilizers, the licences which have been issue for the establishment of new units and those which have been planned but are yet to be licensed.

This also applies to the other types of fertilizers, such as phosphatic fertilizers, complex fertilizers, potassic fertilizers and mixed fertilizers. In addition to figures regarding installed capacity of the units, the publication sets out data regarding prices and subsidy, the third five-year Plan and various other miscellaneous statistics such as recommendations for fertilizers used for different crops in various States, main manuring seasons for various crops in different States, instructions for mixing fertilizers, etc. Also, it provides detailed figures to compare fertilizer production and consumption in India and abroad. An interesting table on page 168 compares fertilizer consumption with yield per acre and the density of population in India and thirteen other countries.

COMPANY MEETINGS

UNITED BANK OF INDIA LIMITED

Excerpts from the Speech delivered by Dr. N. N. Law, Chairman, United Bank of India Limited, at the Annual General Meeting of the Shareholders of the Bank held on March 30, 1964.

BANK'S PROGRESS

The past year has been a period of significant advance by your Bank. The Profit has increased by Rs. 5.19 lacs or 24.5 per cent. The dividend has been raised to 7½ per cent. This is the third rise in dividend since the amalgamation. Deposits have increased by Rs. 7.9 crores, i.e., 12.2 per cent (as against 10.1 per cent rise in the deposits of all scheduled banks). Seven new branches were opened during 1963 and so far this year 2 new branches have been opened. The emoluments of the employees have also been further improved.

Another important and significant event that has taken place during the year is the acquisition of a site measuring 57 Cottahs — nearly an acre — on Old Court House Street. On this site is proposed to be constructed a new home for the Head Office of your Bank. The detailed plans for the building are being drawn up by the architects, and it is hoped that construction work will commence during the year.

I do not wish to give you the impression that the results achieved so far should lead to complacence. On the contrary, in view of the mounting operating costs, referred to later in this statement, a greater responsibility has devolved on all of us, the Directors as also the workers in various spheres and levels in this Bank. A number of steps have been initiated early this year to achieve a wider decentralisation of functions, and as the year progresses, efforts will be made to implement the programme in a phased manner. Our aim should be the attainment of a deposit level of Rs. 100 crores within the next two years, if we are to cater to the increasing credit requirements of the developing economy. I do hope that with the concerted efforts of the workers, shareholders and present and prospective customers, the target may be achieved even earlier than contemplated.

INTEREST RATE

The biggest task before the Bank today is, therefore, to accelerate the rate of growth, and to meet the growing burden of interest on deposits. We shall try to achieve this by intensifying our efforts, opening more branches and by diversifying our services.

As I speak to you, banks are considering whether a further rise in the rates of interest on deposits is necessary, their attention to this matter having been recently drawn by the Reserve Bank. It seems likely that a further rise will be effected, and such a step will add to the already high operating cost and will consequently tend to step up the lending rates. My view on the lending rates is well known to be against such rise.

To my mind, it should be the aim of the larger banks in the country to be able so to rationalise, at an early date, their lending rates as will bear a reasonable relation with the line and pattern of the largest bank in the country. It should, at the same time, be their aim to remain free from anxiety concerning liquidity. An important method for achieving these ends would be to make concentrated efforts to increase deposit resources through means other than that of raising the interest rates. At the same time, an expedient utilisation of resources has also to be ensured.

In this context, I would like also to refer to the conditions obtaining in the Stock Exchanges. Ultimate safety and liquidity of bank advances in a growing economy, incapable, due to various reasons, of planning for extinguishment of debts, depend considerably on the ability of borrowers to shift the credit facilities in due course by obtaining equity and long-term finance through the Stock Exchanges. Apart from the inhibiting taxation, high rate of interest on bank advances stands in the way of the development and expansion of Stock Exchange services. On this ground also it would be against the interest not only of the banks themselves, but also of industrial expansion, to encourage a rising structure of interest rates.

However, the present mood seems to be to ignore these implications and to depend on an upward revision of the rates. In that case, since we cannot swim against the current, we shall also have to fall in line, much as I would have wished that the trend were checked.

If the rates have to go up, it would be better to confine the rise to that portion of bank deposits which could be marginally sensitive to interest rates, viz., term deposits for periods over twelve months, and not to cover the whole range of deposits. The incidence of the cost of term deposits can then be somewhat neutralised by reducing the cost of demand deposits, including Savings accounts which have virtually become Current accounts. One of the ways to do so would be to introduce two types of Savings accounts and to reduce the rate on those with very small balances, limiting the frequency of withdrawals in such uneconomic accounts. Adjustments of other service charges may also have to be undertaken.

SMALL INDUSTRIES

I am happy to report that further headway has been made by the Bank in the matter of providing finance to the small scale industries. As you will recall, a separate Section was started about two years ago, with a view to processing with special care, such proposals from smaller industrial units as could not straightaway be considered, in the normal course, by our Advances Department. After the initial experimenting and probing, some tangible progress has now been made and a number of small scale industrial units have been financed and are being given special service. Steps are now being taken further to expand the activities of this Section in the matter of financing small scale industrial units.

It has been our experience that more than the question of bank finance, the small entrepreneurs are faced with other

problems, those relating, for example, to risk capital, marketing, raw materials, power, land, technical know-how, etc. The difficulty that we mostly face in financing these units is the deficiency in financial management. There have been cases where after proper assessment and discussion it was discovered that a good portion of the required development finance could be found from resources within and that only a small advance from the Bank could satisfy their requirements. In some other cases it was also possible for the Bank to suggest ways and means by which the concerned units could raise finance from other more appropriate agencies or improve their profitability. Our approach, therefore, has been to provide the best possible financial guidance and advice along with the required finance. This is much appreciated by the concerned borrowers.

NATIONALISATION OF BANKS

The most significant issue that developed in the past year relates to the nationalisation of banks. I do not understand the wisdom of this clamour for nationalisation. Take the case of this Bank. The ownership is widely distributed, the management is conducted by people who have risen from the bottom of the ladder, the employees are drawn from the middle class families and number around 4,000. It serves the common man with sincerity and warm friendliness. Could nationalisation make any difference for the better? The only difference it could make, to my mind, is that the profit would then go to the State Exchequer instead of being paid to you as dividend.

The charges levelled by the protagonists of nationalisation are mainly those of concentration of power, of diversion of resources to big industries and of failure to spread in the rural areas. With the recent amendment of the Banking Companies Act, the already existing wide powers of the Reserve Bank of India have been further expanded. It can now remove any director, chief executive or any other employee of a bank and also appoint persons of its choice in place of those removed. It has also been provided that no shareholder can have a voting right in excess of 1 per cent of the total voting rights of all the shareholders of the banking company. With these powers vested in the Central Banking Authority the talk of concentration of power is not tenable.

In the matter of making advances also, the Reserve Bank has extensive powers to issue directives to all the banks generally, and to an individual bank particularly, in various matters regarding advances, including the maximum amount of advance that may be made to an individual borrower.

If the banks are financing big industrial projects it is only in accordance with the industrial policy of the nation. In the situation of control in this regard, installation and expansion of big units can only be in accordance with the industrial policy and with the permission of the Government. If, therefore, such projects are vital to economic development, it is only proper that the commercial banks should assist these to the best of their ability. What is really to be regretted is that on account of inadequate growth of deposits, the banks are not always able fully to cater to the requirements of these projects.

As for the question of expansion to the rural areas, it must be remembered that this could not be undertaken indiscriminately. It is a well-known fact that branches in rural or semi-rural areas incur losses for a number of years. The rate of expansion in this sphere, therefore, must be determined by the ability to bear losses. For any economical unit, whether in the public sector or the private, a balance must be struck between that part of its operation which is already economic and that which is, or is for some time likely to remain, uneconomic. Yet, the banks have already been expanding in these areas and during the past few years the coverage that has been extended must, in the circumstances, be considered satisfactory.

While it augurs well that views advocating nationalisation are held by a very small group and that the government has not endorsed these views, it is imperative that a thorough reappraisal and self-analysis be made by the industry itself with a view to devising ways and means to alter the image of its services to the community. The bankers are conscious of this need. An important step in this regard would be, besides an enlightened collective public relations programme, to develop, with a positive purpose, a wide range of promotional activities with adequate "social content", particularly in assisting growth of self-employment through small scale industries.

These efforts would no doubt need a lot of pioneering in finance, but that need not deter nor delay any such programme. Further, such activities would attract much more resources to the banking system than what higher rates on deposits are likely to fetch. On the other hand, such dissipation of bank earnings through higher rewards to depositors, by charging more to the people who undertake productive economic activity, increases consumption and adds to the factors distorting the efforts to hold the price line. Bank earnings devoted to the promotion of self-employment will accelerate economic development and go a long way in resisting inflationary pressures.

DEVELOPMENT BANKS

In this connection, the role that is being played by the development banks in the country comes to my mind. These institutions, while performing very useful services, are dependent, to a very high degree, on the Government for their resources. The resources made available to the Industrial Finance Corporation are interest bearing. While to State Financial Corporations such funds are not at all made available. Their own attempts to raise resources from the community in the form of increased equity or bonds have not been successful to the extent required. It is true that the conditions prevailing in the country are not yet conducive to the sucess of attempts by the development banks to raise their own resources. This is because in their case the prospects of profits are not only low, but long-term as well.

It would, therefore, be advisable that adequate funds be made available to these institutions in the form of junior capital. At the same time the commercial banks, which are not in a position to play an unrestricted direct role in providing development finance to industry on a substantial scale, though they are doing their best to provide medium term loans and working capital might orientate their operations and provide more resources to these specialised institutions. This would be a worthwhile contribution for the commercial banks to make and would help them as to liquidity. Similar contribution could be thought of in the field of agriculture also. It will still be necessary for the development banks, however, to create their own cells for initiating efforts to place their commitments in capital subscriptions and issue of bonds, direct with the public. This again makes the need for activising Stock Exchanges more urgent.

For assisting the small and medium scale industrial sector, a number of institutions are now functioning: the State Financial Corporations, the National Small Industries Corporation, the Small Industries Service Institute, the agencies functioning under State Aid to Industries Act, and the Guarantee

NATIONAL AND GRINDLAYS BANK LIMITED

(Amalgamating National Bank of India Ltd., Grindlays Bank Ltd., and the Eastern Branches of Lloyds Bank Ltd.)

Registered in London under the Companies Act of 1862 on the 23rd March, 1866. The liability of Members is limited.

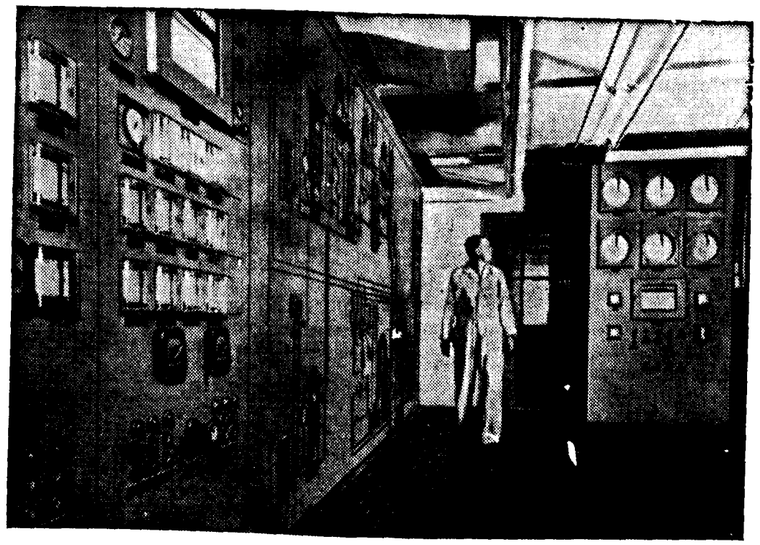
Bankers to the Government in Aden, Kenya, Uganda and Zanzibar.

Authorised Capital ... ... £ 9,000,000
Issued and Paid-up Capital ... £ 5,703,000
Reserve Fund ... ... £ 5,250,000

Head Office : 26, BISHOPSGATE, LONDON, E.C.2.

London Branches :

54, Parliament Street, S.W.1.
13, St. James's Square, S.W.1.



BRANCHES throughout Aden, Ceylon, India, Kenya, Northern and Southern Rhodesia, Pakistan, Somalia, Tanganyika, Uganda, Zanzibar.

The Bank conducts all classes of Banking and Exchange Business throughout the world.

Delhi Branches :

Chandni Chowk ; Chandni Chowk, (Lloyds Branch) ; Bhichha Mal Building, Grand Trunk Road, Kamla Nagar ; Delhi Cloth Mills Premises, Bara Hindu Rao ; 10, Parliament Street, (Lloyds Branch) ; H Block, Connaught Circus ; 10-E Block, Connaught Place ; 1689, Arya Samaj Road, Karol Bagh ; Jeevan Vikas Building, Asaf Ali Road.

Look what you get with

HONEYWELL Instrumentation

Far more than just instruments, you get a complete control system, custom designed for your specific needs, by men who know your processes.

You get expert, interested assistance every step of the way, with your initial planning and long after your instruments are installed. Blue Star assume full responsibility for the engineering, installation and start-up of your system.

You get training for your instrument technicians in the most up-to-date maintenance methods at the tuition-free Blue Star-Honeywell Instrumentation Education Centre at Bombay.

You get prompt, competent service from your nearest Blue Star office and immediate replacement of emergency repair parts.

These are but some of the plus-values that comprise Instrumentation by Honeywell...and they apply regardless of whether you buy a single instrument, a replacement part or a complete control system.

Scheme operated by the Reserve Bank through the scheduled banks. Perhaps it may serve the purpose better if instead of multiplication of agencies dealing with small and medium scale industries, a separate single agency is set up for each region, with a combination of all the varieties of functions now performed by these multifarious agencies. Such an institution at the state level would be better equipped to render not only financial assistance, but also services in the form of marketing information, technical and managerial assistance, etc., which these industries so badly need. Through its provision, even if partially, of risk capital to the small entrepreneurs, such an institution would act as a catalytic agent in the capital market, on the lines of the functions performed by the Industrial Credit and Investment Corporation of India at the national level.

GENERAL ECONOMY

Coming to the overall economic development in the country, it is being increasingly realised that in recent years the rate of growth has not been up to the desired level and that vigorous steps should be taken to accelerate the tempo of development. A number of steps in this regard have been taken recently in the form of relaxation of capital control, price control, streamlining of licensing procedures, increased resources of the development banks, establishment of the Unit Trust and the Industrial Development Bank. The Finance Minister has also repeatedly emphasised the need for achieving faster growth and for this purpose he is contemplating further measures, over and above the fiscal incentives which in a limited way have been provided for certain industries in the budget.

At the same time it is equally necessary to establish a measure of continuity of these policies. An illustration of the lack of continuity in policies, which we have so often experienced, is provided by the recent budget proposals concerning the Annuity deposit, the expenditure tax and the increases in the rates of wealth tax and estate duty. The essence of a sound fiscal policy in the context of the situation prevailing in the country, is its ability to stimulate investments. An essential ingredient of investment decisions is constituted by reasonable expectations regarding the future course of events. Lack of continuity of policies does weaken such expectations, and set at nought all forecasts and planning so very vital in any industrial operation.

There is another facet of this aspect of expectation or forward projection, and that is psychological. But it plays a very significant part in any human activity. To my mind, what seems to be happening is that, while it is a declared objective to encourage investments and thereby to achieve a higher growth rate, there is not yet the full realisation of the significance of the psychological factor of expectations regarding finance of the psychological factor of expectations regarding the future. In the absence of reasonable optimism on this score, no amount of institutional props and persuasion will be adequate to generate the desired degree of economic growth.

What the country needs is an all-pervading atmosphere of development and a climate of self-employment through small and ancillary industries spread all over the country. While fiscal policy, in so far as it had been inhibitive, has undergone certain adjustments, this by itself will hardly be enough. Every region in the country should make a determined and positive bid to generate a real movement for stimulating industrial growth at all levels. An essential step in this respect would be to provide against a degree of risk which is inherent in any pioneering effort. When it is ensured that the community will back up the venture, much will be achieved in orientating the common man to the idea of self-employment through industries. No movement can achieve results without the readiness to pay the price for it.

At the State levels adequate funds should be found to take care of the financial risks which may develop through such a movement. Bearing the risks at the State level, in this manner, would actually be an investment in the future and will prepare the basic background for self-employment through industrialisation. If, from this point of view, it becomes desirable — which possibly it is — to pool the resources of the development banks operating in a particular region, that also should be done. The budgets of the States should be carefully examined and the impact of each item of expenditure should be analysed to see what proportion of the budget is directly aimed at encouraging self-employment. Provision of adequate funds, as mentioned earlier, would constitute a very small percentage of the total State resources but would go a long way towards fulfilling the goals of economic development.

Note: This does not purport to be a record of the proceedings of the Annual General Meeting.

THE INDIAN OVERSEAS BANK LIMITED

SPEECH OF THE CHAIRMAN, SHRI M. Ct. MUTHIAH

Following are the extracts from the speech delivered by Shri M. Ct. Muthiah at the Annual General Meeting of the Shareholders of The Indian Overseas Bank Ltd., held on Tuesday, March 31, 1964.

LADIES AND GENTLEMEN

I am happy to welcome you to this 27th Annual General Meeting of the Bank in this modern and new administrative building which, as you are aware, was inaugurated early this year by the Hon'ble Shri C. Subramaniam, Union Minister for Steel, Mines and Heavy Engineering. This building, as I stated on a previous occasion, symbolises our past performance, our present confidence and our optimism for the future. It is also a happy tribute to the continuing support of our shareholders, constituents and correspondent-banks at home and abroad. Another significant addition to the Bank's facilities will be the provision of a drive-in-counter with television facilities, which incidentally will be the first of its kind in India, attached to the administrative building. All this would not have been possible but for the support lent to us in abundant measure by our shareholders and I may, therefore, be permitted to express both on my own behalf and on behalf of the Board of Directors our deep appreciation of their steadfast faith and interest in the growth and expansion of the Bank.

BOARD OF DIRECTORS

Messrs. S. S. Vasan, C. M. Khatau and V. K. Ramaswamy Mudaliar, who were co-opted to the Board during the year, hardly need any introduction to the shareholders. I am sure you will all join me in extending to them a hearty welcome.

BANK'S PROGRESS

During the year under review, the Bank's progress was indeed very impressive as you will see from the Directors' Report which has been in your hands for some time and which, with your permission, I shall take as read. Capital and Reserves have increased from Rs. 180 lakhs to Rs. 194 lakhs and deposits from Rs. 3713 lakhs to Rs. 4212 lakhs. There was a sizable increase in advances also from Rs. 2442 lakhs to Rs. 2753 lakhs, resulting in an appreciable gross income of Rs. 263 lakhs as against Rs. 237 lakhs for 1962. We continue to maintain a high liquidity.

ALLOCATION OF PROFITS

With an increase in profits, your Directors were pleased, after making adequate provisions for tax and other statutory requirements, to strengthen the general and other reserves by the additional sum of Rs. 6.75 lakhs as against Rs. 4 lakhs in 1962. The dividend on shares was also restored to 14 per cent as against 12 per cent in the previous year, a cut necessitated by the imposition of Super Profits Tax. Provision for bonus was also stepped up to Rs. 6 lakhs as against Rs. 4 lakhs in 1962.

BANK'S EXPANSION

In the year under review the expansion of the Bank continued at an accelerated rate.

We also expect the Reserve Bank of India to give us permission to open a few more branches at important metropolitan centres which offer great scope for additional banking offices.

During the past year, we have also taken over the assets and liabilities of the Coimbatore Standard Bank Ltd., R. S. Puram, Coimbatore and the Nanjinad Bank Ltd., Nagercoil, with its two branches, one at Eraniel and another at Thittuvalai. The Coimbatore Vasunthara Bank Ltd., Coimbatore, with its branches at Satyamangalam, Puliyampatti and Kaniyur, and the Kulitalai Bank Ltd., Tiruchirapalli, with its branches at Tiruchi Cantonment, Kulitalai, Lalgudi, Musiri, Manaparai and Karur were also taken over on the 17th February and 23rd March, 1964, respectively.

INDIAN SCENE

1963 saw little improvement on the slow rate of economic growth witnessed in the preceding year. Measured in real terms, national income rose by only 2 per cent against an estimated rate of population increase of 2.5 per cent, resulting in a slight decline in per capita income. A mid-term appraisal of the third five-year Plan by the Planning Commission revealed the vast ground to be covered in the remaining two years, if the targets set for attainment are to be fulfilled. But the most disturbing factor was the uncontrolled price level which showed a persistent upward trend during the year, the index rising from 126 to 135, due to the defence efforts and decline in food production. The only silver lining amidst this deepening gloom was the buoyancy of exports which rose by nearly Rs. 104 crores — the largest increase for any single year since the Korean boom.

TAX INCIDENCE

The Central Budget for the year 1964-65 is like the proverbial 'Curate's egg good in parts'. It provides several welcome reliefs, but also contains some wholly new and unexpected imposts. With the Chinese threat still looming large, the budget provides for a total expenditure of Rs. 2041 crores as against the revised estimate of expenditure at Rs. 1825 crores in 1963-64. Taking into account the capital expenditure (including assistance to States) of Rs. 1957 crores, the anticipated budgetary deficit is Rs. 176 crores, which is proposed to be reduced to Rs. 86 crores through additional tax measures yielding Rs. 40 crores and an annuity deposit scheme bringing in Rs. 50 crores. The levy of a more liberal surtax on profits of corporate bodies in the place of super profits tax, the abolition of the compulsory deposit scheme and its substitution by an annuity deposit scheme, and the revision of income and super tax rates on the non-corporate sector to provide some modest reliefs to middle income groups, are some of the highlights of the budget. The dividend tax of 7½ per cent, the steep progression in the new rates relating to estate duty, capital gains tax on bonus shares and re-introduction of expenditure tax are some of the harsh features of the budget which need re-examination with a view to soften their rigours. This is hardly the appropriate forum for discussing these taxation measures in detail. With your indulgence, however, I should like to dwell briefly on one measure, viz. the Estate Duty. It lays a very heavy burden on individual estates which is bound to adversely affect the industrial development of the country. With the stress on a rapid and progressive growth of the national income, it will be conceded that enterprises, whether public or private, should in this country be large sized. Large scale private industries can be launched only by entrepreneurs with substantial means. With a steep estate duty taking away over Rs. 6 lakhs out of the first Rs. 20 lakhs and Rs. 8½ lakhs out of every Rs. 10 lakhs of the balance of an estate, the heirs to a large estate would not only be seriously handicapped in running the industries which are under their control but their efforts to pay the estate duty by selling a substantial part of their estate are bound to badly upset stock markets and bring about a depreciation of the value of

shareholdings all round. This may easily prove a serious deterrent to industrial investment. If the objective is to check concentration of wealth, this could be well achieved by the graduated wealth tax, which — because its incidence would be staggered over a period of time — is less likely to cause violent upheavals of our economy.

BANKING AND MONETARY TRENDS

For banks as a whole, the year under review turned out to be a prosperous one. Many banks were able to show larger profits than in the previous year which in turn enabled them to raise their dividends. There was a spectacular increase in scheduled bank deposits (excluding PL 480 and 665 deposits) from Rs. 1929 crores to Rs. 2211 crores. Unlike in previous year demand deposits increased faster than time deposits. The following table illustrates the pattern of deposit growth:

DEPOSIT GROWTH OF SCHEDULED BANKS DURING 1962 AND 1963

(Excluding P. L. 430 and 665 Deposits)

(Rs. Crores)

	VARIATION		
	Demand Deposits	Time Deposits	Total Deposits
1962	+ 84	+148	+232
1963	+ 182	+100	+282

The substantial accretion to deposit resources enabled banks to comfortably meet the demand for credit which rose by Rs. 158 crores to Rs. 1,580 crores and to reduce their borrowings from the Central Banking Institution. Money supply with the public rose by Rs. 421 crores as against only Rs. 281 crores in 1962. A rise in the Reserve Bank rate from 4 per cent to 4½ per cent early in the year had automatically increased the minimum rate for advance to 6½ per cent, i.e. 2 per cent over the Bank Rate under the Inter-Bank Agreement for minimum rates for advances.

Following the Finance Minister's announcement early in October that the credit policy would be liberalised to stimulate economic growth, the Reserve Bank increased the quota for borrowing by scheduled banks from 100 to 150 per cent of their statutory reserves. The control on minimum margin on advances against shares of 40 per cent was withdrawn. The Government and the Reserve Bank have been quite helpful and continued to pay special attention to credit requirements to the strategic sectors of the economy. The enlargement of the resources of the Industrial Finance Corporation and the industrial Credit and Investment Corporation of India, the establishment of the Unit Trust, the formation of an Agricultural Refinance Corporation to encourage the financing of long term needs of agriculture and land mortgage banks and commercial banks, the proposal to set up a Development Bank with an authorised capital of Rs. 50 crores to assist industrial growth, the lowering of the rate of interest on refinancing facilities made available by the Refinance Corporation against medium term export credits granted by banks from 5 to 4½ per cent — all bear testimony to this.

The clock has been put back, however, to some extent by the announcement on March 11, by the Reserve Bank of India of new restrictions on borrowing by member banks. The occasion for modifying the liberalised credit arrangement announced in October last year was probably provided by the increase in borrowings by member banks by as much as Rs. 45 crores, in the week ending March 6th. The striking increase in advances since the beginning of this year has, in my opinion, led to a mistaken impression that it was necessary to once again introduce selective credit control measures and to make credit available on a dearer basis.

BANKING LEGISLATION

Parliament passed the Banking Laws (Miscellaneous Provisions) Act, 1963 ostensibly to provide for stricter supervision and control by the Reserve Bank of India over banks and non-banking financial institutions which accept deposits from the public. The Act reduces the maximum voting rights of individual shareholders of a bank from 5 per cent to 1 per cent of the total voting rights of all shareholders. The Reserve Bank has also been given power (i) to dismiss or remove any person associated with a banking company either in the public interest or in the interest of the depositors or for the better management of that banking company, (ii) to appoint a suitable person in place of the person removed, (iii) to appoint upto 5 additional directors to the Board of a bank and (iv) to control the maximum amount of an individual advance. The Reserve Bank is also empowered to supervise, control and regulate the activities of non-banking institutions which accept deposits from the public.

NATIONALISATION SCARE

The amendments to the Banking Companies Act, though considered drastic, do not unsettle the bankers as much as the continuing uncertainty associated with the Government's intention touching the future of private banking in our country. As I said the other day at the inauguration of our new administrative building, if Indian banking was able to weather the criticisms levelled against it in Parliament recently, it was because the supporters of nationalisation seemed content with the hope that nationalisation was not entirely ruled out. Since then, I am glad to note that the Finance Minister in an interview with 'The Economist' of London (dated February 29, 1964) had this to say in answer to a question put to him about the considerable sentiment displayed at the annual session of the Congress Party in favour of the nationalisation of banks:

"In the first place, the demand is being raised by a very small section and I do not think we need really bother about it. Secondly, the demand is being linked to such aims as combating inflation and effecting the redistribution of wealth, both completely non-sequitur."

We are commited to an economic policy which depends for its success on rapid and large scale industrialisation. This inevitably means the ready, availability of finance and liberal credit. It has been conceded that the private sector has also to play a very important part in the development of our national economy. In one sense, private banks are only an extension of the private sector and the argument that holds good for the continuance of the private sector, ipso facto holds good for the continued existence of private banking."

I may add here that the Finance Minister in the course of the same interview which I referred to earlier went on to say that he would like the banks 'to lend essentially on the basis of a person rather than the security he has to offer'. He also conceded that the State Bank is not doing it but that it should. The Finance Minister had put his finger on the basic difference between Foreign and Indian banking systems. The industrial growth of the West since the war is to be attributed in large measure to the liberal policies followed by private banks. In my considered opinion, private banks in India are equally well fitted to play this role. Convincing statistics were adduced by the Treasury Bench to establish that both in regard to the profitability of their operations and mobilisation of resources, the record of the private banks was unexceptionable. Signs are not wanting that the banks are adopting a dynamic and creative approach to the problem of financing large, medium and small industries in the context of the overall

objectives of our planned economy. I welcome the addition of a special publicity wing to the Indian Banks' Association, which should continually place before the people relevant facts and figures to dispel such prejudice as may be entertained against banks by any section of the public. The banks, as you are aware, have amply demonstrated their vitality in the matter of mobilising resources through planned expansion and also in diversifying their services to effectively help all sections of the community engaged in the promotion of national productivity. It cannot be emphasized often enough that the need is for greater freedom of action for banks in an ever developing economy than regimentation under State monopoly. I am not without hope that sound economic considerations will prevail and the Government will come forward unambiguously against the nationalisation of private banks. Such an attitude by the Government will clear the air and enthuse the banks to dedicate themselves vigorously to nation-building activities.

STAFF TRAINING

In an increasingly competitive business like banking, it has become imperative to enlarge and intensify staff training methods to ensure a highly personalised service. A comprehensive training programme for the staff at all levels was, therefore, carried out through the year at the Bank's own well equipped residential training school and college. There were as many as five courses specially designed to meet the need of the apprentices and the senior clerks in the school and the directly recruited and promoted officers in the college, besides a refresher course for others. The Bank had also availed of the opportunities afforded by the Reserve Bank of India for the training of the senior officers in the Bankers' Training College at Bombay, which includes a specialised course in Industrial Finance.

BANK'S REVIEW

I am happy to state that the Quarterly Review published by the Bank since April 1963 to focus attention on the economic and trading problems of India and the South-East Asian territories which form part of the Bank's area of operations, has been very well received both here and abroad. It will be our endeavour to maintain the high standard of the publication in all future issues.

CONCLUSION

It is with mixed emotions that I address myself to the next task. Mr. S. R. V. Arasu, our General Manager, who has been with us for 19 years, retires as from 21st August, 1964. His geniality, politeness and courtesy had endeared him to all, staff and constituents of the bank. I will be failing in my duty if I do not express our high appreciation of his long and dedicated service to the Bank. You will all join me, I am sure, in wishing him a peaceful and contented retirement.

I now have the pleasant duty of welcoming Mr. K. M. Nanjappa, who will be our next General Manager. He has had a distinguished and long banking career extending over three decades with the State Bank of India. At present he is the Principal of the Staff Training College of the State Bank of India at Hyderabad. I am sure that the Bank will greatly benefit by his long and varied experience and mature guidance.

In conclusion, I should like to take this opportunity to express on behalf of the Directors and on my own, our high appreciation of the excellent work done by the staff at all levels during the year.

Note: This does not purport to be a record of the proceedings of the Annual General Meeting.

GOVERNMENT OF INDIA

4 PER CENT. LOAN 1970 — ISSUE PRICE Rs. 99.00
PER Rs. 100 (NOMINAL) — REPAYABLE ON 15TH APRIL 1970

4¾ PER CENT. LOAN 1989 — ISSUE PRICE Rs. 100
PER Rs. 100 (NOMINAL) — REPAYABLE ON 15TH APRIL 1989.

The holders of 3½ per cent National Plan Loan 1964 and 3 per cent. Loan 1964 have been given the facility of converting their holdings into 4 per cent. Loan 1970 to be issued at Rs. 99.00 per Rs. 100 (Nominal) and repayable at par on 15th April, 1970 or 4¾ per cent. Loan 1989 to be issued at Rs. 100 per Rs. 100 (Nominal) and repayable at par on 15th April, 1989.

2 The securities of 3½ per cent. National Plan Loan 1964 and 3 per cent. Loan 1964 will be accepted for conversion at par and interest thereon will be paid at the rate of 3½ per cent. and 3 per cent. per annum upto and inclusive of 18th April, 1964 and 14th April, 1964, respectively.

3. The new securities to be issued by way of conversion will bear interest from 15th April, 1964. The interest, which will be paid half-yearly on 15th October and 15th April, will be liable to tax under the Income-tax Act 1961.

4. Applications for conversion will be received during the period 15th April, 1964 to 22nd April, 1964 (both days inclusive) at:-

(a) Offices of the Reserve Bank of India at Bangalore, Bombay (Fort & Byculla), Calcutta, Madras, Nagpur and New Delhi;

(b) Branches of the subsidiary banks of the State Bank of India conducting Government Treasury Work; and

(c) Branches of the State Bank of India at other places in India.

MADURA MILLS COMPANY LIMITED

Regd. Office: New Jail Road, Madurai

Speech of the Chairman, Dr. Rajah Sir M. A. Muthiah Chettiar, at the Annual General Meeting of the Shareholders of the Company held at Pandyan Building, Madurai, on 25th March, 1964.

Gentlemen,

The Report of the Directors and the Audited Accounts of the Company for the year ended 31st December, 1963 having been circulated in the prescribed manner, I propose with your permission to take them as read.

The country is still in the grip of the Chinese cold war and although there is at the moment no fighting at the border, the state of emergency cannot be said to have abated. Your Company and its associates continue to play their full part in meeting the defence requirements of the country.

The small carry-over of 13.90 lakh bales of cotton which the country had at the beginning of the season 1962/63, caused a certain amount of anxiety and Mills resorted to buying heavily as the crop started moving. Prices had a tendency to pierce the ceilings. But the system of quality surveys and the Supervisory Scheme introduced by the Textile Commissioner helped to bring down prices somewhat and I am pleased to be able to say that the purchases made by your Company were at reasonable levels.

Because of import restrictions due to the country's limited foreign exchange resources, there was acute shortage of foreign cottons during the year. However, our production programme of fine counts and of our Industrial lines was not impaired to any great extent.

There was very good demand for our yarns in inland markets throughout the year. Sales were maintained at a steady level as in the previous year and the revision in the yarn prices which came into force from 7th February 1963 enabled the Company to maintain a satisfactory turnover notwithstanding power cuts for a number of days on a voluntary basis and an enforced 100 per cent cut for a fortnight during June/July. Market prices for all counts of yarn continued to show an upward trend and the Government continued with their scheme of compulsory allocation of a certain percentage of the production to handloom weavers.

The export performance during the year, although satisfactory, shows a slight fall over the previous year. This is mainly due to increasing competition in all overseas markets and the new licensing procedure which came into force during December 1962 for all yarn exports to U.K. However, there is an encouraging trend in recent months and it is expected that our performance during 1964 will be better than in the year under review.

You will have noticed from the Directors' Report that the 450 Looms Project has been implemented. The year 1963 has thus seen the establishment of the first phase of our Weaving Project, although only in temporary accommodation at present. Our target for the present is 950 looms of which 850 will eventually be erected at Ambasamudram where an up-to-date modern Weaving Shed is under construction. Once again we are placing order with Picanols, Belgium for the additional 500 looms, out of the Belgian credit negotiated by the Government of India.

So far as the production on the existing 450 looms is concerned I am pleased to report that in spite of many difficulties a most satisfactory start has been made, both in the export markets, where we have more than met our obligations and in the Inland Market together with considerable Defence orders and it is anticipated that this progress will be maintained during 1964.

The addition of Bleaching, Dyeing and Finishing Plants has also been taken up and our application having been recommended by the Textile Commissioner is under consideration by the Government of India. We are hopeful that we shall receive their approval before long.

As for the accounts, you will have noted a change in the presentation of the figures in the Directors' Report showing a profit of Rs. 80,17,083. You will no doubt agree that the net profit of Rs. 42,79,091, is a marked improvement on last year's figure of Rs. 31,81,355 bearing in mind the increase in the depreciation charge and Development Rebate Reserve. The Modernisation Scheme and Rationalisation of workloads are beginning to show their beneficial results. The Company, with its large capital base, will not be adversely affected by the levy of Surtax which has been introduced in the place of Super Profits Tax but the imposition of the Dividend Tax is indeed an additional burden.

I should like to invite the attention of the shareholders to the net fixed assets position compared with the Paid-up Capital. In view of the very satisfactory Reserve position the disparity could no doubt be righted somewhat by bringing the Paid-up Capital position rather more into line with Capital actually employed, but the penal tax provisions contained in the recent budget act as a deterrent.

Before concluding, I wish to express my appreciation of the efforts of the staff and other employees who have contributed a great deal to these satisfactory results, and with their continued support we can look forward to increasing prosperity.

Sd/- M. A. Muthiah Chettiar.

NOTE: This does not purport to be a report of the proceedings of the Meeting.

SEN-RALEIGH LIMITED

CHAIRMAN'S REVIEW

The Fourteenth Annual General Meeting of Sen-Raleigh Limited was held in Calcutta on the 31st March, 1964. Below is the Statement of Mr Abhijit Sen, Chairman of the Company :

As anticipated in my last statement to you, the year under review turned out to be one of our more difficult ones. In spite of continuing demand for our products, sales were appreciably lower than in the preceding period as it was not possible to maintain production at desired levels owing to chronic shortage of raw materials, when sections of the factory had to be laid-off for periods extending up to 2/3 months at a time. As a consequence the financial results of the Company for the year have been extremely disappointing. For the first time in some years, your Directors have been unable to recommend payment of a dividend on the Ordinary Share Capital of the Company.

I am sure you would agree with me that in view of the heavy financial commitments ahead of the Company for implementing its expansion schemes about which reference was made in my last report to you, the wisest course for the Company to follow would be to conserve its resources to the fullest extent for the present.

Towards the end of the year under review your Company was ready to put into effect this vital scheme for expansion of bicycle production but it was not till the end of 1963 that it was entirely satisfied that the material flow required for such expanded production would be forthcoming. The expansion of bicycle production which is now under way, is one of a number of steps that the Company needs to take to bring back reasonable profits in its operation.

After three years of near stagnation, the demand in general for bicycles and some of its components has once again started looking up. Your Company intends to reap the full benefit of this rise in demand. In some components where the demand has grown to the degree that it is embarrassing for the Company to have to refuse orders even for supplies to other cycle manufacturers, the matter of expanding production is now actively engaging the attention of your Directors.

Progress in the House Service Meter Scheme of the Company has been limited to sending over the first batch of trainees to Associated Electrical Industries Ltd., Manchester and completing the import application for the plant. It is expected that with the first batch of trainees now actively associated with the planning of the Indian production in the U. K., this scheme will gather necessary momentum.

The protection granted to the Bicycle Industry fell due for review in 1963 and a Tariff Enquiry was held on the subject in July of that year. After the enquiry, the Tariff Commission recommended that protection be withdrawn in the case of the Bicycle Industry and this recommendation was accepted by the Government of India. However, to protect the interests of the consumer, the Tariff Commission further recommended that the manufacturers' prices of bicycles be brought under a system of voluntary control, and as this recommendation was also accepted by Government, today bicycle manufacturers cannot increase their prices without reference to Government. A further recommendation sought to establish a ceiling on retail prices of the bicycle. Both these latter recommendations appear inconsistent with the conditions prevailing at the moment. Whilst it may be possible to effect a control on manufacturers' prices voluntarily, there is little possibility of maintaining a voluntary ceiling on dealers' prices in a market where demand far outstrips supply.

After many years of consistent effort on the part of manufacturers, the export performance of the Bicycle Industry as a whole is showing a satisfactory trend. In common with other manufacturers your Company's exports rose appreciably in the period under review. Orders are now flowing in steadily for the Balaka bicycle which was introduced to African and Middle Eastern markets during the year.

A disquieting feature of exports — particularly from the port of Calcutta — is the pilferage that appears to take place at the docks here. Few of the consignments sent out over the last year from Calcutta seem to have escaped pilferage and importers in other countries are now chary of placing orders on Indian manufacturers as a result of this evil. No dealer in a competitive market can be expected to risk losses by ordering on India when he is assured of certain supplies by ordering on other countries. This matter deserves the serious attention of the Ministry of International Trade as a remedy to this problem is only possible at Government level and does no lie in the hands of the exporter.

A fresh Five Year Agreement in replacement of the expiring one has been negotiated with the Employees Union and is now in the final stage of drafting. It is hoped that the New Agreement would bring in improved operations on the part of the Company and even better relations with its workers.

It was with deep sadness and a sense of personal loss that the news of the sudden demise of Mr. G. H. B. Wilson in an unfortunate car accident was received in December. Many of you, who also knew him, must have felt the loss acutely. Mr. Wilson was a man of rare vision whose interest in the cause of spreading cycling gained for him the soubriquet of "Mr. Bicycle" in his own country — and for India its thriving bicycle industry.

I would extend a welcome to Mr. D. P. Harris, the Works Director of Raleigh Industries Limited who now joins our Board. The experience Mr. Harris brings to this Board would be of great value to the Company in its efforts to tide over it present difficulties.

We were very pleased to receive a visit from Mr. R. D. Young, the Chairman of Raleigh Industries Ltd. Although fleeting, the visit was extremely helpful and it is hoped it would be the precursor of many more in future.

ABHIJIT SEN

Calcutta.
Dated 26th February, 1964.

NOTE: This does not purport to be a record of the proceedings of the annual general meeting.

RECORDS AND STATISTICS

Budget Chasing Shadows?

HE BOMBAY Stock Exchange has brought out a ritical memorandum on the tax proposals in the entral Budget for 1964-65, pointing out the probable dverse consequences for the capital market and indusrial expansion. A particularly useful feature of the emorandum is the analysis of corporate data in suport of two of its principal arguments: (a) the assumption that a dividend tax is needed to prevent excessive ividends is not correct since there has, in fact, been o tendency in the corporate sector to distribute unduly high dividends at the expense of reserves; and (b) a bonus issue does not lead to any immediate or direct accretion of capital values as is contended by the Finance Minister in defence of his proposal to tax the entire value of bonus shares as if they are capital gains. The memorandum has been extensively referred to in the first leading article in this issue and here we reproduce from the memorandum some of the tables which are relevant to the discussion.

MARTIN BURN LOOK BACK TO OVER *180 YEARS OF SERVICE TO INDIA*

...to be able to compute this service by decades, not by years alone...to recall that our creed has consistently been the development of our country's resources through engineering and allied enterprises...to take pride in planning that makes the many units in our organization fall into a rational and complementary group and each one a leader in its particular field, a position which some of them, early pioneers in India, held even in the last century. For us looking back is a worthwhile proposition—an incentive to *move forward.*

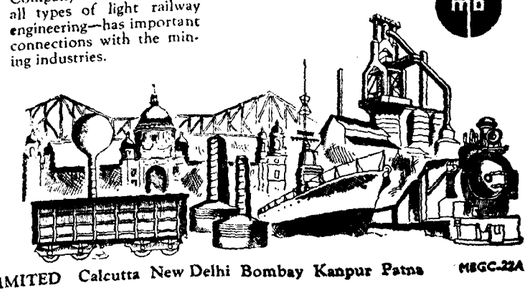
AMONG THE COMPANIES IN THE MARTIN BURN GROUP ARE:

THE INDIAN IRON & STEEL CO. LTD.: With a million ton integrated steel plant at Burnpur, the largest foundry in the Commonwealth at Kulti and its own collieries and iron ore mines, IISCO has an enviable record in production efficiency.

BURN & CO. LTD., HOWRAH WORKS: Pioneers in foundry practice in India, in structural steelwork fabrication and the manufacture of rolling stock—the origins of the Company go back to the year 1781.

BURN & CO. LTD., REFRACTORY & CERAMIC GROUP: Apart from stoneware pipes and chemical stoneware, the works of this group—eight in number and located in four states—manufacture nearly all types of refractories to meet the requirements of India's steel industry, power undertakings, railways, ordnance factories —in fact, any industry requiring refractory material for the maintenance of furnaces.

THE INDIAN STANDARD WAGON CO. LTD., SANTA: The oldest Indian unit started for the specific purpose of manufacturing railway rolling stock—has been mainly responsible for building up the wagon building industry. Also manufactures springs, forgings, pressings and stampings for heavy industry as well as automotive components.



THE HOOGHLY DOCKING & ENGINEERING CO. LTD.: Established in 1819, the Company has a shipbuilding yard, a dry dock and extensive workshops at Salkia.

ROBERT HUDSON (INDIA) LTD: A premier concern in its own field, the Company devotes itself to all types of light railway engineering—has important connections with the mining industries.

RAILWAY COMPANIES: Some of the first feeder railways in India, with six systems in four states.

ELECTRIC SUPPLY COMPANIES: Pioneers again in the generation and distribution of domestic power in India—serve 45 towns in Uttar Pradesh and Madhya Pradesh.

THE VAUGHAN BURN CRANE COMPANY LTD.: A collaboration with The Vaughan Crane Company Ltd. of Manchester... Hand operated and electric overhead travelling cranes and chain pulley blocks.

MARTIN BURN LIMITED Calcutta New Delhi Bombay Kanpur Patna MBGC-22A

Shalimar Lustrol Quick-drying, durable and weath[illegible]. Shalimar Lustrol aluminium paint offers a high covering opacity and a protective, glittering finish. It provides an impervious moisture barrier that repels corrosive agents, withstands high temperatures without blistering, scaling or turning black. Ideal for painting and protecting storage tanks, machinery, bridges, railings, roofs, pipes, etc., Lustrol, like every Shalimar paint offers you the sum of four decisive elements —resources, research, know-how, quality-control — which combine to give you unsurpassed quality and performance.

pathfinders in paintmaking

Holding A Mirror to Caliban

CYNICS, PERHAPS, might be tempted to remark that the Santhanam Committee on Prevention of Corruption has touched nothing that it has not defiled. Its report certainly has tarred with the same brush almost all institutions in national life, including the universities and the judiciary. This, however, is not to suggest that the Santhanam Committee has exceeded its brief or irresponsibly set out to inspire a witch hunt. If the anatomy of corruption is to be studied at all, it is only just and proper that it should be done with surgical objectivity and thoroughness. That Mr. Santhanam and his colleagues have shown both virtues will be admitted even by those who may disapprove one or the other aspect of the Committee's analysis of the nature and dimensions of corruption or disagree with any of the specific measures proposed by it for dealing with the prevalence of this evil in State and society.

The report starts deceptively with a soothing soporific. Corruption, in one form or another, says the Committee, has always existed in India and elsewhere. Kautilya, it appears, had something to say about it in his Arthasastra. Coming to more recent times, the U.S. Senator, Paul H. Douglas, in his "Ethics of Government" has noted that corruption was rife in British public life till a hundred years ago and in U.S. till the beginning of this century. All may not agree that corruption has been banished from either country since then. There is, for instance, the current Bobby Baker scandal in Washington, an episode or, rather, a series of episodes into which many U.S. Senators are obviously unwilling or afraid to look too closely. In another part of the world, where the dictatorship of the proletariat was expected to abolish sin along with God, it has been found necessary to restore the death penalty and apply it extensively to what the Santhanam Committee has classified as "White collar offences", i.e., conduct or activities which damage the interests of the public or the social order.

On the lineage of corruption in our country, the Santhanam Committee has quite a few interesting observations to make. It rightly points out that corruption is not by any means the original sin of the Government or the people of our times. Leaving aside Kautilya and his Arthasastra, corruption was prevalent, in considerable measure, among revenue, police, excise and public works department officials even before the World War II. It might perhaps be added that the judiciary too was not wholly untainted. The Santhanam Committee favours the fashionable view that this corruption was a vice mostly of the lower grades of public servants. Actually, even in the case of the higher echelons of the British Government in India, reaching up to the very highest, there were certainly cases where personal fortunes saved at the time of retirement or at the time of departure for the home country far exceeded what could have been stored for the wintry day merely out of salaries.

The Santhanam Committee, however, is on firm grounds in suggesting that in those earlier days the smaller compass of state activities did set limits to the opportunities and capacity to corrupt or be corrupted. As the Committee points out, the situation changed both qualitatively and quantitatively during 1939-1945 when war expenditure involving hundreds of crores of rupees on supplies and contracts created unprecedented opportunities for the acquisition of wealth by dubious means. After independence a number of steps have certainly been taken from time to time for the prevention of corruption, while anti-corruption machinery, such as the special police establishment at the Centre, has been set up. Various factors,

however, have operated to nullify, in some measure, this anti-corruption drive. The Committee detailing these factors, lists the sudden expansion of the economic activities of the Government, leading to an armoury of regulations, controls, licences and permits, the quest for political power at different levels and a certain failure on the part of those in authority in government or public life to move against corrupt individuals where such individuals happen to be men of power and influence or could appeal for protection or patronage to those who held high positions in government or in the political hierarchy.

Dealing with corruption in the administration, which is the problem specially and specifically posed in its terms of reference, the Santhanam Committee has provided statistics showing an increase in complaints and vigilance cases in recent years but has also added the necessary proviso that this increase might, in part, be due to the growing effectiveness of the anti-corruption drive. The Committee, however, has not taken a complacent view at all of the need for a much more effective programme of preventing or punishing corruption among government servants and the more important measures recommended by it in this context include proposals that government servants should be required to submit periodically a statement of their assets and liabilities instead of, as at present, only immovable property statements which are held to have served no useful purpose, the rationalisation of the protection granted to Government servants under Article 311 and 314 of the Constitution since judicial interpretation of those safeguards have, in practice, been found to come in the way of disciplinary proceedings being effectively undertaken, and the taking of powers to retire compulsorily, where circumstances justify, any government servant who has completed 20 years of qualifying service or has attained 50 years of age. At least one of these recommendations, viz., that the Constitutional provisions should be amended, has already been questioned, but there is no doubt that considering the seriousness of corruption in the public services, the Government's disciplinary jurisdiction over its employees must be strengthened as much as is consistent with natural justice and the rule of law.

While it is dangerous, because it would be destructive of good government or even orderly administration, to condone or compromise with corruption in the services in any sense or to any extent, it is necessary to realise that corruption of this kind is as much a creature of the social environment as it is of the moral turpitude of individuals. From this point of view we have no hesitation in declaring that the Santhanam Committee has done a signal public service in putting on record the role and responsibility of the business community as well as politicians and political parties. In this connection, the report says: "Corruption can exist only if there is some one willing to corrupt and capable of corrupting. We regret to say that both this willingness and capacity to corrupt are found in a large measure in the industrial and commercial classes. The ranks of these classes have been swelled by the speculators and adventurers of the war period. To these, corruption is not only an easy method to secure large unearned profits but also the necessary means to enable them to be in a position to pursue their vocations or retain their position among their competitors.....It is they who maintain an army of liaison men and contact men, some of whom live luxuriously and spend ostentatiously. We are unable to believe that so much money is being spent only for the purpose of getting things done quickly. It is said that, as a large majority of high officials are incorruptible and are likely to react strongly against any direct attempt to subvert their integrity, the liaison and contact men make a careful study of the character, tastes and weaknesses of officials with whom they may have to deal and that these weaknesses are then exploited...."

It is not necessary to agree with every 'i' or 't' of this indictment to be able to appreciate the very important point which the Santhanam Committee has made. The corruptor certainly is as relevant a factor to the problem of corruption as the corrupted and it just will not do to wink at this truth. The Santhanam Committee is, therefore, fully justified in discussing adequate measures for disciplining the corruptor, actual or potential. It recommends that serious thought should be given as to how trade associations or their representatives could be associated with the granting of licences or allocation of scarce goods. Membership of a recognised trade organisation could be made a necessary condition of eligibility for obtaining a licence or a permit.

Secondly, no official should have any dealings with a person claiming to act on behalf of a business or an industrial house or an individual, unless he is properly accredited and is approved by the department concerned or any other appropriate authority. Companies and businessmen should be obliged to keep detailed accounts of the expenditure in their expense account. Whenever an income tax officer or any other official inspecting the books for income tax or other purposes makes a query for which a satisfactory expanation is not forthcoming, it should be his duty to refer the matter to the Chief Vigilance Office in the department concerned. If there is any legal difficulty for passing on such information, under the present law, it should be removed.

On the positive side, the Committee recognises that the necessity for the business community to employ "influence peddlers" and contact men should be reduced by the simplification and speeding up of administrative procedures, weeding out of unnecessary government controls and regulations, restriction of the scope for exercise of discretion at subordinate levels of the administration and possibility of giving special status and emoluments to categories of officials who have to exercise considerable discretion in matters relating to taxation, issue of valuable permits and licences or otherwise deal with matters which require a high degree of integrity.

Perhaps the most interesting as well as the most important part of the report is that its discussion of the problem of prevention of corruption in the context of relations between the business community and the politicians. It is surely to the credit of the Chairman of the Committee who is himself a Congress man of standing and has held important positions in government and public life under the aegis of the Congress party to have emphasized uncompromisingly the responsibility of the ruling party to the prevalence of a social milieu in which corruption has become an increasingly serious challenge not only to good government but to social stability.

It is more in sorrow than in anger that the Committee says: "We wish we could confidently and without reservation assert that, at the political level, Ministers, legislators, and party officials were free from this malady (i.e., corruption). The general impressions are unfair and exaggerated but the very fact that such impressions are there causes damage to the social fabric. That such impressions should have come into existence in so short a time after the people of this country had given themselves a Constitution of their own is all the more distressing if it is remembered that the struggle for freedom in India was fought on a particularly high moral plane and was led by Mahatma Gandhi who personified integrity. The people of India rightly expected that, when the government of the country passed into the hands of the disciples of the Father of the Nation, who were in their own individual capacities known for high character and ability, governments in India, at the Centre and the States, would set up and achieve a standard of integrity, second to none in the world, both in the political and administrative aspects. It is to be frankly admitted that this hope has not been realized in full measures."

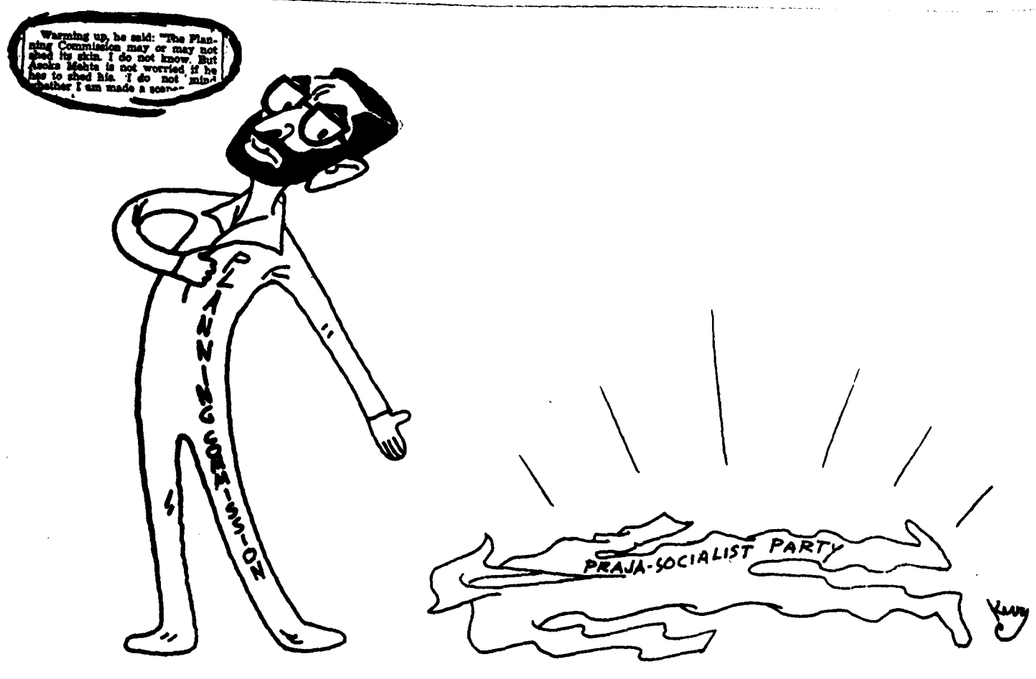
In a short but what is perhaps the most significant chapter in the whole report, the Committee has discussed the requirements of a social climate which would discourage corruption rather than encourage it. The report says: "There is a widespread impression that failure of integrity is not uncommon among Ministers and that some Ministers, who held office during the last 16 years, have enriched themselves illegitimately, obtained good jobs for their sons and relations through nepotism and have reaped other advantages inconsistent with any notion of purity in public life. The general belief about failure of integrity amongst Ministers is as damaging as actual failure....We are convinced that ensuring absolute integrity on the part of the Ministers at the Centre and the States is an indispensable condition for the establishment of a tradition of purity in public services. Therefore, in the interest of the future of public life we consider that following steps should be taken..."

The recommendations made in this context include a code of conduct for Ministers including in it provisions relating to acquisition of property, acceptance of gifts and disclosure of assets and liabilities and secondly, the constitution of a national panel from which an ad hoc committee could, when the occasion arose, be nominated by the President to consider whether there is a prima facie case against Ministers about whom complaints of corrupt practices have been made. The Committee advises that among the circumstances in which a reference to the panel could be made may be a formal allegation by any 10 members of Parliament or a State Legislature in writing addressed to the Prime Minister or the Chief Minister, as the case may be, through the Speaker or Chairman concerned. It has also been suggested that allegations made in the Press or otherwise brought to the notice of the Prime Min-

Eastern Economist 20 Years Ago

APRIL 7, 1944

Next week, as foreshadowed in the budget speech by the Finance Member, the acquisition of the M. and S.M. and S.I. Railways will be put through. The purchase will absorb a sum of £6 millions which will be paid out of foreign balances and adjusted against Government's balances, (The Reserve Bank statement will reflect this payment only on 7th April.) The terms are interesting. The contractual payment to M. and S.M. Railway stock-holders is the guaranteed interest and share of surplus profits to the date of determination plus par for the capital stock of £5,000,000. The other offer is interest and surplus profits to March 21, plus the capital amount plus £275,000 for the loss of 21 months' interest and profit. In recent years, the amount earned for dividend has declined considerably and this offer is almost exactly the equivalent of recent earnings, so there is no reason to suppose that heart-burning or grievance exists. The terms will permit a payment of £110 per cent in April, with some further distribution whose amount will depend mainly on costs, including tax assessments. The shareholders are being asked to provide £5,200 for compensation for loss of office to the Directors and £11,800 for similar payments to the London staff. In considering the payment likely to be received by the shareholders, it should be remembered that for some years past they have received payment of 1 per cent tax free out of reserves. £1 million of S.I. Railway stocks are also to be repaid. Thus, apart from the annuities whose service is now covered and certain deben ures, the only Railway sterling block outstanding will be the £3 million on the Bengal-Nagpur Railway.



ister or Chief Ministers of States may also be referred to the proposed committee.

Other equally important proposals have been made for discouraging or disabling politicians from being corrupted by the business community or from corrupting the public services. Particularly noteworthy, but rather controversial, are the views expressed on the steps to be taken for ensuring the integrity of Members of Parliament and of Legislatures in the States. The Committee observes that it has been talked about that some Members use their good offices to obtain permits, licences or easier access to Ministers and officials for industrialists and business men. It takes note of the fact that some legislators are in the employment of private undertakings for legitimate work, but it suggests that in such cases the legislator concerned should declare his connections and refrain from approaching Ministers or officials in connection with the work of his employer or from participating in the discussion or voting on demands or proposals in which his firm or employer is interested. Other legislators, who are not such bona fide employees, should on no account undertake, for any valuable consideration or other personal advantage, to promote the interests of or obtain favours for any private party either in the Legislature or with Government. It is desirable that a code of conduct for legislators embodying these and other principles should be formally adopted in Parliament and Legislatures and sufficient sanctions provided for the enforcement of the code.

To the recurring debate on the propriety of corporate donations to political parties for election funds or other purposes, the Santhanam Committee contributes a firm opinion that there should be a total ban on all donations by corporate bodies to political parties and purposes. It also considers it essential that all political parties should keep a proper account of their receipts and expenditure and should publish annually an audited statement of such accounts giving details of all individual receipts. Failure to conform to such obligations, it is further recommended, should debar a political party from recognition by the Election Commission, Postal authorities and banks.

Somewhat curiously, the Santhanam Committee does not, however, express itself at any length on the extensive breach by politicians and political parties of the provisions of the Representation of the People's Act, particularly in the matter of the ceiling on election expenses. On the contrary, it declares rather naively that "elections cannot be fought without large funds," but it does not care to proceed to the next step of asking for reform in the election law which, as it stands at present, has resulted in many legislator or would-be legislator starting off on his law-making career with a deliberate and systematic transgression of one of the basic enactments of the Statute Book of the nation.

This, however, is a detail. By and large, the Santhanam Committee has done its work without fear or favour. It has held up the mirror to many Calibans, such as the public services, the business community, and political parties generally, and the ruling party in particular. The greatest virtue of its report is that it

has not hesitated to put the blame on the party in power for the capacity of the business community (and also its virtual necessity) to corrupt, on the one hand, and the willingness of the public services to be corrupted on the other. The Home Minister, Mr. G. L. Nanda, has been talking of a two-year time-table for eliminating corruption among government employees. We wonder whether he would come to fix any time-table for dealing with the larger aspects of corruption to which the Santhanam Committee has relentlessly drawn public attention. As it is, even in the more limited area of corruption among government employees, the Home Ministry is already being accused of being loud in talking but slow in acting. Following an interim recommendation of the Santhanam Committee, a Central Vigilance Commissioner has been appointed. But the necessary machinery through which he could function still remains to be organised. Mr. Nanda now faces a far sterner test. It should be interesting to know whether he or his colleagues in the Government intend to act on any of those recommendations of the Santhanam Committee which might uncomfortably nudge Congress sensitivity. The Home Minister, no doubt has promptly laid the Report of the Santhanam Committee on the Table of the two Houses of Parliament, but we have a shrewd suspicion that behind the scenes, the Congress party today finds itself in the position of Caliban raging at his face when he first saw it.

A Cloth Crisis Around the Corner?

THE TEMPTATION to tackle issues on a "notional" basis has lately been on the increase. At times, it is done with a view to raising more revenue for the Exchequer as, for instance, in the case of the proposed levy on "notional" capital gains in respect of bonus issues. At other times, presumably, it is resorted to out of sheer reluctance to face realities, as, for example, in regard to revision of cloth prices.

Many may not be aware that "notionally" cloth prices are governed by a voluntary price system which is over 40 months old and which is still being invoked to fix prices of new varieties of cloth under a miscalled ad hoc formula incorporated in that system. After the passage of nearly three and a half years, this ad hoc formula has been all but reduced to a mockery. In any case, what sense is there in pressing into service such an out-moded ad hoc formula in respect of an altogether new variety of cloth and proceeding to fix prices after working out what it would have cost to manufacture it in 1959 and adding to it another arbitrary percentage to arrive at a mutually (between the Textile Commissioner's office and the mills concerned) agreed price that could be charged to the consumer? More often than not, the agreed percentage addition to the price arrived at on the notional 1959 basis price has tended to be the average of two figures independently (and none the less arbitrarily) worked out by the Textile Commissioner's office, on the one hand, and the mill interests concerned, on the other. This is the most unsatisfactory and the least scientific formula that could be made to govern prices of products of an industry which is expected to step up our exports and augment our foreign exchange earnings. What is surprising is how the cotton mill industry has managed to put up with it for so long.

We are told that responsible sections of the industry have been thoroughly dissatisfied with the voluntary price system and that repeated representations have been made by them to the Government to do away with it. It is difficult to understand the Government's studied indifference in regard to this matter, although one can appreciate its reluctance to increase prices during a period of inflation for fear of consumer criticism. Surely, both the Government and the consumer must be aware that, by and large, prices ruling in the market today bear absolutely no relation either to basic prices (except that these are prominently printed) or to actual costs of production. Since the voluntary price system, to which the industry agreed in January, 1961, began, production costs have gone up sharply as a result of increases in wages, raw material prices and excise duties, among others. Conservative non-official estimates put the percentage rise in cloth production costs at over 15 per cent (What percentage rise the Tariff Commission, which went into this question, has arrived at is anybody's guess.)

Refusal to accept these facts has led to a serious erosion of the profit margins of mills, especially those which, for the most part, have continued to produce the older varieties. At the same time, the cloth market has been flooded with a plethora of new varieties, determination of the prices of which, as stated earlier, has been reduced to a huge farce. The interest of both the mill industry and the consumers of cloth demand that there must be an end to this senseless stalemate. Unless there is evidence of a refreshingly realistic reorientation in outlook on the question of cloth prices, and that soon enough, conditions in the cloth market may deteriorate to such an extent that the country may again become victim to a cloth crisis similar to that which followed the imposition of heavy excise duties some years ago by the present Finance Minister. The stock position with the mills today is by no means such as to warrant complacency on the part of the authorities. At 209,800 bales, the end-February, 1964 stocks are not only the lowest for the past twelve months but also lower than the end-February, 1963 stocks (301,000 bales). With no significant increase in production and with prospects of increased internal demand and potentialities (to be explored) of higher exports, the likely impact on cloth prices resulting from continued inade-

quate supplies is certainly something for any Government to feel concerned about. If the authorities are keen on preventing a runaway rise in cloth prices and stabilising these at a reasonable level, they have to bestir themselves from their self-imposed stupor and adopt prompt and realistic measures to augment production; and the first of these must be to scrap the 1961 Voluntary Price System.

More Gilt to Gilt-Edgeds

THE ANNOUNCEMENT of the first instalment of the Government of India's borrowing programme is in keeping with Government's latter-day thinking on "realistic" interest rates. Both the short-dated 4 per cent. 1970 loan and the long-dated 4½ per cent. 1959 loan are of course, only conversion loans floated mainly to adjust the outstandings against the 3½ per cent. 1964 National Plan loan due for repayment on April 15, (Rs. 158.17 crores) and the 3 per cent. 1964 loan due to be repaid on April 14, (Rs. 30.33 crores). But even this occasion has been appropriately awaited of by the authorities to offer relatively more attractive terms, which is but a part of the series of measures taken by the authorities to bring interest rates more in keeping with the real cost of capital to the economy. The process may be said to have begun in February itself, with the increase in the rate of interest the Railways are now called upon to pay to the general revenues. The next step was the credit squeeze announced by the Reserve Bank in the last week of March resulting in the stepping up of interest rates payable by scheduled banks. And now comes the third measure in the form of higher interest rates on the two conversion loans. The yield on the short-dated (4 per cent. 1970) loan, offered at a discount of one rupee, works out nearly to 4.2 per cent., which is much higher than the yield to be had from a loan of more or less similar duration. On the eve of the loan announcement, comparable 4 per cent. central loans as, for example, 4 per cent. 1969 and 4 per cent. 1972, were quoting at levels which gave a redemption yield of a little over 4.10 per cent. Similarly, the yield on the long-dated (4½ per cent. 1989) loan works out to 4.75 per cent. as against only 4½ per cent. on a more or less comparable central loan, namely the 4½ per cent. 1986 loan.

It is too early to say—the subscription lists will open only on April 15—what the response to the conversion loans would be like. However, considering that the bulk of the holdings of the two maturing loans is reportedly in the hands of the Reserve Bank, the results should be satisfactory. Inasmuch as acceptance of the conversion would bring in securities offering a better yield, not only the Reserve Bank but other institutional investors also may be expected to offer all their holdings for conversion. But market circles believe that neither the L. I. C. nor the scheduled and the exchange banks carry any sizable holdings of the maturing loans. Also, notwithstanding the higher yields, it is said, many scheduled banks may prefer to liquidate the holdings of their maturing loans for cash now, by reason of the continuing stringency in the money market and the still high inter-bank call money rate. Some of them may also want to wait for the second instalment of central loans which is expected to include a medium-dated loan as well. Really speaking banks have no choice but to augment their holdings of Government securities in order to be able to conform to the liquidity requirements by the target date, that is mid-September. In fact, there have been few offers of sale of securities, if any, lately, or even after the loan announcement, which doubtless explains the absence of a fall in Government securities prices as normally happens in the wake of such a loan announcement.

It may appear idle to speculate on the extent of cash repayments that the Government may be called upon to make in the third week of this month. All the same, one could hazard a guess on the basis of recent experience. The repayments may amount to some 15 to 20 per cent. or, say, Rs. 30 to 40 crores. Proceeding on this basis, the net borrowing arising from the first phase of the Government's borrowing programme for the current year would be around Rs. 150 crores, or roughly 50 per cent. of the target of Rs. 295 crores budgeted for by the Finance Minister.

We must compliment the authorities on having promptly given up their experiment of a combined Central and State borrowing programme which they tried last year. The opinion expressed in this journal that the experiment would lead to the State Governments' approaching the Centre for more and more accommodation even to carry on their day-to-day administration has proved prophetic. The Union Finance Minister has himself admitted in his budget speech that, both in terms of loans from the Centre and market borrowings, the States have been receiving more than what was contemplated. The only way to stop the growing extravagance of State Governments is to make them enter the market and raise their loans themselves.

Now that the Finance Minister has made it clear that State Governments have to float their own loans and raise their requirements separately, they must start planning their respective borrowing programmes. And, when they actually enter the market, they must be prepared to offer slightly higher rates of interest than the Centre. This is about all the attraction that they can offer, their financial position being a matter of the utmost concern, according to the Union Finance Minister himself. But precisely how much higher the rates should be would depend on the terms of the second instalment of central loans.

Highlights of the Week

MENACED MINORITY

PAKISTAN'S HOME Minister, Mr. Habibullah Khan, arrived in the Capital on Monday and he and his Indian counterpart, Mr. Gulzarilal Nanda, plan to have 10 sessions of discussions spread over five days. While it is naturally to be hoped that a meeting of this kind should help to draw the two countries closer, it would be only necessary realism to acknowledge the fact that the conference would be held to have succeeded brilliantly even if it assists simply in checking further deterioration in Indo-Pakistan relations. In his first public statement in this country, Pakistan's Home Minister has struck the right note by saying that the problem of minorities, which is the prime issue before the conference, is a "human rather than political" problem. So far as the people and the Government of India are concerned, they are, of course, wholly keen on discussing the issues involved on a human rather than a political plane, and now that the Pakistani delegate has stated that that would be the attitude of his Government as well, there is no real reason why the talks should not be effective in easing current tensions.

In view of the gravity of the issues involved, India's Home Minister, Mr. Nanda, has been carefully briefed by the Prime Minister and the Cabinet and while it is certainly being appreciated here, in Government circles as well as outside, that the conference should keep clear of recriminations or demands and counter demands, it is also strongly felt that it would have served its purpose only if it results in creating steps being taken immediately to end the flow of refugees from East Pakistan into India. So long as this forced immigration continues, the relations between the two countries are bound to deteriorate steadily. Only second in importance to the ending of this mass movement of Hindus and Christians from East Pakistan into India is the question of a fair sharing of the burden of rehabilitating refugees who are already here. While India certainly may not care to approach this question in a bargaining spirit, it is not unreasonable to expect Pakistan to appreciate the position that it should not fall on this country exclusively to finance the resettlement of people who are after all citizens of Pakistan but, nevertheless, have found it impossible to continue to live safely in that country. Once a programme is discussed and agreed upon for rehabilitating refugees who have arrived already in this country and stopping further exodus from East Pakistan, it should be possible to proceed with the larger question of ensuring conditions in either country which would enable the minority communities concerned to live in freedom, and particularly in freedom from fear.

On the Indian side, while it has certainly been the unfortunate case that organized violence had been perpetrated on Muslims at some places, it is to be recorded on the credit side that the Government has been both willing and able to quell violent outbreaks, if necessary by employing regular troops to restore law and order. In Pakistan's case, however, from the available reports it appears to be the case that the authorities concerned have not displayed similar determination or effort in dealing with outbreaks of communal violence or quickly ending organised harassment of Hindus and Christians. It should be possible to bring about a frank exchange of ideas across the table on this matter which is, indeed, central to the entire situation, without necessarily indulging in or inviting recrimination.

COMMUNISTS AT COLD WAR

THE MOSCOW-PEKING cold war dialogue is becoming more and more outspoken. On April 3, "Pravda" published the recent CPSU Central Committee decision to fight Chinese ideological perversions and the report made to the Committee by Mr. Mikhail Suslov on February 14. The Suslov report is of particular interest to this country since in it the Soviet position on Sino-Indian conflict has been stated, for the first time, in terms which virtually name China as aggressor. The report says:

"The Sino-Indian conflict arose over the position of frontier territories in the Himalayas which had not been disputed either by China or India in the course of many centuries. However, inasmuch as this problem arose, everything should have been done to settle it peacefully by negotiation. The Government of the USSR has repeatedly advocated such a settlement of this frontier dispute....

"Hostilities broke out in the region of the Himalayas. The pernicious consequences of this conflict have now manifested themselves fully. It has rendered a great service to imperialism and inflicted grave harm to the national liberation movement, the progressive forces of India and the entire front of anti-imperialist struggle. Utilising the Sino-Indian conflict for their own purposes, the imperialists and their supporters are seeking to undermine the trust of peoples of young national States in socialist countries, draw India into military blocs, and strengthen the positions of extreme reaction in the country."

The Suslov report significantly accuses the Government of the Chinese People's Republic of extending armed conflict on the Sino-Indian border when the Caribbean crisis was at its height. In other words, Moscow has gone on record that it endorses this country's accusation that China had planned and executed a large-scale invasion of this country in October-November, 1962. Similarly forthright is the assessment of the Suslov report on China's alliance with Pakistan against India. The relevant passage says:

"While allowing relations with India, which as everybody knows is not a member of military blocs, to deteriorate sharply, China's leadership at the same time actually leagued together with Pakistan, a member of the SEATO and CENTO, which are threatening the peace and security of the Asian peoples. It is a fact that having discarded their 'revolutionary phrase-mongering' the Chinese leaders have, in reality, adopted a line that can hardly be dovetailed with the principled position of the countries of the Socialist commonwealth with regard to imperialist blocs."

Denouncing Sino-Pakistan relations as opportunistic, Mr. Suslov twits Peking with showering compliments on the reactionary regime in Pakistan while flinging mud at socialist countries and trying to split "fraternal parties" around the world. That the "fraternal party" in India is presently in the throes of a dichotomy is, of course, not to be denied, and judging from the relish with which the pro-Peking faction in the Communist Party of India has seized upon the Dange letters to denounce the official leadership, it may not be far-fetched to assume that the Moscow-Peking cold war is now being fought well and truly on Indian soil. In fact, Peking's personal attacks on Mr. Khrushchev have been copied in the Indian context by Mr. Basavapunniah, Mr. Sundarayya and Mr. Ramamurti who lead the so-called "splitter" group in denouncing the Party Chairman, Mr. Dange, on the strength of the letters which he is alleged to have written in 1924 to the then Governor-General of India offering to collaborate with the British Government against the national freedom movement. Mr. Dange, who was in Moscow when the storm broke out, had on his return to this country contended that the letters were "forgeries", while two of his supporters in the

party, Mrs. Renu Chakravarti and Mr. Homi Daji, both MPs, claimed to have found "important discrepancies and inconsistencies in the documents raising serious doubts". The letters, which were with National Archives until they became hot stuff in the cold war within the "fraternal party", have now been removed to safe custody by the Home Ministry but are available for inspection by leaders of the warring factions. A demand is being made by pro-Peking group for a commission to be appointed by the party, comprising members of "undoubted integrity", to ascertain the authenticity of the letters. These and other controversies may be pressed to an issue at the meeting of the party Executive on April 9 and the National Council on April 10. The forthcoming meetings might quite possibly end up in formalizing the split in the Party, although a couple of prominent communists, more or less "non-aligned", are reportedly making an effort to avoid an open schism. The outlook is that internecine struggle for the control of the Party has now proceeded so far that it may not be found possible to avert a formal cleavage. From the nation's point of view, the formal identification and isolation of the pro-Peking faction within the Communist Party would be an obvious advantage to the country's security since it would considerably ease the public's and the Government's effort at dealing with treasonable or subversive activities which certain elements in the Communist Party are now free to carry on under cover of legitimate political functioning secured to political parties in a democratic community.

MURDER IN THE MOUNTAINS

ON SUNDAY, April 5, the Prime Minister of Bhutan was shot dead at a dak bungalow in Phuntsoling, a slopy, little township on the India-Bhutan border, and the assassin's bullets could possibly turn out to have shattered not merely and not just temporarily — the ancient calm of this Himalayan region. The killer is yet to be captured and Bhutan has asked for and obtained Indian police assistance in investigating the crime and tracking down the perpetrator. Should Jigme Dorji's killing turn out to be a crime politik, its implications and consequences may be matters of moment for relations between many States. The Chinese, who have consistently refused to acknowledge India's special status in Bhutan, should welcome political instability in the border State, however brought about. Fortunately, there should not be a vacuum in the political leadership of the State. Absolute power in Bhutan rests with the enlightened Maharaja, Wanchuk Dorji, who is the spiritual and temporal head and enjoys popular support. He is presently convalescing in Europe after a serious heart attack and may now plan to return sooner than he expected. The Prime Minister was the brother-in-law of the Maharaja and his office has so far been hereditary. But it is not known if Jigme Dorji's son would inherit the gadi. He is far too young and even during Jigme Dorji's absence from the State, the Prime Minister's brother, Cornell-educated, Lhendup Dorji, has been performing the duties of the office His sister, Miss Tashi Dorji, who steered Bhutan's membership of the Colombo Plan with India's help and co-operation, is another able figure in the political field. Some opposition to the present regime has been coming from the Bhutan State Congress which claims to represent about 20 per cent of the Napalese population centred in the eastern part of the State. Stationed in Gangtok, its Chief, D. B. Gurung, demands formation of a democratic government and establishment of panchayat raj. The State Congress has little hold on Bhutanis of Tibetan origin, who comprise about 70 per cent of the 650,000 population and are solidly behind the Maharaja.

Jigme Dorji was shrewd, strong and energetic but his policies were not always easy to appreciate in this country. His literal interpretation of the Indo-Bhutanese Treaty of 1949 which provides that Bhutan would be guided by India in foreign relations was not altogether welcome. His foreign tours also created a certain amount of misunderstanding. It was said that Bhutan was trying to get herself accepted as a separate State in the international field. Luckily, patient and skilful handling of an otherwise touchy situation reinforced by India's obvious respect for Bhutan's independent character has brought the two countries closer. As against this, the Chinese aggression, emphasized, more than ever before, the threat of assimilation from the North and the liquidation of Bhutan as a separate entity. Earlier, for the past few years, Bhutan had been conscious of the danger and had sealed all her 28 and odd trade routes to prevent vital supplies such as petrol, rice and wheat from being smuggled into Tibet. But the liquidation of Tibetan autonomy and the invasion of India exposed for good the expansionist nature of Communist China.

Even now Bhutan does not have any official treaty of mutual defence with India but she undoubtedly realizes the value of friendship and community of interest with the peaceful neighbour in the South and since 1961, Bhutan had started thinking in terms of economic development and invited India's participation. The outcome was the first five-year Plan for Bhutan, laying stress on road construction, improvement in agricultural production and expansion of educational facilities. The Government of India is financing the entire Plan costing about Rs. 18.5 crores. A new 600-mile highway is being built and later four motorable roads will link the interior of Bhutan with India and one of them will be connecting Bhutan and NEFA. No roads to the Tibetan border are planned. In the field of education, a three-fold increase in primary and secondary schools is expected to be made and nearly 700 Bhutanese students will be coming to India to receive training. Hindi will be the medium of instruction in secondary schools. Exchanges at cultural level are also planned. In all these constructive developments, the late Jigme Dorji played a positive role of leadership and the brutal murder of this statesman, taking place, incidentally, in the wake of a courtesy call paid by the Indian Political Officer on the fatal day, is naturally a matter of deep sorrow for the people and the Government of this country.

BY GRACE OF GOVT.

BROADCASTS BY Mr. Nehru and by Acharya Vinoba Bhave on April 5, marked the inauguration on the following day of the Khadi and Village Industries Commission's "Free Weaving Scheme" — a programme which, it is claimed, will rationalize Government subsidies to the khadi industry. The broadcasts, however, showed that politics and sentiments would continue to have precedence over reason where khadi was concerned. Thus, Mr. Nehru did not stop with expressing the hope that the scheme "will succeed in a big way," but he went on to argue that the purpose of developing village industries was to provide employment on a large scale which, he maintained, the expansion of organised industries would not be able to provide — a doubtful proposition economically, but a very useful one politically. After this, it was no surprise to find Acharya Vinoba Bhave thoroughly sentimental. According to him, khadi is the only means we have of preventing "the spirit of China" from capturing our villages. Acharya Bhave, again, was so impressed with the "free weaving scheme" that he expected it to establish what he called "Gram Raj" in this country within the next five years.

The project on which such high hopes are being pinned seems, however, to be more in the nature of an act of faith than a businesslike proposition which could reduce the chronic deficit in khadi financing. Under the new scheme, it is proposed that those who spin and offer khadi yarn are to be given in exchange khadi cloth without their having to pay any weaving charge. Where cotton is supplied to the spin-

Indo-Pak Relations Major Worry

By Our Parliamentary Correspondent

NEW DELHI:

THE MAJOR worry of the Lok Sabha last week continued to be the inimical attitude of Pakistan towards India. The deteriorating Indo-Pakistan relations came up before the House several times. The other highlights of the proceedings were the expression of misgivings by several members over Kashmir Government's decision to release Sheikh Abdullah and voting of the demands for grants for the Union Ministries of Industry, Health, Irrigation and Power and the Department of Supply and Technical Development.

The deep concern and anguish with which both the Ruling Party and the Opposition view the maltreatment of minorities in East Pakistan was evident from the unanimous support received by a non-official resolution asking the Government of India to take effective measures to influence world opinion on this issue. From the Treasury Benches, the most powerful condemnation of the atrocities being committed on Hindus, Christians and Buddhists in East Bengal came from the Union Minister without Portfolio, Mr. Lal Bahadur Shastri, who indicated that the Government intended to send abroad some delegations to enlighten the world on the misdeeds of Pakistan. He castigated Pakistan for trying to foment trouble in India in order to create a false impression at the time of the U.N. Security Council's meeting on Kashmir. Detailing the steps the Government of India had taken with remarkable speed for improving the communal situation in Bihar, West Bengal and Orissa, he regretfully pointed out that the Pakistan Government had not done so but instead tried to worsen the position. The members who participated in the debate on the non-official resolution pleaded that there should be no restrictions on refugees coming from East Pakistan and all efforts should be made to resettle them expeditiously.

The recent violation of India's air space by a Pakistani aircraft raised a tempest in the House. The explanation put forth by the Minister for Defence Production, Mr. K. Raghuramiah, that the plane had strayed three or four miles into the Indian territory, created a deafening uproar. Even the intervention of the Prime Minister failed to pacify the Opposition members who called for effective measures to check the growing menace from Pakistan to our security.

The announcement of the Kashmir Government's decision to release Sheikh Abdullah got a cold reception from the House. Many an Opposition member feared that this might complicate the Kashmir problem further. The official spokesmen tried to justify the step in the interest of improving the political climate in the State. That this did not carry conviction even with the legislators belonging to the Ruling Party was evident from the fact that the wisdom of releasing Sheikh Abdullah was questioned by many at a meeting of the executive of the Congress Parliamentary Party just before the matter was raised in the House.

During the debate on the demands for grants for the Ministry of Industry, a Communist member assailed the "reorientation" of industrial policy in favour of the private sector. He contended that this had resulted in concentration of wealth in the hands of a few big business houses. Many members called for greater coordination between the various Ministries responsible for industrial growth and pleaded for simplification of licensing procedures. Some stressed the need for giving encouragement to the cooperative and small-scale industries. The affairs of the Khadi and Village Industries Commission, however, came in for vehement criticism; it was even suggested that a high-powered committee should be set up to go into the working of this Commission. The problems of regional development also figured prominently in the debate. So also the complications created by shortage of raw materials.

Replying to the debate, the Minister for Industry, Mr. Nityanand Kanungo, stoutly defended the industrial licensing policy and pointed out that although the target of 11 per cent increase per annum in industrial output fixed under the third Plan, could not be achieved, production was going up satisfactorily even in the face of many odds. There were no "myteries" about industrial licensing, he said. Some key industries had to be given priority in view of the fact that their development had not been upto expectations. He indicated that concerted steps would be taken soon to step up paper and cement production; these two industries were suffering from paucity of raw materials—bamboo and limestone. Mr. Kanungo justified the levy of excise duty on powerlooms, but hinted that some concession in this levy might be forthcoming in the near future. He expressed gratification over the development of the handloom sector and small-scale industries and denied that the latter were being given a step-motherly treatment.

During the debate on the demands for grants for the

(Contd. from page 830)

ner, a nominal payment, however, will be expected. It is also said that others who do not have any yarn to offer will, nevertheless, be able to buy khadi cloth at prices even lower those those ruling hitherto with the advantage of a government subsidy passed on to the buyers at the point of sale. We may be pardoned if we say that all this seems to us to be too fanciful and other worldly and our scepticism, we submit, is more than justified considering the extremely unbusinesslike manner in which the Khadi and Village Industries Commission has been handling public funds allotted to its programmes over the last 10 or 12 years. The total allocation under the three Plans has amounted to Rs. 191 crores and the actual disbursement up to March 1963 to Rs. 143 crores. As against this, it is claimed, these programmes have provided employment as in 1962-63 to about 2.5 million persons of whom nearly 1.8 million were employed in the khadi sector It is well-known that even this scale of employment, which is comparatively small in relation to the capital outlay taken with the value of the output, had been secured at a low level of wages which have been even lower than what is required for subsistence. While this highlights the economic unsoundness and inefficiency of the programmes, there has also been widespread and recurring criticism from responsible quarters, such as the Public Accounts Committee and the Estimates Committee of carelessness or worse in the handling of Government money given to the Commission. Significantly, the validity of the work which the Commission has been doing has been challenged not only by outside critics but also within the Commission itself. Thus, writing in the Tenth Anniversary Number of the "Khadi Gramodyog", Mr. D. P. Sahu, himself a Member of the Commission, remarked: "At present the khadi industry is neither self-sustaining nor does it have popular support. It is surviving because of the benevolence of the present Government". It is presumably the arugment of the Commission and its present Chairman, Mr. U. N. Dhebar, that the "free weaving scheme" now introduced will mend this state of affairs. But, as we have said, the way the scheme is structured is not such as to create confidence in its solvency.

Ministry of Irrigation and Power, members pleaded for expeditious settlement of river water disputes, provision of electricity to farmers at cheaper rates, and according of high priority for power and irrigation schemes (especially the minor irrigation schemes). It was also suggested that the Central Government should have an effective control over the State irrigation schemes and that the Central Water and Power Commission should have a separate wing to review the cost of important projects. One member pleaded that no water should be made available to Pakistan after the expiry of the Indus Canal Waters Treaty in 1970 in the interest of providing irrigation facilities to the peasantry here. Concern was expressed over the shortfalls in the achievement of power and irrigation targets and inadequacy of flood-control measures.

Replying to the debate, the Minister for Irrigation and Power, Dr. K. L. Rao, announced that the five regional electricity grids would be connected into a national grid during the fourth Plan period. By 1969, the irrigation potential would also be increased to 100 million acres. He assured the House that all efforts were being made to expedite use of water for irrigation purposes and contended that utilisation of the irrigation potential already created had now reached 82 per cent, a level which very few countries in the world could claim. He agreed that rural electrification was not receiving the necessary impetus, but hoped that the situation would improve in the next few years. Great emphasis was laid by Dr. Rao on completing the projects in hand rather than on going in for new ones to make up the shortfalls in the third Plan targets. About power tariffs for industries, Dr. Rao stated that the power rates should cover not only the high capital costs of power generation, but also have a margin for future development. Against this consideration, of course, there was the need to keep the rates low enough to encourage industrialisation. A Committee of Chief Ministers, he said, was considering these two aspects of the problem and would make its recommendations at an early date. With the installed capacity for power generation going up to 12.5 million KW. by the end of the third Plan period, most of the States, Dr. Rao hoped, would be able to meet their power requirements. Power scarcity, however, might continue in U.P., Punjab and Rajasthan. The Minister announced that steps were being taken to expedite the completion of the Rajasthan Canal Project.

Targets Exceeded

The discussion on the demands for grants for the Ministry of Health was notable for the plea made by several members for provision of medical facilities and water in rural areas. In her reply, Dr. Sushila Nayar hoped that by the end of the current Plan period, all the 5,000 development blocks would be covered by primary health centres. The Plan target for medical education, she said, had already been exceeded—the country now had 79 medical colleges against the target of only 75. She, however, admitted that there was shortage of qualified teaching staff. Listing the measures being taken for eradication of malaria and checking of cholera, Dr. Sushila Nayar disclosed that a new method of treating cholera had been developed and tried with success in Calcutta. She also revealed that a post-graduate medical institute would be set up at Hyderabad.

The Department of Supply and Technical Development came under fire for the long time it took to process orders and the not-so-satisfactory working of its offices in London and Washington. The former Minister in charge of this portfolio, Mr. Jaisukhlal Hathi, and the present Minister, Mr. Hajarnavis, however, assured the House that through administrative changes, the purchase procedures were being streamlined. Mr. Hathi also stated that apart from utilizing the spare capacity in the private sector to augment defence production, no new licences had been granted to the private sector for manufacturing armament components. The Technical Development Wing, he said, was helping in the planning of indigenous products. It had been geared to meet the defence needs.

Question Hour

Industrial Refinance Corporation: The Union Minister for Finance, Mr. T. T. Krishnamachari, disclosed in the Lok Sabha on April 2 that the Government was considering a proposal to make available to the Refinance Corporation for industry a second and supplementary line of credit upto Rs. 25 crores. The Corporation had received upto December 31, 1963, applications for loans to the tune of Rs. 63.81 crores. Loans had been sanctioned to the extent of Rs. 51.21 crores. The necessity of giving a fresh line of credit to the Corporation had arisen because of the fact that the entire amount of the first loan of Rs. 26 crores had been drawn and utilized. Upto December 31, 1963, the Corporation had disbursed loans totalling Rs. 28.17 crores. Some loans had not been availed of and these had thus lapsed. Loans still remaining to be disturbed amounted to Rs. 17.06 crores.

The Finance Minister also told the Lok Sabha on April 2 that the effective arrears of income-tax as on December 31, 1963, totalled Rs. 192.99 crores. There were 597 individuals or Hindu undivided families in the country having a net wealth of over Rs. 20 lakhs each. Of these, 125 persons had a net wealth above Rs. 50 lakhs each.

L.I.C. Premia: The Deputy Minister for Posts and Telegraphs, Mr. B. Bhagwati, informed the Lok Sabha on April 1 that the experiment of collecting life insurance premia through some post offices in the Rajasthan Circle had proved successful. It had been decided to extend the scheme to the other post offices in this Circle. The scheme was also likely to be extended to some post offices in Madras, Kerala, Andhra Pradesh and Mysore. The selection of post offices in these States would be made on the advice of the Life Insurance Corporation.

Diamond Mining: The Union Minister for Steel, Mines and Heavy Engineering, Mr. C. Subramaniam, revealed in the Lok Sabha on April 3 that commercial exploitation of diamond mines by the National Mineral Development Corporation had not yet begun. The Corporation had spent upto February this year a sum of Rs. 9.27 lakhs on exploitation of these mines. The value of 18,000 carats of diamonds recovered during exploratory work was Rs. 6.47 lakhs, out of which Rs 3.63 lakhs were payable to the State Government as royalty.

The following other information was provided to the House by Mr. Subramaniam on April 3

Scooter Manufacture: There was no intention to select any particular scooter manufacturing unit in the country for expansion. All the units would be allowed to expand in due course to meet the expected increase in demand during the fourth Plan period.

Pact with Dasturco.: Messrs. Dastur & Company would be paid for their consultancy services for the Bokaro Plant approximately one-third of what was normally paid for these services in the United States. The terms and conditions for the consultancy arrangements with Dasturco were being negotiated. The firm was expected to deliver the goods. There was no proposal to withdraw any portion of the work entrusted to Dasturco and give it to foreign engineering firms.

Sugar Quota: The Minister of State for Food, Mr. A. M. Thomas, revealed in the Lok Sabha on March 31 that the Union Government had effected a reduction of 5 per cent in the monthly sugar quotas of various States in view of sugar production falling short of the 3.3 million target. He ruled out all possibilities of increasing sugar quotas in the near future and emphasised that the State Governments should regulate supplies judiciously.

OUR POPULATION PROBLEM—III

Death Control Without Birth Control

R. CHOPRA

NEXT TO avoiding a nuclear war and ensuring lasting peace, the population explosion is the gravest problem facing mankind. One may ask the question: why is it that the population problem for all its seriousness and urgency has received scant attention so far? Why is it that in spite of the fact that leading scientists, social workers and other leaders of the world have time and again warned about its seriousness, the powers that be have more or less neglected this problem? The present article will try to answer some of these questions.

In every society whether underdeveloped or highly developed, whether agricultural or industrialised, whether democratic or totalitarian, there is a strong consensus of opinion in favour of improving health, sanitation etc.; combating disease and pestilence and reducing the incidence of death. There is at present no such consensus of public opinion in favour of taking positive steps to reduce the birth rate, it is, however, essential for every country and much more so for the underdeveloped countries that "any society that practises death control must practise birth control".

There are many reasons, some apparent, others obscure, some straight forward and others complicated, why the deliberate control of the birth-rate and consequently the population control has not received adequate attention when compared to say, death control, health, social welfare, education etc. Some of the important reasons are:

(a) Marxism believes that labour is the principal asset of society and the ultimate source of all values. Communist countries, therefore, reject the idea of excess population and feel that the inefficiency of the capitalist system is to blame for the low standards of living and not dense population. It should be noted, however, that before China became Communist, the principal Communist country, namely, Soviet Russia, was a very sparsely populated country and population was no problem. Nevertheless even Communist countries practise birth control in varying degrees and methods, abortion for example being comparatively high in these countries. The history of population control in Red China makes interesting reading. According to newspaper reports, China has recently launched on its second campaign to limit its vast population. The first drive ended abruptly in 1958 when China's rulers proclaimed a need for more people, not fewer, to achieve the grandiose industrial goals of the Great Leap Forward. By 1961, however, the Great Leap Forward had ended in a disaster and about a year ago, the Chinese have again stepped up propaganda in favour of use of contraceptives, late marriages (30 years for men, 25 for women against legal marriageable ages of 20 and 18 years respectively), sterilisation and even abortion. Clinics dispensing birth control information to the public have sprung up in every city. Shop windows display a complete range of contraceptive devices. In fact, according to reports, the present campaign surpasses the last one in vigour and is being pursued by the Chinese with their characteristic single minded fanaticism. (If only we, in India, were as thorough in at least our Family Planning Campaign!).

(b) The Roman Catholic Church opposes many methods of birth control as a matter of moral principle. This has led to the widely prevalent but mistaken belief that it is opposed to family limitation at all times by any and all methods. Actually it is not so and there are many points of agreement as well as of disagreement about Family Planning between Catholics and non-Catholics. However, a public clarification of the Catholic Church's stand on this problem would be of great help in dispelling the wrong notions that people have.

(c) Concerted and massive action by advanced countries to help under-developed countries is not possible because of opposition by Communist countries and Catholics. This inhibits not only Non-Socialist, Non-Catholic countries from offering help, but the recipient countries also do not come forward asking for aid in combating this problem.

(d) Ignorance on the part of some of the leaders and prominent citizens of the seriousness of the problem particularly in the under-developed but densely populated countries. A surprisingly large number of them still consider a rapidly expanding population as an asset!

The above factors stand in the way of the adoption of population control methods at the national as well as the international level. At the individual level the factors which inhibit reduction of the growth of population, particularly in India, are:

(i) **High marriage rates and early marriages:** India is a land of universal marriage. This is not so everywhere. In Ireland, for example, about 10 to 15 per cent of the people remained single. Elsewhere though less than in Ireland, a significant percentage of mature people stay single as unmarried people are socially acceptable unlike in India. A decrease in the number of people marrying would result in a corresponding decline in the birth rate. But marriage practices are a part and parcel of the traditions and customs of a society and over a long period only can any noticeable change be possible.

Not so long ago, child marriage was widely practised in India. In 1930, the Sarda Act was passed raising the age at marriage of girls to 14 years. Yet the 1951 census revealed that 92 lakhs (9.2 million) marriages were performed by infringing the law. One person out of every 25 married persons in North India was so married, with Central India (1 in 27) and Eastern India (1 in 31) not far behind.

There is no doubt that the age at marriage is increasing, but even now an overwhelming number of women get married before reaching puberty or just after and practically every woman is married by twenty. This means that the whole of the reproductive period is available for child bearing. In Ireland, for example, the average age at marriage was 28 at one time with nearly one-fourth of the women marrying at the age of 45, which is normally considered to be the end of the reproductive period.

It is interesting to note that in 1800, the average number of children born to women in western Europe reaching 45 was about five. The current average is 2 to 3. In India the figure is 5.5 — 6.

Birth rate can be lowered by late marriage as well as by not marrying. An increase of five years in age at marriage in our country would result in a decline

of as much as 20 per cent in the birth rate. A 15 per cent decrease in the number of marriages can lead to a corresponding decrease in the birth rate.

(ii) Desire for children :

Till recently and in certain communities even now, a large number of children signified prosperity and good luck. It meant more hands for working (in an agricultural society); that the parents will be provided for in their old age or simply that more children meant better status. In many countries, especially in India, sons are considered very essential not only to carry forward the family name but also from the religious point of view.

Many other factors also tend to popularise large families, not the least important being the high mortality rate. Decline in the death-rate is not always quickly apparent, so considerable time is required to establish the fact that it is no longer necessary to have several children in order for some to survive.

(iii) Ignorance of the purposes, means and consequences of family planning :

Almost every survey on attitudes towards family planning, from the highly sophisticated areas in the USA to the rustic village in India, shows that a large proportion of people are in favour of limiting the family size — limiting the birth of children to the number wanted, when they are wanted. The single major reason for this attitude towards family planning is the concern for the economic welfare of the family — a better standard of living and a better chance in life for all children. But considering the size of of the populace to be educated in family planning there is hardly any propaganda at the appropriate scale on the subject. Most societies disapprove public communication or discussion about the subject as sex and reproduction are not considered appropriate topics of conversation.

(iv) A high percentage of illiterate population, especially women, make informational programmes difficult.

(v) Dispersal of the population into many small widely scattered villages (over 5 lakhs in India) complicate the problems of communication and supply.

(vi) **Lack of trained personnel :**

The necessary administrative leadership and technical competence to support a mass programme are often lacking in under-developed countries.

(vii) Per capita income being so low in under-developed countries, people just cannot afford to buy the conventional but costly contraceptives even when they have been motivated.

(viii) Finally, any worthwhile plan for mass education in family planning and free supply of contraceptives may be much too costly for the country.

In short, a programme for voluntary fertility control often faces an apparently insurmountable barrier of traditional behaviour in traditional societies, reinforced by social customs and cultural arrangements of long standing. These are formidable obstacles to the success of any effort to promote voluntary fertility control in the type of society that needs it most. The difficulties are altogether real and discouragingly numerous. **Only the importance of the task would appear to justify the necessary effort.**

WINDOW ON THE WORLD

Britain and the Common Market

From our Special Correspondent

PARIS :

STATISTICS, everyone knows, are capable of varying interpretations. A current example concerns Britain's trade with the Common Market. The Board of Trade in London has just published an analysis of Britain's foreign trade, in which it is pointed out that British exports increased satisfactorily last year but that in recent months some disturbing inequalities appeared. Exports to the other members of the European Free Trade Association rose 13 per cent in the last quarter of 1963, but exports to the Common Market, already disappointing in the previous quarter, declined 2 per cent. More British goods were sold in Norway, Sweden and Denmark, but less in France, West Germany and Italy; this trend is said to have persisted in the first few months of 1964. The official document concludes that the effects of tariff discrimination are beginning to make themselves felt: since the breakdown of the negotiations in Brussels for Britain's entry into the Common Market, UK exporters have preferred to work in markets that are easier of access, like EFTA and the Commonwealth, to the relative neglect of more protected markets like those of the Six.

It will be noted that the Board of Trade does not say baldly that tariffs are directly responsible for the supposed setback in the Common Market. Rather, it is business men who are taking the line of least resistance, whereas a more energetic effort in markets where there is said to be some tariff discrimination could still produce an improvement in sales. This fine distinction disappears in a 'Financial Times' comment on the report: "In short, there is no doubt that the Common Market is having repercussions on trade. The tariff discriminations that it entails make all the more urgent the quest for ways to diminish them through GATT." In other words, there is a sure decline in British sales to the Six; tariff discrimination is responsible, and the cure is tariff reduction in the Kennedy Round.

Favourable Growth

A rather different picture was painted by the French Premier speaking to the British Chamber of Commerce here recently. Trade between Britain and France, recalled M. Pompidou, increased in 1963 not only faster than France's trade with all other non-members of the Common Market but even faster than France's commerce with her five partners. Trade with the outside world increased 14 per cent last year, trade with the other five rose 17 per cent, but Franco-British trade rose 20 per cent. Moreover, this expansion was entirely in Britain's favour: French sales to Britain increased 12 per cent, but French purchases from Britain shot up 33 per cent. Franco-British commerce is at its highest level in 15 years and French exports cover only 75 per cent of French imports from Britain, leaving the latter a substantial trade surplus. Since M. Pompidou spoke, later figures, for the month of January 1964, have come out and they show a further expansion of this trade, but also a reversal in France's favour: for the first time in two years France had a monthly surplus with Britain. This was due to the record level of French sales in that month (£16 million) while Britain's sales on this side of the Channel remained high.

Thus to one party the figures prove that the Common Market has begun to damage Britain's foreign trade; to the other, they prove the contrary, at least in the case of one of the most important British markets on the Continent. In sorting out this confusion, one has to know what one is looking for and what one would regard as evidence. As to the first point: one is not looking for trade surpluses and deficits, but for the volume of two-way trade across the Channel and North Sea. No one ever said that the Common Market (or any other trade dispensation) would guarantee Britain a surplus in commerce with the Continent. Indeed, the traditional situation is just the contrary: the Continental countries have usually run a deficit with the overseas sterling area (because of imports of raw materials) which they have balanced by scoring a surplus in trade with Britain. That has been the normal state of affairs, and if Britain had been running a deficit lately with the Six (in fact, she has not) this could not be blamed on tariff discrimination.

What was forecast as the evil consequence of the Common Market was a contraction in trade and a diversion of normal traffic. There is no sign that this has happened. As to what evidence one would adduce for that: one cannot take trade returns over a brief period, such as are cited in London, because these are influenced by fluctuations in relative rates of inflation (among many other things). Italy and France, to mention only them among the Six, were suffering from an alarming inflation through most of last year, so an increase of British sales (such as M. Pampidou quotes triumphantly to support his thesis) would be natural, given the steadier prices in Britain. Since then, those two countries have had to take the inevitable steps to dampen demand, so a decline in British sales (such as the Board of Trade finds ominously significant) would be equally natural.

Broader Perspective

One must look to a longer period. If it is objected that one thereby misses the effects of the very latest tariff adjustments on the Continent (the last 10 per cent cut in internal duties and the second step toward a common external tariff), the only answer is that it is impossible to isolate such a factor in the complex short-term picture. The longer trend, on the contrary, indicates tendencies that have been at work through all the previous tariff adjustments and which are sufficiently striking to suggest that they will persist. Thus, British exporters' performance in France last year (a 27 per cent increase in sales to £194 million, against imports from France of only £154 million), for all that it was aided by the relative rise in French prices, appears to fit into the underlying trend. That trend is this: Britain's sales to the Common Market between 1958 and 1963 more than doubled, rising 105 per cent, while Britain's imports from the Six rose 50 per cent. In turn, that trend fits into a wider picture, the increasing importance of all West Europe as a British export market, as compared with the Commonwealth.

Back in 1953 West Europe took 27 per cent of Britain's exports, but last year it bought 37 per cent, thus outclassing the sterling area as a British customer. Throughout that period, the Common Market Six expanded their purchases much faster than the EFTA countries, despite the "tariff discrimination", and this contrast was never more marked than last year when discrimination was most notable: EFTA bought 7 per cent more from Britain, the Six 15 per cent more. The other side of the account (Britain's imports from the Continent) is just as important, because, as noted, the point is not respective surpluses and deficits but the total volume of trade. It emerges that the West European countries became more important suppliers to the British isles, but are still second to the sterling area, furnishing 50 per cent of British imports. Two facts are notable on this side of the register. The sterling area benefitted more from the increase in British imports than did EFTA, which has the advantage of fresh tariff discriminations. And the Common Market did just as well in the UK market as the members of EFTA, although the Six suffered from just the same disadvantages (EFTA's mutual

tariff preferences) as Britain complains of when she exports to the Common Market.

In short, on neither side of the trade returns can one find (when one takes a period long enough to iron out fluctuations due to temporary price differences) any evidence that conflicting tariff preferences have to date distorted European commerce. On the other hand, one sees a universal expansion of that trade, affecting the whole region, to the relative disadvantrge of Europe's trade with overseas countries. Concerning that latter comparison, one needs to recall that this is a relative disadvantage (the increase in Europe's imports and the deterioration of its trade balance with the rest of the world are notorious); and moreover that an intensification of intra-regional trade, a sort of involution of European commerce upon itself, has been going on since the decline of imperialism and is largely independent of local trade blocs.

In studying the effects of these trade blocs, one cannot stop at the global foreign trade returns which are quite superficial signs. One needs to look for other evidence, notably of increasing inter-dependence of the European economies. Here one finds that co-operation between Britain and the Continental countries is intensifying every month. The surprise is that this is nowhere more striking than between Britain and France. Closer integration within EFTA would be expected, for that is what tariff preferences are designed for. More intimate collaboration between Britain and the other Five of the Common Market would also be expected, because since the British fiasco this has been deliberately stimulated from both sides, in order to preserve the link across the Channel that General de Gaulle seemed anxious to sever. In reality, it emerges that integration, at the level of private business and of industrial co-operation, has progressed fastest between Britain and France. The Concord project is the merest symbol of a collaboration that one sees right down the roster to the food and clothing industries.

One does not conclude from all this that the trade blocs and their discriminatory preferences are quite without interest or effect. Though no such thing is apparent yet, they might come to have notable effects on trade patterns — but there is no reason whatsoever to expect that this will mean a decline in any one nation's exports to its neighbours, in absolute terms. Rather, one would conclude that the long-term intensification of West European trade and integration of West European industry both cut across the boundaries of the present six-nation Common Market, and suggest an inevitable eventual British admission to that association. But of course, not before Britain is ready to pay the price that she found excessive last year in Brussels.

"All Change Here—For Growth"

JOSSLEYN HENNESSY

LONDON:

TODAY, whether we are Conservatives, Socialists, Liberals, or even "Don't knows", we are all "growth men"; we contrast the U.K.'s post-war average growth rate of 2.7 per cent a year with the higher rates attained by Germany and other countries. We applaud Neddy's 4 per cent growth rate target and rejoice to know that we are currently exceeding it. Our enthusiasm for growth is justified, if for no other reason than that without growth our equal enthusiasm for annual increases in wages and salaries will be speedily chilled by bold blasts of inflation: our higher pay will be mopped up by higher prices.

There is, however, a fly in the growth ointment. Growth — the multiplication of wealth — means change and, whatever the reason may be, the way to popularity in this country is not to point to the wealth to be garnered from new techniques but vociferously to lead resistance to the abolition of the old.

An outstanding example of this mystique of growth schizophrenically cancelled out by a simultaneously held mystique of "No change here" is that popular imagination sees the "Beeching Report" essentially as a plan to close services and stations, oblivious to the Report's basic aim, which is to improve, expand, and develop the railways by concentrating on those services to passengers and freight which they can do best.

By yielding to roads, waterways, sea, and air what these are best equipped to do and endeavouring by competition to ascertain and capture from them traffic in which their costs are higher than those of the railways, the Beeching Plan will contribute to a re-allocation of men and resources of the greatest significance to Neddy's plans. Hitherto, far from contributing to the growth of the economy, the railways have been holding back the multiplication of wealth by imposing on the community the burden of a cumulative loss of £1,000 million to date. Who is responsible for this? The answer is — we men in the street and housewives in the home, who, under the illusion that the "government" pays for this vast waste of men and resources, have been indifferent to it. We do not realise that we ourselves pay for it in taxes, direct and indirect, and in retail prices higher than they need be. The margin for price reductions from increased efficiency must be substantial since transport accounts for over 20 per cent of the gross national product, i.e. for £4,600 million out of the total gross national product of £22,000 million.

It is, therefore, encouraging to be able to report that two of the biggest British industries — one nationalised, the other private enterprise — have shown that the adventurous pioneering attitude towards change, which made the U.K. the world's wealthiest country in the 19th century, is still alive. In 1963, British Railways signed long-term contracts for the bulk transport of oil with six leading companies — Petrofina, Gulf, Mobil, Esso, Shell-Mex and B.P., and Regent, and in January, 1964, they signed a long-term agreement with the Central Electricity Generating Board for the bulk transport of coal to a number of existing power stations, and to six new ones under construction.

The old method of loading coal from colliery sidings involved the shunting of empty wagons, their individual loading, and re-shunting for assembly in a train, the whole bemusing process being undertaken anew in reverse on arrival at the unloading terminal. The Beeching method, in place of sidings covering 250 acres, needs only four acres to lay out bunkers fed by conveyors from the pitheads. The train, a permanent unit, never uncoupled, passes under the bunkers, whose hoppers load five wagons simultaneously. At the terminal — power station, port, steel works, or depot — the train passes over conveyor-belt connected hoppers, capable of receiving the content of five wagons simultaneously. Work which required no fewer than 200,000 wagons under the old system can now be done by 10,000. Under the old system, British Railways locked up £200 million of capital at loading and unloading terminals in wagons being used for temporary storage. Under the new system this £200 million is released

All tyres may look alike-BUT

there is a difference with

Firestone

for more profitable uses, together with space saved on land, often in valuable urban centres.

The C. E. G. B.'s new power stations, each of 2,000 M.W. capacity, require up to 2,000 tons of coal per working day. Under the new system, a permanently coupled train with a pay load of 1,000 tons can be unloaded in 60 minutes.

The contracts with the oil companies provide for British Railways to move a minimum and increasing volume of traffic in fast block freight trains. The companies supply their own tank wagons, fitted with continuous brakes for high speed working, and carrying loads of 27½ tons. British Railways arrange special services for each company, of three to four trains per week on some routes, with additional trains as required.

In short, these contracts reveal two major British industries co-operating with British railways to exploit those new techniques without which there can be no economic growth. To what extent will other industries follow the trial thus blazed?

One gets the impression that the disproportionate attention given to the proposed closures of services and stations in public discussion of the Beeching Report has led many industrialists to dismiss it as a negative, backward looking document, irrelevant to their own problems. They tend to think of the railways' possible contribution to their firms in terms of the old type of freight service, with its maze of slow and expensive local collections and marshalling yards and a rigid traditional pricing policy. But there are innumerable industries capable of exploiting the new technique of bulk loading and bulk terminal unloading, with its advantageous terms for long period bulk contracts. Haphazard, there comes to mind iron ore, pig iron, finished steel products, chemicals, fertilisers, building materials, processed stuffs, fish, grain, flour, beer, spirits, milk distribution, paint, varnish, edible fats, glucose, molasses, oils, and solvents.

India's railways are among the handful in the world that pay. But I take it that the Finance Minister would raise no objections if they paid even more. He might therefore urge them to study the revolutionary railway techniques that British Railways are developing. After all, a system which enables 10,000 wagons to do the work of 200,000 cannot be dismissed as unworthy of investigation.

Foreign Aid: A New Phase

By GUY SIMS FITCH

WASHINGTON:

IT HAS become increasingly evident that the effectiveness of foreign aid cannot be measured solely in dollars. Much more depends on a programme's standards and on the co-ordinated efforts and policies of donor and recipient to make a joint undertaking succeed.

In this light one can best judge the proposed $3,400 million foreign aid programme for fiscal 1965 which President Johnson sent to Congress recently. This sum is $1,100 million below the amount requested from Congress last year.

Admittedly, Mr. Johnson is stressing economy in government operations. But, as his emphasis on new programmes to improve the domestic US economy indicates, economizing is far different from retrenching. What the Administration has presented to Congress is not just a tightly drawn foreign aid proposal, but one that is realistically geared to meet projected requirements.

This is particularly noticeable on the economic side of the aid ledger. Mr. Johnson is requesting $2,400 million for economic assistance as against the actual current appropriation of $2,000 million. Military aid, on the other hand, would remain at the present level of $1,000 million. Thus, greater weight is being put on the economic aspects of US assistance, continuing the trend started by President Kennedy.

The new proposal also contains other noteworthy trends. One is the emphasis on development loans, which can be related to sound planning in developing countries and thus contribute to lasting long-term progress. Another is the concentration of assistance in the less-developed areas.

In the formulation of an Aid programme, practical experience dictates that certain assumptions must be made regarding the amounts of money that can be used effectively. Involved in the determination of the $2,400 million economic aid figure are several basic criteria. One is the ability of a developing country to use aid funds in terms of its economic capacities and its resources of manpower and materials. Another criterion is the readiness of countries to undertake the kind of development planning, self-help and internal reform which underlie the effective use of outside assistance. A third criterion is the extent to which other sources of financing, such as the World Bank and I.M.F., may be available. Also to be considered are other forms of US assistance such as export-import bank lending and food-for-peace shipments, which are not included in the annual aid request of the US Agency for International Development. These, too, are being maintained at the high levels of the past.

A Foreign Aid programme must take into account the rate and degree of progress in recipient nations. To the extent that economic assistance may have performed its essential task, and countries may have established strong and economically progressive societies, the United States is obviously in position to start ending its allocations of development aid. This is already true in Greece, Taiwan and Israel, for example, and it is perhaps the best indication that foreign aid succeeds where there is a combined will to make it work. There also are countries where progress permits the United States to change its assistance from the supporting category — large amounts of funds to help shore up economies carrying exceptionally heavy burdens — into the realm of long-term lending to advance sound economic development. Supporting assistance, based primarily on strategic factors, is confined today mainly to four countries — Republic of Viet-Nam, Laos, Republic of Korea and Jordan.

On the basis of all these judgments, about 90 per cent of the proposed fiscal 1965 economic assistance would go to about 20 countries, with the remainder going to about 50 others. Indeed, approximately two-thirds of the development lending would be concentrated in India, Pakistan, Turkey, Nigeria, Chile and Colombia. They are undertaking the kind of self-help and internal measures necessary to foster economic progress. Actually, when exmained on a per capita basis, the differences in aid allocations among the various recipient countries are not as great as the over-all figures might indicate. Moreover, President Johnson has, suggested that he may ask Congress at a later date for an additional foreign aid appropriation.

When it comes to development assistance, of course, the total flow of capital and technical resources — both public and private — merits consideration. It implies the need for developing countries to attract investments, domestic and foreign, and effectively use them. Recognising this, the President in his Aid message incorporated several proposals to stimulate the flow of private American investments to less-developed areas. Chief among these is a tax incentive which would cover new contributions in money or property to a productive enterprise in a developing country. It is expected that as many as 75 countries may qualify for this proposal.

TTK Talks to Yojana Bhavan

By Our Special Correspondent

NEW DELHI:

IN A letter addressed to the Deputy Chairman of the Planning Commission towards the end of last month, the Finance Minister, it is learnt, has emphasized the need for the Planning Commission freeing itself from involvement in executive responsibility or in the day-to-day decisions of the Government. Deploring the slurring of the distinction between planning and policy-making as a result of the Planning Commission having failed all these years to concentrate on increasing the efficiency of and specialization in techniques of planning, Mr. Krishnamachari has held the Planning Commission as well as the Central Ministries responsible for the present state of affairs. The purpose of this communication, however, is not fault-finding, but the constructive one of reorienting the Planning Commission's outlook and reorganizing its functions, so that the operational efficiency of that body may be improved. The issues raised in this communication are expected to be discussed at a meeting of the Planning Commission next week.

While the Ministries are blamed for involving the Commission in issues on which they themselves should take decisions and assume full responsibility, the Commission is criticised on the ground that it has been rather too ready to get involved in questions of government policy which are not germane to planning. Illustrating the tendency on the part of the Planning Commission to stray outside its field of responsibilities, the Finance Minister argues that it should not be the concern of the Planning Commission whether the Government should import wheat under the PL-480 programme or not, or whether contracts for the supply of plant and machinery for a project should be placed with this country or that. The Finance Minister has also expressed the view that policies affecting patent laws, trade marks, etc., should be the sole responsibility of the administrative Ministries. He also asks why the Planning Commission should concern itself with the implementation of the rural works programme, rural industrialisation, water supply or public co-operation in construction works. He feels that it is wrong for the Planning Commission to identify itself too closely with the implementation of projects as that would make it difficult for the Commission to undertake any independent evaluation of the progress of projects.

Realistic Estimate

Turning from the "don't"s to the "do"s, the Finance Minister suggests that in formulating the fourth Plan, every effort should be made to estimate realistically the cost of each project and then select projects with a view to maximising benefits after careful calculation of investment, both in terms of rupees and foreign exchange and the annual outlays which will be needed to keep the schemes going. The evaluation of projects and determination of priorities, in other words, should be done more critically than in the past.

The co-ordination of long-term and short-term planning should according to the Finance Minister, receive greater attention from the Planning Commission than hitherto. Perspective planning, he points out, should not become a mere academic exercise in projections nor an instrument for unduly inflating short-term Plan targets beyond the likely availability of physical or financial resources.

Dealing with the continuing failure in agriculture, Mr. T. T. Krishnamachari has argued that the Ministries concerned and the Planning Commission must share the blame for this since they have not succeeded, among themselves, in securing adequate specialization in the machinery for agricultural planning. Mr. Krishnamachari pointedly asks what particular contribution by way of specialized knowledge from the Centre has gone into intensification of work in the districts covered by the Package Programme. The Finance Minister finds similar weaknesses in planning with regard to the rational utilisation of energy or proper co-ordination of transport.

An issue which occupies a large part of the Finance Minister's communication to the Deputy Chairman of the Planning Commission is the disquieting financial positions of the States, with particular reference to the grant of Central assistance to State Governments. State debts to the Centre and the general public are mounting. Even the interest dues are not being actually paid but are being added to the principal and interest is again charged on the capital thus accumulating. Since the Centre is undertaking larger and larger repayment liabilities from year to year, it should be difficult for it to contemplate writing off the loans granted to State Governments. But, at the same time, the fact has to be faced that, as things are at present, it is extremely unlikely that these loans can be amortized from revenue surpluses of States or even the Centre.

Mr. Krishnamachari proceeds to argue that the only possible course is to capitalize loans by identifying them with particular projects or group of projects. The Planning Commission, he points out, has not been giving any thought to the problem of debt repayment and he urges that the Government and the Commission should think of a different strategy in regard to loan finance for projects of State Governments. In this context he remarks caustically on working groups of relatively low calibre, functioning without adequate information and technical knowledge and yet proposing various targets which are then accepted by the Planning Commission without proper study of the economic and financial costs or return that may be expected from the investment. The working groups, he says, tend to operate as pressure groups for obtaining additional funds for their special interests. He, therefore, urges on the Planning Commission that the major projects of the Centre as well as the States should be adequately evaluated before they are included in the Plan.

★★

The labour trouble which led to the shut down of Heavy Electricals, Bhopal, on March 30, is not the only factor which has been hampering production at this Rs. 100 crore national undertaking. The unsatisfactory working of the plant is also attributed to various managerial bottlenecks, such as lack of delegation of responsibility to the junior cadres of the staff; shortage of technical personnel to man even some key posts; failure to build an adequate commercial engineering organisation; unsatisfactory arrangements made for organisation of work on shop floors, maintenance and production of tools, and purchase, receipt and handling of stores, etc. Excess labour force and lax accounting system too are contributing to the slow development of the project.

According to the latest periodic report of the project's Technical Consultants, Associated Electrical Industries Ltd., the production at the Bhopal plant during the first nine months of the financial year 1963-64 was only about 70 per

cent of the target programme. The level of output achieved in the four principal lines of manufacture individually was as follows:

	% of 1963/4 target to 31-3-1963	% of present Shop Capacity
Transformers	65	32
Switchgear & Controlgear	80	50
Traction Motors	25	25
Capacitors	84	84

The working of the transformer department was particularly ungratifying. The target of production for this department had been originally fixed at 1469 MVA. It was later on reduced to 1200 MVA. Even this revised target was not being adhered to. The Consultants have deplored such programme changes part way through a year on the ground that they not only have a demoralising effect on the manufacturing personnel who tend to think that their failure to achieve original targets can always be covered up by revising the targets downwards, but also because this procedure can have very adverse effects on customers whose delivery dates are put back.

Important Suggestions

For improving the situation, the Consultants have made a number of suggestions. The most important among these is the setting up of a commercial engineering organisation for interpreting consumers' requirements to the factory and the factory's ability to the consumers. This organisation, the consultants opine, should be manned by senior staff having status to talk on equal terms with the senior personnel of the customer parties and the senior engineers and supervisors in the factory, and must act as the prime arbiter on the factory's production programmes.

Stressing the need for delegation of responsibility in the interest of efficient working of the factory, the Consultants say that the stages of responsibility should be:

(a) Government to lay down policy for the industry as a whole—to decide on rate and programme for development and allocation of overall expenditure budget for total cost and foreign exchange requirement. It must not insist on step-by-step approvals and 'justifications' within the agreed overall programme, and should be concerned only with the Board's periodical reports on the general progress of the project and never with details of operation either financial or relating to production.

(b) The Board of the company should evolve the policy for the operation and development of the company within the overall industrial policy laid down by Government and in accordance with the financial budget agreed to by Government. It should continually review the operations of the company on the basis of the accounts and reports submitted by the Managing Director/General Manager, and take such action as may be required through its Chairman.

(c) All executive authority in the factory should lie with the Managing Director/General Manager through whom the Chairman should act in carrying out the Board's policy in all matters concerning the factory.

The Managing Director/General Manager should have full authority and responsibility for implementing the policy laid down by the Board, including financial control of factory operations and development without the necessity for continual "reference back" for decisions on normal operations and details of development already agreed to in principle.

He should operate through a local Management Committee (of which he would be Chairman) consisting of:

(i) The Company's Chief Engineer,
(ii) The Works Manager,
(iii) The Commercial Manager,
(iv) The Comptroller (Finance Officer), and
(v) The Secretary,

each of whom should be executively responsible for the control and development of his function in the organization. The Managing Director/General Manager should exercise his authority only through the above executives.

If any senior management official or departmental head is not considered capable of exercising the authority and of accepting the responsibility appropriate to his position, he should be replaced forthwith. Unless this is done, failure to attain targets must be expected.

The Consultants regretfully point out that organisation of work on the shop floors, maintenance and production of tools, cost accounting, and purchase, receipt and handling of stores still leave much to be desired. The practice of each shift having its separate work programme and refusing to continue or complete the jobs left unfinished by the previous shift, although now largely eliminated in the assembly section, continues to prevail in the machine shops. This not only inflates the working capital requirements, but also leads to inordinate delays in the completion of work and unnecessary wastage of capacity. The maintenance department is inadequate to protect and service the vast amount of capital plant installed at Bhopal by competent preventive maintenance measures. Serious delays also continue to occur in the purchase and receipt of stores, especially the imported ones, because of persistence with the defective "progressing procedures". Most of the stores also continue to be deposited with the central depot instead of these being handled departmentally after receipt. With the transport system within the factory not being very efficient, movement of stores from the central depot often involves dislocation of work. The growing requirements of tools and jigs also are posing a big problem. The Consultants are of the view that procedures in respect of all these matters should be streamlined. A permanent tool room should now be set up, in about a year's time, with a full complement of the necessary equipment. The technical staff at various key positions, such as for supervising building programmes and looking after the technical services department, should be adequately strengthened.

Incentive Wages

Indiscipline amongst workers, the Consultants believe, can be reduced only through introduction of an incentive wages scheme and giving of powers to the supervisory staff of all grades to take summary action against offenders. They deplore that even such major obstacles to maintenance of reasonable discipline in the shops as "absenteeism, failure to work to instructions, idleness, including sleeping, and interference with safety arrangements" are classed as minor offences to be dealt with only by censure and limited fines and that too after a formal inquiry. The present "Standard Standing Orders" of the State Government, the Consultants opine, preclude supervisors from exercising their main function of supervising the labour force and need to be amended. The productivity of labour in some departments, the Consultants point out, is as low as 25 per cent of what it should be.

The Consultants regret that the finalisation of the incentive wages scheme is taking inordinately long time because the conciliation proceedings to which the recognized labour union and the management board are parties, are still pending before the State Labour Department. They have stressed the need for making every effort for concluding negotiations with the labour union and tightening the management's control over workers. The desirability of reducing the surplus labour force has also been impressed by the Consultants.

The Consultants have noted that the production planning organisation is being built up in a satisfactory manner, but

opine that the production progressing function needs to be tightened up and straightened.

★★

The Union Government is understood to have decided to reconsider its earlier decision to abrogate patents for drugs, medicines and foodstuffs. A ministerial committee, consisting of Mr. Asoke Sen, Mr. Humayun Kabir, Mr. M. C. Chagla, Dr. Sushila Nayar, Mr. Nityanand Kanungo and Mr. Manubhai Shah, has been set up to go into this question fully and to make proper recommendations.

The decision of the Union Government last year not to issue new patents for drugs, medicines and foodstuffs had provoked a country-wide agitation from pharmaceutical firms. Many foreign firms also had objected to the move through the embassies of their countries here.

★★

Although the scheme of Hindustan Insecticides Ltd., to manufacture annually 3,000 tonnes of BHC Technical at its Alwaye works has not been included in the third Plan, the Union Ministry of Petroleum and Chemicals is understood to have requested the Ministry of Finance to clear this project in view of the fact that the capacity licensed so far to the private sector in this line of production does not exceed 8,000 tonnes per annum, as against an estimated demand of 15,000 tonnes in 1965-66 and 25,000 tonnes in 1970-71.

★★

The Committee appointed by the Indian Drugs and Pharmaceuticals Ltd., to study the economics of its proposed Phytochemical Project, is understood to have recommended dropping of this scheme on two grounds; firstly, the price of tea waste, the main raw material for the manufacture of caffein, is considered too high to permit economic production of caffein; and secondly, with the expansion of the existing units in Calcutta and Kerala, the current demand for caffein would be met fully. The Committee has suggested that if future demand warrants it, the question of manufacturing synthetic caffein at the Synthetic Drugs Plant of IDPL may be taken up at the time when the expansion programme of the Synthetic Drugs Plant is considered.

★★

Two expansion programmes of Hindustan Antibiotics Ltd., Pimpri, are expected to fructify in the next two or three months. These are the doubling of the capacity of the Streptomycin plant to 80-90 tonnes per annum at an estimated cost of Rs. 60 lakhs (foreign exchange component Rs. 34 lakhs) and expansion of the Penicillin unit from 60 mmu to 84 mmu at an estimated cost of Rs. 25 lakhs (foreign exchange component Rs. 20 lakhs).

The scheme of the company to expand the production of Hamycin at its existing plant from 15 kgs. to 50 kgs. per annum has been approved by the Union Government. This expansion programme is expected to cost Rs. 30 lakhs, including Rs. 16 lakhs expenditure in foreign exchange. The foreign exchange component of the scheme is proposed to be met from the U.S.AID assistance programme.

Another scheme of Hindustan Antibiotics which has been approved by the Government is the manufacture of 50 tonnes of Vitamin C per annum at an estimated cost of Rs. 60 lakhs, including a foreign exchange component of Rs. 33 lakhs. The company has been asked to go ahead with this pilot project at an early date. The decision on large-scale manufacture of Vitamin C at Pimpri will be taken after the pilot project proves successful.

★★

Messrs. Cawnpore Chemical Works, Kanpur, have proposed expansion of their capacity to manufacture sulphuric acid from the present 15 tonnes per day to 25 tonnes per day. Messrs. Shambunath & Sons, Amritsar, have proposed to undertake the manufacture of sulphuric acid (battery grade) to the tune of 3,000 tonnes per annum and some quantities of BP grade sulphuric, hydrochloric and nitric acids. The proposals are stated to be under the consideration of the Union Government.

Hindustan Insecticides Ltd., has also proposed purchase and installation of two spent sulphuric acid purification plants at its Delhi and Alwaye works at an estimated cost of Rs. 3.96 lakhs each. The two schemes have been approved by the Government. The company has indicated that the setting up of the two plants will result in a daily saving of Rs. 2,424.

G. S. SUNDARAM
Secretary

★★

Inaugurating the 31st annual session of the All-India Organisation of Industrial Employers here last week, the Union Minister for Labour and Employment, Mr. D. Sanjivayya, said that the labour policy must necessarily be an integral part of the national policy. He pointed out that what the Government's labour policy sought to achieve was not merely "the limited purpose of better relations", but also the broader one of securing social justice consistent with the needs of national development. Referring to the employers' concern over the current state of industrial relations, he reiterated his faith in the Code of Discipline and the Industrial Truce Resolution and added that nothing had happened so far to shake that faith.

In his presidential address, Mr. D. C. Kothari, said that the upward push to the price level came mainly from inadequate agricultural production. The general index of wholesale prices of all commodities rose from 126 in January, 1963, to over 138 at the end of February, 1964. The main increase had been in the index for food articles which had registered a rise of 17 points, as against only 3 points in the case of manufactures. The problem, therefore, was how to increase agricultural production.

Referring to industrial relations, Mr. Kothari said that the demand of workers for additional leave was not justified as the existing provisions were already over-generous. There were different festival holidays for 4 to 30 days, paid privilege leave for 14 days under the Factories' Act, sick leave for 56 days under the Employees' State Insurance Act, accident leave permissible under the Workmen's Compensation Act, etc. All these combined enabled an industrial worker to absent himself, on an average, for 120 to 150 days in a year. Mr. Kothari added that social security provisions in labour legislation were sought to be interpreted as the minimum, with the result that industrial courts and tribunals had taken a very liberal view of the demands of workers. Recently, the Industrial Court of Maharashtra had allowed an appeal filed by the Rashtriya Mill Mazdoor Sangh and had awarded additional privilege leave (with wages) for seven days and casual leave for five days. Mr. Kothari suggested that till the emergency lasted, all demands for holidays other than those prescribed in the relevant Acts should not be a subject matter either of dispute or of adjudication.

Referring to the employment position, Mr. Kothari pointed out that an important objective of planning was to create employment opportunities and to relieve, if not to remove altogether, unemployment in the country. But a review of the achievements of the last two Plans and the first two years of the current Plan indicated that this objective had proved out of reach. The backlog of 5.3 million unemployed at the beginning of the second Plan increased to 9 million in 1960-61, representing about 2 per cent of the country's total population. Besides this, new entrants in the labour market during the current Plan period were estimated at 17 million. These figures did not include those who were under-employed, which, according to the National Sample Survey, numbered about 18 million. The objective of the third Plan was to create 17 million jobs, i.e., to absorb the new entrants in the labour market and to avoid further deterioration in the situation. Mr. Kothari pointed out that the progress achieved so far had not been satisfactory. According to the mid-term appraisal of the Plan, on a rough estimate, the additional employment opportunities created in 1961-62 and 1962-63 had been of the order of only 2 million per year, as against the target of 3.4 million. He further pointed out that the situation should be more acute if account was taken of the high rate of population growth in the decade 1951-61, based on which the expected increase in the labour force during the current Plan would be 23.6 million, as against the original estimate of 17 million.

Mr. Kothari also referred to the problem of trained manpower and suggested that the future requirements of scientific and engineering personnel should be estimated in advance so that training facilities could be increased in time.

"Package" Programme Under Fire

From Our Correspondent

BOMBAY:

WHILE THE State of Maharashtra, on account of the predominant industrial concentration of Bombay, is bound to remain as the foremost among the industrially advanced areas of India, the change in approach to problems of planning and development emphasises the need for an agro-industrial base as the sure foundation for a rapid rate of development. In this regard, the Chief Minister Mr. V. P. Naik, is talking of a policy which is aimed at strengthening the agricultural base as also the rural industrial structure. Meanwhile, the Estimates Committee of the Maharashtra Assembly recently pointed out that the package programmes for the production of crops such as cotton, groundnut and paddy, the mainstay of agriculture, in the State, launched as pilot projects at various places, during the course of four to five years, had not made any appreciable progress. In fact, the one launched at Pachora for groundnut had proved to be a dismal failure. The reasons for the failure, as indicated in the Report, are a pointer to the immediate steps that are necessary to reorientate the policy in agriculture in the State to improve production levels and productivity. It has been found that programmes were undertaken hurriedly without proper preliminary arrangements such as procurement of the right type of seed, fertilisers, loaning programme and such other things. Difficulties were felt in the recruitment of the necessary trained staff for the operation of the package programme. If there is failure even in such pilot projects, the effect on the confidence of the peasantry is likely to be disastrous.

★★

The power deficit in the State of Gujarat has already been indicated in these columns. This problem was discussed in detail at a Seminar organised by the Conference of the Association of Electrical Undertakings of Western and Central India recently. It appears that there is a wide variation in official and non-official estimates of power loads and the measures that are necessary to meet the demand. According to Mr. K. N. Paulin, Resident General Manager of the Ahmedabad Electricity Co. Ltd., there would be a gap of 500 mw in 1971-72 and if the development process in the State is not to be affected steps should be taken even now to meet this deficit. A 500 mw thermal power station based on oil or gas was recommended by him. Besides, the problem of potential available in the nature of hydro-power was also discussed and the conclusion that emerges is that the advantages of thermal generation from the point of view of speed and economies in construction should be fully explored, as they seem to be increasingly attractive compared to the cost of development of hydel power schemes. It also appears that local fuels could be had at comparatively lower prices than coal which is now transported from outside the State.

Looking to the present power position, it is reported that the industrial development may be affected for want of ade-

quate power supply in spite of projections which are made for additional generating capacity, beyond that available from the sanctioned projects including the second stage of Dhuwaran. What is important in this connection is that the capacity planned should be executed with speed and efficiency to meet the growing demands of power. Mr. R. V. Desai, Technical member of the Gujarat Electricity Board, gave out the details on the power position as projected and observed that the generating stations should be planned in terms of mw rather than kw. The anticipated demand, according to him for 1970-71, would be 1050 mw and with the auxiliaries and the standby capacity, the total generating capacity at the end of 1970-71 would be 1380 mw. While revealing the plans that are on hand for meeting the above demand, he observed that wide variation between maximum and minimum demand is sought to be met by the installation of 200 mw gas turbines near Dhuwaran against the anticipated load of 1380 mw. The State would thus have a total generating capacity of 1500 mw by 1970-71. All these discussions highlight the need for a more precise technical assessment of the power generting capacity in the State as also the demand that may arise not only from the anticipated rate of industrial development but also from the pressures that may arise from factors such as the need for an accelerated rate of development in the whole State in future. In the light of details that are made available the suggestion is that there should be a complementary development of hydel and thermo stations with appropriate scales of priority to give the maximum benefit of power supply to the industrial development in the State. To wait for hydel development alone may perhaps involve a slower rate of development for the State.

Regional Board

In this connection, it is significant that the Western Regional Electricity Board has been set up for the States of Maharashtra, Gujarat and Madhya Pradesh. The Board will plan the generation and distribution of power in the region. With the headquarters in Bombay and with 8 members on the Board, it would function in an advisory capacity and devise integrated operation of the power systems of the adjoining States so that the most economic generation and transmission of power could be assured. The Board will also prepare a co-ordinated overhaul and maintenance schedule for the generating plants of the States and determine the periodical generation schedule to be followed by each constituent power system with a view to utilising the idle capacity to the maximum extent taking into account other relevant factors. It will also formulate the pricing policy for sale or exchange of power from one power system to another. While the functioning of the Board, which is the fifth in the line of regional power boards constituted in the country, will not in any manner affect the existing position in regard to generation and distribution of electricity in the respective areas of the participants, it should greatly help in co-ordinating the integrating power systems towards maximum efficiency in problems of cost and supply of power.

★★

There has been a surfeit of discussion, perhaps, on increasing productivity in industry. Still, the urgency of this problem has not been fully appreciated by our industries except by a few large concerns with enlightened management, as observed by Mr. G. L. Mehta, Chairman of the ICICI, while inaugurating the two-day Annual Convention of the Institute of Industrial Engineers (India) here. It is in this context, he said, that industrial engineering could help in developing a systemmatic and co-ordinated attitude to planning not only in small units but also in big ones, and help in creating an awareness that all planning had to be directed towards the optimum utilisation of resources. He admitted that some of the factors for our high cost structure and low productivity were beyond the scope of industrial engineering; at the same time, he said that development of our industries so far had not always been conditioned by economic and technical considerations, but influenced by political factors, reasons of prestige and regional pressures resulting in units of un-economic size located at unfavourable sites and using wasteful processes. Even so, industrial engineers could contribute effectively in reducing costs by laying out plans to the best advantage, improving material handling and material consumption, introducing wage incentives, setting up inventory control and producton pilanning methods.

Even in respect of cotton textiles, the oldest and traditionally export oriented industry, he observed, adequate steps had not been taken in applying the industrial engineering techniques. It was also the case with jute, where Pakistan had made rapid progress in recent years and was trying to dislodge India from her premier position in export market. He felt that the industrial engineering organisations now functioning were not adequate to meet our needs. Education and training facilities should be increased to provide larger number of suitable industrial engineers to man the various establishments. This is a very important problem and though the urgency of introducing industrial engineering is recognised, there does not appear to be a planned move to introduce the technique in the process of industrial planning.

★★

It was only recently in the second Plan period that the survey of the potential for mineral development in the State of Maharashtra has been taken up with seriousness. There are vast areas where prospects for minerals have been discovered. But these have never been assessed on the basis of a geological survey. A detailed prospecting and drilling in certain areas has now revealed the position approximately in regard to the availability of different minerals in the State. The information was placed before the Maharashtra Legislative Assembly by Mr. S. G. Barve, the Minister for Industries. Coal has been found near Umer, Kamptee and Bokara in Nagpur district and near Warora and Bandar in Chanda district. Bauxite reserves have been noticed near Udgiri and Dhangarwadi in Kolhapur district and Shivardhan and Murud talukas in Kolaba district. Lime stone is located near Rajur and Sindola in Yeotmal district, near Kinwat in Nanded district and near Miraj in Sangli district. Following reserves have also been proved to exist at the places indicated: Iron-ore: (i) 20.8 million tons in Redi and (ii) 0.43 million tons in Tirawada, and (iii) 0.57 million tons in Fuser. Coal: (i) 70 million tons in Umrer area, (ii) 300 million tons in Kamptee area and (iii) three million tons in Bokhara area. Bauxite: (i) 57 million tons in Udgiri area (ii) 1.5 million tons in Dhangarwadi area, and (iii) 1.61 million tons in Shivardhan and Murud talukas. Lime stone: (i) 32 million tons (flux grade) and 50 million tons dolomitic lime stone (flux grade) in Rajur area (ii) 37 million tons of cement grade near Sindola area (iii) 10.8 million tons near Kinwat area and (iv) 1.5 million tons near Miraj area.

Growth of Durgapur Complex

From our Correspondent

CALCUTTA :

DURGAPUR PROJECTS Ltd. — West Bengal Government's most important undertaking —in the course of its second annual report has claimed satisfactory progress for the various projects under its charge. The diverse industrial enterprises include a coke plant, a benzol recovery unit, a gas grid, a number of power generating units and a tar distillation plant. These industries are coal-based and their establishment not only marks the industrial progress of the State on modern, twentieth century lines, but the fulfilment of a dream cherished by the late Dr. Bidhan Chandra Roy who visualised a great industrial complex for the Durgapur area, while the barrage of the DVC across the river Damodar was in progress.

Durgapur Projects now supplies coke to the Tata steel works in Jamshedpur, railways, defence services, several foundries, chemical industries and ferro-manganese plants. As the market demand for the coke has increased more than the plant is equipped to supply, the authorities have planned for a doubling of the capacity within the third Plan period by installing 58 new ovens. During 1962-63, the year covered by the report, the coke plant operated to 95 per cent of its capacity. The plant also turns out chemical byproducts like benzol, toluene, xylene and others besides coal tar, but their production varied with the fluctuations in market demand. The tar distillation plant, however, worked only intermittently, largely because the minimum input of 70 tons of tar a day could not be available from the coke plant, but it is hoped that as soon as the latter's expansion programme is completed, the tar distillation plant will be working to full capacity towards the end of 1965. Also during 1962-63, the Calcutta-Durgapur gas supply scheme was completed and gas supply to the city of Calcutta commenced in July 1963. Since then about 5 million cubic feet of gas, having a heating value of approximately 550 BTU a cubic foot, is being transmitted daily in bulk to the Oriental Gas Company in Calcutta. The supply is expected to increase in the near future.

The Company's capital programme, according to the report, over the entire third five-year Plan, includes the following important projects: (a) expansion of electrical generating capacity of the power plant to 225 MW; (b) extension of the power transmission and distribution system in Durgapur area and construction of a new high tension line connecting Durgapur with Bandel; (c) doubling the capacity of the coke plant and (d) construction of a coal washery having a capacity of 300 tons per hour. All these projects are making satisfactory progress, it is claimed. Two units of the power generating plant of 30 MW each are already in operation, and a third unit with a capacity of 75 MW will be commissioned by the end of this month. The Planning Commission has already sanctioned a 150 MW capacity plant to be put up by Durgapur Projects. Meanwhile, a high tension 132 KV transmission line linking Durgapur with Bandel has already been completed and is currently in the process of energisation. With the completion of this transmission line, Durgapur Projects will assume wider control over the production and distribution of power. With its third power unit in commission, the project authorities will soon have more power than their commitments in the Durgapur area will require. According to one estimate, the industries in the region will consume about half the power produced by the Durgapur Projects Ltd. The balance in that case will have to be transmitted to Calcutta, via Bandel, through the line which has been constructed at the cost of Rs. 1 crore.

As more and more of the existing schemes mature, Durgapur Projects is being asked to take on new responsibilities. For example, a fertiliser and a chemical project, which the State Government has taken up, have been entrusted to this company, although work on these projects has not progressed much beyond the preliminary level. A considerable amount of civil engineering construction work is also being handled by the company on behalf of the State and Central Governments. As for the fourth Plan schemes, a large list has been drawn up already, but the ones receiving prior attention are (a) a plant to produce 100,000 tons of high-silicon pig iron per year for foundry use; (b) a plant to manufacture 60 to 100 tons of methanol per day, (c) and more power units. It is also proposed to plan for extension of gas supply to intermediate points between Durgapur and Calcutta and further expansion of gas grid northwards to Asansol, Chittaranjan, Kamardhubi and other towns.

It would be, however, interesting to take a look at the finances, since it has been a long and persistent public complaint that the Durgapur Projects industries are being set up in complete disregard of a proper relationship between costs and returns. The total investment in the industries under the company's charge so far is Rs. 34.37 crores, consisting of Rs. 15 crores of equity capital and Rs. 19.37 crores of loan capital. The accounts for the year 1962-63 show a return of Rs. 1.09 crores, which after providing depreciation amounting to Rs. 64.24 lakhs comes to Rs. 45.10 lakhs net. This amount represents a return of 3.04 per cent on the depreciated value amounting to Rs. 14.82 crores of the fixed assets in respect of the plants in commercial operation during the year under review. The directors state that unless all the schemes under the company's charge go into full production the financial picture will not improve. The operational results of the company should be judged as having been derived from the commercial operation of the (1) coke plant comprising two batteries of 29 ovens; (2) the power plant running on two generators of 30 MW each and (3) the tar distillation plant which worked for five months only. The results for 1963-64 are expected to be better, firstly because of the gas supply scheme, and secondly because of the third power generating set of 75 MW capacity which will be commissioned by the end of this month. Moreover, the tar distillation plant is likely to work for longer periods in the year.

★★

The engineering industries have welcomed the 17.5 million ton steel target for the fourth Plan, but they are not sure whether the target can be realized in practice considering that the third Plan target of 10.2 million tons of steel has no chance of materialising by the stipulated time. The non-availability of U.S. aid for Bokaro has meant a big setback for India's steel plans. Although this could be converted into a blessing by imaginative and resourceful Indian enterprise, there is no denying the fact that the absence of the quantities of steel and pig iron which were scheduled to be produced by the Bokaro plant, has made a big difference to the overall steel supply for the country. For the engineering industries in particular, this has meant a hopelessly inadequate supply of its essential and vital raw material, pig iron. However, the problem now is to make do with what is available and to fix a system of allocation which makes no discrimination between private sector and State projects, but ensures adequate raw material for those who fulfil essential national needs. Unfortunately, the engineering units in the private sector now feel unfairly discriminated against, and the spokesman to have voiced the feeling was Mr. Cecil Cargin, chairman of the Indian Engineering Association at this body's recent annual meeting. In the first place, an attempt is being made to include in the public sector projects which are better left to private enterprise in the present stage of the country's development, and secondly, having initiated now ventures, the public sector is managing to get only most of what is available but also in the most privileged way possible. The Association has already represented to the authorities on the need to accord a more fair treatment for the private sector enterprises, for they too serve the common good in their own way. In a rapidly industrialising economy, the role of the engineering industry is fundamental. In spite of the quick growth of the public sector, private enterprise in this field has an obvious lead. In such fields as structural fabrication, wagon-building and equipment manufacture, the private sector has a dominant place. In the circumstances, the sector is justified in demanding an assurance that the Government will consider its claim to fair and equal treatment with the public on scienti-

fic and rational principles, and not be guided by mere ideological considerations which produce more ministers and bureaucrats than wealth for the country. Mr. Cargin and Mr. J. R. Armstrong, chairman of the Engineering Association's western region, have also urged the Government to take urgent steps to relieve the acute scarcity of pig iron in the country, because of which a large proportion of the capacity in private engineering units is lying idle. It has been stressed that a smaller amount spent on their imports could save much bigger sums of money which are now being spent on importing engineering products, but the capacity and experience for manufacturing which exist in the country. If this capacity could be made to work, it is obvious that the economy stands to benefit proportionately more through importing some pig iron.

★★

The Assam Government has once again impressed on the Centre the need to develop railway communication in the north-eastern zone consisting of Assam, Nagaland, the N.E.F.A., Manipur and Tripura. The zone is land-locked and it is connected with the rest of India by a narrow 35-mile corridor through West Bengal. The more important thing at the moment is that the zone is flanked on both sides by the hostile territories of Pakistan and Tibet. As its immediate minimum requirement, the State Government has demanded the extension of the broad gauge line from Bonaigaon in Gauhati via Rangaiya, introduction of faster trains between Assam and the rest of India, and the connecting of the Pancharatna-Gauhati line with the proposed line for Garo hills near Dudnai. It also demands that Moranhat should be connected with Dibrugarh in Upper Assam, the supply line to Surma Valley, Mizo Hills and Tripura and Manipur States should be improved, and a new rail-cum-road, bridge should be constructed at Jogighopa. The Centre has recently sanctioned, on a very high priority basis, the construction of a broad guage line from Siliguri in West Bengal to Jagighopa. It is expected that this extension will be completed by the end of 1965-66. But this has fallen short of Assam's demand. The latter wanted the line to be extended from Bonaigaon to Gauhati via Rangiya using the Bramhaputra bridge; the extension in that case would have been some 96 miles — a length considerably more than what the Centre's project allows. However, with the Government of India's keener awareness to protect and develop this strategically important State, it is expected that most of Assam's demands would be met as early as practicable. For in this case, it is not the will but the resources that matter.

Fourth Plan: Setting the Sights

From Our Correspondent

MADRAS:

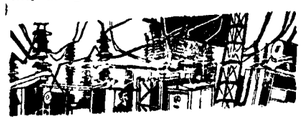
DURING HIS recent visit to Madras City, Mr. Asoka Mehta had a two-day conference with the Ministers and officials of the State Government and had a discussion with them regarding the problems confronting the State. He seemed to have been impressed with the progress made by the State in recent years in the development of its economy. Considerably larger efforts will be required if the tempo of development is to be maintained in the coming years. Apart from further encouragement to the promotion of industries and to the improvement of efficiency of agriculture a "crash programme" for propagating and helping to bring about family planning seems to have been advocated. As Madras State has made good progress in this direction in recent years, it is proposed to take advantage of the suggestion that Central assistance would be made available for this purpose.

As regards the fourth Plan of the Madras Government, its shape is dependent very much on the co-operation that would be forthcoming from the Kerala Government in regard to the sharing of the surplus waters of the west-flowing rivers and the willingness of the Mysore Government to construct the Hogenekal hydel scheme on the Cauvery river on a joint basis. The Chief Minister of Madras State, who is handling also the finance portfolio, indicated some time back that there could be no major irrigation or power schemes, based on water resources within the State, as the available potential had been very nearly exhausted. Indeed, it was even stated that there would have to be a much larger appropriation for completing minor irrigation works and that the State Government might possibly have to embark on industrial projects on its own.

Fortunately, the Kerala Government has been showing a helpful attitude and it is expected that, without the intervention of the Central Government or the formation of River Boards or other bodies, the Madras Government would be able to get reasonable quantities of water from Kerala in a manner which would not only benefit that State but also would irrigate the arid tracts in Ramanathapuram, Madurai and Coimbatore districts. The engineers of the Madras Government have already made some estimates and indicated to their counterparts in Kerala how the surplus waters of some rivers could be utilised for irrigation purposes in Madras State. The Kerala Government has naturally to proceed cautiously in this matter as it should satisfy the local population that the waters given to regions in Madras would be a waste otherwise and that the generation and availability of power would be on the same scale as if Kerala itself utilised these waters. This is something akin to the problems confronting the States of Maharashtra and Andhra Pradesh. It would naturally take some time to arrive at a satisfactory arrangement. But it is hoped that, with a helpful and understanding attitude on both sides, a satisfactory solution would be reached.

Immediately, it has been indicated that Coimbatore would get its requirements of drinking water from the Siruvani river which has its origin in Kerala. This problem has been under discussion for some time. In fact, it was even suggested that some quantity of water could be made available for irrigation purposes in the Coimbatore district. But this request has not been accepted and Kerala has shown its willingness so far only to supply the requirements of drinking water for Coimbatore City. The other question would be considered only after the irrigation needs of the river basin in Kerala had been fully satisfied.

In regard to the development of further capacity for generation of power, the Madras State Electricity Board will obviously have to do some hard thinking. There will no doubt be a number of hydel projects like the Kodaiyar scheme. But taking into account the spectacular progress made during the current Plan and the capability of the engineering staff of the Electricity Board, some ambitious plans have to be drawn up fairly early so that there could be continuity of progress. The Chairman of the Electricity Board has been already suggesting how some of the problems can be handled. It was indicated some time back that three thermal stations having a capacity of 100,000 kW each should be located in three different centres or there would be one mammoth unit located in the north of Madras so that the



SOMEONE, SOMEWHERE WANTS POWER GENERATED AND DISTRIBUTED

And AEI goes into action

Power is the prime mover. In today's society, the generation and distribution of power is essential for industry and the home. AEI leads in the field of power generation: steam, gas, hydro and nuclear. AEI generators are at work in projects all over India. Some have produced power for more than 25 years; others, like the giant sets at Bhakra, are relatively new. And AEI equipment—transformers to step power up and down, switchgear to make and break the current, protective equipment to safeguard plant—make sure that the right voltage is available in the right place. Wherever in use, AEI equipment for power generation and distribution has won a reputation for top quality, high performance and long life.

Punjab's first, Punjab's latest...

Punjab's first major power project lies high in the Himalayan foothills at Jogindernagar. The Shanan Power House was commissioned in 1932 and was a pioneering feat (among other things, a 14,000 foot tunnel was bored through the base of a mountain to get water to the power house!). Four AEI generators at Shanan produce 48,000 kW of power; they have been generating for more than thirty years and engineers reckon they are good for more than another ten.

Original life expectancy: 25 years. AEI also features prominently in India's premier irrigation and power project at Bhakra. Here, a straight gravity dam (the world's tallest) has tamed the river Sutlej. India's largest generators—AEI made—are located in the Left Bank Power House. Each has a capacity of 90,000 kW. They produce power for cities, industries and far-flung villages in the Punjab, Rajasthan and Delhi.

The first dossa to be cooked by electricity in Madras owes a lot to AEI

In Madras State, AEI generating equipment is being used by most of the power stations on the state grid. The Basin Bridge Power Station—the first thermal unit in Madras—has AEI turbo-alternators of a total capacity of 27,500 kW. More than 25 years old, they are still giving yeoman service. At Singara Power House high in the Nilgiris, seven AEI generators produce 70,000 kW of power. This was the first hydro-electric station in Madras and most of the ancillary

equipment—high and low tension switchgear and transformers—was supplied by AEI. At Mettur, on the Cauvery river, four AEI generators, switchgear and transformers produce and control a power potential of 40,000 kW.

Power travels long distances

Over mountain tops and through the deepest valleys, over hundreds of miles of all types of terrain. Power can be transmitted more cheaply at higher voltages. AEI transformers at the power station push up the voltages while those at the sub-station step it down for use in factories and homes. The range of AEI equipment for this purpose includes transformers, rotary converters, motor generators, circuit breakers, rectifiers, switchgear, relay and control boards and ancillary equipment. AEI equipment for the distribution and control of electric power is at work in receiving stations and sub-stations all over the country.

40 years is a responsible age

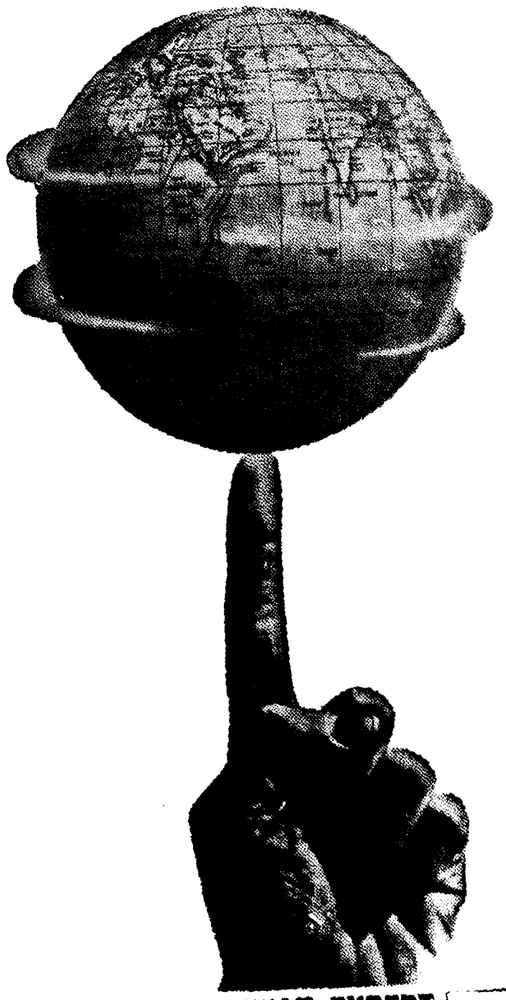
AEI's activities in India date back about forty years and include contributions to the steel works at Durgapur and the 720 mile oil pipeline in Assam and the important heavy electrical project at Bhopal. AEI has been manufacturing electrical equipment in India for over twenty years and a wide range of products is now serving the needs of industry and the home.

We don't usually indulge in name-dropping, but...

In our case it's justified. AEI is no newcomer. Its origins go back *more than sixty years*. Today, Associated Electrical Industries Limited embraces such famous names as British Thomson-Houston, Metropolitan Vickers, Siemens Edison Swan, Henley's, Ferguson Pailin, Birlec and Hotpoint.

WORLDWIDE, AEI OPERATES 60 FACTORIES AND EMPLOYS 100,000 PEOPLE. IT PRODUCES EVERYTHING ELECTRICAL FROM LILLIPUTIAN TRANSISTORS TO THE WORLD'S BIGGEST TURBINE GENERATORS.

Principal products



Steam and gas turbines and generators • Hydro-electric generators • Marine propulsion equipment • Electric drives for rolling mills and mine winders • Electric furnaces • Traction and railway signalling equipment • Transformers and switchgear • Power and telephone cables • Motors and their control gear • Electronic apparatus and radar equipment • Particle accelerators, electron microscopes and mass spectrometers • Industrial controls, instruments and meters • Semiconductor devices and power rectifiers • Private and public telephone exchanges and other telecommunication equipment • Lamps and lighting fittings • Heating equipment • Electro-medical apparatus • Nuclear power station equipment • Domestic appliances.

AEI Largest Supplier Of Electrical Equipment To India

The Bank of Baroda has been handling foreign business for many years. Today, the Bank has branches in London, East Africa, Fiji Islands, Mauritius and East Pakistan.

The Bank of Baroda through any of its foreign branches or its correspondents is fully equipped to offer all the services needed in foreign trade and to handle every type of foreign exchange business—including opening Letters of credit, the negotiation/collection of export bills, clean bills and cheques, foreign remittances, credit information, etc., and is always willing and prepared to assist you in solving your problems concerning imports, exports and foreign travel with prompt and efficient service.

THAT EXPERT TOUCH COMES WITH EXPERIENCE

THE BANK OF BARODA HAS BEEN HANDLING FOREIGN BUSINESS FOR YEARS & YEARS

Branches in London, Nairobi, Mombasa, Kampala, Dar-es-Salaam, Moshi, Mbale, Mwanza, Jinja, Kisumu, Naraingani (East Pakistan), Port Louis (Mauritius), Suva and Lautoka (Fiji Islands) and correspondent banks all over the world.

Write-in for our free booklet 'May We Help You?' which gives details of all our services.

IWT-BB.XIII

power station could be run with coal 'imported' from the West Bengal and Bihar coal-fields. It was also felt that the Kalpakkam Atomic Power Station could be constructed by the Madras State Electricity Board under the supervision of the Atomic Energy Commission. But the State Electricity Board has naturally to think in terms of creating additional thermal capacity apart from the Neyveli and Kalpakkam Stations. It has also to exploit hydel resources in collaboration with neighbouring States and it is needless to say that the Hogenekal project can be constructed by the Madras Government even though the expenditure may be shared equally by the two States. Mysore will have its hands full as the Sharavathy project will have to be completed and the Kalinadi and other schemes have also to be taken up at an early date. The announcement by Dr. K. L. Rao that the Madras and Mysore Governments have agreed to share the expenditure on the Hogenekal project equally is to be welcomed. But in view of the peculiar problems involved an early decision should be taken. Mysore should not go about this scheme in a leisurely manner or be exercised over the location of the dam on a parochial basis.

The proposal to erect thermal stations based on coal is being resisted by the Planning Commission as there seems to be a feeling that another super station should be erected at Neyveli. This objective is no doubt laudable. But there would be need for additional capacity before the end of the fourth Plan and it may also take time for Neyveli to construct an entirely new thermal station because the expansion programme of the existing station in two stages will take several years to be completed. The problem should, therefore, be carefully examined and an early decision reached so that the construction of irrigation and power projects can be undertaken without delay and the good work done during the current Plan continued vigorously.

★★

The aluminium industry is very much in the news now, in this part of the country. While it is expected that the unit of Madras Aluminium having a capacity of 10,000 metric tons of ingots annually, might start production by the end of this year or early in 1965, there is the prospect of other new schemes being implemented at an early date. Somehow, the project for constructing a large-sized unit in Mysore has been unduly delayed. The Finance Minister indicated a few weeks back that a satisfactory agreement had been reached with the Maharashtra Government for the supply of bauxite in order to feed the smelter proposed to be erected in the west coast of Mysore using power from Sharavathi. Some progress is reported to have been made in recent weeks and it is likely that the State Government will form a separate company in collaboration with foreign interests and the public also will be afforded an opportunity to participate in the issued capital. At first, Reynolds of U.S.A. were very much in the picture. But negotiations with Bombay interests, who were having a licence, did not proceed satisfactorily and the U.S. interests would seem to be out of the scene at the present moment.

While no official indication has been given about who will be undertaking the project, the name of Indian Aluminium is being mentioned. This company has been making very good progress in recent years. So far as the South is concerned, there is great activity at Alupuram in Kerala. Under the last expansion programme, it was decided to erect an extrusion press and increase the capacity of the existing smelter to 10,850 metric tons annually from 5,000 metric tons. The extrusion press has been working since 1962 and there was a distinct improvement in output in the past year. It is expected that the first stage of the expansion programme of the smelter will be completed during the current year and the Kerala Government would supply the required power beginning from 1965, the commissioning of the Sabarigiri project being helpful for this purpose. In view of the anticipated improvement in the power situation and the large increase in consumption of virgin metal in this part of the country, Indian Aluminium has thought it necessary to expand further the capacity of the Alupuram smelter to 15,850 metric tons from 10,850 metric tons. The new smelter is expected to cost Rs. 1.38 crores. The required rupee expenditure will be met from internal resources while the needed foreign exchange will be available out of the Canadian dollar and Japanese yen credit. It has been agreed that the full quantity of 5,000 metric tons of metal would be made available to the producers of electrical conductors on the basis of Government allocations. At the same time, it has been considered advantageous to erect a rod mill with a capacity of 5,000 metric tons. Necessary arrangements for this project are being concluded. With the Mettur, Mysore and Alupuram smelters, this part of the country can, therefore, be expected to account for a significant proportion of the total indigenous production. The Mysore scheme, however, is still in its very early stages.

★★

The Madras Stock Market has been listless in the past few days. A quiter trend has been noticeable both in Bombay and Calcutta. The announcement of the terms of Central Government loans had a discouraging effect and till Wednesday last week, it was being freely speculated whether there would be an increase in the Bank Rate. There was actually acute nervousness in Bombay until it was known that the Bank Rate had remained unchanged. It may be argued that the existing Bank Rate is out of line with the prevailing lending rates of scheduled banks and the keen demand for available funds. The Reserve Bank also has been urging that the banking system should raise deposit rates. There were, therefore, fears in some quarters that the Bank Rate may be raised. In knowledgeable circles, however, it was emphasised that the Reserve Bank would not revise its lending rate until the borrowing programme of the Central and State Governments was out of the way. Since there are indications that the peak of the demand for funds has been passed, it is very unlikely that there will be an upward revision in the Bank Rate at least for some months. While latterly there has been a better feeling in evidence, it is felt that there would be no sizeable recovery in prices until the Finance Minister agreed to make significant changes in his tax proposals. Meantime, corporate news has been quite encouraging and both the Life Insurance Corporation and the Unit Trust of India are reported to have been making quietly purchases of Aluminium Industries, Mettur Chemicals, India Cements and other counters which offer a fairly high return on the basis of current market values. Otherwise, business passing has been extremely restricted and a fresh lead is awaited from Bombay.

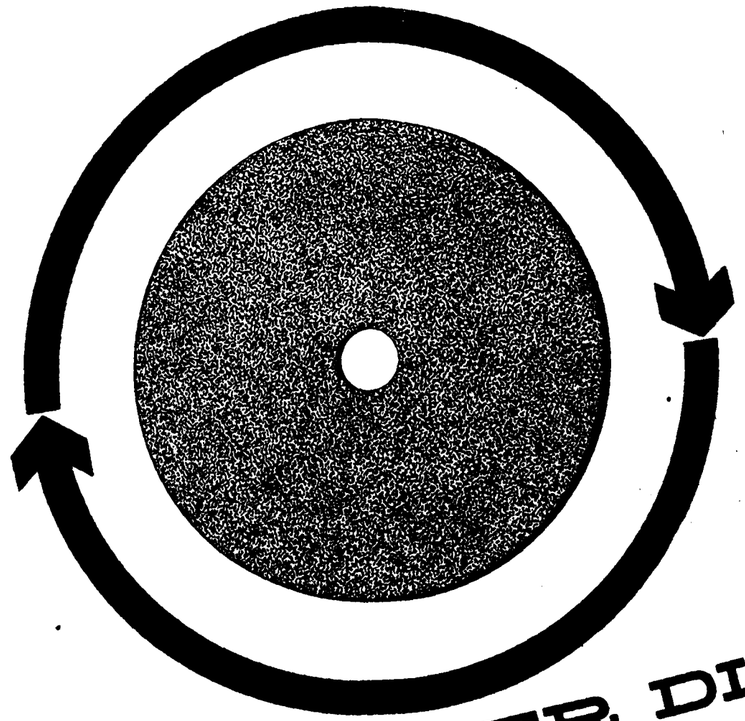
The moving finger writes

I DO not think that it was necessary for Mr. Nehru to go on the air to expound the new Khadi policy. That he did reflects no credit on those who are responsible for sparing him unnecessary work or physical strain. I see, however, the point of Mr. Morarji Desai's broadcast in defence of prohibition and it must be admitted that he did it rather well. Although he necessarily had to deal with the familiar objections to prohibition by labouring over much-trodden ground, the lack of novelty or originality in his arguments was more than made up by the courage of convictions that rang through his advocacy. Even at the level of a formal debate, it is obeviously not easy to make light of the telling point he made on the issue of illicit distillation. Prohibition may be good or bad, but I certainly endorse Mr. Desai's view that abolition of prohibition will not end or even reduce illicit distillation, since, so long as the liquor excise is high, illicit distillation will be profitable and will, therefore, continue to be pursued on an appreciable scale. As Mr. Desai pointed out, although there is prohibition only in one district in the Punjab, illicit distillation in that State is estimated to have gone up greatly since 1947. Incidentally, I am amused to find that while Mr. Desai marked the start of the prohibition week by broadcasting in favour of prohibition, Maharashtra's Chief Minister also went on the air on the same evening to pronounce prohibition a failure. Mr. Naik is entitled to his views as Mr. Desai is to his, but I do maintain that his broadcast, to say the least, was ill-timed in the context of an officially sponsored Prohibition Week.

★★

The Committee on the Prevention of Corruption submitted its final report to the Government on March 30, and its Chairman, Mr. K. Santhanam, left New Delhi for Madras by the morning plane on the following day. I think there is something symbolic in this literal shaking off of the dust of Delhi — but I must hasten to add that it is rather likely that the Capital will soon have further need of Mr. Santhanam. For the time being, however, there is a certain piquancy in the Congress High Command's omission to nominate him for a further term in Rajya Sabha. It can hardly be denied that he was one of the few members in either House who talked with knowledge and information on a variety of subjects of Constitutional or economic importance. And it is to be hoped that his absence from the Congress list was not occasioned by any distaste with which the Party leadership might have viewed his work on the Prevention of Corruption Committee in so far as it related to the responsibility of politicians generally, and the ruling party in particular, for the prevalence of corruption in State and society.

It is, no doubt, true that the Santhanam Committee has said harsh words on the commercial and industrial classes and charged them with playing a large role in the corruption of public servants, politicians and political parties. But is it not a fact that the business community has itself to blame in large measure for this unfavourable verdict? The Committee records with regret the refusal, for instance, of the Federation of Indian Chambers of Commerce and Industry to appear before it and help in its survey or inquiry. It is possible that the Federation has its own reasons. But to me there seems to be some inconsistency in the attitudes exhibited. It may be recalled that at the recent annual meeting of the Federation some of its leaders waxed eloquent on the need for creating and presenting to the public a good image of the business community and yet the Federation thought it fit not to avail itself of an invitation to a frank discussion with a body of the status of the Santhanam Committee on a matter so relevant to the people's estimation of business men as the issue of corruption. It is amazing that, despite the obvious and strong bond of the community of interests which must encourage and enable them to act together constructively, business men and their organisations fail at critical times to function positively and imaginatively in the defence even of their legitimate interests.



★★

I was rather surprised at Mr. Asoka Mehta's somewhat tart reaction recently in Madras to a reference by local journalists to an observation which Mr. T. T. Krishnamachari made some time ago about the need for the Planning Commission shedding its skin from time to time. It should have been obvious that Mr. Krishnamachari was only employing an expressive simile to drive home the point that the Planning Commission would lose its vigour it it did not draw on fresh minds for new ideas. This apart. I should have thought that the context in which the Finance Minister had hazarded "his serpentine" quip should have amused rather than annoyed the present Deputy Chairman of the Planning Commission whose induction into that body is itself in the nature of a stage in that "skinning" process of which Mr. Krishnamachari had spoken. I am aware, of course, that there is currently a discussion on the reorganisation of the Planning Commission and that this is delicate ground — and for the time being, at any rate, I do not desire to rush into controversies, actual or incipient. At the same time, with due respect to Mr. Asoka Mehta, I would certainly urge that the total size of the secretariat of the Planning Commission as well as the claims of some of its present members to continue indefinitely at their posts should be objectively gone into. This screening, I consider to be all the more necessary because of the reports I hear of attempts in Yojana Bhavan to create new posts all over the place.

★★

I see that the National Council of Applied Economic Research has elected Mr. Asoka Mehta as its Chairman in the place of the late V. T. Krishnamachari. There are, no doubt, a number of institutions or agencies doing, or claiming to do, economic research in this country and quite a few of them, of course, are in Delhi. In this difficult and distracting company, the National Council has been remarkably successful in developing a personality which could be respected and an organization which could be admired for its philosophy of looking for (and at) facts. It was, therefore, good to see evidence at its recent annual meeting of the regard and appreciation which the work of the National Council has come to command among people influential in government or business. The annual meeting was also remarkable for an interesting discussion on the many challenges which the nation faces in its pursuit of economic development. Particularly stimulating were the contributions of Mr. P. L. Tandon, Chairman of Hindustan Lever Limited, and Mr. A. R. Foster, who retired a few days ago from the Chairmanship of the Imperial Chemical Industries India (Private) Limited. Mr. Tandon laid provocative emphasis on the desirability in a developing economy of creating planned capacity ahead of demand rather than in the wake of it, while Mr. Foster spoke with practical good sense of the basic requirements of agricultural development.

CANADIAN TRADE MISSION

MATTERS RELATING to the flow of private Canadian capital investments to India were reviewed at a recent meeting in New Delhi between the members of the visiting Vancouver Board of Trade Mission and the Government of India representatives including Mr. C. Subramaniam, Minister of Steel, Mines and Heavy Engineering, Mr. D. S. Joshi, Secretary, Ministry of International Trade, Mr. C. S. Jha, Commonwealth Secretary, Mr. B. N. Adarkar, Additional Secretary, Department of Economic Affairs and Mr. R. S. Bhatt, Executive Director, Indian Investment Centre. Mr. Joshi referred to the rapid rise in India's foreign trade which was now of the order of $4,000 million per annum—exports accounting for $1,600 million and imports $2,400 million. Mr. C. S. Jha said that Canada, with her surplus of technical know-how and the capacity to generate as well as raise capital, could play an important role in the economic growth of India. The Canadian Government's contribution, he added, had been very good but private investments were not on a big scale yet. Mr. B. N. Adarkar pointed out that India provided a fairly sheltered market and that the foreign investor was assured of a satisfactory return on his investment. The country also provided a good base for export industries. With plentiful supply of raw materials, a reasonable level of wages and a diversified economy, India, Mr. Adarkar said, offered a very good field for investment. Over and above all these, India enjoyed the important advantage of political stability in spite of occasional stresses and strains. Foreign private investment proposals were growing in number and about 300 cases were being approved every year involving about $80 million of private investments.

Dealing with the main points of Government's policy towards private foreign investments, Mr. Adarkar said that ever since independence no extra restrictions (which were not applicable to Indian investors) had been placed on foreign investors. Reasonable facilities had always been afforded for remittance of profits. Should a foreign investor decide to repatriate his capital, he had the freedom to do so. It had been laid down as part of the Industrial Policy Resolution that effective control should be in Indian hands, but here too the condition of majority participation by Indians was being relaxed in suitable cases where large foreign exchange resources and a high degree of technical skill were involved.

Explaining the role of Indian Investment Centre in promoting foreign capital investments and techniques on a joint venture basis, Mr. R. S. Bhatt pointed out that in the decade between 1951 and 1961 India's industrial output rose by 94 per cent. With this expansion, foreign private investments which totalled Rs. 256 crores in 1948, rose to Rs. 690 crores at the end of 1960 — an increase of 175 per cent. The major share was claimed by the U.K., the U.S.A., West Germany and Switzerland. In recent years, he said, investments in manufacturing industries had steadily increased and the Government had recently prepared a list of 22 key industries like Tool and Alloy Steel, Industrial Machinery, etc., in which foreign capital was most welcome. (The complete list was published in "Eastern Economist" dated January 17, 1964 — page 118).

Appreciating the policy explanations furnished by the Government of India officials, the leader of the Canadian Mission, Mr. William Anderson, said that Canada was collaborating in power development projects in India and that, among others, Canada could take part in the development of paper and pulp industries in India.

After the general discussion, the members of the Canadian delegation and the Government of India officials exchanged ideas on specific subjects such as Government's taxation proposals, double taxation avoidance agreements, the scope of Government control over industries, the position regarding technical personnel, trained labour, the banking system, etc.

Later in the week, the Canadian delegation also held discussions with the representatives of the Federation of Indian Chambers of Commerce and Industry. It was pointed out from Federation's side that the customs regulations in Canada under which anti-dumping duties were levied if the selling price in Canada happened to be lower than the domestic price prevailing in India, militated against exports of Indian products, particularly cotton textiles.

SUGAR MARKETING BOARD

The Government of India has decided to set up a sugar marketing board to regularise the internal distribution as well as the export of sugar. The Board will function as an autonomous organisation and will be registered as a public limited company. It will consist, among others, of the representatives of the Union Ministries of Food and Agriculture, Finance, Commerce and Industry, Community Development and Co-operation and the Reserve Bank. Representation is also likely to be given to the sugar industry.

The proposal for setting up the Board was mooted by the Union Ministry of Food and Agriculture in order to streamline the system of distribution of sugar and to promote exports. At present sugar quotas are allotted to the States by the Sugar Directorate in the Central Food Ministry. Exports are being handled by the export division of the Indian Sugar Mills Association. The Board might take over the entire production of the mills and store a part of it in its godowns with a view to ensuring the sale of sugar at a uniform price throughout the country.

LIC UNDERTAKES GENERAL INSURANCE

With its entry into the new financial year 1964-65, the Life Insurance Corporation of India has commenced transacting General Insurance Business, viz., Fire, Marine and Miscellaneous. Under the Miscellaneous Section, the Corporation will underwrite Motor Insurance, Personal Accident, Flight Coupons, Burglary, Fidelity Guarantees, Plate Glass, Third Party Life Insurance, Public Liability, Workmens' Compensation, Credit Guarantees, Contract Guarantees and Contractors' All Risks Insurance. The Corporation will also transact Engineering Insurance including Machinery erection, Machinery breakdown, Boilers and Pressure Vessel Explosion and Loss of Profits. The Corporation will transact business as a non-tariff insurer. To start with, however, it will follow the Tariff Rates. In due course the Corporation will evolve its own rating structure based on statistical data.

INDO-KUWAIT COLLABORATION

A joint communique on industrial and commercial co-operation between India and Kuwait was issued in Kuwait on March 30, by Mr. Manubhai Shah, India's Minister of International Trade and Mr. Jabir Al Ahmed Al Jabir, Kuwait's Minister for Finance and Industry. Since trade between India and Kuwait is transacted in free convertible currency, Kuwait and India can look forward to increasing the volume of trade between them in diverse fields; Kuwait, it appears, hopes to be able to export a range of petroleum products. In this context, India has expressed a desire to buy sulphur products in the proposed refinery in Kuwait. There was some discussion at the Kuwait talks of the scope of Indian entrepreneurs participating in the industrial development of Kuwait. The Kuwait, Minister of

Finance and Industry said that Indian participation would be welcome and that it could take the form of project surveys, supply of raw materials and components, provision of technical know-how and export of machinery in addition to cash investment, if necessary, for financing the projects. The two Ministers agreed that certain fields of industrial activity were worth close examination by competent technical experts and businessmen from India and Kuwait. The industries selected for close examination were: caustic soda, salt, soda ash, a modest plant for pig iron and casting (all grades of iron ore could be imported from India), structural works, synthetic rubber plant based on local gas and petroleum products, plastic and plastic products, wooden and steel furniture, dry dock, electrical goods such as heaters, air-conditioners, air-coolers, water coolers and geysers, telephone equipment (assembly), truck assembly, aluminium rolling mill (including industry for making utensils), rolling mill for non-ferrous metals, textile industry (based on import of cotton and yarn), rayon and art silk fabrics processing industry (based on imported rayon and silk fabrics), blending of tea, and shipping.

The two Ministers also discussed the possibilities of Kuwait's private financial participation in Indian industrial development. Mr. Manubhai Shah said that the Government of India had already given considerable thought to the question of development of Indian industries with an export potential and had drawn up a list of such industries. Efficient industrial units were already venturing in these fields and were now ready to embark upon the next stage of expansion. These industries broadly fall under the following 30 groups: Food products (fish canning, instant food, fruit and vegetable canning and food processing industries), ready-made garments, caustic soda and soda ash, hardened oil for industrial uses, starch from tapioca, synthetic fibres (including acetato acrylic and other fabrics), pesticides, sanitarywares, machine-made footwears, grinding wheels, linoleum, aluminium smelter of one lakh tonnes, pig iron and cast iron spun pipes, iron castings, jigs, tools and fixtures, twist drills, steel tubes and pipes, heavy electrical equipment, transport equipment, printing machinery, machine tools, electronic components, storage batteries, dry batteries, sugar machinery, cement machinery, railway equipment, transmission lines for electric power, hand tools, hotel industry, and fertiliser projects. According to the Kuwaiti authorities, there was scope for investment by Kuwaiti investment institutions and businessmen in these fields to the extent of $100 million initially. It was agreed at the meeting that the two Governments should encourage financiers and industrialists and investment institutions of the two countries to examine the possibility of industrial and financial co-operation for mutual benefit. The investment could be in the form of both share capital and credits.

It was also pointed out at the meeting that opportunities would be available in India to train young Kuwaiti engineers, technicians and qualified personnel in technical fields and new professions as mutually agreed upon between the two countries. The Kuwaiti Minister stated that his Government would also welcome Indian technicians being trained in Kuwait's oil and petro-chemical enterprises.

In order to achieve the various objectives discussed at the meeting, the representatives of the two Governments felt the need to constitute a joint commission, which would meet every six months alternately in Kuwait and New Delhi, to review the implementation of the joint proposals.

DYEING AND PRINTING
