Inaugurating the factory of Faridabad Dyeing and Printing Mills, the Chief Minister of Punjab, Mr. Pratap Singh Kairon, suggested that if the industrial development in India was really to be given a fillip, business profits that were re-invested in industry within a period of five years, should be exempted from all taxes. Referring to industrial co-operatives, he said that such ventures had generally proved unsuccessful because the workers lacked the spirit of sacrifice and dedication and formed co-operatives only to avail of financial assistance from the Government and obtain permits and licences. Mr. Mohan Lal, the chief administrator of the Mills, disclosed in his report that technical collaboration was obtained from Messrs. Kovo of Czechoslovakia for the import of a most modern plant. The capacity of the plant per day of two shifts, after complete installation, will be: 45,000 yards of bleaching; 15,000 yards of dyeing; 35,000 yards of printing and 50,000 yards of finishing. The processing plant of the factory, the administrator said, would be one of the best equipped in Northern India and the first of its kind in the co-operative sector in the country.

SMALL-SCALE INDUSTRIES

The main problem facing the small-scale industries in India is the shortage of raw materials. Small units have often complained that they get only a small percentage of the controlled and scarce raw materials. As the capacities vis-a-vis raw material requirements of such units have never been assessed on a uniform basis the total requirements of the small-scale sector have not been known. In order to have an idea of the requirements of controlled and scarce raw materials by small-scale industries the Central Small Industries Organisation of the Union Ministry of Industry will now be assessing the capacities and requirements of small industrial units all over the country on a scientific basis. The assessment, it is hoped, will help in meeting adequately the requirements of small units by securing additional quantities of the necessary raw materials. The criterion for assessment was decided upon at a recent meeting of the State Directors of Industries and senior officers of the Central Small Industries Organisation.

U.S. TIN DISPOSALS

The United States would be putting 20,000 long tons of tin on the market during the year 1964-65 and would dispose of its surplus tin stocks of 1,27,000 tons in six to eight years. An announcement to this effect said that the quantity of 20,000 tons for the coming 12 months was consistent with the expected market requirements and shall be adequate to meet the estimated shortage in supplies. Regarding the plan for long-term liquidation of the entire U.S. surplus stocks of tin, the Government statement said that the plan was drawn up in a manner aimed at minimising market difficulties and taking into account the effect on investment of capital in exploration of the development of new supplies. The U.S. Government disclosed that it would continue to accept only such purchase offers as were reasonably in line with market prices and that it would limit or interrupt sales when prices weakened.

FOODGRAIN IMPORTS

India imported Rs. 183 crores worth of foodgrains last last — Rs. 42 crores more than in 1962. A total of 45.6 lakh tonnes was imported, of which 40.73 lakh tonnes was wheat and 4.83 lakh tonnes rice. Of the imported wheat, 38.98 lakh tonnes was received from the U.S.A. under the P.L. 480 Agreement, 0.19 lakh tonnes from Canada under the Colombo Plan and 1.56 lakh tonnes from Australia against commercial purchases. Of the rice imported, 3 lakh tonnes was from the U.S.A. under P.L. 480 Agreement, 1.73 lakh tonnes from Burma and 0.10 lakh tonnes from South Vietnam.

Company Affairs

INDIAN OVERSEAS BANK

Mr. M. Ct. Muthiah, Chairman, the Indian Overseas Bank Ltd., reviewed briefly the performance of the bank while addressing the shareholders at the annual general meeting held recently. There was an impressive increase of deposits and advances and gross income also improved appreciably. This accelerated expansion of the bank was also witnessed in terms of its sphere of influence as the bank opened many new branches during the year. Mr. Muthiah was of the opinion that the year was comparatively prosperous for all the banks; their profits were higher and in some cases they were able to raise their dividends. There was spectacular increase in scheduled bank deposits (excluding PL 480 and 665 deposits) from Rs. 1929 crores to Rs. 2211 crores. The demand deposits increased faster than time deposits — there was an increase of demand deposits by nearly Rs. 182 crores while time deposits rose by about Rs. 100 crores. This substantial accretion to deposit resources enabled banks to comportably meet the demand for credit which rose by Rs. 158 crores to Rs. 1,580 crores and to reduce their borrowing from the Central Banking Institution.

The Chairman expressed satisfaction over the helpful attitude adopted by the Government and the Reserve Bank. Following the Finance Minister's announcement in October last that the credit policy would be liberalised to stimulate economic growth, the Reserve Bank increased the quota for borrowing by scheduled banks from 100 to 150 per cent of their statutory reserves. Moreover the control of minimum margin of advances against shares of 40 per cent was withdrawn. Other positive factors in the credit policy, according to the Chairman, were the enlargement of the resources of the Industrial Finance Corporation and the Industrial Credit and Investment Corporation of India, the establishment of the Unit Trust, the formation of an Agricultural Re-finance Corporation to encourage the financing of long term needs of agriculture and land mortgage banks and commercial banks. Mr. Muthiah pointed out that the clock had been put back to some extent by the announcement on March 11, by the Reserve Bank of India of new restrictions on borrowing by member banks. The occasion perhaps was provided by the increase in borrowings by member banks by as much as Rs. 45 crores in the week ending March 6. This gave, according to Mr. Muthiah, a mistaken impression that time has come to introduce selective credit control measures and to make credit available on a dearer basis.

The Chairman was pleased with the reported contention by the Finance Minister that the demand for nationalisation was being raised by a very small section and he did not think that the Government really bothered about it. Moreover the demand was being linked to such aims as combating inflation and affecting the redistribution of wealth which, according to the Finance Minister, were both completely "non-sequitur". Mr. Muthiah asserted that it was over and again conceded by the Government that the private sector had to play an important part in the development of our national economy. As private banks were only the extension of the private sector, the argument should hold good for the continued existence of these banks.

MADRAS RUBBER FACTORY

Mr. K. M. Cherian, Chairman, Madras Rubber Factory Ltd., told the shareholders that the balance sheet for the year ended September 30, 1963 was the first after the company started the production of tyres, even though it commenced only a few months prior to the closing of the accounting year. It has installed practically all machinery and now is in a position to produce tyres and tubes at the full installed capacity of the factory — 1000 tyres and tubes per day. The Chairman added, however, that the present installed capacity of all tyre factories in India appeared to be more than the present actual requirement and most of the tyre companies were finding it difficult to sell their full production. The Mansfield Tyres produced by Madras Rubber Factory in collaboration with the Mansfield Tyre and Rubber Co. of the United States have found acceptance in the Indian market and in spite of considerable competition they were able to sell their output. The company has also developed additional line of manufacture, namely tread rubber and camel back. These items are likely to be exported as substantial orders are being received from abroad.

LOAN FOR MUKAND IRON

Mukand Iron and Steel Works Ltd. has secured sterling loan of £600,000 from the Commonwealth Development Finance Co. Ltd., London. The loan will meet part of the foreign exchange requirement of the company's expansion scheme at Kalwe, Bombay. It has plans to melt steel and produce about 70,000 tons of wire rods annually at the new plant. A continuous casting unit, being the first of this kind in India, will be installed at Kalwe to make billets from liquid steel. The Kalwe plant is expected to go into production in 1965-66. Distington Engineering Co. Ltd., a subsidiary of the United Steel Company Ltd., are to build this plant in conjunction with their associates, Concast A.G. of Zurich.

INDIAN TOOL MANUFACTURERS

The directors of the Indian Tool Manufacturers Ltd., have decided to raise Rs. 25 lakhs by the issue of 25,000 (9.3 per cent) redeemable cumulative preference shares of Rs. 100 each. As many as 15,000 shares will be issued initially and 10,000 shares, ranking pari passu with the proposed initial issue, will be issued subsequently. Subject to the consent of the shareholders, these shares are proposed to be offered to the public. The authorised capital of the company will be raised by Rs. 25 lakhs. It had got permission from the Controller of Capital Issues to issue bonus shares of the value of Rs. 10 lakhs but the directors have decided to defer this issue.

BRADY ENGINEERING

The Brady Engineering Co. Ltd., has shown considerably better results for the year 1963. It earned a gross profit of Rs. 11.26 lakhs against Rs. 9.30 lakhs, following a rise in turnover to Rs. 38.95 lakhs from Rs. 29.92 lakhs last year. A sum of Rs. 1.29 lakhs has been provided for depreciation and Rs. 6.37 lakhs for taxation including surtax. An allocation of Rs. 2.27 lakhs have been made to the dividend reserve from which proposed dividend at the rate of 11.25 per cent amounting to Rs. 2.25 lakhs will be paid. The directors observe that owing to a sizable cut in import licences of load chains, pulley block production had to be curtailed.

PREMIER CABLE CO.

The Premier Cable Company Ltd., which will take up the manufacture of PVC insulated power cables, will enter the capital market towards the second half of this month for the issue of capital worth Rs. 70 lakhs divided into 23,000 cumulative redeemable preference shares (9.3 per cent) of Rs. 100 each and 480,000 equity shares of Rs. 10 each. It has entered into a technical collaboration agreement with M/s. VEB Kabelwerk Oberspree of German Democratic Republic, who are one of the leading manufacturers in Europe of Aluminium conductor cables, using FVC for insulation. The factory is to be located at Karukutty in Kerala State.

CAPITAL ISSUES

According to official information available, the Controller of Capital Issues during the last quarter of 1963 sanctioned

95 consents for raising capital amounting to Rs. 87.33 crores. 103 consents for an amount of Rs. 82.88 crores were given during the corresponding quarter in 1962. During the quarter under review 118 applications for a total of Rs. 86.30 crores were received as against 125 applications for Rs. 139.73 crores during the same quarter in 1962. In the third quarter of 1963 146 applications were received involving a total amount of Rs. 125.43 crores.

Of the 95 consents granted in the 4th quarter 1963 fourteen were given to Government companies for a total amount of Rs. 36.08 crores and eighty one to non-Government companies involving an amount of Rs. 51.25 crores.

The distribution of consents given to non-Government companies according to the type of security is given below:

Equity	Rs. 28.69 crores
Preference	„ 2.97 „
Debenture	„ 4.42 „
Bonus	„ 3.82 „
Loans etc.	„ 11.35 „
TOTAL	Rs. 51.25 crores

During the entire calendar year 1963, 475 applications were received for issuing capital amounting to Rs. 634.88 crores as against 506 applications involving an amount of Rs. 429.08 crores during 1962. 410 consents were issued by the Controller of Capital Issues in 1963 for an amount of Rs. 544.31 crores as against 447 consents for Rs. 381.49 crores in 1962.

Out of the 130 consents amounting to Rs. 126.90 crores granted to companies for issue of capital for the first time during 1963, 54 consents for a total amount of Rs. 62.76 crores involved foreign participation to the extent of Rs. 21.15 crores. During 1962, 65 consents for Rs. 52.55 crores involved foreign participation of Rs. 15.59 crores in initial issues.

New Issues

Seven companies have been authorised to raise fresh capital exceeding Rs. 106 lakhs. Of these, three companies are issuing bonus shares, two are issuing equities, and two are floating debentures and preference shares. Two companies involve foreign collaboration.

The consent of the Controller of Capital Issues is valid for 12 months in all cases.

The following are the details:

Hyderabad Asbestos Products Ltd., Hyderabad is to issue capital of Rs. 2,95,163 divided into 1,18,065 equity shares of Rs. 2.50 nP. each to be issued as bonus shares by capitalisation of the company's general reserves.

Khardah Company Ltd., Calcutta, is to issue bonus shares of Rs. 9 lakhs divided into 90,000 Equity shares of Rs. 10 each on capitalisation of its reserves to a like extent. The bonus issue will be made in the ratio of one bonus share for every six equity shares held.

The Eastern Manufacturing Company Ltd., Calcutta, dealing in jute goods, is to issue bonus shares of the value of Rs. 17 lakhs on capitalisation of its reserves. The bonus shares will be issued in the ratio of two bonus shares for every share held.

Kersons Manufacturing Company of India Private Ltd., Bombay, will be issuing additional capital of Rs. 12.50 lakhs in equity shares of Rs. 1000 each, to be issued for cash at par. Of this capital 600 equity shares will be subscribed to by Midland Manufacturing Company Ltd., UK and the balance 650 shares will be subscribed to by Indian directors/shareholders. The capital will be utilised in the manufacture of brass and bakelite electrical accessories, such as Switches, Ceiling roses, Sockets etc.

India Paper Pulp Company, Ltd., Calcutta, an existing company, will be issuing capital of Rs. 40,00,000 divided into four thousand 7 per cent debentures stock of Rs. 1000 each. The debentures will be offered to the public by prospectus. The money will be utilised for financing of Jute Sticks Pulp Plant and Paper plant.

The Saraswati Industrial Syndicate Ltd., Yamunanagar, Distt. Ambala (Punjab), having a paid up capital of Rs. 50,71,500 is to issue further capital of Rs. 4,700 divided into 47 equity shares of Rs. 100 each for cash at a premium of Rs. 140 per share to John Thompson Ltd., Ettingshall, Wolverhampton, England. This is in accordance with the terms of the scheme of arrangement of amalgamation of Indian Sugar and General Engineering Corporation Limited with the company which has already been approved by the Punjab High Court.

Graphite India Limited, Calcutta, is to issue further capital of Rs. 25 lakhs in 9.3 per cent redeemable cumulative preference shares of Rs. 100 each for cash at par. Out of this such number of shares as would qualify the scrip to be listed on the recognised Stock Exchanges shall be offered to the public by prospectus. The capital will be used to meet the revised capital requirements of the company.

LICENCES ISSUED

The following licences were issued under the Industries (Development and Regulation) Act, 1951 – during the week ending March 28, 1964. The list contains the names and addresses of the licensees, the items of manufacture and annual installed capacities.

IRON AND STEEL

Globe Motors Limited, 1/1, Jhandewala, New Delhi (Punjab) — (New Article) S.G. Malleable Iron Castings: Within the earlier licensed capacity of 1,200 tons of malleable iron castings.

COAL

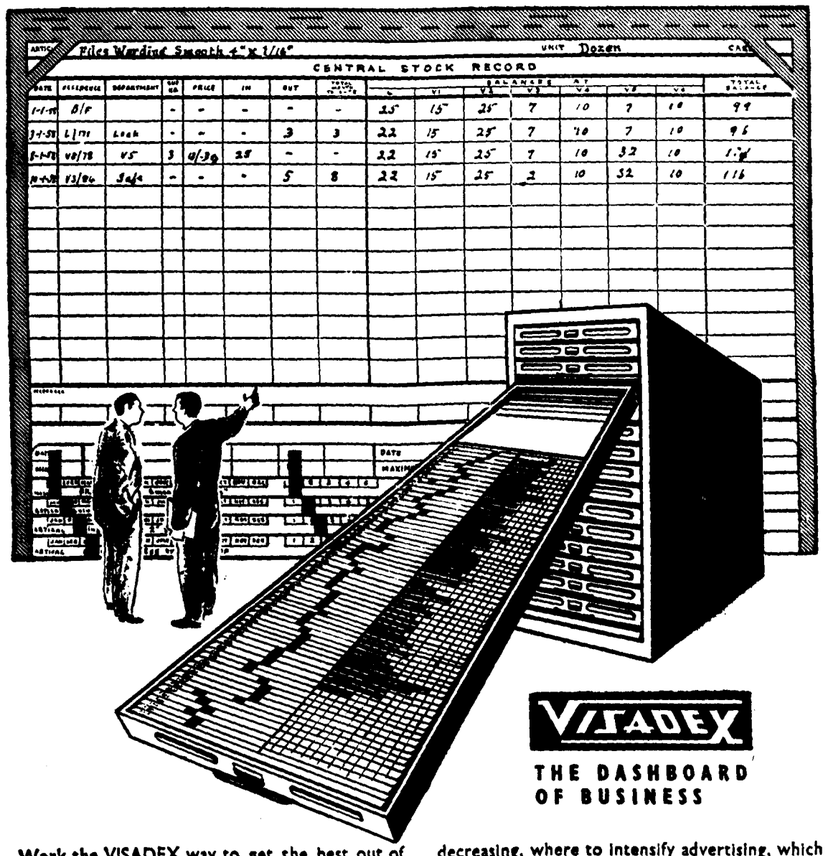
Shri Phanindra Mohan Dutt, Bhootdoba Bunglow, P.O Kalipahari, Distt. Burdwan, (Tehsil-Barabani, Distt. Burdwan, West Bengal) — 40,000 tons per annum. Goenka Coal Co., P.O. Ukhra, Distt. Burdwan — capacity in 1964, 1,65,000 tonnes and 1965 1,88,000 tonnes. National Coal Development Corporation Ltd., "Darbhanga House", Ranchi – 1.5 million tonnes per annum. Smt. Sulekha Maitra, West Burrakar Colliery, P.O. Kumardhubi, Distt. Dhanbad (P.O. Kumardhubi Distt. Dhanbad, Bihar) — 25,000 tonnes per annum. Heliwal Coal Co., P.O. Nawagarh, District Dhanbad (Central Kessurgarha Colliery) — 19,500 tonnes per annum.

ELECTRICAL EQUIPMENT

Voltas Ltd., 19, Graham Road, Ballard Estate, Post Box No. 1198, Bombay-1 (Maharashtra) — Electric motor starters (8000 Nos.), Circuit breakers (600 Nos.), Circuit breakers above 11 kV up to 22 kV (300 Nos.), Switchboards and control panels (744 Nos.), Out-door Isolators (2000 Nos.), Measuring and recording instruments including protective relays (Rs. 30 lakhs by value), Current and Potential transformers up to 33 kV (2000 Nos.). Kirloskar Electric Co. Ltd., Post Box No. 1017, Bangalore-3 (Hubli, Dharwar, Mysore) — Electrical

BIRD'S CENTENARY YEAR

PAPER FOR THE EXTENSION OF EDUCATION



"Education is the most important single factor in achieving rapid economic development . . . ", reports the Planning Commission. To spread education, paper is a vital requirement. The Bird-Heilgers Group, one of the largest manufacturers of a wide range of quality paper, is helping in this task with an ever-increasing supply for books, journals, charts and other needs of education.

Deploying the skills acquired over a hundred years, the Bird-Heilgers Group is making important contributions to the economy . . . through planned diversification and expansion.

Work the VISADEX way to get the best out of your men, machines and materials.

VISADEX can tell you what you need to know at a glance. VISADEX offers you a fluent indexing system by which records are kept on cards, while colour signals spotlight what things are in stock or needed, whether production is ahead of or behind schedule, sales are increasing or decreasing, where to intensify advertising, which department requires more personnel, who owes you and how much ... VISADEX, in short, affords greater control at less cost, besides keeping records secure.

Our VISADEX Representative will be happy to show you, without obligation, how simple VISADEX is to operate—either with Card Pockets or Brass Card-holders—and how easily it can meet your specific requirements.

Motors (small): (Shifting from Industrial Suburb, Rajindernagar to Hubli, Dhawar). Hind Lamps Ltd., Shikohabad, Distt. Mainpuri (Shikohabad, Uttar Pradesh — Lamps (Standard Bayonet type caps): 24 million Nos. per annum and (Caps for Miniature Lamps): 40 million Nos. per annum.

AUTOMOBILES

Shri Sharad Chandra Kothari, Kothari Bhawan, Marwari Road, Bhopal (Madhya Pradesh) — Tipping wagons, mining wagons, asphalt boilers, industrial trolleys, elevating and barrel truck etc. (Shifting from Rajasthan to Madhya Pradesh).

PAPER MACHINERY

Eastern Paper Mills Limited, 2, Dakshindari Road, South Dumdum, Calcutta-48 (Calcutta, West Bengal) — (50 tonnes capacity completely automatic board mill machinery) 2 plants per annum, or (25 tonnes capacity completely automatic board mill machinery) 4 plants per annum, (10 tonnes capacity pulp and paper making plant) 4 plants per annum.

CONVEYING EQUIPMENT

Mukand Iron & Steel Works Limited, Kurla, Bombay (Kurla, Bombay, Maharashtra) — (Anual capacity): Sand Mills (Batch capacity up to 600 lbs.) 4 Nos, Ladles (2 tons to 10 tons capacity) 10 Nos., Shakeouts 4 Nos., Core Ovens 3 Nos., Jaw Crushers 10 Nos., Belt Conveyors, Shuttle-conveyors and Elevating conveyors of various types including continuous buckets elevators, vertical or inclined: Worth Rs. 2 lakhs per annum, Electric Overhead Travelling Cranes: 200 tonnes a year, Steel Structurals: 1800 tonnes a year, Melting Plants, Annealing Furnaces, Ovens and Foundry Moulding machines; Valued at Rs. 5,00,000 per annum.

PLASTIC MOULDED GOODS

Johnson & Johnson of India Ltd., No. 30, Forjett Street, Bombay-26 (Bombay, Maharashtra) — (Annual capacity): Huswitubes 60,000 dozens, Collapsible tubes for contraceptives etc. 60,000 dozens, Rigid tubes for Sutures 240,000 dozens, Disponable syringes 240,000 dozens, Adhesive Plaster container 120,000 dozens, disposable one shot injectable plastic tubes - 350,000 units, disposable plastic container for administration of transfusion - 30,000 sets per annum. Swastik Rubber Products Ltd., Swastik House, Behind Kirkee Railway Station, Poona-3 (Swastik Rubber Products Ltd., Kirkee, Maharashtra) — Water Proof Fabric by Coating & Sandwitching Molten Polythelene 300 tonnes per annum.

MISCELLANEOUS CHEMICALS

The National Rayon Corporation Ltd., Post Box No. 200, Ewart House, Bruce Street, Fort, Bombay-1 (Mohona, Near Kalyan, Maharashtra) — Hydrogen Gas (obtained as a bye-product in the manufacture of Caustic Soda) 1,00,000 Cu. metres per annum.

DRUGS AND PHARMACEUTICALS

Merck Sharp & Dohme of India Ltd., Dugal House, Backbay Reclamation, Bombay-1 (Maharashtra) — Multi-vitamin tablets 2,40,00,000 tablets p.a., Analgesic tablets 2,40,00,000 tablets p.a. Parke Davis (India) Ltd., Saki Naka, Bombay-70-AS. (Maharashtra) — FLADEC-ADC Drops with Fluoride 5,220 litres per annum. Dye's Medical Stores (Manufacturing) Private Ltd., 6/D, Lindsay Street, Calcutta-16 (West Bengal) — BESEROL TABLETS 45 lakhs per annum. Pfizer Private Limited ICICI Building, 163, Backbay Reclamation, Bombay-1 (Maharashtra) — Calcium Borogluconate injection (Plain) 15,600 litres per annum, Calcium Borogluconate Fortified injection 15,600 litres per annum. Glaxo Laboratories (India) Private Ltd., Dr. Annie Besant Road, Worli, Bombay-18 (Maharashtra) — B-Complex injections (Cytexin) 12,00 vials per annum, BETNOVATE Skin ointment 1,200 kgs. per annum, BETNOVATE/N Skin ointment 1,440 kgs. per annum. The Calcutta Chemical Co. Ltd., 35, Panditia Road, Calcutta-29 (West Bengal) — (Items of manufacture and Expansion envisaged): Cyclosac tablets 102 lakhs per annum (expansion) Chloropectidine forte tablets 60 lakh tablets per annum (expansion), Cyclosac (Liquid) 24,000 litres per annum (expansion). Atul Products Limited, Atul (W. Rly.) District Surat (Gujarat) — Ortho Toluene Sulfonamide 100 tons per annum, Para Toluene Sulfonyl Chloride 88 tons, per annum, Para Toluene Sulfornamde 70 tons per annum. Saccharine USP (soluble and insoluble) 25 tons per annum, Halazone 40 tons p.a., Chloramine 20 tons p.a. Standard Chemical & Pharmaceutical Cod., Atlas Mills, Reay Road, Bombay-10 (Maharashtra) — Ortho Toluene Sulphonamide 100 tons per annum. Roche Products Ltd., 28, Tardeo Road, Bombay-34—WB (Maharashtra) — Gantrisin Eye Drops 500 litres p.a., Protovit chewing tablets 2,000,000 tablets p.a., Becozym C. Tablets 3,000,000 tablets p.a.

COTTON TEXTILES

The Telangana Spinnng & Weaving Mills Ltd., "Gum Gates" Saifabad, Hyderabad-22 (Hyderabad, Andhra Pradesh) — 13,000 spindles for manufacture of cotton yarn. The Ajudhia Textile Mills Ltd., Azadpur, Delhi-6 (Uttar Pradesh) — 12,000 spindles for the manufacture of cotton yarn. Shri Amarsinghji Mills Ltd., VANKANER (Saurashtra) (Gujarat) — 12,204 spindles for the manufacture of cotton yarn. Baroda Vibhag, Co-operative Spinning Mills Ltd., Baroda (Baroda, Gujarat) — 25,000 spindles for the manufacture of cotton yarn. Surat Distt. Co-operative Spinning Mills Ltd., C/o Shri Darin Gujarat Co-operative Cotton Marketing Union Ltd., Lal Darwaya, Surat (Surat, Gujarat) — 25,000 spindles for the manufacture of cotton yarn. Narmada Cotton Growers Co-operative Spinning Mills Ltd., C/o Broach Distt. Co-operative Board Ltd., Navadera, Broach (Rajpita, Distt. Broach, Gujarat) — 25,000 spindles for the manufacture of cotton yarn. The Petlad Bulakhidas Mills Co. Ltd., Opp. Station, Petlad (Gujarat) — 100 automatic looms for the manufacture of cotton cloth. Shri Vasantrao Patil, Chief Promoter, The Bharat Co-operative Spinning Mills Ltd., 41, Shivajinagar, Sangli (Bharat Co-operative Spinning Mills Ltd., Sangli, Maharashtra) — 25,000 spindles for the manufacture of cotton yarn. South Punjab Electricity Corporation Ltd., Circular Road, Rohtak (Punjab) — 13,000 spindles for the manufacture of cotton yarn. Shri J. S. Patil, Chief Promotor, Jalgaon Co-operative Spinning Mills Ltd., C/o E.K. Central Co-operative Bank Ltd., Jalgaon (Jalgaon, Maharashtra) — 12,000 spindles for the manufacture of cotton yarn. Jupiter Mills No. 2, Carrol Road, Parel, Bombay-13 (Maharashtra) — 50 automatic looms for the manufacture of terry towelling cloth. Salem Roadways, 4B, Salai Road, Salem-1 (Hosur, Salem Distt., Madras State) — 12,000 spindles for the manufacture of cotton yarn.

INSULATORS

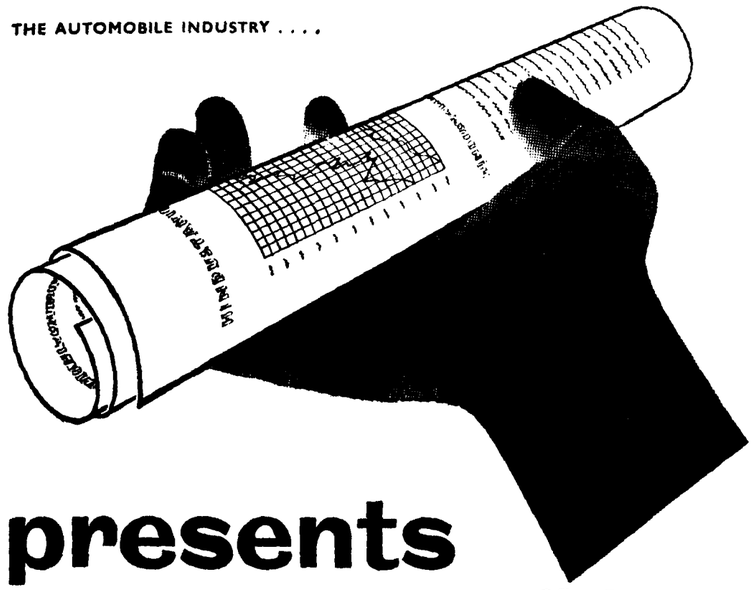
The Director, Government Porcelain Factory, Post Box No. 4, Science Institute Post, Bangalore-12 (Bangalore, Mysore) — Extra heavy duty disc insulators for 220 kv lines., Transformer bushings up to 220 kv., Switchgear and apparatus bushings up to 220 kv., Metallized bushings, Long Red Insulators for Railway Electrification 1,440 tonnes per annum.

CHANGE IN NAMES (Owners or Undertakings)

(During the week ending March 28, 1964)

(Information pertains to particular licences only)

From M/s. Batliboi & Co., Bombay to M/s. Batliboi & Co. (P) Limited, Bombay.



LICENCES REVOKED OR SURRENDERED

(During the week ended March 28, 1964)

(Information pertains to particular licences only)

M/s. P.J.B. Industries, Calcutta — Furnace Type Carbon Black. M/s. Bengal Immunity Co. Ltd., Calcutta — Salvizol tablets and Sarizol cream.

THE AUTOMOBILE INDUSTRY . . . .

presents some facts and figures

Among the owners and prospective purchasers of motor cars in India, there exist an imperfect knowledge and certain misconceptions about the Automobile Industry.

The opinion is often expressed that cars are not readily available and that their prices are too high. Remarks are often made that manufacturers' and dealers' profits are excessive, and that the quality is not up to foreign standard.

Delay in deliveries

The volume of production of the automobile industry is limited by the availability of foreign exchange for the import of materials and components that are not yet manufactured in India. Consequently, the supply of cars cannot keep pace with the demand.

Price structure

The biggest item in the price structure of a car is made up of direct and indirect taxes and this represents at least one third of the "on-the-road" price of a car.

The smallest item is the manufacturer's profit, which is controlled by the Government and yields only a minimum return on the manufacturer's investment.

Components

The automobile industry is not a self-contained industry. It depends, for a large number of the indigenous components of a car, on ancillary industries —some of them recently created—whose productivity and quality have not yet reached the desired standard and whose production costs are high.

Quality

The Indian Automobile Industry, and particularly the ancillary industries, are still young and cannot be expected to have reached, in the short time of their development, the high standards attained by their foreign counterparts which have been in existence for 60 years. The responsibility for improving the quality falls both on the vehicle manufacturers and on the ancillary suppliers.

(c) payment shall be as specified in acceptance, provided that the payment for any material supplied or sold by the company shall be made to the company within one month from the date of such supply or sale.

(d) the contract may be terminated at any time by either party giving to the other one month's notice in writing."

(iv) "RESOLVED that subject to the approval of the Central Government M/s. Birla Brothers Private Ltd. be and are hereby re-appointed the Secretaries & Treasurers of the Company for a period of 10 years with effect from 1st January 1965 upon terms as to remuneration and otherwise and subject to the conditions contained in the draft agreement placed before the meeting and initialled by the Chairman for the purpose of identification subject to such modifications as may be required by the Central Government in granting the approval as aforesaid and agreed to by the Directors of the Company and M/s. Birla Brothers Private Ltd."

The Register of members and share transfer books of the Company will remain closed from 30th April to 14th May, 1964, both days inclusive.

By order of the Board:

for JAYA SHREE TEXTILES & INDUSTRIES LTD.

D. C. GHATAK
Secretary — Company Law.

Rishra, the 31st March, 1964.

NOTES:—1. A member entitled to attend and vote at the above meeting is entitled to appoint a proxy to attend and vote instead of himself and a proxy need not be a member.

2. The dividend if declared in the meeting will be payable to those shareholders whose names would appear in the Company's Register as on 14th May, 1964, or to their order or to their Bankers. The Dividend Warrant will be sent to the shareholders at their registered addresses directly in due course.

The Explanatory statements in respect of ordinary resolution and Special Resolution Nos. (i) to (iv) of the special business have been forwarded to the members of the Company.

The Soorah Jute Mills Company Limited

NOTICE is hereby given that the Annual General Meeting of the Shareholders of the Company will be held at the Registered Office of the Company, at 15, India Exchange Place, Calcutta, on Wednesday, the 27th May, 1964, at 2-30 P.M. for the following purposes:—

1. To receive and consider the Report of the Directors and to pass the audited accounts of the Company for the year ended 31st December, 1963.

2. To declare Dividends on Preference and Ordinary Shares.

3. To elect Directors in place of Shri B. Murarka and Shri T. C. Saboo, who retire by rotation, but being eligible, offer themselves for re-election.

4. To appoint Auditors and to fix their remuneration.

5. As special business to consider and, if thought fit, to pass, with or without modification, the following Resolutions:—

(i) As Ordinary Resolution—

"RESOLVED that Shri Murlidhar Loyalka, a Director of the Company who retires under Article 140 of the Company's Articles of Association be and is hereby re-appointed a Director of the Company."

(ii) As Ordinary Resolution—

"RESOLVED that subject to the approval of the Central Government and the terms of such approval, Messrs. Hindusthan Investment Corporation Ltd., be and are hereby re-appointed the Managing Agents of the Company as and from 15th August, 1965, when their present term expires for the period at the remuneration and upon terms and conditions set forth in the draft Agreement placed before the Meeting and initialled for the purpose of identification by the Chairman of the Board and that the Directors of the Company be and are hereby authorised to enter into an Agreement with Messrs. Hindusthan Investment Corporation Ltd., in terms of the said draft subject to any modifications thereof as may be agreed upon between the Directors and Messrs. Hindusthan Investment Corporation Ltd., for the purpose of complying with any modifications required or conditions imposed by the Central Government in granting their consent as aforesaid."

The Register of Members and Share Transfer Books of the Company will remain closed from the 13th May, 1964 to the 27th May, 1964, both days inclusive.

By Order of the Board,
FOR HINDUSTHAN INVESTMENT
CORPORATION LTD.
R. K. Chhaochharia,
Managing Director,
Managing Agents

Regd. Office:
15, India Exchange Place,
Calcutta-1.
Dated, the 6th April, 1964.

N.B. (i) The Directors have recommended the following dividends for the year subject to deduction of tax under the I.T. Act, 1961:

On Preference Share @ 10% per annum and
On Ordinary Shares @ Rs. 2/- per share.

If dividend on shares as recommended by the Directors are approved at the Meeting, THE DIVIDEND WILL BE PAYABLE TO THE REGISTERED SHAREHOLDERS whose names are on the Company's Register on the 27th May, 1964 or to their order or to their Bankers. No application need be sent for dividends, as relative dividend warrants posted to such shareholders.

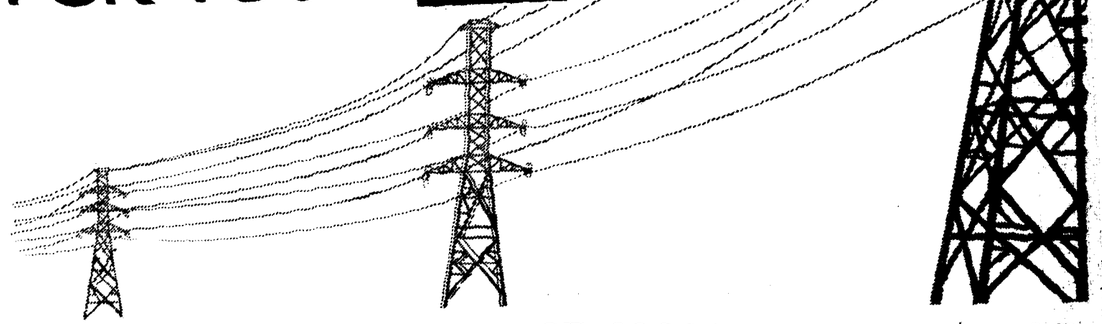
(ii) A member entitled to attend and vote at the above Meeting is entitled to appoint a proxy to attend and vote instead of himself and a proxy need not be a member.

(iii) AN EXPLANATORY STATEMENT IN RESPECT OF THE ABOVE ITEMS OF SPECIAL BUSINESS IS BEING FORWARDED TO THE MEMBERS OF THE COMPANY ALONG WITH THE CONVENING NOTICE OF THE MEETING.

THE GWALIOR RAYON SILK MFG. (WVG.) CO. LTD.

Notice is hereby given that the Board of Directors of the Company at their meeting held on 27th March, 1964, have declared the dividend on Redeemable Cumulative Preference Shares Series 'A' and 'B' for the year ended 31st March, 1964, @ Rs. 8.57 per share subject to deduction of tax under Section 194 of the Income Tax Act, 1961.

The Dividends will be paid from 4th May, 1964, to those shareholders whose names appear on the Register of Redeemable Cumulative Preference Shares, Series 'A' and 'B' on the 2nd May, 1964.



Register of Members and Share Transfer Books of the Redeemable Cumulative Preference Shares Series 'A' and 'B' of the Company will be closed for this purpose from 18th April, 1964, to 2nd May, 1964, both days inclusive.

By order of the Board,
B. N. PURANMALKA.
Secretary.

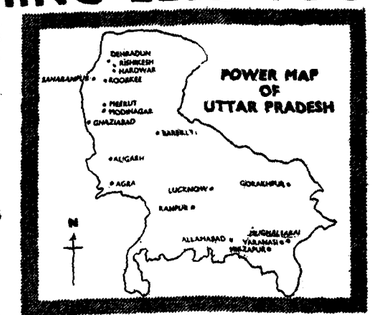
Regd. Office:
Birlagram, Nagda.
30-3-1964.

ATTENTION INDUSTRIALISTS!

HERE'S ELECTRIC POWER FOR YOUR NEW INDUSTRIES

AND EVERYTHING ELSE YOU CAN ASK FOR

Your new industry needs a lot of electric power. The U.P. State Electricity Board is proud of its ability to keep pace with industry's growing demand.



The following are some of the major power projects in U.P.'s Third Five Year plan :

Rihand Hydro-electric Project	2,50,000 KW Completed 1962
Harduaganj, Stage I	60,000 KW Completed May '62
Harduaganj, Stage II	30,000 KW Completed Mar.'64
Matatila Hydro-electric Scheme	30,000 KW Scheduled Dec. '64
Yamuna Hydro-electeic Scheme, Stage I	86,000 KW Scheduled June '65
Kanpur Thermal Expansion	64,000 KW Scheduled Aug. '65
Obra Thermal	2,50,000 KW Starting Oct. '65
Yamuna Hydro-electric Scheme, Stage II	2,00,000 KW Scheduled Dec. '69

A trunk grid of 2,20,000 volts is being constructed to interconnect all the power stations and lines of 1,32,000 and 66,000 volts will branch off from this trunk grid for taking constant electric power to the following important industrial centres :-

Ghaziabad-Modinagar-Meerut - Connected by rail and road with the whole of India. Home of the well known Modi Group of industries - can also be the home of your industry. Industrial sites are offered by the U.P. Industrial Corporation, Kanpur.

Aligarh - Only 16 miles from the Harduaganj Thermal Power Station - assured of ample and constant supply of electric power. 84 miles from Delhi.

Dehra Dun - Home of the Yamuna Hydro-electric Schemes, Stages I, II, III and IV. Unlimited forest produce and limestone of high purity at hand.

Saharanpur-Roorkee-Hardwar-Rishikesh - offer big scope for industries, particularly those ancillary to the Antibiotics Factory at Rishikesh and the Heavy Electricals Factory at Hardwar. Close to rich extensive forests.

Bareilly - Home of the Synthetic Rubber industry, Camphor industry, Turpentine and Rosin industry and the Match industry and developing rapidly as a major industrial centre.

Agra - Main tourist attraction in India and growing industrial centre - conveniently connected with the whole country by rail (both broad gauge and metre gauge), road and air.

Kanpur - Already the most important industrial centres in Northern India. Seat of many technical training institutions. Connected with the whole country by rail, road and air.

Lucknow - Seat of the U.P. Government and a growing industrial centre. Industrial area developed by the U.P. Industrial Corporation, Kanpur. Served by rail, road and air.

Allahabad and Naini - Quick movement of goods between Calcutta and Allahabad assured by electric traction. Land, water and power available in plenty.

Varanasi-Mughalsarai Area - Another industrial area which is growing rapidly. Conveniently connected by rail, road and air with the rest of the country.

Mirzapur District - Home of three major power stations - Rihand, Obra Thermal and Obra Hydel. Rich in limestone deposits and producing large quantities of aluminium and caustic soda. Coal available from nearby Singrauli Coalfields.

Gorakhpur - A large Fertiliser Factory being set up here by the Government of India - also seat of the Madan Mohan Malviya Engineering College and the Government Technical Institute. Important centre of sugar production.

This advertisement is issued for the information of industrialists throughout the country by the

U.P. STATE ELECTRICITY BOARD

COUNCIL HOUSE, LUCKNOW

who will be happy to answer enquiries and furnish any further information which may be required.

RECORDS AND STATISTICS

Heavy Industries: Encouraging Performance

THE YEAR 1963 witnessed an all-round increase in production in almost all branches of industrial machinery. Vigorous steps are being taken to put up additional capacity in machine building and other heavy engineering equipment. The Department of Heavy Engineering is processing in consultation with the Finance Ministry and the Planning Commission the recommendations of 10 Working Groups, which undertook studies in respect of various machine building industries in order to recommend production targets for the fourth and fifth five-year Plans. The Working Groups dealt with electrical power equipment, transport equipment, steel and metallurgical industries' equipment, mining and drilling equipment, machine tools, fertilizers and chemical equipment, industrial machinery, textile machinery, structurals and engineering industries.

During 1963 sugar mill machinery worth about Rs. 6.5 crores was produced. The capacity established is considered adequate for some time and can produce 14 new standard sugar mills and an equivalent of nine more by way of expansion and replacements. Fifteen complete sugar plants manufactured indigenously have already gone into production and five more are under completion.

The production of textile machinery amounted to Rs. 18 crores in 1963 and may go up to Rs. 26 crores by 1965-66. In order to keep the special problems of the textile machinery industry under constant review, a Development Council for Textile Machinery is being set up.

There are 72 firms licensed for the manufacture of chemical and pharmaceutical machinery and output in 1963 was about Rs. 5.4 crores. Sufficient progress has been made in the manufacture of complete plants for producing sulphuric acid, super phosphates, caustic soda etc. The entire range of tea processing machinery is being produced in the country and the quality is considered to be very good.

Adequate Capacity

Capacity established for cement machinery is also considered adequate for some years to come. Seven manufacturers, who have technical collaboration arrangements with reputed foreign firms, are capable of producing complete cement plants and will be able to supply 8 to 10 plants of 600 tons daily capacity by 1965-66.

Four units have been licensed for the manufacture and installation of complete coal washery plants in collaboration with British and American firms. The estimated demand for such equipment is of the order of about Rs. 5 crores per year. The four firms will be able to meet the demand at the rate of 4 to 5 complete washeries per year. For coal mining machinery, there are eight units in the private sector.

In the field of paper machinery, against a target of about Rs. 7 crores to be reached by 1965-66, the capacity already licensed is much more — about Rs. 24 crores. Some of the 22 firms licensed have gone into production and work on others is progressing. The industry produced equipment worth Rs. 1.2 crores in 1963.

Ten more firms have been licensed for the production of printing machinery and the total approved capacity at present is Rs. 5.6 crores.

For the manufacture of boilers and boiler mountings, there are now 16 licensed units, of which 10 are in production. Output in 1963 was Rs. 2.39 crores, about 10 per cent more than in 1962.

In the field of machine tools, the Hindustan Machine Tools Factories I and II at Bangalore produced 1486 machines valued at over Rs. 6 crores during April-December, 1963 as against 1120 machines valued at Rs. 4 crores in the corresponding period of the previous year. During 1963, HMT factory III at Pinjore (Punjab), designed and built entirely by Indian personnel without any foreign collaboration or assistance, was commissioned. This factory is expected to reach its annual production target of 1000 machine tools, worth Rs. 5 crores, by 1966-67. HMT IV being set up at Kalamassery in Kerala is expected to go into production by the end of this year and HMT V at Hyderabad by the end of 1965.

The total number of units producing machine tools is 65, with an installed capacity of about Rs. 19 crores. A few other units licensed recently are expected to go into production this year.

Satisfactory Progress

The production of commercial vehicles, jeeps and cars during 1963 was 27,521; 8,104; and 15,711 respectively as against the previous year's figures of 25,971; 7,597; and 23,326. There was a fall in the output of cars because of a cut in the foreign exchange allotment. Efforts are being made to achieve 90 per cent indigenous content in the manufacture of motor vehicles this year. Satisfactory progress has been made in the automobile ancillaries sector and production increased from Rs. 16 crores in 1962 to Rs. 25 crores in 1963. Capacity has been established for almost all the ancillary items. Production of motor cycles, scooters, three-wheelers and mopeds in 1963 totalled 26,572 as against 25,002 in 1962. The output is likely to go up this year as two new manufacturers licensed for mopeds will start production soon.

The number of diesel engines produced in 1963 was about 55,000 as against 42,645 in 1962. Production has started for the first time of new types of multi-cylinder diesel engines. It is expected that by 1965-66, the country's entire requirements of diesel engines for all applications will be met by the indigenous industry.

As for Railway wagons, the estimated requirements at the end of the third Plan period are 33,500 per year. Fifteen units are now in production. During the first ten months of 1963, the Private Sector units produced 20,000 wagons while the Railway workshops turned out 5,000.

A re-phasing of the Heavy Structurals Project and the Heavy Plate and Vessels Project at Wardha has become necessary due to non-availability of British credit. It is now proposed to take up implementation of the Heavy Structurals Works in the first instance and this would include marginal items of plate and vessel works. Steps are under way to locate necessary foreign exchange resources.

The Elusive Dollar

A CONSTELLATION of American industrial leaders, some 40 in number, is now across the Indian skies and is surveying the business landscape below. The visit of the American group has in some quarters been described, predictably, as a "dollar invasion of India" and has been deliberately misinterpreted as part of a sinister design which the Finance Minister of India is supposed to have worked out for throwing the door of the Indian economy wide open to American monopoly capitalism. Engaging as this conceit may be, it is, however, rather remote from the truth. The visiting Americans are, of course, business men come here to do business or rather to explore business opportunities and estimate business possibilities. We may, no doubt, readily agree that they are coming here because they expect to be able to make a profit on their investment and enterprise here. We may even concede that they hope that these profits which they expect to make will be attractive. We hope, for our country's sake, that in both respects they will have no reason to be disappointed after they have seen and talked and listened in the course of their stay in the Capital and at other places which they may visit. Not very long ago the Deputy Chairman of the Planning Commission, Mr. Asoka Mehta, was telling us that "profit" should not be regarded as a dirty word, as reasonable profits were the wherewithal of economic progress — a view which the Soviet Premier, Mr. Khrushchev, has been propagating enthusiastically for some time now for the benefit of his country men. We may, therefore, readily grant that the American industrial leaders are here to see whether they can make more money for themselves by putting more money into our industries. We may even concede that it is perhaps possible to see here a possible dollar invasion. Only, we do hope that this invasion will actually take place, for the Indian economy is certainly in need of the fertilizing flow of foreign capital and know-how — and the Americans are undoubtedly the people most able and perhaps most willing as well to provide more of it. The pity is that, as it is, India's share of U.S. capital has been too low relative to the needs and prospects of her economy as well as to the investments of U.S. money in other countries of the world.

According to a survey made by the U.S. Department of Commerce, the global total of U.S. direct foreign investments in 1962 was of the order of $37 billion and out of all that vast amount, U.S. money invested in India amounted to only $196 million. The Indian share was not even significant in relation to the Asian sub-total of $2,495 million. A comparison of India with individual countries shows that in Asia, the Philippines with $374 million of U.S. foreign investments was the most favoured and was followed by Japan with $369 million, while Indonesia, despite all its political confusion and economic disorganisation, could still account for $160 million. Comparing India with some of the Latin American countries, we find that Venezuela, Brazil, Mexico, Chile, Argentina, Panama, Peru and Columbia, all have substantially larger American investments than this country. The difference will be striking even after allowance is made for the fact that oil investments accounted substantially for the larger figures in the case of some of the Latin American countries, notably Venezuela, Brazil and Columbia. Another point which may be made here is that, apart from comparisons relating to the absolute sizes, the relative increases in U.S. foreign investments in various countries have also been not greatly to the advantage of this country. Thus, while the world total of U.S. foreign investments has gone up by some $8 billion from 1959 to 1962, the increase in India was only about $62 million. In comparison, Japan had received $160 million more and Brazil $260 million more. The position, therefore, is that compared to the vast stream of U.S. capital which has gone into other national econo-

mies all over the world, that part of it which has managed to ooze into India has been no more than a trickle.

This is one side of the picture, an aspect of American foreign investments considered in their global context. The other side is that, so far as India's own rather meagre economy is concerned, even the relatively small amounts of U.S. capital which have been finding their way into this country have been able to play a large role in our industrialization and economic development. Thus, between 1948 and 1960 U.S. foreign business investments in this country have gone up from Rs 11.2 crores to Rs. 112.7 crores. During the same period the size of British capital invested in India has risen from Rs. 206 crores to Rs. 446.4 crores. Switzerland, West Germany and Japan are three other foreign countries which could be mentioned in this list. But their aggregate investments in this country in 1960 were less than Rs. 20 crores and while it is true that West German and Japanese investments in this country seem to be in a phase of steady growth, it is evident that for many many years to come the United Kingdom and the United States would continue to be responsible for the bulk of foreign investments here. Of the two, the United Kingdom, for historical reasons, has been the leader in the business. But it is now likely that the rate of growth of U.S. capital investments in this country will rise in relation to the rate of growth of British capital investment. This trend is already evident in the manufacturing industries where American capital which was only Rs. 10.8 crores in 1955, had gone up to Rs. 61.2 crores by 1960. This is to be compared with the corresponding increase in British investments from Rs 100.9 crores to Rs. 129.2 crores. Since the manufacturing sector is the one likely to expand fastest during the next phase of India's industrialization, U.S. foreign capital and know-how, which in recent years have been showing more and more interest in the new industries which are being set up or which are being contemplated, are likely to find much scope for rapid growth. It is the business of the group of American industrial leaders in this country to study the actual conditions under which this growth will take place and also consider the possible conditions under which this growth could take place at a faster rate than might otherwise be the case. More specifically, they are here to study the economic factors bearing on the investment climate and pin-point specific investment opportunities under the third and fourth Plan targets in important industries.

It would be wrong to think that the visiting group represents only American Big Business. It is true that the second largest company in the United States has sent one of its senior executives, a Director and Vice-President, but the list of visitors taken as a whole is certainly not over-weighted in favour of the U.S. industrial giants. On the contrary only 12 out of the 39 corporations participating in this visit come within the "Fortune" survey of the 500 largest U.S. industrial corporations. The point is that the composition of the visiting group has had less to do with the bigness or otherwise of the businesses represented in it than with the consideration that the group should, for obvious reasons, be representative of companies which are engaged in the manufacture of goods on the priority list of the Government of India under the third Plan. Consequently, the visitors include producers of tool and alloy steels, industrial equipment, machinery and equipment for heavy industries, fertilizers petro-chemicals, cement, machine tools and agricultural and transport equipment.

Their presence here at the present time is an impressive vote of confidence in the political and economic future of this country. It is also an encouraging assertion that the U.S. business regards the Indian economy as an attractive investment proposition which needs and deserves to be more fully explored than it has been hitherto. India, so far, has been depending considerably on foreign government assistance for its development programmes. While it will continue to be the case that such foreign aid is essential, it is also to be realistically recognised that this country cannot reasonably expect that the aid will continue indefinitely or without reductions, revisions or other uncertainties. This is because both the political and the economic climate in the aid-giving countries is being perceptibly influenced by critical attitudes. The Clay Committee Report in the United States and subsequent developments in the U.S. Congress which form the background of the U.S. President's recent decision to cut down and if possible, stabilize foreign aid programmes at levels which would accord with conservative views in Congress are events which cannot be ignored in any rational assessment of the outlook for foreign aid. While the U.S. approach is certainly of special significance in view of that country's role as a principal and the most generous provider of aid, attitudes elsewhere, as in Britain and West Germany, are also of great relevance. In Britain the tendency is to stress the limited capacity of that country in the field of foreign aid, while in West Germany the emphasis is being increasingly laid on the point that developing countries should learn to enlist more and more foreign capital investments so that they may be able to make do with less and less inter-governmental aid. This is an argument which is being heard increasingly in the United States as well and the net result of it all is that while foreign aid may continue for some time to come, it has now definitely entered its waning phase. Consequently, countries such as ours which have a need of large amounts of external resources for rapid or diversified industrialisation must work with heightened imagination and redoubled energy for attracting foreign capital and foreign private investments. Whether this position is

This issue of "Eastern Economist" carries a number of special articles and other features, including statistical information relating or relevant to the visit of a group of American industrial leaders who are currently in the country discussing economic conditions and studying investment prospects.

formally acknowledged or not, it is evident that the Government of India has rightly concluded that time should not be lost in working out a long-term strategy for stepping up the flow of foreign private capital into this country. While it is an exaggeration to say that the Finance Minister has thrown the door wide open to foreign capital — not that he should not have done so — it seems certainly to be the case that the door has been moved slightly ajar. This, at any rate, is the reading f recent trends in the Government's economic policies which seem to have been finding favour with business nd financial circles abroad and indeed one of the im-plications of the present visit of the American business eaders is that they may be persuaded to think that the economic climate in this country is now coursing in the right direction.

Here it is interesting to note that the Central Government's budget proposals have made a more favourable impression abroad than at home. Indeed, foreign commentary on the budget seems to be determined to look at the budget in the most favourable light possible. Thus the surtax proposals is being appreciated on the ground that the lowering of the rate and the broadening of the base could mean that the normal firm with a debt-equity ratio of approximately 2 : 1 will not have to worry about the surtax. Again, regarding the new 7.5 per cent tax on distributed profits, the point is emphasized that the tax will come into effect only after a firm has paid dividends of 10 per cent or less for five years and that it will apply to distributions greater than 10 per cent in any year. According to one of the assessments, the full effect of tax rate on the earnings of foreign investments, if all earnings are remitted and no surtax is due, would stand reduced as a result of the budget proposals from 62.5 per cent for favoured industries to 56.8 per cent and from 67.5 per cent or more for other industries to 65.3 per cent. Budget features which have attracted specially favourable notice are the cut in the tax rate on earnings from technical assistance rendered by a foreign firm from 63 per cent to 50 per cent and liberalizing the terms of the special tax exemption up to three years available for foreign technicians. The verdict is that, by and large, the budget proposals, to the extent that they bear specially on foreign investments in this country, have changed the investment climate for the better. But at the same time, many foreign commentators have also taken note of the fact that domestic stock exchanges and domestic business judgment generally have not reacted similarly favourably to other proposals in the budget, particularly increases in personal taxation such as the estate duty. It may be assumed that during their stay in this country, the visiting American business leaders are availing themselves of opportunities for a full discussion with both government officials and business men here on the various aspects of the budget and also on the general direction of the Government's fiscal policy.

Meanwhile, there is certainly little reason to doubt that many of the Government of India's recent actions elsewhere in the economic sphere have been wholly welcomed in the United States and elsewhere. Business men abroad, like business men in this country, have also been taking kindly to the Finance Minister's various pronouncements from time to time regarding the need for stimulating the economy and clearing the obstacles in the way of industrial expansion. The abolition of price controls on 16 commodities last December and the freeing of new ventures and expansions up to Rs. 25 lakhs from industrial licensing and capital issues control and a certain readiness on the part of the Government to consider the participation of private investors, including foreign investors in industries such as oil refineries or petro-chemicals, have been enthusiastically commented upon abroad and it has been particularly noticed with approbation that some of the consumer goods industries, such as gramophone records, groundnut butter and motion picture projection equipment have been opened for foreign collaboration agreements. In this context, a good deal of enthusiasm has been generated abroad by the Government of India's more liberal decisions in recent times in respect of equity allowed for know-how. Similarly, Indian official attitudes towards patent fees and royalty payments are considered to have greatly improved.

Foreign business circles have also been impressed with the report of the Swaminathan Committee for simplifying licensing and related procedures for new industries or industrial expansions and the decisions of the Government of India to accept and act on most of those recommendations. As one commentator puts it, in India there is always the age-old problem of time tables which are never kept and budgets which are always exceeded. Proceeding, he says: "After travelling the tortuous route to Indian investment approval, most foreign firms still find themselves facing frustrating delays and unforeseen costs before they can bring their projects to the production stage. A recent survey covering one-third of the major projects completed in 1959-62 shows that in terms of time, only 26 per cent of the companies reached the production stage on schedule and only 15 per cent made it in terms of cost. On the average, they missed their targets by eight months and 24 per cent of planned expenditures".

While it may not be claimed that the Government of India have moved so purposefully or fast in the past few months that complaints of this kind must be held to have become anachronistic, foreign observers themselves are noticing improvements in administrative attitudes and functioning where procedures relating to industrial expansions are concerned. The Government seems to realise that it is in the national interest to cut out time and cost as much as possible where industrial progress is concerned. There is also the awareness that, thanks to the Cooley Fund loans and the US Export-Import Bank credits, the collaboration of American capital and know-how with Indian business has been vastly promoted. Lately there have been indi-

cations that the Government itself has started thinking in terms of a positive policy of seeking foreign collaboration for projects which are wholly in the public sector or with which Indian private business may be associated. Here again is a fruitful direction of exploration for the visiting American business leaders. We are sure that as a result of their visit and their discussions in our country, they will return to theirs with the reasonable conviction that the Government of India and the business community here will do everything possible separately and jointly to maintain an economic climate in which foreign capital and know-how could associate itself with Indian capital and know-how for the further and full exploitation of the vast potential of growth that undoubtedly exists in the Indian economic and social order. Various studies, at home and abroad, have shown that so far as profitability is concerned the American investor, or the foreign investor generally, has had no cause for complaint with regard to returns on his investments in this country. But this is only one part of a larger attraction. American business is traditionally motivated towards mass markets, and thanks to its political stability and its long-term economic planning, this country of 460 million people, whose standards of living are rising under the stimulus of a democratic order of society, surely presents one of the richest prizes which American business or any other business could look forward to anywhere in the world. To the American business men this promise of a vast mass market of the future has always been the greatest attraction which India has held out and the strength of this attraction has never been greater than it is now.

Hopeful in Geneva

AGREEMENT ON world trade is perhaps even less easy to achieve among nations than agreement on world peace — and it might well become impossible to agree on anything at all when 1,500 individuals representing among themselves 123 countries, assemble for discussion, as they have done at the United Nations Conference on Trade and Development (UNTAD) in session at Geneva since March 23. The meetings of UNTAD will go on for some three months and from our own country at least two extremely articulate delegates have gone. It is, therefore, possible that, as *The Economist* (London) predicts, UNTAD will turn out to be a talking shop. It does not, however, necessarily follow that the Geneva marathon might, as *The Economist* fears, also end up as the most frustrating international conference to be held since the War on any economic subject. This is because the developing countries which have gone to Geneva to press for more trade with the industrially advanced countries are under no illusion about the complexity of the project. For them the mere fact that a conference has been convened to discuss how and to what extent the trade policies of developed economies should be liberalized for the benefit of developing economies is victory enough.

They are aware, moreover, that some of the issues, such as an extensive recasting of GATT or the setting up to a new organisation for world trade, on which the industrially advanced countries may have their own ideas, are not by any means highly relevant to their own specific problems or claims. From their point of view, what would really matter is agreement, on broad trade or tariff programmes which would enable the developing economies to secure better prices for their primary products from and larger markets for their manuactured products in the industrially advanced countries. Considered in these terms the Geneva confererence is unlikely to fail totally in the sense that response from developed countries cannot obviously be zero, just as it is unlikely to succeed wholly in the sense that whatever is asked by or on behalf of th developing countries is agreed to. As a matter of fac even when allowance is made for the propagandist ele ment in the gesture, the Soviet declaration on April 7 before a committee of the conference that it will abolisl all tariffs on imports from underdeveloped countrie from the beginning of 1965, has already given a limited but practical, turn to the proceedings. It is true, o course, that an offer of the kind which the Soviet Unior has made in the context of the State-controlled international trade which the Soviet Union is conducting may be more striking in appearance than it is significant in substance. But all the same, it is obvious that the Soviet announcement could be like a ripple in a pool in its ramifications.

The Soviet Union, in fact, has given spectacularly specific expression to more careful and cautious general propositions to be found in, say, the speech which Mr. Edward Heath made for Britain at the conference. Among the 10 key points which the British delegate recommended for world attention were included the removal of duties on all tropical products and on primary products imported from developing countries, the reduction of tariffs on semi-processed and processed products imported from the developing countries and the ending of internal taxes and revenue duties applying specifically to products wholly or mainly produced in the developing countries. The virtue of the Soviet proposal lies in the immediacy of the action which the Soviet Government has pledged itself to take without waiting for the conference to work out formulae. But it is surely interesting that while Mr. Heath also mentioned among his 10 points the abolition of quantitative restrictions adversely affecting the trade of the developing countries, the Soviet Union has so far shown no recognition of the fact that the kind of barter deals and bilateral trade agreements in which it believes are essentially in the nature of a quantitative control of trade.

Taken in their entirety, the Heath proposals seem to justify his claim that they "offer the greatest hope of practical progress." Actually there had been general agreement among the countries participating in GATT discussions last May on such points as that there should not be any new barriers on the trade of the less-developed countries in products which are of particular interest to them and that there should be a general movement towards the removal of quantitative restrictions and the removal or reduction of import duties as well as internal taxes and revenue duties again on products which are of significance, actually or potentially, to the export trade of developing countries. What now remains, and where UNTAD could help, is to organise institutional arrangements for formulating, programming and securing the implementation of means and measures which could concretize that agreement.

An important point made by Mr. Heath in this connection — and this is the seventh in his series of 10 — is that apart from the removal of import duties on products of special interest to the export trade of developing countries, the developed countries should further agree to expand tariff preferences to developing countries over an even wider area of the trade between the two groups. Such expansion and the arrangements of tariff preferences, however, are not to be allowed to impede the general reduction of tariffs among developed countries on which, as Mr. Heath rightly emphasizes, the continued expansion of international trade so largely depends. He, therefore, recommends that the preferences should be created not by raising tariffs against other countries but by lowering or abolishing tariffs for developing countries.

Proceeding to the exchange of preferences among the developing countries themselves, Mr. Heath has rightly viewed it in the context of the building up of regional co-operation which, as he suggests, need not be confined to formal economic units but could be flexible in co-ordinating policies and programmes in economic planning, the exploration and use of natural resources and development of industry and communications. He has also suggested that much could be done in this direction by the various regional economic commissions whose efforts the developed countries could assist in a constructive manner. We consider the Heath proposals important because they ought to correct the impression created, no doubt unintentionally, but certainly unfortunately, by an earlier speech by the US Under Secretary of State, Mr. George W. Ball, who seemed to have chosen the wrong place and the wrong time for saying the right things.

Although we do not fully share the view that the US delegate chose to adopt a far too detached and rather professorial attitude in his application to the specific purposes of the conference, there were certainly passages in his speech before the conference on March 25, which could be taken to suggest that the US Government was not too keen on providing leadership or initiative to a bold new programme for the benefit of developing countries. It is, no doubt, true that Mr. Ball did mention trade and tariff concessions and preferences to developing countries without any condition as to reciprocity. But his declaration that developed countries could help developing countries best through domestic policies of full employment and a larger rate of economic growth, however true in itself, appeared to by-pass the essential problem before UNTAD which is that one of the incidental results of world economic progress seems to be that the gap in wealth and welfare between countries which are already economically advanced and countries which are relatively backward is widening. Again, the US delegate's advice to developing countries that they must learn to sell their manufactures on a competitive basis and be able to compete not merely with other exporting countries but also with the domestic industries of the importing countries could, in the circumstances in which it was given, sound as if it were a carefully prepared defence against anticipated demands at UNTAD that developed countries should take upon themselves large and positive responsibilities for the promotion of the trade of developing countries. The American approach, to world trade sets a premium on efficiency and competitiveness and this is as it should be in any matter of business. But the problem which Mr. Ball did not seem to have fully considered is how a developing country can acquire those virtues of efficiency and competitiveness in the short period when overhead (and labour) costs are heavy and when they also urgently need a favourable trade balance. If production in developing countries could compete effectively in world markets here and now, there need have been no UNTAD. The problem at Geneva surely is how to ensure that, over a reasonable period, the developing countries are treated on a special and preferential basis so that they may be enabled, in due course, to pay their way through international trade.

One of the major issues raised on the agenda of UNTAD has already become a matter of lively debate, thanks principally to the report of Dr. Raul Prebisch, Secretary-General of this conference — a report which has rightly come to be regarded as one of the basic documents for discussion. Pointing out that more than 60 per cent of the labour forces of most underdeveloped countries are still engaged in agriculture and other forms of primary production, Dr. Prebisch says that the purchasing power of the developing countries cannot be protected in world markets unless special steps are taken to maintain the international prices of primary commodities at levels higher than those which would prevail in the absence of international regulation. This forthright declaration has had a mixed reception. While both the American and the British delegations have subscribed in principle to the expansion of commodity agreements to products other than wheat, tea, sugar and coffee which have already been thus covered, and

Mr. Ball particularly has specifically supported negotiations for such agreements on a commodity-by-commodity basis, Dr. Prebisch's suggestion that the prices should be supported deliberately at levels higher than those which would prevail in the absence of commodity agreements has been received with reservations.

The American attitude seems to be to emphasize stability of markets rather than a higher level of prices as the legitimate purpose of internationally promoted commodity agreements. Mr. Edward Heath has also pointed out that while prices should be stabilized at equitable and remunerative levels, the first essential is to secure the maximum effective demand for commodities by broadening and facilitating their access to markets. Mr. Heath as well as other speakers at the conference also pointed to the possibility of over-production in the producing countries or substitution polices in the receiving countries in the event of prices being artificially bolstered. Mr. Heath would, therefore, emphasize rather the desirability of commodity agreements aiming at providing floor prices which have the virtue of preventing the export earnings of developing countries from falling to levels which could absorb their economic development, without running the risk of retarding the development of new markets or the growth of consumption. Incidentally, the leader of the Indian delegation, Mr. Manubhai Shah, has asked for international commodity agreements on a wide range of items, but it is possible that the general response might be more limited than he expects and that Mr. Ball's formula of a "commodity-by-commodity basis" may be preferred for exploration. Meanwhile proposals for commodity agreements had been mooted from time to time for various agricultural products as well as for cocoa, cotton, rubber, lead, zinc, copper and textiles.

An opportunity for an interesting intellectual exercise has been provided by the suggestion made in Dr. Prebisch's report that an as alternative or as a supplement to a series of commodity agreements there could be a scheme for "compensatory finance" under which the developed countries could jointly provide additional foreign exchange resources to developing countries to compensate the latter for any deterioration in terms of trade due to fall in the prices of primary products. The French seem to have somewhat different ideas. The Baumgartner-Pisani plan thus favours a system of price support to imports of primary products by richer countries on the same lines as the latter adopt for stabilising internal agricultural prices. International commodity agreements between interested countries could fix import prices at levels near to internal (USA and EEC) prices. This will raise import prices and reduce the gap between national and international prices. The margin or "prelevement" thus derived will be gathered at the point of import and returned to the exporting country's government which could then utilize the funds for development. Several exporting countries could jointly administer the "prelevement" fund on a regional basis also.

Two advantages are claimed for the French scheme. Since the "prelevement" will be returned to the government of the exporting country and not the individual exporters, the temptation to over-production will be eliminated, the assumption, of course, being that the government of the exporting country for its part will accept the obligation not to boost production deliberately in excess of effective world demand. Secondly, the scheme would provide the developing countries with substantial revenue in foreign exchange which could be ploughed into the development programmes of those countries. Reactions of industrially advanced countries to these and similar suggestions will certainly stimulate debate in Geneva. Meanwhile, Mr. Heath, on behalf of the United Kingdom, has been politely, but reservedly, receptive to the Prebisch proposal for "compensatory finance". He has suggested that it should be possible to ensure that the general foreign aid programmes of developed countries provide for the special needs of developing countries resulting from deterioration in terms of trade.

UNTAD's interest in new schemes and new institutions is thus evident. Equally evident is the interest shown by some of the participants in destroying at least one of the existing institutions, to wit, GATT. The Soviet Union and other Communist countries have made no secret of their desire to see GATT ended. Rather predictably, the reaction of the Western countries has been to stand by GATT, although Mr. Heath has guardedly conceded the desirability of GATT evolving into a more effective instrument for dealing with trade problems of the developing countries. Mr. Manubhai Shah, on behalf of the Indian delegation, has also had his say. While allowing that the UNTAD should "strengthen and extract the maximum work from existing organisations, such as GATT", he has demanded radical changes in the constitution of GATT and specifically suggested that it should widen its membership by including the East European countries. This, however, raises the question whether wholly state trading Communist economies, for their part, have any use for the discipline and processes of GATT. It is perhaps easier to support Mr. Shah's other argument that the World Trade Conference should convert itself into a continuing permanent body under the UN with its own independent and full-time secretariat, but a decision could usefully be taken on this matter only after some progress has been made during the current Geneva talks in the direction of agreement on such specific steps as could be taken early to enlarge the trading opportunities available to developing economies. The immediate task, in other words, is not to set up (or quarrel over proposals for) new international organisations but to agree on early national action of a concrete character at least in a few limited areas along the lines of the Soviet declaration that it would not tax exports from the developing countries from the beginning of next year.

Highlights of the Week

STRICTLY ON BUSINESS

FORTY AMERICAN business men headed by Mr. Franklin D. Roosevelt Jr., U.S. Under-Secretary of Commerce, arrived in New Delhi on Sunday, April 12, to confer with government and business leaders. Mr. Jack Behrman, U.S. Assistant Secretary of Commerce for International Business, accompanies the group, which has for its Chairman, Mr. J. R. Galloway, Vice-President of the Union Carbide Corporation. The visit is sponsored by the Business Council for International Understanding, a non-profit organisation representing 36 major U.S. companies with international interests. The visiting group itself comprises senior executives of 27 U.S. corporations many of which are already participating in Indian industry. The purpose of the visitors is to determine how foreign private investment can help India's economic growth and the theme of the visit is "Investing in India". In the week following their arrival, the American business men have been having a very busy schedule of meetings sponsored by the Indian Investment Centre. They have met the Minister of Finance and key officials of the Finance Ministry as well as Secretaries of other economic Ministries and Departments and have had discussions with, Mr. C. Subramaniam, the Minister for Steel, Mines and Heavy Engineering and Mr. Asoka Mehta, Deputy Chairman of the Planning Commission. The group has also conferred with the Federation of Indian Chambers of Commerce and Industry and also with another group of Indian industrialists at a get-together which was presided over by the President of the Associated Chambers of Commerce.

The broad aim of these discussions has been for the American business leaders to get acquainted with the general investment climate in this country as well as with the more or less specific intentions of Government and Indian business regarding the starting of new industrial ventures in which American private capital and know-how might find scope for participation. The visitors have apparently been seeking official clarification on those aspects of industrial policy, fiscal measures or administrative procedures which might bear upon American investments in or collaborations with Indian industry. Since these discussions have not been open to the Press, it is not proper to speculate in detail on their details, but it can be stated that the general effect of these conferences has been, in the first place, to acquaint the visitors with the incentives and facilities which are open to foreign investors in this country and secondly, to persuade them that both Government and business here would willingly co-operate in further measures for promoting greater foreign interest in India's industrialisation.

The visitors for their part have been far from slow in reciprocating the interest shown in their mission. Mr. Roosevelt Jr., for instance, addressing a well-attended press conference on April 13, responded enthusiastically in the affirmative when asked if he thought that there was a favourable climate for American investment in India; Mr. Roosevelt's actual words were: "Very definitely, yes." He said that this favourable climate had been brought about by recognition by the Indian Government of the need for rather large injections of private investment to speed up expansion and development. According to him, the development needs of India far exceeded the possibilities of strictly government-to-government aid and there is a large role for private investment, private management and private technical know-how to perform in the development and growth of India. As to the immediate objective of the American business men's visit, Mr. Roosevelt explained that the delegation hoped to get a clearer understanding of the Government of India's policy concerning foreign private investment. "We will explore jointly", he added, "the steps which would be taken to facilitate the flow of investment capital". The American group will also examine more closely specific proposals of the Government of India for American collaboration. In this connection, it is interesting to note that the group has already discussed with panels of government officials on particular industrial programmes, such as those for fertilizers, petro-chemicals or engineering goods.

Although the visit of the American business leaders has been arranged on the initiative of U.S. business, the significance which the U.S. Government attaches to it is evident from the active and positive association of the U.S. Embassy here with the organisation and progress of the visit. Apart from Ambassador Chester Bowles himself, who has taken a prominent part in promoting this visit, senior officials of the U.S. Embassy, such as Minister-Director C. Tyler Wood of the U.S. Agency for International Development, Mr. Leonard Weiss, Counsellor for Economic Affairs, and Mr. James S. Lanigan, Counsellor for Commercial Affairs, have been working hard both in preparing the ground for the visit and by giving briefings to the visitors after they had arrived. The interest shown particularly by Ambassador Bowles and Mr. Lanigan was gracefully acknowledged by Mr. Roosevelt Jr. in the remarks prefacing a speech which he delivered following a dinner on April 13, in honour of the visitors, given by Mr. Chester Bowles at the Roosevelt House, official residence of the U.S. Ambassador.

The composition of the visiting American group and the industrial interests of its constituents are as follows:

Company	Representative(s)	Industry
Abbey Etna Machine Co. Perrysburg, Ohio.	Nelson D. Abbey, Jr. President.	Steel Tubes.
Allied Chemical Corp., 40, Rector Street, New York, N.Y.	William Winfield, President, Int'l Div. David A. Climan, Director, Foreign Finance.	Fertilizer.
American Cement Corp., Packard Building, Philadelphia, Pa.	Robert Wolfe, Vice-Chairman.	Cement.
Arwood Corporation, 321 W. 44th Street, New York. N.Y.	Rawson Wood, Chairman.	Investment castings.
Bechtel Corporation, 220, Bush Street, San Francisco, Calif.	R. M. Dorman, Vice-President, Asia.	Heavy Engineering and equipment.
Beloit Corporation, Beloit, Wisconsin.	Harry C. Moore, President. H. E. Tower, Treasurer.	Pulp & paper making equipment.

Company	Representative(s)	Industry
Brown & Sharpe Mfg. Co., Providence, R.I.	Charles M. Evans, Director Foreign Marketing. (Local Representative to be named)	Machine Tools.
Deere & Co., 1325, Third Avenue, Moline, Ohio.	Frank McGuire, Vice-President	Agricultural equipment.
Dow Chemical Co., Midland, Mich.	Elmer Stilbert, Vice-President, Int'l. Robert Forsythe, Far Eastern Manager.	Petrochemicals.
Farrel Corporation, 25, Main Street, Ansonia, Conn.	Franklin R. Hoadley Jr., Manager, Int'l. Operations. R. M. Mueller, Chairman, Australian Subsidiary.	Heavy machine tools.
Ferro Corporation, 4150, East 56th Street, Cleveland, Ohio.	H. T. Marks, President.	Industrial finishes.
Firestone Tire & Rubber Co., Akron, Ohio,	Elton H. Schulenberg, Executive Vice-President, Finance.	Rubber products.
Goodrich-Gulf Chemicals, 1717, East 9th Street, Cleveland, Ohio.	D. L. Mathews, President.	Petrochemicals.
International General Electric Corp. 159, Madison Avenue, New York, N.Y.	George Doughman, Vice-President & Manager-Producer Goods	Electrical equipment.
International Minerals & Chemical Corp., Old Orchard Road, Skokie, Illinois.	Charles S. Dennison, Vice-President, Overseas Development.	Fertilizer.
International Telephone and Telegraph Corp., 320, Park Avenue, New York, N.Y.	John G. Copelin, Vice-President, for Banking Relations, (Mrs. Copelin).	Communications.
Kaiser Industries Corp. Oakland, Calif.	Leonard Schwartz, Assistant to President.	Engineering.
Koppers Co. Inc., 430, 7th Avenue, Pittsburgh, Pa.	George W. Naylor, Vice-President, Int'l. (Mrs. Naylor). Paul M. Mueller, Manager, Asian Operations.	Engineering & Steel Mill equipment.
Mack Trucks Worldwide Ltd., 350, Fifth Avenue, New York, N.Y.	Carl Giese, President. A. F. Kellerman	Transport equipment.
Mobil Chemical Co., 150, East, 42nd Street, New York, N.Y.	C. Coleman Fisher, General Manager, Int'l. Agricultural Chemical Dept. H. A. Hilgendorf, Area Development Specialist.	Fertilizer.
National Forge Co., Irvine, Pa.	Alfredo Rau, General Manager, Int'l. Operations.	Forgings.
Standard Oil of California, San Francisco, Calif.	T. G. Hughes. President of California Chemical Co.	Fertilizer.
Standard Oil Co. (New Jersey), 15W. 51st Street, New York, N.Y.	Willem Holst, Director and Vice-President, Esso Standard Eastern. James E. Lewis. Clayton B. Thomas	Oil Processing.

FIVE WISE MEN

THE GOVERNMENT of India have announced the appointment of a Commission of Enquiry into monopolies and concentration of economic power in India. Constituted under the Commissions of Enquiry Act, 1952, it is headed by Mr. K. C. Das Gupta, Judge of the Supreme Court of India. The Commission is expected to submit its report to Government by October 31, 1965.

The members of the Commission are: Mr. G. R. Rajagopaul, at present Officer on Special Duty, Ministry of Law; Mr. K. R. P. Aiyangar, at present Chairman of the Tariff Commission; Mr. R. C. Dutt, Chairman of the Company Law Board, and Dr. I. G. Patel, formerly Chief Economic Adviser to the Government of India. Mr. Dutt and Dr. Patel will be part-time members. Mr. V. Satyamurti, at present Deputy Secretary, Company Law Division, Ministry of Finance, is Secretary of the Commission.

The Terms of Reference to the Commission are:

(a) to enquire into the extent and effect of concentration of economic power in private hands and the prevalence of monopolistic and restrictive practices in important sectors of economic activity other than agriculture with special reference to —

  (i) the factors responsible for such concentration and monopolistic and restrictive practices;

  (ii) their social and economic consequences, and the extent to which they might work to the common detriment; and

(b) to suggest such legislative and other measures that might be considered necessary in the light of such enquiry, including, in practicular, any new legislation to protect essential public interests and the procedure and agency for the enforcement of such legislation.

The Commission may also report on any other matter bearing on any aspect of national economy or functioning of the private sector and financial institutions that it may deem necessary to look into in connection with the foregoing terms of reference.

A Gazette of India Extraordinary says that the Commission has been appointed in order to secure that the development of the economy in the crucial years ahead is in keeping with the Directive Principles of State Policy contained in Article 39 of the Constitution of India. Under the Article, the State is required to direct its policy towards securing that the ownership and control of the material resources of the community are so distributed as best to subserve the common good and that the operation of the economic system does not result in the concentration of wealth and means of production to the common detriment.

A copy of the Gazette of India Extraordinary Notification was laid on the Table of Lok Sabha by the Finance Minister on April 16.

SHEIKH AT LARGE

THIS HAS been a week of endless talking all round and if there is any method in all this madness, only God — and Sheikh Abdullah — may know about it. The latter's conduct, indeed, has been a plague on his friends and a problem for all others. On April 8, the conspiracy case against Sheikh Abdullah and 13 others was withdrawn by the State Government and the 14 were declared free men. The town of Jammu gave the discharged accused a most generous welcome and on the following day, Sheikh Abdullah responded by starting on the first instalment of his various statements which are making many wonder whether the Government of India has acted wisely in releasing him or whether he is using wisely the freedom which has come to him. At a Press conference at Jammu on April 9, Sheikh Abdullah started no doubt well with a promise to himself as much as to anybody else that he would make no categorical statement about the future of Kashmir until he had had time to consult his friends and people, "especially my dearest comrade and colleague, Mr. Nehru". Perhaps he might have kept that promise had he come to the Capital promptly in response to the Prime Minister's invitation. But for reasons best known to him or perhaps to his advisers, Sheikh Abdullah decided that he would not meet Mr. Nehru until after Id. In any case, later on that very day, he addressed a public meeting at which he certainly did think aloud about the future of Kashmir, graciously allowing that, if it was considered that a plebiscite might cause difficulties, other avenues, including what he described as "genuinely free and fair elections", could be explored for determining the wishes of the Kashmiri people.

Advice and Dissent

There came two more speeches on April 10, and by that time it had become apparent that Sheikh Abdullah was fast making up his mind that only what was good for Sheikh Abdullah would be good for Kashmir. Declaring that he would not be deterred by kicks nor won over by kisses, Sheikh Abdullah lost no time in setting himself up as the grand arbitrator who, no doubt, would condescend to hear what India or Pakistan or even perhaps the people of Kashmir might have to say but whose final verdict would, nevertheless, be determined by what he himself thought to be to the good of India and Pakistan and the people of Kashmir. It was, indeed, amusing — this hurry with which Sheikh Abdullah, paying lip service to the right of the Kashmiri people for self-determination, set out to assert that there was no Kashmiri who mattered, barring himself. Bakshi Ghulam Mohammed was denounced in anger and the present Premier, Mr. G. M. Sadiq, was dismissed with contempt. And then he proceeded to inform the flustered people of Jammu and Kashmir that he would welcome an opportunity to discuss the Kashmir question with President Ayub Khan of Pakistan, the reference here being to the Pakistan Foreign Minister's public statement a few days earlier that he or President Ayub would be happy to confer with Sheikh Abdullah.

It was evident that New Delhi could not continue to ignore all this indefinitely, especially as Sheikh Abdullah had embarked on a triumphal tour of the State for the purpose of reviving his political position and building up public support for his plans. Thus it was that when Mr. Lal Bahadur came to intervene in the debate on the demands for the External Affairs Ministry in the Lok Sabha on April 11, it was almost inevitable that he should enter a firm caveat against Sheikh Abdullah arrogating to himself "freedom of preaching of some kind of independence or getting out of the Union". Recalling an earlier observation of the Prime Minister that the Government was taking a "calculated risk" in deciding to release Sheikh Abdullah, Mr. Lal Bahadur reassuringly stated that "the Government is strong enough to deal with any situation" and also reiterated that the Government stood wholly firm on the point that the accession of Kashmir to India was irrevocable. Significantly, Mr. Lal Bahadur addressed a piece of long-distance advice to Sheikh Abdullah that the latter had better exercise care while speaking on "important matters"; Sheikh Abdullah would have full liberty to indulge in normal

political activity, but he had not been given, nor would be given, a licence to propagate independence for Kashmir.

The Prime Minister in his references to this matter in the Lok Sabha on Monday, April 13, was more circumspect in the sense that, while describing Sheikh Abdullah's reported statements as "unfortunate", refused to be drawn into a discussion of them at the present time since he hoped to meet Sheikh Abdullah soon for discussions. There was, however, little hesitation or reservation on Mr. Nehru's part when it came to the question of dealing with doubts or speculation about any possible change in India's stand on Kashmir. The Prime Minister declared categorically that the Indian stand on Kashmir, as stated by Mr. M. C. Chagla recently before the Security Council, continued to hold good.

Meanwhile, Sheikh Abdullah had not lost time in retorting to Mr. Lal Bahadur's suggestion that the least said was soonest mended. Taking this advice to be an attempt to silence him by threats, Sheikh Abdullah, addressing a public meeting at Bhadarwah, on his way from Jammu to the Kashmir Valley, dared those who would not have him declare his convictions or principles to rearrest him, but he nevertheless thought it prudent to maintain that he had never pleaded for the independence of Kashmir and that Mr. Lal Bahadur was not right in attributing such views to him. His own explanation was that his speeches had not been correctly reported But he did no fail to emphasize at the same time that he could not be shaken in his view that the Kashmir dispute should be settled to the satisfaction of India, Pakistan and Kashmir in accordance with Kashmir's wishes. Sheikh Abdullah, in other words, continued to maintain that he had not accepted, and was not going to accept, Kashmir's accession to India as a closed question. Significantly, his comrade in the conspiracy case, Mirza Afzal Beg, was busy annotating all the time. India, he said, had gone back on what he described as its solemn pledge of a plebiscite. It is on this note, viz., that the Government of India has betrayed the people of Kashmir, that Sheikh Abdullah and his advisers seem to be planning to conduct their re-entry into the politics of the Valley.

MORE TALK SOON

IT SHOULD be tempting to conclude that the Nanda-Habibullah talks which ended on April 11, had failed, but it would be wrong to do so. Let Pakistan's Home Minister speak. At Rawalpindi on April 14, Mr. Habibullah Khan said that a large measure of agreement had been reached on the issue of restoring communal harmony and establishing security and confidence in the minds of minorities. This, in his opinion, was a substantial achievement for both sides. Listing the steps that the two Governments had agreed to in this regard, Pakistan's Home Minister mentioned that both Governments had undertaken to restore communal harmony and establish a climate which would instil security and confidence in the minds of minorities. The two Governments have also made a firm commitment to take stern measures to prevent recurrence of communal riots. While these are certainly substantial achievements, the fact cannot be ignored that the recent talks have failed to settle two of the most controversial issues, one of which related to the eviction from Assam of persons claimed by India to be infiltators from Pakistan, but described by the Government of Pakistan as Muslims of Indian nationality. The second un-resolved dispute was the extent to which facilities were to be granted for the migration of minorities.

On the eviction question Pakistan demanded that a tripartite tribunal, of an "international" character, should be set up to examine the evidence in individual cases of evictions ordered by the Indian Government. The Indian Home Minister, Mr. Nanda, expressed his inability to accept this demand on the ground that no international tribunal could be allowed to sit in judgment on Indian Law and judicial processes in the determination of Indian citizenship. He, however, suggested that opportunities might be given to Pakistan to satisfy itself that the procedures followed in this country were legitimate and fair. As regards facilities for migration, India has pleaded that those who wanted to cross over into India from East Pakistan as a result of the communal tension, should be given facilities to do so, including permission to carry with them their liquid assets. The Government of India on its part, would, it was said, be willing to extend similar facilities to those wanting to move in the opposite direction. The Pakistani reaction has been that such an arrangement would amount to a programme for exchange of populations and could, therefore, not be contemplated. These and other matters relating to communal harmony in the subcontinent and the security of minority communities are to be discussed further at another ministerial level meeting between the two countries. It has been agreed that this round of talks will be held in Pakistan and it is expected that it will take place early in May.

Nehru Looks Ahead

The Nanda-Habibullah talks seem to have made a profound impression on the Prime Minister's mind. In his reply to the debate in the Lok Sabha on the E A. Ministry's demands for grants, the Prime Minister took time off from a contemplation of the present distempers, to look ahead into the future of both India and Pakistan. He spoke movingly of the inevitability in the long run of India and Pakistan learning to live together as good neighbours. In a touching passage he said that he would have liked to say that India and Pakistan should come together even "constitutionally", but then he did not wish to cause any annoyance to the authorities in Pakistan. But keen as Mr. Nehru's awareness of the urgency and importance of Indo-Pakistan amity was, he was in no mood to make light of the depth of the dissonance which is keeping the two countries apart. Hope struggling with frustration, he said at one point that perhaps a new generation would be needed, particularly in Pakistan, before the conflict between the two countries was resolved, well and truly. According to him, an explanation of this conflict must be sought in the hatred and fear complex that were bedevilling Indo-Pakistani relations. Kashmir, he allowed, was an element in the dispute. But the Kashmir issue, he maintained, would have been solved long ago, but for Western help to Pakistan in keeping the dispute alive.

Foreign Policy Assailed

By Our Parliamentary Correspondent

NEW DELHI:

WITH THE Opposition assailing the foreign policy of the Union Government, the debate on the budget demands for the Ministry of External Affairs obviously stood out as the highlight of the last week's proceedings in the Lok Sabha. In all, demands for grants for four Union Ministries — External Affairs; Steel, Mines and Heavy Engineering; Community Development and Co-operation; and Works, Housing and Rehabilitation — were voted by the House during the week.

Acharya Kripalani's, who showed his open dislike for the non-alignment policy pursued by India even after the 1962 unhappy experience on the northern border, was apparently the most hostile attack. He was supported by almost all the Opposition members who participated in the debate, in his allegation that pursuance of this policy had left India without friends even among the neighbouring countries. The assiduous attempts made by the Union Minister without Portfolio, Mr. Lal Bahadur Shastri, who intervened in the debate before the Prime Minister replied, could hardly satisfy the Opposition in this regard. Dr. Ram Manohar Lohia pointed out that the basic issue in the world was the difference between the developed and the developing nations which fell into the pattern of whites and non-whites. He took the Government to task for not being able to meet the challenge of China which was identifying itself with the coloured population of the world. There was a general demand for improvement in external publicity so that the propaganda tirade of Pakistan and China could be effectively encountered. The wisdom of releasing Sheikh Abdullah was again questioned by many, even more vociferously because of Sheikh's utterances after his coming out of jail.

The Communist spokesmen urged upon the Government to have an early settlement with China on the border issue. But Mr. R. K. Khadilkar's suggestion that negotiations should be started even without China accepting the Colombo proposals fully, raised many eye-brows. He failed to get support, as could be expected, even from his own partymen — Congress members. This was evident from the categorical assertions the Prime Minister and the former Minister for Defence, Mr. Krishna Menon, made to the effect that India could go to the conference table with China only if the latter fully subscribed to Colombo Proposals.

Firm Stand

Mr. Lal Bahadur Shastri's expression of pain and amazement at Sheikh Abdullah's utterances failed to convince the House. But his forthright declaration that nobody would be permitted to make propaganda for the independence or secession of Kashmir was hailed. Both Mr. Lal Bahadur Shastri and the Prime Minister firmly reiterated the Government's stand on Kashmir, as made clear to the Security Council, and asserted that the accession of Kashmir to India was irrevocable. The Prime Minister emphasised that India wanted cordial relations with Pakistan and regretted the attitude of Western Powers towards the Kashmir issue, especially after Pakistan's hobnobbing with China.

The debate on the demands for grants for the Ministry of Steel, Mines and Heavy Engineering was notable for the anxiety expressed by members over the growing indiscipline among workers of the public sector undertakings. It was suggested that in the interest of promoting better labour-management relations, adequate production incentives should be provided expeditiously. The two other important points made were: (1) there should be a 15-year perspective plan to develop heavy and basic industries; and (2) greater coordination should be effected between industry, education and research. Many members also stressed the need of bringing down costs of production in the public sector enterprises. One of the principal factors responsible for high costs, it was alleged, was employment of excess labour. Replying to the debate, the Minister, Mr. C. Subramaniam, stressed the need for political parties disassociating themselves from trade unions. Industrial production, he opined, could not progress as long as trade union activity remained political activity in the guise of trade unionism.

Mr. Subramaniam and his colleague Mr. P. C. Sethi, presented a reassuring picture of steel production and hoped that output from the existing facilities would go up by 10 to 15 per cent as a sequel to launching of a crash programme for better utilization of raw materials. Production in the heavy industries, they said, was picking up. About Bokaro, Mr. Subramaniam said, all the preliminary steps, such as acquisition of land, construction of a township and preparation of the project report by the consultants, had been initiated. A number of friendly countries had expressed active interest in financing various parts of this project (speaking at the inauguration ceremony of the fourth coke-oven battery at Bhilai on April 13, Mr. Subramaniam revealed that the Soviet Union had also shown interest in the Bokaro Plant). Global tenders would be issued soon after June

Amalgamation of Mines

About accumulation of coal stocks at the pit-heads, Mr. Subramaniam said that it was only a temporary phase and did not warrant curtailment of coal production programmes. In regard to amalgamation of coal mines, he stated that this process had not proved any great success so far because amalgamation was being done on voluntary basis only. He hinted that it might become necessary to bring legislation to make amalgamation of uneconomic collieries compulsory.

Mr. Subramaniam also disclosed that the Government was thinking of appointing an experts committee to go into the question of how improvement could be effected in the working of the Geological Survey of India and the Indian Bureau of Mines.

The debate on the demands for grants for the Ministry of Community Development and Co-operation was only a dull affair. Although there was almost a unanimous support for expansion of the activities of this Ministry, concern was expressed over excessive official control on both the community development and co-operative movements. The working of panchayats too came in for severe criticism on the ground that these institutions were competing with those at higher levels. Allegations were as well made of factionalism in panchayats and laxity in auditing of their accounts. In his reply to the debate, the Minister, Mr. S. K. Dey, disclosed that with a view to making the Panchayati Raj a national movement and for ensuring for it the support of all the sections of the community, he intended to form a Consultative Committee for his Ministry to suggest the lines along which this movement should be developed. The Consultative Committee would have as its members representatives of all the political, social and economic groups. He further stated that the question of elections to panchayats was already being studied by a Committee and the Auditor-General had agreed to depute a special officer to improve the accounting proce-

dures of panchayats and co-operatives. Special measures, he said, would be taken to strengthen the co-operative movement so as to make it an effective instrument for improving the economic condition of the weaker sections of the society. He hoped that a start would soon be made with development of piggery and poultry co-operatives. He revealed that the Home Ministry had decided to place a sum of Rs. 8 crores at the disposal of the Co-operative Department to assist Scheduled Castes and Tribes.

Held under the lengthening shadows of refugee influx from East Pakistan and on the eve of India and Pakistan Home Ministers' Conference, the discussion on the demands for grants for the Ministry of Works, Housing and Rehabilitation, inevitably centred round the plight of the migrants from East Bengal and the atrocities committed there on Christians, Buddhists and Hindus. Despite the fact that only a day earlier the House had expressed its deep feelings and anguish over the fate of minorities in East Pakistan, the members who participated in this discussion spoke with unabated passion. The Government was cautioned that it should be prepared for even a more massive influx of refugees and to tackle the issue effectively it should set up a separate Ministry for rehabilitation.

Remission of Loans

Passing references, of course, were made to the problem of rural and urban housing and one Opposition member bitterly criticized the rampant corruption in the Central Public Works Department. The Minister, Mr. Mehr Chand Khanna, in his reply, revealed that the Government had decided to remit loans totalling Rs. 50 crores given to displaced persons in the eastern region and another grant of Rs. 15 crores had been made for solving the other residuary rehabilitation problems in West Bengal. He announced that no refugee in the eastern region would be required to repay loans upto Rs. 1,000. Those who had been given loans in excess of this amount would be required to repay not more than Rs. 2,000. No interest would be collected on the loans so remitted. He also announced that any person who had come to India from East Pakistan after January 1, 1964, would be entitled to benefits of relief and rehabilitation measures. Restrictions on intending migrants, the Minister further stated, were also being liberalised and measures were being taken to strengthen the rehabilitation departments both at the Centre and in the States. That the Union Government is deeply exercised over the influx of refugees from East Bengal is evident from the fact that a new full-fledged Ministry of Rehabilitation has been created this week under the charge of Mr. Mahavir Tyagi.

Correction: While commenting on the debate on the budget demands for the Ministry of Food and Agriculture in this Journal on April 3, 1964, it was stated that the Minister for Food, Mr. A. M. Thomas, expected this year's wheat output around 11 million tonnes. The full text of the Minister's speech, however, reveals that Mr. Thomas mentioned this figure either in general terms or in connection with last year's production. The estimate of this year's wheat crop is expected only in May or June. The error is regretted.

Question Hour

TISCO Loan: The Union Minister for Steel, Mines and Heavy Engineering, Mr. C. Subramaniam, told the Lok Sabha on April 10 that as a sequel to partial decontrol of steel, a favourable situation had arisen for the realisation of the Rs 10 crore loan given by the Government to the Tata Iron and Steel Company. Interest to the tune of Rs. 2/3 crores had also accrued on this loan. The Government was negotiating with TISCO the terms of repayment of the loan. Mr. Subramaniam added that there was no proposal at present under the consideration of the Government for converting the loan into equity capital.

Generating Sets: Mr. Subramaniam also informed the House on April 10 that the requirements of generating sets for power projects were mostly planned to be met by the public sector projects at Bhopal, Hardwar, Hyderabad and Tiruchi.

HEL Shut-down: Mr. Subramaniam told the Lok Sabha on April 8 that the shut-down of the State-owned Heavy Electricals Ltd., Bhopal, ordered a few days back, was being lifted gradually. He reiterated that the trouble at the factory arose because of recognition sought by one of the unions. Officially this union had not affiliated itself to any of the all-India organisations, but there appeared to be great attachment between it and the Communist Party.

Newsprint Manufacture: The Minister for Industry, Mr. Nityanand Kanungo, stated in the Lok Sabha on April 10 that with a view to augmenting the supplies of newsprint from indigenous sources, two private parties had been licensed to manufacture 90,000 tonnes of newsprint per annum and the existing newsprint mill at Nepanagar had been permitted to expand its capacity from 35,000 tonnes to 75,000 tonnes. A letter of intent had also been issued to another private party to establish a paper-cum-newsprint plant.

Khetri Copper Project: The Union Minister for Finance, Mr. T. T. Krishnamachari, disclosed in the Lok Sabha on April 9 that the Khetri Copper Mining Project, in Rajasthan, could not be implemented so far because of some technical difficulties. The Government, however, was looking into the matter. Once the technical difficulties were removed, the necessary finance for the project, including foreign exchange, would be found.

Sindri Fertilizers: The Minister of State for Petroleum and Chemicals, Mr O. V. Alagesan, stated in the Lok Sabha on April 8 that the new ammonia plant at the Sindri Fertilizer Factory was working quite satisfactorily but on a reduced load. Both in the gas reforming and the new ammonia plants spare equipment had not been provided and this resulted in 50 per cent reduction in production whenever any equipment was taken out for maintenance. Production of ammonia from the new plant, therefore, was limited to about 38,000 tonnes a year. Steps were being taken for installing two more producers in the lean gas plant to make up the shortfall in gas requirements of coke oven. With the installation of necessary spare equipment, it was hoped, the new ammonia plant would be able to work to its full capacity.

Sugarcane Cultivation: The Minister for Food, Mr A. M. Thomas, told the Lok Sabha on April 7 that a scheme for intensive sugarcane cultivation around sugar factory areas had been taken up for implementation in U.P., Bihar and Punjab. The scheme was expected to cost Rs. 1.44 lakhs per sugar factory every year. The cost would be shared equally by the Central and the State Governments and cane growers and sugar factories.

Rail Electrification: The Deputy Minister for Railways, Mr S. V. Ramaswamy, told the Lok Sabha on April 7 that the Union Government had turned down the Andhra Pradesh Government's proposal for electrifying the Hyderabad-Kurnool railway section. Adequate line capacity, he said, could be provided for the present on this section by taking cheaper measures other than electrification.

Brahamputra-Ganges Link: The Minister for Irrigation and Power, Dr. K. L. Rao, told the Lok Sabha on April 9 that a project to link the Brahamputra with the Ganges was under investigation. He, however, could not say when this scheme would be undertaken for execution. Dr Rao added that it was the intention of the Government to link, if possible, all the waterways in the country.

A Partnership of Common Ideals

FRANKLIN D. ROOSEVELT, Jr.

This is the text of remarks prepared for delivery by Mr. Franklin D. Roosevelt, Jr., U.S. Under-Secretary of Commerce, at Roosevelt House. The occasion was a dinner given by Ambassador Chester Bowles, on Monday, April 13, in honour of 40 visiting American business men. The dinner marked the culmination of the first day of discussions on foreign investment opportunities in India, a week-long programme sponsored by the Indian Investment Centre.

IT IS a great pleasure for me to be here in India — it gives me a chance to pay homage to a great nation and to do so for the simple reason that my country would not have been discovered had it not been for Christopher Columbus' consuming desire to get to India. Therefore, it can be said that India, being a land of great opportunity, directly led to the discovery of another land of opportunity.

But let us consider just what opportunity is for a moment. There is a considerable and sometimes painful difference between being a land which has a high potential for opportunity and being a land which provides opportunity for the individual. I say painful, because both India and the United States went through the transition from the one to the other. The similarities between India and the United States extend also to their colonial status under British rule and their drive for independence. Whether the great ideals behind such a struggle are symbolized by a general leading his men across the frozen Delaware River or by a great and wise man sitting at his spinning wheel, the desire for freedom and for individual opportunity is the same.

My father long had the deep conviction that India had the right, the will, and the power to participate in the future by her own use of her own great resources. The general acceptance of this belief by others, as is usual with such visions, was a long time in coming.

I am here today as part of that continuing belief. My father's faith in the future of India and my mother's great devotion to its people were, I believe, representative of the close relations that are possible because of similar interests, similar history, a similar view of the rights of man, and a similar vision of the future of a free people.

With roots in colonialism, both countries made a democratic advance towards independence. Both our countries have gone through a transition from being groups of economically separate states to being a federated political entity encompassing a single and common market. In the early stages of our independence we both espoused foreign policies based on "no entangling alliances." Both our countries have, by their progress and by their potential, had hemispheric leadership thrust upon them. Both seek to mobilize their resources, human, physical, and ideological, to meet the challenges of such leadership.

Individual Opportunity

It is the cultivation of these resources that makes the history of a land of individual opportunity. As President Woodrow Wilson once said, "America is a name which sounds in the ears of men everywhere as a synonym of individual opportunity." But that very synonym was not achieved without difficulty. Time and time again, our devotion to those truths which our founders held to be self-evident, was tried and tested. And there were and are times when those trials and tests are not always passed speedily or with flying colours.

We are now in the 188th year of our independence. Those 188 years have seen us advance from a loose confederation of largely rural states, to a mighty industrial nation. Our drive to become the most productive and prosperous nation on earth has been distinguished at times with dignity and glory .... and at times without. There have been times when our combat against social and economic injustice has been tardy. But in the end, that combat has been taking place and has been succeeding.

As Gandhi said so many times, true civilization is not the advancement of our surroundings, but the advancement of men within those surroundings. When social advances did not keep pace with industrial advances, the cries of anguish were heard .... louder and louder until they were answered by reform. The achievement of the kind of civilization Gandhi saw depended on the swiftness of reform and the extent of dedication to the rights of man .... and the need for reform is recurrent. For progress is hollow if it is not general; benefits can be meaningless if they are not shared by all; advancement along only one front can breed retreat. In the prosperity my country is currently enjoying, consider where the attention of the government is focused.

Our entire legislative branch is right now in the process of passing a law to provide all citizens specific rights which are generally guaranteed under the Constitution. And while social injustice is being dealt with, economic injustice is occupying the rest of the government in a war on poverty .... a concentrated effort to enable those at the lower level of our economy to fully join in the prosperity enjoyed by the rest of the country. This programme is an attack on the causes of unemployment, poverty, disease, ignorance, and squalor .... on the causes of wasted resources, both human and physical. It is part of the government's continuing drive to assure that all members of our economy have the chance to be more productive, and to share the fruits of their productivity.

Thus is a land of opportunity most concerned that all its individual inhabitants may both build and benefit by that opportunity.

Productive Freedom

But what I have just outlined is not merely the history of freedom and social justice .... it is the history of our free enterprise economy reaching prosperity within a framework of freedom and social justice. We have shown that we can produce freedom .... we have also shown that our freedom is productive.

Consider the late nineteenth century in the United States — when our enterprise threatened to become something less than free. The power of the large trusts raised many questions about freedom in our country. The cry for reform produced first the Sherman Anti-Trust Act, then it produced large-scale enforcement of the Act, finally it produced the extension of its provisions under the Clayton Act, and the New Freedom of Woodrow Wilson became something more than a slogan.

But answers to the question of freedom of enterprise only raised more questions about freedom at all levels of enterprise — for a time these questions were drowned out by the celebration of the booming twenties. Then the depression hit and the future of our entire economy became a question.

Business, labour and government, as well as the ill-housed, the ill-clothed and the ill-fed all sought the answer .... and the largest majority our country ever assembled provided and supported the reforms upon which our modern economy is based — social security, unemployment compensation, the abolition of child labour, protection for working women, minimum wage laws, the guarantee of collective bargaining, the guarantee of a decent living to the farmers who fed the nation .... this was the list of social legislation of the New Deal. Social legislation that re-established healthy business activity and extended the opportunity for advancement to still wider sectors of the economy.

And the economic legislation that accompanied the social reforms brought the TVA and the harnessing of our natural

resources, the SEC and the other regulatory agencies that protect both business and consumer, bank reforms that re-established credit and financial confidence, and new tax policies that eventually enabled the United States to mount a global war effort that helped save freedom from fascism.

But it was the protection of enterprise, the guarantees of decent living standards, the utilization of resources, and the commitment to social and economic justice that worked the miracle. The debate of the programmes themselves dissolved into a debate on how best they could be administered .... and our political progress is such that now the elements of the New Deal are the state foundations of the platforms of both political parties.

Monuments to Success

The success of America as the arsenal of democracy was topped by its success as the rebuilder of a war-torn world. The productivity of Western Europe and Japan stands as monuments to the success of American free enterprise.

Then President Truman's historic Point Four speech set forth the concept that our economic achievements and benefits brought with them responsibilities to those less advanced in other parts of the world. This concept of responsibility led us to help build a road in Africa where only a footpath had existed before; a dam in Asia where only floods had been; a hospital in South America where disease had gone unchecked; and wants and needs were met with goods and know-how.

The important point is that all these benefits, while administered by free government, were made possible by free enterprise. Such freedom has enabled the burgeoning storehouses of a free enterprise to supply this winter what the collectives of communism could not produce.

American productivity has generated and assured our high standard of living. But we do not offer our history as the perfect model for economic success. Our experience includes both success and mistakes, and it is our hope that you may profit from both, as we have ourselves.

We have come to India today not just to contribute private resources to your development .... but also to find how private resources can help speed India's progress toward her own economic goals, and to assure you that economic growth can be achieved without social sacrifice. Social advance can and should go hand and hand with economic advance.

The economic progress of India has been mighty. Its potential for the future is also mighty. That potential has now reached the developmental stage where investment has been attracted. But investment is not philanthropy, nor is philanthropy wanted. The investor looks for opportunity for profit; permanency of his investment; and growing markets for the products of that investment. But markets can only grow where the purchasing power of the consumer increases .... and purchasing power is the logical product of a good standard of living — a standard of living not just in the sense of having material goods, but one whereby dignity, justice and protection of rights is assured to everyone.

We come not to tell you that our system is the best system, that to succeed you must copy our system; for we believe that each nation must conceive and evolve that system which is best adapted to its resources, its peoples, and its philosophy; that system which can best solve its own problems and assure its own future.

The system each of us has is founded on basic principles common to us both. Therefore we come not as critics or crusaders. We come to further a partnership .... a partnership based on common ideals.

We have come at your invitation with the seeds of additional economic growth which are yours to plant and cultivate. We hope only that the ground be prepared, that favourable weather conditions and climate be maintained, that the opportunity for growth be reasonably assured.

EXPERIENCE AND INGENUITY
BUILD BETTER COAL WASHERIES

McNally-Bird offers the following services:

- COMPLETE "TURN KEY" PROJECTS,
- COMPLETE COAL PREPARATION PLANTS,
- AUXILIARY EQUIPMENT FOR MATERIALS HANDLING,
- MATERIAL HANDLING SYSTEMS FOR ALL BASIC INDUSTRIES,
- AUTOMATIC SAMPLING,
- CRUSHERS & BREAKERS,
- CAR HANDLING SYSTEMS,
- COAL CLEANING,
- CONVEYOR IDLERS,
- CENTRIFUGAL DRYERS,
- CENTRIFUGAL PUMPS & VALVES

McNALLY-BIRD
Can harness both for your project

Despite a great variance in the characteristics of various types of coal, McNally-Bird installations can produce high-grade coking coal and middlings. The Dugda Coal Washery is an example of expert engineering and erection, by McNally-Pittsburg. For your project, contact McNally-Bird - specialists in the field.

National Rayon
spins yarn from the bounty of nature

Fashionable fabrics at a low cost—that is the promise of Nature's bounty when spun into Rayon by NRC.

There is bounty of another sort as well: Rayon makes subsidiary chemicals which are vital to many diverse industries; it provides full-time employment to 500,000 workers; affords invaluable training and experience to chemical engineers and technicians, and conserves India's foreign exchange.

This bounty is truly a gift well-timed for this country.

T. 970 A EVEREST

The Second American Revolution

J. S. LANIGAN

(Counsellor, U.S. Embassy in India)

APPROXIMATELY forty American business men are visiting India this week to consider the possibility of undertaking new manufacturing activities here. I think it might be of interest to reflect upon the kind of men who make up this delegation and the general social philosophy which they represent.

These executives are for the most part men in their forties and fifties. They are the product of a profound social and economic revolution which has taken place in the United States during the last thirty years. They differ as much in their social and political outlook from the generation of financial giants who preceded them as the leaders of democratic India today differ from the British colonial officers of the nineteenth century.

The American social and economic revolution has not been accompanied by turbulence and violent upheaval, and consequently it has gone more or less unnoticed amidst the dramatic nationalist revolutions which have given birth to new nations since the World War II. Nevertheless it has had implications for the social and political fabric of the United States —and for the social thinking of the world at large — as great as the implications of America's democratic political revolution of 1776.

The second American revolution began in the early 1930's when the Administration of Franklin Roosevelt instituted a series of economic and social reforms designed to correct the abuses of American big business which were laid bare by the Great Depression. It had become clear that the 19th Century economic system in most of the western industrial nations had neglected the needs of the masses of working people and farmers. This system was controlled to a large extent by a relatively small financial community which had little awareness of the social problems mounting around it. The fact that living standards were not rising for millions of workers and farmers was felt to be of no concern to the laissez-faire individualists who controlled the major industries. There was very little conception among this group of responsibility either to the nation or to the working communities in each plant.

Sweeping Reforms

Recognizing that this system carried within it the seeds of its own destruction, President Roosevelt inaugurated a sweeping series of legislative reforms which have been modified and improved by each succeeding President down to the present day.

Roosevelt's reforms had two principal objectives. The first was the elimination of heavily concentrated economic power based on monopoly, price fixing, interlocking directorates, strike breaking, manipulation of the securities market, and other abuses.

The second objective was broad distribution of the enormous wealth generated by the American productive system in a way that would create an ever rising living standard for the wage earners and farmers. This objective was attained through a variety of techniques including strengthening the graduated income tax, new minimum wage and hour legislation, the establishment of machinery for collective bargaining and the strengthening of labour unions, unemployment compensation and social security systems, public housing, and farm credit.

The new social philosophy embodied in Roosevelt's reforms had a profound impact upon the young men and women who entered the business world during the thirties and since. American business discovered that by raising wages, shortening hours and lowering prices, they were guaranteed a constantly expanding market for high-quality goods. They learned that their own prosperity depended upon an ever increasing standard of living for all segments of American society. In short, they discovered that the interests of business and the interests of society coincided. They also discovered that strong, free trade unions were an indispensable pillar in a society of free men and have learned to work with them in a constructive relationship.

Enlightened Philosophy

As this enlightened philosophy took root throughout the business community, entrepreneurs began to make independent discoveries which increased the momentum of the reforms.

Managers found that healthy workers were more efficient, so the large companies began to establish clinics, hospitals and free health programmes for their employees and families. Free health care now is a virtually universal feature of American industry. It was also learned that industry depended upon a constant inflow of educated young men and women, so most leading American corporations have established scholarship funds for children of employees. These companies also make substantial grants directly to universities to support research, development and the growth of the university system.

The executives of large companies have also discovered in the post-War years that happy community relations within the city or town where new plants are to be located make an important contribution to efficient operation. Before locating a new plant in a community, therefore, the management now meets with city officials to discuss such matters as expanded school facilities, public transportation, public health, labour relations, recreation and park facilities. In many cases, the company will donate land to the community for a new school or park, or construct a new water or sewage system, in order to help the community adjust successfully to the installation of the new plant. The communities, on the other hand, frequently offer incentives such as tax abatement, free land or inexpensive power, to attract new industries.

This kind of social responsibility on the part of corporate management is entirely a product of the Second American Revolution which I have described.

The men and women who are carrying out this revolution as corporate executives are for the most part from middle class families and are without inherited wealth. The overwhelming majority did not own any stock in their company when they joined it. Some of them have purchased stock on the instalment plan during their years of employment and others may have received some options to purchase given amounts of stock as they have risen in the management structure. Most of them will retire on pensions. They will be comfortable but very few of them will be wealthy. In almost every case, these men and their wives take an active part in the civic life of their communities. They serve on the local school boards, hospital boards, the church committees: many are active politically. For this new generation of business people, social responsibility and profit are inseparable.

A second phase of the continuing revolution in American economic and social thinking took place as a result of the experiences many young Americans had in World War II. Before the World War II two vast oceans and a legacy of

political isolationism separated us from the affairs of the outside world. Our own task of internal development consumed the bulk of our energies, attention and capital.

But with the accession of the United States into a position of free world leadership following the War, the sense of social responsibility which had grown in American society quickly broadened to include people throughout the world. The sudden expansion of our horizons from Pittsburgh, Chicago and Cleveland to a world with which we were largely unfamiliar constituted the next big step in the revolution in American thinking.

We discovered that although we were rapidly achieving dignity and a decent life for the working people of our own country, no man can have authentic dignity in his home while other men in the world are starving. Therefore, haltingly and in some confusion, we as a nation set out first to help overcome the ravages of the War in Western Europe, and then to attack the problems of poverty, illiteracy and disease in the newly emerging nations of Asia, Africa and Latin America.

American Commitment

No nation had ever before in history undertaken such a task. President Truman's famous Point Four Programme, enunciated in 1949, was the first commitment of the American people to devote the vast resources of American wealth and technical know-how to helping the emerging nations enter the twentieth century. The size of this task was so staggering that at first many Americans recoiled in panic. Some critics accused Mr. Truman of being a dreamer. It was alleged that the United States would bankrupt itself by undertaking a job of such immense dimensions. Yet, since 1945, the United States has given in the form of one type of aid or another to the newly developing nations some 58 billions of dollars, in addition to the 45 billions of dollars which were given to Europe. In addition the United States has sent out into these nations thousands of scientists, doctors, public administrators, engineers, businessmen, and now thousands of young people through the Peace Corps

Although the task of eliminating human misery in the world is just beginning, a good start has been made and today the American people are totally committed to this unprecedented moral and financial investment in their fellow human beings in every corner of the globe.

It is in the context of the new American sensitivity to the need and potential of the less developed countries that some forty American businessmen are in Delhi this week. They are here to discuss ways to collaborate in the manufacture of goods which either are not produced today at all in India or are manufactured in insufficient quantity. They believe this kind of collaboration cannot only produce more goods but also can pay wages to workers who today do not have jobs.

This kind of endeavour offers additional training to young Indians in the skills of manufacture and management. The prospect of new industry holds the promise of more highways, railroad lines, thermal or hydro-electric power plants, and the development of thousands of new industries to feed such factories with component parts. Some of the goods produced would be exported and would earn needed foreign exchange to improve India's balance of payments.

Unlike foreign investors of the colonial days, they come to help the Indian people build a strong economy and therefore a better life, bringing with them the economic and social ethics of the Second American Revolution. They want also to raise living standards in India because they know that higher living standards mean better markets.

They come as employees of millions of small American shareholders who respect India's independence and its institutions and its culture. These small shareholders in the United States seek a fair return on their investment and they hope that if they can help India grow, the value of their investment will grow. The taxes they pay in the United States have contributed five billion dollars of aid to India. They would like to see that investment of their taxes succeed through the creation of a strong prosperous and free Indian nation. They are extending the hand of the most successful social revolution and economic system in the history of the world to the profound revolution of independence and human dignity taking place in India. They wish to help make India's revolution as successful as their own has been.

Profitability of U.S. Companies in India

"ANALYST"

OF LATE, U.S. industrialists have evinced keen interest in extending their investments in India and, in this context, it would be of interest to analyse the performance of American Companies in this country as compared, first, with leading Indian Companies and, secondly, with the American Corporations in the United States. The profitability of a company is generally measured in relation to the total capital employed by the company or in relation to the sales of the company. But for the purpose of measuring profitability of American investments in India in relation to the profitability of American investments in the United States, the most suitable measure of profit would be the profit after tax in relation to the net worth of the company. This is because foreign companies are interested mainly in maximising their return on the capital owned by them.

Table No. 1 shows the rate of profit after tax on net worth in the case of eight leading American controlled companies registered in India and 100 Indian Companies having a paid-up capital exceeding Rs. 1 crore. The average size of the net worth of the Indian company is Rs. 6 crores and that of the American Company is Rs. 2½ crores.

TABLE I

AVERAGE PROFIT PER CENT AFTER TAX ON NET WORTH

Year	American controlled Indian Companies	Indian Companies
1957 ..	13.0	6.5*
1958 ..	15.6	7.2*
1959 ..	18.6	10.5
1960 ..	15.4	9.9

* Pertains to 100 medium and large companies, i.e., companies having a paid-up capital exceeding Rs. 5 lakhs.

It will be seen that the profitability of American Companies in India is much higher than that of Indian Companies in India. During 1957-60, the average rate of profit of 15.7 per cent on net worth in the case of the American Companies was almost double the rate of 8.5 per cent for the Indian Companies.

Table No. II shows the rate of profit after tax on net worth earned in the United States by six leading American Corporations which have substantial investments in India. A comparison of Table Nos. I and II would show that American Corporations in India are more profitable than some of the parent companies in the United States. The highest rate of profit is earned in India at 18.6 per cent and except for the IBM all the remaining five U.S. giants are earning less in the United States than the Indian controlled rupee companies in this country. Since American companies in India are earning more than what they are earning in their own country and what Indian companies are earning in India, it would appear that American companies in India have invested in the most profitable ventures. Another reason for the higher profitability of American companies is no doubt the advantages of technical know-how which they can obtain from their parent companies. American companies in India are very favourably situated in that they can have the advantages of both the Indian controlled Indian companies and the U.S. giants. That may be a reason why they are earning the highest rate of profit.

Table No. III shows the total dividend paid on the net worth in the case of six American giants in the United States.

TABLE II

PROFIT AFTER TAX ON NET WORTH

(In Percentages)

	1960	1961	1962	1963
I. B. M.			17.4	18.2
Union Carbide		10.6	15.0	
General Electric	13.2			
Phillips Petroleum		9.8	8.9	
Colgate Palmolive	9.5	9.6		
Westinghouse Electric		4.6	5.8	

It will be seen that the maximum dividend declared on net worth by a U.S. giant is 17.4 per cent and the minimum is 4.6 per cent. On the other hand, according to the statistics published in the "Company News and Notes" dated 2nd December, 1963, there were two U.S. controlled companies in India (of which one is a subsidiary) which declared a dividend exceeding 100 per cent on the net worth. Of the remaining 10 U.S. controlled Indian companies, one did not pay any dividend, three paid a dividend of less than 10 per cent on the net worth, three between ten and 25 per cent and two between 25 and 50 per cent and the remaining one between 50 and 75 per cent. In short, of the 12 U.S. companies mentioned in "Company News and Notes" five paid a dividend exceeding 25 per cent as compared to the highest dividend paid by a U.S. giant in USA of 17.4 per cent. It would appear that the U.S. companies in India are able to pay a higher rate of dividend on its net worth in view of their higher profitability.

In the case of foreign companies, the rate of dividend on the paid-up capital of the company has some significance in contrast to indigenous companies. As reported in the "Company News and Notes" dated 2nd December, 1963, of the 12 companies with U.S. capital participation, five paid a dividend exceeding 100 per cent, one between 50 and 75 per cent, one between 25 and 50 per cent, two between 10 and 25 per cent, two less than 10 per cent and one company nil dividend on its paid-up capital. The rate of dividend being paid on the paid-up capital by the U.S. giant corporations may be seen in Table No. IV.

It will be seen that the highest rate of dividend paid by the U.S. giants in recent times did not exceed 44 per cent on

TABLE III

(In Percentages)

Company	1960	1961	1962
I. B. M.	—	—	17.4
Union Carbide	—	10.6	15.0
General Electric	11.6	—	—
Phillips Petroleum	—	9.8	8.9
Westinghouse Electric	—	4.6	5.8
Colgate Palmolive	5.4	5.2	—

Data for this study have been taken from the Company Finance articles published by the Reserve Bank of India. Dividends study published in the "Company News and Notes" dated 2nd December, 1963, and from the Annual Accounts of the leading American Corporations which account for a substantial part of American investments in India.

paid-up capital, whereas five of the twelve U.S. controlled companies in India pay a dividend exceeding 100 per cent.

The rate of dividend paid by 100 big-sized Indian companies having a paid-up capital exceeding Rs. one crore was 10.9 per cent on its paid-up capital and 6.6 per cent on its net worth in 1959 and 11.8 per cent and 6.8 per cent respectively in 1960. This rate of dividend by the large-sized Indian companies was also lower than that of US companies both in the United States and India.

TABLE IV

DIVIDEND ON PAID-UP CAPITAL

(In percentages)

	1960	1961	1962	1963
Union Carbide	—	43.4	43.0	—
General Electric	30.5	—	—	—
Colgate Palmolive	25.0	25.0	—	—
I. B. M.	—	—	—	11.6
Phillips Petroleum	—	12.7	13.9	—
Westinghouse Electric	—	10.3	10.3	—

It was seen that the profitability of American companies in India is higher than both Indian companies and U.S. corporations. A comparative study of the structure of liabilities of these three categories of companies would indicate some of the ways by which the US companies in India are maximising their return on net worth. It may be pointed out that not only the return on net worth but also the return on sales and on the total capital employed is higher in the case of US companies in India than the big-sized Indian companies, as is evident from Table No. V.

TABLE V.

(In percentages)

	1959			1960		
	U.S. Companies in India **	Big-sized Indian Companies ***	Difference	U.S. Companies in India	Big-sized Indian Companies	Difference
Profit after tax on net worth	18.6	10.5	8.1	15.4	9.9	5.5
Gross profits* on sales	12.6	11.4	1.2	11.2	10.9	0.3
Gross profits* on total capital employed	16.0	9.5	6.5	15.0	9.5	5.5

*Including interest charges, managing agency remuneration and tax provision but excluding depreciation.

**Pertains to 8 U.S. companies in India having Rs. 40 crores assets.

***Pertains to 100 big Indian companies having Rs. 1251 crores assets.

It will be seen from Table No. V that the US companies are more profitable by all the three standards, but that the higher profitability of US companies is most marked when the rate of return on net worth is taken into account. Since foreign companies are interested more in increasing this return, the ways in which this has been done may be analysed. Since profit has its origin in sales, the US companies are charging a higher price on the goods sold compared to Indian companies. The rate of profit on sales is higher in both years in the case of US companies. Since the rate of profit is higher on net worth than on capital employed, it appears that the US companies in India are paying a lower rate of interest on borrowed capital compared to Indian companies. Although definite figures regarding the rate of interest paid by both Indian and US companies are not available, it appears that on an average Indian companies paid a rate of 4.9 per cent on their borrowed capital, compared to 3.8 per cent by US companies in 1960 and 1959. Not only is the rate of interest low in the case of US companies, but they have also resorted to financing a greater part of their assets by borrowed funds compared to Indian companies. In 1959 and 1960, eight US companies in India had 30.2 per cent and 27.7 per cent of their liabilities as borrowings compared to 28.2 per cent and 27.4 per cent for 100 large-sized Indian companies. That US companies do not resort to increased borrowings to finance their assets in their own country would appear to be true from the following Table No VI.

TABLE VI.

BORROWING IN RELATION TO TOTAL LIABILITIES

(In percentages)

Name of U.S. Corporation	1960	1961	1962
Union Carbide	27	26	
Westinghouse Electric	20	19	
I.B.M.	..	20	
Phillips Petroleum	14	13	
Colgate Palmolive	12	11	..
General Electric	10	.	.

In short, the US controlled companies in India had made a higher rate of profit than some of their parent companies in the United States and the larger Indian companies in India. As a result of the higher profitability, they were able to pay a higher dividend than their parent companies as well as the Indian Companies. The higher rate of profit was made possible by charging a higher rate of profit on sales and by employing a greater amount of borrowed Indian funds which carried a lower rate of interest. Because of this higher profitability and by resorting to increased borrowings from the Indian money/capital market, eight US controlled companies in India were able to increase their share in the assets of these companies from Rs. 12.3 crores to Rs. 19.5 crores, that is an increase of Rs. 7.2 crores, of which only Rs. 1.6 crores represented the maximum inflow of US capital, even after remitting a maximum of Rs. 3.8 crores as dividends abroad. Thus during the period 1957-60, there was a maximum net outflow of capital from India to the United States to the extent of Rs. 2.2 crores and the Indian assets of US companies increased by Rs. 7.2 crores. In other words, the operations of the eight US controlled companies in India had seemingly increased Indian foreign liabilities to the extent of Rs. 9.4 crores, but this figure would be somewhat on the higher side as separate data regarding the share (which, however, must be modest) of Indians in these eight companies are not available.

The day we share with you...

Esso's second anniversary in India is a day which gains added meaning because we share its significance with you.

Two years ago, the Esso Oval came to India, bringing with it the experience of the world's largest oil company and...a promise.

The promise has been fulfilled...in India's industries, transport, agriculture, in millions of homes, in the dynamic new uses of petroleum products.

Experiments in Rajasthan and Rameshwaram have proved that Esso's Sand Dune Stabilisation programme can well hope to reclaim large parts of India's desert. Esso's 'Magic Mulch' has already showed a vast improvement in agricultural output and crop values. One of our Indian chemists has developed a petroleum-based fungicide which is able to control a fungus disease that has baffled agricultural chemists for over half a century!

Esso is a world-wide association with affiliates in 135 countries. It operates with a firm conviction that the development of human skills is vital to a developing economy...and that potential for learning them exists in every area of industrial activity..

India today is aspiring to a new standard of living. Esso, India, take pride in rededicating themselves, on this occasion, to help make that aspiration come true.

Esso

Profligacy of Foreign Aid

B. R. SHENOY

IN THE PAST about a decade foreign aid to India has assumed phenomenal dimensions. In the first Plan (1951 to 1956) viewed as an aggregate of loans, commodity assistance and gifts, it averaged Rs. 400 million a year. In the two years ending 1962-63 it averaged Rs. 3.9 billion a year. It accounted for 7½ per cent of total investments in the public and the private sectors in the first Plan, 18 per cent in the second and about 30 per cent in the third, though, in the meanwhile, total Plan investments rose to about three times. Virtually the entire amount of the aid is from governments, international agencies and institutions; none of it came from the capital markets of the world. Private capital has been on balance, leaving the country, the net exports of capital on private account during the 14 years ending 1961-62 being Rs. 1.2 billion.

In the first three years of the third Plan, foreign aid support to the public sector, considered separately, is placed at 29 per cent of the "Plan outlay" in this sector.

Foreign aid finance of the plans may be much larger than these percentages indicate, among other reasons, because official statistics grossly understate the value of foreign aid, as aid is converted into rupees at the official exchange rate, which over-values the rupee considerably. This over-valuation (and, hence, the under-statement of foreign aid) may be of the order of 75 per cent, judging from the vast gaps—varying from 30 per cent to 500 per cent or more of the landed costs, depending upon commodities—which exist between the landed costs and the market prices of virtually the whole range of import goods.

Expressed in Indian money at the equilibrium exchange rate, foreign aid during the two years ending 1962-63 may be from four to five per cent of Indian national income. The rate of saving during these two years being about 7½ per cent of the national income, foreign aid of the period was of the order of one-half to two-thirds of the national savings. Except for a year or so in the case of one or two countries, at no time of the post-war reconstruction phase did any of the Marshall aid countries receive aid on so massive a proportion.

Aid Analysis

About 60 per cent of the aid of this period came from U.S.A. and about 45 per cent of U.S. aid was in surplus agricultural commodities given under P.L. 480. Aid from West Germany was the next largest, being about 12 per cent. The Soviet Union and the U.K. contributed about 7 per cent each. If we exclude commodity assistance, U.S. aid is still by far the largest, being 45 per cent of the total; West German aid would be then 16 per cent, the Soviet 10 per cent and the British nine per cent. But there is little to distinguish between commodity aid and the rest of the aid, as all aid is ultimately converted into commodities.

The principal objective of foreign aid is economic development of the less developed nations, which are poor and are also ideologically uncommitted, in an effort to keep them in the free part of the world. A continued rise in the standard of living of the masses of the people, the largest bulk of whom are indigent, is essential to the fulfilment of this objective. But massive foreign aid has brought little relief to them from poverty and unemployment. The consumption of food by the masses continues to fluctuate below the nutritional norm and the consumption of cloth, already substandard, has steadily declined. Unemployment has increased.

This raises the question, where has foreign aid gone? If foreign aid had been utilised wholly, or even mainly, for effective capital formation, there should be no balance of payments difficulties either during or after the conclusion of the investments. During the period of investment the larger imports necessitated by it, should be balanced by foreign aid. There should be no market shortages of foreign exchange. After the successful completion of the investments, the addition to the national product flowing from the new undertakings should lift up exports sufficiently to meet the external debt services. Debt repayments should not cause market shortages of foreign exchange. Foreign aid should thus bring progress with stability; and it should be self-liquidating.

Capital Formation

The evidence of effective capital formation from foreign aid in this manner is conspicuous by its absence. The external indebtedness of the country has sky-rocketted from Rs. 500 million in 1951 to Rs. 13.8 billion in 1963. But there has been little or no improvement in the debt repayment capacity of the country, as can reasonably be inferred in two quite different ways. First, though during the decade ending 1961-62, the national product went up by 43 per cent, exports lagged far behind; they rose by but 16 per cent. The more normal experience is for exports roughly to keep pace with the national product. The rate of increase of the former may even exceed that of the latter, as has happened in the case of U.S.A. in recent years. Secondly, despite the steep rise in foreign aid, India has been harassed by acute scarcities of foreign exchange and had to draw on and deplete her currency reserves to rock bottom. Significantly, the third Plan provides for repayment of maturing external debt from fresh borrowings.

It would seem that much of the foreign aid has been misdirected. Part of it has provided the foreign exchange counterpart of the construction of idle production capacities. A part has financed the creation of uneconomic industries. Idle production capacities of 40 to 50 per cent exist over a wide range of industries. Excess capacity in irrigation is placed at about 30 per cent. The uneconomic character of most of the new industries is evidenced by their performance. Striking exceptions here and there apart, the costs of their output generally are unduly high and the quality of the output poor. Some of these industries may have to be wound up eventually on the liberalisation of imports.

A part of the current accruals of foreign aid provides some of the heavy running costs of these industrial white elephants in the form of imported raw materials, accessories and spare parts; these import goods may be beyond the reach of many of them in the absence of foreign aid and under normal competitive conditions with an equilibrium exchange rate. These running costs are an enormous drain on the national economy, the amount of the drain being represented by the difference between the costs of fabricating the goods at home and the costs of getting them through imports. The magnitude of the drain is indicated by the phenomenal prices which the import licences fetch. A rough calculation suggests that the extent of the drain may be, on an average, about 45 per cent of the domestic costs of the industrial output concerned. By meeting a part of this drain, foreign aid is doing a disservice in disguise to the Indian

economy. It helps to keep alive industries which had better be wound up and be replaced by industries, which have comparative cost advantages, being better suited to the Indian economic climate; have a better chance of survival; will add more to the national product; and have higher employment potentials.

Some of the foreign aid provides foreign exchange finance for illicit exports of capital; the smuggling in of gold and of consumer goods, the imports of which are banned or are severely restricted; the speculative inventory accumulations, induced by inflation; the construction of less essential urban property, as a hedge against inflation; and luxury living, the result of inflation and of the corrupt incomes born of economic controls.

At first sight it might seem astounding that foreign aid should finance all these activities, some of which are illegal. But foreign exchange finance for them cannot conceivably come from anywhere else. It cannot be drawn from the current export earnings of the country; nor from the currency reserves. Export earnings are insufficient even to meet the requirements of open imports; and currency reserves have been close to rock bottom since 1958-59. The only source of foreign exchange finance left is foreign aid. The question is not whether foreign aid is drawn upon to finance these activities. The more intriguing question is, how is foreign aid tapped?

The mechanics of tapping foreign aid is indirect. The smugglers of gold and of the consumer goods obtain foreign exchange from the free markets abroad or the black markets at home. The latter get their supplies of foreign exchange from traders, Indian settlers overseas, who wish to make remittances to India, and tourists. They release foreign exchange in these markets for the better prices they offer. The traders obtain foreign exchange from the Reserve Bank through over-invoicing imports; at the expense of the Reserve Bank, through under-invoicing exports and, partly, by smuggling out exports.

Opposite Forces

This diversion of foreign exchange from the Reserve Bank to the free markets, on the one hand, reduces the receipts of foreign exchange by the Bank; and, on the other, adds to the demand for foreign exchange from it. The effect of these opposite forces is to widen the official balance of payments deficit of the country by the amount of the diversion of foreign exchange to the free markets. The balance of payments deficit gets widened, too, from inventory accumulations and by luxury living financed from inflation and illicit incomes. This results through diverting into these domestic activities potential exports; or through causing a larger flow of imports to feed them. In this manner the balance of payments deficit representing illegal and wasteful transactions get merged with the deficit resulting from the rest of the transactions.

He who covers the balance of payments deficit of the country, therefore, provides the foreign exchange requirements of these activities. From 1958-59 to 1961-62, India's balance of payments deficits aggregated Rs. 11.8 billion. About 10 per cent (Rs. 1.2 billion) of this deficit was met from currency reserves. The rest was made good by foreign aid. It follows that the overwhelming proportion of the foreign exchange for the construction of idle production capacities and of uneconomic industries, of smuggling, of illicit exports of capital, of inventory accumulations, of undue urban building activity and of luxury living was drawn from foreign aid. Foreign aid was divided between these activities and effective capital formation, though it is difficult to say what part went into the one and what part into the other. This would seem to explain the failure of foreign aid, despite its massive proportions, to make a dent on poverty and unemployment.

It is important to note that the misdirection of foreign aid is not a pre-conceived or deliberate act. It is a fortuitous outcome of centralised economic planning and of the extensive controls, the instruments of planning; of the phenomenal illicit incomes, which controls have produced; of the undue extensions of the public sector, which absorbs 70 per cent of the currently available resources; of inflation born of the futile attempt to invest non-existent resources; and of the over-valuation of the rupee, the result of past inflation.

Unless these basic evils are corrected, even as there is no way of carrying water in a sieve, there is little hope of remedying the leakages from foreign aid; nor of achieving accelerated economic growth and social progress. If the prevailing policies continued, the external debt of the country may have to be written off sooner or later. What the under-developed economies need most today is not more foreign aid — many of them are probably having plenty of it already — but fiscal, monetary and exchange stability, and freedom from the harassments of governmental intervention in the economic life of the community. Monetary stability, devaluation and the removal of import restrictions alone might impart considerable resilience to the Indian economy. The State can contribute most to economic and social progress if, rather than dabble in steel mills and such other undertakings, it limited its activities to its natural sphere — Rules of Law, education, basic transport and communications, marketing facilities, public health measures, agricultural extension services and defence from external aggression. Given these reforms — in the implementation of which the aid-giving countries may usefully assist — the need for foreign aid will shrink, the misdirection of it will diminish and the under-developed economies may have much more economic and social progress than massive aid can ever produce in a background of monetary, fiscal and economic instability.

Eastern Economist 20 Years Ago

APRIL 14, 1944

Handling of an unprecedented volume of postal, telephone and telegraph traffic, a record surplus of Rs. 4.5 crores and partly putting into effect the 16-crore scheme for the development of telecommunications are the highlights of the annual report of the Indian Posts and Telegraphs Department for 1942-43 issued last week. The Tele-Communication Development Scheme, the report reveals, is scheduled to be completed by the end of 1944-45. It provides for a large number of additional long-distance telephone and telegraph circuits, connecting all the important centres of India, and the erection of some 123,000 miles of wire and 11,000 miles of new post route. The scheme also includes the construction of a large number of circuits of a local nature required for operational purposes involving some 150,000 miles of wire and 12,500 miles of new post route. The construction of these additional outlets will not only relieve the war-time congestion on the wires but will also be of considerable advantage in the post-war period of reconstruction.

Israel's Policy for Development

PERETZ GORDON
(Consul General of Israel in India)

ISRAEL IS now celebrating the 16th Anniversary of its statehood and it may now claim that it is well on the road to economic independence. The industrialization of Israel has never been rigidly planned nor could it be forced down the throats of its people. First, because Israel is not a totalitarian State; free enterprise exists side by side with a special type of Labour and Government-owned industries. Second, because Israel is a land of immigration, but immigration that is unpredictable, for its numbers and nature depend almost wholly on whether, when and how far given Governments allow Jews to depart, and only in a minor degree on individual choice. In such circumstances, to formulate rigid long-term plans of economic development is impossible.

Israel's industrialization is not academically planned but empirically purposeful. Nevertheless, a certain guidance of industrial development by Government is unavoidable, and consequently the Ministry of Commerce and Industry has drawn up a "master plan" elastic enough to allow for a considerable degree of private initiative and investment. Government and people know that survival, let alone further immigration, cannot be theirs without progressive industrialisation.

Under the Mandate

The Mandatory Government, disinclined to see absorptive capacity expand, for on it the periodical immigration quota in theory depended, pursued an economic policy which slowed down industrial development by denying Jewish manufacturers protection through tariffs against the competition of dumping, in a world rent by Customs wars and import allocations. However, the effort and output of industry in Palestine in World War II confounded the experts and falsified their predictions. This industry had been built up, against heavy odds, by immigrants from Eastern and Central Europe. Its gross output rose — in Palestine pounds, on a par with sterling — from 2.1 million in 1929 to 36.3 in 1942 or, allowing for price reduction to pre-war level, 16 million, while the number of persons employed in it rose from 7,600 in 1930 to 46,000 in 1943, and when the Mandate ended was approximately 50,000. Towards the conclusion of the Mandatory period, the main branches of industry were: food processing, drinks, tobacco-products, textiles and clothing, metal-working and electrical appliances, wood-working, leather tanning and working, printing and paper and cardboard products, chemicals and pharmaceuticals, stone-working, glass, ceramics, and other building materials, diamond cutting and polishing, and such specialities as artificial teeth.

With the State in being, plans had to be worked out immediately for the expansion of industry. Basic industries had to be created; primary industries founded on the use of local raw materials, including industrial crops cultivable locally; factories and plants set up which by exporting their products would earn foreign currency to fill the gap in the country's trade balance largely due to the need to feed and house mass immigration; and finally, employment provided for the hundreds of thousands of newcomers expected in the initial years, and one way to provide it was to place them in industry.

The new State found its technical equipment not only obsolete but worn out by the war effort. The twofold problem was how to replace it and, at the same time, enlarge production capacity so as to create jobs for immigrants and meet increasing consumer demands of every kind. In so far as finance entered into the problem, it was solved in November 1949 with the help of an American Export-Import Bank loan of $135 million of which $20 million were destined for industrial machinery, and later on of big accommodations from Sweden, Switzerland, Belgium and France, and finally by German Reparations. Up to the end of 1958, total investment, including machinery and equipment, plots and factory-buildings, working capital and so on amounted to about 1.35 milliard Israeli pounds ($700 million). This means that more than 50 per cent of the total investment was used for the purchase of machinery and equipment.

The expansion of industry depends on availability of raw materials, technical equipment and machinery, financial resources for investment, sources of fuel and energy and manpower. As far as present knowledge goes, Israel is rich in chemicals but is otherwise rather poorly endowed with regard to raw materials. Iron Ores occur in the north and the south, but the northern or "Manara" deposit of about 40 million tons is mostly poor, containing an average of 27-28 per cent Fe in situ, and has to be enriched up to 41-42 per cent to feed the electric furnaces now under erection in "Steel-Town", near Acre. Copper ores are being mined at Timna, near Eilat; the visible reserves amount to about 11 million tons with an average content of 1.4 per cent Cu, normal by international standards. Additional reserves have been estimated at 35 million tons, some of which have a copper content of two per cent and more. Manganese in the form of pyroluside is charted near Eilat, an ore of moderate content, suited to chemical, not metallurgical uses, for example in making cells for electric batteries. The deposit is not yet commercially exploited.

Mineral Wealth

The total volume of brine in the Dead Sea is estimated at 150 million cubic metres. Even assuming that only a quarter of it is within Israel, the Sea remains the country's richest source of mineral wealth. Production of potassium chloride amounted in 1958 to 140,000 tons, most of which was exported. Extraction of bromine (mainly for producing ethylene-di-bromide) amounts to approximately 2,500 tons a year. Common salt from the Mediterranean, the Dead Sea and neighbouring rock-formations, is important for the electrolytic production of caustic soda and chlorine. Production in 1958 amounted to 34,000 tons. Phosphatic deposits are widespread, but only the phosphatic limestone of Oron in the Negev, which contains a small percentage of uranium, is presently mined commercially — in 1958 about 210,000 tons. Gypsum too is widespread, with greatest occurrences in the Besian Valley near Kibbutz Gesher, and at S'de Boker in the Negev. Most of it is used in cement manufacture. Production (raw) amounted to about 30,000 tons in 1958.

Israel has no coal. Traces of lignite were found in 1958, but their actual value is doubtful. Large beds of peat occur in the Hula, and bituminous limestone is frequent: both these potential sources of fuel are under close investigation, as are the possibilities of exploiting solar and wind energy. Oil prospecting began in 1953, and deep drilling has been done at 32 sites.

Remarkable progress has been made of late with industrial crops — beet, groundnuts, cotton and cottonseed, flax and linseed, all unknown in Mandatory Palestine. Their cultivation provides employment for thousands of workers and is, therefore, all the more important in the national economy. Extensive and promising experiments in producing sisal fibre from 'agava sisalana", newly planted in the Negev, are well under way.

Locally grown cotton covered about 65 per cent of the 1958 requirements of the mills. Production of rayon yarn has started. There are 40 cotton-machines today for making stockings, as compared with 13 in 1951, and their capacity is 230,000 dozen pairs annually, whereof a third is exported.

Other textile products of note are the spinning and weaving of local flax; the making of rope and twine, mainly from imported fibres and now also from locally grown agava; the spinning and weaving of imported jute; the making of fishing nets and tarpaulins, and the spinning and weaving of imported asbestos-fibres. The dyeing, printing and finishing of textiles are well advanced, and so is the production of wearing apparel of cotton, wool, rayon and other fibres. Israel fashion goods are popular in Europe and the USA and their export is furthered by special shows. The chemical industry has gone ahead by leaps and bounds — its range now including acids, fertilizers, electro-chemical products, dyes, colours, paints, lacquers, varnishes and printing ink, cosmetics, pharmaceutics, plastic raw materials, gases, petrochemicals, the Dead Sea and many auxiliary chemicals. The pharmaceutics comprise in the main, antibiotics, sulpha-drugs, vaccines, insulin, hypnotics, tranquilizers and vitamins.

Israel is a small country and its present population only just exceeds two million. Yet the physical output of its industry has been more than quadrupled in the last 12 years and the range of products is incomparably more extensive than it was. One feature which made them possible is the unique confluence of private enterprise, Labour industry and Government development. The Labour sector in 1958 employed about 22,000 workers and its gross output amounted to 385 million Israel pounds. The Government sector employed 9,000 workers, 68 per cent of them in the Palestine Electric Corporation; the remainder had an output of 55 million Israel pounds. Thus, private enterprise employed about 120,000 workers, or 80 per cent of the whole, and its output was 1,460 million Israel pounds, or 77 per cent of the whole (output of electricity excluded). What is salient is that Labour and Government industries are prepared to take risks, which private enterprise is not: as witness "Steel-Town" of the Labour sector, or the Dead Sea Works owned by the Government. Nevertheless, private enterprise engages in such basic industries as electro-chemicals near Acre and cement at Hartuv. But there is no question that Israel industry would be less diversified, more restricted to light products and finishing branches, if Labour and Government had not stepped in to deepen and ramify its process.

Price Stability

A marked degree of price stability in 1963 was an indication that one of the major inflationary dangers following a recent currency devaluation had been successfully withstood. The Consumers' Price Index rose in 1963 by less than 5 per cent, half as much as in each of the two preceding years. Most of the increase was in real estate and services; there was almost complete stability in the prices of industrial and agricultural products. The deficit in the balance of payments fell by almost $29 million to $420 million. This was due to a rise of $93 million or 19 per cent in exports of goods and services which reached $593 million, combined with a rise of $64 million in imports. Foreign currency balances continued to grow, reaching $580 million — $80 million or 16 per cent, more than last year, enabling $50 million of foreign currency debts to be paid off in advance. Repayment of the Independence Bonds sold mainly in the United States was started; $54 million worth were redeemed all told.

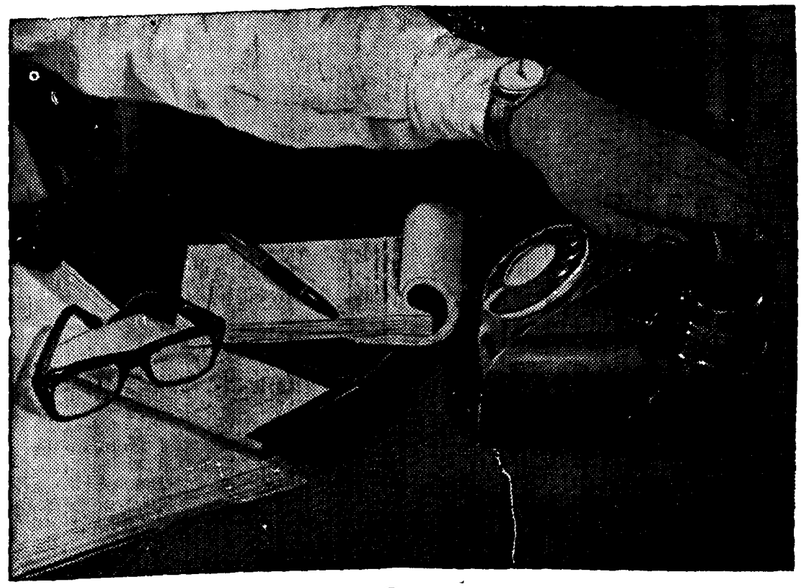
The Gross National Product increased by some 10 per cent to IL 7,691 million — half being due to the rise in the numbers employed, and half to increased output per head. The Government pursued a policy of selectivity in encouraging investments, giving preference to those contributing to employment, exports and the dispersal of the population. Investments rose by the moderate figure of 4 per cent. Though the population grew by 3.7 per cent — and the labour force even more — all the additional labour power was absorbed, and unemployment even fell to the low daily average of 4,206. Israel thus maintained a position of practically full employment. The National Income increased by 20.5 per cent to IL 5,904 million — IL 2,460 per head, and real wages by an average of 6 per cent. Savings showed a very welcome increase, and the importance of the Stock Exchange grew as a medium of investment and savings for the general public. Personal consumption increased by 9.5 per cent — about 5 per cent per head — which was less than in previous years. The means of payment grew by 26 per cent, mainly owing to the increase in foreign currency balances.

Economic policies for the financial year 1964-65 are to be governed by the urgent necessity to keep the economy stable, despite the considerable pressures expected. Investments are expected to mount by at least 12 per cent, and exports to reach $700 million, while capital imports are estimated at $500 million. With such marked expansion in mind, vigorous measure are to be taken to restrain consumption: (a) a balanced budget; (b) credit restraint; (c) increased investment and sale of shares in Government companies; (d) bank loans to the Government for development; (e) discouragement of foreign currency conversion and encouragement of savings. Parallel with this, continuous pressure will be exerted upon manufacturers to keep production costs down.

TOP MANAGEMENT PROBLEM?

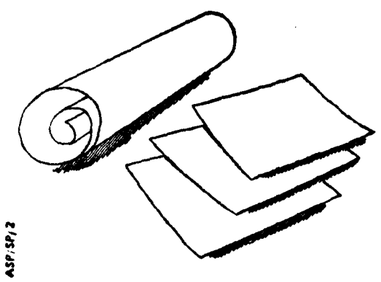
CAN I HELP YOU?

Senior English Executive (44) General Manager American Pharmaceutical Company's Indian Operation shortly leaving present appointment.



Recently successfully completed formation Indian Company with manufacturing licence to establish Chemical and Pharmaceutical Plants as collaborators with Indian Partners .... is now open to receive offers of employment, or consultancy contract which .. present real challenge satisfying sincere desire to serve India with opportunity for enthusiasm and independent action based on experience and mature judgement .... has personally successfully handled complicated negotiations at highest levels in Delhi .... always on basis of, respect, merit of project in context India's needs, and integrity.

First arrived India in 1941 .. has administrative, manufacturing, wide marketing and distributing experience covering all India .... with reputation as Maverick who gets results.



Self and Family would prefer continue to participate in and associate with India's developing future and potential remaining in the country which is now our second home amongst our friends.

Presently Resident Bombay.
Reply Box No. 34, New Delhi.

Esso

EXHIBITION

In cooperation with over 50 leading Indian manufacturers & suppliers

APRIL 16-21

at CONNAUGHT CIRCUS

between Janpath and Parliament Street

AWT-ES-3097 B

Are you a small industrialist ?

LET GOVERNMENT HELP YOU THROUGH N. S. I. C. FOR

MACHINES on easy instalment payment basis

PRODUCTION of prototypes of machinery and machine tools and

TRAINING to skilled and unskilled workers at the Prototype & Production Centres at Okhla (Delhi), Rajkot & Howrah.

CONTRACTS assistance from DGS&D and Railways for supply of stores.

EXPORT assistance for export marketing through Footwear Procurement centres at Agra, Delhi & Bombay.

DISTRIBUTION of Radio and Transistor valves manufactured by M/s. Bharat Electronics Ltd., to small radio manufacturers.

PUBLICITY by displaying small scale industries' products in major exhibitions in the country & abroad.

For further particulars, you are welcome to call on or write to:

THE NATIONAL SMALL INDUSTRIES CORPORATION LIMITED

A Govt. of India concern

RANI JHANSI ROAD, NEW DELHI

DA-63/295

OUR POPULATION PROBLEM—IV

Family Planning Effort—As It Is

R. CHOPRA

THE PROBLEM is formidable indeed. But there are also some favourable factors that must not be overlooked. There is a growing recognition of the problem at all levels, in many institutions both official and unofficial. In India, which is one of the countries most immediately concerned, the Government has officially stated that "family planning is a key programme for the third Plan and subsequent five-year Plans and will be undertaken not merely as a major development programme, but as a nationwide movement which embodies a basic attitude towards a better life for the individual, the family and the community. The objective — to stabilise the growth of population over a reasonable period — is at the very heart of all India's plans for development".

The Government has set up Central and State Family Planning Boards and considerable research is being done in developing effective contraceptives, training in motivation, demography etc. A third Plan allotment of Rs. 27 crores or six times as much as in the second Plan has already been made and may be raised to Rs. 50 crores if required.

The Report for 1962-63 of the Director, Family Planning, Col. B. L. Raina, to the Central Family Planning Board in April, 1963, lays down the proposed aim of the family planning programme in India and the steps taken or proposed to be taken to achieve the aim.

The proposed aim, it says, is to accelerate the adoption of family planning so as to reduce the birth-rate to 25 per thousand by 1973. The present rate being about 40, the proposed figure shows a decrease of 15 per thousand. It is also hoped to bring at least 90 per cent of the married population under the programme.

The programme is based upon what are known as the six basic functions. Two of the six functions considered as primary functions are — "(1) community educational work, which can produce the group support needed for family planning and provide specific information about contraception, and (2) supply of contraceptives through channels which pose the least possible psychological or physical barriers to obtaining them".

Supporting Functions

The supporting (but also obviously equally vital) functions are — (3) provision of clinical services to those individuals who may have some special problems requiring a clinic visit, (4) provision for statistical evaluation of programme impact on birth-rate and on certain other indications of effect, (5) overall administrative co-ordination and support, and (6) training functions.

In so far as the six basic requirements enumerated above are concerned, there can be no disagreement about them Perhaps one or two of them may not be so fundamental in nature. On the other hand, some other factors could have been included as basic functions.

About the first basic function, the report stresses the adoption of the "extension approach". The extension approach, whereby the focus of group pressure can be mobilised, involves methods for indentifying influential leaders among different sub-groups of the population, methods of encouraging them to gain knowledge and take interest in developing the small family norm among their group, methods of imparting to them and others basic information regarding family planning practices among their group. This approach is not only more effective in bringing change, but one worker can reach greater numbers. Panchayats, Village Development Committees etc. can be made responsible for propagating family planning including distribution of contraceptives etc.

The report lays down the organisation required to put "extension approach" into operation. It requires trained family planning officials at Village, Block, District, State and other levels who shall co-ordinate and co-operate with their counterparts in Civil, Medical, Health, Block Development Departments at their levels; provide training to those below them; hold meetings, implement programmes and solve problems in day-to-day working; organise vasectomy camps; establish useful working relations with sub-group leaders etc. They will also help in developing adequate contraceptive storage and distribution facilities at the various levels, keep records and collect family planning demographic data in their jurisdiction.

The lowest level will be that of Family Planning Field Workers, who will be males, and shall be responsible for family planning in about 20,000 population under the guidance and direction of the Block Family Planning Extension Educators. The Block Family Planning Extension Educator shall be responsible to the District Family Planning Extension Educator who in turn is responsible to the District Family Planning Officer.

There will also be 8 Auxiliary Nurse Midwives posted throughout the Block, who would also be actively promoting family planning, with support from the Extension Officers plus the Maternal and Child Health (MCH) Service staff.

Distribution of Contraceptives

Coming to the second basic function, i.e., supply and distribution of contraceptives, it is correctly pointed out that there should be minimum possible psychological and physical barriers to obtaining them. The smooth and satisfactory supply and distribution of contraceptives, it is confessed in the report, has not been very successful so far for various reasons. The future course will be as follows:

> "Contraceptives either from the Central Family Planning Office or the State Family Planning Offices flow directly to the District Family Planning Officer for distribution.
>
> Under direction of the DFPO supplies are distributed to the District and Tehsil hospitals, and Block FP cell.
>
> Distribution at the Block level is a responsibility delegated to the Block Extension Educator Officer, FP who directly supervises a contraceptive storekeeper-cum-clerk.
>
> The storekeeper will deliver contraceptive supplies to Primary Health Centre Sub-centres and contraceptive depot holders on a regular schedule (as e.g., monthly) in the block.
>
> The storekeeper will require a simple signed form from each depot holder when supplies are delivered for accounting purposes.
>
> No additional accounting will be required from depot holders or clinics.
>
> The contraceptive storekeeper-cum-clerk under the direction of the Block Extension Educator will be responsible for maintaining an efficient distribution route, maintaining records of contraceptives distributed, inventory, and maintenance of stores. The contraceptive supplies can also flow through village co-operatives".

The contraceptives to be distributed are rubber contraceptives, condoms, diaphragm, foam tablets etc. It is also mentioned in the Report that the relatively high price of these contraceptives are a barrier to popular consumption. Obviously, even if the Government were to distribute contraceptives free of cost, the strain on the national exchequer would be enormous. Hence the need for a much cheaper type

of contraceptive which should also be convenient for mass consumption. The conventional contraceptives are difficult to store, use and dispose of afterwards and thus inhibit usage. The problem that emerges is two-fold. First the need to motivate the population to reduce the size of the family and provide information on how to do it. Secondly, to supply enough and cheap contraceptives to enable the motivated population to practise family planning.

Let us see whether the proposed plan of action meets the requirements of a population as vast as India's.

The Report lays down that there will be one Family Planning Field Worker for family planning education in about 20,000 population under the guidance and direction of the Block Family Planning Extension Educator when the plan is fully implemented.

Inadequate Allotment

Taking the expense figures as given in the Report as typical a few calculations will show that the budget allotment in the third Plan is extremely inadequate. For a population of say 50 crores we would require 25.000 Family Planning Field Workers alone. Assuming annual salary of Rs. 3,000 on an average, the wage bill per annum will be Rs. 7.5 crores. In a five-year period it will be Rs. 37.5 crores. This does not include other recurring as well as non-recurring expenditure including that of contraceptives (the supply of which is after all the most important), clinics, housing, transport, salaries and honorarium of other workers at various levels etc. Obviously, it is not expected to have one Family Planning Field Worker per 20,000 population in the third Plan period anyway. Or their salaries are expected to be substantially less than the figure assumed. If the former assumption is correct then the effect of the programme on the population during the third Plan, to reduce the birth-rate, will be small indeed. If the latter alternative is correct then it should be remembered that the quality of the Field Worker will be very inferior which may jeopardise the entire plan because the Field Worker is at the very foundation of the family planning programme. Either alternative would seriously jeopardise the achievement of the targets by 1973.

Regarding the contraceptives, as mentioned earlier, the cost of supplying them in adequate quantity to the motivated population can be calculated. Assuming that 8 crore couples have been motivated (which is much below the 90 per cent target), and contraceptives worth Re. 1.00 per couple per month are supplied (the cost assumed is much below the market price), the Annual Bill would be Rs. 96.00 crores. Obviously, the Director of Family Planning has not taken this into consideration or he would not term the third Plan allotment as adequate!

The other expenses though substantial shall not be considered for the time being. It is, however, apparent that though the programme as outlined in the Report is basically in the right direction, the organisers of the programme have not taken into consideration the Bigness of the problem. And in this lies its most serious weakness.

The following are some of the defects in the programme:

(a) One Family Planning Field Worker per 20,000 population is extremely inadequate. Individual and sustained attention which is very essential for such a programme will not be possible.

(b) The contraceptives upon which the programme is based are expensive and inconvenient to store, use and dispose of.

(c) By depending upon voluntary as well as official agencies to propagate family planning, by bringing the Block Development Officers, Maternal and Child Health staff and other social and welfare agencies into the picture, the responsibility for implementing the programme has become diffused. This might lead to the practice of "careerism" in official agencies and prestige-value for voluntary organisations to the detriment of the family planning programme.

(d) At the State and Central levels there is no unified control. The States are practically independent of the Centre which might lead to lack of co-ordination and hence wastage of time and money.

(e) The channels of communication of the methods of family planning are extremely vague. It would seem from the Report that only meetings, seminars, camps will be organised where influential leaders will speak, in addition to the distribution of posters, pamphlets etc. and the screening of a few films. The population thus reached would be very small.

(f) The programme expects the people to come to the Family Planning Workers for help instead of the Family Planning Workers going to the people. This will certainly reduce the impact of the programme if not make it totally ineffective.

(g) No mention is made of using the modern modes of communication i.e., newspaper, radio, television e.c. which have proved extremely effective abroad as modes of propagating ideas.

(h) No stress is laid on the provision of adequate facilities for sterilisation. If, as the Report says, sterilisation is popular when properly explained, it should have received more prominence.

(i) No mention is made in the Report of introducing family planning as a subject in the Universities etc. This is necessary in order to educate the coming generations and is thus very effective.

In short, the problem is too big and the measures proposed are extremely inadequate and limited in scope. In my opinion it is just not possible to achieve the targets envisaged in the Report.

Proposed Measures

While discussing the various measures taken or proposed to be taken as reported by the Director, Family Planning, it would be interesting to quote certain passages from the booklet "The Growth of World Population" —

(1) "Clinical programmes alone do not appear to be sufficient for the task" (i.e., mass programme of family planning).

(2) Continued promotion in the field is necessary for continued effect; the point of self-maintaining activity is hard to reach. At the same time, it seems clear that it is not necessary to reach an entire population in order to achieve substantial effect. In some areas the people themselves help to spread information through informal and often highly effective channels.

(3) "Personal communication between field workers or local leaders and the people is apparently the best single influence for the adoption of voluntary fertility control" in many areas, though mass communication may become increasingly important.

(4) "Experimental efforts to promote family planning with traditional contraceptives that require sustained motivation and preparatory action often fail". The number of people willing to accept the idea is not large and the number of continuing users is even smaller.

(5) Results of the few successful efforts so far suggest that the use of traditional contraceptives can be expected to produce an average reduction of five to seven points in the birth rate in less-developed areas in a period of five years (for example, from 42 births per thousand population to 35-37 per thousand). Because of the backlog of interest among large families, the reduction is often greater in the first year than in subsequent years. **(To be Continued)**

WINDOW ON THE WORLD

Six Against Inflation

From our Special Correspondent

PARIS:

THE COMMON Market Six agreed this week on a joint campaign against inflation. Apart from its immediate significance, as a move against the deterioration of the Community's currencies, competitiveness and trade balance, the fact is notable as a first exercise in joint, short-term economic policy. True, the Six are far from having attained that degree of political unity that would allow a really united stand on these matters: budgets and the management of money are still questions of national sovereignty, and are likely to remain so in law for some years yet, given the paralysis of the Community's will to political union. Meantime, there is no central authority that can dictate credit policy throughout the region, limit public spending by the national capitals, nor intervene in wage settlements. (And no doubt it is just as well that no such central administration exists, as long as there is no popularly elected European parliament to control and censure it.)

So the policy elaborated by the Six Finance and Foreign Ministers at their meetings this month must take the form of mere recommendations and suggestions, which each Government promises to take into account as far as possible. In fact, one of the key suggestions put forward by the ECM Commission — namely, that Dec. 31 this year be set as a deadline for the anti-inflationary measures outlined — had to be dropped from the final draught, as smacking too much of an ultimatum to sovereign states issued by the Brussels bureaucracy. However, there is reason not to put too much emphasis on the "mere" in front of these recommendations, because it is already proven that the moral force of the undertakings exchanged by the Six between themselves can be considerable. Indeed, the binding force of such informal contracts falls not far short of that of policy decisions within any one state — for it is notorious that if these latter were really binding on all sections of the nation, inflation would never be a problem.

Rational Measures

The agreements in Luxemburg and Brussels, then, rank as an approach to a six-nation anti-inflationary policy. Quite apart from their legal or moral force, they have all the persuasiveness of rational measures; they suggest steps that the national capitals would have to take sooner or later, and might take sooner now that they have been co-ordinated. Indeed, several of the Commission's ideas had already been adopted, notably by France, Belgium and West Germany, before they were incorporated in this month's joint declaration.

That document begins by underlining the necessity of a common anti-cyclical policy in a Community where goods, capital and labour move more freely every month, so that the import and export of inflation are easier than across the old national frontiers. Belgium, for example, has just had a taste of "imported inflation". Prices in that country had been the steadiest in the region: between 1959 and 1963, the cost of living rose only 5 per cent, compared with 19 per cent in France, 16 per cent in Italy, 11 per cent in West Germany and 10 per cent in Holland. Then, last year rising prices on the other side of ever more permeable frontiers started to suck goods out of Belgium: exports of meat and other animal products shot up 45 per cent, immediately causing scarcities and rising prices in the kingdom. Under the influence of soaring food prices, the Belgian cost of living jumped 2.9 per cent between September and January, which is equal to an annual rate of 6.9 per cent, or one of the highest rates of inflation in the Community. As an emergency measure, the Belgian Government banned exports of cattle, and prices soon steadied up; but obviously, this can only be a temporary infringement of the common farm policy and anyhow it could not be applied to many other goods. The case is cited to show, in its simplest form, what imported inflation means and hence to explain why the inflationary menace is taken as a common problem even when some members (especially West Germany) have to date suffered less than their neighbours.

Specific Recommendations

That point made, the joint declaration goes on to state the specific recommendations to all six Governments. (1) They must all maintain a liberal import policy. (2) Their national budgets must not grow by more than 5 per cent a year, whether they be balanced budgets or not. This figure of 5 per cent is arrived at by assuming that the average long-term growth of national product is 4 per cent annually, and then adding 1 per cent "for elasticity" or, in plainer terms, allowing that rigidly stable prices are not hoped for and that a 1 per cent rise in prices is tolerable. (3) If and when the mass of the budget swells more than 5 per cent in a year, taxes must be increased. (4) The deficit of public services must be reduced, by raising charges, e.g. for electricity, rail transport, etc. (5) Budget deficits must be financed by long-term borrowing rather than by revolving short-term resources; i.e., the issue of Government loans must replace resort to sale of Treasury bills. (6) Current credit restrictions must be kept in force. The declaration does not go into details here, for conditions vary widely in countries with contrasting banking structures, but it is understood that the present credit-squeeze and limits on consumer finance will be mainained for the rest of this year at least.

The last two recommendations are vaguer, or relate to mechanisms that will take time to set in place. (7) A national incomes policy must be sought, such as would peg the increase in wages to the increase in productivity. (8) The Six Governments are held to be under an obligation to co-operate in financing trade deficits that arise among themselves; this is a reference to the fact that most of West Germany's current trade surplus, and much of the deficit of Italy and France, are incurred in commerce within the Common Market.

This series of measures is addressed to all members, but it applies most appositely to four of them: France and Benelux. Those four nations need to adopt all those counter-measures, and probably nothing more drastic is required. Remain the cases of West Germany and Italy, the situation of the former being much less alarming, and the plight of the latter much more. The joint declaration, therefore, concludes with particular suggestions aimed at Bonn and Rome. The West Germans are advised to postpone contemplated tax reductions, to limit the present lively growth of investments, and to promote the export of capital. The uneasy coalition in Rome is counselled with particular urgency to resort to stiffer taxation and to compress Government spending, which is slated to soar 800.000 million liras this year.

It is remarkable that many of these suggestions, as already noted, are being applied. This is not to say that the Commission is preaching to the converted: its ideas were known well in advance of being set out in this month's joint declaration, and seeing their reasonableness some Governments hastened to implement them. Thus, West Germany has set up barriers to imported inflation in recent weeks by moving to discourage the influx of capital and, if possible to promote its re-export.

Private banks have been forbidden to pay interest on foreign deposits, and reserve requirements have been raised to the legal ceiling; and a 25 per cent withholding tax has been clamped on interest payable to foreign holders of West German securities. Belgium has raised money rates, put the brakes on consumer credit, spread out public investment programmes over a longer period, dampened the housebuilding boom and sought to stabilise food prices. Initial success has been encouraging: retail prices have fallen fractionally since January and exports have improved. It is too early, all the same, to conclude that the inflationary threat has subsided because recent wage settlements foresee a third week of paid annual leave and an increase in family allowances, which will mean in total a rise of 11 per cent in wage costs during this year.

The most notable conversion has been in France, where the Government has adopted virtually all the suggestions made in Brussels as regards budget policy. The total size of the budget will be kept in phase henceforth with the expansion of national product (plus 1 per cent for a rise in prices that is held to be tolerable). The budget deficit will be trimmed severely, after having been halved in the last two years in absolute volume (which meant that its relative importance declined as the mass of the budget rose). In a brave moment, the Finance Minister even spoke of strictly balancing the budget next year. In any event, such deficit as persists will be covered by long-term borrowing. If these promises are kept (and President de Gaulle abandoned the Olympian heights where he meditates foreign policy this week to commit himself personally on their observance), France will at last have come into line with the Erhardian doctrine on public finance. Hence, for the first time in generations, one will be able to take seriously a French stabilisation operation, as a long-term plan to eradicate inflation at the roots.

For political reasons Italy is a case apart, for her acute attack of growing pains coincides with a delicate conjuncture in domestic political life which will make difficult a determined application of the remedies suggested this month in Luxemburg and Brussels. Before very long, however, successful anti-inflationary action in the other five countries will make quite inevitable a rigorous renovation of Italian finances, even if at the cost of a political upheaval that might assume dramatic forms.

The Years of Expansion

GUY SIMS FITCH

WASHINGTON:

IT IS now official. With the coming of April, the current economic upswing entered its 38th month, making it the longest peacetime expansion in the history of the United States. This excludes, of course, the lengthy recovery from the painful depression of the early 1930's, properly viewed by economists as a special case and one not likely to be duplicated.

The question now is how long the rise will continue. With its current advance, the economy apparently has broken out of earlier postwar patterns of recurrent expansion and recession, and has defied repeated predictions of an imminent slowdown. In the process, the economy has withstood a number of major strains. These include the Berlin crisis of 1961, the steel price controversy and stock market drop of mid-1962, the Cuban missile crisis of October 1962, and the tragic death of President Kennedy in November 1963. From all these, the economy has emerged strong, resilient and basically unscathed.

In fact, a survey of more than 50 leading economists, conducted by "Business Week" magazine, discloses a virtually unanimous view that business will continue to advance at a healthy pace throughout 1964, at least. The prevailing opinion is that the recently enacted tax cut with its stimulating impact on consumer demand and business investment, makes such a conclusion all but inescapable.

These experts estimate that the gross national product (GNP) — the total output of goods and services — will average about $ 622,000 million for 1964 as a whole. This is somewhat higher than most earlier estimates, and would represent a gain of some 6.5 per cent over the 1963 level, indicating an accelerating rather than a diminishing rate of growth in this fourth year of sustained economic expansion.

Attention thus is focused on the longer-term prospects, with 1965 the chief centre of attraction. The principal question is whether the U.S. economy can maintain the remarkably balanced growth it has demonstrated till now—rising production, incomes and employment in an essentially non-inflationary atmosphere. On this score, some differences of opinion for 1965 are evident among the experts in the Business Week survey. The more cautious among them see the possible emergence of several potentially unsettling developments:

As the expansion continues and tax revenues rise, the federal budget could begin pulling increasing amount of money out of the economy, exerting a deflationary pressure;

Labour negotiations this year, such as those scheduled in the automobile industry, could conceivably result in costly strikes or in costly settlements with an inflationary impact;

Upward price trends could gather momentum if rising demand were to put pressure on existing productive capacity; and

Rising business costs could threaten profit margins in some industries ,and thus slow the strong rise in capital investment.

While these possibilities merit attention, they still remain no more than possibilities at present. Moreover, even the cautious experts foresee at most a mild decline sometime in 1965 — milder, in fact, than the moderate and more frequent dips of the late 1950's—as businessmen appear to have learned well the practical lesson of restraint in such vital matters as price and inventory policies.

On the other hand, the more optimistic opinion—and there is a slight but significant majority leaning in this direction—sees every reason to expect that the present expansion will continue right through 1965. Experts holding to this view point to the following factors:

Changed Trends

Trends that held back production in the late 1950's have changed. A cycle of consumer goods replenishment appears under way, and a new demand expansion appears in prospect from the nation's rising population, notably from the surging teenage and young married group;

An increase in the number of families is in store. Combined with rising incomes, it will support an expanding market for houses as well as consumer goods;

Plans already on business books point to a continued strong rise in spending for plant and equipment at least to the middle of 1965, and as production rates rise in response to growing demand, there could well be a further need for added capacity;

State and local outlays for public services and facilities will continue to increase at a substantial rate, blunting the effects of any hold-back in federal spending.

These experts believe that the nation's rising productivity and productive capacity will exercise a requisite and wholesome restraint on wage and price increases. The very awareness of the need to accomplish this, as witness the Johnson Administration's oft-expressed concern on this score, could in itself act as a powerful discipline, greatly enhancing the likelihood of keeping the economy moving ahead at a brisk and basically non-inflationary pace.

Plan for Petrochemicals

By Our Special Correspondent

NEW DELHI:

IN A report submitted to the Union Government a few days ago, the Planning Group for Petrochemicals has called for a bold policy for the development of petrochemical industries. The Group regrets that "economic and planning organs do not take sufficient account of the achievements of science and technology and do not use these achievements for the accelerated development of those categories of production and branches which are economically the most advantageous and promising". It has drawn the attention of the planning authorities to the fact that new chemical products, such as plastics, can replace scarce items, like steel, and at much cheaper cost and investment. The Group has tried to correlate the adoption of new materials with the rate of economic growth in some of the advanced countries and has reached the significant conclusion that Japan, Italy, West Germany and Austria which have witnessed the most rapid economic growth during the last decade, are also the countries which have taken resort to extensive use of new materials and plastics.

The Group has reassessed the requirements of various petrochemicals in India by 1970-71, including the possibilities of exports, and is of the view that the gaps between the requirements of various petrochemical products and their production from the already licensed schemes will be as follows (in '000 tons):

PLASTICS: Polyethylene 86.6; Polypropylene 5; PVC Resin 48; Vinyl Chloride (for PVC) 85; Polystyrene 15; Methacrylate Resins 8; Polyacetals 6; Vinyl Acetate (non-fibre) 7; Polyurethane 10; Polyesters 3; Epoxy Resins 2; Nylon 2.

SYNTHETIC FIBRES. Nylons 23; Tyre cord 13; Filament Staple 15; Polyester 16; Polyacrylonitrile 16.5; Miscellaneous 30; Polyvinyl Alcohol 10; Polypropylene 10.

SYNTHETIC ELASTOMERS: Polybutadiene 25; Butyl 30; Polyisoprene, EP rubbers, EPT rubbers and Polybutadiene 35; SBR 30.

OTHER ORGANIC CHEMICALS: **Alkylene Oxides:** Ethylene Oxide 3; Propylene Oxide 8. **Alcohols:** Methanol 27; Ethanol 20; Isopropylalcohol and Derived Solvents 1; Phthalic Anhydride 12.4; Maleic Anhydride 2; Aniline 9; Benzene 68; Detergent Alkylate 20; Formaldehyde 57; Carbon Black 20; Dicyclopentadiene 0.5; Vinyl Chloride (non-PVC use) 1; Polybutane 6; Acrylonitrile (for non-fibre use) 10; Methyl Ethyl Ketone 10.

Recommended Capacities

The Group, however, has recommended that on the basis of the available naphtha and natural gas resources, we should aim at the establishment of the following capacities (in '000 tons) during the fourth Plan period: Ethylene 210; Polyethylene 100; Polypropylene Resin (for plastic and fibre) 15; Vinyl Chloride (for PVC) 50; PVC 30; Styrene (for Polystyrene and Copolymers) 25; Polystyrene 18; Methacrylate Resins 8; Polyacetals 6; Vinylacetate (for PVC and Polyvinyl alcohol fibre) 10; Caprolactam (for 25,000 tons of Nylon for fibre and plastic) 33; P-xylene (for 20,000 tons/year Polyester fibre) 17; O-xylene (for Phthalic Anhydride) 21.5; Dimethyl Teraphthalate (for Polyester fibre) 21; Acrylonitrile (for 16,500 tons/year fibre and 5,000 tons/year for other uses) 23; Butadiene (for SBR Plant in Bareilly) 25; Polybutadiene Rubber 25; Butyl Rubber 30; EPT 20; Polybutadiene/Solprene 30; Ethylene Oxide 20; Propylene Oxide 8; Butadiene extraction 12.

Four petrochemical complexes at Bombay, Koyali, Calcutta and Barauni, have been recommended to be set up by 1970-71 at an estimated cost of Rs. 245.9 crores. An additional investment of about Rs. 10 crores has been suggested for some miscellaneous schemes not included in these complexes.

In addition to the petrochemical projects already licensed for the Bombay area, three new schemes have been recommended by the Group for implementation in this complex by 1967. These are: (1) setting up of an 8,000 tons per annum capacity plant for the manufacture of Methacrylate Resins (cost Rs. 5 crores); (2) establishment of a 25,000 tons capacity Polybutadiene Rubber manufacturing unit (Rs. 15 crores); and (3) putting up of an 8,000 tons capacity Propylene Oxide plant (Rs. 1.5 crores).

As many as 15 schemes have been recommended for the Koyali complex. These are:

Manufacturing programme	Capacity ('000 tons)	Investment (Rs. Crores)	Year of Commissioning
1. Ethylene	100	11.3	1968
2. Polyethylene	50	13.0	1968
3. Polypropylene Resin (for plastic and fibre)	15	5.2	1968
4. Vinyl Chloride (for PVC)	50	8.8	1968
5. PVC	30	2.4	1968
6. Styrene (for Polystyrene and Copolymers)	25	5.2	1968
7. Polystyrene	18	3.9	1968
8. Vinylacetate (for PVC and Polyvinyl Alcohol fibre)	10	1.3	1968
9. Caprolactam	15	11.4	1967
10. P-xylene (for Polyster fibre)	8)		1967
11. O-xylene (for Phthalic Anhydride)	) 10)	4.0	1967
12. Dimethyl Teraphthalate (for Polyester fibre)	10	4.0	1967
13. Acrylonitrile	15	5.2	1968
14. Butyl Rubber	30	19.3	1967
15. Polybutadiene/Solprene	30	17.4	1968

For the Barauni complex, the Group has suggested five schemes: (1) Acrylonitrile manufacture to an annual capacity of 8,000 tons to be established by 1967 at an estimated cost of Rs. 3.9 crores; (2) Butadiene (for the SBR Plant at Bareilly) production to the tune of 25,000 tons by 1967 at a cost of Rs. 8 crores; (3) P-xylene and O-xylene manufacture to 11,500 tons capacity by 1968 and an additional 9,000 tons by 1969 at an investment of Rs. 4 crores and Rs. 3.9 crores, respectively (this is an alternative to the two Koyali schemes); (4) Dimethyl Teraphthalate production to 11,000 tons by 1969 at a cost of Rs. 4.5 crores; and (5) Caprolactam manufacture to the extent of 18,000 tons by 1970 at a cost of Rs. 16.20 crores.

Six schemes have been recommended for the Calcutta complex; all to be completed by 1970. These are: (1) Ethy-

lene production 110,000 tons (cost Rs. 12.5 crores); (2) Polyethylene 50,000 tons (Rs. 13 crores); (3) Polyacetals 6,000 tons (cost not yet assessed); (4) EPT 30,000 tons (Rs. 10.7 crores); (5) Ethylene Oxide 20,000 tons (Rs. 1.3 crores) and (6) Butadiene extraction 12,000 tons (Rs. 1.5 crores).

The Group has also projected the requirements for polyolefins, PVC and Polystyrene upto 1975-76 and desires that the production of these three items at the end of the fifth Plan period should be 220-275,000 tons, 210-235,000 tons and 70-90,000 tons respectively. No firm estimates of demand for other petrochemicals have been made by the Group for the fifth Plan period. A further study has been suggested for this purpose.

For meeting the deficits of some petrochemicals in the last two years of the fourth Plan and for catering to the increased requirements during the fifth Plan period, the Group has suggested that a fifth complex should be undertaken in South India in two stages. The first stage of this complex should commence operation in 1969 and should be planned for: (i) production of approximately 30,000 tons a year Acetylene to be converted into 64,000 tons of Vinyl Chloride and 3,000 tons of PVC (the balance 3,000 tons Acetylene may be used for Chlorinated Ethylene, Acetylene Black and for welding); and (ii) manufacture of 40,000 tons a year Methanol and 40-50,000 tons of Formaldehyde. This programme will entail a cost of approximately Rs. 36.7 crores.

Second Phase

The second phase of the South India complex, it has been recommended, should start production in 1963 or soon thereafter. A naphtha cracker to produce 120,000 tons of Ethylene per annum has been suggested for this stage with the following tentative product-mix: (1) Polyethylene 60,000 tons per annum; (2) Vinyl Chloride 64,000 tons; and (3) some quantities of Styrene, EPT Rubber, etc. This programme is estimated to cost Rs. 100 crores.

In view of the demand for petrochemicals expected to grow rapidly during the fifth Plan period, the Group has further opined that it may be economically viable to plan for the manufacture in Northern India from feedstocks to be available from the proposed North Indian refinery.

★★

The Committee on Social Security, set up by the Union Finance Ministry to consider what measures can be taken for mitigating the hardships experienced by the aged, is understood to have reached the conclusion that an immediate start can be made for providing old-age pensions to those who are in need of such assistance. It has drawn up a model scheme on the basis of the Madras legislation for grant of old-age pensions. The scheme, it is further learnt, has been approved by the Ministries of Finance and Labour and the Planning Commission.

The scheme envisages payment of a pension of Rs. 20 to every destitute over the age of 65, and also to destitutes incapacitated from earning a living if they are over 60. Care has been taken to see that the procedures evolved for verification of claims and payments of pensions do not cause inconvenience to the claimants.

The Committee has also opined that some assistance at a reduced scale may as well be given to those who are partially destitute or have very meagre sources of income, but thinks that consideration of such cases may be taken up only at a later stage.

Assuming that 10 per cent of the Indian population belongs to the age-group over 65, the implementation of the scheme in 1964-65 is expected to cost Rs. 29 crores. The cost will go up to Rs. 30 crores in 1965-66. A total sum of Rs. 59 crores, therefore, will have to be provided for granting old-age pensions during the terminal two years of the current Plan. The total cost of implementing the scheme during the fourth Plan period is estimated at Rs. 160 crores — Rs. 32 crores per annum.

In view of the national importance of the scheme, the Central Government, it is understood, will offer 50 per cent of the cost of implementation to the States.

★★

The Union Government, it is understood, has drawn up a provisional programme for raising coal production during the fourth Plan period to 154.5 million tonnes. According to an assessment made by the Planning Group on Coal, the requirements of steel and merchant cokeries are expected to go up by 1970-71 to 48 million tonnes of coking coal and 8 million tonnes of blendable coal. The demand for non-coking coal by industrial consumers and for brick burning and domestic purposes is estimated to go up to 98.4 million tonnes. These estimates, however, are again under scrutiny. The possibility of their undergoing some change is not ruled out.

In the light of the decision taken sometime ago to link the requirements of coal consumers, particularly the major ones, to specific coalfields, a technical committee has been set up to go into, in the first instance, the question of linkage of the requirements of steel plants and washeries to particular collieries. This it is doing for the time being for the last year of the fourth Plan. The phased programme for the fourth Plan as a whole is proposed to be drawn up later.

With a view to judiciously utilizing the available metallurgical coal reserves, the Union Government has also tentatively drawn up a list of washeries which will be set up during the fourth Plan period. According to the present thinking in official circles, all these new washeries are to be in the public sector. It is proposed to establish by the end of the fourth Plan a washing capacity of 44 million tonnes input which will give an output of 22 million tonnes of clean coal. The availability of middlings in 1970-71 is expected to go up to 13.6 million tonnes in Bengal-Bihar coalfields and to 0.73 million tonnes in the outlying areas. These anticipated supplies have been provisionally linked with the fuel requirements of the thermal power station. For providing adequate facilities for coal movement in the latter part of the fourth Plan, feasibility studies have been instituted on laying of coal pipelines.

Meanwhile, if the present slackness in demand for coal continues during the terminal two years of the current Plan, it is felt that actual production of coal in 1965-66 may be of the order of only 85 million tonnes as against 90 million tonnes estimated in the mid-Plan appraisal. The industry, however, will have by the end of the third Plan a capacity to produce much more than 85 million tonnes. The production of coking coal is expected to go up to 22.3 million tonnes in 1965-66, as against the anticipated demand of 18.52 million tonnes. In view of the increased production of coal and the necessity to earn foreign exchange, the Union Government has decided that 0.5 to one million tonnes of superior grade of coal per annum may be allowed for additional export. A proposal to export 266,000 tonnes of coal to Burma during the current financial year is stated to be under negotiation with the Burmese Government. The present coal export programme is as follows:

i) 1.56 million tonnes agreed to be supplied to Pakistan under Indo-Pakistan Agreement;

ii) 30,000 tonnes to be supplied to Japan under ad hoc arrangements; and

iii) 50,000 tonnes to be supplied to Nepal also under ad hoc arrangements.

The actual exports of coal during 1963, however, were about 1.1 million tonnes, as against 1.2 million tonnes in 1962.

★★

Addressing a Press Conference here soon after his return from Geneva, where he attended the Ministerial Session of the U.N. Conference on Trade and Development, the Union Minister for International Trade, Mr. Manubhai Shah, expressed the hope that a co-ordinated international policy on trade and development would emerge from the Geneva deliberations. He evinced a sense of gratification over the fact that there was a wide understanding on the part of the industrialised countries on the need and urgency to solve the problems of the developing nations.

Dwelling at length at the proposals made by the Indian delegation for fostering world trade and development of the backward nations, Mr. Shah disclosed that India had taken the line that the proposal of the socialist countries to set up an international trade organisation was impracticable, if for no other reason than for the difficulties of drawing up a statute for it and the necessity of getting this statute ratified by the Parliaments of the member countries. As an alternative, India had suggested a radical revision of the GATT Charter and making of the current World Trade Conference a permanent body under the auspices of the United Nations.

On revision of the GATT Charter, Mr. Shah said, India's proposal was to make the GATT responsive to the requirements of the socialist as well as the developing countries. He expected that Poland would soon become a full-fledged member of the GATT, paving the way for the other socialist countries to come into this organisation. India, Mr. Shah further stated, had pleaded for simplification of the GATT contract to make it easily understandable to the emerging nations.

The reorganisation of the GATT alone, Mr. Shah said, would not solve all the problems of world trade. There would still remain a number of problems and issues, such as non-tariff barriers and financing arrangements for trade which the GATT would not be able to tackle. India, therefore, had suggested that a new machinery should be created for this purpose in the shape of making the present World Trade Conference a permanent body. The work of the Conference should be conducted by a Standing Body of 34 members so constituted as to reflect the geographic and economic composition of the U.N. The Standing Body should have its own regular secretariat and a commission of six experts authorised to review any trade problem submitted to it by any nation and to make its recommendations to the Conference. It should also have four sub-committees to assist it. These sub-committees would deal with commodity prices, financing and expansion of trade, industrial planning and shipping and invisible exports.

The Indian delegation, Mr. Shah further stated, had laid particular emphasis on the stabilisation of prices of primary products and raw materials, which figure prominently in the exports of developing countries, at fair and remunerative levels. This should be done by abolishing all tariffs and quota restrictions on these commodities by the developed nations and fixation of support prices. If prices fell below the support levels, the exporting countries should become eligible for monetary compensation from a trade development fund to be financed through contributions from the purchasing nations, levy of a small cess on international transactions in these commodities, sales from stockpiles, contributions by the exporting countries in the form of some notional insurance premia and loans by International Monetary Fund. It had been urged that support prices should be so fixed as not to lead to uneconomic production and unnecessary search for substitutes.

India, Mr. Shah added, had also suggested that terms of trade should be readjusted so that they did not remain as heavily weighted in favour of the industrially advanced countries as they were at present. Another point emphasised was that in the interest of industrialisation of the under-developed countries, the manufactures of these countries should be accorded a preferential treatment in matters of tariff and quota restrictions by the developed nations vis-a-vis similar manufactures of the industrially advanced countries. It was also urged that the developed nations should not insist on reciprocity from the under-developed countries in matters of preferential tariffs. India, Mr. Shah revealed, was willing to surrender Commonwealth preferences if there was a general agreement on according preferential treatment by the developed countries to imports from the under-developed ones.

★★

An ambitious expansion programme has been proposed for the Neyveli Lignite Corporation under the fourth Plan. It aims at not only enlarging the power generation and fertilizer production capacities of this public sector undertaking, but also going in for the manufacture of methanol as a by-product from the Briquetting and Carbonisation Plant.

The Corporation's scheme to expand the power generation capacity from its existing power station from 400 MW to 600 MW has been even approved by the Planning Commission in principle. There is a proposal to increase the power generation capacity further to 1,200 MW by installing a second power station of 600 MW. The expansion of the existing unit from 400 MW to 600 MW is expected to cost Rs. 22.65 crores, out of which expenditure to the tune of Rs. 12.55 crores will have to be incurred in foreign exchange. The setting up of the second 600 MW power station is estimated to cost Rs. 62 crores. The foreign exchange component in this outlay will be Rs. 31 crores.

As regards expansion of the fertilizer manufacturing capacity, two alternatives have been proposed. The first alternative aims at raising the production of urea from the currently-being-installed capacity of 154,000 tonnes to 204,000 tonnes per annum at an estimated cost of Rs. 2.7 crores (foreign exchange components Rs. 1.2 crores). The other alternative proposed is to undertake the manufacture of 33,000 tonnes of nitrophoska annually in addition to 154,000 tonnes of urea. This scheme is expected to entail an expenditure of Rs. 1.89 crores, with a foreign exchange component of Rs. 50 lakhs.

The expansion of the power generation and fertilizer manufacturing capacities of the Corporation, as proposed, will necessitate opening up of a second mine-cut for yielding 7 million tonnes of lignite per annum. The present cut, it is thought, can be economically exploited only to yield about 5.5 million tonnes of lignite. The opening up of second cut is also considered necessary for meeting the fuel requirements of the proposed Salem Steel Plant. The second mine-cut is likely to cost Rs. 45 crores, of which Rs. 25 crores will be the expenditure in foreign exchange.

The proposed methanol manufacturing programme is estimated to involve an investment of Rs. 5.03 crores, with a foreign exchange component of Rs. 1.95 crores. The Plant will have a capacity to produce 33,000 tonnes of methanol per annum. This methanol will be combined with urea to form formaldehyde which is a base for plastics.

All the above proposals are stated to be under consideration in New Delhi.

★★

During the past two weeks, the U.S. Government has extended rupee credits totalling Rs. 6.5 crores to 13 Indian firms. All these enterprises have U.S. participation in their equity capital. The credits, made available under the Cooley amendment to the U.S. Public Law 480, will help in increasing the production of aluminium, antibiotics, electric apparatus, refrigerant gases, ice-making and air-conditioning equipment, steel tubes, sulphur products, glassware, carbon products, motor tyres and tubes, polyvinyl chloride plastics and resins,

shock absorbers and processed shrimp and fish.

The increased production of these commodities should not only considerably reduce the import bill, but may also help in earning some foreign exchange through exports of part of the output.

The recipients of the credits are: (1) Hindustan Aluminium (Rs. 1 crore); (2) Synbiotics Ltd. (Rs. 1.3 crores); (3) Elpro International (Rs. 40 lakhs); (4) Everest Refrigrents (Rs. 60 lakhs); (5) Frick India Ltd. (Rs. 25 lakhs); (6) Bharat Steel Tubes (Rs. 25 lakhs); (7) The IA & IC (Pvt.) Ltd. (Rs. 5 lakhs); (8) Borosil Glassworks (Rs. 71 lakhs); (9) Graphite India Ltd. (Rs. 69 lakhs); (10) Madras Rubber Factory (Rs. 50 lakhs); (11) Chemicals & Plastics India Ltd. (Rs. 33 lakhs); (12) Gabriel India Ltd. (Rs. 14 lakhs); and (13) Cochin Co. (Pvt.) Ltd. (Rs. 23.7 lakhs).

★★

In pursuance of the Indo-Kuwait joint communique on expansion of trade and economic co-operation between the two countries, issued a few days ago, a four-member Indian delegation of technical experts on metallurgical and engineering industries will be leaving for Kuwait by the end of this month to survey the possibilities of collaboration in trade as well as in industrial ventures in these categories of goods. The delegation will be headed by Mr. V. Kamakrishna. The Indian exhibition currently being held in Kuwait is stated to have proved a great success. It is hoped that it will soon lead to concrete proposals being put forth by entrepreneurs in the two countries for establishment of various industries in India and Kuwait. The Kuwait Government will be sending a number of business representatives and trade officials to India in the next few months for discussion with their prospective Indian collaborators.

The Minister for Foreign Affairs of Kuwait, Sheikh Sabah Al-Ahmed Al-Jaber, who came here last week to explain to the Government of India the decisions of the Arab League's Cairo Conference of January, 1964, in regard to the Palestine problem, also had discussions with the Union Ministers for International Trade and Petroleum and Chemicals on strengthening economic relations between India and Kuwait.

★★

The Esso Standard Eastern is currently holding an exhibition here to show how its oil refining venture at Trombay has helped in saving valuable foreign exchange for India not only through processing of crude, but also through fostering the development of many ancillary industries and training of Indians in oil technology. The exhibition has been arranged with the laudable objective of impressing upon the visiting US industrialists the capabilities of Indian technicians to rise to new tasks. The experience of Esso — itself an American company — should go a long way in inculcating US investors' interest in the economic development of India. Particular mention needs to be made of the section in the exhibition which displays a number of engineering items still being imported by Esso. With the rapid growth of the oil industry in India in the next few years the demand for these goods should go up substantially. Some of these lines of manufacture should interest the US investors.

★★

The Joint Plant Committee has announced an increase of Rs. 10 to Rs. 30 per tonne in the prices of various tested varieties and an increase of Rs. 5 to Rs. 25 per tonne in those of the untested products belonging to the decontrolled categories of steel. The enhanced prices are being charged on all despatches sent out by steelworks on or after April 13, 1964.

The upward revision in the prices of these categories of steel has been effected in the light of the price trends after price and movement controls were removed from them on March 2, 1964.

The following table gives the new prices for the various decontrolled items of steel. The prices which prevailed before April 13 are given in brackets:

(In Rupees per Tonne)

Steel Items	New base† prices F.O.R. rail-head destination, effective from April 13, 1964. Pre-April 13, 1964, prices are given in brackets. Tested	Untested

FINANCE FOR SMALL SCALE INDUSTRY? NOT A DIFFICULT PROBLEM

Are you having financial difficulties in running your plant? Or is it that you want additional raw materials to manufacture more—or some money to keep your plant running till you get enough from your sales?
Or it might be that you want a machine or two, to increase your production or to raise your status as a small scale industrialist.
Why not take your problem to the State Bank Agent who will be glad to assist you in all matters connected with your industry? Your security for finance is not the main consideration—what the State Bank seeks is your sincerity and capacity to produce more.
With over 1500 offices throughout the country THE STATE BANK OF INDIA AND ITS SUBSIDIARIES are at the nation's service.

Three Cheers for the Merchant Navy

From Our Correspondent

BOMBAY:

WHOEVER WAS responsible for conceiving the idea of making a beginning with the celebration of National Maritime Day by India deserves to be congratulated obviously. Once the idea came, happily, it seems, no time was lost in indulging in such sentimental considerations as to whether the Day marked the completion of a decade or a generation or some such traditional passage of time. What was necessary was to give a start and this has been done. It is all that really matters.

After the decision was taken, there must have been long deliberations on how best to celebrate the Day. Naturally everyone has his or her own ideas on a subject like this, but, from the innumerable messages received on the occasion, it was clear that, on one point, at least, opinion has been singularly unanimous, namely that there could be no better way of celebrating the National Maritime Day than giving attention to problems connected with the life and service of our seamen. But the occasion was too important not to recall the struggles of Indian shipping during the pre-independence days or not to take stock of the achievements since independence. The three main speeches made on the occasion, namely by the Union Minister for Transport, Mr. Raj Bahadur, the Chairman of the First National Maritime Day's All-India Celebrations Committee, Mrs. Sumati Morarji, and the grand old man of shipping, Mr. M. A. Master whose active association and devoted service to the cause of Indian National Shipping were publicly recognised, dwelt on all these aspects. The reminiscences of Mr. Master on the occasion especially took one not only through the struggles of national shipping to establish itself but also the significant role played by Mr. Master — which is not so well-known — in securing benefits for Indian seamen. The credit for building up a highly qualified and fully capable force of officers and engineers for manning efficiently and running economically the ships of Indian merchant navy must go to the sponsors of the move for establishing the Training ship the "Dufferin" in 1927 like Mr. P. T. Sivaswamy Iyer. It would be ungrateful not to recall the distinctly pro-Indian stand taken even in those days by people like Sir Joseph Bhore to Indianise shipping services by encouraging the appointment of Indian cadets. Several names stand out when one recounts the romantic saga of the struggles of Indian shipping, commencing from J. N. Tata, Chidambaran Pillai, Narottam Morarji, Shoorji Vallabhadas and Walchand Hirachand, all of revered memory. To this illustrious list must be added the names of many of those who are fortunately still with us and who have been carrying on the traditions of their distinguished predecessors. It is a great pity that many of these were not present at the function. Those whom one particularly missed include Mr. C. H. Bhabha, Sir Ramaswamy Mudaliar, Mr. G. L. Mehta and Mr. S. N. Haji. The last of these, whose name will always remain associated with his memorable work for reservation of coastal traffic to Indian ships, it was learnt at the function, had breathed his last only a few hours prior to the function.

To the vigour of the veterans of old in the field is now happily added the dynamism of the new entrants. Thanks to intelligent understanding and willing co-operation between

the shipping interests and the Government, the country's mercantile marine has already exceeded the 1.5 million-ton mark, as per the estimate of Mr. Raj Bahadur. The Union Minister for Transport justifiably took some pride — and he is certainly entitled to it by reason of the active role played by him in building up of the Indian Mercantile Marine — in mentioning that the Government today has already begun to think in terms of a 2.5 million-ton target by the end of the third Plan period. This is more than what the National Shipping Board and the Planning Commission were prepared to consider as feasible. And what is gratifying is that this increased tonnage is also going to constitute a more balanced national fleet.

★★

Of great importance to the decentralisation of industries in the Maharashtra State is the project which is taken on hand to construct a bridge across the Thana Creek. The project, entirely financed by the Maharashtra Government would consist of a four-lane bridge across the creek and six-mile approaches, consisting of a four-lane divided highway between the Sion-Trombay road in Bombay city and Thana-Belapur road on the mainland. The project would cost Rs. 407 lakhs. The Thana Creek, with its marshy banks running north-south and separating Bombay suburbs from the near mainland on the east, had impeded proper expansion and development of Bombay and substantially contributed to the present congestion. All the heavy traffic between the south and the island of Bombay had to take a long north-south detour for crossing the Thana Creek via the existing bridge at Thana. Therefore, one of the solutions to the problem of traffic and population congestion lay in the opening out of new areas on the mainland across the Thana Creek within the easy reach of the city. This would be made possible by the construction of this bridge.

★★

At the annual general meeting of the Ahmedabad Millowners' Association at Ahmedabad, the President, Mr. Kanchanlal Parikh, gave a succinct account of the performance of the textile industry and its present problems. It was ironical, in his view, that whereas the cotton textile mill industry had been requesting the Government since May, 1963 to allow, under its voluntary price regulation scheme, a rise in cloth prices, which had become necessary owing to the increase in cost of production at various levels, the Finance Minister had thought it fit to collect Rs. 7 crores or more by way of rise in excise duty on cloth, thus increasing the price of cloth to the consumer. He pointed out that the rise in cost of production in the industry continued and the over-all increase in 1964 was estimated to be about 14 per cent over the 1961 level. Higher prices of raw cotton, heavier wage bill, increase in cost of stores, and chemicals, rise in fuel and power cost, enhanced railway freight, Emergency Risk Insurance premia, additional taxation by the Central and State Governments — all had contributed to the rise in the cost of production. He added that the revision of tariff on electricity had increased the bill of Ahmedabad mills by Rs. 50 lakhs. He expressed his regret that in spite of the persistent demand of the consumers, the State Electricity Board had still not decided to constitute a rating committee to probe into the matter.

Referring to the proposal to propagate the increased use of staple fibre in the textile mills by compulsory blending of from 10 to 20 per cent of staple fibre with cotton, Mr. Parikh observed that though this had been advocated with a view to saving foreign exchange, on closer scrutiny of the economics of the problem, it was revealed that the notion that the use of staple fibre would result in saving of foreign exchange, was not based on sound reasoning. Blending of staple fibre with cotton between 10 and 20 per cent was possible in counts 20s to 40s with consequent fall in strength of the yarn. Such blended yarns were normally used in this country to manufacture heavier type of fabrics like coatings. This was done not with a view to reducing the price of the yarn but for improving the appearance and feel of the cloth. The present prices of indigenous staple fibre are very close to the prices of Egyptian cotton used in 70s yarns. Therefore, one could easily see how these blends would affect the price of cloth of this type. Besides, if the use of blended yarns was to be made compulsory, there would be a tendency towards manufacturing heavier fabrics, which would give less yardage to a pound of yarn consumed and therefore, the overall requirement of cotton per yard of such fabrics would go up. The correct solution to reduce imports of cotton would be that out of 8 lakh bales of cotton imported at present, if imports of long staple cotton are increased by about 2 lakh bales, the yardage manufactured out of this quantity would be much greater.

The other important point to which Mr. Parikh referred was the phenomenal growth of the powerloom sector — particularly of unauthorised powerlooms — and the serious problems which it created for the textile mills. On the estimated production of 2,000 million yards in 1961-62, the total amount of excise duty collected from the powerloom sector was Rs. 95 lakhs which worked out hardly to 0.5 nP. per yard as compared to 30 nP. per yard payable by the mill industry on similar pattern of production. Thus, he said, the Government lost on an average over 30 nP. for every yard of cloth produced in the powerloom sector and the overall loss of revenue to the Central exchequer by way of lower incidence of excise duty on powerlooms was to the extent of Rs. 60 crores per year. He hoped that the Asoka Mehta Committee on powerlooms which was examining the problem would consider all the aspects of this question.

★★

The growing role of the Refinance Corporation for Industry in providing refinance to the various industrial sectors was stressed here by its Chairman Mr. P. C. Bhattacharyya, in his address to the sixth annual general meeting of the Corporation. He referred to the rapidly increasing demand on the resources of the financial institutions. This fact, he said, was strongly emphasized in the mid-term appraisal of third Plan where it was pointed out that in the remaining two years of the third Plan as well as subsequently the investment effort would have to be substantially stepped up and that lacunae in our industrial sector would need to be filled in with as much expedition as possible having regard to the human and material resources of the country. In order to meet this objective, certain preliminary steps have been taken by the Government in the shape of physical concessions and various procedural reforms have already been announced to accelerate industrial expansion and to encourage the flow of resources into those specific industries the growth of which would help to complement the existing industrial structure and lay the foundation for a stronger economy. Besides, a Bill has also been introduced in the Lok Sabha for setting up the Industrial Development Bank of India to expand and co-ordinate the assistance extended by financing institutions, including banks, in the field of industrial finance.

In this connection, Mr. Bhattacharyya welcomed the provision in the Bill for the take-over of the Refinance Corporation by the Development Bank at a future date. He expressed the hope that the banks would handle during the current year, a sizable volume of medium-term export credit of which a part would come to the Corporation for refinance. This was based on the creditable performance in the field of exports in 1963 including the export of a number of relatively new commodities. He also revealed that the Government is considering proposals which would facilitate increased provision of medium-term export credit by banks. One such measure was the insurance of such credits against certain classes of risks which were not previously covered. The Corporation has recently obtained an additional loan of Rs. 2 crores from the Government on top of the allotment of Rs. 26 crores made out of PL 480 funds and he has also received an assurance that further resources would be made available from the Government to enable it to entertain fresh applications for refinance.

★★

There is hope for the under-developed areas in the south of Maharashtra (Konkan Region) to have a rail communication in the near future. Mr. Ratan Lal,, General Manager of the Central Railway, broadcasting from the AIR at Bombay in connection with the 111th anniversary of the Indian Railways this week, revealed that considerable progress had been made in the construction of the 33.69 mile long Diva-Panvel-Uran railway estimated to cost Rs. 304 lakhs. According to the present expectations, the Diva-Panvel section would be opened to goods traffic in October this year and two months hence to passenger traffic. He also said that the project for the electrification of 191-mile-long Igatpuri-Bhusaval section, at a cost of about Rs. 18 crores was in progress and the first phase from Igatpuri to Nandgaon would be completed by March, 1966 and the second phase by December of that year. He expected that Umrer coal-fields would be provided with rail transport facilities by April next. On the whole, he observed, the railways were well set to meet transportation needs in the context of our developmental economy

★★

Small-scale industries have come into their own only in the last three years. In spite of the importance attached to this sector, there is continuous stress and strain in the matter of fair allocation of raw materials to small scale industries. Mr. S. G. Barve, State Minister for Industries, who was speaking at a reception given to him by the Maharashtra State Co-ordination Committee of the Federation of Associations of Small Industries of India, stated that he would take up with the Government of India the question of fair allocation of raw materials. He suggested that there should be an agency for ensuring quality and standards of the goods turned out by the small scale sector. Mr. A. R. Bhat, President of the FASII urged for an early increase the allocation of foreign exchange for import of raw materials for small industries from Rs. 12 crores to Rs. 16 crores. He also pointed out that the small units in the State were not getting their due share of the defence orders.

★★

Addressing the Central Committee of the All-India Manufacturers Organisation in Bombay recently, Mr. William Clark, Director of Overseas Development Institute, London, mentioned that his Institute was studying the issue of how the mode and content of foreign aid should be adjusted to ensure the efficient use of it and was also trying to find out whether aid facilities inhibited initiative in certain spheres. Elaborating the aspect of better utilisation of aid, he said, at present huge outlays were planned on various projects by the developing nations in anticipation of foreign aid. But subsequently, the aid was pruned by the donor nation and not used fully by the recipient nation. It would therefore be more realistic if the two parties meet even at the initial stages and arrive at mutual agreements in respect of phased utilisation. Further, he was of the view that aid giving nations should co-operate with the developing nations even in drafting the development plans. There was also need to change the present mode of giving annual aid for plans. The donors should take note of the nature and time schedule of the projects and provide long-term facilities suited to the needs of the recipients. In fact, the British Government was considering a scheme for grouping all aspects of foreign aid under a single Ministry. While suggesting that India should develop an efficient marketing system to effect more substantial sale of her commodities through private initiative rather than through government channels, he said that there were no immediate prospects of trade substituting aid as desired by the developing nations.

Sugar Control Snags

From Our Correspondent

CALCUTTA:

THE UNION GOVERNMENT'S latest move to control the internal distribution of sugar (through the proposed marketing board) and exports (through the State Trading Corporation) has not been greeted with any marked enthusiasm, even among the consumers. As the Indian Sugar Mills Association correctly interprets it, the decision to set up the marketing board (which the Economic Sub-Committee of the Union Cabinet is already reported to have approved) will mean the perpetuation of controls, which are justly unpopular. It is impossible to see how a marketing board can ensure better distribution of a commodity which has been in short supply; people do not get cement more easily because its internal distribution has been controlled. On the other hand, the usual corruption and malpractices associated with controls have noticeably increased. The Indian Sugar Mills Association has, therefore, done right in opposing the formation of the marketing board, although it runs the risk of being misunderstood in doing so. Controls are no answer to shortages, even in the short run. They rather tend to perpetuate shortages by destroying all incentives for higher production, lead to flourishing black markets and the consequent harassment and suffering for the consumer, and breed corruption among officials.

The more important economic point, from the long-term point of view, is that the contemplated marketing board, which will no doubt find reasons to perpetuate itself will adversely affect the country's sugar economy. By rigidly controlling the ex-factory price of sugar and channelling distribution through official agencies, the new measures will not stimulate growth and expansion of the sugar industry for two reasons; firstly controlled marketing does not lead to an expansion of the market and secondly, it deprives the industry of resources to finance its expansion. The current pricing formula does not give much hope that the Government's pricing policy will be more realistic than it has been so far. Mere setting of targets — 3.5 million tons by the end of the third Plan and 4.5 million tons by the end of fourth Plan — does not automatically ensure their realisation, without the pricing policy of the Government acting as a sort of steering mechanism. So far, the Government-controlled prices have put production in the reverse gear in the industries in respect of which they operate.

The new marketing board will only concern the sugar industry, and not the gur and khandsari units, which are its rivals. If no corresponding controls are imposed in their case (this could be indirectly done by raising the minimum price for cane to a suitable extent without giving up the present formula of linking prices to quality), the present equilibrium in the industry will be upset. If the Government must proceed with the proposed marketing board for sugar, the least it can do to accommodate the objections of the industry is to associate the industry's representatives with the proposed

marketing body so that no decision is taken to unfairly and improperly penalise sugar manufacturers. This is what the Indian Sugar Mills Association has also demanded. The Association has not expressed its reaction to the Government's decision to hand over the responsibility for sugar exports entirely to the State Trading Corporation. But the claim made on behalf of the new arrangement that it will lead to more sugar exports may turn out to be a tall one. In spite of all that is being said about the wonders which the STC is supposed to have performed in the ore export field, its record really is not such as would inspire great optimism about its capacity to perform miracles in other fields. It, however, needs to be recorded that the Indian Sugar Mills Association did not do a bad job. In fact, its record of the export of sugar is wholly creditable.

**

The problems of the coal industry continue to receive wide attention — not only from the World Bank which has advanced it a loan of Rs. 17 crores, or the industry which must necessarily be pre-occupied with its problems, but from other interest as well. Views, however, vary as to the nature of the problems now facing the industry. For example, Mr. N. L. Jalan, President of the Indian Colliery Owners Association, has approached the present problem of over-production from a refreshingly new angle. In his view, there is over-production of selected grades as well, not only of the inferior varieties, which is the common view. But he does not advocate any drastic restriction on production; his remedy, naturally, lies in exploring new lines of consumption. The countryside is at present consuming as fuel huge quantities of cow-dung, firewood and vegetable wastes, which are a national waste, because they can be put to more profitable uses. Cow-dung and vegetable wastes can be used as manures for raising food production. In their place, inferior coal can be be used as fuel and once the Government sets up machinery to ensure adequate supplies of such coals to rural areas, the present problem of over-production will have disappeared. Similarly, the present pattern of consumption as a whole is irrational. Mr. Jalan has given some extremely interesting statistics on this point. Out of the estimated deposits of 51,312 million tonnes up to a depth of 4,000 feet, selected grades from 2 per cent, medium grades (consisting of grade I and II, coking and non-coking) 7 per cent, and inferior grades 91 per cent. With these reserves, the present pattern of consumption of different grades shows 26 per cent of selected grades, against a reserve of 7 per cent, whereas the consumption of lower grades amounts to 12 per cent of the total against a proportion of 91 per cent of the total reserves. Mr. Jalan adds: "The position becomes further aggravated if we take into account various factors like the less volatile matter with depth, deterioration in quality due to intrusions, the level of technology, and the locking up of a fair percentage of reserves under townships, roads, railway lines and other surface features. This disquieting revelation would have been enough to prompt our Government to strictly restrict the production and consumption of selected grades and to recast the schedule of gradewise allocations for various industries in the light of proved reserves".

If timely action is not taken, the proved reserves of selected grades of coal may get exhausted sooner than expected. For example, during the past year out of a total production of 17 million tons of coking coal, eligible users consumed only 12 million tons. The rest, it is to be presumed, was used for non-metallurgical purposes. According to Mr. Jalan, diversion of superior grades to inappropriate uses is still going on unchecked. As long as the present system of allocations for use of coal for industrial purposes remains as it is, a fair percentage of output of superior grades will find its way to non-scheduled consumption. Mr. Jalan has given the example of brick burning, and a few other similar uses. For these purposes, coal of lower grades can be used without any loss in quality. But Grade I coal has been allowed to be used to the extent of 31 per cent of total supplies of coal under "BRK" category during 1963. The World Bank experts who some time ago studied the coal economy of India found a large variety of wasteful uses. The root cause they found lay in the pricing system. By pegging the prices at unrealistically low level, the Government had encouraged wasteful uses, as the price did not reflect the intrinsic value of various grades of coal, but merely what the consumer has to pay to get his supplies in any manner he pleases. But the latest price revision for certain grades has not produced a happy solution; it has led to heart-burning in quarters who feel they have been unfairly discriminated against.

Nightmare of Power Shortage

From our Correspondent

MADRAS:

EVEN WITH the spectacular progress made by the Madras State in respect of power generation, it is now apprehended that the summer months might again cause anxiety and it may not be possible to avoid a cut in power supply in the absence of an early monsoon. A few days back, Mr. R. Venkataraman, Madras Minister for Industries, actually observed that it might not be necessary to effect a power cut in this summer as two units in Kundah Power House I and II had been inaugurated and the fifth unit in Neyveli was also expected to be commissioned shortly. The additional generation of power by two new units having a capacity of 55 mW at Kundah is no doubt helpful as available water resources will be harnessed more effectively. In fact, it is expected the remaining units in the Third stage of the Kundah Project will come into operation by the end of next year and that the availability of power would be considerably augmented if only the lake gets filled up suitably.

Unfortunately, two adverse developments in recent weeks have had an upsetting effect on the calculations of the Madras Electricity Board. For some time the supply of power from Neyveli was much lower than the usual quota as some adjustments had to be made in regard to the conveying of lignite to the power house. This has necessitated the use of hydel capacity to a greater extent than expected with the result that nearly one week's storage had to be utilised for meeting the demand for power which is estimated to be 24 per cent higher than the consumption during this period last year. This phenomenal growth in consumption has been brought about by the coming into being of new industrial units. Besides, the utilisation of electricity for agricultural operations has expanded in an unexpected manner and there is no longer any need for the hesitation noticeable in some quarters about the large power generated by hydel stations in the latter half of this year being absorbed. The generators in the first stage of the Mettur Tunnel Scheme will be commissioned in the third quarter of this year and the delay experienced in the receipt and erection of some parts of machinery is not expected to upset the schedule seriously. The problem of power supply will not, however, present any serious difficulties in the latter half of this year as the hydel reservoirs will be full especially as the fourth unit at Periyar also would be ready.

Fortunately, Neyveli is the mainstay and arrangements are being made to increase power generation even upto 300 mW, even though the installed capacity will be only 250 mW. Even now it is stated that four units have been regularly giving an output of 210 mW every day and the basic load has been taken care of by the Neyveli thermal station. The fifth unit will be coming into operation at a crucial stage. It is, however, felt that Kundah may not be able to fulfil general expectations as the continued drought in the Nilgiris has led to a rapid depletion of the water storage in both Pykara and Kundah while the Mettur power station is out of commission. The level in Periyar too is not satisfactory. If there are summer showers and there is early onset of the monsoon, the difficult situation may yet be got over. But the position will become clear only by the end of May. If a cut is to be imposed, it may not be so severe as last year. This only underlines the need for firming up further the Madras grid by creating additional thermal capacity.

The work of construction on the Kodayar Project in Kanyakumari district has started and it is expected that this project which will cost Rs. 8 crores will be completed in the next three or four years. The scheme has been ingeniously designed, the catchment areas at two different levels in the mountain range being effectively tapped. There will be two dams so that available water resources could be effectively stored. The waters of many streams will be gathered in the lakes through a series of tunnels and it is expected that the power units in both the stations would have a capacity of 100 mW. There are plans for starting some more medium-sized hydel projects in the Madurai and Tinnevelly districts.

**

Iron ore has been very much in the news latterly and it is encouraging to know that Andhra Pradesh and Mysore State will be able to export large quantities of this valuable mineral to Japan and East European countries. In fact, it has been argued that the potentialities of developing the export trade in iron ore from this part of the country have not been adequately realised and developed and that much trade has been lost by the inability of the transport system to handle larger quantities of ore. The Visakhapatnam port is even now the largest outlet for exports of ore from Andhra Pradesh and mines in Orissa. But it has not been possible to promote the trade on the anticipated scale because of the delay in developing the ore mines and the difficulties encountered in expanding port facilities. Some engineering problems had to be encountered. But it is now expected that with the new facilities, the port would be able to export additionally one to two million tons annually.

The Madras port is even now accounting for export of 1 million tons yearly while the Cuddalore port also would handle fairly large quantities. The Madras port has a scheme for installing a mechanical loader as it has been found that the existing semi-mechanical loader is unable to handle the traffic in iron ore available and ships calling at the port cannot be cleared as quickly as desired. Now it has been pointed out that there is no prospect of stepping up ore exports significantly if the new scheme for installing a fully mechanised loader is not taken up early. The port authorities have submitted a scheme which would cost Rs. 3 crores. It can be easily implemented as the full details have been drawn up and much preliminary work also has been completed. There will also be no problem of finding the required foreign exchange as out of the World Bank loan sanctioned for the implementation of the expansion of Madras Port a large amount has been saved and it has been suggested that this amount could be applied for implementing the new scheme. Somehow, the sanction of the World Bank has not been forthcoming. Meantime, valuable export earnings are being lost. Why at all there should be delay in giving the necessary permission for proceeding with the scheme is not clear. It is hoped that this project will be taken up early. Meantime, the Cuddalore port is being expanded, while the Mangalore port after completion, would be able to handle additionally two million tons of ore. The main source of supply will be the Bellary-Hospet region in Mysore where iron ore of rich quality is available. In order to facilitate movement of ore, the metre gauge railway system is to be dieselised while there are proposals for connecting ultimately Hospet with Marmagao with a broad gauge track so that the exports from this port could be stepped up to 10 million tons from the present level of six million tons annually. The capacity of the broad gauge track connecting the Hospet area has been considerably increased and diesel locomotives are being employed for moving large quantities of ore for being exported from Madras. The dieselisation of the metre gauge system in order to step up exports from Cuddalore, will also be completed shortly as the necessary arrangements are being made at Guntakal for stationing diesel locomotives. It is emphasised that diesel locomotives would be able to do the work of 2½ steam locomotives and that the problem after some time will relate to the handling of the quantities of ore received at the port points. Since there is also a scheme to develop the Tuticorin port and connect it with Trichy by the broad gauge system, if new iron ore deposits are found in the Coimbatore or Salem area, it may happen that between Tuticorin, Mangalore, Marmagao, Madras and Cuddalore additionally, 10-12 million tons of iron ore could be exported early. This would mean an increase in foreign exchange earnings by over Rs. 50 crores which will be in no small contribution to the total of export earnings. This increase in offtake of ore can be achieved within the next three years. No time should, therefore, be lost in implementing the various schemes.

**

The new amendment to the Madras Rice Procurement (Levy) Order which compels the licensing of wholesalers and millers in the rice trade, has been resented by the interests affected. It is felt that the interference with normal trading practices will hamper the transaction of business and that the consumers' interest would not be protected to any extent. Even after the modification of some of the terms of the new order there was a hartal on Friday by millers and wholesale dealers in rice. As supplies from Andhra Pradesh also have not been coming in freely and there is uncertainty about the immediate difficulty, prices have risen to new high levels and stocks have been depleted. As it is not known in what manner future business would be conducted, consumers are finding it difficult to get their requirements especially as the supplies through fair price shops are not ample. The State Government have explained that the purpose of the order is to prevent large scale exports that might be made by dealers and millers to neighbouring areas with a view to evading the procurement levy. The grievances of the trade and millers have been examined and it was expected that there would be some modification. The Chief Minister, however, has said that all the difficulties have been taken into consideration and that without some measure of control the interests of growers and consumers cannot be protected. How this experiment in control of an essential commodity, without actual rationing, would operate is difficult to anticipate at this stage. But there has been a significant deterioration in the trading conditions in the past few weeks and there may be anxious moments before new crop supplies arrive.

The moving finger writes

THE GOVERNMENT'S decision reviving the Rehabilitation Ministry as a separate and independent charge is bound to be received with mixed feelings. There will be a certain sadness that the relief and resettlement of refugees from Pakistan have once again become a large-scale operation which threatens to be of some duration. But along with this sadness there will be satisfaction that the Government has had the courage to look facts in the face and come to terms with the inevitable. A very large number of Hindus and Christians have come to this country from East Pakistan and that most, if not all of them, are likely to want to settle here. In the circumstances, their orderly absorption into the social and economic fabric of this country has become an unavoidable obligation of the Government of India.

The choice of Mr. Mahavir Tyagi as Cabinet Minister in charge of the new Ministry is a happy one since he has many personal qualities suitable for the job that is now ahead of him. He has compassion, a sense of humour and considerable shrewdness. He has, in addition, his unorthodox ways with the somewhat solemn bureaucracy of the Government and in his previous Avatars as a Minister of the Central Government, they had certainly enabled him to get things going. I am aware that Mr. Tyagi's ebullience has occasionally been taken for shallowness, and I would readily concede that his clowning, inside Parliament or outside, has frequently been of a quality which is less than divine. Nevertheless, I for one have great respect for his commonsense approach to political issues and I have often been struck by his genuine passion fo economy, efficiency and integrity in public expenditure. In fact, I have been expecting for some time that he would be rejoining the Government and while it is possible that he might have done so earlier had he been willing to accept less than full Cabinet status, I am happy that he has waited until now. If Mr. Tyagi were to become a Minister again at all, it was only right and proper that he should become a Minister with full Cabinet status; his seniority in the party and Parliament alike entitles him to this position.

In this week's issue there is a Leading Article on the Geneva talks on trade which, I must confess, does not do full justice to the Indian participation. My explanation is that we did not have adequate material on this aspect at the time the article had to be prepared for the Press. Indeed, I must say here that the Central Ministries concerned along with the principal news agencies functioning in this country, could have shown a little more initiative and imagination in arranging for adequate coverage of the Indian participation. I am told that one reason why the news reports were meagre or fragmentary was that the foreign exchange allowed for cable charges was insufficient.

It must be said to the credit of the Minister for International Trade that he has been quick to appreciate the gravity of the lapse in publicity. His press conference on Tuesday was a very valuable and effective attempt at compensation. I am aware, of course, that the Minister for International Trade has no partiality for under-statements, but even when allowance is made for this fact, it is evident that the Indian participation has been constructive and competent in significant particulars and on extremely controversial issues. In our Leading Article this week, to which reference has already been made, we have questioned the rather facile assumption of "The Economist" (London) that the Geneva Conference was likely to do little else besides talking. From what Mr. Manubhai Shah has had to say, it is evident that "The Economist" has been unnecessarily and unduly cynical. According to the Minister, a large number of agreements seem to have emerged or are in the process of emerging on specific measures for liberalizing world trade for the benefit of developing countries. While proposals for amplifying GATT and even admittedly revolutionary schemes for compensatory financing of export losses suffered by developing countries as a result of their peculiar vulnerability in world commerce have on the whole been constructively regarded, there seems to have come about an even more firm and clear consensus on the abolition or reduction of tariffs and quota restrictions on items of commerce of particular significance to the foreign exchange earnings of developing countries. Mr Manubhai Shah himself seemed to draw the greatest encouragement from the support which is emerging through the Geneva discussions for proposals that the present U.N. Trade Conference should be constituted into a permanent body of the U.N. General Assembly, which could function independently of Committee No. 2 of the U.N. and the United Nations Social and Economic Council. This scheme, for which the Indian delegation has extended its active sympathy, envisages a general committee to discharge the executive functions of the U.N. Trade Conference. All in all, the work of the Indian delegation evidently has been of considerable practical utility and it is proposed to discuss it as well as the emerging trends of agreement at the Geneva talks in the next issue of the Journal.

**

I have no doubt that the gallant effort which Mr Ananda Nambiar is making in a largely indifferent Lok Sabha to extend the benefits of Labour Legislation to circus artistes deserves richly to succeed. The absence particularly of a statutory right to circus artistes for compensation from employers against death or disability is most unjustified. Incidentally, why are our circus artistes who are certainly among some of the best public entertainers in this country, themselves such a glum and even sad lot while in the ring? Their attempts at forcing a smile on their faces or working up enthusiasm for the show are so pathetic that they take away much of our pleasure in witnessing a circus show. In contrast, the Soviet circus, which was in the Capital recently, demonstrated how much more enjoyable a show could be when the artistes themselves could act as if they too were enjoying it as much as the audience. Here, a special word of praise to the animal performers of the Soviet circus or rather their trainers. The dogs playing with the coloured ball were obviously having fun, while throughout a long and difficult act with tigers, the trainer seldom found it necessary to strike them. And what a pleasure it was to see the glossy coats of the tigers or bears, or the way the bears would beg for the "eats" which their trainer was generously dealing out to them on the arena! Communism, it can confidently be said, has at least succeeded in making its circus animals happy.

V.B.

Trade Winds

MARKETING OF SUGAR

ACCORDING TO a decision taken by the Union Government, the State Trading Corporation will be in sole charge of the export trade in sugar — right from the conclusion of agreements to the actual export of the commodity. This means that the handling of exports, which has hitherto been the job of the Indian Sugar Mills' Association, will be taken over by the STC. It is, therefore, clear that the setting up of the Sugar Marketing Board, decided upon by the Government last week, will in no way alter the STC's role as exporter of sugar. The Board will concern itself primarily with the regulation of the internal distribution of sugar.

The taking over of the entire responsibility for sugar exports by the STC, it is claimed, will help build up permanent and bigger foreign markets in future when through increased licensing of factories, more sugar will be available for export. The Government has already decided to license an additional crushing capacity of eight lakh tons to ensure enough sugar next season. Meanwhile, sugar production in the current season is likely to touch three million tons against the revised official estimate of 2.9 million tons. The target, however, stands at 3.3 million tons.

Since the Indian Sugar Mills' Association has already made arrangements for the export of 100,000 tons of sugar, the STC will fulfill the commitment for the rest of one lakh tons. The STC will also start negotiations with Malaysia for the export of 30,000 to 40,000 tons of sugar. At a later stage the Corporation may negotiate for the export of 50,000 tons of sugar to Canada.

In a communication addressed to the Food Secretary, Government of India, the Committee of the Indian Sugar Mills' Association has represented that the proposal to set up Sugar Marketing Board will not be in the larger interest of the country, the industry, the growers and the consumers. The Committee fears that the Sugar Board would perpetuate controls on the sugar industry and thereby stifle production, as was actually experienced in the past whenever control was imposed. On the other hand, a policy of de-control and incentives, the Committee points out, has always stimulated production and consumption. The presence of alternative users of sugar cane, namely, the sugar, gur and khandsari industries, competing for the available supplies of cane, is the unique feature of the Indian economy, and in this context, control on the sugar industry alone, the Committee opines, would upset the parity between these three users of cane with adverse effects on the production of sugar. The Committee further observes that the present regulation of ex-factory prices and of distribution through State agencies — a pattern which the Sugar Board is also likely to adopt — has not prevented prices from rising at the consuming centres and, therefore, the creation of the Sugar Board would not by itself improve the situation. Citing the case of cement, the Committee points out that distribution of cement by the STC has not achieved the desired objectives both in regard to production and availability of the commodity to the consumers in required quantities at controlled prices.

In another communication to the Food Secretary, the ISMA Committee has suggested that the cane price for 1964-65 season as announced by the Government (Rs. 1.85 per maund for a recovery of 9.4 per cent and below) is not adequate. The Committee has further suggested that the mills in Northern Zone, i.e., in U.P., Bihar and Punjab, and in the Central Zone, i.e., in Madhya Pradesh and Rajasthan, should be authorised to pay a uniform minimum cane price of Rs. 2 per maund as is being done in the current season of 1963-64 within the framework of the Price Linking Formula already announced.

TRIPARTITE BODY FOR ESI

The Union Government has set up a Tripartite Committee to review the working of the Employees' State Insurance Scheme and to recommend any modification or change in its structure and organisation that may be considered necessary for ensuring a more satisfactory functioning of the Scheme. This step has been taken in pursuance of the recommendation made by the Standing Labour Committee at its last session held in New Delhi in October, 1962. Mr. C. R. Pattabhiraman, Union Deputy Minister for Labour, is the Chairman of the Committee which also includes Mr. M. Bhaktavatsalam, Chief Minister of Madras, Mr. Bijoy Singh Nahar, Labour Minister of West Bengal and Mr. Shantilal Shah, Health Minister of Maharashtra. The Committee also includes three representatives each of the Central Organisations of employers and employees.

The Committee has issued a comprehensive questionnaire to the Central Organisations of employers and employees, the different Union Ministries concerned with the subject, the State Governments, the Employees State Insurance Corporation and medical associations. The questionnaire covers such subjects as the scope of coverage under the ESI Act, contributions, cash benefits, medical benefits, administrative structure, organisational set-up, finance, audit control and the plans and procedures.

At present the ESI Scheme covers over two million industrial employees out of a total insurable population of 3.1 million. The ESI Fund, which dispenses benefits of Rs. 10 crores per year, was a little over Rs. 24 crores on March 31, 1963.

HMT FORGES AHEAD

Performing the opening ceremony of a new show-room of the Hindustan Machine Tools in Bombay, Mr. S. M. Patil, Managing Director of HMT, disclosed that the production capacity of the undertaking would be raised to Rs. 30 crores annually with the establishment of a network of five to six factories by the end of the third Plan period. This would mean a threefold increase in the production capacity of HMT. The first machine from the Pinjore factory, which was inaugurated recently by the Prime Minister, would come out in June this year. The fourth unit at Kalamasery in Kerala was expected to go into production before the end of the year and the construction of the fifth unit in Hyderabad was expected to commence very soon. The HMT Bangalore had turned out 1,983 machines valued at about Rs. 8 crores during the year ended March, 1964, as against the production of 1,315 machines valued at Rs. 6.7 crores during the previous year.

Mr. Patil further disclosed that while after-sale service facilities in respect of machine tools had already been made available, similar facilities in respect of watches would also be made available in the new show-rooms. The undertaking also had proposals to open training cells in its show-rooms to provide instructions to engineers in the working of the machines.

Regarding the production of watches, Mr. Patil said that the HMT had now stepped up the indigenous content from 60 per cent to 72 per cent. At the present rate of production of 800 watches a day, the watch unit would turn out about 20,000 watches a month. By the end of the current financial year the production was expected to go up to 30,000 watches a month. By then the training of personnel for making such parts as balance wheels, barrels to house the main spring and

jewel-tipped pallet forks would be completed and 80 per cent of the parts would be of indigenous manufacture. In addition to the manufacture of the three types, namely, Citizen, Janta and Sujata, the factory had already taken up the production of luminous watches for jawans.

INDIA'S SHOW ROOMS ABROAD

The Union Ministry of International Trade has invited Indian manufacturers and exporters to exhibit their exportable merchandise in rotational displays of Indian goods in India's show rooms and trade centres in foreign countries. These displays are scheduled to be organised in Bahrein, Colombo, Nairobi, Lagos, Cairo, Bangkok, Djakarta and Rangoon during April-June, 1964. This is in addition to the Ministry's programme of participation in the International Trade Fairs and holding of exclusive Indian exhibitions abroad.

In Bahrein and Colombo the main items of display will be textiles of all sorts and in Nairobi, besides textiles, jute and coir goods will be the important items of display. In Lagos furniture and fittings are intended to be exhibited. In Cairo, mainly sports goods, spices, crockery and kitchen wares will be on show and in Bangkok handicrafts, medicines, pharmaceuticals and sports and leather goods will be exhibited. In Djakarta, the main exhibits will consist of madicines, hospital equipment and sports goods, and in Rangoon the display wares will include dyes, paints, varnishes, and chemical and allied products. The centres of display are also equipped to disseminate commercial information about India and to give trade introductions to importers, wholesale houses etc. in the concerned countries.

The Indian manufacturers and exporters, dealing with commodities indicated in the programme, can participate in the scheduled displays free of charge. All that they have to do is to offer samples of their goods, free of cost, to the Government's clearing agents at Bombay or Calcutta as the case may be. All expenditure on transport of goods from and back to India will be borne by the Government of India. The Director of Exhibitions, Ministry of International Trade, Udyog Bhavan, New Delhi, may be approached for any other details required by the intending participants.

EXPORTS FROM KERALA

A three-member Trade Delegation of the German Democratic Republic, led by Mr. Kurt Roettger, head of the Trade Representation of the GDR in India, is on a ten-day tour of Kerala. The object of their visit to Kerala is to explore the possibilities of increasing exports from the State to East Germany. At present the GDR imports cashewnuts worth Rs. 1.3 crores, spices worth Rs. 1.1 crores, coir worth Rs. 50 lakhs and also a large quantity of coconuts.

Mr. Kurt Roettger disclosed at a Press conference at Trivandrum that his country can offer complete thermal plants to Kerala which was facing power shortage.

LEAKPROOF TRANSISTOR BATTERY

A leakproof transistor radio battery has been introduced by Union Carbide India Ltd. The battery has been specially designed for transistor requirement with a view to giving excellent performance and low-cost operation.

HOTEL COLLABORATION

Some important foreign hotel interests have indicated their willingness to enter into collaboration arrangements with Indian entrepreneurs and with the Government. 'Sheratons' of the USA is negotiating with an Indian party to set up a new hotel in India. Inter-Continental Hotel Corporation has concluded an agreement with another Indian party. 'Hiltons', who own and operate 35 hotels in the USA and 21 hotels in other countries, are negotiating with a party in Bombay to set up a first class hotel. The US company has also submitted a proposal for collaboration with the Government.

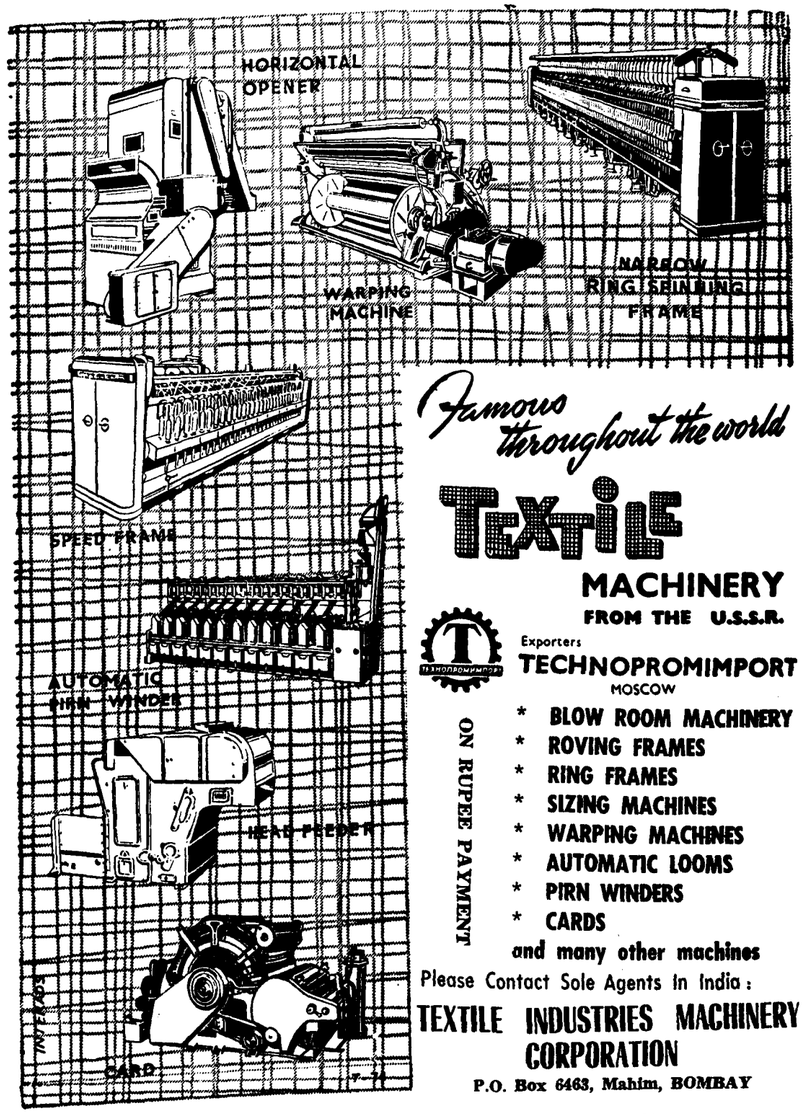
The Union Finance Minister, Mr. T. T. Krishnamachari told the Informal Consultative Committee of Parliament for his Ministry that 'Hiltons' were prepared to own hotels here and take back 25 per cent as profits. He added that there was, however, no question of any financial participation by the Government.

The desirability of foreign collaboration for setting up first class hotels had been recommended by the Ad Hoc Committee on Tourism. The Committee had pointed out that the growth of the hotel industry in India was not adequate to meet the requirements of foreign tourists. According to the Committee, the number of hotel beds increased by only 11 per cent during the last seven years while the number of tourists increased by as much as 300 per cent in the last four years. Explaining the position of the hotel industry in the country, Mr. T. T. Krishnamachari said that there were at present 7,085 rooms with 11,732 beds in 136 hotels declared suitable for foreign tourists.

MANGANESE EXPORTS

The Minerals and Metals Trading Corporation has concluded contracts for the export of 1,52,120 tonnes of manganese ore mainly to the USA, the UK, Japan and Switzerland. Last month the MMTC effected shipments of 68,965 tonnes of manganese ore and 9,500 tonnes of ferro-manganese.

SULPHUR FROM PYRITES



The Pyrites and Chemicals Development Company (of the Union Ministry of Industry) has under examination a project for the production of elemental sulphur from pyrites ore. A delegation headed by Mr. N. N. Kashyap, Joint Secretary, fromatour of Finland. The delegation discussed with M/s. Ministry of Petroleum and Chemicals, has returned recently from a tour of Finland. The delegation discussed with M/s. Outokumpu Oy., the newly developed Finnish process with reference to its suitability for the production of elemental sulphur from iron pyrites ore found in Amjhore in Bihar.

The Pyrites and Chemicals Development Company is also examining global tenders for setting up a sulphuric acid plant at Sindri. The production of sulphuric acid from Amjhore pyrites ore is a distinctly separate project and the proposed 400-tons sulphuric acid plant will meet the partial requirements of the Sindri Fertilizer Factory and the Bihar State Superphosphate Factory. The site for the sulphuric acid factory at Sindri has been selected and according to the present estimates, the plant is likely to be commissioned in early 1966.

A project report on the mining scheme for the annual production of 2.4 lakh tons of pyrites ore from Amjhore mines has been prepared by the Indian Bureau of Mines and is being considered by a committee of experts appointed for the purpose. The Company has initiated preliminary action for implementing the mining scheme on the basis of 2.4 lakh tons per annum production target. Tenders have been invited for the purchase of essential machinery for the production of 400 tons of ore per day to begin with.

NEW G.A.T.T. DEPARTMENT

The GATT has been frequently criticised by some of the under-developed countries as a club dedicated to protecting the interests of the industrialised nations. To meet this criticism, the GATT member-States agreed to add a new chapter on trade and development to the 16-year old Treaty in order to reflect trade problems relating to the less developing countries. It has been decided to set up a new department for dealing with the problems of the under-developed countries.

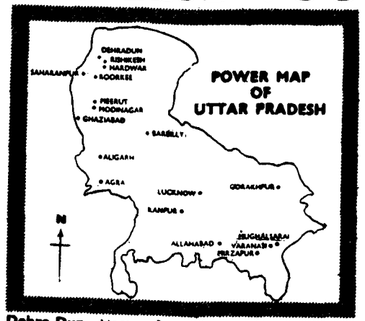
ATTENTION INDUSTRIALISTS!

HERE'S ELECTRIC POWER FOR YOUR NEW INDUSTRIES

AND EVERYTHING ELSE YOU CAN ASK FOR

Your new industry needs a lot of electric power. The U.P. State Electricity Board is proud of its ability to keep pace with industry's growing demand.



The following are some of the major power projects in U.P.'s Third Five Year plan :

Rihand Hydro-electric Project	**2,50,000 KW Completed 1962**
Harduaganj, Stage I	**60,000 KW Completed May '62**
Harduaganj, Stage II	**30,000 KW Completed Mar.'64**
Matatila Hydro-electric Scheme	**30,000 KW Scheduled Dec. '64**
Yamuna Hydro-electcic Scheme, Stage I	**86,000 KW Scheduled June '65**
Kanpur Thermal Expansion	**64,000 KW Scheduled Aug. '65**
Obra Thermal	**2,50,000 KW Starting Oct. '65**
Yamuna Hydro-electric Scheme, Stage II	**2,00,000 KW Scheduled Dec. '69**

A trunk grid of 2,20,000 volts is being constructed to interconnect all the power stations and lines of 1,32,000 and 66,000 volts will branch off from this trunk grid for taking constant electric power to the following important industrial centres :-

Ghaziabad-Modinagar-Meerut - Connected by rail and road with the whole of India. Home of the well known Modi Group of Industries - can also be the home of your industry. Industrial sites are offered by the U.P. Industrial Corporation, Kanpur.

Aligarh - Only 16 miles from the Harduaganj Thermal Power Station - assured of ample and constant supply of electric power. 84 miles from Delhi.

Dehra Dun - Home of the Yamuna Hydro-electric Schemes, Stages I, II, III and IV. Unlimited forest produce and limestone of high purity at hand.

Saharanpur-Roorkee-Hardwar-Rishikesh - offer big scope for industries, particularly those ancillary to the Antibiotics Factory at Rishikesh and the Heavy Electricals Factory at Hardwar. Close to rich extensive forests.

Bareilly - Home of the Synthetic Rubber industry, Camphor industry, Turpentine and Rosin industry and the Match industry and developing rapidly as a major industrial centre.

Agra - Main tourist attraction in India and growing industrial centre - conveniently connected with the whole country by rail (both broad gauge and metre gauge), road and air.

Kanpur - Already the most important industrial centres in Northern India. Seat of many technical training institutions. Connected with the whole country by rail, road and air.

Lucknow - Seat of the U.P. Government and a growing industrial centre. Industrial area developed by the U.P. Industrial Corporation, Kanpur. Served by rail, road and air.

Allahabad and Naini - Quick movement of goods between Calcutta and Allahabad assured by electric traction. Land, water and power available in plenty.

Varanasi-Mughalsarai Area - Another industrial area which is growing rapidly. Conveniently connected by rail, road and air with the rest of the country.

Mirzapur District - Home of three major power stations - Rihand, Obra Thermal and Obra Hydel. Rich in limestone deposits and producing large quantities of aluminium and caustic soda. Coal available from nearby Singrauli Coalfields

Gorakhpur - A large Fertiliser Factory being set up here by the Government of India - also seat of the Madan Mohan Malviya Engineering College and the Government Technical Institute. Important centre of sugar production.

This advertisement is issued for the information of industrialists throughout the country by the

U.P. STATE ELECTRICITY BOARD

COUNCIL HOUSE, LUCKNOW

who will be happy to answer enquiries and furnish any further information which may be required.

Company Affairs

A CONSTRUCTIVE ADDRESS

IN HIS statement to the shareholders to the United Commercial Bank Limited, Mr. G. D. Birla has made constructive suggestions to the Government for implementing its policy of stimulating the economy by providing appropriate incentives. He points out that it is, indeed, a great gain to the nation that persons in key positions, such as the Congress President, the Finance Minister of the Central Government and the Deputy Chairman of the Planning Commission, have, in important public speeches underlined the need for achieving rapid industrialisation. Referring with approbation to Mr. T. T. Krishnamachari's observations in his Budget speech that one of the prime objectives of our economic and fiscal policy must be to generate savings both in the hands of individuals and in the hands of corporate bodies, Mr. G. D. Birla poses the question whether the proposals of the Central Budget this year are as fully in accordance with this approach of the Finance Minister as they could and ought to be. While the Finance Minister has certainly made a commendable effort to offer incentives to industry in the form of modification of the super profits tax, rationalization of inter-corporate taxation and other incentives, has he not whittled down these reliefs by such measures as the new dividend tax, tax on notional capital gains on bonus shares and steep increases in gift tax and estate duty and the imposition of annuity deposits on individual taxpayers?

Mr. Birla asks whether, in this new environment, capital could be raised by the private sector for new enterprises, since unless there is incentive for individual investors there can be no positive activity in the capital market. A healthy stock exchange, Mr. Birla points out, with steadily appreciating values of the shares dealt thereon, based on actual and potential growth of companies, is absolutely essential if a steady growth in the number of new enterprises is to be maintained. He consequently urges the Finance Minister to take a second look at his Budget proposals with a view to providing sufficient incentives to individuals. In his view, even government incentives, such as the proposed Development Bank, cannot be wholly effective in mobilizing resources for industrialisation unless there are healthy and active conditions in the stock exchanges which would enable the Development Bank to resell investments arising out of its underwriting obligations as well as help the Unit Trust in its investment operations.

Credit Squeeze

The Chairman of the United Commercial Bank has welcomed the steps taken by the Government to attract foreign capital and foreign collaboration. He has also expressed appreciation of the revised attitude towards controls and the removal of price controls on some commodities in the recent past. Mr. Birla feels that the process of assuring a favourable economic climate will not be complete unless certain other steps are also taken. Fiscal policies favourable to investment activity is one of them. Equally important is the need for a liberal monetary policy because unless industry and trade are assured of their legitimate requirements of bank finance, current production will be affected, while the growth of the economy in the long run will be affected even more. Returning to the firm views he had expressed on past occasions, Mr. Birla emphasizes the adverse impact of credit scarcity created by Central Bank restrictions. He points out the anomaly of a tight-money policy being suddenly introduced early last month when the Reserve Bank's advances to scheduled banks had touched their peak against the background of credit liberalisation announced towards the close of 1963 for the benefit of the 1963-64 busy season. Such vacillations in policy are bound to create difficulties for banks which have planned ahead to provide finance for industry on the basis of securing assistance from the Reserve Bank as and when necessary.

The Chairman of the United Commercial Bank is equally critical of the multiple-tier Bank rate which, he points out, necessarily comes in the way of orderly interest rates. Mr. Birla holds the view that the rationalization of the interest rate structure, which is urgently needed to keep down the cost of bank finance to trade and industry, on the one hand, and for the pursuit by the banking system of a dynamic policy for mobilizing funds from the community, on the other, cannot be worked out except around a single Bank rate.

Facts Vs Fiction

The Chairman's speech contains passages of much interest in the context of current controversies. Mr. Birla draws on the experience of the United Commercial Bank to refute the allegation made against the banking system in general that it does not cater to the credit requirements of medium or small businesses. In the case of the United Commercial, for instance, out of about 10,400 borrowers, as many as 3,700 borrowers have been sanctioned limits of Rs. 10,000 or less, 4,500 borrowers limits between Rs. 10,000 and Rs. one lakh, and 1,500 borrowers limits between Rs. one lakh and Rs. 5 lakhs. Limits of over Rs. 5 lakhs have been sanctioned only to about 700 borrowers or about 7 per cent of the total. So much for the charge that banks lend only to big business. As for the other complaint that banks are owned by big business, facts would again appear to give the lie. The United Commercial Bank, for instance, had 6,241 shareholders on its register as at the end of 1963 and of them only 663 shareholders owned over 100 shares, while those holding shares between 51 and 100 numbered 680. This meant that the remaining 4,895 shareholders were holding 50 shares or less, thereby indicating a large presence of small shareholders in the equity of the bank.

The Chairman's statement takes note of important changes in the bank's organisation. New-comers to the Board are Mr. M. P. Birla, whose "vast experience of industry and trade", the Chairman said, should be of great benefit to the bank, and Mr. S. T. Sadasivan, who relinquished office as General Manager on March 31, 1964. Mr. Birla paid handsome tributes to the outgoing General Manager during whose stewardship the bank's dimensions have more than doubled as well as to his successor, Mr. R. B. Shah, who has also contributed to the progress and growth of the bank first as Chief Accountant and, since July 1955, as its Deputy General Manager.

HINDUSTAN ALUMINIUM

In spite of the initial teething troubles, Hindustan Aluminium Corporation Ltd., has shown a marked improvement during its working in 1963. It has recorded a profit of Rs. 199.88 lakhs as against a loss of Rs. 199.12 lakhs last year. After providing Rs. 195.22 lakhs for depreciation for the year and Rs. 1.27 lakhs for taxation, there is a credit balance of Rs. 3.38 lakhs. This has been adjusted against last year's deficit balance of Rs. 194.06 lakhs. While full depreciation as prescribed under the Act has been provided, reserve for development rebate has not been credited because of inadequate profits. However, as the development rebate reserve is allowed for income tax purpose to be carried forward, it is proposed to be provided out of the assessable income in 1964 and thereafter. The directors are hopeful that the reserves for 1964 would be much better than 1963. Total production of primary metal during the year was 22,138 tonnes exceeding the rated capacity of 20,000 tonnes. The total production of the alumina plant has reached 39,040 tonnes. Its sales amounted to 19,799 tonnes. With a view to increase its sales, the company has been permitted to export ingots and import the same in fabricated form due to inadequate fabrication facilities within the country.

A plant for continuous casting and rolling of redraw rods has been in production since 1963, but regarding the others

the company has to await the arrival of other fabricated equipment due to late sanction of the Export-Import Bank loan. The directors report that the Government has agreed to the proposal to increase the capacity to 60,000 metric tonnes and the company has approached the Export-Import Bank for loan to finance the foreign exchange requirement of the first phase of the expansion programme. For setting up a thermal plant to meet the additional requirement of power for expansion programme, provisional orders have been placed for two generating units with International General Electric Co. against long-term suppliers' credit. A separate wholly-owned subsidiary has been formed to run this power plant with an authorised capital of Rs. 5 crores.

CENTURY SPINNING

The directors of the Century Spinning and Manufacturing Co. Ltd., have recommended a final dividend of 18 per cent for the year 1963 — the same as that paid for the previous year. This is in modification of the earlier proposal not to declare a final dividend but to issue bonus shares in the ratio of one per five shares. This change has been necessitated by the recent proposals to levy capital gains tax on the bonus issue. The directors have, however, decided subject to the approval of the shareholders, to make a rights issue of preference shares of the value of Rs. 25 lakhs to be offered to the existing preference shareholders in the ratio one for every five shares. Following an increase in sales from Rs. 17.10 crores to Rs. 22.25 crores the gross profit was also higher at Rs. 477.61 lakhs as against Rs. 366.87 lakhs. Depreciation absorbed Rs., 177.24 lakhs, taxation Rs. 112 lakhs and development rebate reserve Rs. 57.85 lakhs. The interim dividend at 12 per cent on the equity shares absorbed Rs. 30.59 lakhs leaving a balance of Rs. 57.18 lakhs. This amount has been transferred to the dividend equalisation reserve, out of which preference dividend already paid absorbed Rs. 10.71 lakhs and the final dividend on equity shares at 18 per cent will take up Rs. 45.88 lakhs.

KOHINOOR MILLS

The Kohinoor Mills Co. Ltd., recorded higher turnover of Rs. 8.55 crores during 1963 as against Rs. 7.61 crores last year. The gross profit has consequently gone up from Rs. 83.85 lakhs to Rs. 98.92 lakhs. The final dividend is Rs. 14 a share making a total of Rs. 21, less tax, for the whole year against Rs. 18 paid previously. After providing Rs. 21.57 lakhs for depreciation, Rs. 23.20 lakhs for taxation and Rs. 6.10 lakhs for development rebate reserve, the net profit comes to Rs. 42.71 lakhs. The directors have provided Rs. 23.02 lakhs for bonus for earlier years. The proposed divided including the interim distribution absorbs Rs. 21 lakhs. The company added new machinery worth Rs. 43.26 lakhs.

GWALIOR RAYON

The Board of Directors of the Gwalior Rayon Silk Manufacturing (Weaving) Company Ltd., has decided that the dividend for the year ended March 31, 1964 on 150,000 cumulative preference shares series 'A' and 765 cumulative preference shares series 'B' in the capital of the company be paid at Rs. 8.57 a share less tax. These dividends are payable on or after May 4 to the shareholders on register as on May 2.

SOORAH JUTE

According to a preliminary report the Soorah Jute Mills Co. Ltd., has shown a surplus of Rs. 11.18 lakhs for 1963 against Rs. 18.14 lakhs last year. After adding the amount brought forward the directors have proposed the allocation of Rs. 2.24 lakhs for depreciation Rs. 4.66 lakhs for taxation and Rs. 25,000 for development rebate reserve. After paying the dividend on the preference shares the directors has proposed to reduce the ordinary dividend from 25 per cent to 20 per cent, less tax. The directors stated that the set-back in profits has been mainly due to the decline in prices of jute goods during the year whereas price of raw jute was by and large maintained.

ASIAN CABLES

Asian Cables Corporation Ltd., has shown satisfactory working during the year ended September 30, 1963 — he second year of its production. Sales, however, could not increase mainly due to the shrinking demand for cables. Even then sales proceeds were around Rs. 64.62 lakhs against Rs. 9.40 lakhs last year. After making provisions for depreciation, there was a net loss of Rs. 58,902. The factory is presently working on single shift basis and the management is considering the proposal to work on a two shift basis in the current year. The P.V.C. cable plant was commissioned towards the close of the year, under review. The construction of the factory building for project II for H.T power cables is progressing and machinery is arriving. It has been licenced to import machinery worth Rs. 1.05 crores. Erection is expected to be completed by the end of this year and the plant is expected to go into production early in 1965.

SCOTTISH INDIAN MACHINE TOOLS

Scottish Indian Machine Tools Ltd., a new Indo-British venture for the manufacture of machine tools will enter the capital market shortly with a public issue of Rs. 19.20 lakhs, all in equity shares of Rs. 100 each. It has been promoted jointly by Voltas Ltd., and Scottish Machine Tools Corporation Ltd., Glasgow. It will undertake the manufacture of guillotine shears, punches, plate bending rolls and other items of plate and bar working machinery. The authorised capital of the company is Rs. one crore. Its issued capital is Rs. 64 lakhs, consisting of 64,000 equity shares of Rs. 100 each. Of the total issued capital of Rs. 64 lakhs, 40 per cent will be subscribed by its fully-owned subsidiary, Scottish Machine Tool Overseas Ltd. This amount will be utilised for the import of plant and machinery needed for the project. Thirty per cent of the issued capital will be subscribed by the Indian promoters and the balance of 30 per cent will be offered to the public. The plant will be located at Thana, near Bombay, and is expected to go into production by the middle of 1965. Voltas Limited have been the sole Distributors for Scottish Machine Tools since May 1959. They will also be Sole Distributors for the products to be manufactured by the new company.

HINDUSTAN POLYMERS

Hindustan Polymers Ltd., will enter the capital market shortly with an issue of Rs. 127.40 lakhs in 127,400 equity shares of Rs. 100 each for cash at par. It has an authorised capital of Rs. five crores and issued capital of Rs. three crores made up of 300,000 equity shares of Rs. 100 each. 112,600 equity shares have been subscribed by the promotors, directors and their friends, 20,000 equity shares have been subscribed by Bakelite Xylonite Ltd., London and 20,000 by the Industrial Credit and Investment Corporation of India Ltd., Bombay. Another 20,000 equity shares of Rs. 100 each are reserved for subscription in cash at par by Commonwealth Development Finance Co. Ltd., London. The entire public issue has been underwritten. The company has been incorporated with the object of manufacturing power alcohol, styrene monomer, polystyrene and its copolymers etc. The company has obtained technical collaboration from M/s. Universal Oil Products Co. Inc. of the U.S.A. and M/s. Bakelite Xylonite Plastics Ltd., of England. Plant will be located at Visakhapatnam.

PHILIPS INDIA

An increase in the rate of dividend for the year 1963 was decided at a meeting of the board of directors of Philips India Ltd., held in Calcutta recently. The proposed dividend for 1963, subject to tax is 15 per cent as against 13 per cent for 1962. The sales of Rs. 10.63 crores were about Rs. 20 per cent higher than Rs. 8.85 crores in 1962. The profit before taxation for the year 1963 amounted to Rs. 1,65.57 lakhs as against Rs. 1,20.20 lakhs for 1962. The provision for taxation was Rs. 1,17.00 lakhs as compared to Rs. 85.50 lakhs in 1962 and thus the net profit after taxation stood at Rs. 48.57 lakhs as against Rs. 34.71 lakhs in 1962. A sum of Rs. 5.50 lakhs was transferred to the development rebate reserve and Rs. 11.04 lakhs to the general reserve. The increased dividend will absorb Rs. 33.00 lakhs.

NATIONAL RUBBER

The National Rubber Manufacturers Ltd. has reported a substantial rise in sales from Rs. 351.78 lakhs to Rs. 457.09 lakhs in 1963, reflecting an all round increase in production as the installed capacity for most of the items was more than fully utilized. The net profit, after providing for depreciation and taxation, was higher at Rs. 10.64 lakhs against Rs. 6.41 lakhs in the previous year. Apart from providing Rs. 2 lakhs for general reserve, the directors have proposed to transfer Rs. 7.92 lakhs towards depreciation, Rs. 11.80 lakhs towards taxation and Rs. 2.50 lakhs towards dividend equalisation reserve. The directors have found it possible to raise the ordinary dividend from 8 to 10 per cent less tax.

The company has decided to expand the capacity for the manufacture of important items in which it specializes and to produce a few more articles which are considered essential by the directors. Fresh industrial licenses have been received from the Government permitting substantial expansion of the capacity and the manufacture of new items. It is also permitted to manufacture PVC conveyor belting with the capacity already licensed and established for transmission and conveyor belting. To raise a part of the finance to implement expansion, the company has decided to make a further issue of capital. It has been authorised to issue capital to the value of Rs. 50 lakhs in 500,000 ordinary shares of Rs. 10 each at par. These will be issued in the ratio of one new share for every existing share held.

CAPITAL ISSUES

Four companies have been authorised to raise capital aggregating Rs. 5.37 crores. Of these, one is offering bonus shares to existing shareholders, another is floating equities and two are issuing equities plus preference shares. One company is offering part of its equities and preference shares to the public. Foreign collaboration is involved in one of the issues. The consent of the Controller of Capital Issues is valid for 12 months in all cases.

Associated Cement Companies Limited, Bombay, will be issuing further capital of Rs. 119,21,800/- in 1,19,218 equity shares of Rs. 100/- each, to be issued as bonus shares to the existing equity shareholders of the company on capitalisation of the Share Premium Account to a like extent.

The Indian Tube Company (1953) Limited, Calcutta, an existing company, is to issue capital of Rs. 1,05,00,000/- divided into 87,500 equity shares of Rs. 100/- each for cash at a premium of Rs. 20/- per share to be subscribed as to 40% by Stewarts & Lloyds Limited, U.K. and 60% by Tata Iron and Steel Company Limited and their nominees. The capital will be utilised for financing the expansion of the seamless tube plant.

Bist Industrial Corporation Limited is to issue capital of Rs. 68,64,500/- divided into 4,86,450 equity shares of Rs. 10/- each and 20,000 cumulative redeemable preference shares of Rs. 100/- each carrying dividend at 9.27% free of company's tax but subject to deduction of taxes at source at the prescribed rates. This supersedes an earlier consent granted in 1960 for issue of preference shares of Rs. 40 lakhs.

The capital is required for the establishment of a sugar mill at Nainital at an estimated cost of Rs. 260 lakhs. The company has already raised a capital of Rs. 51,35,500/-.

Central Pulp Mills Limited, Poona, is to issue Rs. 275 lakhs capital—Rs. 170 lakhs equity and 75 lakhs preference—to be issued for cash at par. Equity shares of the value of Rs. 86.70 lakhs will be subscribed privately and the balance of Rs. 83.30 lakhs equity and Rs. 75 lakhs preference will be offered to the public. The money will be utilised in establishing a pulp mill.

LICENCES ISSUED

The following licences were issued under the Industries (Development and Regulation) Act, 1951 — during the week ending 4th April, 1964. The list contains the names and addresses of the licences the items of manufacture and annual installed capacity.

IRON AND STEEL

The Mysore Kirloskar Ltd, Yantrapur, P.O. Harihar. (Harihar, Yantrapur, Mysore) — Cast Iron Castings — 9,000 tons.

TYPEWRITERS

Rai & Sons Pvt. Ltd., 9A, Connaught Place, Central Ring, New Delhi. (Taluk West, Andhra Pradesh) — Standard Typewriters (Shifting) (Change of location from Chandigarh, Punjab to Hyderabad (Taluk West), Andhra Pradesh.

INORGANIC HEAVY CHEMICALS

Barium Chemicals Ltd., Ramavaram P.O., Khammam District (Ramavaran, District, Khammam Andhra Pradesh) — (1) 30 per cent Hydrochloric Acid — 720 tonnes. (2) 92 per cent Nitric Acid — 720 tonnes. (3) 98 per cent Sulphuric Acid — 3,600 tonnes.

ORGANIC HEAVY CHEMICALS

The Newasarwa Mills Private Ltd., Chemical Division, Railwaypura, Ahmedabad-2. (Railwaypura, Ahmedabad Gujarat State) — Oxalic Acid — 1,260 tons.

COTTON TEXTILES

Madhavnagar Cotton Mills Ltd., Madhavnagar, Dist. Sangli. (Maharashtra State) — 100 automatic looms for the manufacture of cotton cloth.

SYNTHETIC FIBRES

The Sirsilk Ltd., Sirpur — Kaghaznagar (C. Rly.). (Sirpur, Khagaznagar, Andhra Pradesh). — Acetate Rayon Yarn. 1.8 million kgs. per annum.

VANASPATHI

The Bhavnagar Vegetable Products Ltd., Bunder Road, Bhavnagar. (Bunder Road, Bhavnagar, Gujarat) — Vanaspathi — 75 tons per day. (Capacity after expansion).

GLASS WOOL

Shri P. M. Verghese, M/s. Insulux India Private Ltd., 42, First Main Road, C.I.T. Nagar, Madras-35. (Korattur, Madras) — Fibre Glass Pipe Covering — 840 tons. Industrial blanket type insulation — 1,980 tons. Fibre Glass chop strand —1,020 tons. Glass Yarn — 960 tons. Sound Insulation — 1,980 tons. Reinforcement for plastics — 960 tons. Air Filters — 540 tons. Paper Industry — 960 tons. X-Ray protective shields — 240 tons. Shortage Battery Industry — 240 tons. Medical Industry — 300 tons.

MISCELLANEOUS WARE

Sarabhai Glass, Karamchand Premchand Pvt. Ltd., Post Box No. 144, Subhanpura, Baroda. (Wadi Wadi, Baroda, Gujarat) — Penicillin Vials — 105 million pieces. Vibhuti Glass Factory, P.O. Ram Nagar, Varanasi. (Ramnagar, Varanasi, Uttar Pradesh) — Penicillin Vials — 1,200 tons.

CHANGE IN NAMES (Owners & Undertakings)

(During the week ending 4th April, 1964).

(Information pertains to particular licences)

From M/s. Hindustan Transmission Products Private Limited, New Delhi to M/s. Hindustan Transmission Products, Proprietors Madhusudan Limited, New Delhi. From M/s. Indian Electric Instruments Private Limited, Bombay to M/s. EAW Meters and Motors Private Limited, Bombay.

LICENCES REVOKED OR SURRENDERED

(During the week ending 4th April, 1964).

(Information pertains to particular licences)

M/s. New Standard Engineering Company Ltd., Bombay. — Chemical Machinery. M/s. Ramdas Barkat Ram, Delhi. — Spanners, wrenches, screw drivers, bandsaw blades, hacksaw blades. M/s. Rohtas Industries Ltd., Dalmianagar — Newsprint.

BOOKS BRIEFLY

Sensitive Aspects of Labour Relations

Collective Bargaining Versus Government Regulation: India and U.S.A.; By A. V. Raman Rao; Allied Publishers Private Ltd., Bombay; Pp. 198; Rs. 14.

Reviewed by K. N. KABRA

WITH THE expansion of the industrial sector the importance of industrial labour is increasing, not only because of its increasing numerical strength, but also because it is an important variable, determining industrial productivity. As things are still in the formative stage, it is all the more important that intensive analytical studies are made of the Indian labour problems. Dr. Raman Rao's work deals with a very sensitive aspect of industrial relations, — a comparative study of collective bargaining and government regulation as instruments of wage-policy.

The background of the study is the whole panorama of legislation in this behalf by the Union and States Governments. Stating that clear-cut ideas regarding labour participation in management are yet to be seen, he asks some searchingly relevant questions: "Who is to participate in management? Is it the labour, i.e., the grass-roots workers or their representatives? Or trade union leaders who are affiliated to one or the other of political parties? What is the extent and nature of their participation? Are training and management essential techniques or not? How is the labour director supposed to act effectively in the absence of any business knowledge?

The 36-page Introduction gives a commanding view of the state of labour affairs in the largest democracy of the world. It is shown how "after 16 years of independence and in spite of three five-year Plans, our pattern of industrial relations seems to be saturated with a sense of complacency and righteousness. We seem to think we have given a moral and spiritual outlook to our industrial relations, because of a confusion between laxity in implementation and inspection of labour laws and sense of voluntarism, mistaking the former for the latter". It is not clear whether government policy should not aim at implicit execution of labour laws, instead of resorting to ineffective conventions as alternatives.

The study also touches upon the basic structural and organisational deficiencies of Indian trade unions. It highlights its limited area of operations in excluding the large army of agrarian labourers from the trade union movement. In passing, it refers to our heritage of labour legislation copied from Britain, blind imitations of foreign labour practices, lack of labour education, etc.

Another major plank of the study is the apathetic condition of industrial relations in public sector undertakings. Here not only the pitiable state of labour relations in the public sector is pointed out, but the dual standards regarding industrial relations for the public and the private sectors are pinpointed. While the public sector has its own norms to go by, "very high-flown humanitarian approaches are suggested for the private employers towards their employees."

In India voluntarism in free collective bargaining had proved to be a failure and even the Royal Commission of Labour commented on its inadequacy. The study brings out the hollowness of the criticism that in India free collective bargaining has become a casualty in the process of government regulation of industrial disputes through compulsory conciliation, arbitration and adjudication. It spotlights the fact that the tripartite system of labour - management relations in India is not a substitute for free bipartite bargaining because tripartite bargaining is a "standby" to step in when bipartite procedures have been exhausted without settlement. In fact the Industrial Disputes Act, 1947, provides for free collective bargaining failing which government regulation is provided. The processes of conciliation and arbitration are discussed in detail.

The study refrains from either a wholesale condemnation or an exaggerated praise of the government regulation machinery and underlines the delicacy of the task as it is forced to steer through two strong pressure groups. A proper perspective for the elaboration of the problem of collective bargaining is provided by tersely stating the requirement of a planned economy in regard to wage policy: "Even under economic planning, let alone full state socialism, the powers of the trade unions to determine wage policy independently and to effectuate it through economic force, are restricted."

Finally, the study deals with the experiences of the United States and brings out a close similarity between India and that country regarding labour legislation and government attitudes towards industrial relations in the post-war period "barring some fundamental differences depending on the national orientation of public policy".

Dr. Raman Rao makes some very interesting suggestions regarding collective bargaining and government regulation. Of these the one regarding "an exact collective bargaining time-table" on the Danish pattern seems to have potentialities.

JUBILEE FARE

"Capital", Seventyfifth Anniversary Number: Edited by Dinesh Bahl; Published by W.H. Targett & Co., 5, Mission Row, Calcutta; Pages 194; Price Rs. 5.

THIS RICH publication, marking a special occasion, not only for one of our leading economic weeklies, but also for economic journalism in this country, starts appropriately enough, with a nostalgic piece by Geoffery Tyson, Editor of "Capital" from 1932 to 1954, in which it is interesting to find the author already speaking of the "ever increasing burden and complexity of taxation". From Tyson's "reflections" which not only covers the inter-war years but spills over into the years thereafter, we proceed to the world of Colin Clark on economic growth, that is to say, to the problems of the present day and hour. There should be no difficulty in agreeing with this writer that the most urgent of India's tasks is a higher rate of growth of agricultural production and we are sure that Mr. Swaran Singh and the rest agree also — that, unfortunately, does not, however, seem to bring the prospects of greater agricultural growth nearer. Incidentally, Colin Clark feels that the ratio of imports to net national product is unduly low in the case of this country and would like to see the volume of imports rise by some three per cent per annum. Here he surely errs in believing that the desire on our part for what is called "import substitution" is a pointless exercise in virtue.

Elsewhere, as is usual with the Annual Numbers of "Capital", a rich variety of fare is provided by a number of eminent contributors among whom is B. R. Shenoy who, like Colin Clark, pleads for more attention to agriculture if the growth of our national income, which is among the lowest in the world, is to pick up. Dr. Chandrashekhar praises American economic aid for helping India's growth — an assessment with which B. R. Shenoy may not readily agree—and, predictably pleads that some of that aid should be given to India's population control programmes. Dr. P. S. Lokanathan, who in recent years had been actively interesting himself in productivity problems, discusses the importance of management education and suggests that training programmes need to be suited to a situation where heredity must, and is, giving way to science in the evolution of managerial class. It is impossible to notice individually all the discussions presented in this sumptuous publication, but it is necessary to put down a special word of praise to the excellent editing of the articles, particularly the brief editorial notes which have been provided to every article, partly, no doubt, for the reader's convenience and partly, evidently, to whet his appetite.

The first choice of public utility concerns and Industrial undertakings all over India, MEI Switchboards have become a by-word for their superb quality and sustained performance.

COMPANY MEETING

UNITED COMMERCIAL BANK LTD.

CHAIRMAN'S SPEECH

G. D. Birla Calls on Government to Implement its Policy of Incentives: Urges Single Bank Rate; Fiscal Policy should Encourage Individuals as well as Companies – Second Look at Central Budget Proposals Essential.

Statement of Shri G. D. Birla, Chairman, circulated to the Members at the Twenty-first Annual General Meeting held on Wednesday, the 8th April, 1964 :

GENTLEMEN,

I have the pleasure to present to you for your consideration and adoption the Balance Sheet as at and the Profit and Loss Account for the year ended 31st December, 1963, which have been in your hands for some time.

You would have noticed from the Report of the Directors that Mr. P. D. Himatsingka who had been a Director of the Bank almost since its inception resigned from his office as a Director in order to devote more time to his duties and work as a Member of Parliament and that Mr. R. L. Nopany, who retires by rotation this year, is not seeking re-appointment as Director as he wishes to retire from all active business. The Bank has benefited greatly by their long association and I wish to acknowledge on your behalf the very valuable guidance and counsel given by them in the affairs of the Bank. In the vacancy caused by the resignation of Mr. P. D. Himatsingka, the Board of Directors have appointed Mr. M. P. Birla as Director I have pleasure to welcome him on your behalf and am confident that the Bank will greatly benefit by his vast experience of industry and trade.

The Directors' Report has referred to the change that has taken place in the general management of the Bank Mr. S. T. Sadasivan, who joined the Bank as Deputy General Manager in January, 1945 and who was appointed General Manager from 1st May, 1955 has relinquished his office on 31st March, 1964 and has gone on leave prior to retirement. I now add to the widespread tribute paid to his outstanding services in the field of banking, commerce and industry an acknowledgement on my and your behalf, of his very valuable contribution to the progress of the Bank, especially in his capacity as the General Manager since 1955. It is worth noting that the Bank's working more than doubled during his stewardship. I am confident that you would pass the resolution proposing to appoint him as Director which would enable the Bank to have the advantage of his long and rich experience in the field of banking and his intimate knowledge of the Bank's working and its special problems.

Mr. R. B. Shah has been appointed to succeed Mr. S. T. Sadasivan, as General Manager, and I extend to him our best wishes for success during his period of office. Mr. R. B. Shah is no stranger to the Bank. After a number of years in the Accountancy profession, he joined the Bank as its first Chief Accountant and has been its Deputy General Manager since July 1955. His contribution to the development of the Bank has been great and I have every confidence that he would ably guide the Bank's affairs with vigour and care and make it possible for the Bank to achieve still greater progress and growth.

BRANCH EXPANSION

In order to meet the banking needs of the expanding economy our programme of branch expansion continues unabated. During the year we opened 18 new branches some of them in unbanked centres bringing the total number of branches to 177. Since the beginning of the current year we have opened 4 more branches and we have chalked out a programme to open 43 new branches by 31st July, 1965 under the programme approved by the Reserve Bank of India.

STAFF

During the past year the volume of business continued to expand calling for increase in the staff both for the new and the old branches. In the course of 1963 the number of our staff, clerical and supervisory, reached over 4,800. More and more staff is being given special training at the Bank's own Training Centre started in 1951 and facilities for training in banking and industrial finance afforded by the Reserve Bank of India are being continuously utilised by us to enable our staff to be more useful in meeting the needs of the growing variety and volume of business. I wish to thank, on your behalf, all the members of the staff for the good work done by them which has enabled us to present to you today a more favourable position of the Bank as compared to the last year.

DEPOSITS

In my last statement I had mentioned that the deposits of the Bank had crossed the Rs 100 crore mark. During the year there was further augmentation and I am happy to state that they rose to Rs. 120.98 crores — a rise of Rs. 15.24 crores as against a rise of Rs. 6.84 crores last year — the percentage of increase being 14.4 as compared to the percentage increase of 10.7 per cent for Scheduled Banks. This is all the more heartening as during the year, the deposits of Rs. 2.40 crores of our Burma offices, which were taken over, passed out of our control consequent upon the nationalisation of Banks in Burma.

CASH AND SECURITIES

Cash on hand and with banks and money at call and short notice were Rs. 11.75 crores and represented 9.7 per cent of Deposits. The proportion of the Bank's holding of Government Securities to its Deposits continued to be high, the net addition being of the order of Rs. 2.34 crores. Our quick assets consisting of cash on hand and with banks, money at call and short notice and unencumbered Government Securities totalled Rs. 48.71 crores forming 40.3 per cent of Deposits. You would appreciate the undoubtedly high state of liquid position maintained by the Bank.

ADVANCES AND BILLS

Our Advances and Bills portfolio rose during the year from Rs. 71.08 crores to Rs. 85.95 crores, the main increase being in the Bills portfolio, which includes usance promissory notes obtained in cash credit accounts to facilitate borrowings under the Bill Market Scheme. The Bank has been providing credit facilities not only to large-scale industries for augmenting the output of goods for defence, exports and other productive purposes, but also to small-scale industries. The refinance obtained by the Bank from the Refinance Corporation for Industry Ltd., for medium term credit facilities extended by it to the borrowers is now of the order of Rs. 2.10 crores.

Of late, an impression has been created that the commercial banks cater largely to the credit requirements of big

business. I must say that this impression is erroneous. Speaking for our Bank, I would like to mention that out of about 10,400 borrowers as many as 3,700 borrowers have been sanctioned limits of Rs. 10,000 or less, 4,500 borrowers have limits between Rs. 10,000 and Rs. 1,00,000, 1,500 borrowers have limits between Rs. 1,00,000 and Rs. 5,00,000 and only about 700 borrowers have limits of over Rs. 5,00,000. A very large number of borrowers in the first three categories are those engaged in small-scale industries.

PROFIT AND LOSS ACCOUNT

The year's working has resulted in a further rise in profits. There has been an increase of nearly Rs. 81 lakhs in the earnings. The major factors contributing to the rise were the increased volume of business in all fields of banking activity and the employment of larger volume of funds. The interest rate on bank advances remained steady and the average return on advances to the Bank was practically unchanged from the previous year. The average yield on holding of securities was more or less the same as last year. Of the increase of Rs. 81 lakhs in the earnings approximately Rs. 38 lakhs was paid as interest on deposits and borrowings and about Rs. 27 lakhs was taken up by salaries and allowances and provident fund. In spite of the opening of new offices which naturally take some time to come to profit-earning stage, the amount spent on rent, taxes, insurance and lighting, stationery, printing and advertisement, and other expenditure showed fractional increases of about Rs. 2 lakhs, Rs. 4 lakhs and Rs. 5 lakhs respectively. Although the allocation to Reserve Fund is less by Rs. 11 lakhs after paying a higher bonus of Rs. 2.50 lakhs to staff, it has been possible to maintain the dividend at 12 per cent less tax on the increased share capital. The amount of prorata dividend paid last year on the increased capital was only Rs. 56,000 whereas this year the dividend on the increased capital amounts to Rs. 9.60 lakhs.

BONUS SHARES

In my last Statement I had referred to the issue of 200,000 ordinary shares at a premium of Rs. 25 per share and the adverse factors prevailing at the time the issue was actually made, which resulted in applications for only 1,60,000 shares being received. The premium of Rs. 25 per share was considered by some of the shareholders as rather high in relation to the situation obtaining in the capital market at the time the issue was made. The Directors have carefully considered the letters received from the shareholders on this subject and have felt it desirable to capitalise a sum of Rs. 20,00,000 out of the sum of Rs. 40,00,000 standing to the credit of the Share Premium Account and have accordingly applied to the Controller of Capital Issues for his consent to issue 40,000 "A" Shares of Rs. 50 each as fully paid bonus shares. The consent of the Controller of Capital Issues has not yet been received. As stated in the Report of the Directors the final outcome of this year's Budget proposals relating to the taxation of bonus shares in the hands of the shareholders would be taken into account before deciding on further course of action.

You would be interested to know that the ownership of our shares is widely distributed. Out of the total number of 6,241 shareholders on 31st December, 1963, 4,895 shareholders owned 50 shares or less, 680 shareholders owned between 51 and 100 shares and only 666 shareholders owned over 100 shares.

ECONOMIC SITUATION

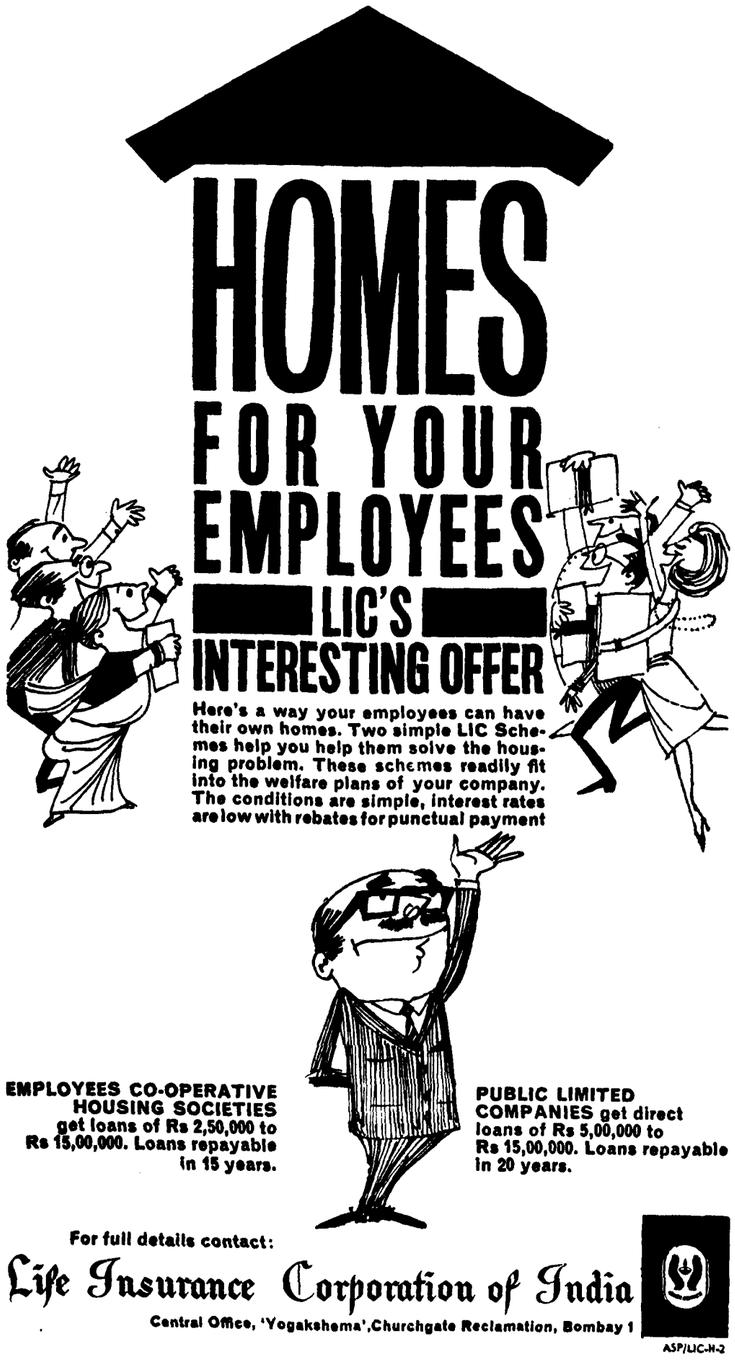
Having reviewed the business of the Bank let me turn to a survey of the general economic situation in the country. The year 1963 was similar in several respects to 1958. Both witnessed a decline in the rate of growth of industrial production, both showed a fall in the production of foodgrains, and in both the years there was also a set-back in the growth of employment. However unlike 1958 the year 1963 was under the shadow of the Chinese aggression and consequently the "defence and development" Budget of the Union Government presented early that year providing for heavy expenditure to meet the aggression. The mere fact that in the face of the national emergency revenues had to be raised for sustaining our defence effort could not, however, conceal the dismay caused by the magnitude as well as the range of the new taxes that were proposed and particularly the Super Profits Tax. To what extent the economic situation had deteriorated consequent upon the Budget of 1963-64 can be clearly seen from the figures relating to new capital issues and the drop in stock market prices.

As for the former, capital issues during 1963 declined to Rs. 54.6 crores as compared to Rs. 73.8 crores in 1962. Taking a more detailed view of 1963 issues, it will be noticed that during the quarter ending June — the quarter following the Budget — capital issues amounted to Rs. 17.1 crores as against Rs. 25.6 crores during the corresponding quarter of the previous year. But this is not all. In the quarter following July to September, by which time the full impact of the budgetary proposals had been felt, capital issues deteriorated still further to Rs. 7.2 crores only. It is true that in the quarter ending March 1964 the capital issues amounted to Rs. 33.7 crores which is described as a "phenomenal spurt". This so called spurt in the capital issues was, however, due to the fact that the companies who had already made commitments and proceeded with their projects could no longer wait and had to come out in the market which they felt was regaining confidence. The response from the public, however, was disappointing and except in the case of issues of a few well-known companies, the underwriters had to take up a major portion of the shares to fulfil their obligations This stagnation in the capital market is the reflection of the significant fall in the prices of industrial securities, the index price for which fell to as low a level as 160.6 in August 1963 compared to 179.5 — the average for the whole year

Apart from the capital market the general economic situation was none too satisfactory. Agricultural production, has, in fact, gone down. The total foodgrains production which stood at 79.8 million tons in 1961-62 declined to 77.5 million tons in 1962-63 and went still further down to 76.2 million tons in 1963-64. We thus appear to have gone back to the year 1958-59 so far as agricultural production is concerned.

In regard to industrial production, we would appear to have maintained an increase of 8.9 per cent but not improved upon our rate of growth. But I am not at all sure in my mind whether in fact we have improved in the sphere of industry. For there is a well-defined time-lag between the setting up of capacity and the commencement of production; and this interim usually works out to three years. If therefore, output improved during 1963-64, it was because, three years earlier, the foundations for additional capacity had been laid. Production alone is no index of the progress of industrialisation; a more important indicator is the creation of new capacity. In this regard, as we have already noted, for at least half of the last fiscal year, there was virtually no setting up of new enterprises; and we shall be feeling the effect of this stagnation three years hence. Thus, while the rate of growth of industrial production may have been maintained last year the rate of industrial growth itself will necessarily have suffered a set-back in the long run.

The decline in agricultural production and the imposition of additional excise duties and taxes were reflected in the behaviour of prices. The Finance Minister, in his Budget speech this year has described the rise in the price level as "the most



DUNLOP
HIGHWAY for highest
mileage on long heavy hauls

The Dunlop Highway Truck and Bus Tyre assures higher initial tread mileage on heavily laden long distance trucks and modern fast buses. And finally, when the tyre is worn smooth, the excellent retreadability of the casing means that it will continue to serve for many more thousands of miles.

TO PUBLIC LIMITED COMPANIES

disturbing feature" of the economic scene. In the period between 2nd March, 1963 and 22nd February, 1964, the general index of wholesale prices has risen from 126.3 to 138.6. This in itself would not have been a disturbing fact if the rise had been clearly due to circumstances beyond our control, as for example failure of agricultural crops, and if the rise had been confined to one category of commodities, I am afraid that we can have no such consolation; the price behaviour can be succinctly summarised as follows: the index number of food articles rose from 123.0 on 2nd March, 1963 to 141.4 on 22nd February, 1964; that for liquor and tobacco from 98.9 to 122.1; the index number for fuel, power, light and lubricants shot up from 125.9 to 139.6; the relevant figure for industrial raw materials rose from 135.3 to 144.4. The only semblance of some stability was under the category of manufactures, the index number in respect of which moved within a narrow range between 129.2 and 131.7. Prices could not be kept in check for the simple reason that production could not keep pace with demand; nor could we augment supplies through imports for lack of foreign exchange. Whether we like it or not, therefore, the summing-up of the fiscal year just past must be that, whether as regards agriculture or in respect of industry, we have fallen behind.

Taking all these factors into account it becomes clear that the country can ill-afford the stagnation in growth that had set in and it had become apparent that steps had soon to be taken to re-activate the capital market and revive the sagging economy. With the reshuffle of the Union Cabinet on the implementation of the Kamaraj Plan the new Finance Minister, Mr. T. T. Krishnamachari set before himself the task of restoring confidence in the future of Indian economy. The Finance Minister began well in word and deed and the general expectation of an attempt by Government to offer encouragement to expansion of industrial activity found expression in a large number of capital issues in the first quarter of 1964 to which a reference has been made earlier.

INCENTIVES AND INVESTMENTS

It was refreshing to hear the President of the Indian National Congress, the Deputy Chairman of the Planning Commission and the Finance Minister all giving expression to the feeling that industrial development should be fostered and that everything should be done to provide the means and the incentive to bring this about. All the three, more or less, recognised that incentive to individuals and enterprise alone can accelerate production. This is clear recognition of the important role which profit motive plays in fostering enterprise. Thus at the close of the Bhubaneswar session of the Congress, Mr. Kamaraj in referring to the need to raise the standard of living of the masses said: "It is only through rapid industrialisation that we can increase our wealth and improve the standards of people". While delivering the Sir Sri Ram Memorial Lecture, Mr. Ashoka Mehta described the profits of industry as the sinews of growth and emphasized its important role. He also said that in order to increase savings and to spur investments it was necessary to augment profits both in the public and private sectors and he proceeded to say that in a developing economy profit was a "growth point". He warned that without a 10 per cent return on capital the chances of maintaining the tempo of investment and growth would be slim.

Mr. T. T. Krishnamachari in his Budget speech said: "It is equally important for our development that the private sector has the resources to expand in the fields assigned to it in our planning". And again "One of the prime objectives of our economic and fiscal policy, therefore, must be to generate savings both in the hands of individuals and in the hands of corporate bodies". Moreover in the opening paragraph of Part B of his speech, which contained his new proposals, Mr. Krishnamachari said: "....the existing taxation policy, good as far as it goes in the direction of producing revenue, has also to be geared to the paramount task of promoting growth. It is admitted on all hands that fiscal measures have a major role to play in the process of economic development". Referring to the working of Public Sector undertakings, the Finance Minister said: "Many of the public sector projects are lagging behind the schedule of their construction and what is more disappointing is that their contribution to our resources is nowhere near the plan estimates. It is of the utmost importance to our economy that enterprises in the public sector should not only make profits but should make good profits. By that I mean that they should give a good dividend to the exchequer and yet be able to build up reserves to finance their own future expansion".

Having regard to such explicit expressions of belief on the need for increased production and for the provision of the means of expansion and of faith in the profit motive it has caused no little misgiving that the Finance Minister's actual Budget proposals have fallen so greatly short of expectations. While there is a serious and even commendable effort by the Finance Minister to offer incentive to industry in the form of modification of the Super Profit Tax, rationalisation of inter-corporate taxation and other incentives he has whittled down these reliefs by such measures as the new dividend tax, tax on notional capital gains on bonus shares and steep increases in gift tax and Estate Duty and requirements of Annuity Deposits by individual tax payers. It is difficult to see how in this new environment capital could be raised by the private sector for new enterprises. Unless there is incentive for individuals there is no meaning in offering incentive to industry. A healthy Stock Exchange with steadily appreciating values of the shares dealt thereon based on actual and potential growth of companies is absolutely essential if a steady growth in the number of new enterprises is to be maintained and I sincerely trust that the Finance Minister will have a second look at his Budget proposals with a view to providing sufficient incentives to individuals.

It needs to be admitted that the Finance Minister, perhaps recognising the conditions in which it would be impossible for the new capital issues market to function smoothly or to function at all, has proposed to bring into existence the Development Bank endowed with large capital funds with the intention of making a substantial contribution to the resources of the development of our industrial economy. This institution would absorb the Refinance Corporation for Industry Ltd., and with such absorption the limitations and the financial ceilings on individual loans subject to which the Refinance Corporation functioned hitherto would presumably be done away with and industrial concerns could have a new institution to turn to for their requirements of finance against fixed assets without the handicaps which the bigger institutions were subjected to by reason merely of their size. Furthermore, the establishment of an investment trust (Unit Trust) under official auspices to gather funds from small savers for investment in industry would afford powerful support to the Stock Market and to the extent such purchases are effected by the Unit Trust, moneys might be released for investment in newer enterprises. But all this, while helpful to industrial development, is no substitute for the free functioning of the capital market and for incentives to the small investor to invest his funds with the hope of reward in the form of appreciation of his investments over a period of years and for a fair running return. Healthy and active conditions in the Stock Exchanges would enable the Development Bank to resell any shares which it might be called upon to take up in fulfilment of its underwriting obligations and so release funds

for new underwriting. They would also help the Unit Trust in its investment operations.

In many of my previous statements to you I had emphasised that so long as our economic expansion is dependent on the availability of external funds it should be our aim to encourage foreign investment instead of a recourse to foreign loans. Foreign loans have to be repaid in foreign currency some day and our liability for servicing and repaying the debts might assume such dimensions as to prove a strain on our ability to repay. It is a matter of satisfaction that in dealing with the problem of foreign exchange resources of the country Government policy shows signs of a shift towards attracting foreign capital rather than depending on external aid in the form of loans. I have also stated that for attracting foreign investments we must create a proper climate and I am happy to mention that the Government has streamlined the procedure for foreign collaboration and has in this year's Budget provided greater tax relief for foreign investors.

MONETARY POLICY

So far, we have been mainly concerned with consideration of such changes as would encourage economic growth. There is also as much need for monetary policy to be so framed as would help the process. "Economic Survey 1963-64", issued a few days before the Budget, remarks that, last year, "both fiscal and price policies were employed to stimulate production in priority industries"; and in the opening paragraph, the statement is made that "the fiscal and monetary situation was also reviewed and a number of measures were taken in the latter part of the year to revive the capital market, to stimulate investment and output, to extend social security and to provide such relief to the consumer as was consistent with the claims of defence and development". Thus the "Economic Survey" further makes the point that "there has been increasing recognition of the fact that while a measure of control over basic items in short supply is necessary in a planned economy, it is equally important to ensure that basic industries secure returns adequate to finance expansion and to attract capital which would otherwise go into non-priority industries". The increase in the price for additional production allowed to the cement industry and the raising of Development Rebate to 35 per cent from 20 per cent for the colliery industry were both, it is true, instances of Government's attempt to give a spur to production in priority industries. The decontrolling of prices of certain items of manufacture like chemicals, rayon and steel was another step in that direction. The monetary measure was the scheme announced by Government and implemented through the Refinance Corporation for guaranteeing loans taken by the coal industry for availing of the World Bank's line of credit of 35 million.

But, apart from the scheme for the coal industry has the monetary policy as implemented been such as would subserve the end of increasing production? The year 1963 started off with a rise in the Bank Rate to 4½ per cent --- a necessary adjustment in order that the primary lending rate might be brought into alignment with other interest rates ruling at the time. It can hardly be maintained that the unusually large contraction during the 1963 slack season was due to the Reserve Bank's raising of Bank Rate early in the year; a more tenable explanation would be that the slackness in production reduced the rate of growth of bank credit to industry. Nevertheless, at the end of the year, it seemed as if, for the financing of the 1963-64 busy season, banks would stand in need of considerable assistance from the Reserve Bank; and the Central Banking institution did act promptly, in sanctioning liberal credit limits, by modifying somewhat the multiple-tier Bank Rate system and reducing the penal rate of interest on borrowing from 6½ to 6 per cent. Banks were encouraged to feel, through the fact of such relaxation, that they could, in counting upon assistance from the Reserve Bank, extend themselves fully in the provision of credit for productive endeavours.

Disillusionment was in store for the banks. Precisely during the week when the Reserve Bank's advances to Scheduled Banks touched their peak, a communique was issued tightening credit once again. Whereas banks had, on the eve of the busy season, been allowed to borrow upto 75 per cent of their Statutory Reserves at 4½ per cent and another 75 per cent of such reserves at 6 per cent, the penal rate of interest on borrowing in excess of these limits with the special sanction of the Reserve Bank of India having been lowered to 6 per cent, the directive issued early in March was to the effect that the two tranches were each cut to 50 per cent and that, besides, any borrowings beyond that limit (permitted only under special circumstances) would bear a penal interest rate of 6½ per cent. One implication is that banks which had planned ahead to provide finance to industry on the basis of securing assistance from the Reserve Bank as and when necessary may now be compelled to cancel limits. Industry would not be unduly worried as much by dear money as by tight money i.e., scarcity of credit. For its smooth working and increasing tempo of production industry must be assured of availability of money at all times.

The other, more basic implication, concerns the impact of a multiple-tier Bank Rate upon the whole structure of interest rates. It would be pertinent to quote here from my statement last year: 'Orderly interest rates obviously require that the anomaly of three-tier Bank Rate be set right. I am afraid that all the devices we have woven in and around the Bank Rate, possibly with a view to avoiding straight increase in it, have served merely to add to the complexity of our interest rates".

If banks, even though for short periods, are required to pay 6½ per cent for their borrowings, at what minimum rate are they to fix their own lending rates? Furthermore, would the rates of interest on Deposits as they exist today be found a sufficient inducement for mobilisation of resources? Yet again, can banks at all be expected to invest in Government Securities that could at best yield 3¾ to 4 per cent, when on borrowings against the same securities they might have to pay interest at 6½ per cent? I once again plead for rationalisation of the interest rate structure and a prerequisite in this respect certainly is that we have just one, single Bank Rate. What is important for banks is the minimum spread between the lending rate and the "borrowing" rate, that is, the interest payable on Deposits. It would follow, then, that the various banking interest rates would need to be linked with Bank Rate itself; but this cannot be done, I repeat unless the multiple-tier Bank Rate goes.

In the face of uncertainty about the Reserve Bank's lendings it obviously becomes essential for banks to plan on lending only on the strength of their deposit resources. Thus, the mobilisation of deposits assumes more importance than ever before, I should like to quote again from the 'Economic Survey" which, in its paragraphs on monetary trends, asserts that "the accent of monetary policy will also necessarily have to be on realistic interest rates which reflect adequately the real cost of capital to the economy". One aspect of mopping up of funds in areas now unbanked is of course a branch expansion programme; another is the inducement that can or should be held out to the owner of money, to make a deposit with banks. If, consequently, there are no emerging signs of interest rate rationalisation, I feel apprehensive that the banks will be com-

SOMEONE, SOMEWHERE WANTS POWER FOR INDUSTRY AND THE HOME

And AEI goes into action

A vast network of men and machines is required to generate, distribute and put electric power to use. AEI, pre-eminent in the fields of power generation and distribution, also leads in the manufacture of equipment which puts power to use: All over India, in busy towns and distant villages, AEI equipment puts power to work for industry and the home.

Pick a mill at random

Any mill in the cotton city of Ahmedabad. Chances are it will be electrified by AEI. Most of the 65 cotton mills in Ahmedabad have some AEI equipment; some mills are completely electrified by AEI. One of the oldest, the Ambika Mills, has been using AEI products since 1934: 200 AEI motors, transformers, switchgear and control boards have given faultless service for almost thirty years. AEI equipment is also extensively used in other industries. In the huge workshops of the Tata Engineering and Locomotive Company, Jamshedpur, AEI equipment

has been used for half a century. Here, eight AEI furnaces (total capacity 25 tons) melt metal for the production of trucks, locomotives, excavators and other heavy machinery. At the neighbouring Tata Iron and Steel Works, 20% of all electrical equipment is AEI, including a 7,500 h.p. motor to run at 94 r.p.m. At Ennore, near Madras, one of India's largest foundries has invested heavily in AEI equipment: two three-ton capacity induction furnaces, one four-ton arc furnace. The Avadi Works of Tube Products of India has four AEI furnaces including an electric resistance furnace, *the only one of its kind in India*, which produces 48 tons per day, working round the clock, seven days in the week.

His ginning factory

AEI is very active on the domestic front. Take the case of Sham Rao Dayaram Saoji of Saoner, a town in Nagpur District. Saoji is a confirmed 'AEI' man. His ginning factory is run by a 70 h.p. AEI motor; his oil mill has a 20 h.p. AEI motor and a 10 h.p. AEI motor runs his flour mill. 6 sturdy AEI pumping sets provide water from deep wells for Saoji's 3,600 orange plants. He and his

family keep cool with *ten AEI fans*. Electricity and AEI equipment to make it perform, have brought Saoji comfort, more leisure and lots more profit.

Healing by faith, formula and AEI equipment

Cures bordering on the miraculous occur with amazing frequency at Telungupalayam Hospital in Coimbatore. Dr. Arjun, who runs the hospital, is known all over the country for his skill in treating polio sufferers. A few years ago, he began using an electronic muscle stimulator made by AEI. He finds it an invaluable help...AEI has pioneered in the field of electro-medical equipment. The world's first clinical linear accelerator for use against cancer was built by AEI. This and other types of AEI equipment are in use in hospitals throughout the world.

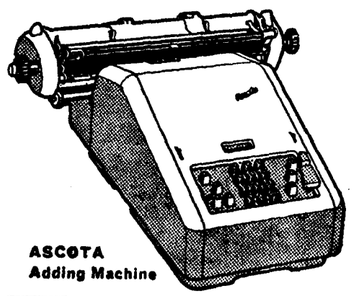
Our nose is always in other people's business

...and they like it that way! AEI equipment is used in all areas of industrial and domestic activity: from small 'one-man' saw-mills to India's largest steel complexes, from Punjab's 'cottage' industries to Bengal's coal mines, from a villager's hut to the magnificent House of Legislature in Bangalore ...in India's homes, industries and scientific institutions, AEI equipment is putting power to work.

We don't usually indulge in name-dropping, but...

In our case it's justified. AEI is no newcomer. Its origins go back *more than sixty years*. Today, Associated Electrical Industries Limited embraces such famous names as British Thomson-Houston, Metropolitan Vickers, Siemens Edison Swan, Henley's, Ferguson Pailin, Birlec and Hotpoint. Worldwide, AEI operates 60 factories and employs 100,000 people. It produces everything electrical from lilliputian transistors to the world's biggest turbine generators.

Principal products worldwide



Steam and gas turbines and generators • Hydro-electric generators • Marine propulsion equipment • Electric drives for rolling mills and mine winders • Electric furnaces • Traction and railway signalling equipment • Transformers and switchgear • Power and telephone cables • Motors and their control gear • Electronic apparatus and radar equipment • Particle accelerators, electron microscopes and mass spectrometers • Industrial controls, instruments and meters • Semiconductor devices and power rectifiers • Private and public telephone exchanges and other telecommunication equipment • Lamps and lighting fittings • Heating equipment • Electro-medical apparatus • Nuclear power station equipment • Domestic appliances.

pelled to revise upward the rates of interest they pay on Deposits and those charged on advances.

I have not sought to be critical, but I have this year striven to emphasise that while every official pronouncement has unequivocally acknowledged both the need for production and the incentives that have to be provided for that purpose, we are still far away from the existence of such favourable economic conditions for an automatic and sustained effort for industrial growth. If, as is possible, the effect of the last Budget is to make the capital market shy, I am sure that the banking system, to the best of its ability and to the full extent of its capacity, will provide every kind of financial assistance for the furtherance of production, though a limiting factor in this regard will be the higher liquidity requirement that becomes effective from next autumn under the Banking Companies Act as amended in September, 1962. In conclusion, may I be permitted to express my hope that the Government will increasingly create a climate of incentives, so that we can go ahead speedily with the industrialisation of our country?

Note: This does not purport to be a record of the proceedings of the Annual General Meeting.

Acropolis, Athens

Here's how on your next trip to Europe or North America, you can avail of reliable KLM's jet services and see Athens on your way, at no extra fare!

Athens, one of the 44 key cities covered by KLM's network of air routes in Europe, is now served direct by both the KLM's flights from India. A nice opportunity to visit this increasingly popular city for a while, before continuing your journey. Read on for more interesting KLM facts...

1. A KLM DC-8 jet leaves for Europe on Saturdays from Calcutta, on Tuesdays from Delhi and on Mondays, Tuesdays, Thursdays, Fridays, and Saturdays from Karachi

2. KLM's flight from Calcutta leaves on Saturday at 20.30 hrs., arriving Athens on Sunday 05.30 hrs.

3. From Athens, this flight goes to Zurich on its way to Amsterdam, providing you with yet another attractive possibility! Arrival: Zurich Sunday at 08.00 hrs. Arrival: Amsterdam Sunday 09.55 hrs.

4. KLM's flight from Delhi to Amsterdam leaves on Tuesday at 21.55 hrs., arriving Athens on Wednesday at 05.55 hrs. Arrival: Amsterdam (via Frankfurt) Wednesday at 10.05 hrs.

5. Both these KLM flights from India can easily be connected at Karachi by passengers from Bombay and also from Delhi and Calcutta.

6. In Amsterdam, these services link up with daily non-stop KLM flights to New York and with frequent flights to Houston, Montreal and Mexico city.

7. On the Amsterdam-New York route, KLM will have 24 DC-8 jet flights a week during the peak season—17 non-stop, 5 via Glasgow and 2 via Shannon.

Attractive KLM facilities

8. KLM has its own air-conditioned resthouse at Karachi airport, called "Midway House". It has spacious, comfortable rooms with shower baths and provides many facilities such as a supervised nursery, a barber shop, a souvenir and carpet shop and a floodlit tennis court. The service there matches the standards of a good European hotel.

9. KLM offers many interesting side-trip possibilities. For example, on the normal round-trip fare from Calcutta, Delhi or Bombay to London, you can enjoy a side-trip to Copenhagen or Paris.

10. KLM's multi-stopover plan lets you make more than one stop en route your final destination at no extra fare. For instance, if you are flying from Delhi to New York, you can visit Rome, Frankfurt, Dusseldorf or Paris, London, Amsterdam — all for the price of your ticket to New York. Ask KLM for details of other stopover possibilities.

11. Make your choice of a number of attractive organised tours, planned to provide visitors to Greece with comfortable and easy means of access to every point of interest in the country. Contact KLM for full particulars regarding the number of days involved and the routing.

12. From Athens, many important cities in Europe and North America are served direct. For example, London, Madrid, Paris, Rome, Vienna, Zurich, Frankfurt, Brussels, Geneva, Copenhagen, Milan, Munich, Amsterdam, New York, Detroit, Chicago etc.

13. When flying via Amsterdam, you can do a lot of interesting things at the airport. Shop for luxury bargains at the Tax-Free Shopping Centre. Buy a tax-free car at ShipSide Showroom. Take a Minitour of Amsterdam. Visit the airport's fascinating aeronautical museum.

14. All KLM flights to Europe from Calcutta, Delhi and Karachi arrive in Amsterdam next morning, offering immediate connections to London, Paris, Brussels, Geneva, Hamburg, and many other cities in Europe and also to New York.

15. Your Travel Agent will tell you more about the advantages of flying KLM. Get in touch with him or contact the nearest KLM Office. Calcutta—7, Chowringhee Road; Delhi—9A, Connaught Place; Bombay—Taj Mahal Hotel.

ATHENS— KLM's new gateway to Europe

Things to do in Athens: See the Acropolis by moonlight (a thrilling experience!); the Benaki Museum by daylight; go to a "taverna" (small typically Greek restaurant); try "Cocoretsi" (Greek speciality) or crisp "Kalamarakia" (fried squid); drink 'ouzo' (aniseed flavoured Greek aperitif); take a stroll during a cool summer evening throughout the picturesque winding streets of the old Plaka quarter and if you happen to be there during August/September, in time for the Festival of Athens, attend the remarkable performances of ancient drama, concerts and ballets.

RECORDS AND STATISTICS

Dollars for Development

U.S. ECONOMIC assistance to India consists of both grants and loans. The total commitments of the United States under various agreements with the Government of India stand at $5,315.5 million (Rs. 2,531.2 crores) as on March 9, 1964.

American assistance to India is at present extended through the following three agencies:

1. U.S. Agency for International Development (U.S.-A.I.D.). This Agency was created on November 3, 1961 to bring American economic assistance under a unified administration. It is in charge of activities previously administered by the International Co-operation Administration, which was represented in India by the Technical Co-operation Mission (TCM), the Development Loan Fund, the Food for Peace Programme (Public Law 480) in its relation with other countries, and other staff and related functions.

U.S.A.I.D. gives both development loans and grants. Grants have been made to the Malaria Eradication Programme, smallpox eradication, higher education, National Productivity Council, craftsmen training, dairy development, community development, crop production and a number of other projects. U.S.A.I.D. and its predecessor, TCM, have also aided India by making available American experts to work in specific technical and economic problems in the Indian development programme, by giving advanced training to Indian participents both in India and abroad, and by the provision of supplies and equipment. The names of the principal divisions of U.S.A.I.D. (Agriculture, Industry, Health, Education, Labour and Management) indicate the comprehensive scope of its activities. Development grants total $365.6 million (Rs. 174.1 crores). These, of course, do not involve repayment.

Debt Servicing

The 25 development loans extended by U.S.A.I.D. since its establishment in November 1961 total $1,072.8 million (Rs. 510.9 crores). These loans are repayable in dollars, but in order to avoid an excessive foreign exchange debt servicing burden to India, the terms of the loans are set at a long period, taking into account such factors as other foreign debt and the foreign exchange earnings of the country.. Repayment is scheduled over 40 years, including a 10 year grace period; that is, no payments of principal during the first ten years.

The 22 loans authorized through 1963 are free of interest and carry a credit fee of three quarters of one per cent per annum. The foreign aid legislation enacted by the U.S. Congress for Fiscal Year 1964 effected a slight change in the terms of these loans: instead of a credit fee they are now subject to payment of interest at three quarters of one per cent during the first ten years and at two per cent during the remaining thirty years. Three loans have so far been authorized in India under the new terms.

Prior to November 1961, the Technical Co-operation Mission had given the Indian Government loans totalling $154.2 million (Rs. 73.4 crores). These could be repaid in either rupees or dollars at the option of the Government of India.

The U.S. Development Loan Fund, which has now been absorbed into U.S.A.I.D., made loans to India totalling $510.3 million (Rs. 243.0 crores) between 1958 and September 30, 1961. These loans are repayable in non-convertible rupees.

2. Public Law 480 (Food for Peace) Programme: Public Law 480, which is playing a significant role in ensuring the availability of agricultural commodities to India at reasonable prices at a time of intense economic development has four titles (or chapters).

Under Title I of PL-480, the United States has entered into eight agreements with India for the supply of large quantities of wheat, rice, coarse grains, cotton, dried milk powder and tobacco. India pays for these commodities in rupees. The total value of the commodities covered by these agreements is Rs. 1,183.6 crores ($2,485.6 million). Of this, Rs. 150.3 crores ($315.7 million) is reserved for U.S. Government uses; Rs. 80.1 crores ($168.1 million) for loans to private enterprise under the Cooley Amendment; Rs. 375.3 crores ($788.2 million) for grants to the Indian Government for development projects and the balance of Rs. 577.9 crores $1,213.8 million) for loans to the Indian Government for the same purpose. Thus, 87 per cent of the value of agricultural commodities supplied under Title I of PL-480 will be utilised in financing irrigation dams, power projects, educational and research facilities, the malaria eradication programme, industrial enterprises and other development undertakings.

Emergency Assistance

Title II of Public Law 480 enables the U.S. President to furnish emergency assistance to foreign countries in meeting famine or other urgent or extraordinary relief requirements. Under this title India has received agricultural commodities worth $8.5 million (Rs. 4.1 crores).

Under Title III of Public Law 480, $180.0 million (Rs. 85.7 crores) worth of dried milk, wheat, rice, corn, cotton seed oil and other such commodities have been distributed in India through voluntary agencies. Some 70 lakh school children receive free lunches through programmes assisted under this title.

Title IV provides for long-term credits to friendly nations for purchase of agricultural commodities during periods of economic development. Repayment in dollars could be spread over twenty years. No transactions have taken place between India and the United States under this title.

The Cooley Amendment to Public Law 480 (named after Congressman Harold D. Cooley, Chairman of the Committee on Agriculture of the U.S. House of Representatives) provides that up to 25 per cent of the local currency proceeds from the sale of American agricultural commodities shall be made available to U.S.A.I.D. for lending in the private sector to two categories of borrowers: (1) American firms or their subsidiaries operating in the host countries or indigenous firms having an affiliation with an American firm; (2) indigenous firms of the host countries with no American affiliation but which are facilitating the disposal of American agricultural products, e.g. local private warehouses storing grain or flour mills processing the grain, etc. The eight agreements between India and the United States under PL-480 provide for Rs. 80.1 crores to be given in loans to private enterprise under the Cooley Amendment.

3. The Export-Import Bank: The Bank has authorised 18 loans to India totalling $343.3 million (Rs. 163.5 crores). The Bank extends loans and guarantees for the primary purposes of promoting the export and import trade of the United States. Loans given by it are repayable in dollars. In determining the rates of interest to be charged on loans, the Bank takes into consideration the maturity of the loans and the extent of credit risk to be assumed by the Bank as affected by such guarantees as may be offered, as well as prevailing United States commercial and government rates. For instance, the First Line of Credit of $150 million to the Government of India authorized in 1958, carries an interest rate of 5¼ per cent. The principal is repayable in 20 semi-annual instalments beginning in January 1964.

The Wheat Loan: In 1951 the U.S. Congress enacted legislation for a loan of $189.7 million (Rs. 90.3 crores) to India to finance the purchase of two million tons of wheat to meet an acute food shortage. The loan is repayable in dollars and carries an interest rate of 2¼ per cent. Repayment was scheduled to commence on June 30, 1957. However, in view of India's serious foreign exchange difficulties, the U.S. Government postponed the 18 semi-annual instalments of interest and principal due from December 31 1959 and rescheduled them to fall due from December 1986 to June 1995, without additional interest payments.

To recapitulate, American economic assistance commitments to India total $5,315.5 million (Rs. 2,531.2 crores). This consists of:

	Dollars (Million)	Rupee equivalent (Crores)	% of total
1. Grants (not repayable)	1,347.8	641.8	25.4
2. Loans repayable in dollars	1,605.8	764.7	30.2
3. Local currency repayments (This includes loans repayable in rupees or dollars, the Cooley Fund for loans to private enterprise and amounts under PL-480, Title I, agreements reserved for U.S. Government uses)	2,361.9	1,124.7	44.4
Total	5,315.5	2,531.2	100.0

It will be noted that only 30 per cent of total American aid to India involves foreign exchange repayments. The greater part of this amount bears exceptionally low rates of interest and is repayable over a long period (40 years).

A quarter of the total aid represents grants. The remainder (44 per cent) represents loans repayable in rupees. These repayments do not involve the utilization of India's foreign exchange earnings or the export of goods from this country.

U. S. ECONOMIC ASSISTANCE TO INDIA

(June 1951 to March 9, 1964)

	Dollars (Million)	Rupee equivalent (Crores)

U.S. PUBLIC LAW 480

The United States has entered into eight agreements with India under Title I of US Public Law 480 covering agricultural commodities valued at $2,485.6 million (Rs. 1,183.6 crores).

Payment is made by India for these supplies in rupees. The agreements provide for the utilization of the sale proceeds in the following manner:

1.	For grants to Indian government for development	Rs. 375.3 crores
2.	For loans to Indian government for economic development	Rs. 577.9 „
3.	Cooley Fund for loans to private enterprise	Rs. 80.1 „
4.	For U.S. government uses	Rs. 150.3 „
	TOTAL	Rs. 1,183.6 crores

As of January 31, 1964, a sum of Rs. 860.6 crores had

accrued as sales proceeds of commodities supplied to India.

This amount has been allotted as follows :

1.	For grants to Indian government	Rs.	257.8 crores
2.	For loans to Indian government	Rs.	422.1 ,,
3.	Cooley Fund for loans to private enterprise	Rs.	61.4 ,,
4.	For U. S. government uses	Rs.	119.3 ,,
	TOTAL	Rs.	860.6 crores

GRANTS FROM U.S. PUBLIC LAW 480 SALES PROCEEDS

The eight agreements between the United States and India under U.S. Public Law 480 provide for the grant of Rs. 375.3 crores from the sales proceeds of agricultural commodities to the Indian government for economic development projects.

As of January 31, 1964 a sum of Rs. 257.8 crores had become available from sales proceeds for grants to the Indian government. Agreements have been concluded for grants to be made to the following projects.

1.	River Valley Development (Chambal, Hirakud, Damodar Valley, Mahi Right Bank Canal, Kakrapar, Nagarjunasagar, Kosi, Bhadra, Tungabhadra, Mahanadi Delta Irrigation, Kundah and Koyna Projects)	Rs.	5.9 crores
2.	Malaria Eradication	Rs.	52.9 ,,
3.	Indian Institute of Technology, Kanpur	Rs.	2.2 ,,
4.	Uttar Pradesh Agricultural University, Pant Nagar	Rs.	2.2 ,,
5.	All India Institute of Medical Sciences, New Delhi	Rs.	2.9 ,,
6.	Indian Investment Centre	Rs.	0.4 ,,
7.	Dairy Development	Rs.	3.6 ,,
8.	Soil and Water Conservation	Rs.	4.0 ,,
9.	National Highways	Rs.	20.0 ,,
10.	Exploration of Groundwater Resources	Rs.	0.8 ,,
11.	Craftsmen Training	Rs.	9.0 ,,
12.	Modern Storage of Food Grains	Rs.	12.2 ,,
13.	Higher Technical Education	Rs.	6.9 ,,
14.	Elementary Education	Rs.	42.0 ,,
15.	Smallpox Eradication	Rs.	1.0 ,,
16.	Primary Health Centres	Rs.	7.0 ,,
17.	Medical Educator Training	Rs.	5.4 ,,
18.	National Productivity Council	Rs.	0.1 ,,
	TOTAL	Rs.	178.5 crores

LOANS TO THE INDIAN GOVT FROM U.S. PL 480 SALES PROCEEDS

The eight agreements between the United States and India under U.S. Public Law 480 provide for loans totalling Rs. 577.9 crores from the sales proceeds of agricultural commodities to the Indian government for economic development projects.

As of January 31, 1964, a sum of Rs. 422.1 crores had become available from the sales proceeds for loans to the Indian government.

Agreements have been concluded for loans to the following projects :

1.	Refinance Corporation	Rs.	26.2 crores
2.	River Valley Development	Rs.	178.8 ,,
	Chambal—Rajasthan & M.P.	Rs.	30.8 crores
	Hirakud—Orissa	Rs.	5.8 ,,
	Damodar Valley Corporation) Bihar & West Bengal	Rs.	7.5 crores
	Mahi Right Bank Canal, Gujarat	Rs.	2.9 crores
	Kakrapar, Gujarat	Rs.	4.7 ,,
	Nagarjunasagar, Andhra	Rs.	43.7 ,,
	Kosi, Bihar	Rs.	32.3 ,,
	Bhadra, Mysore	Rs.	13.2 ,,
	Tungabhadra, Andhra	Rs.	14.1 ,,
	Mahanadi Delta Irrigation, Orissa	Rs.	10.6 ,,
	Kundah, Madras	Rs.	7.6 ,,
	Koyna, Maharashtra	Rs.	11.5 ,,
	TOTAL	Rs.	184.7 ,,
	LESS GRANTS	Rs.	5.9 ,,
	LOANS	Rs.	178.8 ,,
3.	Sharavathi Hydro-electric Project, Mysore	Rs.	34.5 ,,
4.	Industrial Credit and Investment Corporation of India	Rs.	20.0 ,,
5.	Industrial Finance Corporation	Rs.	20.0 ,,
6.	Chandrapura Thermal Power Project, Bihar	Rs.	20.5 ,,
7.	Barauni Thermal Power Project, Bihar	Rs.	1.3 ,,
8.	Durgapur Thermal Power Project, West Bengal	Rs.	3.4 ,,
9.	Kanpur Thermal Power Project, Uttar Pradesh	Rs.	1.0 ,,
10.	Barapani Hydro-electric Power Project, Assam	Rs.	6.4 ,,
11.	Trombay Fertilizer Plant, Maharashtra	Rs.	13.4 ,,
12.	Rihand Valley Hydro-electric Project, Uttar Pradesh	Rs.	5.6 ,,
13.	Cambay Thermal Power Project, Dhuvaran, Gujarat	Rs.	9.0 ,,
14.	Birsinghpur Thermal Power Project, Amlai, Madhya Pradesh	Rs.	6.7 ,,
15.	Bandel Thermal Power Project, West Bengal	Rs.	8.4 ,,
16.	Talcher Thermal Power Project, Orissa	Rs.	8.5 ,,
	TOTAL of loan agreements	Rs.	363.7 crores

Commitments have been made for loans to the following projects :

1.	Pamba-Kakki (Sabarigiri) Hydro-electric Project, Kerala	Rs.	18.4 crores
2.	Satpura Thermal Power Project, M.P.	Rs.	14.8 ,,
3.	Delhi "C" Thermal Power Project	Rs.	8.3 ,,
4.	Ramagundam Thermal Power Project, Andhra	Rs.	3.7 ,,
	TOTAL commitments	Rs.	45.2 crores
	TOTAL of loan agreements and commitments	Rs.	408.9 crores

COOLEY FUND

The Cooley Amendment to U.S. Public Law 480 (named after Congressman Harold D. Cooley, Chairman of the Committee on Agriculture of the U.S. House of Representatives) provides that up to 25 per cent of the local currency proceeds from the sale of American agricultural commodities shall be made available for lending in the private sector to two categories of borrowers :

(1) American firms or their subsidiaries operating in the host countries (India) or indigenous (Indian) firms having an affiliation with an American firm ;

(2) Indigenous firms of the host countries with no American affiliation but which are facilitating the disposal of American agricultural products, e.g. local private warehouses storing grain or flour mills processing the grain, etc.

The eight agreements between India and the United States under Public Law 480 provide for a sum of Rs. 80.1 crores to be allocated to the Cooley Fund.

As of January 31, 1964 a sum of Rs. 61.4 crores (Rs. 614 million) had become available to the Cooley Fund.

The following loans have been extended from the Cooley Fund :

		(Rs. crores)
1.	Otis Elevator of India Ltd., Bombay (elevators)	0.10
2.	Goodyear Tyre & Rubber Co. of India Ltd., Ballabgarh, Punjab (rubber products)	2.25
3.	Mysore Cements Ltd. (M/s. Sarangapani Mudaliar/ Kaiser Inc.), Ammasandra, Mysore (cement)	1.00
4.	Hindustan Aluminium, Ltd. (M/s. Birla/Kaiser Inc.) Pipri, near Rihand dam, U.P. (aluminium)	1.00
5.	Synthetic & Chemicals, Ltd. (M/s. Kilachand/Firestone Inc.), Bareilly, U.P. (synthetic rubber)	6.50
6.	Ex-Cell-O (India) Pte. Ltd. (M/s. Amerind Engineering Co./Ex-Cell-O Inc.), Bombay, Maharashtra (machine tool parts)	0.20
7.	Premier Tyres Ltd. (Joint enterprise with Daytor Rubber Co. Inc.), Cochin, Kerala (rubber tyres)	0.30
8.	Seshasayee Paper & Board Ltd., Erode, Madras (M/s. Seshasayee/Parsons & Whittemore Inc.) (bagasse pulp and paper mill)	2.00
9.	Lederle Laboratories (India) Pte. Ltd., Bombay, Maharashtra (American Cyanamid Co. of New York) (antibiotics)	0.25
10.	Gabriel India Private Ltd., Mulund, Bombay, Maharashtra (M/s. D.C. Anand/Gabriel of Detroit) (shock absorbers)	0.05
11.	Madras Rubber Factory Ltd., Madras (factory has been set up in collaboration with Mansfield Rubber Co. of Ohio) (rubber tyres)	0.25
12.	East India Hotels Ltd. (M/s. Oberoi/Intercontinental Hotel Corporation Inc.), New Delhi (construction of hotel in New Delhi)	0.76
13.	Wyeth Laboratories, Pte. Ltd. (American Home Products Corporation), Bombay, Maharashtra Steroid compounds and hormones)	0.17
14.	Victor Gasket India (Pte.) Ltd., Mulund, Bombay, Maharashtra (gaskets)	0.08
15.	Union Carbide (India) Ltd., Calcutta, West Bengal (chemicals and plastics)	2.16
16.	McNally-Bird Engineering Co. Ltd., Calcutta West Bengal (manufacture of coal washeries and allied equipment)	0.50
17.	Harig-Malik Manufacturing Co. Pte. Ltd., New Delhi (tools, dies, gauges, etc.)	0.03
18.	India Precision Bearing Ltd. New Delhi (ball and cylindrical bearings)	0.30
19.	Wyman-Gordon Ltd., Bombay, Maharashtra (precision forgings)	0.25
20.	Arbor Acres Farm India Pte. Ltd., Delhi (Poultry breeding)	0.25
21.	Mandya Paper Mills, Ltd. Bangalore, Mysore (affiliated with Parsons & Whittemore, Inc., New York) (paper mill)	1.50
22.	Kirloskar-Cummins, Ltd., Poona, Maharashtra (affiliated with Cummins Engine Co., Columbus, Indiana) (engines)	1.25
23.	Napco Bevel Gear of India, Ltd., Faridabad, Punjab (affiliated with Napco Industries Inc., Minneapolis, Minnesota) (gears, joints and allied parts)	0.40
24.	Coromandel Fertilizers, Ltd., Visakhapatnam, Andhra (affiliated with California Chemical Company, Inc. and International Minerals & Chemicals Corporation	10.76
	TOTAL	32.31

U.S. EXPORT-IMPORT BANK LOANS TO INDIA

U.S. A.I.D. MISSION'S TECHNICAL COOPERATION PROGRAMME

Project and Title	In Thousands of dollars		
	Loan	Grant	Total
Agriculture and Natural Resources:			
1. Acquisition and distribution of of Fertilizers		17,310	17,310
2. Acquisition and distribution of Iron and Steel for Agricultural purposes		19,739	19,739
3. Plant Protection and Locust Control		584a	584
4. Soil Fertility and Fertilizer use		1,029	1,029
5. Expansion and Modernization of Marine and Inland Fisheries		2,902	2,902
6. Groundwater Irrigation		18,284	18,284
7. Agricultural and Home Science Extension and Training		2,460	2,460
8. Groundwater Exploration		4,092	4,092
9. Training in Agricultural Machinery Utilization		206	206
10. Agricultural University Department		11,919	11,919
11. Foodgrain Storage		1,667	1,667
12. Technical and Engineering Advisory Services to Central Water and Power Commission		43	43
13. Animal Husbandry		794	794
14. Agricultural Information, Production and Training		371	371
15. Agricultural Economics Research		289	289
16. Crop Production		1,279	1,279
17. Farmers Organization		275	275
18. Dairy Development		994	994
19. Co-operative Marketing and Warehousing of Agricultural Produce		20	20
20. Calcutta Milk Scheme		519	519
21. U.P. Agricultural University		1,110	1,110
22. Co-operative Membership Education		93	93
23. Soil and Water Conservation		601	601
24. Agricultural Extension		8	8
25. River Valley Development		7,187	7,187
26. Water Resources and Minor Irrigation Works		477	477
27. Forest Research and Desert Afforestation		356	356
28. Engineering Services to the Damodar Valley Corporation		95	95
29. Augmenting Fertilizer Supply	3,800		3,800
30. Citrus Fruit		17	17
31. Assistance to Ministry of Food and Agriculture		33	33
32. Fertilizer	5,054	2,808	7,862
33. Fertilizer	5,262b		5,262
34. Agriculture Programme Direction		162	162
Total Agri. and Nat. Resources	14,116	97,723	111,839

a—Includes $28,500 from Regional Allotment.
b—Triangular Trade Activities.

Project and Title	In Thousands of dollars		
	Loan	Grant	Total
Industry and Mining:			
1. Development of Forest Research and Desert Afforestation		189	189
2. Training Construction Equipment Operators and Mechanics		491	491
3. Rihand Valley Development		6,009	6,009
4. Assistance to Industrial Research and Technical Services Organizations	489	2,522	3,011
5. Hot Lines Maintenance		405	405
6. Water and Power Development		1,075	1,075
7. National Productivity Council		3,158	3,158
8. Delhi Thermal Plant	175	3,825	4,000
9. Geological Survey of India		537	537
10. Oil and Gas Commission		106	106
11. Line Industry		1	1
12. Assistance to Coal Industry		239	239
13. Assistance to Council of Scientific & Industrial Research		19	19
14. Steel Training		1,249	1,249

GWALIOR FABRICS

Announcement

With the increase of duty on indigenous and imported yarn the manufacturing cost of fabrics has substantially increased but looking to the interest of the country at large

Gwalior Rayon

feel pleasure in announcing that the prices of our suiting and all other fabrics are not increased. We request our patrons as well as dealers to kindly help us

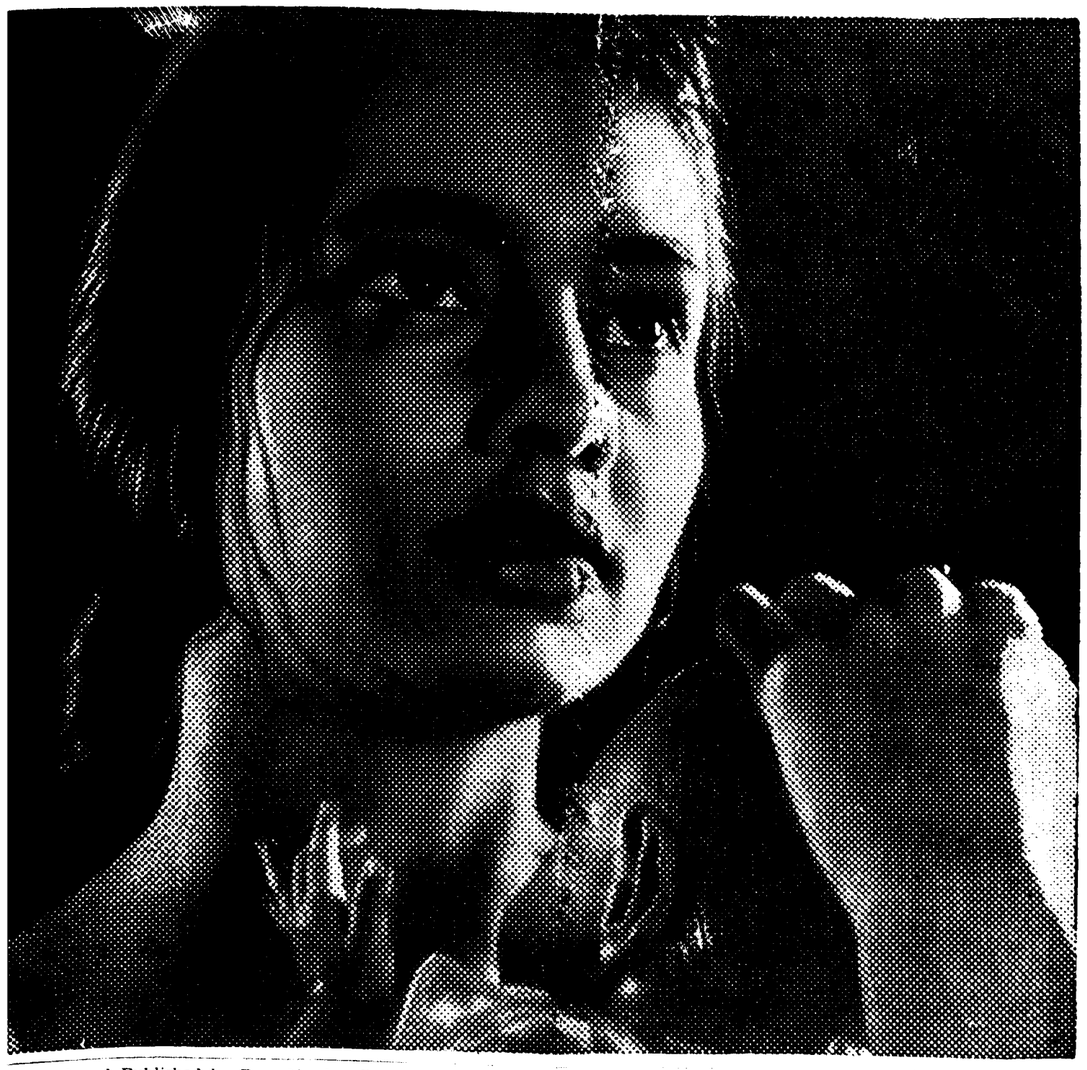
HOLD THE PRICE LINE

Gwalior Fabrics are still available at pre-budget prices throughout the country.

PLEASE DON'T PAY MORE

GR/NPS-170

The Gwalior Rayon Silk Mfg. (Wvg.) Co. Ltd.
Birlanagar - (M.P.)



Good-bye my love

You were my husband for just a little while.
Now all the dreams we dreamt together have
been shattered by one cruel moment of fate.
It killed you, and left me with a living death.

The real tragedy of road accidents
is that we can prevent so many of them.
These accidents do not just happen,
they are caused. By human error,
carelessness and selfishness.
Very little effort is required to avoid
the road tragedy.
Surely, WE CAN be brave and prevent
many lives saved = [illegible]

Road Safety
is a matter of life...and death

After and Beyond the Budget

TOWARDS THE end of his speech moving for consideration of the Finance Bill in Lok Sabha last week, Mr. T. T. Krishnamachari said: "In conclusion, I would like to point out that, while the amendments proposed by the Government seem to be formidable and indicative of revised thinking, in fact, they are not so as I have mentioned before." This observation is evidently intended to reassure the wild men of Bhubaneswar, both within his Party and outside. After this confession by the Finance Minister himself that the changes and concessions effected in the Budget proposals do not, and are not intended to, amount to anything of significance, it is unnecessary on our part to say anything further than to draw the obvious inference that the capital market and the investment climate depressed by the original Budget proposals, are unlikely to improve as a result of the modifications. We doubt that the Finance Minister will quarrel with this conclusion. Has he not himself prepared the ground for the persistence of bearish conditions in the stock exchanges by asserting in advance that the economic policy of the country cannot be geared towards making conditions bullish for the share market?

While we may certainly agree with the Finance Minister that market quotations do not always reflect accurately the economic health of the nation, the fact remains that, over a period, market trends are at least as reliable an indicator of the investment climate and the industrial outlook as is a series of daily weather readings covering the seasons of the physical climate of a region. It cannot certainly be said that the economic policy of the Government should be dictated by what is good for stock exchanges, but so long as the Government does not propose to finance industrial expansion in its entirety through State institutions or agencies, it is difficult to see how it can dispense with or even ignore the normal market mechanism for inducting capital into industry. Mr. Krishnamachari is not the first Finance Minister, nor, we suspect, will he be the last, to adopt a highly subjective attitude to the stock exchanges. In any case, those who had criticized his original budget proposals as being adverse to economic expansion and who might consider the modifications he has made as marginal and inadequate are not necessarily obsessed with the stock exchanges as he seems to think. Market quotations, we readily admit, are only an indicator but the question, surely, is whether, at this particular time, they are discharging this function properly. We do not know whether it is the Finance Minister's contention that the budget proposals, whether in their original form or in their revised state, will have the effect of implementing his own declared purpose of stimulating the economy. For our part, we believe that the budget is not positive enough to do the job. The issue, of course, will not remain one for academic debate. If the Finance Minister is right, the coming months should see a high level of activity in investment, particularly in new capital issues.

The American business men who are in this country have no doubt taken a constructive view of the economic climate. But they are naturally and necessarily concerned, in the main, with the steps taken by the Government of India in fiscal and other matters to facilitate the entry of foreign capital and know-how. Facilities for the foreign investor, however, are only one part of a complete programme for stimulating industrial expansion. The rest is no less relevant and it is here that there is this problem of rupee finance. Government institutions may, no doubt, provide part of it. But a good deal of it may still have to be mobilized by normal market agencies. The Finance Minister has said that it is not

the Government's policy to rely on the continuance of large personal fortunes for the provision of development capital. But while Mr. Krishnamachari's budget proposals will quite certainly be effective in dispersing large family fortunes within a few generations, there is surely very little elsewhere in his fiscal policy to encourage habits of saving and investment in the community at large. All that he has done is to make a massive and compulsory draft on the resources of the public without evidently asking himself seriously whether the means by which and the manner in which he has done this do not amount to a war of attrition on the sources of capital in the community.

We have mentioned earlier that, in view of the Finance Minister's own statement that the modifications in the budget proposals do not indicate any rethinking on his part, it may not be useful to discuss in detail the various amendments he has effected. Nevertheless, it would be churlish on our part to fail to take note of the few liberal tendencies which Mr. Krishnamachari has been persuaded to entertain. It is particularly gratifying to note that the widespread criticism of his proposals relating to the disclosure to the members of the public of information containing tax records has had the effect of making him incorporate certain safeguards for the assessee. Secondly, the Finance Minister has added a few more industries, such as electronics and petro-chemicals, to the list eligible for preferential tax treatment. Since this concession is of great value in the context of the heavy incidence of the general level of corporate taxation, the Finance Minister ought to explore further the possibilities of extending its scope. In this connection, it would obviously be a mistake to assume that only the so-called basic industries or new industries should be shown this fiscal favouritism. On the contrary, other major industries should not be neglected simply because they are traditional. Their value to the economy is great because they provide consumer and other goods which are essential to the maintenance of the price level or turn out goods for export which are valuable for earning foreign exchange. Many of these industries are in great need of internal finance either for building up reserves as an insurance against market fluctuations in the values of their outputs or for financing the rehabilitation or modernization of their equipment. Now that the Finance Minister has not found it possible to give up the surtax on companies, or the new dividend tax, the least that he ought to do is to make liberal use of the discretion he has wisely reserved to the Government to add from time to time to the list of industries eligible for favoured fiscal treatment. In our view industries, such as, cotton textiles and synthetic fibres in the consumer goods field, and jute goods and transport equipment elsewhere, seem to be deserving candidates for early inclusion in the preferred list.

Now that the dust of the budget controversies is due to settle down, it is only fair to make it clear that, while the Finance Minister's budget proposals have been fiercely criticized, there has never been at any time any serious or extensive questioning of his intentions or purposes. It has always been clear that Mr. Krishnamachari desires economic expansion as sincerely and fervently as anybody else in this country. It follows that, differences over the budget proposals apart, there may be broad agreement on what may be done to stimulate the economy and make it more dynamic. One way, as we have already suggested, is to use the discretion in the matter of preferential tax treatment of selected industries as generously as possible. Secondly, the Government's monetary and credit policies should not function in such a way as to reinforce the depressing or restrictive impact of its fiscal policies. While it is quite true that, in view of the inflationary potential, the Government cannot contemplate cheap money or unregulated bank credit for business activity, it should still be possible for it, while maintaining a reasonable level of interest rates as well as some restrictions on the nature of bank advances, to ensure that adequate credit is available for all legitimate and productive business activity. While it may be periodically necessary for the Reserve Bank to restrict or prohibit advances against specified commodities or for specified transactions, it is difficult to see why individual advances made by banks should be scrutinized in detail before Central banking accommodation is made available to that bank. Once advances of certain type have been restricted or banned and the limit for rediscounting facilities is fixed,

Eastern Economist 20 Years Ago

APRIL 21, 1944

At the fourth All-India Pharmaceutical Conference held recently in Calcutta trenchant criticisms were made of the industrial policy of the Government which hampered the progress of the pharmaceutical industry among other industries of the country. Dr. B. C. Guha, Professor of Applied Chemistry in the University of Calcutta, expressed the view that all manufacturers' associations should combine to form a representative committee with a view to bringing to the notice of the Government the handicaps under which the Indian industries have been working. Speaking at the Conference, Mr. G. L. Mehta referred to the uncertainty facing the pharmaceutical industry on account of the failure of the Government to give any assurance that a proper policy of protection would be adopted in respect of these industries in the post-war period. The pharmaceutical industry of India has proved its potentialities; 60 per cent of medical stores are now produced in India as compared with 15 per cent before the war. But this industry is still in the struggling phase and will be more so in the post-war period. The want of proper planning, encouragement and assistance by the Government of this country by way of introducing a modern system of pharmaceutical training as was introduced in England over a century ago was criticized at the Conference by Mr. P Das, member of the Central Drugs Technical Advisory Committee.

it is desirable, and it should be possible, for the Reserve Bank to discount bills submitted to it without going into the details of each and every advance. Considering the fact that the deposit resources of the banking system have been stretched to the limit in their meeting the credit needs of the business community, it is surely essential that bank resources should be sufficiently supplemented by re-discount facilities to the extent, say, of 25 per cent of the advances, without, let us repeat, detailed scrutiny of individual advances, so long as they do not contravene any particular statutory requirement or directive issued by the Reserve Bank for the purpose of selective credit control or for any other purpose. The Government, no doubt, has been assuring the public that its credit restrictions are not intended to curtail legitimate bank finance for productive industrial or commercial purposes. The fact, however, is that whatever may be the policy of the Government, its implementation has certainly not been consistent with the intentions professed. There seems to be a case here for the Finance Ministry to assume possible direction of policy so that its intentions are not frustrated in the day-to-day application of policy.

Finally, there is the problem of administrative delays and procedural obstructions. Following the report of the Swaminathan Committee and its acceptance by the Government, there was a shortlived hope that the Government would learn to do business more smoothly and more quickly, but such improvement as there was seems now to have exhausted itself and there is a feeling in the business community that government departments and agencies are now going back to business as usual. The visiting American industrial leaders have mentioned procedural delays as one of the significant difficulties still to be reckoned with by the foreign investor. The Indian business man is not placed any better. If the immense demands made by defence, development and rehabilitation on the productive resources of the community are to be met at all, it is evident that the Government, now free to turn its mind to problems other than those of annual budgeting, should interest itself actively in promoting industrial expansion by removing obstacles for which its own departments and agencies may be responsible.

Back from Geneva

BRIEFING THE Press on his return from the Geneva Conference on Trade and Development, the Minister for International Trade claimed that some solid gains had been made even during the early weeks of a discussion which is scheduled to last for about three months. In Mr. Manubhai Shah's view, among the more important of those gains was the emergence of a consensus in favour of the present conference being given a more permanent form. In his statement at the ministerial session of the conference, Mr. Shah had backed the proposal in the Prebisch report that the conference should become a permanent feature meeting periodically — once in two or three years, as may be necessary — and that it should have an adequate, permanent and full-time secretariat, with such standing committees and committees of a permanent nature as will review and push forward the work of the conference.

This proposal was amplified in a subsequent statement by one of the members of the Indian delegation, Mr. Vohra, who explained that there should be a standing committee on trade and development to be appointed by the UN General Assembly so that, assisted by the secretariat of the conference, it could review and carry forward the work and programmes endorsed and initiated by the conference in co-operation with GATT and other agencies and institutions. Mr. Vohra, proceeding, said that the standing committee should co-ordinate the work of its other committees and bodies in different directions along with the work of the other specialized agencies. The standing committee could appoint four or five sub-committees for as many specialized subjects, such as commodities, financing the expansion of trade, shipping and other invisibles, regional trade and economic co-operation. At his Press conference, Mr. Manubhai Shah seemed to give the impression that these proposals could be expected to go through substantially, but this does not seem to be quite certain if we are to judge from the reported reactions of some of the other national delegations. Mr. Allott, speaking for Britain, for instance, made it clear that, although the UK Government was prepared to concede the need for a standing committee and for further periodic conferences, it was not in favour of creating any new organisation which could come to be regarded as constituting the first step towards the establishment of an International Trade Organisation. The British conception of the standing committee, Mr. Allott explained, was that of a co-ordinating body rather than that of a policy-making or executive authority and he further said that the main function of the standing committee should be to act as the focus within the UN for problems of commodity trade and its importance to the developing countries.

This emphasis on the commodity aspect is evidently due to the fact that the GATT, as at present constituted, has very little specific responsibilities in this particular area of world commerce. As Mr. Wyndhan White, Executive Secretary of GATT, himself put it to the conference, the criticism that one of the inadequacies of the GATT is that it does not deal with the problem of commodity trade, is "a good, valid criticism". Consequently, the notion that the proposed standing committee could supplement the GATT in this area of international trade has naturally found large acceptance. But at the same time, on the important question of the independent authority — either policy-making or executive — of the conference converted into a permanent body or

its standing committee, the consensus obtained might not have been as clear as the Minister for International Trade evidently thinks it is. On the contrary, there has been a fairly firm presentation of a different point of view that the standing committee should be responsible to the UN Economic and Social Council and work closely with the UN department concerned. What the final decision will be remains to be seen. Meanwhile, all that can be claimed at this stage is that while the proposal for an International Trade Organization on the lines advocated, for instance, by the Communist bloc, proved to be still-born, some support has been gathered for a compromise proposition that in addition to the GATT and to the various specialized UN agencies already functioning in the economic field, there is also need for another processing and co-ordinating agency which might carry on the work of the present conference on a more permanent and regular basis.

On the future of the GATT again, the Minister for International Trade seems to have been rather over-ready in anticipating decisions. While it is true that the need for framing international institutional arrangements for commerce between countries with market economies and those whose economies are based on central planning and state control has been recognized at the conference, it is not by any means certain that the essentially multilateral character of the GATT charter is in the process of being liquidated. What is happening is that, with the growth of trade contacts between market economies and centrally planned economies, attempts are being made within the GATT charter to explore the terms on which a country which organizes its economy on other than the market basis could accede to the General Agreement. Some success has already been achieved in this direction. Yugoslavia which had acceded provisionally to the General Agreement is due for full accession shortly. The provisional accession of the United Arab Republic has been negotiated and Poland, which has had an arrangement of association with the GATT may be expected to become a full member as a result of the consultations which are currently being held.

While these are considerable advances, it still remains to be seen whether Mr. Manubhai Shah is quite justified in assuming that a general formula which could bring about a procession of such entrants has been invented or is on the point of being invented. Indeed, it is doubtful that among the Communist countries themselves there is universal enthusiasm for the GATT. The Soviet Union, for instance, has at no time made a secret of its desire that the GATT should be scrapped and in its place, a new international trade organization set up. While the Soviet Government must necessarily accept for the time being the reality that its proposal for an International Trade Organization has failed to muster enough support at Geneva, it may be assuming too much too soon to take it for granted that it will agree to do business with a reformed or even a transformed GATT.

On the issue of commodity agreements, Mr. Manubhai Shah has perhaps more reason to be justified. It is true that there has been widespread support for the stabilization of the prices of primary commodities through international agreements. There are five such agreements in existence now, covering tea, coffee, wheat, sugar and olive oil. Mr. Manubhai Shah has proposed that the aim should be to deal with from 20 to 25 principal products over the next five or seven years and the list he has suggested in this connection includes rice, cocoa, copra and vegetable oils, jute and jute goods, cotton, wool, spices, iron ore, manganese ore, natural rubber, meat and meat products, shellac and tobacco. How widely his view of the scope of commodity agreements is shared in Geneva will be revealed in due course. But it is certainly encouraging that spokesmen of industrially advanced countries, such as the United States and the United Kingdom, have given guarded support to the notion of bringing more commodities under international arrangements. Here it is interesting to note that Mr. George D. Woods, President of the World Bank and its allied institutions, has come out strongly in favour of liberal international trade policies with regard to primary commodities. Addressing the Geneva conference, he said: "Some 30 countries, accounting for nearly half the trade of the developing countries, are dependent on a single commodity for more than half their export earnings; and many other countries are dependent on only two or three. Despite the overall increase in world trade, the demand for primary commodities has grown only slowly and prices have faltered. The value of the exports of the under-developed nations as a group has increased since the War at a rate only of some three to four per cent a year. This is less than the growth in the volume of such exports and, more significantly, less than enough to support the level of developmental imports needed for a satisfactory growth of income. To use but one striking example, the Latin American countries increased the volume of their exports of primary commodities by 25 per cent during the period from 1956 through 1962, but they actually earned less foreign exchange in the last year of the period than in the first."

A relatively new development in discussions of international commodity problems is the notion of compensatory financing, a concept to which Dr. Prebisch, the Secretary-General of the conference, has given keen and reasoned expression in his report to that body. A well-reasoned statement on the subject made by Dr. N. A. Sarma of the Indian delegation envisages the building up of stocks and market operations based on them, both of which are to be financed through contributions by developed countries, particularly the principal consuming countries. Recommended also is an arrangement within each commodity agreement for a "trade, development and price fluctuation fund". The statement points out that the International Monetary Fund adopted in February, 1963, a limited scheme for

compensatory financing of export fluctuations in the sense that it agreed to finance export shortfalls of a short-term character, up to 25 per cent of a member's quota, normally, by waiving the limit of 200 per cent on Fund holdings of a member's currency. Dr. Sarma suggests that the Fund could explore in the future the possibility of further widening of its scheme. The remarks of the President of the World Bank on this point have been most helpful. He said: "This conference will be discussing over the weeks ahead whether the answer or part of the answer is to seek greater price stability through commodity agreements, or to try to mitigate the effects of price fluctuations through some new form of compensatory financing or to try some new approach altogether. The important thing for our present purposes is the increasing awareness on the part of the industrial nations that the problem is serious and that practical solutions must be sought."

For the rest, Mr. Manubhai Shah, at his Press conference, seemed inclined to take a rather roseate view of the prospects for a deep and wide programme of trade and tariff concessions as well as preferential treatment by the advanced countries where the export trades and the export commodities of developing economies were concerned. In particular, Mr. Shah sounded hopeful of an early disappearance of trade quotas and other quantitative restrictions on primary commodities significant to the export trade of developing economies. He also expressed confidence in prospects of the abolition of tariffs by advanced countries on such items of trade. The Minister for International Trade further reported that the climate of opinion in Geneva was tending to favour reduction of tariffs in the granting of preferences by the advanced countries to exports of semi-manufactured and manufactured goods from developing economies.

It must be pointed out, however, that so far as good intentions or even formal declarations go, fairly advanced positions were taken up by the industrialized countries in all these respects as early as in November, 1961 when, under the auspices of the GATT, there was a declaration of Ministers regarding trade problems of developing countries. Among the points made in this declaration was the recognition that restrictions hindering access to markets for the export products of less developed countries should be removed and that tariffs should be reduced in order to step up their exports of manufactured and semi-manufactured goods. It is important to add that the declaration did not merely stop with expressing pious thoughts, but proceeded to indicate how governments could contribute to these general objectives, taking into account facts regarding tariff and non-tariff measures affecting access to markets under the heads of quantitative restrictions, tariffs, revenue duties, state trading, preferences, subsidies and disposal of commodity surpluses. The real issue, therefore, is whether present talks at Geneva would manage to proceed further in the direction of concrete implementation of this general understanding. Here again, to the extent that the Minister for International Trade is speaking from his experience of the proceedings in Geneva, his hopeful outlook may be allowed to spread an infectious optimism. At the same time, it is necessary to bear in mind that specific commitments and actions are yet to be assumed by the countries which are supposed to make concessions.

Three Bags Full

A VERITABLE storm in a tea cup has been raised by a section of the Indian Woollen Industry in an unfortunate attempt to establish that Indian wool can be used for making apparel. The attempt is unfortunate because this claim is hardly tenable and may lead to avoidable injury to the country's raw wool exports. As it is, traditional importers of India's raw wool are believed to be unhappy that they cannot get all the wool they need, by reason of the ceiling placed on our wool exports. The seriousness of the position should be evident by the reported experiments in certain of these countries to create "dead hair", which is available in natural form in Indian wool. Incidentally, it is the presence of "dead hair" in our wool that makes it ideal for carpet-making. It may also be noted here that, although our raw wool is being imported for a number of years now by several countries, especially the UK and Japan, none of them is known to have ever used it to make apparels. Were it possible to do so, they would have done it long ago and entered into trade deals of the pattern prevailing in pre-independence days, when Japan, for instance, had an agreement with India to import a given quantity of short-staple cotton in exchange for permission to export to this country a specified quantity of textiles.

However, it should not be necessary for us to look for all these evidences. Sufficient convincing evidence has been available in the country itself. Some time ago, the Government of India had appointed a team of foreign experts to give their considered view on the suitability of Indian wool for apparel-making. This team has given its unequivocal verdict on the question. So also the International Wool Secretariat. And, more recently, our defence forces, who have had occasion to use apparel made of Indian wool, have given their reactions. Immediately after the Chinese attack in late 1962, earnest efforts were made by all the interests concerned to produce woollen goods out of indigenous wool only and the finished goods were rushed to the borders. The armed forces, which took them when anything that was called woollen seemed acceptable, were thoroughly disappointed with the supplies, it is stated. Mr. Kanungo, Union Minister of Industry, told Parliament a few days ago that the defence authorities were so dissatisfied with the hosiery yarn produced out of Indian wool for making jerseys that they now insist on the

use of imported wool only for the purpose.

This is not to condemn Indian wool as altogether unusable. It is not without many sound uses. In fact, if it is so desired, the entire supply of Indian wool could be used in India itself. But this would mean India going in, in a big way, for mechanised carpet-making, instead of exporting raw wool and importing wool carpets, and export India-made carpets and thereby earn not only more foreign exchange but also add to the country's existing employment potential. The apprehension in certain circles that this might lead to the disappearance of hand-made carpets and the extinction of small-scale carpet manufacturers is somewhat exaggerated, in that there will always be a demand for hand-made carpets by those who have a fancy for them. In fact, both the sections could exist and flourish side by side. Meanwhile, that is, until we take to mechanised carpet-making, we need not insist on any ceiling on our wool exports and lose our foreign exchange earnings. For pound for pound, the imported clothing wools are said to be cheaper than Indian carpet wool and for every pound of carpet wool exported, we can import comparatively more of apparel wools from abroad, convert them into finished goods which save foreign exchange if these goods are consumed within the country or earn foreign exchange if exported.

Save for this solitary excuse of scarcity of foreign exchange, no convincing argument has been put forward, whether by official spokesmen or by those who have been ill-advisedly opposing imports of foreign wool. This unimaginative policy has given rise to many unauthorised combing units which, it is alleged, have been clandestinely manufacturing wool tops and selling them at fancy prices. It is not clear how those in authority who must have surely known about the 30 per cent rise in foreign raw wool prices, could reconcile themselves to a drastic cut in the foreign exchange allocation for wool imports from Rs. 15 crores to Rs. 5 crores during 1963-64. Anyway, their action has resulted in the utilisation of the industry's capacity to less than 20 per cent. Forcing the industry to work far below its installed capacity thus and then to blame it for higher prices is only to give the dog a bad name to hang it. This is apart from the effect on employment consequent on the industry working below capacity.

There seems to be an impression that the import of raw materials is not a sound policy. If this were so, the UK and Japan, which primarily depend on imported raw materials even to this day, would not be the industrially advanced countries they are today. To manufacture quality woollen goods acceptable alike to our Defence Forces and to our customers abroad, it is imperative to import merino wool, and not every country produces this wool. But merely because they do not produce merino wool, these countries have not opposed its imports by their respective woollen industries. For that matter, they do not at all feel ashamed to import any raw material that they do not possess themselves. It is high time, therefore, that the mistaken belief that the Indian raw wool is an all-purpose wool and the more mistaken policy, being based on it, of banning our raw wool exports and imports of foreign wool are given up.

EASTERN ECONOMIST BUDGET NUMBER

March 6. 1964

THE BUDGET NUMBERS of "Eastern Economist" are a popular and valued annual feature of the Journal. This year's Number should be of special interest and importance in view of the complexity as well as ingenuity of the economic and fiscal policies presented through the Central Budget.

An attempt has been made in the Budget Number to analyse the various aspects of the Budget proposals and study the Budget documents with a view to bringing out the larger and deeper implications of Government policies for the future course of the national economy. The result is an objective and critical evaluation of the economic situation and outlook at a significant turn in the course of national development.

The Budget Number is illustrated with graphs and diagrams and it features a special section in which important budget documents have been reproduced for record and reference. Priced at Rs. 5 per copy, the Budget Number is available to subscribers without extra charge—a facility which new subscribers may also avail themselves of by entering, before April 10, an annual subscription for "Eastern Economist" at the usual rate of Rs. 65.

Minor Changes in Tax Proposals

THE UNION Finance Minister, Mr. T. T. Krishnamachari, announced some changes in the tax proposals on April 17, which, according to him, will cost the exchequer not less than Rs. 66 crores. The loss from the alterations in the personal tax structure was estimated by him at Rs. 36 crores. The abolition of the super profits tax will cause a loss of Rs. 30 crores. A clause by clause discussion of the Finance Bill, however, brought about some more changes (which are not contained in the speech reproduced below).

An important amendment related to the clause on penalty for hiding income. The bill had stipulated that where the income returned by an assessee was less than 90 per cent of the assessed income, the assessee would be deemed to have concealed his income and would be liable to the penalty clause unless he provided evidence to prove his bona fides. By an amendment of the relevant clause, this percentage was lowered from 90 to 80. It was a sizable softening of the rigour of the original provisions which brought the penalty clause into play when the difference between the income revealed and the income assessed was only 10 per cent. At this juncture in the discussion on tax evasion, the Finance Minister said that the Government estimates on evasion were somewhat on the lower side. An estimate prepared by Mr. Kaldor some years ago put the increment in the tax evaded each year at about Rs. 200 crores. Has the Finance Minister come to the conclusion that the volume of tax evasion has grown beyond Rs. 200 crores per annum? Have the Ministry of Finance made any study in this regard? No research agency in the country has attempted researches into this highly problematical sphere. There is no doubt that tax evasion is a "social evil" which needs to be eradicated but this is also a fact that its volume has been exaggerated out of proportion.

Prosecutor as Judge

There is need for proper collection of taxes. The Finance Minister may be right when he says that if the present taxes were collected efficiently, then, there would be no need to impose new taxes. However, in his enthusiasm to eradicate taxes evasion, he has made imprisonment mandatory where it is found that the assessee had "deliberately" concealed his income. "The placing of onus of proof on the assessee made the income tax officer the prosecutor, judge and executor", rightly remarked Mr. R. R. Morarka, a Congress member.

Speaking in support of his Annuity Deposit Scheme, the Finance Minister made the point that it would immobilise funds which might otherwise add to inflation. As only five per cent of the income of higher brackets was being mopped up, no harm would be done. He commended particularly the benefits of the Scheme to film artistes whose income over the years was not steady. Regarding distress sales of estates in order to pay for estate duty and capital gains tax, the Finance Minister said that he was prepared to adopt changes which would set a ceiling at 85 per cent on the total amount of taxes levied on an estate passing from one generation to another. Pressed by Mr. M. R. Masani of the Swatantra Party to bring about this change immediately, the Finance Minister held out the promise that the necessary change would be effected in the course of the next two years. Mr. Krishnamachari also conceded that charitable institutions which were running companies and declared dividends had certainly a case for being excluded from the purview of dividend taxes. He declined to do anything "on the spur of the moment". After careful examination only will he take some measures to protect them.

The text of the Finance Minister's speech is reproduced below :

"It is now more than six weeks since the Finance Bill was presented to the House along with the Budget for 1964-65. Government's policies as reflected in these proposals have been very fully discussed in both Houses of Parliament. In my replies to the general debate, I had explained the broad economic and social objectives of the tax proposals. Elucidations of the detailed implications of these proposals have also been furnished to hon. Members. I would, in particular, draw attention to the document "Rationale of the tax proposals" circulated a few days ago which relates to the basic economic objectives with the specific tax measures in the Finance Bill. It is not, therefore, necessary for me now to go again into the economic basis of the budget.

Active Resistance

"The tax proposals have evoked a considerable amount of active and well-informed interest and perhaps also active resistence among certain sections not only in this House but also outside, in the Press and among the public at large. Some of the interests concerned have made specific representations to Government. This wide discussion that has taken place has been very useful and has helped us to formulate certain amendments to streamline the proposals in the Finance Bill to give a measure of relief where it was deserving and to remove some unintended hardships and anomalies. The official amendments that have been tabled are as a result of this process. I place them before the House in the hope that the provisions of the Finance Bill, as modified by these amendments, will serve to implement more effectively the basic objectives of the Budget, namely, growth with social justice, and I shall confine my remarks, in the main, to explaining how the amendments proposed fit into the overall rationale of the provisions in the Finance Bill.

"Sir, at the time of introducing the Budget, I gave some thought whether it was necessary for me to inroduce the Finance Bill as it related to direct taxes at the same time and whether I should not follow the practice followed in the United Kingdom of introducing a Bill later on after outlining the provisions. Finally, I stuck to the convention but in the light of my experience this year, I do hope — if I am Finance Minister next year — to be able to make the departure, namely, to announce the proposals first and bring in the Bill later so that the Bill will not be subject to minor amendments such as this Bill has been subjected to.

"The new structure of personal taxation in the Finance Bill is a considerably simplified one. The main changes introduced in this year's budget aim at a simplification of the rate structure of income-tax and super-tax, relieving persons in the lower and small income groups from the burden of compulsory deposits, moderating and readjusting the incidence of tax consistently with the interests of revenue and introducing the advantage of tax savings in mobilising greater private savings in the middle and higher income groups. Over-lapping surcharges on income-tax and super-tax have been abolished and replaced by a single surcharge for purposes of the Union. This surcharge operates in respect of unearned income only when such income exceeds Rs. 10,000 and in regard to earned income when such income is over Rs. 1 lakh. In carrying out these changes in the structure of personal taxation, a some-

what higher incidence of tax might have arisen at some income levels when compared with the incidence of net tax for 1963-64 exclusive of the element of compulsory deposit. This has been criticised in the House and outside and I have been considering whether some concession could be given to lower income groups in the income range up to Rs. 20,000. In the nature of things, no large concession is possible but it is now proposed that the initial tax-free slab of income for this group should be raised from Rs. 3,000 to Rs. 3,200 in the case of a married individual with no child or a Hindu undivided family with no minor co-parcener; from Rs. 3,300 to Rs. 3,600 for an individual with one child or a Hindu undivided family with one minor co-parcener and from Rs. 3600 to Rs. 4000 for a married individual with more than one child or a Hindu undivided family with more than one minor co-parcener. The effect of these changes on married individuals with more than one child, which is the most important category of assesses, will be to lower the tax payable on earned as well as unearned income as compared to 1963-64 rates excluding the compulsory deposit at all levels of income up to about Rs. 8500. On incomes above this level also, there will be a reduction except at a few points where the tax payable now will be slightly higher but in no case exceeding one-fifth of one per cent of the total income. These concessions will provide a measure of further relief to these income groups.

Alternative to Annuity Scheme

"The Annuity Deposit Scheme, in the new scheme of taxation. is an important instrument for mobilising private savings and to counter inflationary trends. The provisions reating to this scheme have already been fully explained and I need not go into them again. I would, therefore, confine myself to the changes that are proposed to be made. I had already indicated in my reply to the general discussion in the Lok Sabha that the deposit is proposed to be made optional in the case of persons who are more than 70 years of age. Such persons, under the amendment proposed, may exercise the option not to make the deposit in the first year of assessment in which they are liable to make a deposit. Any such option, once exercised, will be final and will not carry with it any extra tax liability. It has been suggested that the Annuity Deposit Scheme should be made optional for others also. In the case of others, there will be an option not to make the deposit but the exercise of such an option will, naturally, have to be made unattractive if the basic objective of mobilising private savings is not to be defeated. In such cases, therefore, an additional amount of income-tax of 50 per cent of the difference between the Annuity Deposit amount and the extra tax payable when the deposit amount is not deducted from the assessee's income, is proposed to be imposed.

"Two other changes have also been proposed in regard to the Annuity Deposit Scheme. It is proposed that income of the nature of capital gains or of compensation received for loss of employment, etc., will not be taken into account in calculating the amount of annuity deposit since such income cannot be classified as part of regular earnings and is already taxed at concessional rates under the Income-Aax Act. The other change proposed is to allow playwrights, authors, artists, musicians or actors to make an additional deposit of 25 per cent of their income instead of 15 per cent provided in the Finance Bill. There has been a request from some of the associations of artists that the limit may be increased. I am glad that artists are interested in voluntarily availing themselves of the benefits of the Annuity Deposit Scheme and the raising of the limit will be an encouragement for them to do so.

"As part of the same objective of encouragement to private savings, the rate of deduction of income-tax and surcharge at source from interest on securities in the case of resident assessees is proposed to be fixed at 20 per cent as in respect of dividends instead of 29 and odd per cent as it is today. This will ensure similar facilities for investment in Government securities as in shares of joint stock companies.

"One other change that is proposed in personal taxation is to exempt stipends or remunerations received by foreign students and professors from foreign Governments or institutions for carrying on research work in India under an approved programme. This exemption will be available for a period of two years for each such individual.

Corporate Taxation

"I now turn to the proposals relating to corporate taxation. The basic objectives in the Finance Bill in the matter of company taxation are to provide general incentives for stimulating investment, specific incentives for priority industries, and while encouraging growth to induce diversification of ownership in industry. The general incentives provided for the generation of greater savings in the corporate sector are mainly the replacement of the superprofits tax by the Companies (Profits) Surtax, which will have a generally lower and more equitable incidence, and the exemption of inter-corporate dividends from super-tax.

"In addition, the development rebate incentive is proposed to be extended to second-hand plant and machinery newly imported from abroad. In the budget speech I had referred to the need for a fuller utilisation of capacity that exists in Indian industry. And as a specific incentive for securing this, it is proposed to revive the additional depreciation allowance for a third-shift working of plant and machinery at 50 per cent of the normal rate of depreciation. This concession was in force from 1949-50 to 1954-55, and would be given effect to by an amendment of the Income-tax Rules which will take effect from the assessment year 1964-65.

"It is necessary that the savings generated in the corporate sector should be increasingly utilised for industrial investment and growth. This is the primary object of the extra amount of tax on companies on the dividend distributed by them on their equity capital. The exemption to certain categories of companies from the requirement of compulsory distribution of dividends also proceeds from a similar rationale. This exemption is now proposed to be extended to such companies as are mainly, although not wholly, engaged in manufacturing or processing of goods or in mining or in the generation and distribution of electricity. It is also proposed to extend this exemption to Indian companies, the book-value of whose machinery or plant used for the purpose of their business, exclusive of office appliances and road transport vehicles amounts to or exceeds Rs. 50 lakhs. This will benefit Indian companies which may not be engaged in manufacturing

In Hospitals, Factories, Schools, Public places...

PUT AN END TO THE DANGERS OF

SUDDEN DARKNESS

In hospitals sudden darkness can be a danger to life. Emergency lighting is the obvious safeguard—and that's where Keepalite comes into its own. Keepalite is an automatic emergency lighting system employing lead-acid storage batteries which are automatically triggered into operation by the actual mains failure. Modern methods of control and 'trickle' charging mean that Keepalite equipment has outstandingly long life and requires minimum of maintenance. That's why architects everywhere specify Keepalite as sure inexpensive protection for hospitals, factories, schools, banks and public places.

industries but in engineering and other constructional activities or in other services and are capital-intensive, and will enable them to build up sufficient resources for expansion. The next change, I propose is to remove a specific anomaly. At present, a company in which not less than 40 per cent of the shares are held by the Government is treated as a company in which the public are substantially interested. This condition is, however, not satisfied by the Industrial Finance Corporation or a few State Finance Corporations, as the Reserve Bank of India and not the Government holds a substantial block of their share. The result is that these financial corporations are, for the purpose of the Income-tax Act, as it now stands, treated as companies in which the public are not substantially interested. It is patently incongruous that such corporations should be equated with closely held private limited companies in the matter of tax treatment. In order to remove this anomaly, it is proposed to amend the relevant provisions in the Income-tax Act, 1961, so as to provide that a company in which the Government or the Reserve Bank of India or a corporation owned by the Reserve Bank singly or taken together hold at least 40 per cent of the shares, will be treated as a company in which the public are substantially interested. This will free such companies from the higher rate of taxation applicable to companies in which the public are not substantially interested as also from the requirement of compulsory distribution of dividend.

"Under the proposed scheme of taxation, companies in which the public are not substantially interested bear a heavier tax burden, as they are closely held by a few controlling interests. The Finance Bill has a provision to increase the super-tax on such companies from 25 per cent to 35 per cent. 'This measure is necessary if the present devices of preventing abuses in closely held corporations, like obligatory distribution of profits and dividends, are to be varied.' By the same reasoning, it is necessary to encourage small companies formed by 'entrepreneurs' of the small or middle income groups. In this behalf, I have given notice of an amendment providing that, in the case of companies in which the public are not substantially interested and which are wholly or mainly engaged in manufacturing or processing of goods or in mining or in the generation and distribution of electricity and whose total income does not exceed Rs. 2 lakhs, the overall rate of tax on the first Rs. 1 lakh of the total income is proposed to be fixed at 50 per cent as against the normal overall rate of 60 per cent provided in the Finance Bill.

"I have since given some further thought to this matter and I am now prepared, subject to the approval of the House, to further extend this concession and to liberalise this provision so that in the case of such companies whose total income does not exceed Rs. 5 lakhs, the overall rate of tax on the first Rs. 2 lakhs of income will be 50 per cent. An amendment in this behalf will be tabled

Rebate for Basic Industries

"In the scheme of the Finance Bill, certain specific incentives have also been provided for directing corporate savings to priority investments. Basic industries which are capital-intensive and have a relatively low profitability and longer periods of gestation have been chosen for these incentives. The articles of manufacture concerned have been listed in Part IV of the First Schedule to the Finance Bill. The profits derived from the manufacture or production of these articles qualify for a rebate of 10 per cent of the overall normal tax on companies. I now propose certain changes in this list. Electronic equipment and petro-chemicals, in which we foresee a large expansion in the fourth Plan, are two important additions. Manganese ore, dolomite, magnesite and mineral oil are to be added under 'mining industries'. The entry relating to 'electrical equipment' has been modified and will be applicable to equipment for the generation and transmission of electricity including transformers, cables and transmission towers. The entry of 'fertilisers' has been spelt out. Coffee and rubber are the only deletions since the income derived by the companies engaged in these plantation industries falls under the category of agricultural income which is exempt from the purview of the Income-tax Act.

"There are two other changes in Corporation taxation which are not of major character. Under one of the provisions in the Finance Bill, the expenditure incurred by companies on providing perquisites to employees in excess of 20 per cent of the employees' salary will not be allowed as a deduction in computing the taxable income of companies. It is proposed to exclude from the purview of this, any expenditure incurred by companies in providing free or concessional passages or travel concessions to their employees for going on leave to their homes abroad or in India. The other amendment is in respect of the rate of deduction at source in the case of resident companies from dividends and interest on securities. It is proposed to reduce this rate from 25 per cent to 20 per cent as in the case of resident non-company assessees. While involving only a deferment of tax collection for a short period, this change will facilitate transactions in securities in public debt offices and in shares in the stock exchanges.

Capital Gains

"Certain changes have been proposed in regard to the taxation of capital gains accruing to equity shareholders from the issue of bonus shares and of capital gains other than short-term capital gains accruing to non-company assessees. In respect of bonus shares, the amendments proposed are the following :

"The fair market value of bonus shares as on the 31st day from the date of their allotment will be taken as the amount of the capital gains.

Such capital gains will be charged to tax in the case of non-company assessees at one-half of the average rate of the tax applicable to the assessee's income other than capital gains, subject to a minimum tax of 15 per cent thereof. The first Rs. 5,000 of such capital gains will be exempt from tax.

"Companies will be charged only to income-tax (and not super-tax) on such capital gains at the rate of 12½ per cent thereof. This concession is in line with the other concession of exemption of companies from super-tax on intercorporate dividends.

"I had promised in my closing speech on the general discussion of the Budget to treat issues of bonus shares from share premium account on a different footing and exempt them from the tax on capital gains. 'A fortiori' the tax on companies on bonus share issues from share premium account should also be eliminated. This has been done in the proposed amendment. But the clause relating to relief from taxation of companies on the issue of bonus shares from the share premium account looks like having a retrospective effect for issues in the year 1963-64. This is not the intention and an amendment will be moved to remedy this possible interpretation. As I am giving no retrospective relief to companies in this regard, I also propose not to give retrospective effect to the exemption of shareholders from tax on capital gains in respect of bonus shares issued to them wholly out of the share

premium account of companies during 1963-64. A suitable amendment for this purpose will be tabled.

"In respect of capital gains other than short-term capital gains arising to non-company assessees, the following changes are proposed. This has been found necessary because the changes in this section made in 1962 are so complex that interpretation of a revised scheme of capital gains tax into them would lead to a variety of interpretations. The first Rs. 5,000 of such gains will be wholly exempt from tax. No tax will be chargeable on such capital gains if the assessee's total income does not exceed Rs. 10,000. Tax on such capital gains will be charged at a specified percentage of the average rate of tax applicable to the assessee's ordinary income exclusive of any capital gains other than short-term capital gains or any income by way of compensation for termination of managing or selling agency etc. If the capital gains relate to lands or buildings, tax would be charged thereon at 75 per cent of this average rate, and in other cases at 50 per cent of the average rate. However, the minimum amount of tax payable on long-term capital gains will be 15 per cent of the amount of the gains.

Tax Evasion

"While indicating these revisions in the scheme of capital gains taxation, I would like to highlight clause 13 of the Finance Bill which is designed to check evasion of tax on capital gains through an under-statement of the consideration received on the transfer of capital assets. It is commonly known to hon. Members that when sales are made, the value in many cases is an under-statement. According to this provision, the capital gains shall be computed with reference to the fair market value on the date of transfer, if in the opinion of the income-tax officer, the fair market value exceeds the value declared by an assessee by an amount not less than 15 per cent of the declared value.

"Another provision in the Finance Bill which is of importance, in our many-pronged attack on the problem of tax evasion, is the clause relating to disclosure to the members of the public of information contained in tax records.

"Some misgivings have been expressed in Parliament about these provisions and I agree that they should not be capable of being used for personal ends or for malicious harassment. They should also not result in an excess of administrative discretion in the tax authorities with a potential for abuse. With these ends in view, the following changes are proposed: (i) The application asking for the information will have to be in a prescribed form, but no fee will be required to be paid. (ii) The Commissioner of Income-Tax will furnish the information only if he is satisfied that its disclosure would be 'in the public interest'. His decision in this matter would be final and not subject to question in any court of law. (iii) The protection available under the Income-tax Act, 1922, relating to assessments made prior to 1-4-60 will be maintained. (iv) The Central Government will have the power to notify classes of assessees in respect of whom disclosure of information would not be made, having regard to the practices and usages customary or any other relevant factors. At the moment, for instance, we have in mind banking companies, which under sec. 34A of the Banking Companies Act are protected from being compelled to disclose information in any proceedings under the Industrial Disputes Act in regard to their secret reserves or secret provisions for bad and doubtful debts. In such cases, it would be agreed that it would not be desirable to have a disclosure of information. There may be similar cases in the future and this enabling provision has, therefore, been proposed. (v) It is also proposed to amend sec. 280 of the Income-Tax Act, 1961, to provide for the punishment of any public servant who makes any unauthorised disclosure of information. This again, it would be agreed, is a necessary safeguard.

"As part of our policy to reduce the concentration of wealth, particularly that arising from unearned prosperity passed on from generation to generation, the rates of estate duty have been sharply enhanced in the Finance Bill. It has been represented that the rate of tax of 85 per cent at the highest slab may in some cases have the effect of taking away as duty and taxes the full value of the estate. In partial mitigation, it is therefore proposed to allow the full amount of the probate duty to be deducted from the estate duty payable instead of one half of the probate duty allowable under the present provision.

Expenditure Tax

"In respect of the expenditure tax, two amendments are proposed. These are merely to effectuate the intentions as explained in part B of my budget speech. It is proposed to amend clause 51 of the Bill so as to omit the provision to the charging section of the Expenditure Tax Act, 1957, in order that the expenditure tax is attracted on all expenditure above Rs. 36,000 per annum, no matter from what source the money for expenditure came. This will make the provision in the Bill conform to the announcement in the budget speech. The other change is in the matter of customs duties or taxes paid by a person on importing or purchasing articles for his personal use. In line with the policy to reduce to the minimum the exemptions and deductions in the computation of the expenditure tax, an amendment has been proposed which will have the effect of such expenditure not being allowed as a deduction from taxable expenditure for the purposes of the expenditure tax.

"In my reply to the general debate on the Budget in this House, I had also mentioned that steps were being taken to move an amendment to the Gift Tax Act for reducing from Rs. 10,000 to Rs. 5,000 the existing monetary limit up to which gifts are exempt from tax under the Gift Tax Act. An amendment in this behalf is also being moved.

"I now turn to indirect taxes. In both Houses of Parliament, I have explained the reasons why it is not possible to give any concessions of a substantial nature in excise duty. Considerations of revenue and the need to conserve foreign exchange by restraining the demand on imported articles have, no doubt, weighed with us. But even more strongly, what has prevented me from making any substantial reduction in indirect taxation has been the firm conviction, which I have often expressed, that any such reduction is not likely to be passed on to the consumer and will only go to increase the margins of traders. I came across a very queer instance of this in one of the government companies. When a concession was given in regard to caustic soda in respect of the duty, the prices were maintained, but when the duty was altered the prices were raised — by one of our own concerns. The amendments proposed in regard to excise duties, therefore, represent only marginal reliefs.

"The first part of my proposals relates to textiles. Taking into account the needs of the handloom and the smaller powerloom sectors, I am extending further the total exemption on yarn in the form of hanks, to new French counts below 29 and halving the duty on such yarn of 29 counts but below 34. Corresponding reliefs to the extent of 5 nP. per kg. in each case is also to be given on these two groups of cotton yarns in forms other than in hanks, and the ceiling rate is also slightly proposed to be readjusted.

"Secondly, on the analogy of a similar concession already in operation in respect of 'independent processors' and for the same reasons, a concession of 1/5th of the special excise duty payable on sized yarn is being given to 'independent' sizing units.

"Thirdly, considering that the duty liability at the existing compounded rates for fine and superfine fabrics payable by small powerlooms which are hit by the anti-fragmentation clause is somewhat high, relief is also being given to them by re-fixing the compounded levy rate at one-third of the present figure. This, together with the reduction in the yarn duty mentioned earlier, should give them sufficient additional assistance.

"Fourthly, the effective rate of duty on industrial rayon yarns (mainly tyre cords) is being reduced from Rs. 4 to Rs. 2.67 per kg.

Minor Adjustments

"Certain relatively minor adjustments are being made with regard to tyres and paper boards, manufactured in certain new units set up during the third Plan period. Extruded aluminium rods are being put on a par with the rolled product. I am also making certain minor adjustments in the manner of fixing the effective rates of duty on the different categories of match factories. These changes, I feel, will have the desired effect of preventing fragmentation of larger units and at the same encouraging higher production in, and consolidation of, the smaller units.

"All these reliefs would be given effect to by notifications which are being issued separately.

"In conclusion, I would like to point out that while the amendments proposed by Government seem to be formidable and indicative of revised thinking, in fact they are not so. As I have mentioned before, the re-drawing of the sections relating to capital gains has been found necessary because of certain confusion that might arise unless the subject matter of the sections is specifically stated. Secondly, the import of certain concessions in regard to section 104 or the old section 23-A companies also needs spelling out. Another set of amendments relating to Annuity Deposits, while they seem extensive, are comparatively simple amendments in order to provide the concessions I had already indicated. I am circulating to hon. Members a brochure showing the clauses of the Finance Bill as they will read if the amendments proposed to be moved by me are accepted by the House. Hon. Members will find that the amendments proposed are underlined in the brochure. It will be evident to them that the bulk of these amendments are of a drafting nature, and are intended to clarify the position better than originally stated in the Bill. One paricular amendment in regard to Expenditure Tax is the change in a provision of the Act to which I had referred in my Budget Speech, but which had not found a place in the Bill.

"I hope hon. Members will appreciate that the changes proposed by the amendments will go to show that an attempt has been made to simplify the tax structure, to rationalise it and to make the burden more equitable. The criticism outside the House has been largely on two items of tax proposals. One is the dividend tax of 7½ per cent. Suggestions have been made for varying it for providing a slab and so on. In actual fact, the dividend tax will not, as it applies to the income of companies, be more than 2¼ to 3 per cent of profits, and it is impossible to give any concessions for ploughing in of income into reserves without at the same time putting a check on indiscriminate distribution of profits as dividends. There may be many people who are not concerned about building up reserves of companies, and to them the dividend tax will certainly look harsh. But that is not the view of the Government, and the dividend tax base, if it is altered, will become far more onerous than it is at present.

"The other complaint is about the tax on bonus issues which has been highlighted in the press, and in the criticisms by the concerned interests. The tax on bonus issues now proposed will have a low incidence, if actually the large mass of the shareholders, as is often made out, is the middle-income group. In the case of the less affluent of the middle-income group, and I do not know if they have any shares, the exemption of Rs. 5,000 will take care of them. In the case of the better off sections of the middle-income group, the incidence may not exceed more than the 15 per cent limit now imposed. In the case of people who have invested large amounts of money in shares, the House will agree with me that they should pay a progressively higher rate of tax even on bonus issues. I hope the hon. Members will study the changes as proposed and accept the proposals in entirety and help in the creation of steady conditions in the markets which have been subject to scares and alarms every now and then.

"Another fact I would like to refer to, with all apologies to the interests concerned, is the undue emphasis on the importance of the share market that seems to have crept into our concept of economic growth. I do not say that the share market is not necessary, nor do I say that it is not useful. What I would like to say is that it does not represent the views of the large majority of the people in this country who want to buy shares for investment.

Share Market

"I am sure many people make the share market their profession. I have no doubt they are honourable people, but the economic policy of the country cannot be geared towards making conditions bullish for this section of the community, which is but a microscopic section of the community as a whole. On a closer examination, one would find that the quotations in the share market do not always represent the reality. For instance, in the case of the shares of a concern, which we may call "X", which, on the basis of the last issued balance sheet will make Rs. 26.4 lakhs more on the basis of the proposed taxation, the shares are hammered down, so that the price would not rise anything beyond Rs. 25. The break up value of the share is several times the current quotation. What does this figure of Rs. 25 really represent, when the company's earning capacity is greater, when its break up value is several times more than the market quotation? I think this instance should show to intelligent people in India that while the share market might provide one of the indicators, it is by no means a reliable indicator of the prevailing economic trends.

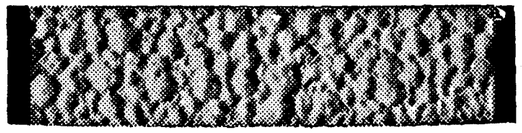
"I recognise that many people are angry with the Budget and also perhaps with me. They have a perfect justification to be so angry. Members of Government would be greater fools than they are expected to be if they did not recognise that with the Estate Duty as proposed, along with the ancillary levies like Gift Tax etc., they would not be resisted by persons affected. They would be. But the basic philosophy behind these duties is that they serve to promote the objectives accepted as imperative by the Congress Party. I am afraid, while I have every sympathy for the people who are angry with me and I do not at all reciprocate their feelings, I am unable to do anything to assuage or lessen their anger with these proposals. We as a Government have no doubt that we are proceeding on the right lines, and the proposals contained in the Budget and in the Finance Bill are an earnest effort in that direction."

Highlights of the Week

TOWARDS CLIMAX OR ANTICLIMAX

WE EXPRESSED in these columns last week an apprehension that Sheikh Abdullah would set out to seduce the Valley with the slogan that New Delhi had betrayed Kashmir. His speeches in Srinagar and elsewhere have borne out this foreboding. Although Sheikh Abdullah continued to keep up adroitly the pretence of treating India and Pakistan as two equal parties to the dispute and claimed that he was the natural arbiter in this quarrel, he did not, at the same time, fail to insinuate that if the threat to Kashmir's existence came from Pakistan in 1947, the threat which Kashmir faces today and has been facing for some time now is undoubtedly from the Indian side. Addressing Srinagar audiences, he charged the Government of India generally, and the Prime Minister in particular, with attempting to resile from the pledge of self-determination which, he claimed, had been given to the people of Kashmir.

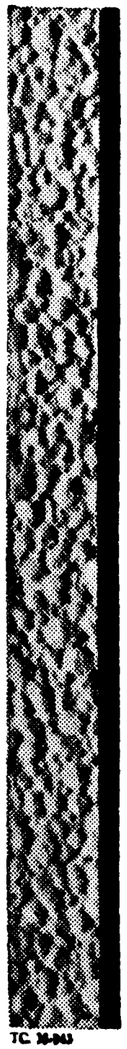
Sheikh Abdullah's strategy, at the present time, seems to be to utilise the period before his meeting with Mr. Nehru in whipping up for himself political support in the Valley through the exercise of all the demagogic arts. In tactical terms, he is asserting and re-asserting the demand for a plebiscite but at the same time, he has been throwing hints that other means of ascertaining the wishes of the people of Kashmir need not be ruled out. On his notion of what the status of Kashmir should be, or what Kashmir's political relations vis-a-vis the rest of India, or Pakistan could be, Sheikh Abdullah has adopted the conveniently virtuous attitude that he would not like Kashmir to continue to be an apple of discord between India and Pakistan; and he has magnanimously suggested that, allowed his way in Kashmir, he might even condescend to serve as an instrument for bringing about amity between India and Pakistan. On one point, however, Sheikh Abdullah has left neither friend nor foe in doubt, and that is the matter of accession. He has not only denied the finality of the accession of Kashmir to India, but he has also demanded that there should be a reversal of the process of integration which has been going on all these years.



Given this mood of Kashmir's self-proclaimed Man of Destiny, his forthcoming meeting with Mr. Nehru could as easily peter out into an anti-climax as it might culminate in a climax. Everything would depend on the capacity of Mr. Nehru at this critical hour to avoid doing a Hamlet. From this point of view it is all to the good that the meeting has been postponed by a few days. At the Prime Minister's instance, Sheikh Abdullah will be coming to the Capital on April 29 instead of April 26. It has been suggested in some quarters that the latter date has been chosen because the Prime Minister desires that Mrs. Indira Gandhi, who has gone to the World Fair at New York, should have returned to New Delhi when Sheikh Abdullah arrives as Mr. Nehru's guest. There is also some speculation that the Prime Minister desires Mrs. Indira Gandhi's presence on the occasion not wholly on social grounds, but also because it has lately become his practice to keep her fully in the picture when important political developments take place or important political decisions are to be made.

What Price "Gushtawa"

Whatever may be the substance in speculations of this kind, it is certainly desirable that, at this momentous hour, when national unity and national security are gravely threatened, Mr. Nehru should act in full consultation with colleagues and confidants. This is particularly important because indications are not wanting that Mr. Nehru and Mr. Lal Bahadur Shastri are not disinclined to do a deal with Sheikh Abdullah on terms which might fall far short of the complete integration of Kashmir with the rest of India. Thus, in his characteristically vague and wandering manner, the Prime Minister confessed to a General Body meeting of the Congress Parliamentary Party on April 21, that the Kashmir question had become more complicated of late. Whether this is his way of suggesting that the Government of India is coming round to the view that it must reconcile itself, on grounds of sheer necessity, to an acceptance of a settlement on Kashmir which may not satisfy or, indeed, be inconsistent with its declared policy in this regard is a point for uneasy contemplation and thanks to the atmosphere of uncertainty which has thus been created, it has become difficult for public opinion to be impressed by bold talk in other quarters. It is true that the Kashmir Premier, who arrived in Delhi on April 18, had been reassuring Congress M.Ps. and others that the State Government was quite capable of meeting any political challenge that might be posed by Sheikh Abdullah. It is true, again that, as Mr. Sadiq says, Sheikh Abdullah's is not the only voice that matters in Kashmir. But it is also true, unfortunately, that his is the voice that has come to be magnified out of all proportions. As a result, the absurd situation has arisen where a settlement of the Kashmir problem is now being talked of not so much in the sense of a settlement with Pakistan as of a settlement with Sheikh Abdullah. In other words, the only valid argument that there ever has been for a reconsideration of the Government of India's Kashmir policy, viz, that it might be a price worth paying for buying peace with Pakistan, is now being quietly discarded. The significance of this is that even if we were to succeed in appeasing Sheikh Abdullah, we might still have failed to satisfy Pakistan. The prospects then are anything but cheerful, for it might come to pass that Kashmir is sold for a mess of "gushtawa".



COMRADES NO MORE

THE CONGRESS Party, it would appear, not only harbours factions within itself, but is also the inspirer of factions in other parties. That, at any rate, is an allegation made by the "Leftist" leaders in the Communist Party of India, who, on April 14, issued a statement repudiating the present CPI leadership on the ground of its "reformist line of general united front with the Congress". Bristling at this denunciation, the CPI National Council first took a decision to expel the seven "Leftist" leaders, but ultimately adopted a less heroic resolution on April 15, merely suspending the offenders. Along with the errant seven were suspended 25 other members of the party, including some "Centrists". The sin of the 25 was that they had joined the "seven" when the latter walked out of the meeting of the National Council on April 11 in protest against the rejection by the Party Establishment of their demand that Mr. Dange should step down from the Chairmanship of the Party pending the completion of a full inquiry into the authenticity of the "Dange letters". Although the now notorious "Letters" have thus precipitated a formal split, there is little doubt that a real and deep division in the leadership as well as in the rank-and-file of the Communist movement in this country has existed far longer than has been generally suspected. A unanimous report of the Party's Control Commission has, in fact, contended that the Left faction has been running a rival party centre in Delhi since November, 1962. In the circumstances, the National Council's ultimate decision to suspend and not expel the "Leftist" leaders can only mean that the "Rightists" are far from confident of their own relative strength within the

Thermocole®

KEEPS IT COOL AT CIBA

Research has a perfect setting at the new CIBA centre in Bombay. It has the perfect insulation, too, thanks to THERMOCOLE.

There are many organisations in India that know and use THERMOCOLE for insulation, and CIBA is one of them. No matter how hot and noisy it is outside, THERMOCOLE keeps it cool, quiet and comfortable inside.

THERMOCOLE is foamed polystyrene—the lightest rigid insulation material in the industry. It has a very low thermal conductivity. It can deaden airborne and vibrational sound and cut out heat, dust and humidity.

There is one sure way to work under ideal conditions: insulate against heat and sound with THERMOCOLE

The Trade Name—Thermocole is your Guarantee of Quality for Expanded Polystyrene

When the need is insulation against heat and sound, call in...

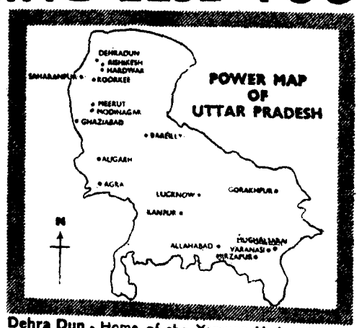
ATTENTION INDUSTRIALISTS!

HERE'S ELECTRIC POWER

FOR YOUR NEW INDUSTRIES

AND EVERYTHING ELSE YOU CAN ASK FOR

Your new industry needs a lot of electric power. The U.P. State Electricity Board is proud of its ability to keep pace with industry's growing demand.



The following are some of the major power projects in U.P.'s Third Five Year plan :

Rihand Hydro-electric Project	**2,50,000 KW Completed 1962**
Harduaganj, Stage I	**60,000 KW Completed May '62**
Harduaganj, Stage II	**30,000 KW Completed Mar.'64**
Matatila Hydro-electric Scheme	**30,000 KW Scheduled Dec. '64**
Yamuna Hydro-electcic Scheme, Stage I	**86,000 KW Scheduled June '65**
Kanpur Thermal Expansion	**64,000 KW Scheduled Aug. '65**
Obra Thermal	**2,50,000 KW Starting Oct. '65**
Yamuna Hydro-electric Scheme, Stage II	**2,00,000 KW Scheduled Dec. '69**

A trunk grid of 2,20,000 volts is being constructed to interconnect all the power stations and lines of 1,32,000 and 66,000 volts will branch off from this trunk grid for taking constant electric power to the following important industrial centres :-

Ghaziabad-Modinagar-Meerut - Connected by rail and road with the whole of India. Home of the well known Modi Group of Industries - can also be the home of your industry. Industrial sites are offered by the U.P. Industrial Corporation, Kanpur.

Aligarh - Only 16 miles from the Harduaganj Thermal Power Station - assured of ample and constant supply of electric power. 84 miles from Delhi.

Dehra Dun - Home of the Yamuna Hydro-electric Schemes, Stages I, II, III and IV. Unlimited forest produce and limestone of high purity at hand.

Saharanpur-Roorkee-Hardwar-Rishikesh - offer big scope for industries, particularly those ancillary to the Antibiotics Factory at Rishikesh and the Heavy Electricals Factory at Hardwar. Close to rich extensive forests.

Bareilly - Home of the Synthetic Rubber industry, Camphor industry, Turpentine and Rosin industry and the Match industry and developing rapidly as a major industrial centre.

Agra - Main tourist attraction in India and growing industrial centre - conveniently connected with the whole country by rail (both broad gauge and metre gauge), road and air.

Kanpur - Already the most important industrial centres in Northern India. Seat of many technical training institutions. Connected with the whole country by rail, road and air.

Lucknow - Seat of the U.P. Government and a growing industrial centre. Industrial area developed by the U.P. Industrial Corporation, Kanpur. Served by rail, road and air.

Allahabad and Naini - Quick movement of goods between Calcutta and Allahabad assured by electric traction. Land, water and power available in plenty.

Varanasi-Mughalsarai Area - Another industrial area which is growing rapidly. Conveniently connected by rail, road and air with the rest of the country.

Mirzapur District - Home of three major power stations - Rihand, Obra Thermal and Obra Hydel. Rich in limestone deposits and producing large quantities of aluminium and caustic soda. Coal available from nearby Singrauli Coalfields.

Gorakhpur - A large Fertiliser Factory being set up here by the Government of India - also seat of the Madan Mohan Malviya Engineering College and the Government Technical Institute. Important centre of sugar production.

This advertisement is issued for the information of industrialists throughout the country by the

U.P. STATE ELECTRICITY BOARD

COUNCIL HOUSE, LUCKNOW

who will be happy to answer enquiries and furnish any further information which may be required.

Communist movement in this country.

As a matter of fact, although Mr. Dange has described the coalition of the "Leftists" and the "Centrists" as a group which is factionally united but politically divided, it is not at all unlikely that his own group of "Rightists" is anything but a happy family. Much would depend, of course, on the outcome of the labours of the seven-man committee which the National Council has set up to inquire into all aspects of the "Dange letters". More than the prestige or the political future of the Chairman of the Communist Party is involved in this country; and it may well be the case that the Committee's report may herald a further breakaway from the establishment. So far as the "Leftists" are concerned, they are more likely to engage themselves actively in bringing about this further split than in rehabilitating themselves with the present party leadership in order that their suspension may not mature into expulsion. There is no doubt still some talk on the part of the mediators in the party of the two factions being brought together. But the Chairman of the CPI does not seem to entertain any illusions on this score. According to Mr. Dange, a war of some sort has broken out within the Communist movement in this country. Some of its earliest repercussions may be seen in West Bengal where the State Council is dominated by the Left. Side effects of the split should also be felt in Parliament where the Communists, because of the division in their ranks, may cease to be the largest opposition group. The beneficiary from such a development would be the Swatantra Party which, as a result of recent elections to the Rajya Sabha, has already come to be the main opposition group in that House. It might score a similar position in the Lok Sabha as well, thanks to the ill wind which is blowing through the Communist crowd.

DYNAMICS OF AID

THE UNION Government has decided to effect a number of far-reaching changes in the import policy and procedures in the light of the recommendations of the Rao Committee on Utilization of External Assistance. The changes proposed will provide greater flexibility to industrial entrepreneurs in importing equipment, components and raw materials.

One of the most significant changes being made is that the Director-General of Technical Development would be required to take a broad view of the foreign exchange requirements of industrial units having fixed assets less than Rs. 25 lakhs. Such units will be allotted a certain overall amount of foreign exchange after a careful assessment of the indigenous availability of the equipment required, and within this overall ceiling, subject to banned items not being imported and the capacity as proposed being established, will be allowed to import equipment as they choose. The actual users also will be given somewhat greater flexibility for meeting their import requirements within the overall foreign exchange allocations made to them. The exchange allocations in their case too will be determined on an overall basis after allowing for the supplies available in the country. In the case of bulk imports of components, equipment and raw materials by public sector units, the need to secure clearance of the Administrative Ministry/Ministry of Finance before placing orders is also proposed to be done away with. It has also been decided to dispense with the requirement of prior clearance by the D.G.T.D. from the point of view of indigenous availability in regard to the imports of components and raw materials. But this decision is proposed to be implemented in the first instance in the case of public sector projects on an experimenal basis. It will be extended to the private sector later after detailed examination

In the case of maintenance imports by public sector units, the Government has also decided to examine the possibility of making exchange allocations on an annual instead of half-yearly basis. For projects requiring specialised components and raw materials with long delivery periods, the release of foreign exchange for longer periods against detailed foreign exchange budgets will also be considered. When these imports are to be financed against external assistance, this will, however, be subject to the agreement of the country or institution providing assistance. In the case of the private sector units whose import entitlements are licensed on a yearly basis, the Government has accepted the Rao Committee's plea that it should indicate to such units some minimum percentage of the exchange allocations made to them during the first half of a licensing year for utilisation during the second half.

Other Rao Recipes

Among the other recommendations of the Rao Committee accepted by the Government are: (1) the Government should publish periodically statistics of ordering against available assistance from abroad, in addition to data regarding disbursements; (2) considerably greater attention should be paid to geological, meteorological, soil, water and forest resources studies; (3) no project should be proposed for aid unless a feasibility report for it has been completed; (4) frequent changes in the scope of a project at late stages should be avoided; (5) after the overall financial estimates of project have been reasonably assessed, the project authorities should be given complete freedom within the overall amount placed at their disposal, to order supplies, subject, of course, to their adhering to the scope of the project and the suitable timetable drawn up for its execution; (6) the private entrepreneurs should be assisted in drawing up projects acceptable to financing institutions; the Indian Investment Centre should expand its activities in this field; (7) the possibility of laying down standards of foreign collaboration terms for different industries should be examined; and (8) Government should review the legal position in regard to acquisition of land etc.

The Rao Committee has also made a number of suggestions for speeding up matters at the end of the aid-giving countries and institutions. Its main observations in this regard are: (a) non-project assistance should form a larger part of the total aid made available by a friendly country and project assistance should be defined to include components needed for the manufacture of capital equipment and the initial stock of components of machinery manufacturing industries whose equipment is financed by aid; (b) for avoiding delay between pledges at a Consortium meeting and actual commitments, selection of programmes and projects should be made a part of the Consortium exercise; alternatively, such a selection should be made within a specified period of, say, two months after a Consortium meeting (this pre-supposes that projects and programmes put forward at Consortium meetings will be at an advanced stage of readiness); (c) the delay in placing of orders can be reduced if it is agreed in advance that all orders placed after the date of Consortium pledge will be picked up for financing in the event of loan agreements being concluded; (d) the commitment of the entire foreign exchange cost of a project at the start is a major cause for apparent delay in utilisation; while partial financing is a solution, it has its limitations and it should be resorted to only for high priority projects; (e) it will be of considerable help if at least 10 per cent of the aid given for a project is made available for purchase in third countries; (f) the World Bank and the I.D.A. should agree to relax the requirement that the lowest tender should be accepted in order to permit placing of orders on indigenous suppliers who may charge higher prices but who would require less foreign exchange; (g) the U.S. authorities may be requested to relax the requirements that there should be tendering confined only to the United States if American assistance is to be forthcoming; the results of global tenders should be accepted; and (h) the minimum value restriction on use of external assistance should be done away with to the extent feasible.

FROM THE PRESS GALLERY

TTK Concedes But Little Ground

THE FINANCE Bill received the assent of the Lok Sabha on April 21 after a heated clause by clause discussion. The Finance Minister's speech of April 17 embodying some of the salient amendments has been reproduced elsewhere in this issue. The important changes in the Bill are put together here.

In personal taxation, the initial tax-free slab of income has been raised from Rs. 3,000 to 3,200 in the case of a married individual with no child, from Rs. 3,300 to Rs. 3,600 for an individual with one child and from Rs. 3,600 to Rs. 4,000 for a married individual with more than one child. These concessions will reduce the tax payable on earned and un-earned income in relation to the rates prevalent in 1963-64.

The annuity deposit scheme has been made optional in the case of persons more than 70 years of age. For others an alternative scheme has been provided whereby, in lieu of the annuity deposit, a person may pay by way of income tax "50 per cent of the difference between the annuity deposit amount and the extra tax payable when the deposit amount is not deducted from the assessee's income". Also, compensation for loss of employment or "income in the nature of capital gains" will be excluded in calculating the value of the annuity deposit. The playwrights, authors, artists, musicians and actors have been allowed to make an additional deposit of 25 per cent of their income instead of 15 per cent. To stimulate savings, the rate of income-tax and surcharge from interest on securities in the case of resident assessees has been slashed from 29 per cent to 20 per cent. Students and professors from foreign countries carrying on research work in India on approved programmes are exempted of taxation on stipends or remuneration for a period of two years.

Corporate Taxation

The development rebate incentive has been extended to second-hand plant and machinery imported from abroad. Besides this relief, additional depreciation allowance for a "third-shift working of plant and machinery at 50 per cent of the normal rate of depreciation" has been allowed. This concession will take effect from the assessment year 1964-65.

The exemption from the requirement of compulsory distribution of dividends has been extended to companies which are engaged in "the manufacture of goods or in mining or in the generation and distribution of electricity". This concession has also been extended to such Indian companies as have machinery or plant exceeding Rs. 50 lakhs (in book value) to provide relief to capital-intensive units.

The Industrial Finance Corporation, the State Finance Corporations and similar institutions have hitherto been treated as companies in which the public are not substantially interested because less than 40 per cent of the shares are held by the Government. In this way, these financial institutions have been clubbed with private limited companies. To remove this anomaly, the Income Tax Act has been amended so as to include in the 40 per cent share not only the Government but the Reserve Bank of India or a Corporation owned by the Reserve Bank. It will lower the incidence of taxation on these institutions. In the case of small private limited companies, the super-tax (35 per cent) has been lowered. If the income of such companies does not exceed Rs. 5 lakhs, the rate of tax on the first Rs. 5 lakhs has been fixed at 50 per cent (income tax at 25 per cent and super tax at 25 per cent as in the case of the public limited companies).

The list of basic industries qualifying for a rebate of 10 per cent of the overall tax has been revised. The industries included are electronic equipment and petro-chemicals; manganese ore, dolomite, magnesite and mineral oil have also been included in the list of mining industries. Coffee and ruboer have been removed from the list. Two more small changes have been incorporated in corporate taxation. Any expenditure incurred by a company in providing a free passage to an employee for going on leave will not be included in the list of perquisites (which has been provided at 20 per cent of the salary). In the case of resident companies, dividends and interest on securities which are taxed at 25 per cent at source currently will be charged at 20 per cent only as in the case of resident non-company assessees. The bonus shares issued from the share premium account will not attract the tax on bonus shares with effect from April 1, 1964.

Capital gains (other than short-term) accruing to a non-company assessee will be exempted from tax up to Rs. 5,000 if the total income does not exceed Rs. 10,000. The tax on capital gains arising from lands or buildings would be charged at 75 per cent of the average rate applicable to an assessee and in all other cases at 50 per cent of the average rate. The minimum tax on long term capital gains has been fixed at 15 per cent of the gain. The capital gains will be calculated on the basis of the fair market value where, according to the income tax officer it is more than 15 per cent of the declared value.

Harassment Through Disclosure

In order that disclosure of information to the public from the official records may not be abused, the Commissioner of Income Tax has been authorised to furnish the information only if he was satisfied that the disclosure was in public interest. Section 280 of the Income Tax Act, 1961, has been amended so as to punish any public servant who made unauthorised disclosure of information.

In view of the steep rise in estate duty reaching up to 85 per cent at the highest slab, it is feared that a whole estate may have to be handed over to the Government by way of taxes and estate duty. To provide some relief in such cases, the full amount of the probate duty is allowed to be deducted from the estate duty instead of half the probate duty as it present.

The Expenditure Tax Act, 1957, has been changed to attract this tax on all expenditure above Rs 36,000 per annum. Customs duty and other taxes paid in the purchase of imported articles will not be allowed as a legitimate charge for purposes of expenditure tax. The present limit of Rs. 10,000 for exemption from the Gift Tax has been lowered to Rs. 5,000.

The handlooms and the smaller powerlooms will benefit from the changes in excise duties on yarn. The exemption on yarn (in the form of hanks) has been extended to new French counts below 29. The duty on yarn of counts between 29 and 34 will be halved. For yarn not in the form of hanks, the concession has been given up to 5 nP. per kg. The independent sizing units have been given a concession of one-fifth of the special duty payable on sized yarn. Further relief has been provided to small power looms by re-adjusting the rate at one-third of the present figure. The duty on industrial rayon yarn has been cut from Rs. 4 to Rs. 2.67 per kg. Minor changes have been made in rates of duty on tyres and paper boards manufactured in new units. Similar is the case with match factories. Extruded aluminium rods and the rolled products will attract the same duty.

The Companies (Profits) Surtax Bill was passed by the Lok Sabha on April 22 with some important changes. The funds borrowed from the Industrial Finance Corporation or the Industrial Credit and Investment Corporation or from any other financial institution approved by the Government have now been allowed to be included in the capital base. The original bill had provided that the moneys borrowed from a banking institution could be included in the capital base only if they were repayable in not less than 10 years, but according to the new amendment, the borrowed sums will be included in the capital base subject to the condition that the minimum term of repayment should in all cases be seven years. The primary objective of borrowing such sums of money should be the creation of capital assets. The inclusion of borrowed money in the capital base is likely to benefit some of the steel and shipping companies. The Finance Minister also explained that Surtax would be attracted only at comparatively high levels of profits and its incidence would also be generally low. That is why he had not considered it necessary to provide for carry forward and set off of any deficiency of profits against the chargeable profits of subsequent years. [For the Finance Minister's speech of April 17 and for some additional changes in the Finance Bill, please refer to page 957].

Besides voting the Finance and Surtax Bills, the Lok Sabha last week also passed the budget demands for the Ministries of Finance, Planning and Home Affairs, the Departments of Atomic Energy and Parliamentary Affairs, Lok Sabha, Rajya Sabha and the Vice-President's Secretariat.

Dull Affair

The debate on the demands of grants for the Ministries of Finance and Planning was a dull affair. Criticism centered mainly on evasions of taxes, bureaucratic handling of its affairs by the Life Insurance Corporation and lack of proper control over administration of Plan programmes to see that the allocations made for them were properly utilised. While alleging that there was lack of co-ordination between the Planning Commission and the various departments of the Government, Dr. L. M. Singhvi suggested that a small economic parliament", consisting of M.Ps., should be created to discuss the economic and financial matters in detail. This, he said, was necessary because these matters did not claim sufficient time of the House at present. The former Minister for Oil, Mr. K. D. Malaviya, felt that in excessive zeal for stepping up production, the Government had neglected the distribution aspect, thereby contravening the spirit of the Industrial Policy Resolution. He deplored the "mad running" after foreign capital to boost industrial output. Some members also called for making the plans more agro-oriented.

Replying to the debate, the Finance Minister vehemently denied that there were any differences between him and the Deputy Chairman of the Planning Commission. His recent letters to the Prime Minister and Mr. Asoka Mehta, he said, were in connection with the strategy for the fourth Plan which was being formulated now. The next Plan would be a "big one", involving an outlay of Rs. 18,000 crores to Rs. 20,000 crores. A Plan of this massive size obviously necessitated a clear enunciation of the strategy, he emphasized. The Finance Minister further stated that in view of the heavy indebtedness of the States to the Centre, the Union Government had now to decide whether it should take over all the major projects such as those for power generation. The States might be asked to incur the working expenses on such projects out of their revenues and when these projects started yielding profit, the interests on the loans advanced by the Centre could be collected. The Finance Minister also indicated that he would seek the permission of the House during the current session to amend the Income-tax Act, in order to make it more effective and to remove some legal defects in the way of easier collection of income-tax. The provocation for amending the Income-tax Act obviously has been provided by the recent judgment of the Supreme Court that when alterations were made in assessment on appeal, the assessment had to be made de novo. In regard to the relationship between the Finance Ministry and the autonomous bodies like the Life Insurance Corporation as well as between Parliamentary Committees and such organisations, the Finance Minister expressed the view that the whole matter had to be studied again and the Government had to decide how far it could intervene in the working of the autonomous bodies. Defending the Government's policy to attract foreign investments, Mr. Krishnamachari asserted that without progress, standard of living of the masses could not be raised. Foreign money did not destroy the social set-up India had.

Unusual Pandemonium

The debate on the demands for grants for the Ministry of Home Affairs was marred by an unprecedented pandemonium which prevailed in the House following Mr. Frank Anthony's observation that minorities in India faced danger from the revival of religious and caste feelings in the majority community. He alleged that all the political parties were conniving at this revivalism and this had resulted in the Muslims walking in the shadow of death. Such serious allegations naturally could not go unchallenged and various members made a demand for expunging them. The other matters which figured prominently in this debate were the plight of the landless labour, high costs of litigation, infiltration of Pakistani Muslims into India, rooting out of corruptions, the Kashmir situation, Sheikh Abdullah's utterances and the need for administrative reforms. In regard to checking of corruption, it was urged that the Santhanam Committee's report should be implemented without delay.

The Minister for Home Affairs, Mr. G. L. Nanda, in his reply, stoutly refuted the allegations made by Mr. Anthony and characterised them as a traversity of the truth. He assured that all the resources of the State would be used to protect the minorities and pointed out that the communal disturbances in India were the repercussions of persecutions of minorities in East Pakistan. Dwelling at length at the steps taken by the Union Government for quelling communal disturbances, he said that no stone would be left unturned to maintain peace in the country; the Government would use the Defence of India Rules and other powers without hesitation to round up all the anti-social elements. Mr. Nanda rejected the demand for ending the emergency and renewed his pledge that if substantial progress was not achieved in eradicating corruption within two years, he would go. Regarding Kashmir, Mr. Nanda reiterated that the State's accession to India was irrevocable.

Intervening in the debate, the Minister of State for Home Affairs, Mr. Jaisukh Lal Hathi, and the Deputy Minister, Mrs. M. Chandrasekhar, made several important announcements. Mr. Hathi revealed that the Government had decided to set up special cells in the Ministries of Law and Home Affairs for studying the question of judicial reforms. A department of administrative reforms was also proposed to be created. Mrs. Chandrasekhar disclosed that the Government proposed to amend the Untouchability Act to make it more effective. The State Governments were being asked to cancel the licences of the cinemas, hotels and other commercial establishments which practised untouchability. Mrs. Chandrasekhar also revealed that the Government was thinking of having a national service of doctors, etc., so that the requirements of the defence forces could be speedily met in times of emergency.

Question Hour

Aid-India Club: The Deputy Minister for Finance, Mrs. Tarakeshwari Sinha, revealed in Lok Sabha on April 16, that India had pressed its case for further untied aid at the meeting of the Aid-India Club held in Paris in March last. The response from the members of the Consortium, she added, had been good. The decisions of the various participants, however, would be available only at the Club's pledging session to be held on May 26. Availability of untied loans, she point-

ed out, would enable purchase of equipment for various projects from the most competitive sources.

Steel Controller's Office: The Union Minister for Steel, Mines and Heavy Engineering, Mr. C. Subramaniam, assured the Lok Sabha on April 17 that the staff that may be rendered surplus in the main office of the Iron and Steel Controller in Calcutta by the implementation of the Raj Committee's recommendations, would be absorbed in suitable existing vacancies or those that may arise in future in the other Central Government offices in Calcutta. No estimate, he said, however, was available as yet of the number of the employees likely to be rendered surplus because of the re-organisation of the Steel Controller's Office.

Manufacture of Tractors: Mr. Subramaniam also revealed in the House on April 17 that the Union Government was considering the establishment of a big public sector project for the manufacture of tractors. Some States had written to the Central Government suggesting that this project should be located in their jurisdiction. The Punjab Government had even suggested that it should be allowed to start a tractor manufacturing unit of its own. The various requests were under the consideration of the Union Government. The need to set up a tractor manufacturing plant in the public sector arose because the progress made by the private sector units licensed in this line was not considered satisfactory. Mr. P. C. Sethi, Deputy Minister in the Ministry of Steel, Mines and Heavy Engineering, told the House that with a view to rectifying the situation, the Union Government had also lifted the ban on licensing of further capacity for the production of tractors. A number of new schemes had been received. These were being examined. Efforts were also being made to step up production in the existing units through larger allocation of foreign exchange for import of components and raw materials as well as capital goods.

Cement Research Institute: The Minister for Industry, Mr. Nityanand Kanungo, told the Lok Sabha on April 17 that a Cement Research Institute was proposed to be established near Delhi as a co-operative venture in which all the cement producers in the country and CSIR would participate. For providing finance for the institute, the industry would contribute 10 nP. per tonne of cement sold in India. The CSIR had agreed to sanction grants up to an amount equal to the contribution made by the industry. The blue-print for the institute would be finalised in about six months.

Management Cadre: Mr. Kanungo also revealed in the House on April 17 that the Government had rejected the suggestion for constituting an all-India managerial cadre for employment in public sector undertakings. There were about 60 public sector enterprises in the country, he said, and each was an independent unit, legally and constitutionally. It was not thought proper to interfere with their working. The Government, however, was considering certain model rules of recruitment. When finalised, these would be sent to the managements of the public sector companies for their guidance.

Protection to Plants: The Minister of State for Home Affairs, Mr. J. L. Hathi, told the Lok Sabha on April 15 that the Government would be prepared to extend the benefits of the proposed industrial plant protection scheme to the private sector establishments. The broad outlines of this scheme, he said, had been communicated to the States, but details had not been worked out as yet. The scheme envisaged raising of a security force to protect the national plants. The decision was taken at a recent conference between the Union Home Minister and the Chief Ministers of States.

Sugarcane Price: The Minister of State for Food, Mr. A. M. Thomas, told the Lok Sabha on April 14 that there was no proposal under consideration at present for further increasing the price of sugarcane for the 1964-65 crushing season. The minimum price fixed for the ensuing season was Rs. 4.96 per quintal at the factory gate for a recovery of 9.4 per cent or below. For every 0.1 per cent increase in recovery above 9.4 per cent, the minimum price was to be increased by 4 nP. per quintal. The prices payable by individual factories for cane supplies to them during the next crushing season would be notified after the recovery from the supplies effected to them during the current season were known. Mr. Thomas, however, indicated that the Government might consider the situation further in August as to wheher it was necessary to give any further incentive to the canegrower. The Minister added that attempts were being made to pay each grower according to the sugar recovery from his cane.

ESTATE DUTY SIMPLIFIED

by S. A. L. NARAYANA ROW

Here is a book out of ordinary that will prove useful to assessees and officers who have to deal with Estate Duty Assessment.

With the reduction of the exemption limit to Rs 50,000 more and more estates will be liable to Estate Duty. This book will be useful to probable assessees to know their rights and obligations. The provisions of the Act are explained in a simple and lucid manner and all relevant Rules and Notifications have been printed as Appendices. A Supplement containing the amendments in Estate Duty rates and Estate Duty Amendment Rules (1964) will be supplied free to purchasers of this Edition.

Madras Law Journal Office, Madras.

North, South, East, West—the universally recognised label 'Sanforized' can help Indian Cottons enter new markets, earn more foreign exchange

The trademark 'Sanforized' is recognised and inspires confidence on every continent. The name 'Sanforized' on cotton cloth always has the same connotation—a trusted, uniform standard of shrinkage control.

In India, cotton textiles, along with jute and tea, form one of the three most lucrative export items. In 1962-'63, the export of cotton textiles netted the country Rs. 46.50 crores in foreign exchange.

India faces tough competition in world markets; she needs greater diversification of her markets—needs to capture new ones. The label 'Sanforized' can greatly aid the export of cotton textiles, for it is known and relied upon by millions of consumers in 49 countries. 'Sanforized' has been of inestimable benefit in improving the quality and increasing the range of India's mill-made cottons. The use of this label is helping to step up the sales of Indian cottons abroad and earn us still more foreign exchange.

Issued by Cluett, Peabody & Co., Inc. (Incoporated in the U.S.A. with limited liability) proprietors of the registered trademark 'SANFORIZED'. The trademark proprietors use the trademark 'SANFORIZED', or permit its use by authorised registered users, only in respect of tested fabric which meets the trademark proprietors' strict requirements as to residual shrinkage.

OUR POPULATION PROBLEM—V

Essentials of A Strategy

R. CHOPRA

AFTER 16 years of freedom and 12 years of planned economic progress, we are slowly realising that the exploding population is our most serious problem and the only obstacle in the way of rapid economic growth. But the realisation has not yet been matched by the will and determination to bring the population growth under control. We still feel that some time, somehow the population will stabilise. We are hoping for a miracle to take place, to make the people suddenly conscious of the evils of large families. Otherwise how else can we explain the insignificantly small budget allotment for Family Planning?

To achieve results, both short-term and long-term, it is essential that the problem of population control should be tackled on a war footing and immediately. Mobilisation of all our resources and very generous budget allotments are necessary. The programme should be manned by the best people we can lay our hands on in the country as well as abroad. "For, no matter what we do in other fields, if the population is not controlled and soon, it will most assuredly frustrate our prospects for self-fulfilment.

Outline of Plan

It is now proposed to discuss an outline of a plan for an all-out attack on the population problem. The plan is based on the following basic assumptions:

(a) There should be no limit to the budget allotment for Family Planning. Before the reader rejects this assumption he is requested to study the financial implication of this programme for family planning (which will be discussed later on) compared to the capital investment that will be required if the population is allowed to grow unchecked.

(b) The democratic method of popularising family planning and the voluntary and conscious acceptance of it by the people is the best way both in the short and the long run. It is only the initial resistance which is most formidable. Hence a programme as vital and as sensitive as family planning should be massive and intensive in its educational approach and leave nothing to chance.

(c) The work on the programme should start immediately to recruit, train, organise and plan. It will be launched as a full scale attack on the problem along with the fourth five-year Plan and will last till the end of the fifth five-year Plan.

The plan which is aimed at cutting down the actual number of births is based on the following fundamentals:

(a) **Contraceptives:** They form the core of the plan.

(b) **Sterilisation**

(c) ***Abortion:*** *This is a controversial* point and may or may not be accepted. But it is worth considering soberly and rationally. After all a country as civilised as Japan has legalised abortion and practically every country has hundreds and thousands of illegal abortions every year which are really harmful to the health of the mother and would be minimised if abortion is legal and open.

(d) **Organisation:** A large, dedicated and disciplined organisation of professional men (and women) working whole time is very essential. Voluntary help is most welcome provided it is dedicated. The usual part time social workers (ladies, particularly wives of important people who "dabble" in social work) are worse than useless. They tend to use such programmes as stepping stones to social success.

(e) **A comprehensive propaganda machinery:** Every type of modern communication aid such as television, films, radio, newspaper, seminars, talks etc. should be pressed into service to show the advantages of Family Planning from social, economic, health, political etc. angles.

(f) A programme like this which aims at changing the centuries-old traditions and customs and in fact questions some of the basic axioms of society and touches the most intimate part of a person's life, can only succeed if each individual is given individual as well as group attention.

(g) Motivation without the means to practise Family Planning is of little or no use. Studies have shown that even where motivation for family planning exists, if the means, i.e., contraceptives etc., are hard to get or expensive the people quickly lose interest in family planning. Motivation backed by ample and easy access to the means for family planning is essential.

(h) The programme, which would require the combined effort of thousands of people at a pitch as high as say, during the war, must necessarily be over during as short a period as possible. That is why the period 1966-76 i.e. 10 years is considered as the maximum for sustained effort. The programme, therefore, must be massive and fool-proof and nothing should be left to chance so that we are able to accomplish what we set out to do within ten years or less.

Central Theme

The central theme of the family planning organisation as envisaged is that individual attention will be given to every married couple. Experience has shown that any plan which deals with such an intimate part of a person's life must aim at providing attention for each person if success is desired. Group psychology and "extension approach" are also very important but cannot replace individual attention. Remember, that each human being likes to be treated as a self respecting individual and not as "one of the crowd."

Family planning is for married couples. It is estimated that at the start of the programme there will be about 12.00 crores married couples in the child-bearing span of life. At

the lowest level of the organisational chart, say at the village or field level, the plan aims at providing one village/field level worker for every 600-700 married couples or a population of 2,500-2,800 people. Hence we require nearly 2,00,000 village/field level workers. The entire country will be suitably divided into groups of 600-700 married couples with one village/field worker in-charge. Above him will be the block, district, divisional, regional, State, zonal and central level officials and workers.

The organisation chart above the village/field level worker will be as given below:

Village/field level	1 for 600-700 couples	200.000
Block level	1 for 6 village/field level	33,000
District level	1 for 6 Block level	5,500
Divisional level	1 for 6 District level	1,000
Regional level	1 for 5 Divisional level	200
State level	1 for 5 Regional level	40
Zonal level	1 for 5 State level	8
Central level	1 for 8 Zonal level	1
	TOTAL	239,749

The "span of control" at each level has been deliberately kept at one boss controlling six subordinates. In this connection, the following statement attributed to an Army General, from the writings of Lyndall F. Urwick is worth quoting:

"The average human brain finds its effective scope in handling from three to six brains. If a man divides the whole of his work into two branches and delegates his responsibility, freely and properly, to two experienced heads of branches he will not have enough to do. The occasions when they would refer to him would be too few to keep him fully occupied. If he delegates to three heads he will be kept fairly busy whilst six heads of branches will give most bosses a ten hours' day. Those data are the results of centuries of the experiences of soldiers, which are greater, where organisation is in question, than those of politicians, business men or any other class of men.

Politician Running Business

"Of all the ways of waste there is none so vicious as that of your clever politician trying to run a business concern without having any notion of self-organisation. One of them who took over munitions for a time had so little idea of organising his own energy that he nearly died of overwork through holding up the work of others; i.e. by delegating responsibility coupled with direct access to himself to 17 sub-chiefs! Now it will be understood why a Battalion has four companies (and not 17); why a Brigade has three or four battalions (and not 17).

"Organisations are run by rule then; a rule whereby from three to six 'hands' are shepherded by one 'head', each 'head' in turn being member of a superior group of from three to six who are being wheeled into line one by one....

"As to whether the groups are three, four, five or six, it is useful to bear in mind a by-law; the smaller the responsibility of the group member, the larger may be the number of the group and vice versa. That is to say, one NCO in charge of three private soldiers would be too idle; one lieutenant general in charge of six divisional generals would be too busy. The nearer we approach the supreme head of the whole organisation, the more we ought to work towards groups of six"

The above organisation will be purely a "Line" organisation on the lines of a military organisation. In addition to it there will be nearly 20,000 more at various levels to provide propaganda, advertisement, accounts, personnel, welfare, office work, procurement, distribution and other specialised and general services including the upkeep of the audio-visual and other aids. In short, they will be similar to the General Staff and other specialised agencies of the Armed Forces.

The population control programme is so vast and so vital to the country's progress that the entire organisation needs to be headed by a Minister at the Centre. To avoid any lack of co-ordination between the Centre and the States, the entire programme shall be under one authority and that of the Central Ministry. Many of the present-day ills of lack of co-ordination, waste of money, dissipation of effort, indiscipline etc. will thus be avoided.

Attractive Salaries

The personnel at various levels should be paid salaries which are attractive enough to attract the best talent in the country. This is very important since the entire success of the plan depends upon the type of persons in the organisation.

(a) As the staff will be very widely dispersed and living kept in mind:

(a) As the staff will be very widely despersed and living under comparatively difficult conditions, discipline should be strict. In fact, Army personnel would be desirable at the lower levels provided they meet the other requirements. But in any case, discipline should be as strict as in a Military Organisation.

(b) Adequate incentive for good work and punishment for delinquency should exist and everyone should be aware of it. Targets to be achieved should be set and rewarded when achieved. These will be discussed later in more details.

(c) Up to the Block or District level, no income tax, house rent, provident fund shall be deducted. This will be an added incentive at those levels. In addition, the PCP staff at all levels shall be paid a bonus up to a maximum of half the total wages earned during the ten-year period of the PCP. The bonus will be proportional to the loyalty, conduct and initiative of each individual, the achievement of targets and the individual's overall contribution to the success of the PCP.

(d) The staff at lower levels must know the local language, customs and traditions. They should be from the same locality and thus acceptable to the populace.

(e) The staff at all levels must be adequately educated to effectively carry out the programme.

(f) The duties and responsibilities of each individual in the organisation at all levels shall be laid down in as great details as possible. This will ensure that the minimum effort required for the success of the PCP is put in, while leaving enough scope for the development of a person's initiative.

(g) The personnel should be married with not more than two children. It is desirable that they should volunteer for sterilisation, but it is not compulsory.

(To be continued)

WINDOW ON THE WORLD

Disinflation Without Tears

From our Special Correspondent

PARIS:

THE PERFORMANCE of the French economy in the past six months is sufficiently remarkable to warrant attention, for it has belied the many pessimistic forecasts made with great assurance last autumn. At that time, and indeed from last summer, the signs of a dangerous inflation were all too evident. Prices were rising faster than anywhere else in the West with the possible exception of Italy. The competitive advantage that French exports had gained in the generous devaluation of December 1958 seemed to have been wiped out; the trade surplus that had been constant for over four years had narrowed and eventually been replaced by a small deficit; and the payments surplus was dwindling. Both these latter developments looked like being accentuated by the liberalisation of imports, firstly in the tariff disarmament within the Common Market, and then in the unilateral duty cuts decided upon in order to restrain domestic price increases.

Apart from these statistical indicators, the inflationary psychology looked to be returning: savings diminished, retail sales shot up, and labour agitation for higher wages began, assisted by an acute manpower shortage. The regime's political opponents concluded that the much vaunted virtues of strong stable government had failed to save the Fifth Republic from the inflationary disasters of all its predecessors. They found the explanation of this failure not only in the present government's reluctance to modernise the country's credit and retail systems (all previous governments had shrunk from that, because it entails attacking powerful vested interests), but also in its pursuit of military independence. The great and growing cost of the national nuclear deterrent, in other words, was the root cause of the return of inflation in France.

Dangerous Situation

By September of last year, the dangers of this situation were admitted even by a Finance Minister who had till then chosen to explain away alarming symptoms of inflation as the backwash of such accidents as the cruel winter of 1962-63 and the long coalminers strike. Thereupon corrective action was undertaken, was intensified in November and further completed by new measures announced periodically since. The battery of weapons used is impressive; with a fine disregard for economic doctrine, it includes almost every sort of measure ever tried, by liberal or socialist governments, to curb inflation — from the classic increase in bank rate to the subterfuge of a price-freeze that concenrtates on goods entering into official cost-of-living index-numbers. To this motley panoply is now being added (it takes time) the specifically Erhardian formula of strictly equal percentage increases in the national product and in the total size of the budget.

The curious thing is that, drawing ideas from liberal critics like Jacques Rueff as well as from socialist predecessors like Paul Ramadier, the Finance Minister applied none of them with any particular vigour. Consumer-finance was limited, but gently, on some goods one might say symbolically. The rise in bank rate was long in coming and was modest when it did. The reform of the money market was in a liberal direction, increasing competition between lenders, but stopped far short of the complete freedom recommended by theorists. The price-freeze was maintained but much less rigorously than by earlier governments who restored to this socialist measure: authorisation for increases can be obtained more simply, and there have even been cases (as with textiles) of the administration shutting its eyes to illicit increases. The volume of bank credit has been restrained, but by no means pegged: the authorities are satisfied when the pace of increase of total advances slows down, and have not tried to keep that pace down to the 5 per cent annually that the Brussels experts think safe. The budget is being brought back nearer strict equilibrium, but the job is spread out over several years: the deficit began to fall two years ago and may not have quite disappeared in the 1965 budget. Similarly, the transfer of the financing of this deficit from short-term borrowing (Treasury bills payable on presentation) to long-term government loans is being managed gradually. And so on through the long list of varied (some said confused and incompatible) steps taken in the past seven months.

Empirical Procedure

In sum, the policy decided upon last autumn was a sort of cocktail, a series of touches none of which were very firm; gaps were stopped where they drew attention to themselves but exclusive reliance was not placed on any overall formula. Naturally, this empirical procedure satisfied no school of thought and must particularly have disappointed those who expect a French Finance Minister to show some logical consistency in his ideas. Dr. Erhard, who had been loud in his praises of the Pinay reform of 1958, refrained from approving M. Giscard d'Estaing's hotchpotch as ostensibly as did the trade unions in this country. The Minister contented himself with the reply that his programme was to be judged on its success, which might take many months to emerge, and meantime if anyone had suggestions about inflationary leaks that had been overlooked they would be attended to without regard for doctrinal consistency.

Still, the commenest opinion was that this incongruous mixture of stopgaps added up to deflationary medicine: the expansion of French industry would be broken, producers of durable consumer goods, notably automobiles, would be hard hit, and a retreat from full employment was inevitable. A lakh of unemployed was forecast for late last winter, and when it did not appear, the rendezvous was pushed back to this spring. Company profits, it was said, even were bound to contract and investments to decline, so that even if French industry succeeded in keeping its prices competitive with those of imports in the short term, this would be at the cost of being left behind by expanding West German industry. Worse, this deflationary contraction of the economy would probably be accompanied by continued price-inflation, a contradictory phenomenon that has been seen recurrently in the United States in recent years.

It is no doubt too early to say that the anti-inflation operation started last September has finally succeeded (does the time ever come when one can say that an economic policy has completely succeeded, and without engendering new ills?), but one can be definite about the fact that none of the above morose prophesies has been realised, nor seems in danger of being so. The present situation in a nutshell is this: the pace at which prices were rising has been more than halved without stopping the steady expansion of industrial production, without causing the least retreat from full employment and without reducing the gold and dollar reserves. So much is fact. As to the foreseeable future, the best opinion is that the continuing rise in prices can be further curbed till it falls from the current moderate rate to one comparable with that seen in West Germany, and that the highest price that need be paid for this is that the tempo of industrial expansion decline in the second

half of 1964 while remaining well in excess of 4 per cent annually. As for the possibility of unemployment during the rest of the stabilisation operation, it is no longer even mentioned.

The battle, then, is only half won but at no cost to the community, even to the wage-earners who protested that the whole affair would be at their expense. True, the injustices that appeared during the period of incipient inflation have not been corrected; lags that accumulated while prices were soaring faster than certain wages (those in the State sector, essentially) have endured, and there is no intention of removing them until the situation is safely stabilised — for at this delicate half-way point, any general increase of wages could be interpreted (and hence really act) as a renewal of the inflationary fires. But meantime, no sector's position has worsened, and everyone agrees, including the Leftist trade unions, that the chances of real success are too great for anyone to take the responsibility of wrecking the venture at this stage.

To say that no sector's relative position has deteriorated is to say too little, because in absolute terms all continue to benefit from the constant industrial expansion. Last month, for example, steel production set a new record and the first indication for April are that it will be bettered this month; automobile registrations similarly touched a new high last month; retail sales also climbed new peaks and were 9 per cent up in the first quarter, a figure that is more significant because the rise in prices was less this year. Electricity consumption in the same period advanced 10.5 per cent, whereas 7.5 per cent is the normal gain from one year to the next; petrol sales advanced 27 per cent. And so on through all the table of economic indicators, there is plain evidence that economic progress has been maintained during the course of a successful if unconventional campaign to eradicate inflation. This is a new experience for the French, and for that matter is not so familiar elsewhere either.

While reserving judgment on the government's ability to bring the movement of French prices strictly into line with that of West German prices, its interim achievement deserves note. To decry inflation is not to attack economic expansion, even in the short term. A stabilisation operation is not, as all trade unionists and many employers suppose, synonymous with an unpleasant spell of industrial stagnation and reduced employment.

Maudling's Lenient Budget

PAUL BAREAU

LONDON:

IT MUST at first sight seem unduly severe to criticise Mr. Maudling's second Budget as soft and lenient. It was certainly not the piece of electioneering, which one might have expected with the approach of a General Election. New taxes were announced to yield about £100 million and the choice (alcoholic drinks, tobacco) ensured that they hit as many voters as any increase in indirect taxation would have done. This is not the kind of budget that will turn the tide which has been running so strongly against the Conservative Party recently.

If, therefore, the Budget is to be criticised as inadequate it must be on the ground of the general arithmetic and not of the nature of the tax changes. The widely held view is that an increase in taxation by £100 million is not enough to secure the objective of this particular budget exercise, namely, a retardation of the rate of economic expansion in Britain from the somewhat giddy six per cent per annum which has recently obtained, to a more sustainable four per cent. A very few figures will illustrate the basis of this argument.

Shot in the Arm

A year ago, with his first budget, Mr. Maudling had to give the economy a much needed shot in the arm. There was a considerable margin of unused resources and unemployment was still relatively high. He decided to inject an additional £280 million of additional purchasing power into the economy, disregarding advice that was being showered on him from all quarters at that time, to make it £400 million. His judgment proved much better than that of his critics and it is to be hoped that in the offices of the eminent weekly journal which greeted the budget with the headline "Half-Speed Ahead" the faces to-day are appropriately red.

The outturn of Mr. Maudling's first budget was a current surplus of £73 million, a deficit on capital account of £551 million, leaving an overall deficit of £478 million. In his second budget the Chancellor has to deal with an economy which has taken up nearly all the slack that existed a year ago and which is now virtually at full stretch. Despite these changed circumstances, the Chancellor is again budgeting for a large overall deficit, which on a basis comparable with that of 1963-64 is in fact larger by about £120 million. It is very difficult to believe that this will secure the deceleration of the economy which the Chancellor said was his objective. He may, of course, once again prove more right than are his critics. Alternatively, he may here have provided a budget attuned to the timing of a June election which would have enabled him to take the more appropriate corrective measures after the electoral contest (or to leave his victorious opponents to clear up the mess).

The financial markets have put an inflationary interpretation on the Budget. Disregarding the pro-Labour tide in the country as a whole the Stock Exchange has hoisted the prices of industrial ordinary shares and has depressed those of fixed interest Government securities. Behind these divergent movements lies the argument that whatever a Labour Government may do by way of taxing company profits, the underlying investment considerations will continue to favour equity investment in the long run, that economic expansion will continue, that prices and profits will rise and, conversely, that this spells a continuing climate of relatively dear money and, therefore, justifies a lowering in the prices of gilt-edged securities.

If this be the reasoning, it must lead to other and perhaps more disturbing conclusions. If the Budget is inadequate in restraining demand and if, with the full use of available capacity of equipment and skilled labour wages, costs and prices begin to rise rapidly, balance of payments difficulties may loom up in the near future. The fear of a sterling crisis and of still dearer money lies behind the depression in the market for Government securities.

Such fears, however, seem premature. There has, admittedly, been some diminution in the balance of payments surplus of the United Kingdom. The surplus earned in 1963 has probably turned into a modest deficit in the first quarter of 1964, but the figure remains within wholly manageable proportions. There is convincing evidence that British industry is, by and large, in a satisfactorily competitive position in the overseas trade figures which have just been published. For two consecutive months, February and March, exports of British manufactures have reached record levels. Compared with the figures for a year ago, exports in the first quarter of the year were 9 per cent higher. Imports have admittedly risen even faster; but part of the explanation lies in larger use of industrial materials by expanding British industry and in stockpiling of these materials. For the rest the greater part of this increase in imports is due to higher prices, a movement which Britain can hardly grudge to the primary producing countries, which for so long have had the terms of trade screwed tightly against them. If all goes well an appropriate proportion of those increased imports of industrial materials will in due course be converted into still larger exports of manufactured goods. The present trend of exports suggests that this will duly occur.

The other reassuring factor in the balance of payments situation lies in the fact that the inflationary trend is rather more marked in many other industrial countries than it is in Great Britain. There has been an important and highly significant meeting of the Finance Ministers of the six countries of the Common Market in Brussels this week at which their collective inflationary troubles were discussed. Some attempt has been made by the Common Market Commission in Brussels to lay down the lines of sound monetary and budgetary policy, but laying down lines is one thing, following them is another. Financial policy is still the strictest preserve of national sovereignty and there are many even unsceptical people who gravely doubt whether the sound advice which is now being showered on these inflating countries, particularly on Italy, will in fact be accepted and followed. There is, therefore, a grain of negative comfort for sterling, in the fact that other currencies are being undermined even more rapidly.

The final reassurance for sterling comes from the massive structure of available reserves. The gold reserve is still being strengthened and now amounts to about £1,000 million. No debt is owing to the International Monetary Fund or other central banks, with which Britain has mutual credit facilities. The technical position of the currency is, therefore, reassuringly strong. This strength could, however, be deceptive if, as a result of an unduly lenient Budget, the British economy, instead of slowing down to a sustainable rate of growth, were to leap forward into galloping inflation. The next few months will show whether the fears which Mr. Maudling has unleashed will be realised or whether once again he will have read the omens better than most of his critics.

Themes for Geneva

ASHOK V. DESAI

OXFORD:

THE OPENING speeches set out the themes on which the Geneva Conference will play variations in the next few weeks. M. Manubhai Shah expressed dissatisfaction with the GATT and suggested that it needed to take cognizance of trade with the Communist countries and the special arrangements that governed it. Mr. George Ball, the US Under-Secretary of State, argued for across-the-board tariff reductions by industrial countries and policies to maintain high rates of economic growth. Mr. Giscard Estaing, French Minister of Finance, set forward a plan whereby each industrial country would give special tariff preferences to particular under-developed countries and act as a guinea pig on which they might practise exporting.

In expressing doubts about the efficacy of GATT, Mr. Manubhai Shah voiced a widespread feeling of the under-developed countries; most of them would not mourn much if the GATT passed away. The basic reason for this feeling is that the GATT has done nothing towards solving the chief problem of under-developed countries — the shortage of foreign exchange resources. In the 1950's, these resources were depleted by the worsening of primary producers' terms of trade; now, while the terms of trade are improving, the Russo-American detente might lead to a contraction in the flow of aid. Even in the absence of such a contraction, the distribution of aid is very uneven and dependent on political and para-military considerations. Hence most under-developed countries have an interest in augmenting their export earnings.

Two Approaches

There are two possible approaches to the problem of raising export earnings: increasing the volume of exports and raising their prices. A choice has to be made between them since they are mutually incompatible; and very different obstacles stand in their way.

The chief obstacle to an increase in the exports of semi-temperate food products is agricultural protection in industrial countries. Elaborate systems of agricultural protection were built up in the depression of the nineteen-thirties and in the ensuing war, and arguments have been found for its continuance after the war: it has been defended on the grounds of more equitable distribution of income between agriculture and industry, and on balance of payments grounds.

The case of manufactured goods is similar to that of semi-temperate foods: their exports from under-developed countries are hindered by protection in industrial countries. All countries have given protection to their industries in the process of growth, and protection has acquired all the sanctity of a tradition.

The exports of raw materials are not generally hampered by protective policies; many of them are, however, facing the competition of synthetics. Thus, natural rubber is being replaced by synthetic rubber, jute by paper, some minerals by plastics and vegetable oils by resins. And the technological fertility of the chemical industry is such that substitutes will be found for an ever larger number of natural materials.

Competition from Synthetics

This competition of synthetics has not touched tropical foods, and beverages yet: in fact, many of them have come to be favoured by the consumers in temperate industrial countries quite recently: large-scale exports of bananas and citrus fruits from the warmer countries have developed in the last decade, and the European demand for coffee has risen sharply. For the staple tropical foods, however, the response of demand to increases in incomes is meagre, and the prospect of a rapid rise in their exports is bleak. Further, their world market is divided up by the imperial preferences of the Commonwealth and the EEC. And in industrial systems, production follows demand. It must not be assumed that industrial countries will inevitably import their tropical foods. It is chastening to know that the United States is now the biggest exporter of rice, and promises to become, in the next decade, the biggest producer of sorghum, a cereal which India could hitherto regard as its own. About the only tropical products that industrial countries would not produce are those whose production cannot be mechanised — chiefly plantation products — and the demand for them is not likely to grow rapidly anyway. Further, the distribution of industrial countries' demand for tropical products is very local: Europe obtains much of its citrus fruit

from the Mediterranean, while the Americans run orchards in Central America for their requirements.

Plans to raise prices also run into difficulties. Often the technical conditions of production rule out any long-term price increases. The prices of many raw materials are held down by the prices of their synthetic substitutes, and are often lower to compensate for the superior quality of substitutes. Similarly, the prospects of raising the prices of goods whose production can be easily expanded are not very bright. There are, for example, vast areas in Africa where the production of coffee and cocoa can be extended: their output cannot be restricted, and international price-fixing in their case would break down. It would work better in the case of labour-intensive products like jute and tea, for they require population densities which are rare outside the present growing areas in South-East Asia. The Portuguese have been trying to develop tea growing with conscript labour in Mozambique. They have not, however, made much impact on the world market, probably owing to labour scarcity. But both tea and jute have close substitutes which would limit price rises. The prices of non-ferrous metals, especially tin and copper, have turned up sharply in the past year, but the long-term prospects are not so rosy for any of them except aluminium, which is being increasingly substituted for other metals.

Divergent Interests

Two facts emerge from this review of demand conditions. First, the policies required to increase the export earnings of primary producers depend closely on the products they export, consequently their interests in this field are divergent, and in some respects such as preferential trading arrangements, conflicting. This explains why there has been little co-operative effort between under-developed countries in the matter of trade policy. In political matters they have often acted together: their protests against nuclear testing have been effective, and recently they have been engaging in a lively game of chasing South Africa out of international organisations. But they fall apart when it comes to questions of trade, for they do not see any identity of interests. This is also the reason behind the search for an international trade organisation: there is the expectation that a reformed GATT or a new institution will solve their trade problems for the under-developed countries and save them the trouble of co-operation.

Second, the exports of under-developed countries can be divided into two groups facing very different obstacles to their growth. In the first group come the raw materials and the traditional tropical beverages whose exports are limited primarily by technical and economic factors — competition of synthetic substitutes in the former case and low income-elasticities of demand in the latter. There is little scope for policy here, for no measures to stimulate demand can be contemplated. In the case of processed goods and temperate (as well as some tropical) foodstuffs, however, protection diverts demand in industrial countries to home produce, and preferential arrangements to the produce of countries within the trade blocs; this is where the scope for new policies lies.

One can proceed in two directions here. First, the tariffs and quota restrictions in industrial countries might be dismantled. This will be a difficult and tortuous process, since there are often powerful interests for protection; and even where a government is ready and able to ignore such interests, it is difficult for it to turn a blind eye to the dislocation and unemployment that follow the decline of an industry in the face of imports. Given the will, these difficulties can be met: an arrangement can be worked out, for example, whereby the rate of reduction of a tariff will be inversely related to the rate at which imports capture the home market, so that the rate of decline of home industries can be regulated. The general difficulty in the dismantling of protection is not economic and technical but political; and under developed countries must apply persistent political effort to the task of obtaining freer entry into the markets of industrial countries.

The second approach is to abolish the division of export markets by preference systems. This will not in itself lead to an expansion of these markets, unless it is accomplished by reducing tariffs in Britain and the EEC; but it will end the division of interests which hampers co-operative effort by under-developed countries. And co-operative effort between them is necessary today, not only in inducing industrial countries to reduce tariffs, but in working out trading arrangements among themselves whereby they can conserve their foreign exchange resources and grow as rapidly as possible within the foreign exchange constraint.

In fact, the hope for under-developed countries in the long run lies, not in expanding their markets of primary produce, but in building up their own capacity to produce industrial goods. For, as Maizels points out in his recent study 'Industrial Growth and World Trade', "technological changes and secular shifts in demand both tend to reduce the requirements of industrial countries for primary produce in relation to their total income", and "there seems little doubt that in the final quarter of this century international trade in manufactures is likely to be largely, or even mainly, in the 'development sector' of engineering and chemical products." So whether they want to reduce imports or increase exports, under-developed countries will have to produce engineering products and chemicals. All of them are, however, by no means capable of producing these products with equal efficiency, and they will need to specialize between themselves. In other words, they will need to have free trade arrangements between themselves, and to co-ordinate their plans of industrialization.

Prebisch Plan

It is from this long-term point of view that the merits of Dr. Raul Prebisch's plan stand out. Dr. Prebisch, who is the Secretary-General of the Geneva Conference on Trade and Development, has proposed that (a) industrial countries should give blanket preferences to imports of manufactured goods from under-developed countries, and (b) an international fund should be financed by industrial countries from which under-developed countries would receive development aid to compensate for deterioration in their terms of trade.

Blanket preferences will extend markets for manufactures of under-developed countries, and at the same time dismantle the preference systems of the EEC and the Commonwealth. They will thus serve both the ends we have outlined above. The compensation fund is designed to ensure the stability of foreign exchange flow to under-developed countries. It is uncertain, however, whether it will achieve its objective. The fund will, presumably, provide finance if the export prices of a country fall below those in a base year. The difficult question is, however, whether the compensation would be calculated from the export volume of the base year or the current year. If the base year export volumes are used, the base year export earnings will set an absolute limit to the finance a country can get, which might come to bear no relation to its current exports or requirements. If, on the other hand, compensation is based on the current volume of exports, the receipts of foreign exchange will be proportional to the volume, and there will be an incentive to export as much as possible regardless of the price. A glut of primary goods can result. Thus, the compensation scheme is likely to break down in either form.

However, controversy in the Conference is not likely to centre around Prebisch's proposals, for it has neither powerful backers among the industrial countries nor the unanimous support of under-developed countries. Discussion will turn more and more towards the American proposal of across-the-board halving of tariffs by the US and Western Europe and the EEC tendency towards special concessions to particular countries. Hitherto, the EEC line of approach would have won wide support because most under-developed countries belong to the British or the EEC preference system: Latin American and a few South-East Asian countries are the only ones without sheltered markets. Recently, however, the attraction of preferences in the British market has greatly diminished, and it is likely that many Commonwealth countries will favour the American proposals. The EEC and ex-French Africa might, therefore, find themselves isolated.

Isolation will, however, do little to change their views, and it is probable that the Conference will founder on the schism between America and W. Europe. We might expect it to set up some new committees or organisations which hurt no one; but new policies are unlikely to emerge. It is just possible, however, that the Conference might lead to a crystallization of international opinion around the Prebisch, American and European proposals, a definition of approaches the international community could follow and the degree of support they muster. This would by itself be a great step forward, for once policies were defined, world's governments would have something to grip on, and political forces might start working towards whichever solutions attract most powerful support.

Effective Use of Development Capital

GUY SIMS FITCH

WASHINGTON:

AS THE United Nations Conference on Trade and Development (UNCTAD) enters its fourth week, it faces as one of its major issues the problem of expanding the flow of capital to developing nations. This flow helps these nations not only to build farms and factories, but also to increase the foreign exchange earnings at their disposal to buy the capital goods they need. It thus has a direct bearing on the capacity of developing nations to somehow reach a balance between their earnings from exports and the cost of importing the equipment required to carry out development programmes and raise living standards.

At a recent meeting of the UNCTAD committee primarily concerned with this problem, the United States had some significant ideas to offer on how these objectives can be achieved. It should be noted, in this regard, that the United States has long based much of its foreign economic policy on the large-scale transfer of resources to developing countries under suitable terms.

Emphasis on Development

As the U.S. delegate pointed out, from 1948 to 1963 economic assistance by the United States to newly developing nations amounted to no less than $37,800 million. This is entirely apart from the $14,900 million extended for military aid in the same period. Just in the past six years, reflecting the increased emphasis on development needs around the world, U.S. economic assistance amounted to $21,200 million. Of this, some $10,000 million was in grants and the rest in loans on generous terms. The trend is amply illustrated by the fact that the level of annual U.S. economic aid of all kinds was about $4,500 million in 1962 and 1963, nearly double the $2,400 million in 1948.

Put another way, U.S. Government assistance amounted to about 12 per cent of all the foreign exchange receipts of developing countries in 1962. A principal objective of this U.S. aid has been to increase the export earnings of new nations. The United States has sought to do this in two basic ways. For one, it has provided assistance to both the agricultural and the industrial sectors of developing economies, offering a direct boost of export capacity. For another, it has encouraged indirect expansion of exports by providing capital needed to build power, transportation and port facilities, which form an indispansable basis for direct export production.

In the process, this U.S. assistance has helped developing nations finance imports of needed materials and components, has helped reduce their dependence on imports from the outside, and has contributed substantially to the general strengthening of their economies. The practical results of these U.S. assistance programmes are to be found in all parts of the world.. A few examples will suffice: construction of the massive Niger dam in Nigeria; support for national development plans of such countries as India, Pakistan and Colombia; assistance for the mining industry of Bolivia. The United States also is aware of the advantages of multilateral financing for economic development. It has, for example, played a leading role in the establishment of the International Development Association, soft-loan affiliate of the World Bank, and of the Inter-American Development Bank. It has contributed the largest share of any country—more than 40 per cent of all contributions—to United Nations agencies engaged in promoting economic growth in developing countries.

Apart from Government assistance, there is the recognized role of private investment in development. The United States has undertaken a number of initiatives to encourage American business to put money and know-how into developing areas, ranging from investment guaranties to preferential tax treatment. Legislation now is pending in the United States that would further assist borrowing by developing nations, and President Johnson has proposed a new special tax credit for investment undertaken by American companies in these nations.

How much private investment actually flows to developing countries depends to a large degree on what these countries do to attract that capital. With capital demands rising throughout the world and investment funds limited in quantity, the flow is bound to be affected by the policies and economic opportunities offered by developing nations. When these various aspects of the development picture are viewed as a whole, it is evident that solving the problems of economic progress depends greatly on the effective use of practical instruments in the related fields of trade and aid. The United States is making it clear at UNCTAD, as it has on other occasions, that it will continue to seek solutions which offer the soundest promise for raising living standards and achieving development goals.

PL 480 Funds to Rescue Again?

By Our Special Correspondent

NEW DELHI:

THE PL 480 counterpart funds may be utilised for underwriting capital issues of new Indo-US collaboration ventures. A proposal to this effect is understood to have been mooted during the last week's visit of the US industrial and business magnates to New Delhi. The idea, however, is still at the discussion stage. The approval of the US Congress may have to be obtained for it.

The scheme envisages creation of a Trust out of the PL 480 funds accumulated here. The Trust will undertake to provide rupee resources for any new Indo-US industrial venture, to the extent required, through participation in its share capital. But this participation will not be of a permanent nature. The Trust's holdings will be available for subscription by Indian nationals. With the Indian public taking up the share of the Trust in an enterprise, the Trust will withdraw from the scene completely. This mechanism, it is thought, will help in mitigating the rigours of the rupee finance shortage that India is facing today. With rupee funds thus assured, the flow of US private investments into this country is expressed to receive a fillip.

In case the above proposal fails to receive support either from the US Administration or from the Government of India, another scheme has also been suggested for overcoming the hurdle of rupee capital for the new Indo-US collaboration ventures. Under this plan, the collaborating US company may provide capital in dollars initially in excess of what it may be required to put in under the collaboration arrangement approved by the Government of India. The excess capital will then be offered to the Indian public gradually for subscription. The US industrialists are understood to have appreciated the Government of India's point of view in allowing only minority share to foreign investors in industrial undertakings here. They have shown willingness to participate in India's industrial development on this basis.

Fruitful Talks

The US industrial and business magnates had had very fruitful talks with the Union Government officials during their stay here and were impressed by the efforts being made to attract foreign private capital. They found India a good market for investment in view of the political stability obtainable in the country, the functioning of a "well-groomed" democratic government and the consumption opportunities offered by a population of 450 million. The ease with which Indian technicians have been learning new and complex techniques is also understood to have impressed the US industrialists. The members of the US delegation will be conveying the benefits of their discussions with the Indian officials to a comprehensive industry group in New York some time next month.

The US industrialists and business men, however, are said to have pinpointed three hurdles in the way of increased flow of foreign private capital to India. While appreciating the efforts being made to simplify licensing procedures in the light of the Swaminathan Committee's report, they are understood to have impressed upon the Union Government the desirability of doing away all the unnecessary and cumbersome controls and regulations. The recent decontrol of prices of 16 commodities was hailed by them and in this measure they saw a healthy trend of thinking in the official circles.

The second point said to have been stressed by the US delegation was the desirability of India following a reasonably long-period taxation policy. Too frequent changes in the tax structure and giving of retrospective effect to taxation measures, they are understood to have opined, would scare away the foreign investor. The third point to which they attached great importance was the tax reliefs given to foreign technicians for only a period of three years. This period of time was considered by them too short. They urged the Finance Minister to take a broad view of the matter as training of Indians for complex jobs could take as many as five to eight years.

The one concrete result of the US business men's visit has been the finalisation of the collaboration agreement between EID Parry Ltd., Madras, and the California Chemical Company and International Minerals and Chemicals Corporation of the United States on setting up the Rs. 32.5 crores Vishakhapatnam fertilizer plant, capable of producing 365,000 tonnes of complex fertilizers and 16,500 tonnes of prilled urea per annum. Negotiations were also held for a number of other undertakings. Agreements in regard to these are expected to be announced within the next few weeks.

The US industrialists evinced interest in collaborating in such vital industries as heavy machinery, tool-making, chemicals, fertilizers, electricals and electronics. They also showed inclination for starting processing industries in partnership with Indians for boosting exports

★★

In view of the fact that development of agriculture occupies a pivotal position in determining the tempo of industrialisation, expansion of employment opportunities, growth of exports, accumulation of savings and capital formation in this country, the Planning Commission's Working Group on Agriculture is understood to have called for a minimum growth rate of 5 per cent per annum in this sector during the fourth Plan period. This implies a substantial stepping up of efforts, as the rate of agricultural growth during the past 12 years has been of the order of only 3.5 per cent per annum. The Group is said to be of the view that a growth rate of 5 per cent is not out of reach and should be possible of achievement in view of the fairly high techno-economic potential already created.

The Working Group, it is further learnt, has emphasised the need for making the village, block and district agricultural plans a reality and has strongly urged preparation of area plans for at least one district in each State to begin with. It has suggested that the State Governments may be advised to draw up their fourth Plan agricultural programmes keeping in view a 5 per cent per annum rate of growth. If there is any likelihood of a shortfall in this regard, they should consider special measures

The Group had estimated that for achieving the suggested target, a provision of approximately Rs. 2,750 crores will have to be made for agricultural development programmes in the fourth Plan, as against Rs. 659 crores provided under the third Plan. The outlay on the major programmes may have to be of the following order: (i) minor irrigation Rs. 460 crores; (ii) soil conservation Rs. 275 crores; (iii) manures and fertilizers Rs. 490 crores; (iv) plant protection Rs. 127 crores; (v) agricultural implements Rs. 220 crores; (vi) animal husbandry Rs. 157 crores; and (vii) forestry Rs. 137 crores. The foreign exchange component in the overall Rs. 2,750 crore cultay is estimated at approximately Rs. 300 crores — nearly double the foreign exchange component of the third Plan agricultural development schemes.

The Group is also said to have made some tentative estimates of the material inputs required for a 5 per cent annual agricultural growth and is understood to have suggested that these will have to be of the following order: nitrogenous fertilizers 1.5 to 2 million tonnes (N); phosphatic fertilisers 0.7 to 1 million tonnes; potash fertilisers 0.35 million tonnes; pesticides 0.2 million tonnes; tractors 150,000 nos; power tillers 500,000 nos; steel and steel products 0.42 million tonnes and 3.6 million sq. ft. of tubular trusses; coal 2.5 million tonnes; and cement 5 million tonnes.

Although in terms of financial outlay, the agricultural development plan suggested by it is obviously an ambitious proposition, the Group is stated to have expressed the view that only minor modifications need be made in it. If there is a shortfall in the overall resources for the next Plan, it should be reflected in the development programmes of the other sectors of the economy.

The suggestions of the Working Group are understood to have been discussed at a meeting of the Planning Commission and Food & Agriculture Ministry officials last week-end. No firm decisions, however, are said to have emerged from this meeting.

★★

New Delhi welcomed last week the US Secretary of Agriculture, Mr. Orville L. Freeman. Though Mr. Freeman's visit is in connection with a conference being held here, of the US officials on agricultural development in South-East Asia, a great deal of significance is attached to this trip of his at the present juncture when India is passing through a difficult period on the food front. The Union Government, it is understood, will be having discussions with Mr. Freeman on extending the 1960 PL 480 Agreement for the supply of 15 million tonnes of wheat and one million tonnes of rice to India for about a year so that these supplies are completed. Discussions are likely to be held on the request India made recently to the US Administration for making available to this country another approximately 10 million tonnes of foodgrains under PL 480 during the fourth Plan period

During his stay in India, the US Secretary for Agriculture will be inspecting two Indian agricultural development districts — one in the rice zone and the other in wheat-growing area — which are receiving assistance from the Ford Foundation. He will also visit Calcutta to inspect port facilities there for receipt of US foodgrains under the Food-for-Peace Programme. Mr. Freeman will return to Washington on April 25.

★★

The Minister for Railways, Mr. H. C. Dassappa, announced at a Press Conference here last week the decision of the Railway Board to link Kandla port with Jhund by a 233-km. long broad gauge railway line. The project is estimated to cost Rs. 14.5 crores and is expected to be completed in about four years i.e., by 1967-68.

Jhund being on the Ahmedabad — Viramgam broad gauge section, the new line, passing through Dharangadhra, Halvad and Malia, will facilitate diversion of traffic to Kandla port instead of Bombay. It will aso help in making the proposed Free Trade Zone at Kandla a success.

The construction of the Jhund-Kandla broad gauge line will be an engineering feat as it will be passing through the Rann of Kutch, an area subjected to tides from the sea. A 10-km. causway and a 1000-metre long bridge is proposed to be constructed over the Rann of Kutch.

Overcrowding Problem

With a view to reducing over-crowding on railways, the Railway Board has also decided to introduce between June and October next, six new passenger trains. These are:

(1) An express train between Lucknow and Gauhati, expected to be introduced form August 15 to coincide with the commissioning of the Nunmati — Siliguri oil products pipeline;

(2) A broad-gauge express between New Delhi and Barauni to be introduced from October 1;

(3) Conversion from October 1, 1964, of the bi-weekly Southern Express between New Delhi and Madras, introduced from April 1 this year, into an express running on five days in a week. With the Air-Conditioned Express on the other two days, there will, thus, be an additional express train between New Delhi and Madras every day, besides the GT and the Janta Express trains;

(4) A passenger train between Tatanagar and Kharagpur —likely to be introduced from August 15;

(5) A passenger train between Bangalore and Erode from October 1 (This train may later on be extended either to Tirchi or Cochin);

(6) An additional passenger train from October 1 between Quilon and Ernakulam.

The direct broad gauge service from Delhi to Barauni will provide a connection to the metre-gauge Assam Express.

Another significant event that has taken place on our railway system during the past week has been the opening of the 160-km. broad gauge rail link between Churk and Garwah on April 19 by the Vice-President, Dr. Zakir Hussain. Constructed at a cost of Rs. 21.33 crores, this line opens up the undeveloped but mineral-rich areas of U.P. and Bihar. This line also provides an alternative route for movement of coal and other traffic from East India to western, central and northern parts of the country, avoiding the Mughalsarai bottleneck.

★★

The heavy engineering complex being built at Ranchi is now expected to cost much more than envisaged in the detailed project reports of its three units, the Foundry-Forge, Heavy Machine Building and Heavy Machine Tools plants.

According to the estimates prepared by the Union Department of Heavy Engineering in October last, the cost of the Foundry/Forge Project is likely to go up from Rs. 46.60 crores for the first and the second stages of this project and Rs. 15.06 crores for the first phase of its third stage to Rs. 74.75 crores and Rs. 18.75 crores, respectively. The cost of setting up the Heavy Machine Building Plant is expected to go up from Rs. 28.15 crores to Rs. 39.30 crores. The Heavy Machine Tools Plant may now cost nearly Rs. 6.25 crores more than the original estimate of Rs. 18.55 crores.

The official circles attribute the upward revision in the cost estimates of the three plants to various reasons primarily to the cost of some items not originally included in the detailed project reports of these schemes. The new items of cost are stated to be: (1) outside net-work of water works, drainage, sewerage, electric supply, railway siding and motor roads;

(2) construction of temporary storage sheds and other installations for construction purposes; (3) fees payable for the preparation of project reports, for the erection, supervision and establishment of the works as well as for consultancy and technical services to be provided by the foreign collaborators for progressive raising of production; (4) salaries, travelling allowances and other expenses of the suppliers' specialists, etc.; (5) salaries and expenditure of staff sent on deputation to the collaborating countries; (6) expendiure on training of staff and workers in India and abroad; (7) preliminary expenditure in connection with the project planning staff and establishment charges of the staff employed on civil construction and other erection work; and (8) increase in customs duties, railway freight, port clearing charges and the cost of storage and handling of materials. There has also been an increase in construction costs due to such factors as strengthening of the foundation soil in the case of the Foundry/Forge Project and the going up of the prices of structurals and other building materials. An extra expenditure of Rs. 6.27 crores is also being incurred on the Foundry/Forge Plant due to setting up of a 6,090-ton press not originally provided in the detailed project report. An expenditure of Rs. 12 crores is also to be incurred for providing some common charges for the three projects. These charges include salaries of staff at headquarters, expenditure on the training institute, construction equipment, temporary housing and other such items.

★★

Inaugurating the fourth annual conference of the All-India Bank Employees' Federation here this week, the Union Minister for Labour and Employment, Mr. D. Sanjivayya, opined that constitution of a wage board for the banking industry was not necessary at this stage. The continuation of the existing award, he added, would provide relief consistent with stability. On the question of amendment of the Industrial Disputes Act, Mr. Sanjivayya said he did not think it proper to proceed in the matter without a tripartite discussion at the national level. He further added that the forthcoming Labour Secretaries' Conference would consider rectification of the errors in the cost of living index. The Chairman of the Bank Employees Federation, Mr. C. L. Dudhia, in his presidential address, called for the appointment of a wage board for the banking industry, including the Reserve Bank and the State Bank, grant of an interim relief in the shape of 25 per cent increase in the emoluments of the bank employees and appointment of an expert committee to suggest suitable methods to rectify the present system of compiling consumer price index. The former Union Minister for Labour, Mr. Khandubhai Desai, also addressed the conference and urged the Government to accept the majority recommendations of the Bonus Commission.

Maharashtra Lags in Road Construction

From Our Correspondent

BOMBAY

THE INDUSTRIAL complex of Maharashtra and the fast pace of development in certain sectors of industry do not hide the inadequacies in the building up of the economic overheads, particularly evident in transport and communications. The transport and communications problem in the State is not limited to the increase in the overall road milage but also to the removal of the regional imbalances which are very prominent. According to Mr. S. B. Chavan, Minister for Buildings and Communication, the State had achieved only 50 per cent of the road construction target, as envisaged under the Nagpur plan, while many other States had not only accomplished the target of this plan but had even projected the targets for the 1961-81 period. If Maharashtra had to achieve the 1961-81 plan targets, the rate of construction would have to be stepped up to 2,000 miles a year on an average during the next 20 years. The cost of the programme would be roughly Rs. 500 crores. The Minister observed that provision of Rs. 75 crores, Rs. 150 crores and Rs. 250 crores would have to be made in the next three five-year plans for the purpose. But, unfortunately, the paucity of funds, machinery and technical staff were the three major impediments in the construction of roads in the State. While efforts were being made to overcome these bottlenecks by manufacturing some machinery indigenously, the position would require a more concerted drive to augument the resources and find the equipment necessary for increasing the pace of development in transport.

It was admitted that the conditions of the national highways in the State were far from satisfactory, particularly on the Bombay-Poona and Bombay-Nasik sections, on account of heavy traffic. It is again significant to note that the recommendation of the sub-committee headed by Dr. Rafiq Zakaria, State Minister for Urban Development, for the widening and asphalting of these highways could not be implemented because of financial stringency. In order to increase the allocation of funds for road construction in the fourth Plan period to an appreciable extent, the question of increasing the share of duty on petrol and diesel was being taken up with the Union Government. In the third Plan, there was provision of Rs. 26.5 crores for roads against the demand of Rs. 40 crores. Two-thirds of this provision was utilised for mostly spill-over works and only a little over Rs. 5 crores were available for new roads. At this rate, it would be very difficult to implement the programme of expansion of the transport system in the State.

★★

Dr. Otto Schiller, Head of the Department of Agricultural Economics at the South-East Asia Institute of Heidelberg University, stated in Bombay that the food situation in India was so depressing that something had to be done about it. The food deficit is growing, not diminishing, and will continue to grow until 1980. While expressing himself strongly against depending upon imports from the USA to cover the deficit, he emphasised that if we desired to avoid the catastrophe of hunger, we should direct our energies to finding other sources for agricultural production. The solution lay in adopting improved methods of farming to increase productivity so that the country might satisfy its requirements through its own efforts. In this context, he referred to the new approach in extension services which had been made in Bhiwandi and Manjri in the State which had increased production by 50 per cent and would double it in two years. Perhaps, Dr. Otto Schiller was not aware that in the Maharashtra State, as in other States, the experimental programmes which are a success, are only isolated examples and are not spread out so as to make an impression on the whole agricultural supply position.

In regard to means of increasing agricultural production, he suggested that for India the basic idea of co-operative farming was right, because the country had too many holdings — about 60 million — and the people were illiterate. But he was careful enough to draw a distinction between two kinds of co-operative farms — those in which there was joint use of land and those in which there was individual use of land though in both farming was through co-operative effort. Even in Russia, individual farms had given much better results than the collective farms. In Israel, the collective farm, the Kibutz, had worked very well because of the special conditions that

obtained there. The spirit of co-operation was stronger there but, it was his view, that even in Israel, collective farming would not work on a permanent basis. Already, there had been a tendency for a decline in the enthusiasm for the organisation of collective farms.

While the views of Dr. Otto Schiller reveal the need for an enthusiastic drive for increasing food production, the uncertainty and the state of tension that prevail in the matter of distribution arrangements arising from the new licensing order would seem to call for a quick decision so as to avoid any distortion of the already precarious food supply position. This would particularly affect States like Maharashtra and Gujarat. In the tug-of-war between the organisations representing the dealers in foodgrains and the Government, the future of the consumer seems to have been ignored. However, there seems to be a ray of hope that both the parties would work out the new licensing order in the spirit of fair trial. Mr. V. Sankar, Secretary of the Union Ministry of Food and Agriculture, who was here, had discussions with trade representatives and impressed on the trade that they should not create a deadlock by adopting a rigid attitude towards the measure which aims at providing the needs of the consumers at reasonable prices. He assured the trade that no harassment would be meted out to the business community as a result of the licensing order. The enforcement staff would resort to prosecution only after consultation with the State authorities. By exempting the retailers from the obligation of submitting the quarterly returns about stocks, sales and purchases, a large section of the trade will not be affected by the order. He also said that regarding the requirements of security deposits, the States have been asked to make suitable changes in the provision.

In this connection, it is also necessary to note how even factors external to the sphere of agriculture and trade could affect the supply position. Mr. V. Sankar was correct in pointing out that the go-slow tactics adopted by the workers in the Bombay Docks were a major cause for congestion in the docks where huge quantities of foodgrains and fertilisers were still awaiting clearance. Meanwhile, there was also the strike of the matadi workers in one of the biggest Government grain depots which affected again the movement of foodgrains.

★★

With the completion of the Rs. 3.6 crore Trombay plant for the production of plutonium next month, India will rank as the sixth country in the world in the utilisation of atomic energy. The plant will be commissioned into full production in July, 1964, according to Dr. H. J. Bhabha, Chairman of the Atomic Energy Commission. At a press conference, Dr. Bhabha said that the Trombay plant had been set up with the help of indigenous talent. In a workshop at the plant site, equipment worth Rs. 50 lakhs was fabricated for the 'Project Phoenix'. The purpose of this project was to treat waste fuel elements from atomic reactors, 'to separate the highly radioactive fission products and to extract plutonium, an extremely valuable fissionable material and atomic fuel for future reactors. The plant was one of the advanced type of chemical plants, using the latest techniques in chemical technology and had several unusual features. All operations were controlled and monitored pneumatically from an operating gallery.

★★

The non-ferrous re-rolling industry has a vast export potential and has been playing an important role in the industrial expansion of the country. But, according to Mr. S. P. Khaitan, the outgoing president of the Western India Sheet Rollers' Association, 48 per cent of the capacity of the industry remained idle for want of raw materials. The existing installed capacity of about 54,000 tons was, however, sufficient for meeting the increased requirements of the country for many years to come. The capacity, if fully utilised, could therefore contribute to the increase in exports which were so vitally necessary. This was disclosed at the 15th annual general meeting of the association which was inaugurated by Maharastra's Minister for Industry. The difficulties faced by the industry were also reviewed at the meeting. Among these, the imports under the DLF loan programme from the US posed a problem for the industry. In the last three months, it appears no offering was forthcoming from the US producers. Besides, the rates quoted were high and the dealers required a long time for deliveries. Higher prices meant reduced quantities of metals for the industry which is granted licences on the basis of value. The imports at such high costs also resulted in considerable loss to the nation. Above all, the shortage of raw materials, was responsible for the shortage of non-ferrous semi-manufactures, whose demand was expanding fast with the increased industrial activity. The Minister disclosed on the occasion that the stage was set for the early launching of the Koyna and Sharavathy aluminium projects in the State and called upon the industry to increase its export earnings.

Shareholding Habit Penalised

From Our Correspondent

CALCUTTA:

MR. T. T. KRISHNAMACHARI's reply to the Budget debate confirmed what his critics had suspected in him — a certain animus against the stock exchange. Referring to the current depression in the stock markets, the Finance Minister is reported to have said that "on a closer examination one would find that the quotations in the share market did not represent the reality. While the share market may provide one of the indicators, it is by no means a reliable indicator of the prevailing economic trends in the country". This statement was made with reference to the tax on dividends and on bonus shares as a form of capital gain, both of which Mr. Krishnamachari is unwilling to withdraw, although he tried to convince the House that the latter tax is not as pernicious in principle as it had been made out. But because of his prejudiced view of the role of the stock exchange in India's developing economy, the Finance Minister apparently did not keep himself correctly informed as to the way share values had crashed in the stock exchange or if he did, he conveniently chose to disregard it.

On the Calcutta stock market alone, investors have lost as much as Rs. 20 crores since the Budget day of 28th February, 1964. According to the figures compiled by the stock exchange authorities, the order of losses in different classes of shares belonging to the 122 companies or so which have been listed is as given in table on p. 984.

It may suit Mr. Krishnamachari's purpose to minimise the importance of the stock exchange, but as he himself has so often said that the private sector industry still accounts for 90 per cent of the country's production. If this sector is to function as a living and dynamic force, it will surely have to rely on institutions like the stock exchange to find its capital. If Mr. Krishnamachari is anxious that the shareholding habit should spread among individual savers, there is hardly any other way in which this can be done. The Unit Trust alone cannot serve the whole purpose. All talks of socialism notwithstanding, the supreme need of the country today is to increase production. The private sector is in a position to deliver the goods much better than the public sector of industry which it has been the purpose of the Government of India to boost.

at the cost of private enterprise. It would be very enlightening for the people of India to know what the performance of the public sector has been like. Quoting again from a reliable source, 46 public sector companies accounting for a total investment of Rs. 1,090 crores showed a loss of Rs. 10.60 crores in 1961-62. It is unlikely that by and large public sector undertakings will attain the efficiency of private business organisations in the near future unless a magician takes charge of them. In the circumstances, the private sector will have to remain the mainspring of economic growth, which it has been all these years.

In 1963, India's jute industry — one of the major industries in eastern India — had a very successful year. With a total production of 1.3 million tons and an export of 9 lakh tons of goods, both records, it earned Rs. 160 crores of foreign exchange, that is, Rs. 5 crores more than in the previous year. The industry has been able to achieve its third Plan targets of jute goods and fibre production a year ahead of schedule, besides ensuring a minimum price to the grower throughout. Mr. C. L. Joneja, Jute Commissioner, entertains an optimistic belief about the current year's jute crop; it may rise to 8 million bales in the 1964-65 season from 7.5 million bales in the current crop year. The Jute Commissioner's optimism is based on the fact that the grower is satisfied with the price he has got — the market quotation often went beyond the prescribed minimum of Rs. 30 — and, therefore, feels enthused about producing a good crop in the next season too. In fact, sowing has started in many areas where there has been some rain. There has been some pressure to revise the minimum price upwards, but Mr. Joneja has firmly opposed the move. In his view, the minimum price of Rs. 30 a maund is a fair one. Moreover, there is the competition from Pakistan to reckon with. In that country, raw jute sells at Rs. 20 a maund. The Indian jute industry has not opposed the minimum price fixed for raw jute; in fact, it has at times paid more for it, but some of them have complained about the Jute Commissioner's quota system. Under this system they have to lift the quota fixed by the Commissioner irrespective of their actual requirements, and some are carrying excess stocks involving extra storage charges and other costs. But the authorities apparently are not inclined to revise the quota system for they feel that it has been working fairly satisfactorily.

★★

The strategy of industrial development followed by Bihar is different from other States, most of whom appear to have entered a contest for attracting large industries, irrespective of whether or not all the economic criteria exist. As recently outlined by the Chief Minister, Mr. K. B. Sahay, the State Government's industrial policy consists essentially in creating facilities for industrial growth more than setting up its own industrial units. With this end in view, areas are being developed near Jamshedpur (Adityapur), Ranchi, Bokaro and Barauni for the growth of anciliary industrial complexes. The area development programme includes town planning, power and water supply facilities and proper communication. The areas selected are all located around the sites, where large-scale industries are coming up in anticipation of the petro-chemical and metallurgical ancillaries.

State Ventures

Within this policy framework, the State Government itself has set up some industries, mostly of the small and medium varieties. It is setting up a creamery in Barauni. A high tension-insulation factory has already been established in Ranchi. It is also expanding the production capacity of its super-phosphate factory in Sindri. A spinning mill, with 12,000 spindles is coming up in the co-operative sector, in which the State Government owns one-third of the share capital. In the second five-year Plan, Bihar invested 30.51 per cent of its total plan in industries, transport and communications. In the third Plan, the proportion has been stepped up to 31.47 per cent. Heavy industries have been more or less confined to Central Government projects. The Sindri fertiliser factory, the Barauni oil refinery, the heavy machine building and foundry forge plants, the heavy machine tool factory and others are all Central Government undertakings. In the second Plan period, the Centre invested about Rs. 10 crores in Bihar and in the third Plan, over Rs. 15 crores of Central funds have been invested. Industrial progress has been reinforced by expansion in the private sector. Both T.I.S.C.O. and T.E.L.C.O. have taken steps to expand their production further. Most of the sugar and refractory units have also expanded. A big paper factory (in addition to the existing one) and five small ones are being installed

Even with all this activity, Bihar's economy remains overwhelmingly agricultural and, therefore, stagnant. A breakthrough will be possible with faster industrialisation, which in turn depends on an adequate supply of power — the only limiting factor at present. Bihar is trying to catch up with the arrears in this respect, but such things are inevitably time-consuming. At the end of the first Plan, the total installed capacity of power in Bihar rose to 491 MW (from nearly half this figure at the beginning) largely because of the D.V.C. and expansion of State-owned and private sector units. At the end of the second Plan, the total installed capacity of power rose to 788 MW. The target for the third Plan, is 1,338 MW, but the projects have been delayed for one reason or another with the result that there is now a shortage of power in the State. Only when the 400,000 MW Pathratu power station is commissioned, will the State's power shortage be appreciably eased.

★★

In common with Bihar, West Bengal and Assam, Orissa too is experiencing power shortage. A power-load survey recently carried out by the State Government shows that as against a likely demand of 614 MW by the end of the third Plan the availability from all sources has been estimated at 555.5 MW. This shortage is likely to be aggravated by the end of the fourth Plan when demand may rise to 1,280 MW as against an estimated supply of 915.5 MW. This estimate is based on the State's industrial development plans, which are ambitious. Even to rehabilitate the refugees from East Pakistan, the Government of Orissa proposes to start industries in its Koraput district close to Dandakaranya. It is expecting Rs. 34 crores from the Centre as a loan for this purpose. To utilise this sum, the State Industrial Development Corporation plans to set up a cement plant, a paper plant and a pig iron plant, all in the Koraput district. These industries will be based on local raw materials and will have the following production capacities: paper plant 150 tons per day, based on locally available rice straw and bamboo; the pig iron plant 350 tons per day, that is larger than the Barbil plant which the Corporation acquired some time ago from Mr. Patnaik. The State Government maintains that limestone deposits in Koraput are so vast that it will be possible to install a large-sized cement plant.

"Reliefs" Create No Sense of Relief

From our Correspondent

MADRAS:

THE 'CONCESSIONS' announced by Mr. T. T. Krishnamachri in Parliament a few days back have fallen considerably below the expectations of industrialists, operators and investors in the stock markets. Even though Mr. T. T. Krishnamachari had repeatedly stated that there would be no major changes in his budget proposals and that there would be only marginal adjustments, there were fond hopes that the proposals relating to the taxation of capital gains, accruing notionally on the issue of bonus shares by companies, and the dividend tax would be considerably modified. It was also expected that the annuity scheme might be revised while the severity of the estate duties and gift taxes would be minimised. These expectations have not proved correct and most of the proposals are intact. In the tax on capital gains on bonus shares there is some modification but the anomaly in regard to the determination of capital gains has not been eliminated and a new concept has been introduced which might have dangerous implications.

It is difficult to understand how the fair market value of bonus shares can be treated as "capital gains" at the hands of the shareholders while a minimum rate of 15 per cent would be levied when the total "capital gains" is in excess of Rs. 5,000. Some satisfaction has been exhibited over the exclusion of bonus shares issued out of premium reserves both for purposes of taxation at the company's end and for "capital gains". But it is only fair that this decision was taken because the return on capital in the form of scrip cannot by any stretch of imagination be considered as an additional receipt.

Indefinite View

The operators in the Madras market were unable to take any definite view as the reactions of the Bombay and Calcutta markets were not quite clear. But it was apprehended that genuine investors might not be attracted to the market until there was a definite indication that prices would stage a smart recovery and normal trading would be possible. The announcement of the rebates in respect of income-tax and super profits tax to some more industries would be helpful as a number of scrips traded on the Madras Stock Exchange would benefit by their inclusion in the list of eligible industries. Aluminium industries particularly will derive considerable relief on account of the reduced incidence of the Surtax on profits and the rebate in respect of corporate taxes as belonging to the special group of industries. Many units manufacturing electrical goods will also be benefited while it was noted that the dropping of the rubber and coffee industries from this list was made after it was realised that the earlier inclusion gave rise to wrong impression. These two industries will not benefit in any way by the rebate in corporate taxes as their incomes are wholly agricultural in character.

The mill-owners in this part of the country are happy that the Finance Minister has recognised the hardship caused to the handloom weavers and small powerlooms by the adjustments in the duties on yarn. As a result of the various representations made by the Government, following the announcement of the budget proposals, it has now been decided to exempt yarns in hanks up to 29 counts while the rate will be reduced on other varieties. As the handlooms weavers and small powerloom owners were adversely affected by the high rates of excise duty, the latest move is welcomed. There are reports that the offtake of cloth has been quite satisfactory. Yarn sales can be expected to pick up appreciably.

Capital Issues

It is feared, however, that without an appreciable recovery in prices for industrial securities and a more active capital market, many capital issues, which are yet to be launched, cannot be made very successful. Coramandel Fertilizers Limited will be approaching the market shortly for raising a portion of its equity capital from the outside public. This issue has, no doubt, been underwritten by the statutory corporations but having regard to the large size of the issue and the present state of the capital market, it is felt that the response may not be such as to result in even a reasonable over-subscription as public issue. As already indicated, the company will be erecting a large-sized fertiliser unit for producing compound fertilizers at Visakhapatnam in Andhra Pradesh in conjection with American interests. The company has received substantial assistance from the U.S. Export-Import Bank and the U.S. Agency for International Development. The American participating interests will also be taking up a large parcel and the total cost of the project will be Rs. 32 crores.

There will also be another large-sized issue of a big company which will be undertaking the manufacture of polysterene, styrene monomer, and polymers of various kinds based on alcohol. This company will be having its factory at Visakhapatnam which is now growing into a big industrial complex. The Rs. 6-crore project is being sponsored by influential Bombay interests. The promoters will see to it that the new company is provided with the required funds. It would, however, be helpful if the public can be made to take interest in a big way though conditions in the capital market are not quite propitious. There are some other new issues which are pending flotation.

In view of the special interest taken by the Madras, Andhra Pradesh and Mysore State Governments in promoting new industries, entrepreneurs have been thinking of establishing a number of paper and cement units. Efforts are being made to exploit limestone reserves in Rameswaram Island and the promoters of Madras Cements might soon be establishing a new cement factory as an entirely independent unit in Rameswaram Island itself. The sponsors have already acquired the necessary land and secured the lease of limestone deposits over a large area. If the negotiations for the purchase of machinery are satisfactorily concluded, the new company can be expected to come on the market for raising capital after some time. In regard to the promotion of paper mills, it is reliably understood that one unit having a capacity of 100 tons daily will be constructed at Bodhan in Andhra Pradesh. The bagasse supplied by the existing sugar mills will be the

basic raw material. This scheme has been under contemplation for some time and it is only now that it is assuming concrete shape. The other paper mill will be located in Mysore and the intention would seem to be to attempt to manufacture newsprint based on unconventional raw materials. It is somehow confidently felt that newsprint of acceptable quality can be produced from available resources as the technique relating to the preparation of pulp has been considerably improved recently and the yield would be very much higher. If these two paper mills can be brought into being, there will be a substantial increase in the output of paper and boards in the next few years, especially as it is also proposed to expand in a big way the paper mill near Rajahmundry in Andhra Pradesh.

★★

The find of lignite of quality even better than the reserves in Neyveli. near Karaikudi in Madras State, has given rise to the expectations that the State Government might make an effort to exploit vigorously the new mineral reserves. There is a sense of urgency because the State Government is anxious to establish a thermal station in this area and use lignite for the purpose. The experiences gained in Neyveli in mining lignite should prove to be quite helpful. It is not known, however, what exactly are reserves that could be commercially exploited though there are indications to the effect that fairly large quantities exist at depths which may not present any serious problem. If the new reserve of lignite can be effectively used, the problem of power development in the next few years may not prove to be a major headache.

★★

The sad demise of Mr. Anantharamakrishnan, a reputed industrialist of Madras State, came as a shock to everyone even though it had been known that he was seriously ill for sometime past. The unobtrusive and brilliant industrialist had been responsible for the development of numerous industries and it is a great loss, as Mr. R. Venkatarakan, Industries Minister pointed out, to Madras State, indeed, to the whole country. The cruel hand of death snatched away Mr. Anantharamakrishnan at the fairly early age of 59. His ripe wisdom and experience could have been utilised in many ways for developing further the economy of this region. In fact, he had many schemes on the anvil and it had been programmed that nearly every unit in the group would expand in a big way. Apart from the manufacture of diesel engines which are supplied as original equipment to truck producers in Bombay and Calcutta, there was a proposal to undertake the manufacture of truck chassis in collaboration with foreign interests. The production of automobile components of different kinds is also being regularly increased while the manufacture of medium-sized tractors in collaboration with Canadian interests has made good progress. As the Amalgamations Group of Indusries headed by Simpson, is owned by a small group, it is now apprehended that the heavy estate duties will have a soaking effect on the wealth of the late Mr. Anantharamakrishnan. It is not known what exactly will be the net liability under the revised arrangement but reliable reports suggest that the incidence of the new estate duties will be very heavy and that it might be difficult to preserve the same character of ownership of shareholdings. It remains to be seen how the new problems will be tackled. The new developments may also provide some food for thought to the Union Finance Minister. As the phenomenal growth of the Simpson group has been due to the dazzling personality of a great philanthropist and industrialist, it should not happen that the smooth conduct of flourishing and important industries should be rudely disturbed by egalitarian policies especially where industrialists have pursued honest practices and taken spacial pride in creating living monuments.

The moving finger writes

ADDRESSING a meeting of the Congress Parliamentary Party, the Prime Minister reportedly enumerated three knotty problems facing the country. They were, according to him, Kashmir, the influx of refugees from East Pakistan and the slow rate of economic growth. Others perhaps might state the position somewhat differently. It could be suggested, for instance, that the three knotty problems which the country faces really are: a Prime Minister who no longer seems to know his own mind on Kashmir, a Government which is capable neither of telling the Hindus of East Bengal firmly that their place is in Pakistan nor of recognizing the implications of and formulating a policy for a mass influx of the victims of religious persecution into this country, and a Finance Minister who lectures on economic growthmanship while budgeting for economic stagnation.

★★

Mr. Nanda, I see, is still sticking to his old time-limit of two years for the ending of corruption in the Administration. That he should continue to maintain this posture even after the Santhanam Committee's report is certainly most impressive. Our admiration, however, cannot be unqualified. If Mr. Nanda means business, he must surely give up talking of corruption as if it were only a weakness of government officials or a vice of the business community. The Santhanam report has squarely demanded of the ruling party that it puts its own house in order. I should like to know what Mr. Nanda proposes to do about it. I am yet to learn that the Congress leadership plans to take note of what the report has to say about Ministers or Members of Parliament. As the Congress leader, who has most fully identified himself with the campaign against corruption, Mr. Nanda surely ought to have taken the initiative in this respect. Instead, all that he seems to have done so far is to ask a committee of secretaries headed by the Cabinet Secretary to process the recommendations of the Santhanam Report in so far as they relate to corruption in the public services. Since Mr. S. S. Khera is obviously not going to attempt to stir the hornet's nest of ministerial malpractices, it is obvious that the Home Minister's much-advertised enthusiasm for rooting out corruption in our public life is in fact highly selective and strictly limited.

★★

The Finance Minister has an engaging habit of making important pronouncements in the most casual manner possible. When, in the course of the discussion on the Finance Bill in the Lok Sabha, Mr. Masani suggested that the Government should permit estate duty to be paid in the form of shares or securities so that distress selling might be avoided, Mr. Krishnamachari promptly responded that he would consider the suggestion and might even set up a department of estates in the Finance Ministry for taking over and managing estate duty payments in kind. The notion of a department of estates, it appears, has been occupying the Finance Minister's mind for some time. It seems to be his view that, apart from the question of facilitating payments of estate duty in kind, such a department is needed for the larger task of the care, maintenance and management of government properties which are at present being looked after by the CPWD.

★★

The Finance Minister has complained that Ministers' residences are like pigsties. There is perhaps more truth in his description than he suspects. Mr. Krishnamachari, no doubt, was thinking only of the dampness, the aging and the rather old-fashioned construction of Ministers' bungalows. But apart from this there is also the fact that far too many of his colleagues just do not seem to care how well-kept or how ill-kept their residences are. I should not be expected to particularize, but I would venture so far as to say that there are ministerial residences within a stone's throw (or thereabouts) of the Central Secretariat which could be a disgrace to any well-bred pig. And this is a state of affairs for which the blame cannot, in fairness, be thrown on the parsimony of the tax-payer. My point is that there are quite a few Ministers who are either too busy or too ignorant to live properly. The Finance Minister, of course, is one of the rare exceptions. He has style, he has taste and he has the background, and it is no wonder, therefore, that wherever he happens to be for the time being, whether it is on Duplex Road, as it was some years ago, or at No. 3, Motilal Nehru Place, as at present, or in the Madras suburb of Tambaram, as it was in-between, he could always make a little money go a long way in creating an environment of gracious and refined living.

★★

Talking of pigsties or pigs, I am reminded of the occasion when I had the pleasure of making the acquaintance of one of the finest members of the swine species. That was on a farm in the State of Iowa which, in the United States, is known and celebrated for its hog-and-corn agricultural cycle. The pride of this farm was an extremely prolific mother-sow who had been so successfully house-broken that its quarters presented no sanitary problems at all. I myself was so impressed with the lady-like behaviour of this extremely hygienic animal that had I happened to have some pearls with me, I would have considered it a discourtesy to throw them before it — I should have put them around its neck.

★★

I have wondered occasionally what Professor Ranga is professor of. It cannot surely be the English language. According to a report in the 'Indian Express' of April 22, just before the Finance Bill was put to vote in the Lok Sabha, Mr. N. G. Ranga declared: "We shall see in 1967. We throw the gauntlet at the face of the Government". I could appreciate the vehemence of the Swatantra leader, but even so I must tell him that he ought really to have thrown the gauntlet at the feet of the Government and not at its face, however much he might dislike that part of the Government's anatomy.

★★

Talking of the use or the abuse of the English language, I was considerably amused by a recent item in the Press which described a birth-control pill as very "potent" stuff. Incidentally, this one was a pill with a difference, or rather two types of pills, both of which are reported to be in the experimental stage; and their special quality is that they are intended to be taken by men. They are reported to have the property of suspending the production of spermatozoa and their advantage over oral contraceptives for women is that, whereas in the case of the latter a pill has to be swallowed every day for 20 days, in the case of the new men's pills, a single dose is reported to have a fairly lasting effect.

V.B.

Trade Winds

FOODGRAINS LICENSING ORDER

THE UNION Minister of Food Mr. A. M. Thomas, in a statement in the Lok Sabha, firmly rejected the foodgrain dealers' demand for a drastic revision of the Foodgrain Licensing Order which, he said, was primarily aimed at checking a rise in prices.

The regulations relating to the foodgrains trade were devised from time to time with reference to such objectives as (i) the enforcement of a minimum or a maximum price; (ii) procurement by Government at notified rates; (iii) vigilance over stock position; (iv) regulation of margins and ensuring that the trade does not make excessive profits at the expense of the community and (v) reduction in the number of intermediaries between the producer and the consumer. The system of regulations has been in force since 1958 and, according to the needs of different situations, amendments to these regulations have been made from time to time. Anticipating the difficulties that might arise from the shortfall in production in 1962-63 and in view of the broad approach to the "emergency" (settled in consultation with the Federation of All-India Foodgrain Dealers' Association) certain modifications were made by the Central Ministry of Food and Agriculture which were communicated to the State Governments in January 1963. One of the modifications required furnishing of detailed information by the licensed wholesalers in respect of their transactions including costs and profits. Subsequently, certain State Governments promulgated orders regulating margins and requiring, 'inter alia', display of prices. The abnormal rise in the price of both rice and wheat towards the end of 1963, lack of attention paid by some State Governments to the recommended regulations and the difficulties that were encountered in the maintenance of prices at reasonable levels focussed attention on the need for a review of the licensing regulations to secure strict observance. Accordingly, a revised "model" form of licensing order was circulated to the State Governments in December 1963 and the question was considered at the Food Ministers' Conference in February 1964. The arrangement was that in the model form, the State Governments could make minor changes but if they made any major changes, they were required to consult the Union Food Ministry so as to ensure uniformity.

The Federation of the All-India Foodgrain Dealers' Association has been making representations to the Government on these regulations from time to time. The requirements of, and the reasons underlying the regulationss, including the original offer of the Federation to regulate margins, have been discussed between the Federation and the Government on various occasions. Besides the apprehension of harassment by the enforcement staff, the governing consideration with the Federation has been the difficulty in submitting the detailed information required by Government. Minor changes have been made by the State Governments in the regulations to meet the difficulties of local or general type and the Union Government has not raised any objection. Again, in view of the representations received from individual foodgrain dealers as well as from the Federation, the Central Food Ministry recently suggested certain alterations in the provisions of the licensing order; the more important were: (a) exclusion of retailers and commission agents from the purview of the licensing order; (b) permitting licensed wholesalers to sell foodgrains to (or purchase from) licensed wholesalers in States or in certain circumstances in markets within the State; (c) reduction in the amount of security deposit and complete exemption to small dealers from payment of security deposit and (d) extension of the time allowed for the submission of information every quarter about average prices of purchases and sales and details of average margin of profit.

The changes are acceptable to the Federation and the foodgrain dealers in general. But on the question of furnishing information about margins and the requirement of security deposit, the Federation and the trading interests in some States have been adamant despite the Government assurance that care would be taken to eliminate harassment.

According to the Food Minister's statement in the Lok Sabha, both the provisions were essential in the scheme of regulations and could not be given up without making the scheme ineffective and unsuitable for service to the community. He pointed out that the offer to regulate margins came from the Federation itself and if the Federation and the trade were not prepared to meet the logical consequences of these regulations, it could only mean that the offer was made with mental reservations. Certain sections of the trade, he said, had not denied themselves the opportunity of exploiting situations of difficulty to raise prices unduly and without any justification. Unless the Government had the necessary power to deal with such situations under the scheme of regulations, the evil would recur and persist to the detriment of the interests of the community at large.

PAPER AND PULP CONVENTION

Inaugurating the first convention of the Indian Pulp and Paper Technical Association in New Delhi this week, the Deputy Chairman of the Planning Commission, Mr. Asoka Mehta, made a pointed reference to the acute shortage of newsprint in the country and urged upon technologists to give top priority to finding of ways and means for stepping up newsprint production.

In his presidential address, Mr. V. Podder emphasised that the main problem of the industry was the acute shortage of raw materials, particularly forest products such as bamboo. He suggested that different varieties of bamboo should be planted in small and compact blocks to avoid simultaneous flowering and in the interest of reducing transport costs. He further recommended that the U.S. pattern of farmers growing bamboo and other trees as a cash crop like tobacco, coffee or sugarcane, should be followed in India.

Referring to the acute scarcity of trained personnel in the pulp and paper industry, Mr. Podder urged upon the Government to consider the introduction of a degree course in paper technology in university education. He also suggested that the Cellulose Section of the Forest Research Institute, Dehra Dun, should be converted into a National Institute for Pulp and Paper Technology and that the industry and the Government should co-operate in running it on modern lines. He revealed that with the help of the Swedish Government, a School of Paper Technology would be established at Saharanpur to train technicians for the paper industry.

In regard to spare parts requirements, Mr. Podder pointed out that the pulp and paper industry was at present allowed to import only Rs. 3.2 crores worth of spare parts, apart from Rs. one crore worth of wood pulp. Out of the former, Rs. one crore worth of raw materials were allowed to be imported by paper converters for producing special types of paper, films, foils, inks, waxes, etc. The industry was thus left with only Rs. 2.2 crores for importing felts, wires and other essential spare parts. This worked out to Rs. 40 per ton of production. Reduction in the import entitlements of the pulp and paper industry from Rs. 6.6 crores a few years ago when production amounted to only about 3,00,000 tons of paper and board to Rs. 4.2 crores when production has gone up to about 5.00,000 tons has created difficulties for the industry. Mr. Podder suggested that some relief should be given to the industry by allocating more foreign exchange. This is, he said, would pay handsomely.

FOUNDRYMEN'S CONVENTION

Inaugurating the three-day annual convention of the Institute of Indian Foundrymen at Chandigarh, the Union Minister of Steel, Mines and Heavy Engineering, Mr. C. Subramaniam, said that the 'craze' for foreign collaboration needed to be eliminated and that the country should become self-reliant in technical know-how. Regarding the time taken to set up new projects, he pointed out that in the Soviet Union the period for setting up a furnace had been reduced from two years to one year; in India this period should be reduced by at least six months if not one year. Referring to the demand for pig iron in the country, he stated that it was about two million tons while the production was only 1.2 million tons. The Chief Minister of Punjab, Mr. Partap Singh Kairon, pleaded with the Union Minister that his State's applications for licensing to start a coke oven plant, an alloy steel plant and a heavy electricals plant should be expedited. The Chief Minister also announced that the State Government will soon be signing a collaboration agreement with 'Davy Ashmore' — a British firm — for the setting up of a pig iron plant with 100,000 tons capacity.

In his presidential address, Dr. B. R. Nijhawan, Director of the National Metallurgical Laboratory, revealed that the Institute had decided to hold examinations on different aspects of foundry technology and to award diplomas to successful examinees. He added that with a view to introducing the latest techniques of manufacture, the Institute had decided to organise a short course in Operational Research in collaboration with the Productivity Centre, the Regional Labour Institute and the National Metallurgical Laboratory. Dr. Nijhawan also disclosed that the International Foundry Congress will meet in India for the first time in 1966.

L.I.C. HOUSING SCHEMES

Besides the "Own Your Home" Scheme announced at the beginning of the year, the LIC has now introduced two new schemes with a view to removing the acute shortage of houses for the middle classes in urban areas. Under the first scheme, loans ranging from Rs. 5 lakhs to Rs. 15 lakhs will be made available to public limited companies which have been working profitably for the last five years or more and can be considered to be approved in terms of Section 27A of the Insurance Act. The loans will be up to the value of 70 per cent of property in question and will be granted against first legal mortgage for a term of not more than 20 years provided the unexpired lease is 50 years or more. The interest rate will be 8 per cent subject to a rebate of one per cent for punctual payment.

The second scheme relates to the grant of loans to co-operative societies of employees of public limited companies for constructing houses. Such societies will admit only permanent employees to their membership. The loans will range from a minimum of Rs. 2½ lakhs to a maximum of Rs. 15 lakhs and will be granted for a period of not more than 15 years. The rate of interest under this scheme will be only 7½ per cent subject to a rebate of one per cent for punctual payment. Under this scheme it is required that the employees concerned must be covered under renewable one year temporary assurance during the period of the loan. The amount of insurance must, in the aggregate, be equal to the amount of the loan outstanding at the beginning of each year. Every member of the society must be insured for his proportionate share of the aggregate insurance.

U.S. COTTON FOR INDIA

An agreement for the supply of 367,000 Indian bales (equivalent to 300,000 US bales) of upland cotton under the US P.L. 480 programme was signed on April 17, 1964. Valued at Rs. 22 crores ($46.2 million), it will be shipped from the United States by June 30, 1964 and will help the Indian mills to increase their production and stabilise the prices of cotton goods. It will also help India to maintain a buffer stock. The agreement raises the total quantity of US cotton supplies under the P.L. 480 programme to 2.4 million Indian bales valued at Rs. 131 crores ($275 million). The eight P.L. 480 Agreements between India and the United States concluded since August, 1956, provide for the supply of wheat, cotton, maize, rice, sorghum and other agricultural commodities of the total value of Rs. 1183 crores ($2,485 million).

H.E.L. BIFURCATED

The Heavy Electricals factory at Bhopal has again started functioning after a shut-down which lasted 19 days. The Union Government has decided to bifurcate the Heavy Electricals Ltd. Mr. K. Mathulla of Hindustan Machine Tools has taken over the Chairmanship of the new company formed to run the Bhopal plant. Mr. K. B. Mathur will now look after the heavy electricals factories that are under construction at Hyderabad, Tiruchirapally and Hardwar. The decision of the Union Gvoernment to bifurcate HEL shows its concern regarding the lack of efficient management and supervision at the Bhopal factory. The plans are underway to shift the headquarters of the Bhopal project from New Delhi to Bhopal where Mr. Mathulla will stay in order to keep a vigilant eye on the progress of the plant.

STANDARDS FOR MULTIPURPOSE PROJECTS

Addressing the twelfth meeting of the Building Division Council of the Indian Standards Institution in New Delhi, Prof. M. S. Thacker, Member of the Planning Commission, said that the total outlay in the fourth five-year Plan was likely to be double of that in the third Plan, and that out of the proposed outlay of about Rs. 20,000 crores, at least 25 to 30 per cent would be spent on civil engineering constructions, in the field of river valley projects for irrigation and power, roads and railways, for transportation and communication, buildings and housing or public health projects. One of the most important aspects which the Council considered in its meeting related to the formulation of national standards for the multipurpose river valley projects and their implementation so as to achieve optimum use of natural resources coupled with economy, efficiency and speed in the execution of projects. The Council decided to set up 18 special Technical Committees and approved the appointment of a number of eminent engineers available in the country to guide the work in these fields.

INDO-VIETNAM VENTURE

South Vietnam has shown interest in securing Indian help in setting up joint ventures and also in buying more commodities from India. The possibilities of expanding trade and economic relations between India and South Vietnam were explored at a meeting last week between the Union Minister of International Trade, Mr. Manubhai Shah and the Vietnamese Industrial Delegation which is on a fortnight's tour of India, meeting industrialists and business men at Delhi, Bombay, Calcutta and Madras. At present the trade (imports plus exports) between India and South Vietnam is of the order of Rs. 2.5 crores. India exports engineering goods and imports rice, rubber and timber.

Company Affairs

DUNLOP RUBBER

TODAY, WHEN there is no overall shortage of tyres of any type in the country and competition between various indigenous producers is deepening, it is quite creditable that Dunlop Rubber Company (India) Ltd. has been able to maintain its predominant position. Mr. M. L. Bexon, Managing Director of the company, while addressing the annual general meeting held recently indicated that this success was attributed to the continued demand for its product based on its high reputation and loyal support extended by its dealers. The Chairman also informed the shareholders that the company had also done considerably well in the non-tyre range of products such as industrial rubber products and Dunlopillo. At present such non-tyre business covers nearly 10 per cent of the total turnover and further diversification is being explored. A scheme for the manufacture of PVC belting is being implemented and it is also expanding in the range of braided hose by further specialised developments.

Mr. Bexon informed the shareholders that its various units had shown considerable improvement in productivity. Ambattur factory, for instance, increased its output by nearly 17 per cent during the year under review. Apart from the continued effort at better productivity, the company has pursued its endeavour to carry through its expansion schemes. The fact that finance was comparatively scarce did not discourage it from carrying through the proposed expansion and Mr. Bexon outlined measures through which it was able to negotiate sufficient funds for a full-scale expansion programme. In the first instance, it negotiated additional bank overdraft facilities to tide over its temporary requirements. Secondly, a decision was taken to proceed with an application for rights issue and the Dunlop Rubber Company Ltd., UK agreed to advance, in the meanwhile, the necessary sterling for expansion by way of loan. Thirdly, more money was raised through a modest increase in tyre prices to the extent of 3 per cent from the end September, 1962. The expansion schemes are now well in hand and it expects to achieve higher output of its various products during the latter half of this year, although complete expansion will be implemented around the middle of 1965. The rights issue is expected to be made towards the end of this year.

Although, the company suffered a slight setback as a result of the sudden ban on exports during the latter part of 1962, total exports in 1963 were nearly 17 per cent higher than last year. A significant feature in the field of exports was the demand for special service off-the-road tyres in Europe. There was, however, a drop in cycle tyres exports due to unsettled condition in South-East Asia and the company expects to make up this damage by larger efforts in other markets.

UNION CARBIDE (INDIA) LTD.

Union Carbide (India) Ltd., has earned a higher profit of Rs. 2.69 crores, after providing Rs. 58.82 lakhs for depreciation during 1963 against Rs. 1.86 crores last year. A taxable dividend of 15 per cent, including an interim dividend of 7½ per cent, has been declared against 12½ per cent, which will absorb Rs. 42 lakhs. Provision for taxation was around Rs. 1.70 crores and for general reserve Rs. 70 lakhs. After transferring Rs. 10.50 lakhs from special reserve, profit exempt under section 84 of the Income-tax Act, 1961 and making other adjustments, a sum of Rs. 1.93 lakhs has been carried forward against Rs. 4.44 lakhs brought in. Sales during the year were higher at Rs. 14.33 crores against Rs. 12.26 crores during the previous year. During 1963, capital expenditure for modernization and replacement amounted to Rs. 27.80 lakhs against Rs. 33.80 lakhs. Major expenditure included Rs. 12.30 lakhs for improved manufacturing facilities at the existing battery plants, Rs. 8.10 lakhs for the further expansion of facilities at metal and ores plant and Rs. 3.32 lakhs for a new projector carbon and midget electrode plant under construction at Calcutta. This unit will start production by the end of this year and full capacity may be reached in 1965. Major expansion of polythylene and chemical manufacturing facilities at Trombay is being carried out and extended plant may begin production in 1966.

ANDHRA FOUNDRY ISSUE

Andhra Foundry and Machine Co. Ltd., Secunderabad proposes to enter the capital market next month to offer for public subscription equity shares of Rs. 30 lakhs and cumulative redeemable preference shares (9.3 per cent) of Rs. 15 lakhs. The present subscribed capital of the company is Rs. 20 lakhs. The company was incorporated with the object of manufacturing chemical plant equipment, sugar machinery and parts and fabricate structurals. It proposes to manufacture cast iron spun pipes and has entered into technical collaboration with a German firm. The capacity of the plant is 12,000 tonnes of cast iron spun pipes per year on a single shift basis.

TIWAC INDUSTRIES ISSUE

Tiwac Industries Ltd., of Dharwar proposes to enter the capital market some time in June to raise Rs. 10.30 lakhs by public subscription. It proposes to manufacture 'Swito' alarm watches before the end of the current year and has secured technical and financial collaboration of two firms — one Swiss and the other British. The total capital outlay of Rs. 37 lakhs will be met by long and medium-term loan of Rs. 16 lakhs including a foreign exchange loan of Rs. 9 lakhs from ICICI and equity capital of Rs. 21 lakhs. Of the issued capital, shares worth Rs. 8.5 lakhs will be taken by the directors and their friends and Rs. 2.20 lakhs by foreign collaborators. The balance of Rs. 10.30 lakhs, as indicated above, will be offered for public subscription.

KIRLOSKAR ELECTRIC

Kirloskar Electric Co. Ltd., proposes to increase its authorised capital from Rs. one crore to Rs. 2.50 crores by creating additional 1,000,000 equity shares of Rs. 10 each and 50,000 preference shares of Rs. 100 each. The proposed increase in capital has become necessary to meet the company's financial requirements. On one hand it has taken in hand several expansion schemes including one for the manufacture of transformers of up to 20,000 KVA at voltages of 132 KV. Of the present authorised capital of Rs. one crore divided into 1,000,000 equity shares of Rs. 10 each, the company has already issued equity shares worth Rs. 62.53 lakhs leaving a balance of Rs. 37.47 lakhs for further issue. The company has also sought permission to issue redeemable preference shares carrying a cumulative dividend of not more than 10 per cent, subject to tax.

DEVIDAYAL CABLE

The directors of Devidayal Cable Industries Ltd., have recommended the payment of a dividend of 15 per cent on equity shares. The gross profit of the company was Rs. 13.94 lakhs. After providing Rs. 3.39 lakhs for depreciation, Rs. 4.80 lakhs for taxation and Rs. 38,730 for development rebate reserve, the net profit was Rs. 5.35 lakhs. The proposed dividend will absorb Rs. 3.38 lakhs. A sum of Rs. 4.41 lakhs has been transferred to general reserve.

The turnover of the company increased from Rs. 115.08 lakhs to Rs. 126.18 lakhs. It incurred during the year, a capital expenditure of the order of Rs. 5.77 lakhs so that net fixed assets increased considerably. The total capital employed went up from 79.53 lakhs to Rs. 103.52 lakhs. The percentage of the net profit to the capital employed has gone up from 9.5 per cent to 10.1 per cent.

SHREENIWAS COTTON

The directors of the Shreeniwas Cotton Mills Ltd. have recommended the payment of higher dividend at 16 per cent for the year ended December 31, 1963 as against 14 per cent last year thereby restoring partially the cut made last year from 20 per cent. The sales crossed the 5 crores mark to a peak of Rs. 5.14 crores — nearly Rs. 41 lakhs more than last year. Gross profit was also higher. After making provisions for depreciation (Rs. 26.72 lakhs) and taxation (Rs. 24.34 lakhs) there is a net profit of Rs. 30.94 lakhs. The allocation to the development rebate reserve is Rs. 5.50 lakhs and the bonus liability in respect of the previous year amounts to Rs. 6.23 lakhs. The improved results are attributed primarily to the improved efficiency on account of modernization and renovation carried out during the previous years. It made additions to machinery worth Rs. 37 lakhs during the year. Out of the sanctioned 20,000 spindles, 15,000 have been installed and have started working and the remaining 5,000 will be installed before the end of this year. Moreover the company has been granted permission to instal 6,700 spindles. The installation of automatic looms is also being considered

MAHALAKSHMI FIBRES

Mahalakshmi Fibres and Industries Ltd., proposes to enter the capital market on April 27, with a public issue of Rs. 25 lakhs comprising 10,000 cumulative redeemable preference shares (9.3 per cent) of Rs. 100 each and 150,000 equity shares of Rs. 10 each. It is setting up cotton spinning mill with a capacity of 25,000 spindles at Ranchi. Orders for machinery for 12,500 spindles capacity have been placed. Marubeni-Iida Company Ltd., of Japan will supply the imported machinery while the indigenous equipment will be provided by the Textile Machinery Corporation Ltd., Calcutta. Both the imported and indigenous equipment will be supplied on deferred credit terms. The loan of Rs. 30 lakhs has been sanctioned by the Industrial Finance Corporation, India. The total cost of the project is estimated at Rs. 103 lakhs. The production is likely to commence by the end of this year. The issue is fully underwritten.

NATIONAL AND GRINDLAYS BANK

The working results of National and Grindlays Bank Ltd., for the year ended December 31, 1963 reveal a profit of £679,318 after providing for taxation etc. as against £714,730 last year. After taking into account a sum of £316,941 brought forward from the previous year there was a total of £996,259 for distribution. Interim dividend of 7 per cent, less tax, paid in October 1963 absorbed £244,516 and now the final dividend of 7 per cent will absorb the same amount. A sum of £150,000 has been transferred to reserve fund and £357,227 is proposed to be carried forward. The directors have reported that the bank maintained the policy of seeking to expand its network of branches: Thana Branch, Bombay commenced operations on April 8, 1963 and a new branch at Shambazar, Calcutta will open at an early date; a branch was opened at Kingsway, Salisbury and small sub-branches were established at Essexvale (Bulawayo, Southern Rhodesia), Sheikh Othman (Federation of South Arabia), Eastlands (Nairobi, Kenya) and Bushenyi (Uganda). The Bank now has 163 branch offices overseas and continues to provide a mobile service over a wide field in Kenya, Tanganyika and Uganda

VYSYA BANK

The Vysya Bank Ltd. increased its deposits during the year ended December 31, 1963 to Rs. 2.81 crores against 2.48 crores last year. Advances also increased to 1.26 crores against 1.32 crores last year. The directors of the bank proposed the payment of dividend at the rate of 4 per cent per annum. It opened two branches, one at Gowribidanur and the other at Ulsoor, both in Mysore State, so that the bank now has 22 offices.

ESSO REDEEMS DEBENTURES

A draw of lots was carried out recently by Mr. G. L. Mehta, Chairman, ICICI, of the ten-year old Esso Refinery debentures. The total debenture issue of Rs. 4 crores was divided as nearly as possible into batches of Rs. 50,000 each for the redemption of one-fifth of the issue amounting to Rs. 80 lakhs. This redemption of debentures represents the first return to Indian investors of long-term funds lent for the construction of a modern oil refinery in India. The bonds are being redeemed at par after having paid full interest over the last 10 years. The Esso debentures are currently yielding 7 per cent per annum. The draw was made in accordance with the provisions contained in the Trust Deed entered into between the Esso Standard Refining Company of India Ltd. and the State Bank of India in July 1953 for securing Rs. 4 crores 5¼ per cent debentures.

KILLICK INDUSTRIES

During the year ended November 30, 1963 Killick Industries Ltd. recorded a profit of Rs. 19.67 lakhs. After making provision of depreciation to the extent of Rs. 2.60 lakhs and taxation Rs. 6.92 lakhs the directors have proposed the payment of dividend at the rate of Rs. 7.50 per share, subject to tax, which will absorb Rs. 9.37 lakhs. The company acquired 2,000 equity shares in Filtrona India Ltd., for which a sum of Rs. 2 lakhs was paid. By and large working of its managed companies was quite satisfactory. It was appointed managing agents of the Thana Electric Supply Co. (Pt.) Ltd., for a period of five years with effect from April 1, 1964 for which the Central Government accorded its approval.

SANKEY WHEELS

The first annual report of Sankey Wheels Ltd., which covers a period of November 21, 1962 to December 28, 1963 revealed that the contruction of the factory building at Durgapur has been substantially completed and most of the plant and machinery for the truck wheel plant, both imported and indigenous, has arrived at the site and is being installed. It has also made arrangements for power and water. Import licences for raw materials have been received. The progress made is, therefore, considered satisfactory. The company has applied for an Industrial Licence for the manufacture of truck and tank wheels and the directors feel that the production of these items can be economically combined with its existing manufacturing programme.

T.I. DIAMOND CHAINS

T.I. Diamond Chains Ltd., has started production at its factory in Ambattur, Madras, in collaboration with an American Firm Messrs. Diamond Chain Company, Inc. It has been licensed to produce 1,500,000 feet of industrial chains and it hopes to achieve the installed capacity within two years. It is a subsidiary of Tube Investments of India Ltd. and will

be the largest producer of roller chains. At present the raw material for the manufacture of chains is released from Development Loan Fund. Diamond chains in single and multiple strands will be available from the Ambattur factory for automobiles, motor cycles, scooters mopeds, textile and general engineering industries.

MYSORE KIRLOSKAR

The Mysore Kirloskar Ltd., proposes to promote a new public limited company to manufacture drilling, milling and special purpose machines in technical collaboration with James Archdale and Co., Ltd., Worcester, UK. The new Company will be registered with an authorised capital of Rs. one crore divided into 100,000 equity shares of Rs. 100 each. The initial issued capital will be Rs. 30 lakhs of which the technical collaborators will subscribe Rs. 12 lakhs or to the extent of 40 per cent and Mysore Kirloskar Rs. 9 lakhs or 30 per cent. The balance of Rs. 9 lakhs will be offered for public subscription.

CAPITAL ISSUES

Five companies have been authorised to raise capital exceeding Rs. 82.36 crores. Of these, three are issuing equity shares, one is floating equities plus preference shares and the fifth is issuing debentures. One of these companies is a Central Government undertaking. Foreign collaboration is involved in the case of one issue. The consent of the Controller of Capital Issues is valid for 12 months in all cases.

Hindustan Steel Limited, Ranchi, a Central Government Undertaking, is to issue capital of Rs. 80 crores, divided into 8,00,000 equity shares of Rs. 1000 each to be issued for cash at par. The capital will be utilised for construction and expansion of its steel producing and coal washery units.

Associated Bearing Company Limited, Bombay, is to issue Rs. 1 crore value of debenture stock carrying 7 per cent rate of interest. The debentures will be pledged with banks against loans to be granted to the company by them and would mature for repayment not earlier than 1975 but not later than 1980.

India Meters Limited, Madras, is issuing capital of Rs. 52.50 lakhs for cash at par consisting of Rs. 40 lakhs divided into 4,000,000 equity shares of Rs. 10 each and Rs. 12,50,000 divided into twelve thousand five hundred 9.5 per cent cumulative redeemable preference shares of Rs. 100 each. Preference shares are free of company's tax but subject to deduction of taxes at source at prescribed rates. The capital will be utilised for the manufacture of polyphase and single phase electric watthour meters.

Gujarat Engineering Industries Limited, Ahmedabad, is to issue Rs. 50 lakhs equity capital in shares of Rs 100 each for cash at par. The money will be utilised in the establishment of a factory for the manufacture of steel castings.

Graner & Weil (India), Limited, Bombay, is to issue Rs. 34.43 lakhs in equity shares of Rs. 10 each for cash at par, out of which Albright & Wilson Limited, UK, will subscribe in cash in sterling for shares of the value of Rs. 10 lakhs. The money will be utilised in the manufacture of compressed woollen felts, basic chemicals etc.

LICENCES ISSUED

The following licences were issued under the Industries (Development and Regulation) Act, 1951 — during the week ending 11th April 1964. This list contains the names and addresses of the licensees, articles of manufacture and annual installed capacity.

COAL

The Singir - Rampur Coal Co. Ltd., Killick House, Home Street, Fort, Bombay - 1 (Distt. Sambalpur, Orissa) — Coal 1964 2,80,000 tonnes, 1965 3,00,000 tonnes, 1966 3,00,000 tonnes.

INTERNAL COMBUSTION ENGINES

Engine Valves Limited, Galendale, Post Box No. 1305, Madras (Madras) — Valves for Internal Combustion Engines 30,00,000 Nos.

AUTOMOBILES

Usha Automobile & Engineering Private Ltd., 14, Princep Street, Calcutta-13 (West Bengal) — Hydraulic and Mechanical tipping gears for automobiles 3,000 Nos.

CONVEYING EQUIPMENT

Testeels Limited, Near Idgah Gate, Ahmedabad-11 (Dehgam, Gujarat) — (1) Electric Hoists (1-5 ton capacity) 1200 Nos., (2) Light and Heavy Cranes 50 Nos.

MACHINE TOOLS

Addison & Company Limited, 158, Mount Road, Madras-2 (Madras) — Drill Point Grinders (1/8" to 1" capacity) 120 Nos.

MISCELLANEOUS CHEMICALS

J.K. Traders Ltd., Kamla Tower, Post Box No. 25, Kanpur. Name and style of: M/s. J.K. Traders Ltd. (Gorakhpur, Uttar Pradesh) — Oxygen 30.0 million cu. ft., Dissolved Acetylene 6.0 million cu. ft.

DRUGS AND PHARMACEUTICALS

Cyanamid India Ltd., The International, 16, Queens Road, Bombay (Gujarat) — Ledinac: Liver protein hydrolysate 30,000 kgs. Burroughs Wellcome & Co. (India) Private Ltd., 16, Bank Street, Bombay-1 (Maharashtra) — (1) Bephenium Hydroxynaphthoate 1560 kgs., (2) Methyl Stearate 1200 kgs.

COTTON TEXTILES

Gopichand Textile Mills Ltd., New Anaj Market, Sirsa (Sirsa, Punjab) — 13,392 spindles for manufacture of cotton yarn. Punjab Co-operative Spinning and Textile Mills Ltd., Uklana, Distt. Hissar (Uklana Distt, Hissar, Punjab) — 25,000 spindles for manufacture of cotton yarn. V.M. Salgaocar E. Irmao Ltd., Vasco Da Gama, (Goa) — 500 automatic looms for manufacture of cotton textiles. Calico Textiles, Indu House, Dougall Road, Ballard Estate, Bombay (Maharashtra) — Processing of 20 lakh yards of cotton cloth and 5 lakh yards of rayon and synthetic fabrics per month.

PAPER

Shri T. S. Menon, "Devi Vilas", Palghat (Palghat, Kerala) — (i) Paper 3000 tonnes, (ii) Pulp 3000 tonnes.

FOOTWEAR

British India Corporation Ltd., Cooper Allen Branch, Sutherland House, Kanpur, (Kanpur, Uttar Pradesh) — Rubber and canvas footwear gum boots, jungle boots and hockey shoes 24,00,000.

CHANGES IN NAMES (Owners or Undertakings)

During the week ending April 11, 1964

(Pertaining to particular licences only).

From M/s. Tecalemit (India) Ltd., Calcutta to M/s Tecalemit (Hind) Ltd., Calcutta.

LICENCES SURRENDERED

During the week ending April 11, 1964

(Pertaining to particular licences only).

M/s. Manju Shree Industries Ltd., Calcutta — Cotton yarn.

BOOKS BRIEFLY

Morton's Fork

Studies in Indian Public Finance: By M. H. Gopal; Published by Rao and Raghavan, Mysore, 1963; Pp. vii+128; Rs. 12.75.

Reviewed by D. KRISHNASWAMI RAO

DR. M. H. Gopal, well-known for his writings on Indian Public Finance, has brought together in this volume an anthology of his Papers on this subject, contributed to different journals over the past 12 years.

The opening essay is a review of Indian Finance in the first half of this century which shows how the broad trends in the finances of Government have followed in this country, as elsewhere, the great changes that have occurred in the economic and social conjuncture — in our case mainly the transition from an agricultural to an industrial economy and from a Law and Order State to a Welfare and Development Planning State. By way of perspective the author alludes to trends in public revenue and expenditure in the United Kingdom and the USA in the same period. There is a minor misstatement in this context: the rise in government expenditure in the UK in the decade after 1929 was not "the result largely of Britain's recognition of the Welfare State" as is stated on page 13, but of re-armament.

We then turn to Dr. Gopal's Paper on the role of taxation in a developing economy. In his treatment of this subject he is doctrinaire and lays it down as a dictum that whereas ability to pay and equity are the leading tax principles in a developed free enterprise economy, they are less important "and may even be overlooked" (page 61) in a developing economy where the yield of a tax and its administrative practicability become the first principles of taxation! In our opinion this amounts to elevating expediency into a basic principle of public finance: one of the causes of the present economic malaise of our country.

Commendable Suggestions

Certain suggestions that the author makes in the same Paper regarding taxation of land are however commendable. He would have the taxing power and the yield of land revenue transferred to local bodies, especially in view of present attempts to revitalize the village community, and he would combine the taxes on agricultural and non agricultural income in the hands of the Union Government, compensating the States for the loss of revenue by larger Central grants.

There is included in the book the author's memorandum on Tax Resources for the third Plan which he had presented to the Panel of Economists of the Planning Commission while the present Plan was on the anvil. It is noteworthy that Dr. Gopal had therein suggested a lowering of rates of tax on corporate incomes and held that it was not advisable to raise tax rates on personal incomes. He had advised greater resort to indirect taxation and such direct imposts as could tap the pockets of the rural population. Cutting straight at socio-political convictions that are only now being mildly shaken, he had also recommended the reimposition of the Salt Tax and the scrapping of Prohibition.

Next comes a note on a National Development Tax, a proposal of Dr. Gopal, which would seek to guide private investment into socially desirable channels by permitting a tax-free profit rate which would vary from industry to industry according to Plan priorities and from firm to firm in the same industry according to the efficiency rating of each concern. However impressive the proposal may be as a theoretical model, it would be administratively impossible and grossly discriminatory juridically.

The next article, on the basic principles of a rational public salaries policy, considers a problem that has repeatedly recurred in this country since the close of the last War. The last essay is on the structure of the Indian Budget and suggests certain changes in its formulation.

It must be said in conclusion that the Papers gathered in this book share a common assumption that a transfer of resources to the State is desirable as such in the interests of Development. We would suggest that the current rate of growth of the economy warrants re-examination of this premise.

PUBLIC Vs PRIVATE SECTOR

Nationalisation of Industries in India: By K. C. Bhandari; 1962; Academic Publishers, 11, Panchanan Ghose Lane, Calcutta-9; Pp. 221; Rs. 10.

REVIEWED BY "M.M."

THE QUESTION of nationalisation of industries has been agitating many minds, especially after the Independence of the country in 1947 and the incorporation of a rapid programme of industrialisation in India's five-year Plans. And quite a few things have been appearing in the Press, in Government publications and in the deliberations of the business community and their associations from time to time. Dr. Bhandari tries to give a short, but comprehensive, account of the whole subject; and he succeeds in this.

Dr. Bhandari's book is divided into nine chapters, three appendices, a bibliography and an index. Chapter I deals with controversy about the meaning and implications of the term 'nationalisation' and with the historical aspect of the theory of nationalisation. Chaper II discusses the economics of public enterprise in relation to some standard criteria, such as, maximum welfare to the whole community, maintaining full employment, and others. Chapter III gives the views of well-known thinkers, scholars and economists on the subject. Chapter IV narrates nationalisation elsewhere, that is, in other countries. Chapter V examines the economic policy of the "State vis-a-vis nationalisation". The nationalised sector in India is reviewed in Chapter VI. Various forms of administration of public enterprises in India are discussed next in Chapter VII.

Broad Divisions

In Chapter VIII, Dr. Bhandari discusses the problems of 'nationalisation' in India under two broad heads: (a) Problems of nationalisation, and (b) Problems of nationalised industries and services. This, according to the author, can claim to be an "original contribution to the subject". This Chapter is interest-

ing, specially the second part. Some of his observations merit serious consideration, e.g., Members of Parliament and Ministers should not find a place on the Boards of Corporations or of Directors, there should be no Civil Service personnel on the Boards, the arguments against creating an "Economic Service", etc. This chapter should be enough for a busy reader.

The weakest chapter is, however, the last one devoted to 'Conclusion'. No one disagrees with Dr. Bhandari's main conclusion that "Nationalisation" is a 'fait accompli' — it is accepted fairly widely. But some of his other conclusions are rather scrappy, and smacks of political slogan and speech. For example, take the last paragraph of Chapter IX which reads as:

> "Nationalisation as an important part of the planned economy of the country has come to stay. With its future is linked the future of the country. It must, therefore, succeed, as failure would be national disaster. Let us, therefore, be cautious, vigilant and watchful and the future is ours."

Again, there are two lines in this chapter on page 172 (last para) which read:

> "It may, however, be stated that Fertilisers Industry should also be developed exclusively under the public sector. Public ownership of such an industry in an underdeveloped country like India which is fighting its food battle, is bound to accelerate the development of agriculture which is the mainstay of the country's economy."

The sentiments expressed above are high-sounding indeed; but they do not carry conviction on scrutiny. If the author's idea was to justify public ownership of the Fertiliser Industry, then he could have done it much better by giving some hard facts.

Dr. Bhandari's book — "Nationalisation of Industries in India" is, on the whole, a good introduction to the subject and is a good compilation of much scattered materials that have appeared many places from time to time.

FACTS ON INVESTMENT

Company Formation and Capital Issue Encyclopaedia, 1963: By M. C. Bhandari; Published by the Author, 134/1, Mahatma Gandhi Road, Calcutta-7: Price Rs. 75.

AS A large number of entrepreneurs are coming forward to participate in the country's industrialisation, there is a wide-spread need for specialised advice involving formation and functioning of the companies. Those entrepreneurs and executives who are associated with the corporate activity and like to be equipped with up-to-date information on company formation will, therefore, find this publication valuable. Considerable amount of hard work has gone into the compilation of this over 1000 page volume in which the author has tried to put together a variety of facts such as the primary nature of a company, the manner in which it is floated, its capital structure, the functioning of the directors, the conduct of general meetings, and some more complicated issues such as the process of industrial licensing, taxation and foreign collaborations. It contains complete details about various financial institutions like the International Finance Corporation, the Commonwealth Development Finance Company Ltd., etc. A list of foreign collaborations approved by the Government of India between April, 1961 and March, 1963 is one of the interesting annextures.

COMPANY NOTICE

HINDUSTAN ALUMINIUM CORPORATION LIMITED

Registered Office:
INDUSTRY HOUSE,
159, Churchgate Reclamation,
BOMBAY-1

NOTICE is hereby given that the Fifth Annual General Meeting of the Shareholders will be held at the Registered Office of the Company on Friday the 12th June, 1964, at 4 P.M. to transact the following business:

1. To consider and adopt the Directors' Report, the Audited Balance Sheet and the Profit and Loss Account for the year ended 31st December, 1963.

2. To appoint a Director in place of Mr. Edgar F. Kaiser, who retires from office, by rotation, in accordance with Article 146 of the Articles of Association of the Company, and, being eligible, offers himself for re-election.

3. To appoint a Director in place of Mr. Marvin L. Lee, who was appointed by the Board to fill up the casual vacancy caused by the resignation of Mr. T. K. McCarthy, and who retires from office, by rotation, in accordance with Article 146 of the Articles of Association of the Company, and, being eligible, offers himself for re-election.

4. To appoint a Director in place of Shri G. D. Birla, who is an associate of the Managing Agents and who has attained the age of 70 years and who retires from office by rotation, and, being eligible, offers himself for re-election, and to consider and, if thought fit, to pass the following resolution as a Special Resolution, of which special notice under Sections 261 and 281 of the Companies Act, 1956 has been received by the Company:

As a Special Resolution:

"RESOLVED that pursuant to the provisions of Section 261 and 281 and other relevant provisions, if any, of the Companies Act, 1956, Shri G. D. Birla, who is an associate of the Managing Agents and who has attained the age of 70 years and who retires by rotation, be and is hereby re-elected a Director of the Company, and it is hereby specifically declared that the age limit prescribed in Section 280 of the Companies Act, 1956 shall not apply to him."

The reasons which make this Special resolution necessary are more fully set out in the Explanatory Statement annexed hereto, which, for the purpose of the said Section 261, shall be deemed to be incorporated in this notice.

5. To appoint Auditors to hold office from the conclusion of this meeting until the conclusion of the next Annual General Meeting and to fix their remuneration.

6. As Special Business:

To consider and, if thought fit, to pass, with or without modification, the following resolutions:

(a) **As Special Resolutions:**

(i) "RESOLVED that the Company hereby approves of the appointment of Messrs. Traders International, Inc., United States of America, who maintain an Office in Washington D.C. and whereas the said Company is established to carry on business inter alia of acting as Agents in the United States of America and other countries for purchase and sale of goods including raw materials, stores, plant and machinery etc. and to have dealings and business connections with parties and for utilizing their services for recruiting technical personnel and/or Consultants, making arrangements for securing Know-How, credit facilities etc., attending to enquiries and generally to act as representative of the Company, as and when required, for negotiations in the U.S.A. and other countries outside India, and operate on a large scale and WHEREAS their annual expenses of maintaining the office establishment are likely to amount to $50,000 approximately, in the initial stages, and WHEREAS expenses which can be reasonably attributed to the work to be done for and on behalf of the Company would depend on the value of purchase effected through the said Company in relation to the total turn-over in each year, NOW it is hereby RESOLVED that Messrs. Traders International Inc., be and are hereby appointed to act as Buying Agents and Selling Agents of the Company for the periods of 3 years and 5 years respectively, with effect from 1st April, 1964, in the U.S.A. and other countries outside India, and to provide other services and to represent the Company in manner aforesaid, on the following terms as to commission:

a) For purchase of stores and spare etc., 2½ per cent of the invoice price,

b) For purchase of plant and machinery, 2½ per cent of the invoice price,

c) For sale of goods manufactured/produced by the Company, 2 per cent of the invoice price, and

d) For recruiting technical personnel and/or Consultants and for making arrangements for Know-How, Credit facilities etc., as aforesaid, in the U.S.A. and other countries, all expenses incurred and/or approtionable in respect of the work done by them in each particular case.

Provided that if anything to be done in pursuance of the above arrangements requires permission of the Central Government and/or the Reserve Bank of India, as the case may be, the same will be done in accordance with such permission."

(ii) "RESOLVED that Article 57 of the Articles of Association of the Company regarding 'Fee for Transfer' be amended by adding the following sentence at the end of the existing Articles:

"The Directors may waive payment of the fee,

aforesaid, for transfer or transmission of shares"

(b) **As an Ordinary Resolution:**

"RESOLVED that pursuant to the provisions of Section 372 and other applicable provisions, if any, of the Companies Act, 1956 the Company hereby sanctions the investment by the Company by subscription and/or purchase, at par, upto 3,50,000 Equity shares of the face value of Rs. 100 each of Renusagar Power Company Limited, so as to make it wholly owned subsidiary of the Company, and the Managing Agents be and are hereby authorised to apply for and obtain the approval of the Central Government to the said investment"

BY ORDER OF THE BOARD,

MANAGING DIRECTOR'S SPEECH

THE DUNLOP RUBBER CO. (INDIA) LTD.,

The following is the speech delivered by Mr M. L. Bexon, M.C., Managing Director of the Dunlop Rubber Co. (India) Ltd., at the 38th Annual General Meeting of the Company held in Calcutta on the 22nd April, 1964.

I have much pleasure in welcoming you to the 38th Annual General Meeting of the Company. The Directors' Report and Accounts have been in your hands for some time, and with your permission I should like to take them as read. You will have noticed that the Accounts this year are being presented in the modern columnar form. This outlines the highlights of the Profit and Loss Account and Balance Sheet more clearly, while the details are given in the form of notes and schedules.

THE YEAR'S TRADING

In 1963 the Company maintained its predominant position in the car, truck and motorcycle tyre replacement market, and as suppliers to the automobile manufacturing industry. We were called upon to make substantially increased supplies of tyres for Defence purposes involving a complicated range of specialised sizes for military use, and taxing our technical and production resources heavily. It is a source of satisfaction that we managed to maintain and increase our overall level of sales in spite of the supply problems thus created.

During the year three new tyre manufacturers began marketing their products, and the Company's success in holding its position was attributable to the continued public demand for our products based on their high reputation, to the loyal support of dealer friends and to the efforts of our sales and depot organisation in giving first-class service to fleet owners and the trade. Distribution has become more complicated as the result of the increase in the rate of tax on inter-State trading and disparities between sales tax in various States resulting in price differentials.

Our sales of large earthmover covers continue to be satisfactory although somewhat affected by capacity priorities for Defence. It is our intention to expand our production to incorporate larger sizes to meet the increasing demand from national multi-purpose and major irrigation schemes, which should result in a saving of valuable foreign exchange.

Our cycle tyres continue to be extremely popular and we are unable to meet the demand for our brand. We continue to supply the original equipment requirements of both large and small-scale cycle manufacturers.

The turnover contribution by the non-tyre range, i.e. Industrial Rubber Products and Dunlopillo, increased substantially over the previous year. This was mainly due to the increase of the conveyor belting business resulting from the implementation of some Plan projects. Generally, the demand for all items of our range continued to rise and our selling efforts were, in some measure, limited by production capacity. It may interest you to know that non-tyre business represents about 10 per cent of total turnover, and further diversification is constantly being explored.

Conveyor belting, the largest turnover item in our non-tyre range, engaged our attention on increased productivity, technological development and expansion of the range. The scheme for manufacture of PVC Belting is being implemented and supplies are expected to be available towards the end of the year.

We are also expanding the range of braided hose by further specialised developments.

Dunlopillo sales showed an increase over 1962, and the requirements of the railways and the automobile industry, which geared its output to the defence effort, necessitated our special attention.

EXPORTS

Our total exports in 1963 registered a 17 per cent increase over 1962 in spite of the setback suffered as a result of the sudden ban on exports during the latter part of 1962, and also capacity limitations due to our heavy defence commitments.

A significant feature of our export achievement during this year has been our success in the export of special service off-the-road tyres to Europe. The value of these made a substantial contribution to our overall exports.

There was, however, a drop in our cycle tyre exports which has been primarily due to unsettled political conditions in South-East Asia.

While we hope to be able to maintain, if not better our exports during 1964, it will not be out of place to mention that the export market for products that we manufacture is fast shrinking with the setting up of local manufacture in many neighbouring Asian, Middle Eastern and African countries.

RAW MATERIALS

The raw material supply position in 1963 was reasonably satisfactory, although import licence delays again caused some difficulties.

We started using large quantities of Indian-made rayon, synthetic rubber and carbon black, and are planning for a further increase in consumption during this year in substitution for imported materials, with a corresponding saving in foreign exchange. The generally higher prices of indigenous materials are having a serious effect on the cost of production, which can only be partially offset by our planned increase in production efficiencies.

PRODUCTIVITY

Once again I can report that the output from both factories in the last year was a record. The Ambattur factory increased its output by nearly 17 per cent over the preceding year and a slight increase was recorded at Sahaganj, despite the severe power cuts which affected factory operations during the greater part of the year. This achievement reflects great credit on the factories' management and labour, and their joint effort continues further to improve productivity. I am confident that nothing will be spared towards the achievement of the higher production targets set for this year.

EXPANSION

Last year I had to tell you that, following the introduction of Super Profits tax, we were reviewing our expansion schemes and that no positive report on their progress could be given. Indeed, 1963 laid increased financial burdens on your Company as a result of additional taxation, extra costs arising from the use of indigenous raw materials, premia payments in respect of Emergency Risks Insurance, and the tie-up of more capital following the further surcharge on Excise duties.

New temporary and permanent sources of finance had to be explored if we were to avoid abandoning or cutting back some of our schemes. Three measures were successfully negotiated in the latter half of the year which have enabled us to embark once more on a full-scale expansion programme. These were, first, negotiation of additional bank overdraft facilities to tide over our temporary requirements, second, a decision to proceed with our application for a rights issue and the agreement of the Dunlop Rubber Company Limited, UK, to advance meanwhile the necessary sterling for expansion by way of a loan, and third, a modest increase in tyre prices of 3 per cent from the end of September, 1963.

Our expansion schemes are now well in hand and we anticipate increased production in many of our products during the latter half of this year, although the complete expansions will not be finally implemented until about the middle of 1965. The rights issue is now being processed and is expected to be made towards the end of this year.

PROFIT AND LOSS ACCOUNT

The main features are given in the Directors' Report, from which you will have seen that the profit before tax remains much the same as the previous year, this despite an increase in sales of approximately Rs. 3.61 crores. The additional profit which would normally have arisen as a result of the increased sales was more than absorbed by additional costs, particularly those arising through the use of indigenous raw materials.

The net profit for disposal after tax — Rs. 1,68,86,953 — is substantially higher than last year, entirely due to taxation adjustments as already explained in the Directors' Report. After the compulsory transfer to Development Rebate Reserve of Rs. 10,25,000, and providing for Preference Share dividend of Rs. 4,60,000, a balance of Rs. 1,54,01,953 remains.

The Directors propose to transfer to General Reserve Rs. 75,26,953 of this balance and recommend a dividend for 1963 on the Ordinary Share Capital of 17½ per cent, subject to tax. This will absorb Rs. 78,75,000 and compares with 15 per cent paid in respect of 1962.

BALANCE SHEET

A concentrated effort was maintained to contain Inventories despite the higher volume of output and I am pleased to say this was successful.

Debtors are substantially higher mainly due to the larger volume of business, most of which took place in the latter part of the year.

Bank borrowings are also higher, reflecting heavier taxation payments during the year and also the higher working capital required to sustain the increased volume of business.

FUTURE PROSPECTS

The 1964 Budget proposals reduced the incidence of tax payable by your Company through the abolition of the Super Profits tax and the substitution of a Surtax on excess profits. However, increased tax arises from the 7.5 per cent tax on dividends.

During the closing stages of 1963 Government made the welcome announcement that Emergency Risks Insurance premia would not be payable for the first quarter of 1964, and that price control over our products was discontinued. Tyre prices were increased by 6 per cent at the beginning of 1964, which will help to offset the increased costs imposed on the industry during the course of last year.

Two years ago I referred to the increasingly competitive conditions in the tyre industry. This trend was slowed down by the Emergency and subsequent rise in Government purchases, but is now again very evident. There is now no overall shortage of tyres of any type, but we are confident of our ability to achieve the targets we have set ourselves for 1964, both in the sales field and in the factories, through the wholehearted efforts of all concerned. We look forward to another year's satisfactory working, although the trend of rising costs is a disturbing factor.

In conclusion, I am sure you would like me to associate you with the Directors in expressing our thanks to all employees for their loyal efforts during the past year.

NOTE: This does not purport to be a record of the proceedings of the annual general meeting.

TRADE CONFERENCE IN GENEVA

Have-Nots Seek Concessions

THE FOLLOWING statements of the Leader and members of the Indian delegation to the United Nations Conference on Trade and Development (UNTAD), currently in session at Geneva, present not merely a particular national point of view on problems of international commerce, but make an informed and positive contribution to the progress of the conference on constructive lines.

Along with the Indian documents we are also publishing a statement made by the Executive Secretary of GATT. This statement, again, is remarkable for its responsiveness to the changing needs and emerging challenges of international economic co-operation:

Development Through Trade

Statement of Mr. Manubhai Shah, Leader of the Indian Delegation, at the UNTAD Conference is reproduced below:

After the last World War, the establishment of the United Nations Organisation in order to preserve peace and steadily pursue progress for mankind, has been the landmark of history. Maintenance of peace and harmonious relations between the nations so that prosperity and good life could be secured for all the peoples of the world, has been the mainstream of all the thoughts and actions of the peoples of the world. It is also fully realised on all hands that peace and prosperity are indivisible; and poverty anywhere is a menace and threat to peace and prosperity of the whole globe. After the political emancipation of all the peoples of the world in the form of 122 sovereign nations, it was obvious that political freedom must receive social and economic content. Without providing optimum standards of living for the millions and millions, the peace, containing poor life for the vast majority of the people, will be short-lived. Therefore, the threat posed to peace by wide differences of standards of living among the nations of the world is obvious and does not need to be stressed.

The relationship between international trade and economic development has received full recognition in recent times. It is therefore very appropriate that this historic Conference on International Trade and Development is meeting here in Geneva for the first time in the history of the world. The previous few conferences on trade were rather limited and restrictive in their approach and neither represented nor reflected the aspirations of all the nations. As this Conference is historic, it has evoked great hopes everywhere. As the problems of international trade and economic development are complex and not easy of immediate solution, one should rule out over-optimism on complete success in one sitting of this Conference, that is during the first session of over 12 weeks, for all the problems that come under its umbrella. Realistic as we are, we in India along with all the other nations, do believe that a down-to-earth approach can alone help to make this Conference work and we need not judge the work of this Conference in simple words of 'success' or 'failure'. But India would like to recognise the Conference as initiating a "new era of understanding and action" through a series of steps in different sectors of international trade and development in concrete and precise terms as much as could be practicable during these 12 weeks. This Conference can lay strong and deep foundations for future work and superstructure of healthy international trade and progress being built on these secure foundations. While, therefore, we may avoid over-optimium or complacency, it is clear that any tendency to classify this Conference as "mere talk" or "mere words" or as "one more socalled conference" would be doing severe damage to the cause of peace and progress of the world.

A failure of this Conference will not only shatter hopes but would prove a disaster in every sense of the word. Therefore, India would appeal to all the sovereign nations at this Conference to give their very best in a constructive way, notwithstanding different situations, stages of economic growth, differing ideologies and political patterns and widely divergent systems of national constitutions, to give their very best constructive approach so that meeting of minds can be created and constructive results can flow in quick succession.

Gradualness in achievement of specific results is obvious, but this gradualness should itself not become a mere palliative to wish for everything and give, grant or receive nothing. I would therefore urge that we should all act in a spirit of great human understanding of the distressing positions and situations obtaining in three-fourths of mankind living in the less developed countries.

In paying a tribute to Dr. Prebisch, the Secretary-General of this Conference, I would not merely be formal or customary. The work done by the distinguished Secretary-General, the great economist Dr. Raul Prebisch, has been of fundamental nature. The Prebisch report which is before all of us, the enormous work put in by him and his colleagues and different representatives of nations in the three Preparatory Commitees, is of tremendous significance, and if I may say so, of highly practical value. Dr. Prebisch and his colleagues have not merely analysed in the most succinct manner all the factual positions as they exist in different countries and regions of the world, but they have given us a series of constructive ideas which can be worked out in a practical manner. Therefore, on behalf of my delegation and myself, I would like to convey the heartiest greetings of my own country and other member nations of this Conference to Dr. Prebisch and his colleagues on this remarkable report.

Stagnant Export Earnings

The trends as they emerge in the field of international trade are very disturbing indeed. While the world has become free, in the last fifteen years, from political domination, the economic disparities have grown rather than diminished in their intensity. The international cake in the form of world trade has grown and expanded in a tremendous way in the last decade. This is good and desirable and our efforts should be to still further expand world trade so that human prosperity everywhere, both in the industrialised countries and the less-developed countries, really grows. However, the hard fact stands out that the main objective, Mr. President, of increasing the export earnings of the developed countries has completely failed. The export earnings of the less developed countries has remained almost stagnant in the last decade. We are not here gathered to reduce the prosperity of the industrialised countries. Rather, we wish them more progress. We are not gathered here in a spirit of obstruction or some trade unionism or some parochial groups wanting to rob some in order to benefit others. We here at the Conference table represent the human family with its diversity, with its tremendous achievements, and at the same time we recognise disparities, distress and the yawning gap between those who are in the vanguard of progress and the vast majority who are without adequate resource and incomes.

It is clear therefore that we are studying these problems here at the Conference table in the most constructive and comradely spirit. And it is in this environment, that India would like to appeal to the leaders of the advanced countries like the United States of America, the Soviet Union, United Kingdom, France, Germany, Italy, Japan, and various leading industrialised countries of the world, to give us the benefit of their advice and constructive plan of action which while recognising the existing state of affairs should seek to redress and remedy the situation in all directions. The objective of the Conference should be to make the Development Decade a reality. If at the end of the Decade we find that poor have remained poor or become poorer still, the objective would have definitely receded. If, therefore, we wake up in time at this Conference and reverse the present trends in trade, the Development Decade can be made a tremendous success. Only a determined and concerted 'Political Will' can initiate measures in mutual co-operation to bring about a new trend in international trade and development where trade can become a senior partner along with aid to secure the benefits of the growing prosperity in the industrialised countries, being shared by the peoples of the less-developed countries. And this is not so difficult to achieve because we are not meeting in any spirit of hostility or animosity, but as I said, we are meeting in the most co-operative and understanding manner to accept the analysis before us and work out practical solutions. The advancement of the less-developed countries through the reversal of present trends by enabling them to earn more of foreign exchange through expansion of their export trade, would itself create and provide far more expanding markets for the products of the industrialised countries. Therefore, of all the processes of assistance, the process of expanding international trade in favour of the less-developed countries is the easiest and the best of all the methods of maintaining and expanding world prosperity.

New Understanding

If the above approach of harmony and co-operation is accepted by this Conference and by the participants, namely the industrialised countries and the less-developed countries, then the next question would be as to how do we go about to secure the new understanding between the partners, in this great human endeavour, for enabling the less-developed countries to expand their export trade. Naturally, such a policy would have to provide for adequate institutional and organisational framework. India has always supported healthy institutions and organisations which work for greater co-operation in the international field. The General Agreement on Tariffs and Trade which is the major organisation of the contracting parties who are now about 61 out of the 122 countries of the world, has been doing good and essential work in the last sixteen years of its existence. In spite of several deficiencies, GATT has on the whole worked well to bring order out of chaos in international trade. But the very nature of GATT and its membership at the time of its foundation, naturally led by the industrialised countries of the world, have tended to provide a framework and policy forum in the GATT in which the major trading nations of the world have derived greater benefit rather than provide an instrument of promoting the trade of the poorer countries of the world in new directions as we all wish. From our contacts and talks with the industrialised partners, we are convinced that the industrialised nations do desire, as much as we do, that the GATT should be enabled to perform the new tasks, where necessary, by enlargement and reconstruction of the GATT. While this is so, there might be some difficulty as to the manner and form in which the GATT should be remodelled. The Havana Charter has to be modified and expanded into a charter adequate to meet the present pressing needs. In our view, the following few steps are clearly indicated if GATT is to continue to function as an instrument of international trade in the desired manner for the benefit of all the countries of the world.

(1) The present multilateral contract has also to provide in a suitable way for the bilateral balanced commodity exchange of the centrally planned economies. The value attached by most of the countries of the world to trading with the centrally planned economies is well known to need any reiteration here. Most of the countries at this Conference table are trading with some of these centrally planned economies. In spite of some of the handicaps, the trading policies of the Socialist countries have generally found acceptance in most countries as much as the multilateral pattern of the GATT has found acceptance between the Contracting Parties. Therefore, either through amendments or additions of a suitable nature or through any supplementary organisation, the international contract on trade will also have to provide for trade between market economies and the centrally planned economies, so that while recognising and benefiting from these trading patterns which exist and which cannot be ignored, we can bring about a measure of regulation and improvement in these bilateral trading patterns. We have some ideas on this, but this can be best discussed in Committee No. 4 provided there is readiness on the part of all concerned to seek a solution of this major problem.

(2) It is also necessary that the GATT should become a fully representative organisation of all the trading countries of the world, namely, more than 100 multilateral trading countries, and about 10 or more centrally planned economies. All the members of the United Nations have to be provided full membership of the GATT if international trade is to work under a broad pattern of rights recognised and obligations accepted by all the different members of the enlarged GATT.

(3) The main effect of the contract as it stands and of its different clauses and regulations is to maintain the status quo in the trends of world trade. If a reversal of these trends is desired by the Conference, as I hope it is, by both the industrialised countries and the less-developed countries, we will have to radically modify and remodel the policies, so that a full, free and an expanding access for the products originating in the less-developed countries to the expanding markets of the industrialised countries is secured through such policies which may be built into the GATT. This is not so difficult to achieve by maintaining what is good and working well in the GATT and redefining what is newly desired by all the countries of the world so that the international trade of the less-developed countries expands commensurate with their needs. Or at the minimum, their share in expanding international trade should continuously increase from its present poor proportion of 20% to a much higher and larger figure in order to wipe out the gap between their needs and their present small earnings as clearly brought out in the Prebisch report. I would not take the time of the Conference by going into greater detail in this matter and leave it to Committee 4 to work out the new organisational pattern.

Periodic Conferences

Along with the GATT which should be reconstituted and remodelled as desired by all the member-nations, we should meet periodically in this Conference so that larger policies of economic growth and development and aid and trade can be discussed in this forum. By its very nature, a contract or an agreement on trade has got to work within specified rules, regulations, protocols and framework. A contract, however liberal, cannot be so flexible as to include so many facets of economic growth and aid which necessarily have to remain flexible, changing and emerging according to new situations that continue to arise. It is in this context that India has constantly advocated what the Prebisch report has underlined so clearly, the need for this Conference of the United Nations on Trade and Development to become a permanent feature. This Conference should meet periodically, once in two or three years, as may be necessary, with an adequate, permanent, and full-time secretariat in the United Nations Organisation with such standing committees and committees of a permanent nature which will review

and push forward the work of this Conference. Whatever are the ultimate agreed decisions of such a Conference and which have to be implemented in the form of contracts and agreements can be considered and accepted by the GATT to the extent possible so that the close liaison between the functioning of the World Trade Conference in its periodical meetings and the reconstituted GATT as a dynamic instrument of international trade. can be fully established and harmonised.

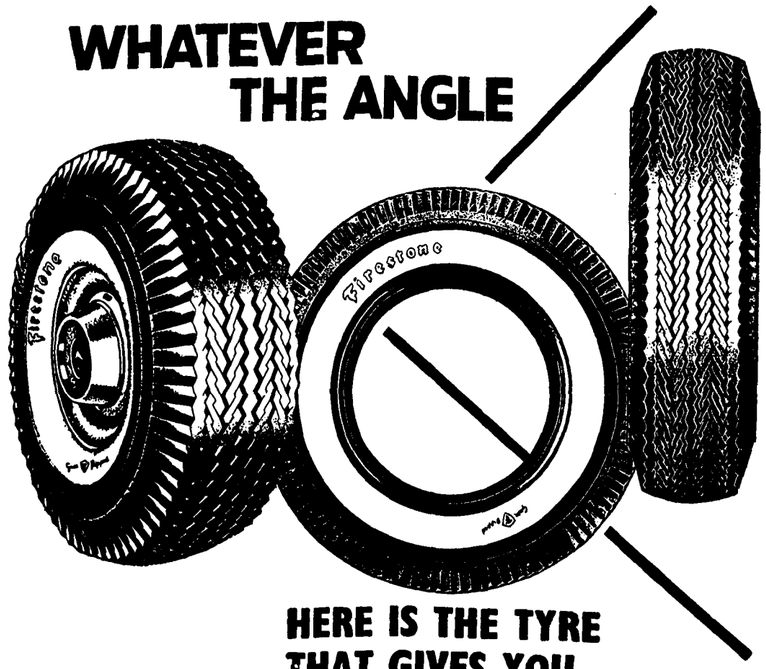
Coming to the specific problems of world trade. India gives the highest importance to a reduction and removal of tariffs, and removal of obstacles and restrictions so as to create a proper climate for free play of international economic forces. The dominant experience of the depression of the Thirties throughout the world, when the trade went down, was for restrictions to grow up in each country and each country tried to protect its own balance of payments by ushering in agricultural protectionism and 'infant industry' arguments. The wide growth of complicated tariff structures was the outcome of these policies of protectionism. It is therefore most essential, in our view, to consider the removal of all these restrictions and obstacles in the way of trade of the weaker partners, namely the less-developed countries, that this Conference should address itself.

India therefore attaches the greatest importance to secure free and full access for all products of the less developed countries into the markets of the developed countries. To this end the various non-tariff barriers like quota restrictions, import licensing, internal duties and various administrative restrictions have got to be closely studied for their elimination and removal and the Eight-Point Action Programme approved by the GATT Ministerial Meeting of 1963 has to be worked out and implemented in detail.

Primary Products

Mr. Chairman, our impatience and our anxiety arise from some of the trends which the Secretary-General has indicated in his report. On the one hand, we are continuously talking and seem to agree that the export trade of the less-developed countries should expand. As these economies are more primary than industrialised, it is clear that the export trade of each of the less-developed countries generally hinges on less than half a dozen primary products. These primary commodities which constitute the core of the export trade of the most less-developed countries, have been facing very severe weather in the field of international trade. As the report mentions on page 20, even in the field of primary products, the industrialised countries have greatly enlarged their share of world exports of primary products from 47% in 1950 to 55% of the overall increased world trade in 1961, whereas over the same period, the share of the less-developed countries in primary products, excluding petroleum, fell from 41% to 20%. Further, it is stated that between 1950 and 1961, the terms of trade of primary commodities fell by 26% in relation to those of manufactures. All this points to the immediate need to give higher priority to the overhauling of the policies and practices of trade in primary products.

Without going into the detail of this problem of primary products, the Indian delegation would like to advocate that ways and means should be devised to secure fair and remunerative prices for the primary products originating in these countries. We heard just now the President of World Bank on primary products and the need to stabilise these prices. With this broad objective, I am happy to say that there is a considerable measure of agreement among all of us. In the list of such commodities, it is clear that we can tackle 20 to 25 principal products over the next five or seven years through suitable international commodity agreements or arrangements. In the light of the experience gained in the case of agreement on tin. coffee, wheat, sugar and olive oil, it should not be difficult to work out in concrete terms commodity agreements tackling about 3 to 4 commodities every year, so that commodities like wheat, rice, tea, coffee, cocoa, copra and vegetable oils, jute and jute goods, cotton, wool, sugar, spices, iron ore, manganese ore, natural rubber, meat and meat products, shellac, tobacco and such other commodities of major interest to some of the less-developed countries could be covered through a system of international commodity agreements providing for fair and remunerative prices.



Monetary Compensation

In this, Mr. Chairman, we clearly believe that a system of monetary compensation will have to be worked out in a suitable manner by Committees of Experts, so that each commodity agreement may have under its constitution a "trade development and price fluctuation fund" which should enable automatic reimbursement to the exporting country in case the world prices of the commodity sag below the floor price. Such a fund could be created from the sale of stockpile when the prices spurt and the surplus being deposited into the fund; second, by financial contributions from industrialised countries which may be the main consumers of these products, so that additional resources are provided to this fund by industrialised countries, and a small notional contribution can be made by producing countries themselves. These compensations would only come into play when other methods of regulating prices by regulation of production and consumption fail in any particular period or year to support the prices at agreed levels. While advocating remunerative prices, we are conscious of the fact that the prices will have to be related to what the commodity can bear in an economic manner, and the prices need not be pitched so high as to induce growth of substitutes or to induce over-production in uneconomic directions as to defeat the very purpose of price support at remunerative levels. It is not beyond practical possibilities to work out agreements commodity-wise, with all the necessary safeguards on the one hand and adequate provisions for compensation on the other. We attach great importance to this because in the economies of the less-developed countries, which are not very diversified and whose dependence mainly is on a few primary products, the one single factor which can contribute greatly to the balance of payments position is the increasing export earning through remunerative prices and growing trade in primary commodities.

Kennedy Round

On the matters of tariff, India fully supports the Kennedy Round of talks. India hails it as a revolutionary movement in history of tariffs. My delegation views the forthcoming tariff negotiations for reductions in tariffs as an integral part of this overall movement for the expansion of international trade, removal of obstacles and securing a freer and fuller access to the products originating in the less-developed countries. Reciprocity on the part of the less-developed countries would be more than adequately provided in the form of their purchasing more from the developed countries out of their increased earnings, rather than in the form of conventional methods of negotiating reductions of tariffs which, it seems to us, they cannot obviously afford to do in the present state of their economy. We do hope that further improvements would be secured in the Kennedy Round of negotiations so as to enable the world to dismantle the tariff walls to the very minimum. Also, progression in tariff between the raw materials and the manufactured products therefrom, should be reduced so as to facilitate and encourage the natural industrialisation based on these raw

WHATEVER THE ANGLE

HERE IS THE TYRE THAT GIVES YOU EXTRA SAFETY

This is the tread pattern which reflects years of research on testing grounds and race-tracks to provide motorists with maximum tyre safety. Thousands of safety traction angles grip the road and make all the difference in easier steering and better traction when you start and stop. You know what you are getting when you buy Firestone.

materials in the less-developed countries.

In order to promote the industrialistion and rapid expansion of export trade of the less-developed countries, it is in our opinion necessary that preferential treatment should be accorded to the exports of the less-developed countries and we do trust that it will be possible to take this concept into account when we embark upon the forthcoming tariff negotiations. We are, however, clear that such a system must be non-discriminatory and should be applicable as a whole to all the less-developed countries of the world, so that the complex system of discrimination between one group of countries and another or between one region of the less-developed countries and another is firmly avoided. To this end, India would also suggest that, while taking note of the existing systems of preferences such as the Commonwealth preferences, the ECM Association of Overseas States, the Latin American Free Trade Area and various other forms of regional economic groupings, these systems should, in due course, be brought under a uniform policy of non-discriminatory preferential treatment by the advanced countries to the products of the less-developed countries as a whole. It is a difficult and complex task and we do recognise that only patience and hard work towards creating common understanding on these problems will have to be put in while this Conference continues and also in future conferences. India has also shown readiness to give up preferences which she might be enjoying provided adequate benefits are made available to all the less-developed countries through a system of non-discriminatory preferences in the markets of all the industrialised countries to the products of the less-developed countries. We have already agreed to give up preferences on tea and a few other products. It is our earnest hope that the leaders of the different regional economic groupings would give their best attention to this problem, so that a very complex system of discriminatory preferences does not take away all the benefits, which otherwise are sought to be secured through different measures of liberalisation of world trade in favour of the less-developed countries. Also India is in favour of grant of preferences by less-developed countries to manufactured and semi-manufactured goods of the less developed countries on an agreed basis between the less developed countries themselves.

Linking up Formula

There have been suggestions of linking up of preferences to the degree of development of particular industries in the different less-developed countries. While this sounds reasonable in principle, it will be a most difficult practical exercise to work out, with any degree of completeness or dependability, agreed criteria and classification of such degrees and stages of under-development or development. The raison d'etre of preferential treatment to the goods of the less-developed countries is the undeveloped nature of the economy of these countries as a whole, and the growth of any particular industry or industries does not neutralise these disadvantages. Trying up preferences industry-to-industry-wise would not be easy to work out. Besides, once this principle is admitted, any number of gradations can be thought of and pressed, making the whole approach almost unworkable. It seems to us that if some less-developed countries feel that for certain items of manufactures, they need more encouragement, it may be possible to stipulate a quantum for such items for which they may be granted a somewhat higher special preferences for some time. However, I do not know to what extent such a complicated system would be practicable or workable and to what advantages, if any.

In addition to the removal of non-tariff barriers and reduction and removal of tariff barriers, India attaches the greatest importance to industrialisation of the economies of the less-developed countries. It is true, Mr. Chairman, that the primary products do form bulk of the exports of the less-developed countries in general, and therefore, there can be no disagreement on the point that utmost efforts should be made to give maximum encouragement to the exports of primary products. However, a point is sometimes made that as far as the less-developed countries are concerned, the question of free and full access to be given to the export of manufactured goods from these countries to the markets of the industrialised countries is not of immediate significance, as very few less-developed countries have achieved any reasonable level of industrialisation. To our mind, there is an obvious fallacy in this argument. While it is true that industrialisation depends upon a large domestic market, it is far more true to say that the less-developed countries will not be able to raise their living standards by merely relying on the production and export of primary products.

Agro-Industries

While in several countries due to the size of their population, the domestic markets may be small, the economies of scale in industrial development could be secured only through the outlets which the products of manufacturing industries would receive through their exports. The example of Switzerland, Scandinavian and Benelux countries and other relatively small but industrialised countries is there before us. The entire process of industrialisation, through which the advanced countries of the world have passed, is one of consumption of manufactured goods at home and increasing exports of their manufactured products to the rest of the world. In terms of priority, it is clear that the less-developed countries will have to usher in programmes of industrialisation based on agro-industries and processing industries for raw materials available in these countries. But, in due course, through inter-regional planning and international division of labour, each of the less-developed countries according to its economic situation and potentialities will have to implement, as most of these countries have been most keenly doing in the last decade, the phased programmes of industrialisation. The keenness with which Indonesia, Pakistan, U.A.R., Brazil, Argentina, Mexico, Malayasia, Ceylon, Burma, Kenya, Tanganyika, Ethiopia, Nigeria and most of the less-developed countries of Latin America, Africa and Asia are forging ahead in their programmes of economic and industrial development, is a positive sign, if any proof were needed of the growing need to assist and promote this process of industrialisation of their economies, by giving larger scope to the semi-processed and manufactured goods of these countries to be sold into the markets of the industrialised countries.

The per unit return in terms of foreign exchange earned is obviously much higher for the processed and manufactured goods as compared to the primary products. Also, the human skill functions and the technological and human development, which these programmes of industrial development bring into countries' social, economic and political life, need not be stressed by me here, because they are obvious. World cannot afford to keep the peoples of the countries of Africa, Asia, and Latin America perpetually as primitive hewers of wood and drawers of water. Unless the people of the less-developed countries are brought in close touch with modern science and technology to the extent economically and socially possible, neither their living standards nor their skills and managerial functions and human personality are likely to develop. Full human development is not possible without the environment of modern industrial society. Human dignity demands that the benefits of modern science and technology should be enjoyed by millions and millions of people of the less-developed world. I have stressed this point to some extent because due to the small size of popu-

lation of some of the less-developed countries, it is sometimes doubted whether industrialisation of these countries could be undertaken. On a selective and reciprocal basis with intra-regional planning and on the basis of division of labour between the groups of countries on the one hand, and the industrialised countries helping to set up industries in the less-developed countries both for their domestic consumption and for exports, is the surest way to industrialise these economies and to raise the living standards and prosperity of the less-developed countries.

In regard to the trade in manufactures the situation is that while the share of the less-developed countries of total world exports is about 5.6%, it works out to less than 2% if base metals, semi-tanned skins and essential oils are excluded. Despite this low starting base, the magnitude of what is misconceived as a problem arising out of promoting exports of manufactures from the less-developed countries is often exaggerated. According to the report of the Secretary-General the exports of manufactures from the developing countries amounted to somewhat in excess of $2 billion in 1961 and even assuming an increase of $10 billion by 1970, that is by more than half the trade gap, this would represent only some 4 to 5% of the increment in the advanced private enterprise countries' consumption of manufactures. These proportions would, of course, be lower still if the more industrially advanced countries with centrally planned economies are included in the calculations. The Secretary-General has raised a very relevant question—"Can so tiny a figure possibly be a cause of anxiety?"

The diversification of exports is as much a solution to the problem of stagnant earnings as anything else. This means that the less-developed countries should increasingly undertake the export of manufactured and semi-processed articles based on their own resource endowment. It is well-known that in the beginning of industrialisation, due to a variety of factors such as the relative smallness of the size of the internal market, lack of an economic-social infra-structure, lack of up-to-date know-how, credit facilities and knowledge of markets and marketing techniques, the cost of production in these countries may be high. In these circumstances, the manufactures from the less-developed countries will not be able to compete in the markets of the developed countries. The nature of these special facilities has been examined in various forums and the consensus of opinion is that the establishment of preferences by the developed countries in favour of the products of the less-developed countries will be most useful.

Unfounded Fears

The difficulties which arise with regard to the acceptance of such an idea have been analysed carefully in the report. The first is the fear that such manufactured goods will flood the markets of the developed countries and disrupt their well-established industries. The report itself gives the reason why such fears are unfounded. Firstly, the quantities which less-developed countries can export will be such a small proportion of the consumption of such items in developed countries that the disruption caused may be negligible. For instance, thouh India's exports which are extremely small today, are expected to be twice their present level in 1970, they will still account for hardly one per cent increase in the aggregate trade of all the market-economy countries. Secondly, the long-run effects on the exports of capital goods, etc., from developed countries will be sufficiently beneficent to make it worthwhile for industrialised countries to resolve such temporary difficulties as may arise from the imports of such manufactures.

With regard to economic assistance our views are more or less in agreement with the views of the Secretary-General's report. Our experience has been that if a given volume of assistance is to be most effective for development, it should be tied neither to projects nor to countries. The former ties aid utilisation to the progress of particular projects and not to the requirements of the economy as a whole. The latter by restricting the freedom of purchase, prevents the aid receiving country from buying the latest equipment in the cheapest market. It also acts as a drag on progress because Governments cannot meet freely the demands for foreign exchange. Such stipulations are made because developmental assistance is partly intended to find export markets for domestic industry. Howsoever laudable this is, it does not help the growth of less-developed countries.

The second problem is with regard to the terms. It is normal to charge commercial rates of interest and the period for which assistance is given is also based on commercial principles. Development assistance should be based on altogether different considerations. Repayment has necessarily to be spread over long periods so as to give time to the economy to build up an adequate export capacity. Therefore, it is improper, as is done sometimes, to assess the repaying capacity of a particular industry or project to which assistance is being given. The rate of interest has to be suitably low, considering the fact that the burden of servicing becomes very large as development programmes are implemented. Repayment as far as possible may be worked out in sales of goods.

Integrated Picture

Our experience also indicates that assistance should not be confined only to the import of capital goods. An integrated picture of the balance of payments as a whole should be taken and foreign assistance should provide the required net addition to the resources of the economy. As development goes on and capacity gets built up within the country to manufacture all kinds of goods, what may be required would be raw materials and components to feed this capacity rather than equipment. This principle is now being recognised to some extent and a sizable amount of what is called non-project assistance is being made available.

Mr. Chairman, I have tried to deal with broad problems coming before this Conference in my speech. There are other problems of details which are equally important and in many respects much more important to some of the countries, such as the problem of transit of goods from the landlocked countries, the problem of shipping, freights, insurance and other charges for the goods of the less-developed countries. Due to inadequate facilities of domestic shipping and high rates of shipping freights the invisible earnings of most of the less-developed countries are very small and the burden of foreign exchange on payments of these charges are excessively high. I trust that these problems will be dealt with in respective Committees. We will be prepared to lend our fullest support in the solution of these problems.

Mr. Chairman, the variety of subjects that the Conference will be dealing with is very vast indeed and I would not venture to deal with other points, than those I have mentioned above. However, in dealing with any system of encouragement, assistance and preferences, there is some need to take an over-all view of the different forms of assistance. Whatever special devices are evolved to provide equality of opportunity to less-developed countries vis-a-vis developed countries, it is likely that there would be a tendency to impose conditions on such devices in an attempt to secure benefit for all from each device, sometimes to the point of arithmetical equality. However, the question of trade and economic growth being of extremely diverse nature, both from the practical point of view as well as in the interest of new international division of labour, such conditions and

expectations to derive and allot equal benefit to every one from each device can only complicate schemes and may even make most of them unworkable. Mr. Chairman, we are in fact looking forward to a series of devices being evolved for the benefit to the less-developed countries so that in the aggregate of the benefits, each would be able to derive substantial gain depending on its natural endowments and other factors without every device being contemplated to benefit each of the countries in equal proportions. Even though this is an obvious fact, I am merely mentioning it in order to serve as a word of caution so as to make the solutions that we evolve here, both practical and satisfying.

Mr. Chairman, I have dealt with only some of the major problems confronting this Conference and have shared with you our present thinking on them. My delegation keeps an open mind and we have learnt a great deal from the statements already made by my distinguished colleagues from developing countries. We have also been heartened by the speeches made by the distinguished Ministers of industrialised countries of the world at this Conference welcoming the broad objectives of the Conference and signifying their agreement and willingness to make a constructive contribution to the solutions of these problems. It is in the spirit of an international co-operative effort that we have met here to bring about a mutual understanding of one another's needs and possibilities and also of solving the basic problems even if it involves some sacrifices on the part of the industrialised countries and more intensive efforts on internal development on the part of the less-developed countries. To this effort, Sir, I pledge the full support of my delegation.

On the part of the industrialised countries even though I have used the word sacrifice, it is a pleasant direction of adjustments and investments into the long-term prosperity of their own countries and the world as a whole. In regard to the internal efforts of the developing countries, the friendly atmosphere in this Conference and such results as we hope will emerge out of deliberations of this Conference should give strength and confidence to the governments and the peoples of the less-developed countries to activise their productive apparatus in the field of agriculture and industry and other sectors of development of human resources in their own countries. Let us hope that all the internal programmes of economic growth aided by increasing external trade and aid from industrialised partners could ultimately result into the major objective of reducing and eliminating poverty and hunger from all the lands of the world.

Need for a Practical Twist

STATEMENT MADE by the Indian Delegate, Dr. S. R. Sen, in Committee I on "International Commodity Problems" (April 10, 1964) is reproduced below:

During the last two weeks we have heard in this Committee a number of interesting and useful statements both of a general nature and on sub-item (a) of our agenda. It is now possible to summarise the consensus reached on sub-item (a) as follows:

(i) the demand for primary products is growing at an unduly slow rate;

(ii) the share of developing countries in world trade is declining;

(iii) there is a tendency for primary commodity prices to deteriorate in relation to prices of manufactures;

(iv) there is a tendency for primary commodity prices to fluctuate unduly;

(v) the developing countries are unable to finance out of exports the needs for imports of machinery and manufactured goods needed, especially for achieving the objectives of the Development Decade; and

(v) the developing countries are unable to finance out of exports the needs for imports of machinery and manufactured goods needed, especially for achieving the objectives of the Development Decade; and

(vi) the inadequacy and uncertainty regarding the foreign exchange earnings of developing countries are adversely affecting their plans for economic development.

The Indian delegation feels that it would be desirable not to spend any more time on sub-item (a). On the basis of this consensus the Committee should now proceed to give practical consideration to the various measures which have been proposed in the Report of the Secretary-General, the Report of the second session of the Preparatory Committee and other relevant documents. The Secretariat has been good enough to circulate a list of some of the concrete measures proposed. The list may not be complete. But the Committee could accept it provisionally as a basis for its work. Meanwhile, the Secretariat could prepare a more complete and suitably classified list for the consideration of the Committee.

In course of the discussion in the plenary as well as in this Committee, we have already got certain valuable indications of the positions of different delegations on the various proposals under consideration. These proposals may be classified into two broad categories:

(a) policies and measures of a general character, and

(b) policies and measures relating to specific commodities. Since the time at the disposal of this Committee is rather limited, my Delegation feels that this Committee may now profitably concentrate its attention on considering the former, that is, policies and measures of a general character. So far as the latter is concerned, that is, policies and measures relating to specific commodities, it may be useful to follow the suggestion of the distinguished delegate of Australia and prepare a "request list of commodity tasks to be transmitted to the concerned agencies of the UNO with the backing and authority of this Conference for the purpose of achieving fresh break-through of specific commodity problems" in the light of the general decisions that may be taken in this Conference. This list may be prepared at the end of our consideration of the general policies and measures in course of which the problems of specific commodities also will no doubt be mentioned by way of illustration.

So far as policies and measures of a general character are concerned, there is now near-unanimity among the developing countries. This is indicated not only in the declarations made at Alta Gracia by the Latin American countries, at Tehran by the Asian countries and at the recent meeting of the ECA by the African countries, but also by the statements made by their representatives at this Conference. There is general support for the proposals made in regard to commodity problems in the report prepared by the Secretary-General.

In the view of the Indian Delegation, a time has come when piecemeal solutions must be regarded as grossly inadequate and a bold approach has to be made on a number of related fronts in regard to trade in primary commodities, if we are to achieve not only the objectives of the Development Decade, but also to create conditions for accelerated development of all the under-developed countries in the period beyond. The general approach has to be outward-looking, expansionary and dynamic rather than inward-looking, restrictive and rigid.

The Indian Delegation feels that the minimum that requires to be done for achieving these objectives is to agree that—

(a) there should be free access for all the products of the less-developed countries into the markets of the developed countries;

(b) tariff and non-tariff barriers and discriminatory practices in the developed countries against the import of primary commodities which they do not produce should be immediately removed; and a phased programme (including programmes for reconversion) should be adopted for reducing and removing the obstacles to the import of other primary commodities to the developed countries from developing countries;

(c) centrally planned economies should progressively enlarge, according to an agreed scale, their purchases of the primary commodities exported by developing countries;

(d) a phased programme (including programmes for reconversion) should be adopted to reduce the obstacles standing in the way of trade in primary commodities between different developing countries, although they are not able to reduce protective measures against imports from developed countries;

(e) effective measures should be taken at the international level for guarding against adverse impact of substitutes and synthetics, for promoting new uses for primary commodities and generally for increasing the demand for and trade in these commodities;

(f) ways and means should be devised to stabilise and secure remunerative prices for the primary commodities exported by the developing countries. With this end in view, the system of commodity agreements should be improved and extended to major primary commodities or groups of such commodities. Serious consideration should be also given to the proposal to have multilateral agreements to establish floor prices at equitable levels for primary commodities. However, the basic approach of all these agreements should be expansion of consumption and regulation of marketing rather than restriction of production;

(g) where commodity agreements do not appear to be feasible or desirable, alternative commodity arrangements, including provision of a forum for consultation and confrontation, should be made;

(h) there should be a strong Committee on Commodity Trade under the new institutional arrangement for Trade and Development so that commodity problems are vigorously pursued and solved. So far as agricultural commodities are concerned, the FAO machinery should be utilised to the full extent. But for non-agricultural commodities, especially for minerals, which demand increased attention and also for the co-ordination of the work of various agencies dealing with commodities, such a Committee is essential;

(i) there should be adequate provision for compensatory financing

(1) on a general basis through IMF, IBRD or some other UN organisation, and

(2) related to specific commodity arrangements through "trade development and price fluctuation funds".

This provision should not, however, be at the expense of general development aid which is essential for the development and diversification of the economy and hence for the diversification and steady growth of the export trade of the developing countries.

As has been mentioned earlier, there is near-unanimity among the representatives of developing countries in regard to most of the proposals outlined above. But there seems to be still a certain difference of opinion between the developed countries. The Indian Delegation feels that it would be useful if in regard to each of the proposals listed by the Secretariat, the developed countries first give a more precise indication than has been available so far as the extent to which they are prepared to go. Where one developed country finds it possible to go much more than other developed countries towards meeting these proposals, an explanation of its position would in fact go a long way to allay the apprehensions and overcome the reservations of the latter. It is in this manner that the discussion in the Committee can be given a most constructive and fruitful turn. In view of the encouraging statements which have been made by some of the representatives of the developed countries, the Indian Delegation hopes that it should be possible for this Committee to recommend unanimously concrete and effective measures and actions which will lead to a steady expansion of the markets for primary commodities, stabilise their prices at equitable and remunerative levels and ensure for the developing countries a steady increase in their export earnings.

Accent on Export of Industrial Goods

STATEMENT BY the Indian Delegate, Mr. K. P. Goenka, President, Federation of Indian Chambers of Commerce and Industry, in the Second Committee of the U.N. Conference on Trade and Development on April 1, 1964 is reproduced below:

My Delegation attaches the utmost importance to the work and the results of the Second Committee. The establishment of this Committee is based on a clear recognition of the need for a rapid expansion in the exports of manufactured and semi-manufactured goods from the developing countries. The problems confronting exports from such countries have been studied in the GATT as well as in the Preparatory Committees of this Conference. I do not, therefore, want to take the time of the distinguished delegates here in reciting too many statistics, but I would just state very briefly the nature of the problem.

Today the share of the less-developed countries in the world exports of manufactured goods is only 5.6 per cent. This figure includes such goods as base metals and other semi-processed products, which themselves are in the nature of raw materials for further processing. The rate of growth of exports of manufactured goods from the less-developed countries is only 4.3 per cent as against the average rate of growth of 7.9 per cent for the whole world. The various documents that are before us and the many speakers who have given expression of their views in the plenary conference and in this Committee here recognise that in bringing out the much needed

structural change in the economies of the developing countries, the exports of manufactures and semi-manufactures will have to play a very important part. A new pattern of international co-operation both in the field of trade and developmental assistance has to emerge. It is in fact one of the historical imperatives of our times that it should be so, not only in the mutual trading interests of the nations but also in the interest of harmonious and peaceful co-existence. Increasing facilities for the exports of manufactures from the less-developed countries are needed to foster their economic development.

Sir, the paper on allocation of agenda items to the Second Committee has divided this subject under three head. The first deals with the measures and actions for diversification and expansion of the exports of manufactures and semi-manufactures by developing countries. As far as my country is concerned it has given the pride of place in its developmental programmes to increasing its exports. Our target is to double our exports by the end of the fourth Plan, i.e. by 1970. Of course here I may draw the attention of the Committee to the fact that ours is the lowest per capita exports of £1.10 sh. per head per year against the average of exports of £15 per head per year and of some countries like New Zealand and others whose per capita export is as high as £250 per head per year.

Diversification of Exports

It has been, therefore, India's endeavour to diversify and increase her exports both direction-wise and commodity-wise. Although these exports are giving us some results, three-fourths of our foreign exchange earnings continue to come from traditional items like tea, textiles, ores and other raw materials. Despite the fact that India has the resources and the requisite manpower with which she is in a position to produce items of comparatively simple manufactures based on locally available raw materials, its share in the world market for such manufactures is still negligible. As far as we are concerned, we are giving a new orientation to our export effort, organisationally as well as by exploring new markets. The limiting factor seems to be the lack of willingness on the part of our more developed friends to absorb a larger percentage of our products.

Before I come to the second item on the agenda namely, the measures for securing greater access to the markets of the developed countries, I would like to mention that we look upon exports and this also happily has been recognised in the various documents I have referred to as a very important pre-condition of development itself. Although we are in the middle of our third five-year Plan, we still find that industrial development even on a modest scale in our country is thwarted, among other things, on account of the low purchasing power of our people and inadequacy of capital and foreign exchange resources. In the case of quite a number of products which India is pre-eminently suited to manufacture on a large scale, an assured access to some of the important markets for them will, therefore, be of great help in her economic development.

The increased access to manufactured goods of the developing countries will have to be provided not only through the removal of the existing trade barriers such as high tariffs, quantitative restrictions and others, but also by according specially favourable tariff and trade treatment to their products. It is relevant to mention, in this connection, the role of co-operation between industrialised and less-developed countries in the field of capital investment in export oriented industries. I am sorry to say that there have been instances where foreign collaborators have made it a pre-condition of investing in India that the products of those industries would not be exported. Happily a mild change is noticeable in this attitude, but still the resistance continues.

Some distinguished delegates have referred to oligopolistic purchasing organisations of some of the developed countries. A reference has also been made to restrictive business practices in the field of international trade. I suggest that it will be useful if this Committee were to devote some of its time to these problems.

National policies in the industrialised countries will have to be reoriented and adapted so as to enable them to absorb the imports of manufactures and semi-manufactures from the developing countries in larger and larger quantities.

At present the manufactured goods exported by the less-developed countries are such that they are produced by highly labour intensive industries. These exports take place on the basis of the comparative cost advantage. However, in future export sectors with greater capital intensity will have to be built up with the help of advanced technologies which will have to come from the Industrialised countries. Ways and means will have to be devised for obtaining the technologies and also an assurance of offtake of such manufactures by the industrialised countries. I, therefore, feel Sir, that in this field the efforts of the less-developed countries should be actively supplemented by the aid and assistance from the industrialised countries.

I would like to refer in this context in particular to the facile reasoning by which the competitive exports from less-developed countries are sought to be excluded. In the case of commodities which are able to compete on their merits we are quite frequently confronted with the argument that these commodities are low cost manufactures. We have tried to prove on more than one occasion that in spite of the fact that wages per man-hour in countries like ours may be low, we are not a low cost country in the sense in which the term is interpreted in some of the importing countries. It is a fact that there are several economic factors which make it difficult for less-developed countries to offer equal competition in manufactured products in world markets. My Delegation appreciates the fact that some of these commodities and particularly textiles are well established industries in the countries in which these arguments originate. The point, therefore, has to be made that if any concrete results are to be achieved by this Conference a plea should be made to the more advanced countries to bring about structural and organisational changes in their industries with a view to shifting the emphasis in production to the more sophisticated goods of advanced technologies, i.e. capital goods and other complex goods. In the absence of this orientation no substantial advance on the lines on which the Conference is thinking will be possible.

Developmental Resources

Some of our colleagues have made suggestions which merit serious and expert thought and attention. The distinguished delegate from Nepal made a valuable point. Our Delegation considers that this point is worth recapitulating and reiterating. The problem of finding developmental resources and of bridging the gap between the need for resources and their availability is one that faces all developing countries uniformly. Some of the developing countries like India, Pakistan, Indonesia, United Arab Republic, Malayasia, Philippines, Nigeria, Ceylon, Mexico, Brazil and others are perhaps in the process of earlier industrialisation than some others. But the problem of resources is central in character and is with us right now. It is realised that this problem is inescapable in the case of any developing country and has to be faced rather sooner than later. I would therefore submit that all of us, whether representing developed countries or developing countries, should look upon this as a universal problem of

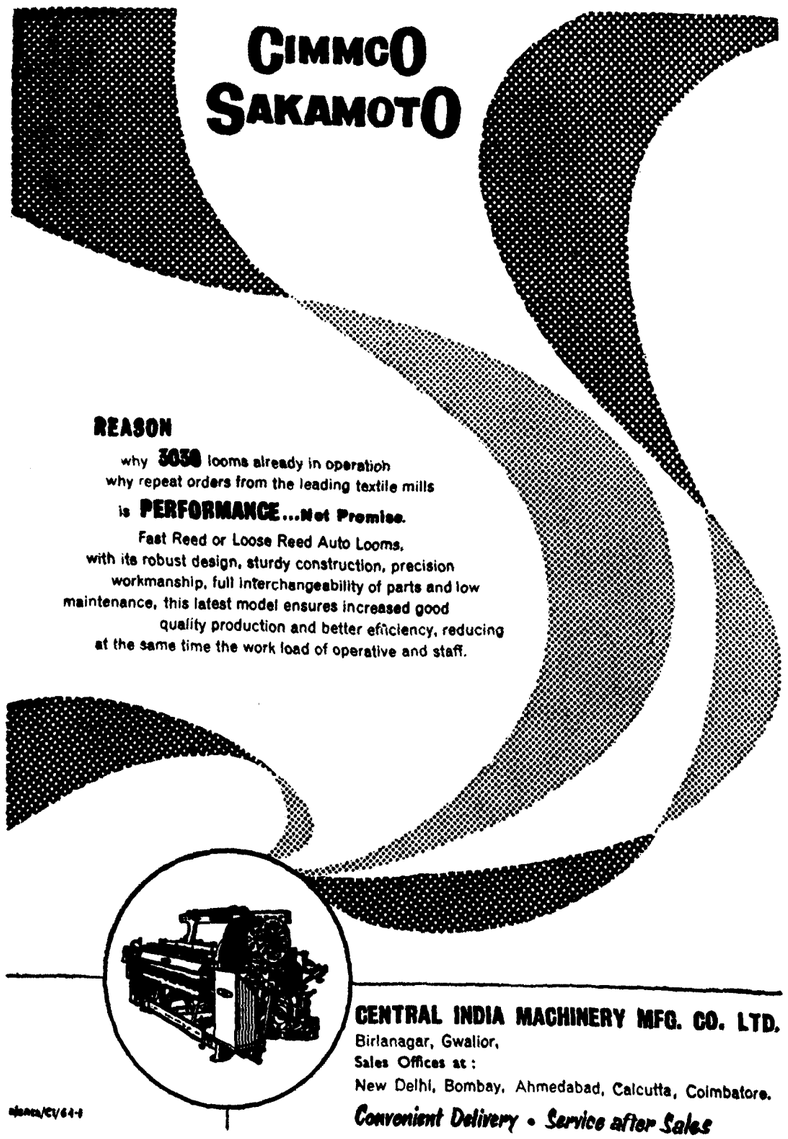
A topic often raised ....

The prices of cars produced in India

The "on the road" price of a car such as the Hindusthan Ambassador in Calcutta is Rs. 15,266 (in other parts of India, transportation and other charges/taxes are to be added). How is this price made up?

1
The total amount of Government levies, including excise, customs duties and taxes paid by the car manufacturer and by the ancillary industries constitutes the highest element of the price structure. It represents fully one-third of the "on the road" price of a car such as the Hindusthan Ambassador delivered in Calcutta.

2
Considering the high cost of raw materials and capital goods in India as compared with costs in the U. K. and the U. S. A., this item constitutes a relatively low percentage of the total price of the car, and the manufacturer's profit included in this item represents but a small fraction of the total.



3
This element of the price represents the cost of the large quantity of components of the car purchased by the manufacturer from ancillary industries in India, exclusive of direct and indirect taxes paid by these industries. Largely because of the low productivity of some of these recently established industries, the cost of the indigenous components purchased from them is over twice as high as that of the imported counterparts.

4
In the case of the Hindusthan Ambassador, for instance, the indigenous content has now reached 80% and therefore the cost of the remaining imported components (exclusive of Government levies) represents only about one tenth of the "on the road" price in Calcutta.

5
The commission of the selling dealer including distribution, service, advertising, etc., comes to barely 7% of the "on the road" price. Considering the high overhead expenses and the service obligations of the dealer, his return on investment is an absolute minimum.

development and not something that affects some developing countries and not others.

I would wish to pick up also a point which the Leader of the Delegation of Afghanistan mentioned in the plenary on the 30th March — while undoubtedly enlarging the size of the market, regional groupings of developing countries in our view cannot provide an adequate panacea or even a proximately effective means for increasing the exports of manufactures and semi-manufactures of developing countries. Many of the developing countries have a measure of purchasing power. They are afflicted by balance of payment difficulties. Their capacity for absorbing manufactured goods is often limited. This is not to deny that benefit could be derived from the development of regional economic groupings and perhaps, even more, through payments arrangements with suitable backing in certain fields. But these are matters that require careful study, patient work and intelligent co-ordination, informed by mutual goodwill. Immediate and purposeful promise lies, however, in the direction of increased exports of manufactures and semi-manufactures by developing countries to the industrially advanced, affluent, developed countries.

While referring to the need for expansion of exports of manufactured and semi-manufactured goods from the developing countries, the distinguished delegate of the Netherlands said in the plenary the other day that protectionist arguments against such expansion reflect shortsightedness and selfishness. This point has also been emphasised by Dr. Prebisch in his report when he says that the possible magnitude of the problem, if it is a problem at all, caused to the developed countries by the expansion of exports of manufactured and semi-manufactured goods from the developing countries would only be marginal.

I hope that in the detailed work of the Committee which is to follow this general discussion, the delegates of the industrialised countries who are assembled here will come forth with ideas and concrete proposals to achieve the accepted ends. The problems confronting the exports of manufactured goods are many and I would not wish to catalogue them all in this brief speech. I have, however, attempted to give my broad ideas and the lines of thinking of my Delegation. My Delegation will spare no effort in co-operating with all the delegates in this Committee towards finding constructive solutions for the many problems which we have to deal with.

Untied Loans for Development

STATEMENT BY the Indian Delegate, Dr. N. A. Sarma, Director Reserve Bank of India, in Committee III of the U.N. Conference on Trade and Development on 6th April, 1964 is reproduced below.

The main work of this Committe would pertain to a few broad sub-heads.

(i) Financial arrangements for the stabilisation of markets and prices for primary commodities, including any arrangements for compensatory financing when there is a perceptible deterioration in terms of trade;

(ii) Financial assistance for trade development, including the financing mechanism required to promote intra-regional trade against developing countries themselves ;

(iii) Development assistance proper: its magnitude, as well as terms and conditions thereof. The inflow of private foreign capital into the economies of less-developed countries is an integral part of this which needs careful consideration, as it has a distinct role to play in the economic development of less-developed countries ;

(iv) Invisibles, including especially freight charges.

Any assistance rendered by industrially advanced countries to developing countries through the removal of existing barriers to their exports as well as through preferential treatment accorded to their exports, or any compensatory financing of short-falls in export proceeds for primary producers, and, in fact, any form of assistance rendered through trade, is important. However, if in its totality it should impinge to any degree on the scale of development assistance proper, it would be of little use. It is important to remove the structural deficiencies in the trade pattern of less-developed countries, but this cannot replace the need for development aid for the economic growth of these countries. A basic premise to our consideration of these questions, therefore, is that the total assistance to the weaker economies, through trade and aid, should be enlarged. For a long period of years both trade and aid will have to continue as the main instruments for assisting the economic growth of less-developed countries.

The stabilisation of prices and markets for primary commodities could be attempted in a series of commodity agreements covering the main cereals, fibres, beverages, vegetable oils, rubber, minerals and metals. A measure of discipline both on the consuming countries (by way of balancing the growth of synthetics and substitutes) and on producing countries (by periodic restraints on production, to be determined from time to time, which might otherwise tend to overstrip demand) has to be an accepted feature of such commodity agreements. Secondly, the building up of stocks and market operations based on them would require financial contributions by developed countries, particularly the principal consuming countries. An arrangement within each commodity agreement for a "trade development and price fluctuation fund" should also be considered. There may also be several commodities in respect of which there may not be any definite commodity agreement but which may have to be subjected to a certain degree of informal regulation through the process of consultation and confrontation in a common forum and may require a certain modicum of financial assistance for reconversion operations or for tiding over difficult periods of adjustment. One way of assisting the primary producers is to conduct systematic research for finding new uses for some of these commodities, and thereby to some extent offset the consequences of technological progress which results in the development of synthetics and more economical use of the raw material resources. Much greater effort and finance must go into this than hitherto. Finally, the enduring solution to the problem of primary producers lies in the diversification of their export trade, so that undue dependence on one or two items is gradually reduced; this diversification could be partly in the agricultural sphere itself, but should certainly be partly through industrialisation.

The International Monetary Fund has adopted in February 1963 a limited scheme for compensatory financing of export fluctuations. In brief, it seeks to finance export shortfalls of a short term character, up to 25 per cent of a member's quota normally, by waiving the limit of 200 per cent on Fund holdings of a member's currency. The Fund could explore in the immediate future the possibility of further widening the scope of its scheme. In this context we may note with satisfaction the reference made by the President of the IBRD in his address to this Conference to the World Bank's role in this regard. It is to be hoped that the Fund and Bank would soon together

explore the issues involved and be able to provide finance for mitigation measures to a much greater extent than hitherto.

Another general aspect relates to the functioning of the International monetaryl mechanism. So far this mechanism, and proposals currently under consideration for its reform, have been looked at from the question of international liquidity, that is essentially from the view point of the problems of the so-called key or reserve currencies; it is important that these are considered as part of the world trade mechanism. The case of developing countries for general balance of payments support from the International Monetary Fund or some other such institution, on a medium-term basis, say five to seven years, and at reasonable interest, would then appear in better light. There is also the need for extending financial support to enable the developing countries to experiment with liberalisation of trade among themselves. In this the Fund and other institutions can play an important role.

The scale, and terms and conditions, of development assistance have also to be considered. Urgent consideration needs to be given to the net magnitude of aid, i.e., 'net' of repayments falling due. A long period of maturity and low interest cost are particularly indicated in case of all long-term credits for development projects. Several of the less-developed countries are already faced with a very difficult situation in regard to servicing of external debt. India herself, while making but a modest effort in development, already finds servicing of its external debt obligations to be about one-sixth of her export earnings. One possible approach to the problem of servicing is through deliveries of goods; this would call for a considerable measure of understanding on the part of the creditor countries. We should note here that more recently there have been instances of long-term loans with fairly long initial moratoria, waiver of interest for an initial period; other examples too of not-so-long period loans but with low interest rates, and even of repayments in goods. Thus the arithmatic of development financing is being better understood in some of the developed countries. What is needed is further adaptation, extension and combination of these methods; this needs to be closely studied.

Flexibility in Utilization

Aid for a development programme as such should give a degree of freedom to the recipient country in regard to foreign exchange allocations and utilisation, instead of being tied to projects. This would give a certain measure of flexibility which enables the recipient country to rearrange the constituent parts of its development programme according to any necessary changes in priorities. On the other hand, assistance earmarked for a particular project makes it rigid; the aid will be utilised or remain unutilised depending upon what progress the project makes. Moreover, aid to a project gives rise to cost-benefit consideration specifically to a project whereas aid for a development programme would be governed by much larger considerations. The implications of tying aid to particular sources of supply are:

(a) the operations become rigid;

(b) the recipient country is denied the opportunity to purchase in the most competitive market; and

(c) if the cost of machinery and goods purchased with the credit in a particular market are relatively high, the real value of the aid is reduced.

For some time, the difficulties of the recipient countries could be met by the willingness on the part of the creditor countries to accept repayments through purchases of goods in the repaying countries, in addition to the normal commercial purchases. A developing economy requires, in the process of industrialisation, not only imports of capital goods and equipment but also imports of raw materials and components. These keep on increasing as industrialisation proceeds and it may not be possible to finance their import out of export earnings. Therefore, development assistance has to cover also such maintenance imports.

Consideration may also be given to yet another aspect of aid...the possible use of aid funds to an increasing extent for procurement of supplies from developing countries. This would be analogous to the "off-shore" purchases by the U.S.A. during World War II. Such purchases out of aid funds would contribute to economic activity in the developing countries in which purchases are made.

Private Capital Transfers

It is not necessary to consider in detail the relative merits of private capital transfers and official loans; in view of the large requirements of developing countries, both should be welcome, so long as neither imposes in onerous burden on the recipient country. Private capital brings technical know-how and business management. However, private capital inflows into under-developed economics in recent years have been inadequate and have been into fields which are not of basic importance for the over-all development of the economy; the foreign exchange burden has also been heavy. There are several measures which both the creditor countries as well as the recipient countries can take to assist the smoother and larger flow of private capital into productive enterprises. One of them is the provision of investment guarantees by capital exporting countries; the role of the I.B.R.D. (or some other international institution) to enlarge the scope of investment guarantees provided by national governments might be explored. In considering the private capital flows, hardly any attention has been paid so far to the reverse flow of private capital from developing to developed countries. Capital flowing from developing countries to advanced countries is indeed a paradox. This may be due to several factors, not only to the repatriation of foreign capital for genuine reasons. Suffice it to note, in this context, the observations in the Annual Report for 1963 of the International Monetary Fund: "The recent rise in the flow of total financial resources from the industrial countries to the less-developed countries appears to have been offset, to some extent, by increased outflow of domestic capital from these countries, which in some instances has had the character of a capital flight."

Under invisibles, while banking and insurance charges, royalty payments and other items are important, the importance of shipping freight rates to the trade of developing countries, especially in the case of low value commodities of heavy bulk in their exports and in the case of equipment and machinery in their imports cannot be over-stated. Far from helping the exports of underdeveloped countries, there seems to be prima facie evidence to show that freight rates discriminate against developing countries, not only by commodities but by routes also. There is also need here for greater co-operation, and co-ordination of effort, among developing countries themselves. Measures to regulate shipping conferences and to exercise some degree of control over the structure of freight rates, to what extent promotional freight rates could be adopted to assist new exports of developing countries, the scope for investment in merchant shipping by developing countries acting jointly, are among the several complicated questions that would need to be considered with care. This is an appropriate subject, it seems to us, to be referred to a Sub-Committee of this Committee for intensive consideration. Similarly, questions relating to the financing mechanism required to promote intraregional trade among developing are suggesting these two Sub-Committees with a view to be referred to another Sub-Committee, with advantage. We countries, say, through a payments arrangement, could also facilitating the work of this Committee, and their recommendations should come up before this main Committee for final consideration.

Permanent Body to Regulate Trade

STATEMENT MADE by Mr. S. Vohra, Indian Representative, in the Committee on 'Institutional Arrangements.' (April 7, 1964) is reproduced below :

This Committee has been entrusted with the task of considering what institutional arrangements, methods and machinery are necessary to implement measures relating to the expansion of international trade. The Conference has been convened to consider the problems of the developing countries...the problems of trade and development. We have, therefore, to make a re-appraisal of the existing international bodies dealing with problems of international trade and economic development of developing countries, and to establish co-ordination and consaolidation of the activities of these bodies by effecting organisational improvements and initiatives, so as to maximise the beneficial results for promotion of trade and economic development. We have also to study to what extent any new institutional machinery is needed to strengthen these efforts in the directions and fields desired by this Conference.

The specific problems which are to be solved to help the developing countries to achieve the objectives of economic growth through expansion of their trade have been entrusted to the various Committees. We have no doubt that this Conference will be making many important recommendations for the solution of these problems. This Committee No. 4 has been entrusted with the task of examining how far the existing institutions are in a position to implement and to help to give a practical shape to the recommendations of this Conference in particular, and to the problems of world trade in general.

A suggestion has been made earlier that the Committee should issue a questionnaire to the existing international organisations in the field of trade to ascertain their own assessment of how far they would be in a position to tackle the various problems of trade and development which are under consideration. In the opinion of my delegation, this procedure is neither practicable nor necessary. The working of the various international organisations dealing with trade is within the knowledge of the various countries. More particularly, their working has been under review in connection with the preparatory work of this Conference, and it is now for the member countries to express their opinion and conclusions regarding the efficacy of these bodies for carrying out the tasks that are likely to be entrusted to them as a result of the decisions that would be taken at this Conference.

Prominence of GATT

Among the institutions connected with world trade, the GATT has undoubtedly a prominent place. We have been associated with the GATT as its member from its inception and there is no doubt that the GATT has worked as a useful instrument for the limited purpose for which it was created. The basic agreement of GATT has been governed by contractual obligations relying on mutual benefit derived from an exchange of concessions on a multilateral most-favoured-nation approach. However, the working of the GATT has tended primarily to help the developed countries to expand their trade due to the character and content of the Agreement and the policies pursued by the industrialised countries. This has to be reversed if GATT has to serve the interests of the less-developed countries as desired by all the nations and this Conference. The problems before this Conference are much wider and of a fundamental nature. The problems of developing countries have to receive the consideration that they deserve in the GATT. Some beginning has been made in this direction by the GATT Ministerial declaration of May 1963. The GATT has also instituted a Committee on Legal and Institutional Framework to draft a Model Chapter for the steps that need to be taken for helping the development of the trade and economies of the developing countries. However, in view of the nature of the problems which confront us, we shall have to carry this effort much further and introduce certain radical changes in the composition and the working of the GATT. Our specific proposals are as follows:—

(i) the policies, rules and procedures of the GATT should be amended to take into account the consequences of structural inequalities between the developed and the developing countries so that it is better fitted to tackle the problems of world trade, especially those of the developing countries;

(ii) the GATT through the additional of a suitable contract or through a supplementary arrangement of the GATT, should recognise the system of bilateral trading with centrally planned economies and market economies. The state trading system has come to stay and its recognition and regulation by the GATT will help to promote trade between the developing countries and the countries with state trading systems on the one hand, and between industrialised countries and the state trading countries on the other;

(iii) this will enable the GATT to become fully representative of all the members of the United Nations who are agreeable to its liberalised policies and revised rights and obligations.

Without such radical alterations, the GATT will remain an instrument of limited utility insofar as the problems before this Conference are concerned. We are therefore in favour of reorganising the GATT on the lines proposed.

International Organisations

There are a number of other international organisations which are doing useful work in the field of international trade. The Economic and Social Council of the United Nations, and the Regional Economic Commissions established under its auspices are doing very useful work in the economic field. The United Nations Commission on International Commodity Trade (CICT), the Interim Co-ordinating Committee for International Commodity Arrangements (ICCICA) and the F.A.O. are doing useful work in the field of primary commodities. International financial institutions like the IMF have also played a useful role in international financing. It will be necessary for these and other organisations to play an even more important role in international trade than in the past. However, it is clear that it is most essential to establish an overall competent machinery to look after the diverse aspects of international trade and economic development and also to co-ordinate the activities of the existing organisations and new specialised bodies or committees that may be set up insofar as they are related to trade and development.

This re-appraisal of the existing bodies dealing with international trade and development with a view to consider as to how far they are capable of dealing with the problems of trade and economic development of the less-developed countries as clearly identified in the Prebisch Report and by the Preparatory Committee of this Conference, shows their inadequacy and underlines the need for the setting up of more comprehensive and adequate machinery to deal with the problems of different systems of trade, and development. The important question that arises is what machinery would implement the decisions that are being taken or the recommendations that are being made at this Conference.

It is clear that there is need (1) to make this Conference a continuing permanent body under the direct

auspices of the General Assembly of the U.N.; (2) it should have an independent, permanent and full time secretariat under the overall authority of the Secretary-General of the U.N.; (3) the Secretariat of this Conference should also be assisted by a compact high-level commission or group of six or seven experts to whom important economic questions and problems can be referred to as may be found necessary; (4) as the Conference will be meeting only periodically, say, once in two years (or as the need may be), there should be a Standing Committee on Trade and Development to be appointed by the U.N. General Aseembly, so that such a Standing Committee, assisted by the Secretariat, can review and carry forward the work and programmes endorsed and initiated by the Conference in co-operation with GATT and other agencies and institutions. The Standing Committee should co-ordinate the work of its other committees and bodies in different directions along with the work of other specialised agencies; (5) there could be four or five committees to be appointed by the Standing Committee for specialised subjects, for example, (i) commodities, (ii) financing the expansion of trade, (iii) shipping and other invisibles, (iv) regional trade and economic co-operation, etc. In addition, the GATT with its reoriented structure and policies could continue to deal with problems of trade agreements and tariffs. We also envisage that the GATT will report on its activities periodically to the Conference and will maintain liaison with the Standing Committee.

We have earlier mentioned how the trade between market economies and centrally planned economies should be recognised and regulated by the GATT. In case, however, because of any technical reasons, the GATT is not able to undertake this, an appropriate body wil have to be set up under the Conference and its Standing Committee for this purpose.

The Conference and the Standing Committee organised as above, will (1) examine the implementation of the recommendations and the decisions of this Conference so as to identify the countries who have to take action in pursuance of these decisions and recommendations, and take up with them the question of implementing them, (2) co-ordinate with other international organisations insofar as they can help in the implementation of these decisions/recommendations, and (3) study and make recommendations regarding other problems of world trade and development that may arise from time to time.

In other words, a permanent body like the Standing Committee is nedeed to ensure that the decisions and recommendations of this Conference are given effect to, to the maximum extent possible, by the countries concerned, by taking concrete steps to implement them, and also to see that suitable action is taken by the other U.N. organisations in the field of economic development and trade in pursuance of these decisions. What the precise composition and size of this standing body should be, is a matter on which we shall have to take a joint view when we discuss the matter in detail in the Committee. My delegation would, however, like to suggest that this body should report to the UN General Assembly and the U.N. Conference on Trade and Development from time to time.

Mr. Chairman, Sir, the Indian delegation has made the above proposals in the hope that the industrialised countries and other nations will find them worthy of consideration and acceptance. Our object in making the above proposals is to utilise the existing machinery and institutions to the extent we can benefit from their experience to provide additional machinery which is necessary for the new tasks before us. If, however, the industrialised nations would not be willing to consider the reorganisation of the GATT as proposed above, so as to make it an effective instrument for promoting the trade of the developing countries and for making it universal in character open to all the members of the United Nations, I am afraid, we will have to seek some more far-reaching solution in the form of a comprehensive international trade organisation which will cover all the functions of trade and economic development, namely, trade agreements, tariffs and other aspects of trade and development as proposed by us above, so that they can be looked after by such an organisation functioning under the auspices of the United Nations. It is our earnest hope that it would be possible for this Committee to consider the above proposals as a whole for the overall institutional and organisational pattern in the field of trade and economic development.

New Rules for Development-Oriented Trade

STATEMENT MADE by Prof. V. K. R. V. Rao, Member, Indian Planning Commission, in Committee Five on "Principles of International Trade in Relation to Promotion of the Economic Development, is reproduced below":

Our Committee has been charged with such wide terms of reference that part of its deliberations are bound to cover the spheres of the other Committees appointed by the Conference. It is, therefore, desirable that in our deliberations, we should concentrate on enunciation of the principles on which we can build up international trade with its accent on the promotion of the economic development of the less-developed world rather than on details of the arrangements regarding individual commodities or sectors. We have, of course, also a specific responsibility for considering the place of regional economic planning in international trade, from the point of view of its relation to economic development.

The stage has been set for us by the decision taken by the United Nations Organisation to make these 10 years as the Development Decade when with national and international effort, the less-developed countries of the world would achieve a global rate of economic growth of not less than 5% a year. We have no doubt that the achievement of this target is bound to call for almost heroic efforts in the national field both as regards mobilisation of resources as also their utilisation in a planned manner. There is no substitute for national effort either in defence or in economic development. But with all the national effort in the world, logic as well as experience has shown that international effort is also a necessary condition for the achievement of the U.N. target for the Development Decade.

Let me illustrate the point from the record of my own country. We have completed two Five-Year Plans and achieved a rise of 42% in our national income in real terms as a consequence. During these 10 year period ending with 31st March 1961, we invested total amount of more than $20 billion of which foreign aid excluding private foreign capital and PL 480 funds, accounted for not more than 10%. It will be seen from these figures that India has largely relied on her own resources for her economic development during this period. But I must say quite frankly that apart from other reasons, an important factor that impeded our rate of growth, was scarcity of foreign exchange. This was due not so much to the lack of substantial foreign aid as the fact that our exports failed to increase to any significant extent during the period. Partly, no doubt, this was our fault; and we have tried to correct it during the Third Plan period by more vigorous export measures. I may add that we also achieved some success in this effort. But the progress achieved is not

Shalimar Industrial Finishes

Shalimar Paints offer you a wide range of industrial finishes, ready-made or specially formulated for stoving, air-drying, dipping and spraying; litho varnishes and stand oils, fire-resistant paints, epoxide chemical-resistant paints, wire enamels and insulating varnishes and compounds. Like every Shalimar product, Shalimar Industrial Finishes bring you the sum of four decisive elements — resources, research, know-how, quality-control — that guarantee superior quality and performance.

good enough from the point of view of enabling a satisfactory rate of economic growth. Much the most important reason for the failure of our exports to grow was the absence of an accepted policy by the developed countries for using international trade as an instrument for promoting economic development of the under-developed world. Our experience has shown clearly that while aid is important, trade is even more important and this requires a new orientation in the policies followed by developed countries in regard both to their imports from the developing countries as also in regard to linking up their own economic development with the needs and circumstances of the developing countries.

The third five-year Plan, of which we have completed three years just a few days ago, aims at the growth of national income at the same rate as that aimed for the Development Decade, namely, 5% a year. The development programme is expected to lead to payments abroad during this five-year period of the order of $13.3 billion, of which $4.4 billion would be for imports of equipment and allied goods, $7.7 billion for imports of components, raw materials and essential consumer goods like foodgrains, and the balance of $1.2 billion for servicing the debt that we have already incurred for development during the first two Plans. The average level of imports in the third Plan is approximately 50% higher than during the first Plan, increases being mostly in equipment, manufactures of metals, chemicals and fertilizers—all items imported from the developed countries. As far as we have been able to project our needs into future, the pattern is expected to remain more or less the same for the next few years.

On the receipts side, however, the picture is not very reassuring. Even after getting substantial aid, we have to export goods of the order of $8 billion, i.e., $1.6 billion per annum. Our exports have to increase by about 15% over the average of the second Plan. To the extent that assistance falls short of expectations, exports have to be increased further. Hence, the crucial importance of exports to our development plans. This will increase even more substantially in the years to come as the tempo of development rises and the scope of the programme widens. In fact, it has been estimated that the order of increase in the fourth Plan period would have to be about 75% over the level we hope to reach at the end of the Third Plan.

Machinery Imports

The position regarding the under-developed world as a whole has been estimated in some detail in the documents placed before this Conference. In order to increase the gross domestic product of the under-developed world by the U.N. Development Decade target of 5% a year, imports of machinery and industrial materials will have to be much larger than in the past. Assuming a continuation of past trends, imports of developing countries would rise from $25.5 billion in 1960 to $42 billion in 1970, the ratio of imports to gross domestic product going up from 13% to 15%. The deficit in merchandise trade would rise from $1.5 billion in 1960 to $11 billion in 1970, in addition to which the developing countries would have to make net payment for services totalling $9 billion as against $3.3 billion. Thus, the deficit in the balance from $5 billion in 1960 to $20 billion in 1970.

The minimum needs of developing countries may, therefore, be stated as covering the gap of $20 billion per annum in 1970. The gap will have to be covered by export earnings and the net flow of long-term public and private funds from abroad. Obviously, it is not possible to think of expecting from foreign aid more than a small share of the increased amount required to fill this gap. Moreover, foreign aid has to be repaid and that means increase in exports. The developing countries want to pay for their economic development. This means that they must increase their exports by an amount far larger than what they can hope to achieve by their own unaided efforts in the present framework of international trade. I agree that further national effort on our part is required and I have no doubt this will be forthcoming. But there is no escaping the conclusion that international action is needed to bring about a substantial increase in the exports of the under-developed world; and this means primarily action by the developed countries.

The Report of the Secretary General and the several documents circulated make it clear beyond doubt that the economic development of less-developed countries imposes an unbearable strain on their balance of payments. Imports mount up due to the increasing need for equipment and material from abroad, while exports remain at their previous level because they are determined by international market forces. In the absence of foreign exchange resources or international assistance, the development programmes have to be cut down to make imports match the level of export earnings. Hence, the imperative need for stepping up exports from the under-developed world and the emphasis on increasing their share in the expansion of international trade. Hence again, our emphasis on action by the developed countries to facilitate this process.

Essential Problem

How can this be done? This is the essential problem that faces this Conference; on the success with which it tackles it will depend its ability to fulfil the hopes and aspirations of millions of human beings, who are eagerly looking forward to the practical results this Conference will have on the expansion of the exports of developing nations in world trade and therefore the extent to which they will be able to raise their rate of economic growth to the minimum of 5% a year envisaged in the U.N. Development Decade.

As I said before, I do not propose to go into details at this stage. There will be, no doubt, many opportunities before us when this can be done; nor must we forget that the other Committees will also have a lot to say on this matter. What I propose to do is to suggest some broad principles for your consideration which, if accepted, will enable the necessary detailed action to be undertaken for fulfilling the objective we have assembled for.

To begin with, it must be recognised as a principle of development-oriented international trade that prices of primary products cannot be allowed to fluctuate as they have been doing in the past and thus leading to substantial and quite often continuing decreases in the export earnings of the developing countries. This will require, to some extent, diversification in the economic structure of the primary product producing countries, for which they would be prepared to assume responsibility provided of course the necessary technical and financial assistance is given to enable them to do so. This, however, will take time. In the meanwhile, immediate action is necessary for stabilising the prices of primary products and also to ensure an increase in the demand for these products along with the increase in the national incomes of the developed countries. This question is going to be considered in detail in Committee One. All that I would like to stress here is the crucial importance that this occupies in the subject of international trade as an instrument for the promotion of economic development.

The second principle of development-oriented international trade should be the removal of all barriers, both tariff and non-tariff, in the developed countries to the inflow of goods, manufactured and semi-manufactured, from the developing countries. The developing countries are interested in exporting semi-manufactures and simple manufactures to the developed countries. The tariff on such imports, however, tends in many cases to be higher than the tariffs on their imports of sophisticated manufactures, which are ex-

ported not by the developing countries but by the developed countries. In other words, tariff barriers in the developed countries are lower for the exports from developed countries than they are for the exports from the developing countries—truly a paradoxical situation when viewed in the context of the promotion of economic development. This odd result is due to the fact that the developing countries do not have much negotiating strength, while the developed countries have. Now that we are thinking in terms of looking at tariff levels not solely from the point of view of negotiating strength, but from the point of view of the promotion of economic development, it follows that developed countries should no longer impose tariff barriers on the exports of simple manufactures and semi-manufactures from the developing countries. Surely, the technologically advanced and more efficient economies of the developed countries are in no danger from the superior competitive ability of the developing countries, and do not therefore require to be protected against them by tariff barriers. No doubt, some transitional difficulties will arise in some developed countries if this policy results in a big increase in their imports of simple manufactures and therefore in some adverse effect on their own domestic industries going in for such manufactures. This is no more than an aspect of the principle of industrial transformation to which I shall revert later. For the time being, I am content with asserting the need for the removal of all tariff barriers in the developed countries to the exports of simple manufactures from the developing countries.

Mere removal of tariff barriers, however, is not enough to secure an expanding flow of exports of manufactures and semi-manufactures from the developing countries. It is also necessary to remove the numerous non-tariff barriers that have come into existence in the developed countries such as quotas, licences, mixing regulations, marketing regulations and other devices, the net result of which is to reduce the competitive ability of the exports of simple manufactures from the developing countries. It is also necessary to ensure that the situation created by the removal of tariff and non-tariff barriers is stabilised and not subjected to subsequent change, as otherwise, it would not be possible to assure expanding markets for these products of the developing countries.

Positive Discrimination

A third principle of development-oriented international trade is the creation of conditions that will make more certain the entry of the products of developing countries into the markets of the developed countries. This can be done only if the developed countries would accept, as has been advocated in so many documents placed before this Conference, the principle of a positive discrimination in favour of the products of developing countries as against the products of the developed countries. It is not necessary to add that this will not have a serious effect on the exports of the developed countries which mainly consist of sophisticated manufactures and which the developing countries are in no position to export. Indeed, a policy such as is advocated will in the long run expand the markets of the developed countries for the more the developing countries are able to export, the more will be their ability to buy imports; and more imports in the context of development means more imports of machinery, equipment, components etc. by the developing countries which means in turn more exports for the developed countries. The action suggested will thus prove to be like the quality of mercy that blesseth both him who giveth and him who receiveth. Both the developed and the developing countries will thus be able to increase their exports to one another and in tune with the current trends in the changing patterns of their economic development.

The fourth principle of development-oriented international trade is really in line with the orthodox principles of international trade which have been built on maximizing the advantages accruing from a geographical division of labour. Many of the developing countries today find themselves heavily handicapped when they want to process their agricultural and other primary products and then export them, for the tariff barriers in the developed countries are very much lower on raw primary products and very much higher on these products in processed form. Obviously, the intention behind this difference is to deny the processing industries of the primary producing countries the competitive benefit they would otherwise have enjoyed, because of the geographical location of the primary products; and instead to build up in the developed countries the processing industries, thereby giving more to those who have more and taking away from those who have less a portion of even the little they have. Obviously, such principles of tariff fixation have no place in a framework of international trade oriented towards economic development. It is necessary, therefore, that there should be a thorough review of the tariff policies of the developed countries with a view to seeing that these policies encourage rather than discourage the building up of processing industries and, therefore, simple industrialization, in the developing countries.

Diversification of Economy

As part of the principles of development-oriented international trade, or, if one were to be technically more correct, as part of the concomitant action required for the implementation of the principles of development-oriented international trade, it is important to ensure that the developing countries get all assistance from the developed countries in the diversification of their economies and in the promotion of their industrialisation. For this purpose, technical assistance is required from the developed countries for the establishment and expansion of export-oriented industries in the developing countries. It is true that it is primarily for the developing countries to take the action necessary for the establishment of export-oriented industries; but we have already seen that their technical and financial ability is somewhat limited and needs supplementing; even more, they do not have the know-how or the necessary facilities to effect an entry into the markets of the developed countries for the products of the export-oriented industries they may establish. I would like to suggest, therefore, in all humility, that perhaps this is a field where a part of the initiative may be taken by the developed countries themselves. Thus, for example, as has been suggested by one leading delegation from the developed countries, the developed countries may establish link industries in the developing countries manufacturing some parts themselves and getting manufactured in the developing countries some other parts for which they will guarantee an adequate market. There would also be many other ways by which the developed countries, if they are so inclined, can help the developing countries in establishing export-oriented industries and facilitating the export of the products of such export-oriented industries, thereby enabling these countries to finance their development by increased trade. I have no doubt that, knowing the sympathetic attitude that the developed countries generally have taken to this problem, they will themselves put forward concrete proposals for expanding the export capacity of semi-manufactures and manufactures, link industries and the like, in the developing countries and assure them at the same time of a continuing and expanding market for the products of such industries.

Before I conclude, I would like to make a brief reference to the place of regional economic planning in international trade and its relation to economic development. I believe that the developing countries should not merely ask for non-discriminatory preferences for their products from the developed countries. Nor must they proceed on the assumption that the only way to expand their exports is by obtaining a larger share of the markets of the developed countries. It is also important for the developing countries to see

that they promote trading with one another. The developing countries must take positive action to stimulate imports into their own markets of the products of other developing countries, which means in turn that developing countries will also look to the markets of other developing countries for a part of their expansion in exports. Whether this could more appropriately be done by regional economic groupings or by having non-discriminatory trade and other economic relations between all developing countries is a matter that requires to be considered in much greater detail than is possible for me to do at this stage. I have no doubt that there will be more opportunities to consider this question in this Committee later. I would like, however, to affirm the support of my country for the principle that development-oriented international trade requires the expansion of trade not only between the developed and the developing countries, but also among the developing countries themselves. My Government would be prepared to consider all practical measures that can be suggested for the expansion of the mutual trade among the developing countries, as also the strengthening of mutual aid and economic relations among them.

In conclusion, I would like to assert that the broad foundation of the case for using international trade as an instrument for the promotion of economic development, rests upon the changing economic pattern that we are witnessing in both the developed and the less-developed world. There was a time when the developed countries imported raw materials and exported simple manufactures. Over the years, the situation has changed. The developed countries are now so advanced that more and more they are turning from simple manufactures to sophisticated manufactures and their exports are consisting increasingly of machinery, equipment and other sophisticated manufactures. The developing countries now find themselves having to import machinery, equipment and the like in order that their economies may develop and get diversified and industrialised. They are finding it difficult to pay for these imports. If they export raw materials, the markets for these are not expanding due to technological advance in the developed countries, in addition to which the prices they receive fluctuate and bring them reduced earnings. If they export simple manufactures, they find that the developed countries, by and large, close their markets to these products, because perhaps of an understandable concern on their part for the adverse effects this may have on their own domestic industries that are engaged in simple manufactures. But these simple manufactures are becoming less and less important in the developed countries. Even domestically their productivity is low and their own economic growth would be accelerated if they could turn their labour now engaged in the simple manufactures to the more advanced and more productive sophisticated manufactures which indeed is becoming the keynote of their economic development. Here then is, in some ways, a similar problem that confronts both the developed and the developing countries. The developed countries have their problem of industrial transformation in going from the stage of simple manufactures to the stage of more complex manufactures, while the developing countries have their industrial transformation problem in going from their agricultural and non-industrialised economies to diversification, industrialisation and the establishment of simple manufactures. There is, therefore, no conflict between the developmental needs of both the developing and the developed countries. By assisting the developing countries through international trade in diversifying and industrialising their economies and promoting their economic growth, the developed countries would be ensuring for themselves larger markets, more continuous progress in their industrial transformation, and rising standards for themselves which will be accompanied by rising standards elsewhere. It is in this great task of facilitating the economic change and industrial transformation that we need to use in a positive and deliberate manner the instrument of international trade; and it is not only international trade as such, but international trade as an integral part of national development and economic policy. What the world needs today is a positive, deliberate and co-ordinated international development programme to which all Governments who are members of the United Nations, whether of developed or developing countries, feel themselves committed as a primary aid of their own national policies. It is against this background that our Conference should function and our Committee should deliberate. We have to enunciate new principles of international trade which, on the one hand, will be built into national policies for the promotion of national development, and on the other hand, be also concerned with the promotion of economic development in the developing countries. It is this which has made us link in, what I hope will prove to be, an indissoluble marriage of international trade and economic development. I trust that the principles I have outlined for this new policy of development-oriented international trade, will receive the sympathetic consideration of this Committee and be found useful for the formulation of practical programmes and policies that will enable the world at large, both its developed and developing parts, to fulfil the United Nations target of economic growth during this Development Decade.

Team-Work In Trade

STATEMENT BY Mr. Wyndham White, Executive Secretary, General Agreement on Tariffs and Trade, made in plenary meeting of the United Nations Conference on Trade and Development, on April 8, 1964 is reproduced below:

It is no mere formal sense of courtesy that I venture to congratulate you — or rather to congratulate the Conference — on your election as its Chairman, because I still retain very vividly in my mind the stimulation and encouragement which I felt when you were good enough to receive me in Cairo on the occasion of our conversations leading up to the provisional accession of the United Arab Republic to the General Agreement on Tariffs and Trade. I am, therefore, more than happy to be taking part in this Conference under your distinguished guidance.

Before touching on some of the issues which are before the Conference, I would like to make one point which was mentioned the other day by the Secretary of State for Industry and Trade of the United Kingdom, but one which I derive from my own experience of many years of dealing with the problems of trade and development which are the subject of this Conference. It is that, in my view, we are not dealing here with the interests of one group of countries as opposed to another group of countries; we are not, I feel — or shoud not be — thinking in terms of a confrontation between poor nations and rich nations, between less-developed nations and more highly developed nations, between under-privileged and privileged; the problem with which we are dealing here is a problem for the international community, and it is just as much a problem for each member of the community, whatever his stage of development, poverty or wealth. It seems to me that, just as in the national community today no country would accept that one part of the country should be wealthy and prosperous and another part poor and under-privileged, so this is true also of the international community. And if we are to tackle this problem effectively it must be on the basis that it is, as I have said, an urgent problem in which it has itself a stake. That is what we have tried to establish in recent years when we have dealt with these subjects in the framework of the General Agreement. We have a Committee, which has achieved some fame, as Committee III, in which

discussions are not between ranks of countries with opposed or divergent interests but between countries which are seeking together to deal with problems to whose solution all of them must contribute.

We have submitted abundant documentation to this Conference about the work of the Contracting Parties to the General Agreement on Tariffs and Trade in relation to the problems under consideration here, and it would be wearisome if I were to reiterate the content of those documents. However, I hope that I may make some supplementary remarks which will be of some help in critical days which now lie ahead of this Conference. If I use the expression "critical days", it is because I feel that the Conference has now reached the point when the general debate is drawing to its close and the committees will be addressing themselves to practical problems, and we shall be in a position to judge whether the international community, confronted with the need to adopt practical, down-to-earth and positive measures is able to discharge its responsibilities in connection with the problems it is examining.

I would like to recall first of all the long and painstaking study of the trade problems of special concern to developing countries which has been made in the General Agreement on Tariffs and Trade since 1957. This work in the GATT has undoubtedly had great influence far beyond the GATT inself. The process of study and education was a necessary prelude to more positive action, although, in fact, concurrently with the process of study and education, Committee III of the GATT, to which I have referred before, has been exercising continuous pressure for the removal of restrictions bearing particularly on the export trade of developing countries. It became clear to us, however, that more was needed than this unspectacular, although necessary, work: it was desirable to obtain endorsement at a political level of concepts and principles which could provide guidance for more positive and effective action in the future.

Major Elements

The first step in this process was the declaration by Ministers of November 1961, regarding the trade problems of developing countries. This Declaration is set out in the documents before you. Nevertheless, it seems to me to be of such major significance that I will venture to recall its main elements: it contains important principles which a large number of governments of countries accounting for a very large proportion of international trade have accepted at the political level as a basis and guidance for their commercial policies.

This Declaration affords recognition of what is required in the interests of trade and economic development of less-developed countries, namely:

First, the need for a rapid and sustained expansion in the export earnings of less-developed countries;

Secondly, that aid can be no substitute for trade, and that in the final analysis economic development will have to be paid for from the earnings of the countries concerned;

Thirdly, the need for restrictions hindering access to markets for the export product of less-developed countries to be reduced to a minimum;

Fourthly, the desirability for increased opportunities for the developing countries to increase their exports of manufactured and semi-manufactured goods.

The Declaration then goes on to indicate how governments can contribute to these general objectives, taking into account facts regarding tariff and non-tariff measures affecting access to markets under the heads of quantitative restrictions, tariffs, revenue duties, State trading, preferences, subsidies, and disposal of commodity surpluses.

This comprehensive coverage by the Declaration of the questions involved is completed by statements in regard to the question of reciprocity in negotiations, the improvement of the production and marketing methods of developing countries, the need to lessen the instability of export earnings resulting from fluctuations in primary commodity markets and the diversification of the export trade of the less-developed countries to reduce their vulnerability to market fluctuations, and, finally, the recognition of the possibilities for encouraging sound economic development in the less-developed countries through increased trade amongst themselves.

Hearing this, one might well ask why this Conference is necessary, or why in fact any other action is necessary. Of course, the answer is that, while it is important to set up appropriate guide lines, it is even more important to secure active implementation of agreed principles and policies.

Programme of Action

It was for this reason that, in 1962, a group of twenty-one less-developed countries put forward a Programme of Action which set targets for the removal of barriers to the trade of less-developed countries. This Programme, which I think is worth recalling and which largely reflects the practical work which had been done previously in subsidiary bodies of the GATT, is as follows:-

Firstly, it provides for a "standstill", namely that no new tariff or non-tariff barriers should be erected by industrialized countries against the export trade of any less-developed country in the products identified as of particular interest to those countries;

Secondly, it calls for the elimination, within a period of one year, of quantitative restrictions on imports from the developing countries which are inconsistent with the provisions of the General Agreement. There is, of course, recognition that there may be problems which prevent action being taken within this short time limit, and there is provision for consultations in these hard-core cases; but even here the period of grace is limited to December 31, 1965;

Thirdly, the Programme also calls for duty-free entry for tropical products to be achieved by December 31, 1963;

Fourthly, it calls upon industrialized countries to agree to the elimination of customs tariffs on the primary products important in the trade of developing countries;

Fifthly, it calls upon industrialized countries to prepare urgently a schedule for the reduction and elimination of tariff barriers on exports of all semi-processed and processed products of less-developed countries, providing for a reduction of at least 50 per cent of the present duties during the next three years;

Sixthly, it calls upon the industrialized countries to reduce internal changes and revenue duties on products wholly or mainly produced in less-developed countries, with a view to their elimination by the end of 1965.

Industrialized countries which maintain barriers of the kind to which I have referred are also called upon to report to the secretariat of the GATT, in July of each year, on the steps taken by them during the preceding year to implement these decisions, and on the measures which they propose to take during the next twelve months to provide greater access to the products of developing countries;

Finally, the Programme calls upon the contracting parties to the General Agreement to give urgent consideration to the adoption of other appropriate measures which would facilitate the efforts of the developing countries to diversify their economies, strengthen their export capacity, and increasing their earnings from overseas sales.

This was a Programme put forward by developing countries to translate into action the Declaration to which I have referred. It was adopted by the Ministers of the Contracting

Parties to the General Agreement at their meeting in May 1963; I may point out that this Meeting of Ministers was the most comprehensive ministerial meeting on trade since 1947 and prior to the present Conference.

It is true that the group of countries linked together in the European Economic Community found it necessary to make certain reservations on the Programme of Action, but I would point out, however, that these reservations were expressed in terms that, in the view of these countries, the measures proposed did not go far enough in dealing with some of the basic problems of the developing countries; we have had indications from the representatives of the European Economic Community that both in the General Agreement and in this Conference they will be making a proposal relating to these basic problems. The fact remains, however, that the bulk of the contracting parties to the General Agreement have accepted this Programme of Action.

The Programme of Action represents a significant reinforcement of the attack which has been made in GATT on barriers to the exports of less-deveoped countries. I, for my part, would be very happy to see this Conference, which is broader in scope than the General Agreement on Tariffs and Trade, endorse this Programme and thus bring to bear upon it the political prestige of the United Nations.

Implementation of Programme

Of course, the question remains as to how far the Programme is being implemented. I am happy to say that there are some positive indications that I can give to this Conference.

There has been a substantial adherence to the "standstill" provision of the Programme, namely to the requirement that no new tariff or non-tariff barriers should be imposed on the export trade of the less-developed countries. Significant progress has been made in achieving the removal of barriers to this export trade as a result of the follow-up work in the GATT in relation to the commitments of the Action Programme.

Committee III's approach has been to consider products by groups. It carries out a systematic examination of a particular group of products, makes recommendations and, thereafter, applies pressure for the removal of the trade barriers which it has identified. It then moves on to another group. In this way more and more products of interest to less-developed countries have come, and continue to come, within the purview of Committee III, and trade barriers affecting an increasingly wide range of products have come under the attention of the Committee. The scope of the investigation now extends to 270 headings of the Brussels Tariff Nomenclature.

As regards quantitative restrictions, the number of industrialized countries applying such restrictions against the exports of the less-developed countries has constantly decreased. Some countries have eliminated all restrictions or have reduced their application to one or two items only. In fact, in many markets quantitative restrictions have ceased to constitute a significant barrier to trade. It is important, however, to remember that among the hard-core restrictions that remain are some affecting productions which are of very considerable and immediate importance to less-developed countries in the context of their export earnings and their economic development.

In the tariff sector some downward movement in tariffs was achieved in the course of the 1960-61 tariff negotiations which were known as the Dillon Round. In cases where preferences are involved there has been a decrease in discrimination during the past year.

This modest, but solid, measure of progress pales into insignificance before the opportunities which are offered to the international trading community, in the course of the comprehensive trade negotiations which will open next month and which are generally known as the Kennedy Round, to make a major contribution to a solution of the problems we are considering. As I say, these negotiations offer opportunities. Unfortunately history is strewn with the corpses of great opportunities, which have been missed and I would exhort all governments represented in this Conference who are intending to participate in the Kennedy Round not to miss this one. The hour is late and, unless we tackle this problem with the generosity, imagination and courage which is required, it may very soon be too late.

In the course of the session of the Contracting Parties to the General Agreement which terminated just prior to the opening of this Conference, the industrialized countries again re-emphasized that they considered that one of the major objectives of the Kennedy Round is the attainment of a significant contribution in the trade of the less-developed countries. In these circumstances, I think it is important to be quite clear on what is needed if the Kennedy Round is to give significant results in this field.

First of all, the reductions in tariffs in industrialized countries must be deep and comprehensive. They must cover not only fully manufactured products but also semi-manufactures which is an area in which some of the developing countries can most rapidly develop their own capacity. There will be exceptions to the general reduction of tariffs which are proposed but I would hope that, in no case, will the exceptions which are made by industrialised countries bear upon products which are of significant importance to the export interests of the developing countries. As is, I think, generally known, the industrialised countries have agreed that, in the Kennedy Round, they will not seek reciprocity from the developing countries and this attitude represents a significant advance on the somewhat rigid conception of trade reciprocity which prevailed in some of the earlier trade negotiations under the aegis of the General Agreement.

The second requirement if this aim of the Kennedy Round is to be achieved—and I emphasize again that the industrialized countries have said that this is one of the principal aims of the negotiations — is that non-tariff barriers must be properly covered. Here there are difficult and delicate problems involved. But it seems to me that, when viewed against the great human and social problem to which we are addressing ourselves here they are by no means difficulties which cannot and should not be overcome.

Agricultural Products

Thirdly, and certainly not least important, is the fact that the negotiations must cover — and cover adequately — the question of trade in agricultural products. This is an area where the industrialized countries themselves have acute social and political difficulties. I have noted that they are remarkably sensitive to these social and political difficulties in their own countries; I would hope that this Conference would perhaps focus their attention with equal intensity upon the rather more acute social and political difficulties which restrictions in this field create in the developing countries. I would, therefore, lay particular emphasis on the importance of making real progress with a significant liberalization in the course of the Kennedy Negotiations with respect to agricultural as well as industrial products.

I should like to turn to one or two other specific topics which have arisen here and which are concurrently being examined in the General Agreement. First of all I shall take my courage in both hands and refer to the subject of preferences.

We in the General Agreement have been accused of rigidity and doctrinaire attitudes, and in no area more so

than in the case of preferences — and, I think, quite understandably. I think that the most-favoured-nation clause is more than an abstract principle of economics. It is something which has been at the basis of international trading relationships since the international trading community took shape in the nineteenth century. It is however, no more sacred, in my view, than any other principle and one ought to be prepared to examine with an open mind whether there are departures from most-favoured-nation clause which will offer real benefits and advantages, particularly to the developing countries. However, I think these benefits must apply to all the developing countries. I think that if we got into a position where preferences were accorded by some countries to some developing countries, and not accordd to others, this could create serious and lasting damage to those which were not so favoured and would act as a seriously devisive force which would far outweigh the particular advantages which might be derived by the favoured few.

As a matter of fact, this question is being actively discussed in the GATT at the present moment in accordance with ministerial directives; and I can say that it is being discussed with an open mind. However, I would be less than frank if I were to suggest that, so far, we have found it easy to make progress in this field. The reason is that it is an extremely complicated, difficult, and, above all, very important development which has to be worked out and elaborated with the utmost care. We have found in the preliminary discussions in the GATT that there are substantial differences of view, not only between the highly developed countries and the developing countries, but also between the developed countries themselves; and there are very strong differences of view between the developed countries themselves; and there are very strong differences of view between the developing countries.

It is for this reason that with perhaps more prudence than heroism, but still I think with prudence, we have recorded that our preliminary investigation indicates that there are interesting possibilities in this field — I repeat, there are interesting possibilities — but that much remains to be done in order to work out the procedures and conditions under which such preferential arrangements should be negotiated. We shall resume this examination at a fairly early date.

Arrangements have been made for the competent bodies of the General Agreement, after the governments have had an opportunity to consider the results of the first reconnaissance, to revert to this question later this year, in the hope that a report leading to decisions could be considered at a session of the Contracting Parties during November of this year.

Difficult Question

I have been speaking so far of preferences to be accorded by the industrialized countries to the developing countries There is of course another side of the question which relates to preferences between the developing countries themselves. That, of course, is rather a difficult question because, in the first instance, any preferential arrangement in effect means that the country according the preference agress to pay rather more for its imports from one particular source of supply than it would if it obtained them from the cheapest source of supply. Unfortunately, the plight of the developing countries is such that they need to mobilize every possible resource they can for imports; and therefore the luxury of discriminating between sources of supply, other than on grounds of prices and advantages, is not an easy one for them to contemplate. On the other hand. I think that most of us would concede that a process of industrial development which could proceed on more rational lines on the basis of a large regional market, made possible and favoured by preferences or liberalization of trade on regional basis, is a concept well worth consideration.

In fact, in a sense, this whole question is — so far as the GATT is concerned — rather like pushing at an open door. It was carefully considered in the course of the review of the General Agreement in 1955, when it was conceded that the waiver provisions of the General Agreement could be invoked in favour of systems of regional preferences of this type. These waive-provisions depend upon obtaining an approving vote of two-thirds of the contracting parties which in effect means, in present circumstances, that provided the developing countries themselves were agreed on the desirability of such arrangements, the GATT presents no real obstacle to them, because at the present moment more than two-thirds of the contracting parties are developing countries. I think, therefore, that one cannot argue that the most-favoured-nation principle, as incorporated in the General Agreement, accompanied as it is by the waiver provisions of Article XXV, is a significant obstacle to valid regional arrangements which commend themselves at least to most of the developing countries.

Commodity Problems

I turn now to the question of commodity problems. The GATT has been widely criticized in that one of its inadequacies is that it does not deal with the problem of commodity trade and, as developing countries are largely dependent on the export of and trade in primary products, this means that the General Agreement excludes to a large extent the major part of their trading interests. To some extent I think this criticism is directed at the modesty of the GATT; I think it is a good, valid criticism. I think that it is rather difficult to argue that an international trade agreement should not concern itself with such an important sector of international trade but of course this argument conceals certain fallacies.

First of all, as regards the examination of commodity questions in the ordinarily accepted sense of the term, that is, through the negotiation of commodity arrangements, the Contracting Parties to the General Agreement have consistently taken the view — and this is a self-denying attitude which is rather rare — that they should not arrogate to themselves the right to deal with questions which have been entrusted by the United Nations to its own organs. Therefore we in the GATT have directed our efforts so far as we can to seconding and assisting the efforts of the appropriate United Nations bodies such as the Interim Co-ordinating Committee for International Commodity Arrangements, the Chairman of which is appointed by the Secretary-General on the recommendation of the Contracting Parties; the United Nations Commissions on International Commodity Trade and the Food and Agriculture Organisation. But within these limitations I myself have taken the initiative in the Administrative Committee on Coordination in suggesting to my colleagues that as far as secretariats are concerned we should establish, within the framework of inter-agency co-ordination, a committee to keep our activities under constant review and to ensure that we are giving the maximum support we can to governments in the orderly consideration and discussion of these questions. Apart from that, however, there are in fact constant consultations, discussions, and negotiations on problems relating to particular primary products entering international trade, which take place within the framework of the General Agreement, although these are not directed to the formulation of classical commodity agreements in general in the accepted sense of the term.

One of the things this Conference will be doing will be examining with a critical eye the institutional machinery which exists for dealing with international trade problems of special concern to the developing countries, and I would certainly think there might be a very good case for calling upon the GATT to fulfill additional responsibilities in this field; and I am quite sure that, if that is the view of this Conference, the Contracting Parties to the General Agreement would give

the most careful consideration to any suggestions or requests in this direction that might be made to them.

I pass now to another aspect of this problem which I regard as being of the utmost importance. There has been much discussion in this Conference — I think quite rightly — of the serious consequences for developing countries of the deterioration in their terms of trade as exporters of primary products. This is a problem of very grave concern and one which we have examined for some years in the General Agreement. I must say that my own conclusions on this are that, whilst wherever possible it is desirable -- indeed, urgent — to enter into and elaborate agreements for the stabilization of prices to prevent violent fluctuations, a solution to this problem is not to be found by attempting to mainpulate prices in such a way as to jeopardize the competitive position of primary products; these are already seriously threatened by competitive synthetic products and by technological processes which — at a price — enable considerable economies to be made in the use of primary products in manufacturing processes. Therefore, one form or another of compensatory financing for primary producers is the way to deal with one side of this probem.

Export Potential

The way to deal with the other side of this problem is to assist in every possible way in the diversification of the primary producers. It is with this objective in mind that we have recently initiated in the GATT — with perhaps too modest means, but on a pilot basis — a new project in which I place great hopes, and on which we would certainly be interested to hear any suggestions and comments by this Conference. This project entails a systematic series of studies of development plans and prospects of individual exporting countries with a view, above all, to identifying what is the most readily available potential export capacity in these countries and what is needed to develop that potential production, and then enquiring into the possibility of providing really adequate guarantees that, if this potential does become actual, it will not be frustrated by restrictions in inernational markets. The latter part is the particular concern of the organization which I serve. However, we hope to collaborate very closely with the International Bank for Reconstruction and Development, with the OECD, with the United Nations and with lending governments, in order to offer advice about the directions in which development finance could be moved in such a way as to bring about the earliest possible return in the form of export proceeds. This, I think, is a programme of great potentiality. It will of course — and this is a point I make with some trepidation, but I make it because I think it is honest to make it — bring out that the problem of developing industrial export potential in the developing counties is not only a problem which relates to restrictions which they may or may not encounter in the markets of other countries. I will also bring out the fact that there are certain minimum conditions which must be observed in the developing countries themselves if they are to develop manufacturing capacity which will be capable of competing in international markets; in many countries restrictionist policies, which are not protectionist in their origins or perhaps even in their purposes, are nevertheless creating conditions which in fact inhibit the possibility of production by export industries on conditions which would enable them to be competitive in international markets. This, I think, is an important element which cannot be excluded when one is looking towards the long-term solution of these problems. The problem is not exclusively an external one.

I should not like to finish without saying a few words on the institutional question. First of all I should like to voice an apprehension. I have been a bureaucrat for far longer than I care to remember, and I have had one consistent experience. That is that, whenever I have raised an awkward problem in the GATT which has caused some embarrassment to any of the member governments, their reaction has been immediate and predictable: they create an institution -- they set up a committee — and that is usually the end of the problem. There is another one, however, which is even more insidious, and that is to set up several institutions, for nothing rejoices the heart of a government more when confronted with an awkward problem than to have it discussed simultaneously in several institutions. This enables you to move from one to the other and, with a sufficient amount of ability, you may avoid dealing with the problem in any of them.

However, let me say this. I think it does all of us who are engaged in established institutions good to have the cold eye of criticism directed upon us. Complacency is one of the most catching of sins. I think it is extremely useful and valuable for all of us — not only GATT but all of us — to come under close exmination here. Some of us will not pass. We may have to pull up our socks. There may be gaps and, if there are, these should be filled — there is no question about that.

Let us also remember that international institutions are as effective as the governments which constitute them. To group the same lot of governments, or perhaps even a few more, in another place does not often change their habits. Therefore, although it is important to have effective and comprehensive institutions, and to have organization where organization is required, I hope that we will not at any stage lose sight of the fact that we are dealing with an urgent, challenging social and human problem where the solution lies really in the will of governments to act. I do not think that they lack the instrumentalities for making their action effective. What is lacking so far is the will to take the necessary political decisions.

GATT Obligations

Now I should like to say a little about the institutional character of GATT itself. GATT is not a universal institution. That is usually put forward as a criticism. Why is it not a universal institution? The reason is that it is an obligations and confers upon its members legal rights and a means of vindicating them. It is open to accession by any country provided that two thirds of the members are convinced that the acceding country can accept, fulfil and carry out the obligations which they have accepted, in exchange for which they, for their part, are prepared to extend to that country the full frights which accrue to any contracting party.

I ask myself what sort of international trading management which did not have that character would be of any value at all. One can of course have an institution where there are no rights, no obligations — just principles, declarations and resolutions. There do exist, and one can envisage crea ing, institutions or arrangements where valuable discussions may take place within that sort of framework, but they are not of the same character as an organization which rests on an international agreement involving carefully defined legal rights and obligations, and machinery for their enforcement.

There is an area in which the adequacy of this international trading instrument has been strongly questioned; it has been said that it is not adapted to dealing with the relations between countries with market economies and those whose economies are based upon central planning and State control. I have been glad to see that in the course of this Conference much

emphasis has been placed upon trade between the centrally-planned economies and developing countries, because I share the view which has been expressed here that this is an area in which there is much room for development of trade, if only because, relatively, this is where there has been a considerable lag. I think this is something which merits the most careful study and examination, and that there must be the institutional means of stimulating the process.

It is true, of course, that the General Agreement, as an international trade agreement, was conceived and brought into being fundamentally as an instrument to serve as the basis for trading relationships between countries with market economies. However, as I have said, there is a provision which says that any country which wishes to do so may accede on terms to be discussed and agreed with the contracting parties and acceptable to two thirds of them. There is no limitation as to what those terms may be, and I cannot conceive of any circumstances in which, if such discussions resulted in the finding of a formula under which a country, which organized its economy on other than the market basis, could satisfy its trading partners in the General Agreement that it could assure and carry out commitments and obligations comparable to those which the contracting parties accept, the concession of that country to the General Agreement would create serious problems.

Centrally-Planned Economies

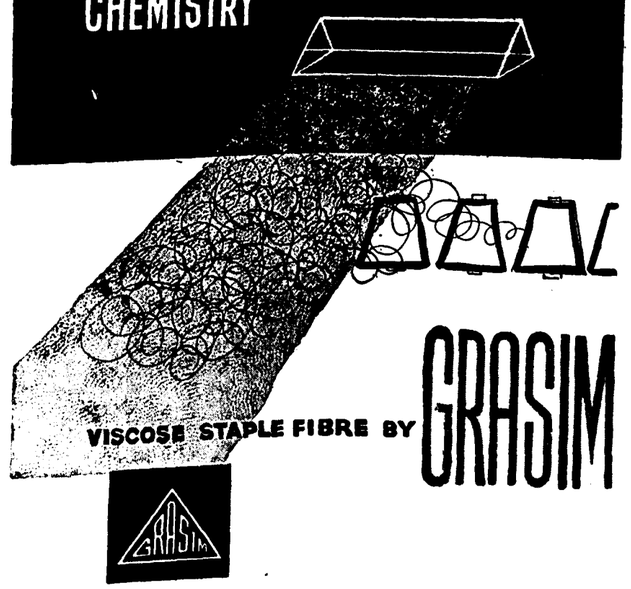
In recent years we have, in fact, carried out negotiations with certain countries which have chosen the system of a centrally-planned economy, entrusting all trading transactions to State institutions, and we have found a basis for their accession to the General Agreement. I refer specifically to to the case of Yugoslavia, which has acceded provisionally to the General Agreement and whose provisional accession will ripen automatically, and very shortly, I hope, into full accession. We have negotiated for the provisional accession of the United Arab Republic, and I am equally hopeful that the remaining steps to convert that provisional accession into full accession will also be taken in the near future.

For a number of years we have had an arrangement of association with the Government of Poland which I know has given great satisfaction to the contracting parties, and which has enabled Poland to play an active and important role in the work of the Contracting Parties. Again, I have no doubt that as far as the contracting parties are concerned there is no reason why this association should not similarly ripen, through processes of consultation and discussion, into the full accession of Poland to the General Agreement.

Then there are a number of developing countries which have not so far seen it to be their advantage to accede to the General Agreement. I find that quite understandable. For one thing, the General Agreement is a pretty unappetizing document to read. It is also a document which is very badly out of date as it does not reflect the great changes and modifications which have been made in the actual content and nature of the work of GATT over the past few years. We have perhaps been remiss in not bringing it up to date—perhaps, I say; I myself, shortsightedly maybe, have placed greater emphasis on getting on with the work rather than repairing the facade. But these are political questions and I think that this was possibly an error — an error, however, which we are now in the process of repairing. We have recently concluded a careful investigation of the respects in which the GATT needs to be modified in order to bring it up to date and to reflect the present state of international trading relations and what is in fact currently taking place within the GATT particularly with respect to the problems of developing countries. We have largely completed the establishment of a special chapter on trade and development which will confirm, among other things, the great flexibility which the contracting parties observe in the application of the obligations and commitments of developing countries under the General Agreement. It will — and this is perhaps more important — embody as treaty commitments and obligations, fully binding on all contracting parties, a good deal of the Programme of Action and a good deal of the 1961 Declaration on the trade of less-developed countries, to which I have referred. That, I think, will be an improvement and also give a truer picture of what GATT is about.

Meanwhile, it is, of course, a matter of judgment for individual developing countries as to whether or not they seek accession to the General Agreement. But the door is open, the entrance is fairly wide and would certainly be my hope that more and more of the developing countries, as they come to have a clearer understanding of what it is we are trying to do and of the spirit in which we are trying to do it, and perhaps paying rather less attention to the somewhat ungainly language in which international legal instruments have necessarily to be drawn up, would see an advantage in coming and assisting us with their own contribution to our efforts and, at the same time, benefiting from the work which is being done currently by so many of their fellow developing countries in the GATT.

As I have said before, this one time rich-man's club now has developing countries as two thirds of its membership, and this number increases daily. I think this is good evidence that, within the limitations which quite naturally and properly exist on the total scope of the work of the Contracting Parties the GATT's value and relevance to the problems of developing countries are being more fully appreciated.



Co-ordinated Programme

One final word. It has been my strong hope that, apart from the political impulse which this Conference will give to the work on which we have all been engaged for some years — and that will be an important result of this Conference in itself — there will be one other result, and that specifically in the institutional sphere. It is this. I think that one thing clearly apparent to anyone working in this field for any length of time, and of which he must be very conscious, is that there is in fact an absence of a coherent international development policy which takes into account all aspects of a very wide and complex problem. I doubt whether all these aspects can be encompassed in one technical organization or series of technical organizations. But I think it would be a source of great strength to us who are engaged in sectors of this programme if one did have the feeling that there was a purposeful, coherent, co-ordinated, international development programme to which all governments of the United Nations felt themselves to be committed as a primary aim of policy—and I mean by that, of national policy.

That brings me back to where I started. I think that such an international policy, and acceptance of the fact that the effective carrying out of this international policy is a primary concern of national policy in each country, is perhaps the type of political decision which needs to be forged and the type of political decision with which any institution resulting from this Conference might well serve to provide us.

A Sad Spectacle

THE UNION Minister for Food and Agriculture, Mr. Swaran Singh, has acquired in recent years a reputation which stands higher on the diplomatic plane than it does in the field of his direct ministerial responsibilities. Not unexpectedly he has failed to make any impress on problems of Food or Agriculture. His statement at the joint convention of the Sugar Technologists' Association of India and the Deccan Sugar Technologists' Association on April 19 that controls on prices and distribution of sugar had come to stay and that no one should have any doubts about this, coupled with his thesis regarding the "desirability of setting up a Sugar Marketing Board" expounded at the annual general meeting of ISMA on April 27 has rightly failed to arouse enthusiasm. To state that an industry for which we have all the necessary raw materials — as against certain others whose production has been hampered because of the non-availability of the essential ingredients — and also the manufacturing capacity, will need to be subjected to price and distribution control is to make an open admission of the failure of the Government's policy for increasing production.

At the start of the sugar season in November last, the Government announced with great fanfare that the target of sugar output had been fixed at 3.3 million tonnes and an assurance was held out that all efforts would be made to achieve that goal. In actual fact, much valuable time was lost in grappling with the real problem of diversion of sugarcane from the mills to khandsari and gur producers. Because of the steep fall in output in 1962-63 at 2.15 million tonnes from 2.71 million tonnes in 1961-62 and 3.03 million tonnes in 1960-61, the free market price of sugar had shot up providing an opportunity to the khandsari producers to offer higher prices for sugarcane and, thus, starve the mills of cane supplies. This disequilibrium took an acute turn because of the delay in permitting the sugar mills to increase the minimum price of cane to Rs. 2 per maund. While the industry went on transmitting the danger signals to the Government week after week saying that the target of 3.3 million tonnes would not be achieved unless the mills were allowed to pay a higher price for sugarcane, the Government wasted much valuable time and awoke to the realities of the situation rather too late.

It is not for lack of raw materials that the output of sugar in the country has been reduced. In fact, the mills crush only a fraction of the total sugarcane produced. The output of sugarcane since 1960-61 has no doubt registered a decline, but it should not affect the supply of cane to the mills. As against 91 million tonnes of sugarcane produced in 1962-63, the sugar factories crushed around 25 million tonnes. Similar was the case in 1963-64, when less than 30 per cent of the cane produced in the country was crushed by the mills.

Regarding the capacity of output, the mills gave a happy performance in 1960-61 when production attained a new peak of a little more than 3 million tonnes. Since then, some new units have come into being, while a few of the older units have also been expanded. The target of 3.3 million tonnes in terms of availability of raw materials as well as installed capacity is, without a shade of doubt, within the reach of this country. It was bungling in a different sphere, as stated above, which made the attainment of this target impossible. Will the Government learn any lesson from its past errors? As things stand today, it seems the Government is determined not to see clearly through the artificial fog created by the distortion in the sugar industry by the steep rise in the production of

khandsari. Unless a happy balance is struck between the two and the mill sector is allowed to play its rightful role, the occurrence of violent fluctuations in output of sugar will not be eliminated.

The latest estimate of sugar production at 2.6 million tonnes in 1963-64 shows a 22 per cent gap between achievement and the target for which the Minister has blamed the industry in not having faced the challenge. "It was the industry's duty", he said, "to have faced the situation even if it meant some sacrifice on its part rather than depend on transferring the whole burden to the Central and State Governments and to the consumer". It means that at the time when the khandsari producers had lured the farmers away from the factories by paying higher prices for sugarcane, the factories should have offered competitive prices even at the risk of incurring losses. What is the logic behind this approach? On the one hand, the khandsari producers enjoyed complete liberty in the matter of procurement of cane, were subjected to no price control and bore limited excise duty, while, on the other, the factory owners had to put up with double the excise duty while the price of sugar was fixed by the Government at half the price fetched by khandsari. The Tariff Commission has more than once analysed the cost structure of the industry; the price of sugar is fixed on the basis of the formula evolved by it. Even a cursory glance at the Tariff Commission's costing formula will show that the manufacturing cost is hardly 15 per cent of the controlled price of sugar while the lion's share is distributed amongst the cane grower and the Government. The margin for manoeuvrability available to the factories is negligible and the Minister's exhortation to face the challenge meant inviting outright losses, landing the mills in a financial crisis.

If the Government sincerely cherished the desire to attain the target of production of 3.3 million tonnes of sugar, it could have been attained by allowing the market forces to evolve a new equilibrium through a free play of the forces of demand and supply. If the sugar industry had been unyoked even in a single season in the matter of fixing the price of cane and also the selling price of sugar, there is no doubt that not only the production of sugar would have increased but the consumer also would have been subjected to a lesser pressure. The last season saw sugar selling at about a rupee a kilogram at a time when khandsari was fetching Rs. 2 a kilogram. The present policy of the Government failed in achieving both the objectives; it neither provided relief to the consumer nor created conditions whereby production level could be raised to the stipulated goal.

The President of the Indian Sugar Mills Association, Mr. G. M. Modi, rightly gave expression to a serious concern at the proposal of the Government to set up a Sugar Marketing Board in the country — a scheme which had adorned the shelves of the Food and Agriculture Ministry for more than eight years. It had been proclaimed impracticable by the Indian Sugar Delegation which visited Indonesia and Australia as long as in 1955. A similar opinion had been given by the Gopalakrishnan Committee. Why the Government have now brought to life what was already known as a rejected scheme, is not known. The handing over of the operations of a gigantic industry to a bureaucratic machinery will no doubt thwart its growth and will create more problems than it will resolve. The long and painful story of controls in this country will bear out the apprehensions entertained by industry in regard to the futility of the proposed Board as a solution to the problems faced by it. Just as one false step can land an industry into a mire from which it may not be able to extricate itself for years and remain dwarfed, the sugar industry is likely to meet a similar fate if the Marketing Board with its paraphernalia of slow pen-pushers and desk-workers should come into being.

The Sugar Marketing Board will offer, in the words of the Minister, "a guarantee of receiving an adequate price for production without having to do anything about its distribution". Like a good salesman, he has attempted to list the "favourable" points. It is promised that the Board will be able to procure an adequate price for the sugar produced by the mills. It will also take upon itself to organise the sale of the product. How far this will leave any incentive for the manufacturers remains to be seen. It is not known how the Minister has come to the conclusion that the establishment of the Board is not synonymous with the imposition of a system of controls which the industry has disfavoured and the Minister has agreed not to impose upon the industry. The Board will not only enforce a price control but, in fact, an overall all-pervading control with the result that the mills will be reduced to the status of mere contractors for crushing cane. The opinion given by the Minister that the consumer will stand to benefit by the establishment of the Board is hardly warranted if the operations of similar bodies in India are any guide. In any case, the Board is likely to dry up the springs from which has emerged the initiative for growth in the past.

In his reply to Mr. Modi's Presidential address, Mr. Swaran Singh promised to take action in regard to three of the vital issues raised by him. He agreed that the ex-factory prices of sugar needed an early revision because the current prices are based on a formula evolved in 1957-58 and in view of the changing circumstances, it had become outmoded. He also held out an assurance that an enquiry would be instituted regarding the possibility of listing the sugar industry as a priority industry entitled to a rebate in corporate taxation. The last promise related to some sort of a control over the production of gur and khandsari; this aspect is exceedingly important because of the severe competition which has developed between the three sectors of the sugar industry out of which two have operated in an unbridled manner. There is a lurking fear in the mind of the industry — and rightly so — that the promised regulation of the gur and khandsari producers may not take place because of the political strings attached to this problem. The rural vote in the sugar producing States of Uttar Pradesh and Bihar has always had a bearing on the Government sugar policy which has been governed more by political considerations than the economics of the industry. If the Union Minister for Food and Agriculture can make bold to put these two sectors under some regulation whereby supplies of cane are ensured to the factories, there is no doubt that the targets of production fixed by the Government will turn into a reality.

Another point needs a mention here. The Indian sugar industry in Northern India has been dogged by the inferior quality of cane which has not improved in quality over the last two decades. The sugarcane cess realised by the Government for this purpose has been usurped for other schemes. Unless the sucrose content of the cane improves as in Maharashtra and other South Indian States, the economics of this industry will not improve and the consumer will continue to bear the unwarranted burden. It is, thus, seen that it is the unimaginative policy pursued by the Government which stood as an impediment for attaining the goal of production at 3.3 million tonnes in 1963-64. If the three promises made by Mr. Swaran Singh are fulfilled and the proposed establishment of the Board is abandoned, the industry will continue its onward march so as to reach the target of 3.5 million tonnes in 1965-66 and the tentative target of 4.5 million tonnes at the end of the fourth Plan.

Wanted: More Research in Staple Fibre

WHATEVER MAY be the reason for it, cotton has been and it will continue to be the major problem of the Indian cotton mill industry. The Textile Commissioner may assure us that there is no need to be pessimistic at all about the supply position of cotton in the immediate future and Mr. Krishnaraj Thackersey may ask us not to be defeatist about eventual self-sufficiency in cotton. But the fact is that, today, this country is still a long way behind the cotton consumption target of the third five-year Plan of 70 lakh bales. In the latest cotton season the total cotton production was no more than 57 lakh bales, but cotton consumption in 1964 is expected to be 63 lakh bales. It is not only quantitatively thus that we are far from self-sufficient in cotton; we are so qualitatively as well, and the authorities have recognised this. Mr. R Doraiswamy, Textile Commissioner, recently listed marginal supply conditions relating to long-staple cotton as one of the principal reasons for stagnation in mill production of cotton cloth.

In order to meet our marginal supply requirements of long-staple cotton, we have arrangements with some traditional sources, such as Egypt, Sudan, East Africa and America. Bearing in mind the admittedly accommodating attitude of these sources of supply generally, as, for instance, in agreeing to accept payment in rupees or supplying cotton by way of aid or tripartite barter, and also the more or less moral obligation on our part to import cotton from some of these countries, if only to maintain the markets for our cotton textiles there, we have perforce to provide, almost on a permanent basis, for imports of a certain quantity of cotton from these sources. Even at the risk of being dubbed as pessimists, we must say we cannot do without some imports of cotton for several years to come, certainly not in the near future.

We believe these considerations were fully borne in mind by those responsible for our cotton or cotton import policy, when they encouraged the production of staple fibre and viscose yarn. Surely they were not primarily motivated in this decision out of fascination for man-made fibres or even out of a desire not to be left behind in the race for being modern and up-to-date in the use of synthetic fibres. Anyway, large sums of money have been spent on the plant and machinery to produce these synthetic fibres and the fact that the domestic market has been absorbing nearly all the output of the industry suggests that the industry has been serving a purpose meeting a felt or existing need. May be, presently, the two units producing staple fibre account for hardly 34 million kgs. annually, the bulk of which is absorbed by the silk industry, leaving very little, if any, for the cotton mill industry. But the third Plan target of staple fibre is as much as 75 million kgs. and, if the demand is assured, this target should not be difficult of achievement. It is unfortunate, therefore, that a belated controversy should have been started about the suitability of staple fibre, though the last word has yet to be said on the subject. It may be noted that staple fibre interests do not dispute the absence of certain features in their product as compared to other and newer fibres in the field such as polynosic fibre. These interests are also not averse to the use of polynosic fibre which has lately gained greatly in popularity in the U.K., the U.S.A. and Japan by reason of its better blending possibilities, durability and softness of texture under varying conditions. Indeed, the existing staple fibre units have themselves applied to the Government to import the additional equipment that they would have to instal to turn out polynosic fibre. In view of this, we welcome the practicable suggestion of the re-elected Chairman of the Millowners' Association, Mr. Radhakrishna Ruia, Bombay. He adopted a statesman-like approach to the subject in his address at the last annual general meeting of the Association, when he observed: "The scope for utilising the polynosic fibre to supplement cotton should be exa-

mined and the producers of staple fibre should be requested to manufacture it on a commercial scale to suit Indian conditions." This is in striking contrast to the unqualified opposition in certain quarters to the Government's suggestion for using staple fibre to the extent of some five per cent of their total raw material requirements. Even Mr. Radhakrishna Ruia feels that "the matter demands serious consideration before any final decision is taken on it."

The Textile Commissioner, however, has apparently made up his mind and actually wants cotton mills to take to staple fibre more and more, so that, before long, these mills may cover up to 10 per cent of their total raw material requirements in this way. His seriousness in making the suggestion should be clear from his emphatic hint: "we may have to judge the question of cotton allotment to mills on the basis of staple fibre consumption". In the considered view of Mr. Doraiswamy, it would appear, the only way to bridge the gap between total demand and total availability, until our own cotton production is raised appreciably, is to use staple fibre (or/and polynosic fibre) anywhere up to 10 per cent of the total cotton requirements of our mills. Taking all the relevant factors of the situation into account — and only he can do it because he has all the data and is in a position to assess them more accurately than anyone else — he has arrived at this conclusion. And so, rather than spurn his suggestion or describe it as 'fibre fad", our millowners and textile research associations would be well advised to carry out further research to find out improvements, if any, that could be effected in the staple fibre manufactured in this country and make it, along with such quantity of polynosic fibre as we may be able to produce or import (in the interim period), serve their purpose better Let us not forget that, whoever may be involved, what is at stake is the hard earned investment in an industry of the nation as a whole and that we are still not so rich as to afford the luxury of scrapping an industry that has entailed sizably handsome outlay.

Steel—Its Costs and Conflicts

MANY THINGS stood out in the recent debate in Lok Sabha on Steel, Mines and Heavy Engineering but few so prominently as the problem of productivity and rising costs in steel plants, labour conflict in leading public sector projects, over-production of lower grade coal and the question of amalgamation of uneconomic coal mines. The stress on importance of cost accountancy was a happy development; so was the announcement that the Government proposed to adopt a new personnel policy in keeping with modern industrial practices. There was a general satisfaction at steel targets set by the Steering Group for the Fourth Plan and it was hoped that the Government would avoid delays and pitfalls experienced in earlier projects.

Strange as it may appear, critics of the Steel Ministry used two or even three years' old statistics to level charges of rising costs of production in public sector steel plants. The Minister naturally had the latest figures and was able to establish that actually the costs of steel ingots, cold rolled sheets and salable steel had since been going down and at present compare favourably with the estimated project costs and Tariff Commission estimates in private sector plants. However, his silence on the massive labour force we use and our costs of capital equipment betray the weak spots in our projects. According to one estimate while, on the average, Japan employs about 2,500 men to produce a million tons of steel, we hire from 20,000 to 30,000 hands and while she spends about Rs. 800 towards her capital cost per ton, our cost of capital equipment comes to about Rs. 2,800 for one ton capacity. Of course, productivity and costs of production depend on so many factors and any comparison, particularly under different sets of conditions, can be misleading if not invidious but when differences assume such wide proportions, fears must be allayed with a frank and honest analysis. One of the major causes of high capital costs of our steel plants has been the gross miscalculations done by foreign experts regarding the cost of raw materials. It is hoped the government would make special efforts to see that such errors are not repeated by Indian or foreign consultants. Also, in this respect, Mr. Subramaniam's announcement regarding introduction of a crash programme to enable better utilisation of raw materials is undoubtedly a welcome step.

It is a strange paradox that while comparative peace has prevailed in the private sector industries, industrial undertakings of a State pledged to socialist objectives should be the scenes of bitter labour strife jeopardising production and bringing enormous losses to the country. The causes spelled out by Government spokesmen for this unfortunate situation appear to be too hackneyed and lack conviction. Even the analysis about multiplicity of labour unions on the basis of affiliation to political parties and the built-in-position of conflict smells a little too stale. Mr. Subramaniam rightfully claims that he grew up as a labour leader and that he knows the problems of labour. Unfortunately, his managers' approach to the labour situation is a poor tribute to this claim. While no one will justify the acts of vandalism and indiscipline on the part of labour, the fact remains that Government's handling of labour and its efforts to avoid prolonged strikes have also not been too complimentary. What is needed is a strict adherence to statutory obligations by state enterprises, a human understanding of labour problems by the management and firm stand against extravagant demands of the Unions, whatever their hue and colour. The "original sin" may have been the starting of trade

Highlights of the Week

MAHALANOBIS REPORT

AFTER THREE and a half years' deliberations, the report of the committee on distribution of national income—part I only—was presented to the Lok Sabha on April 29. The committee was constituted in October 1960 under the chairmanship of Professor Mahalanobis, a member of the Planning Commission, to review changes in the levels of living of the people during the first two five-year Plans, to study trends in the distribution of income and wealth and to ascertain the extent to which the operation of the economic system had resulted in concentration of wealth and means of production. The findings of the committee, though based on inadequate data, are full of interest. The committee has arrived at the conclusion that there has been a general improvement in the standard of living of the people who were, at the end of the second Plan, better fed and better clothed than they were at the commencement of the first Plan. The national income over the first two plans rose by 44 per cent from Rs. 8,850 crores in 1950-51 to Rs. 12,750 crores in 1960-61—both estimates measured at constant, 1948-49 prices. Government expenditure in the decade under review rose from Rs. 520 crores to Rs. 1,030 crores indicating an increase of about 98 per cent; domestic savings from Rs. 500 crores to Rs. 1,040 crores. Domestic savings and Government expenditure together increased by about 103 per cent. This was made possible by putting a restraint on private consumption which increased by only 36 per cent in ten years as against a rise of 44 per cent in income. About 77 per cent of the additional income was available for increasing private consumption. A major portion of this increase was utilised to feed a rising population and only about 28 per cent or almost a quarter of the additional income was available for the net increase in per capita consumption.

The committee has made estimates of the size-distribution of income from the available data and has come to the conclusion that the degree of inequality in income distribution is not higher in India than in some other developed or underdeveloped countries. This finding of the committee has given the lie to the mis-conceived notion prevalent in some circles in this country that planning had made the rich richer and the poor poorer.

Regarding the growth of big business the committee has stated that the presence of economic concentration did not necessarily mean the "deliberate adoption of an anti-social policy." The economy of scale was in favour of big business, on purely economic grounds. In this regard, economic consideration was certainly relevant specially in the context of India's scarce resources and the imperative need for making the most economic utilisation of these resources. In very emphatic terms, the committee has stated that "any attempt to reduce the degree of concentration by breaking down economic size units into a larger number of un-economic size plants would only lead to waste."

The salient features of the report are presented in the following twelve concluding observations on distribution of income and wealth:

(1) "The most important conclusion which emerges from this study is that we do not have the required data for drawing valid conclusions concerning the changes in income distribution which might have taken place over the two Plan periods.

(2) The available estimates and data relating to size-distribution of income seem to suggest that the degree of inequality in income distribution is not higher in India than in some other developed or under-developed countries; the distribution of income in the urban sector is more unequal as in the other countries, than that in the rural sector.

(3) The analysis of the available income-tax data suggests some reduction in inequality of income among the tax paying group as a whole and also for some of the subgroups of this population over the period under study except for pure salary earners where the picture is mixed. However, in view of the deficiencies to which these data are subject, it is not possible to place much confidence in this conclusion.

(4) Available estimates and data suggest no significant change in the overall distribution of incomes though they do indicate a slight probable increase in inequality in the urban sector and some reduction in inequality in the rural sector. Again, in view of the inadequacies of the data used for comparison purposes, it is not possible to be definite about this conclusion.

(5) Trends in wages and salaries received by selected occupation groups over the decade 1950-51 to 1960-61 indicate that, with the notable exception of agricultural labourers, the growth in income of employees generally kept pace with the growth in average income per employed person for the country as a whole. In particular, there is evidence that the growth in incomes of the mining and factory workers has kept ahead of the rate of growth in the average income per employed person. Agricultural labourers as a group do not seem to have shared in the increase of incomes.

(6) Analysis of the income-tax data based on the occupation of common assessees reveals that over the period 1951-59, the average incomes received by contractors have registered the highest increase. The rise in income of this group has been very much higher than the rise in the income per employed person for the country as a whole; self-employed persons engaged in business (manufacture, trade, transport, and financial business) and the salaried class among the tax-payers have also increased their incomes but in their case the rate of growth in income seems to have just kept pace with the rate at which average income per employed person has grown.

(7) It should be noted that there is a general feeling that the working conditions have also improved generally over this period. An average person whether in the urban or rural areas is better fed, better clothed and better housed in the 1960's than in the 1950's.

On the other hand, since there is also some evidence that the rate of growth in income for certain high-income groups has been as high as or higher than the rate of growth in income per employed person for the country as a whole, it has not been possible for the committee to pronounce a definite judgment, even of a broad nature, on the changes in income distribution. However, it can be stated that there is no clear indication of a significant change in income distribution over the Plan decade.

(8) Much less information is available on the distribution of wealth among different groups in the population than on the distribution of income.

(9) Some scattered data obtained through household sample surveys indicate that there is a fair degree of concentration of personal wealth held in the form of land both among the rural and urban sectors. The distribution of

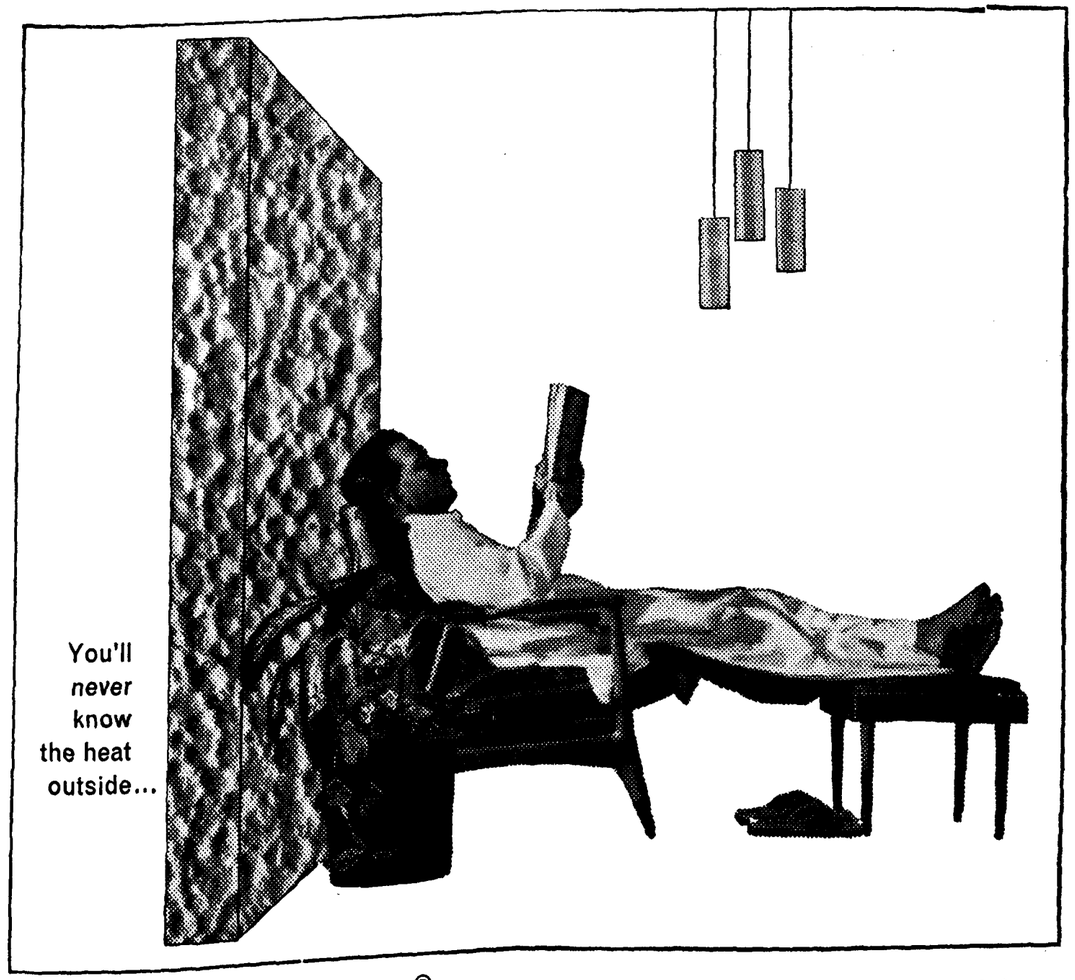
personal wealth held in the form of owner occupied houses is known only for the urban sector, which indicates that there is less concentration of wealth in this form than in the form of land holdings.

(10) The available income-tax data relating to dividend incomes indicate that there is a greater degree of concentration of personal wealth held in the form of company shares than in the form of land or owner-occupied houses.

(11) Available fragmentary data relating to distribution of important items of wealth indicate that the degree of inequality in wealth distribution is higher than that in income distribution. Wealth distribution seems to be more unequal than income distribution as in some other countries.

(12) If the question of income distribution is to be answered satisfactorily, there is clear need for the Government to organise the collection of required data. The earlier we start the job the better. The available data on the distribution of income and wealth are too meagre to draw any firm conclusion on the issues referred to the committee."

A.I.M.O. CONFERENCE



THE TWENTY-FOURTH Annual Conference of the All-India Manufacturers' Organisation held in New Delhi on April 24-25, focussed attention on the constraints imposed on India's industrial development by the fiscal and wage policies of the Government. Three resolutions were passed suggesting suitable measures for removing the various handicaps faced by the industry. In the first resolution on 'Wage Policy and Productivity in Industry' the Conference urged upon the Government, the labour and the management to co-operate with one another in evolving and implementing a rational wage policy based on the principle that only a rise in productivity could bring about the desired increase in real wages, curb inflation and bring down the costs and prices.

In the second resolution on 'the Development of Small Industries', the Conference expressed regrets that the impact of small industries on the rate of growth of the economy was not appreciable mainly due to the difficulties that arose from (i) the rigid definition of a small-scale industry, (ii) smaller allocation of raw materials and (iii) the lack of adequate credit facilities. The Conference, therefore, recommended to the Government that small-scale units which, as a natural process of growth, crossed the limit of Rs. 5,00,000 of fixed investment should continue to receive assistance from the State Directorates of Industries or alternatively, the Directorate General of Technical Development should cater to their needs. The Conference also recommended that the present procedure of including the value of land and building while computing the fixed assets of small units should be discontinued as the value of land and building varied widely in different parts of the country and therefore, resulted in regional injustices. On the question of raw materials, it was suggested that the issuance of essentiality certificates should be governed by the installed capacities of small-scale units and not by their actual production in any particular year which is subject to wide fluctuations due to extraneous factors. Another suggestion made at the conference regarding raw materials was that, as due to the limitations of their size, small-scale industries hardly benefited by the import entitlements available against exports of certain goods, such institutions as the National Small Industries Corporation and the State Trading Corporation should secure bulk orders from abroad and that the accruing import entitlements should be distributed among the participating small units on a 'pro rata' basis. As regards credit, it was suggested that, as the obsolete nature of machinery and equipment used by small industries was the major reason for the reluctance of commercial banks to provide credit facilities, measures for their modernisation should be encouraged including the grant of foreign exchange for the import of capital goods not indigenously available.

In its resolution on 'Fiscal Policy and Industrialisation' the Conference urged upon the Government (i) to encourage savings and investment in industries in the private sector by giving adequate tax concessions on profits that were ploughed back by small-scale and medium scale manufacturing concerns in whose case the overall rate of tax would be more as a result of the current year's budget proposals, (ii) to revive the confidence of entrepreneurs by immediate abolition of dividend tax and tax on bonus shares and general reduction in the incidence of tax (including the surtax) on profit from industrial enterprises as compared to speculative business, (iii) to remove the additional tax burden of 10 per cent imposed on a large number of companies coming under Section 104 of the Income Tax Act, (iv) to give no retrospective effect to any fiscal measure, and (v) to ensure that fiscal policy once adopted at the beginning of a five year Plan period will not be materially changed during the period.

Earlier, in his presidential address at the Conference, the Chairman of AIMO, Mr Prabhu V. Mehta, besides criticising the fiscal and labour policies of the Government which, in his opinion, were inimical to the basic objective of increasing industrial production, emphasised that for securing India's larger participation in international trade it was essential to reduce the indigenous cost of production. In spite of the efforts made by the National Productivity Council, the Local Productivity Councils, the Institute of Industrial Engineers, the Institute of Production Engineers, various management associations etc., there was no integrated national programme for cost reduction which could be achieved by reducing the varieties of particular products. Illustrating his point, he quoted from a publication of the Industrial Resources Technical Aid Branch of the U.S.A. which said: "During the last World War, the Conservation Division of the War Industries Board observed with dismay the prevalence of a multiplicity of sizes, varieties, qualities and grades of such varied items as furniture, farm implements, typewriter ribbons, bicycles etc. In axe manufacturing, for example, it was found that the maximum possible variety of single-bit axes was 9,94,840, i.e., 34 models, 4 grades, 35 brands, 11 finishes and 19 sizes. This was reduced by a mandatory order for the duration of the war. Afterwards, forged axes were reduced from 845 to 150, a variety of reduction by 82 per cent.....During 1917 and 1918, materials and man-power had to be conserved. 250 industries were brought under schedules issued by the War Industries Board as a means to that end. Thereafter followed some spectacular results during the period of the War. 750 tons of steel were saved by eliminating fancy bars from bicycles; 1,000,000 feet of rubber hose were saved through variety reduction of vacuum cleaners; 16,000 tons of steel were made available through substitution of zinc in the lining of refrigerators." Mr. Mehta, therefore, suggested that a high-power committee be appointed by the Government to report on simplification and variety reduction in India.

Mr. Asoka Mehta, Deputy Chairman of the Planning Commission, laid stress on the fact that the time factor was an essential ingredient in the establishment of new industries. A year's delay in producing a million tons of steel would have a chain reaction leading to a further postponement of supplies of necessary machinery. Mr. Lal Bahadur Shastri, the Union Minister without portfolio, harped on the theme that there was no escape for the higher income groups from shouldering increased responsibilities for savings and investment.

Thermocole® keeps your room so cool!

THERMOCOLE is foamed polystyrene: The lightest rigid insulation material. Its closed cells provide an effective barrier against heat, noise and moisture.
THERMOCOLE is versatile. It is ideal for insulating roofs, walls and floors in all kinds of buildings. One inch of THERMOCOLE insulates better than four feet of concrete!
THERMOCOLE false ceilings are very attractive. It is excellent for fabricating lightweight insulating partitions and doors.
THERMOCOLE is feather-light, yet strong, durable and easy to work with. It cuts structure and labour costs. Efficiency with economy—that's the insulation THERMOCOLE provides.

THE AUTOMOBILE INDUSTRY . . . .

strives to raise the standard of

The Indian Automobile Industry is still in its infancy. During its short period of development, it has achieved a high percentage of indigenous content. In the case of a car such as the Hindusthan Ambassador, this indigenous content has now reached approximately 80%, comprising a large number of components produced not only by Hindustan Motors but also by numerous newly created Indian ancillary industries.

The creation and development of these new industries have been, and continue to be, a difficult and costly process. These infant industries are confronted with considerable problems, such as the paucity of experienced technicians and skilled labour, high costs of production because of low volume, high prices and inadequate supplies of raw materials as and when required, foreign exchange limitations for imports of modern and multipurpose equipment, etc. Despite these handicaps, their achievement to-date is noteworthy. Obviously, however, these young industries cannot be expected to attain, in such a short time, a standard of quality comparable to that reached by the older and more highly developed foreign industries.

A BETTER TOMORROW FROM TODAY'S SACRIFICES

It is reasonable to anticipate that with rising production volume, modernized methods and greater experience, in addition to the manufacturers' and ancillary suppliers' earnest endeavour to strive for better quality and rigid inspection, the standard of the Indian-made motor vehicles will soon compare favourably with that of foreign manufacture. The responsibility for improving quality must be shared by both the vehicle manufacturers and the ancillary suppliers.

A Trying Week for Government

By Our Parliamentary Correspondent

NEW DELHI:

THE UNION Government this week suffered the biggest parliamentary shock of its 18-year tenure when it failed to muster the requisite majority for moving the controversial Constitution (Seventeenth Amendment) Bill for consideration in the Lok Sabha. Its experience with the other proposed amendment to the Constitution — the eighteenth one — also was none-too-happy; this amendment had to be withdrawn as a sequel to the bitter assault on it by the Opposition and several Congress members. This week in the Lok Sabha, thus, was a period of discomfiture for the Treasury Benches. The highlight of the proceedings in the Rajya Sabha was the passage of the Appropriation, Finance and Surtax Bills.

The Constitution (Seventeenth Amendment) Bill, seeking to provide protection to several State land reform enactments from challenge in courts, fell through when only 206 votes were cast in its favour — 48 short of the constitutional requirements of a simple majority of the total membership of the House which currently is 506. The other constitutional requirement that the Bill should have secured two-third votes of the members present in the House at the time of voting, of course, was fulfilled, the negative votes totalling only 19.

This debacle has been attributed to the fact that many Congress, Communist and other members who would have voted for the motion found themselves locked out for their failure to reach the House in time after the division bell had been rung. They were said to be busy with the elections of the three parliamentary committees — the Estimates Committee, the Public Accounts Committee and the Joint Committee on Public Undertakings. It was also alleged that many of them even did not hear the division bell, presumably due to some defect in the mechanism. Whatever may be the force in this contention, this ignominious defeat of the Government is a sad reflection on its whips; they failed to rise to the occasion. The Speaker deserves to be complimented for his ruling that once he had announced the result of the voting, he could not order re-voting on the ground that some members were busy in elections of the three parliamentary committees. He rightly maintained that the facts had to be accepted whatever the consequences. The Bill now cannot be brought forward again during the current session of Lok Sabha unless the rule 338 of procedure is suspended as was done in 1955 when the Constitution (Seventh Amendment) Bill, seeking to give effect to the recommendations of the States Reorganisation Commission, fell through similarly.

Trenchant Criticism

Although the voting on the Bill revealed substantial support for it, the criticism on it was no less trenchant. Spearheading the attack, the Swatantra Party leader, Mr. N. G. Ranga, saw little in the Bill to merit his approval. The Bill, even as amended by the Joint Select Committee of the two Houses of Parliament, he maintained, would spell disaster for the landholders. Compensation for the acquisition of lands below ceilings he contended, was a meaningless safeguard as long as the State Governments were free to bring down the ceilings. Mr. Ranga was supported in this contention of his by even some Congress members who otherwise supported the Bill. The other scathing attack on the Bill came from the independent member, Dr. L. M. Singhvi. He has dismayed at the casual and cavalier manner in which the Bill had been brought forth by the Government without collecting reliable economic data to support it. No sustained or legislative analysis, he alleged, had also been made to evolve an economic rationale for a measure of this kind. He as well pointed out that the retrospective effect which the Bill sought to provide was repugnant to legislative propriety.

Many members, both from the Treasury Benches and the Opposition, also criticised the measure on the ground that it discriminated between the rural and the urban folk as there was no ceiling on urban incomes. The Jan Sangh spokesmen objected to the Bill alleging that the Government was going to take over land from the farmers in the name of co-operative farming. The Bill received general approval from the Congress, the Communist, the PSP and the Socialist members. The latter two groups, however, criticised the Government for not vigorously implementing land reform measures legislated by the States.

Right of Parliament Challenged

The Constitution (Eighteenth Amendment) Bill, seeking to remove doubts about the powers of the State to make laws or take executive action during an emergency irrespective of the fundamental rights contained in Part III of the Constitution, encountered strong opposition even at the preliminary stage of introduction, leading to a walk-out by all the Opposition members, except the Swatantra Party and a few independents. In a spirited criticism, Mr. N. C. Chatterjee characterised this measure as a crude attempt on the part of the Government to cover up violations of the Constitution. The flouting of the fundamental rights, Mr. Chatterjee opined, would lead to the rule of law coming to an end. The other most bitter critic of this Bill was Mr. Hiren Mukherjee, who challenged the right of Parliament to deal with it. His argument was that Article 34 of the Constitution allowed indemnification of violations of its provision only if they had taken place during a period of martial law. This did not cover the emergency period. Among others who criticised the measures were Mr. Kapur Singh who called it an "unconstitutional lawlessness", Mr. S. M. Bannerjee who styled it as a "fraud" and Mr. Nath Pai who characterised it as an attempt to maul and maim the Constitution. Although the Law Minister, Mr. A. K. Sen, succeeded in seeking the permission of the House to introduce the Bill by a majority of 172 to 52 votes, the Government later on announced that it would withdraw it in deference to the strong feelings expressed by the Opposition in the House and some Congress members in a party meeting.

The Rajya Sabha adopted the Appropriation, Finance and Surtax Bills as passed by the Lok Sabha. The debate on the Finance Bill, though marred by the bringing in of such side issues as the release of Sheikh Abdullah and the problem of Muslims in India, was constructive and of fairly high order. Mr. A. D. Mani suggested that the Annuity Deposit Scheme should have been introduced as a Social Security Scheme as in the West. Mr. R. P. Sinha pleaded for setting up of a revolving fund of about Rs. 100 crores out of the PL 480 counterpart funds for mitigating the rigours of rupee finance shortage for new industrial undertakings. Concessions to the foreign investors were generally welcomed in the interest of industrialisation of the country. Concern was expressed over rising prices, tax evasion and population explosion. The Finance Minister, Mr. T. T. Krishnamachari, in his reply, hit out at the stock markets for their failure to respond to the budget proposal. He threatened that if the stock exchanges and the private sector did not help in reaching the goal of

socialism — his budget proposals, he maintained, were the beginning of a long-term policy to achieve this goal — the Government would have to think of other methods. Mr. Krishnamachari held out the hope that if the Government was successful in its attempts to check tax evasion he would be prepared to reward the honest tax-payer by lowering income-tax on earned incomes. The Finance Minister expressed the view that the necessary resources for rehabilitation of refugees from East Pakistan could be raised without additional taxation. Rehabilitation of these refugees and the development of backward areas, he said, would be taken up simultaneously so that the backwardness areas could also contribute to the growth of national economy. He shared the concern over growth of population and expressed the hope that the Governmen would be able to take a big leap in regard to opening of family planning clinics and stepping up of propaganda on the need for family planning.

The Rajya Sabha discussions on the Appropriation and Surtax Bills lacked lustre. But the debate on the Appropriation Bill was enlivened by the Finance Minister's references to Kashmir. He reiterated that the accession of Kashmir to India was irrevocable and the talks with Sheikh Abdullah (who arrived in New Delhi on Wednesday) would not be on the fundamentals of the Kashmir question, which were settled facts and part of history. All that could be discussed with Sheikh Abdullah, he said, were the "nuances" of the Kashmir problem. Expressing gratitude for the assistance made available by the US for meeting the Chinese aggression, he reminded the US Administration that this was a recognition of the fact that defence of Ladakh was necessary because of India's obligation to defend the Kashmir Valley as a part of India.

Mr. B. R. Bhagat, Minister of State for Finance, introduced in the Lok Sabha this Wednesday a Bill seeking powers for income-tax officers to go ahead with pending tax arrear recovery proceedings even in cases which would require, because of a recent Supreme Court judgment, service of fresh notices.

Question Hour

Bokaro Plant: The Union Minister for Steel, Mines and Heavy Engineering, Mr. C. Subramaniam, told the Lok Sabha on April 24 that tenders for the supply of equipment for the Bokaro Plant would be invited in the middle of this year. While no firm offer had yet been received from any foreign Government for collaboration in this project, private parties from the United States, West Germany, Japan, France and some other countries had evinced interest in making available equipment for it on commercial credit basis. Suppliers in two or three of these countries had even formed consortia for this purpose. There were also chances of getting aid for the Bokaro Plant from the Soviet Union.

The Deputy Minister for Steel, Mines and Heavy Engineering, Mr. P. C. Sethi, earlier denied a report that financial and technical collaboration for the Bokaro project had been sought by the Union Government from the Japanese steel industry.

Ore Reserves: Mr. Subramaniam also informed the Lok Sabha on April 24 that reserves of iron ore and manganese ore in Goa had been estimated at 525 million tonnes and 6 million tonnes; respectively. The reserves of ferro-genous manganese had been placed at 10 million tonnes.

Iron Ore Exports: The Minister for International Trade, Mr. Manubhai Shah, revealed in the Lok Sabha on April 24 that the possibility of granting further relief in freight on iron ore exports was being examined by the Government. Iron ore meant for export already enjoyed preferential treatment as it was subjected to a 5 per cent railway supplementary charge, as against 12 per cent on general merchandise. Rebate was also allowed on low-grade iron ore moved for export from Rajasthan to Kandla. Mr. Shah confirmed that there had been experienced a continuous fall in iron ore prices in the international market. Brazil and Sweden had brought down their prices, thereby putting India at a disadvantage.

Sugar Corporation: The Parliamentary Secretary to the Minister for Food and Agriculture, Mr. A.S. Shinde, indicated in the Lok Sabha on April 21 that the Union Government would be constituting a Sugar Corporation to handle internal distribution and export of sugar. The sale price of sugar would be a matter to be decided by the Corporation when it came into being. The purchase price, however, would be the ex-factory price fixed by the Government.

The Minister of State for Food, Mr. A. M. Thomas, added that an important objective of setting up of the Sugar Corporation was to ensure uniformity in sugar price over as large an area in the country as possible. A small commission was likely to be levied on the sale of sugar by factories to meet the expenses of the Corporation. The Corporation would not, however, undertake retail sales of sugar. It would utilize co-operatives and other existing retail trade channels, including small traders, for this purpose. The Corporation would appoint wholesalers. It would give preference to co-operatives in this regard. There was no intention to appoint any non-official on the Corporation. It would consist of official representatives of various Ministries and will have a wholetime chairman. A chief executive officer would also be appointed. The Corporation would not function as another intermediary in the sugar trade. It would be a semi-autonomous body looking after the trade in this commodity. The sugar production during the current year, Mr. Thomas stated, was expected at 2.6 million tonnes. The Government was originally thinking of exporting 300,000 tonnes, but now exports would not exceed 250,000 tonnes.

Sugar From Beet: Mr. Thomas told the Rajya Sabha on April 24 that the Government proposed to set up a pilot plant at Dehradun to produce sugar from sugar-beet. Experiments conducted so far had indicated that sugar content in beet was about 15 per cent. There were, however, practical difficulties in the processing of this sugar. Sugar-beet, Mr. Thomas further pointed out, was not grown anywhere in India on a commercial scale.

Oil Prospecting: The Minister for Petroleum and Chemicals, Mr. Humayun Kabir, informed the Lok Sabha on April 22 that a re-examination of the data supplied by the Stanvac Oil Company had led to the conclusion that there was a possibility of finding oil at Port Canning, near Calcutta. No decision, however, had been taken as yet on when to start offshore drilling here.

Amalgamation of Coal Mines: Mr. C Subramaniam told the Lok Sabha on April 24 that owners of small colleries had not shown enthusiasm for amalgamation of their mines with larger units. The Government, he added, was considering the question of bringing about compulsory amalgamation of small coal mines.

Marine Diesel Engines: The Minister for Defence Production, Mr. K. Raghuramaiah, informed the Lok Sabha on April 25 that the soil survey at Ennore in Madras State was in progress in connection with the project for the manufacture of marine diesel engines. He further stated that detailed planning for this venture had been already undertaken. A collaboration agreement had been signed with M/s. MAN of West Germany. The cost of the scheme was estimated at Rs. 5 crores, with a foreign exchange component of Rs. 1.5 crores.

Rocket Launching: Mr. Raghuramaian told the Rajya Sabha on April 21 that the objective of firing a high-altitude three-stage composite rocket by the Defence Research and Development Organisation at Balasore recently was to establish indigenous know-how on rocketry and allied science with a view to gathering knowledge for the ultimate designing and development of guided weapons.

OUR POPULATION PROBLEM—VI

What Needs to be Done—'The Pill'

R. CHOPRA

SINCE EMPHASIS is being laid on the voluntary limitation of the family and consequently the population, the success of any Family Planning programme would depend to a very great extent on the universal use of contraceptives. This is borne out by studies carried out in the Western countries, which show that the universal and voluntary usage of contraceptives by married couples to avoid conception has been responsible for stabilised populations. A contraceptive should, therefore, be readily available, cheap, reliable, convenient to use as well as to dispose of, etc.

The conventionally accepted contraceptives, however, do not have all the qualities listed above. They are, generally speaking, expensive (at least Rs. 2/- per month per couple if regularly used), not readily available (the report of the Director of Family Planning of April 1962 is a good illustration), reliability is very limited and conditional and are most inconvenient to use and dispose of particularly in India with antiquated sanitary facilities and poor and inadequate housing with little or no privacy. The better the contraceptive—better in the case of use and in effectiveness—the less the social resistance to the acceptance of Family Planning and the greater the efficiency of implementing voluntary fertility where it is needed.

Effective Protection

The only proven contraceptive available at present which answers all the conditions listed above is the Oral Contraceptive or simply "The Pill". The pills, which on the average, are 20 times as effective as "safe period" control, ten times as effective as the most commonly used contraceptive devices, promise protection against unwanted pregnancies to a degree never before possible. It is estimated that almost two million women in the United States now use the pills as their only means of regulating fertility and it is likely that at least another two million are doing so in other parts of the world. When a woman takes the pills as directed—one a day for 20 days a month—she cannot become pregnant.

At the present time there are two widely used preparations that are taken orally, as pills and many more preparations are under development or study.* Although research workers are still studying whether the pills have any side effects or not, it should be stressed that of the thousands of women who have taken the pills for the last 4-5 years, not one seems to have been harmed by them.

Their cost is, at present, a barrier to wide distribution in India but it is certain that cost can be minimised by mass production. India should, therefore, immediately approach countries (notably the USA) who manufacture the pills and arrange to set up manufacturing facilities in the country. Considering that the pills will have to be supplied to nearly 12 crores married women of child-bearing age at the rate of 20 pills a month, mass production methods can be used to cut down costs.

The manufacturing facilities may be set up either under the Family Planning Organisation or in the private sector but should be strictly on no profit-no loss basis. The pills must be supplied to every woman in the country free of cost.

The distribution of the pills at the Village/Field Worker level, shall be the responsibility of the Family Planning Organisation. The Village/Field Level Worker shall personally hand over the supplies to each married woman in his/her beat. It is desirable that transport and distribution of the pills by the Railways, Roadways, Airways and/or Post and Telegraphs Department should be free of cost. After all the extra traffic due to the pills would be insignificant compared to the nomal traffic carried by them. The pill packages should be labelled distinctly and should be given priority in transporting them.

The pills should be in attractive containers each holding one month's supply. To begin with, three months' supplies should be given to each woman and recouped every month or so, so that the stock with each woman varies from 2 to 3 months. This is very essential to avoid break in regular use of the pills in case of temporary break-down in supplies which may occur occasionally. Each container should preferably include instructions on the use of the pills which should be understood by even illiterate women. In any case the Village/Field Level Worker must explain the method to use the pills properly to every woman initially either at a meeting or individually as the case may be. He/she should also be readily available to give any advice later on as may be desired by any woman.

The Village/Field Level Worker should have a buffer stock of pills against irregularity of supplies for not only 3 months' normal consumption but at least 20 per cent in excess. This is essential to cover sudden increase of married women in his jurisdiction due to various reasons. After all the Success of the programme depends upon the Organisation being able to forestall any emergency.

Adequate Supply

The family planning workers at Block Level and above shall be personnally responsible in ensuring that adequate supplies reach the right Village/Field Level Worker at the right time. They will also carry out surprise checks to see that the people get their supplies in time.

In addition to the Family Planning Organisation supplying the pills, the pills should be freely available in the cities and villages, whenever possible, from drug stores, shops and even "press-button machines" with the least amount of inconvenience.

Although it is very difficult to estimate the cost of manufacturing and supplying the pills, 20 nP. to 40 nP. per month's supply per woman appears to be a reasonable estimate if the pills are produced at the mass scale envisaged. This would entail an expenditure of nearly Rs. 50 crores per year since the pills are to be supplied free of cost. The capital expenditure for setting up the manufacturing unit(s) will be additional.

Next in importance to contraceptives as a means for birth control is the sterilization operation. The operation is known as Vasectomy in the male and Salpingectomy in the female. This operation makes a person sterile permanently but has no effect whatsoever on the sexual life of the person. On the other hand, studies have shown that married couples achieve better sexual and marital harmony after one of them has

* Even better contraceptives, pills, vaccines etc. are being experimented with. (See the chapter on Bio-Medical Factors in the book "The Growth of World Population" issued by the National Academy of Sciences of U.S.A.). But for India the pill is the best answer yet and its use should be immediately encouraged. As and when other methods are perfected they can be adopted with no loss of time provided the programme fulfils its most important mission, i.e., motivating the population.

undergone the operation since the ever present risk of conceiving no longer prevails.

Acceptance of this method of preventing reproduction appears to be increasing particularly in India. The report of the Director of Family Planning rightly stresses the importance of sterilization in the overall plan of birth control. It says that facilities for free sterilization are widely available. The Government of India has sanctioned special casual leave of six days to its employees and it has now been extended to industrial employees also. Besides free transport and the casual leave, a compensatory allowance of Rs. 10 to Rs. 30 is also given by certain States to persons undergoing sterilization but not by the Government of India.

Sterilization camps and mobile teams have also been organised and the response has far exceeded the expectation as stated in the report of the Director of Family Planning. In the period January 1956 to February 1963, 3,34,477 persons (2,09,923 males and 1,24, 554 females) have been sterilized.

Sterilisation Target

It is estimated that if sterilization has to have a significant effect on the birth-rate the number of such operations have to be stepped up. A target of at least 10 lakhs operations per year has been set under the PCP. This means that each Village/Field Level Worker has to persuade 5 to 6 persons from his jurisdiction to undergo the operation.

To encourage sterilization the following steps are recommended :

(1) Every married man with a wife capable of producing children and every married woman of child-bearing age should be motivated to undergo the operation after the birth of two normal children.

(2) A cash award of Rs. 75 to Rs. 100 to every man who undergoes the operation. A scale may be laid down of the cash awards depending upon the number of children after which the father decides to undergo the operation, i.e., less children at the time of the operation the more the cash award.

(3) A cash award of Rs. 75 to Rs. 100 and a free delivery to any woman who is prepared to undergo the operation. In the case of woman the operation is easier if performed just after delivery.

(4) The family Planning Organisation shall underwrite the costs of the operation to any doctor up to Rs. 100 or so. The Village/Field Level Worker shall bring to the notice of the Block Level Worker the people prepared to undergo the operation. The Block Level Worker, who has lists of qualified and licensed doctors* (it would be worthwhile to issue licences to doctors who have a private practice and wish to carry out sterilization operations under the auspices of the Family Planning Organisation), and hospitals etc, shall be responsible for making all the necessary arrangements for helping the persons undergoing the operation. In case travel by train or bus is necessary the Organisation shall pay the fare (it would be desirable that the Railways and the Roadways agree to transport such persons free of cost on the certificate of the local Family Planning Administrator).

(5) A special casual leave of one week should be given to every employee undergoing the operation.

(6) The Family Planning Organisation at the State or Regional level, jointly with the Indian Medical Association or the various Medical Colleges, Institutes etc should organise well publicised sterilization camps as frequently as possible all over the country and particularly in areas where such facilities are normally lacking. Fifth year medical students or those who just complete their studies are to man these camps in addition to experienced medical personnel. In fact, attendance of such camps can be made compulsory for all medical students and student nurses. Foreign doctors or teams of medical personnel can also be invited for conducting the camps.

(7) Children of persons undergoing the operation, if they are three or less, should be insured by the Life insurance Corporation at very reasonable rates compared to children of those persons who are not sterile.

(8) Free or subsidised schooling facilities for children of persons undergoing the operation.

(9) Preference in jobs and/or land allotment if any to persons undergoing the operation, other things being equal. Also income tax reduction etc.

(10) Incentives and rewards to the Village/Field Level or Block Level Workers who exceed the quota of sterilization operations set for their jurisdiction.

(11) The Government should enact legislation for the compulsory sterilization of feeble-minded persons who might bring idiot children into the world and/or people suffering from diseases which are liable to be passed on to their children. Since it may not be possible to stop such persons from marrying, they can at least be prevented from producing children. According to the book "A History of Sexual Customs" by Richard Lewinsonn, some States of USA have passed laws for the compulsory sterilization of lunatics. It is further stated that the operation is practised very widely all over the USA to sterilize habitual criminals, especially sexual offenders.

(To be continued)

*Incidentally this will also attract doctors to rural areas once they find that carrying out sterilization operations alone will get them Rs. 100 per head. Considering that the target is 10 lakhs operations per year, hundreds of doctors would be tempted to start practice in the countryside and thus solve the problem of providing medical facilities to village folks. The doctors would also act as effective allies of the Family Planning Organisation.

The Planned Approach

Goodlass NEROLAC Paints

ONE STEP AHEAD OF PROGRESS

Paints and surface coatings must keep pace with the changing and unceasing demands of industry □ We at Goodlass Nerolac welcome the challenge of remaining ahead in technology, quality and production ... of meeting these ever widening demands □ We accept the challenge in a characteristic way by adopting new methods of manufacture ..., by conducting constant research into new qualities ... by giving you today the paints for tomorrow's needs.

WINDOW ON THE WORLD

Car Trouble

ASHOK V. DESAI

OXFORD :

A FEW YEARS ago, the appearance of cartoons about traffic jams marked the advent of summer in Britain. Gradually, however, they spread to other seasons; now they are perennial But in spite of this increased topicality, they seem to be losing ground and passing into sick humour. The British Railways have put out posters suggesting that it is a positive ordeal to travel by car; and so it is in many towns. Cars are built nowadays to cruise comfortably at 60 m.p.h. and more; yet one cannot exceed 30 m.p.h. in towns and villages. Even this speed limit is only theoretical in many areas; the average speed of traffic in cities is only 11 m.p.h. At this rate, the day may not be far when Britain will be a vast car park.

With the growing number of irate car-owners, roads have become a political issue. The opening of Britain's first motorway two years ago was accompanied by much political fanfare, and so was its cracking up in the severe frost of last winter. The Ministry of Transport claims one of the ablest members of the Government, and he makes headlines whenever he introduces new restrictions on parking or right-hand turns in London. And the Government has published a programme of road building in which it promises to double the annual expenditure on roads in five years.

Thus, authorities, both national and local, are under pressure to do something; and they invariably choose measures that are quickest and involve least disturbance. A popular palliative is to discover alternative routes to congested streets and divert traffic to them, thereby reducing quiet residential areas to bedlam. At a pinch, new relief roads are built. A proposal to build a road to relieve Oxford's High Street has been hanging fire for years because it would cut the Christ Church meadow in two. The latest idea is to sink it twenty feet below ground, but the college thinks it is not deep enough. But relief roads, by-passes and ring roads have been readily tried out in other cities.

The other common remedy is to cut down traffic, e.g. by introducing parking meters and no-waiting areas. However, there is a growing shortage of palliatives.

Unprecedented Problems

In the meanwhile, the magnitude of the traffic problem has been emerging out of studies, especially those done at the Road Research Laboratory. For example, it has been estimated by extrapolating trends that the number of motor vehicles, which is around 12 million today, is likely to get up to 18 million in 1970 and 27 million in 1980. The vehicles population is likely to reach around 40 million in 2010; and the next two decades are going to see an explosion of the car population — an explosion which must bring, in its wake, unprecedented problems of congestion, noise, pollution of air, accidents and general worsening of tempers.

Many towns in Europe, as in India, have grown up round a mediaeval market town or local capital. Vehicle ownership was much less widespread in previous centuries, and all older towns show a lower rate of road space to the built-up area than would be necessary today. Further, a compact town was more easily secured against attack, so mediaeval towns were more densely populated. Thus, modern towns start with a congested core; and they develop radially round this core, so that an increasing volume of traffic has to pass through it.

Where traffic is not heavy enough to impede itself, a radial town plan is not bad. In such semi-rural conditions, the aim of planners would be to minimise the average road distance between random points in the town; from this point of view, a plan of radii and concentric circles is as good as a square grid. Besides, a radial plan provides focal points for impressive monuments (the consideration must have been in Lutyens' mind when he built New Delhi). Where traffic is at all heavy, however, road distances often become a minor consideration, and it becomes more important to prevent traffic from getting in its own way. The principal ways of doing this are (1) to separate vehicles going at different speeds, (2) to avoid intersections, and to design them for minimum delay, and (3) to keep the traffic flow below road capacity.

More Efficient Modes

The idea of separation of traffic flow is not new. The pavement, which isolates human beings from faster vehicles, is a variant of it. What is new, perhaps, is the realisation that having different streets for different kinds of traffic is more efficient than giving them different lanes in the same street: it not only prevents vehicles straying into the wrong lane, but also makes intersections less clumsy and reduces accidents.

The separation of human beings and motor vehicles is easy, because the activities which involve walking — going to and from bus stops, shopping, going for a walk etc. — do not require the proximity of cars; residential areas, shops and parks can easily dispense with motor vehicles. The idea of pedestrians' shopping areas has caught on in Germany, many of whose towns have mediaeval cores with narrow streets which are pretty useless for motor traffic; everywhere one finds Bummelstrassen, streets where the business of parting with money is not complicated by the risk of parting with life. In Britain's new towns, there are many residential areas with footpaths and lawns, but no cars. These carless areas are surrounded by terminal car parks.

The same principle can be applied to animals and motor vehicles (e.g. dairies may be moved out of towns), and to motor vehicles moving at different speeds. The difference in the speed of motor vehicles is due less to their capacity than to the different purposes of the travellers — people who are pulling in or out or looking for a parking place travel slowly, as do buses, whereas long-distance drivers wish to go fast, and towns can be planned so as to separate their routes.

The number of intersections depends on the density of the road grid, and cannot, therefore be much controlled within towns; but their design has been the subject of much research. The proportion of lanes at an intersection that can be kept open without crossing one another declines as the number of roads meeting increases. From this point of view, therefore, three-day crossings are the best; they allow traffic to move simultaneously in four out of six possible directions, while the conventional four-way crossing allows movement in only six out of twelve directions. The recently published Report on Traffic in Towns — the Buchanan Report — shows a system of three-way crossings and one-way streets which allows simultaneous movement at all crossings. Lane crossing can

be avoided by means of multi-level crossings, which are, however, expensive and surprisingly space-consuming.

It is very important to keep traffic within the bounds of road capacity, for congestion reduces the traffic flow; a larger number of cars can use a road per hour if it is uncongested. Thus, besides waste of time and money (economic losses in Britain due to congestion were estimated at £250 million in 1963), congestion does not even work as a relief measure.

Evidently, traffic can be adjusted to road capacity in two ways: either one can build more and wider roads or one can restrict the use of roads. The Americans believe in building roads; the result is a network of roads that is a marvel of engineering, and vast, sprawling cities. Los Angeles is, for example, 80 miles long and 50 miles wide, and is still growing. There is considerable building and widening of roads in Europe as well. Some of the best roads have been built by pulling down and leveling city walls; thus, Brussels is ringed by a splendid boulevard on which one can speed happily.

Rubber-Tyred Sacred Cow

But in general, Europeans are much more chary about demolishing buildings to make roads, and more willing to restrict traffic. Hitherto the restriction has been haphazard: it has resulted largely from the introduction of parking meters with a time limit and from the tedium of congested streets. But looking at the huge traffic loads expected in the future, more systematic restriction would seem inevitable. And there are sound arguments for it, for as Professor William Vickrey says, "our rubber-tyred sacred cow is ravenously space-hungry". A group studying the transport needs of Washington, D.C., found that the cost of provision of road space at peak hours was more than seven times the cost of an ordinary car. Much better to tax cars off roads!

An ingenious scheme of road pricing for this purpose has been worked out by Vickrey. The idea is that each car would have an electronic response block which would be recognised by equipment in roadside pillars and the identity of the car recorded. There would be a charge for passing every pillar, and the charges could be varied according to the area and the time of the day. The total monthly charges would be added up by computors and bills sent out, just like telephone accounts. In the variations worked out in Britain, there would be a meter in each car to be charged up by putting in a token to be bought, and it would be run down by signals from equipment on the roadside or the road surface.

There is much opposition to road pricing schemes, especially on the ground that they would not discriminate between more and less well-to-do people and therefore be inequitable and that the charges involved would be absurdly high. These considerations may not be decisive, however. An equitable scheme would involve rationing of road space on the basis of some priorities, and with such a variegated service as car travel, it is difficult to lay down priorities: should, for example, commuters rank above shoppers? And if there are too many commuters, who should be allowed to travel? And the sting of inequity can be removed by providing a cheap and adequate public transport service, which might be subsidized out of road use charges. So if the situation gets desperate, we might see some fascinating experiments in traffic management.

Sterling Area and Franc Zone—I

From Our Special Correspondent

PARIS

PROPHESIES OF the disintegration of sterling area continue to be made from time to time (a recent one appeared in "The Banker" in January, over the signature of H.A. Spengler), but nothing of the sort has been heard about the franc zone for several years. In accounting for this difference, we shall be able to assess the arguments of those who hold that the sterling area is headed for break-up sooner or later — because most of the arguments they advance should apply equally well to the franc zone. Both these monetary blocs are undergoing immense structural changes, due to the political liberation of numerous colonies since the war and to the increasing economic independence of their overseas members. If the future of one of them (the sterling area is called in doubt, while the other seems secure, it is natural to suggest that structural changes are not the cause of the sterling bloc's loss of cohesion. The reason must lie elsewhere and the case of the franc zone soon indicates where. The cohesion of such monetary areas, it can be argued, depends directly on confidence in the pilot-currency.

That is to say, it is because the French franc's value in world exchange markets has been beyond question continuously since 1958 (because, indeed, you can count on your fingers the number of days that the US dollar has risen above its floor quotation in Paris), that the franc zone has held together without fissure through all the political upheaval of the dissolution of the French empire and "Community", the liberation of Algeria and the recurrent grave breaches with Guinea, Mali, Morocco, Tunisia, etc. On the contrary, it is because sterling has been repeatedly exposed to speculative onslaught, has been at least once in those five years in real difficulty, and has inspired little confidence in between those bouts of fever, that the sterling area shows signs of disintegration.

If this seems an obvious remark, one may recall that ponderous authorities commonly argue just the opposite: it is because the sterling area is not holding together, they say, because the overseas members are not playing the game, that the British pound is weakened. Comparison with the evolution of the franc zone at least indicates that this is the reverse of the truth. It is just because the pound is weak that members of the sterling bloc choose not to play the game. Specifically, they prefer to accumulate independent gold and dollar reserves, distinct from the central reserves of the sterling area, and they prefer not to hold more sterling than they have to. This weakens the pound, but the reasons the overseas members have for doing this are the same as for all currency-holders and speculators: they are doubtful about the future of the British currency.

The impact of structural economic changes on the sterling area is not to be denied. The original theory of the bloc was that the balance of payments of Britain would usually be compensated for by the contrary balance of payments of the overseas members. For example, when raw materials prices fell, the overseas members would earn less because they exported mainly commodities, but for the same reason Britain's earnings would rise because she exported manufactures made from those commodities (or made by workers fed with those commodities). Similarly, in reverse: when Britain's earnings declined, the gains of the rest of the sterling area would rise. Since both sides' earnings went into a common pool, these fluctuations would cancel out. And to be sure one can see this mechanism at work throughout the decade of the 1950's: the current payments of Britain and the overseas sterling area generally moved in opposite directions, and the resulting net balance of the sterling area as a whole was more stable than either of its two components. Since 1959 this has ceased to be true: instead of compensating movements one sees parallel movements, each accentuating the other.

The reasons are evident. On the one hand, Britain is no longer so largely an importer of commodities and an exporter of manufactures: she imports more industrial goods (hence the expansion of her trade with the Continental countries), while her exports of manufactures have not been consistently competitive, as costs rose. On the other hand, the overseas members, while importing more and more manufactures, have not drawn them so largely from Britain. This was in part for the reason just mentioned, that British goods were less competitive, but also because these countries deliberately preferred to assert their economic independence by buying elsewhere. The end of quota-discrimination against the USA and Japan, and the diminution of Commonwealth preference in favour of Britain, hastened this process. It was further reinforced by the fact that development aid was commonly "tied" to imports from countries other than Britain, notably from the USA.

These factors combined to destroy the compensating mechanism of the sterling area, but they do not explain why its total central reserves declined. As long as all the members continued to pay their way in the world, their pool of reserves might show more violent fluctuations but it need not shrink. There are two proofs of that. Firstly, the same diversification of ex-colonies' foreign trade occurred in the franc zone, while the Central pool of gold and dollars in Paris soared spectacularly. Secondly, if one adds up the individual payments surpluses and deficits of all the members of the sterling area, one gets a rising total. In other words, when overseas members of the sterling area incurred deficits, they drew on the sterling balances, but when they scored surpluses they did not put gold and dollars back in the central kitty but used a part to constitute individual reserves in gold and in currencies other than sterling. Mr. Spengler, in the article referred to, calculates that if the overseas sterling area countries had turned into pounds all their surpluses since 1958, then the central reserves of the area would now be over £1300 million, or more than they have ever been since the war. (£1300 million is $3640 million; at the end of last December, the area's reserves were $2740 million only).

Structural changes, then, do not account for the reluctance of members of the bloc to hold the pilot-currency. Nor do more rigorous regulations inside the franc zone oblige members to hold their pilot-currency, the French franc. The franc zone has become much less centralised and authoritarian in recent years, so much so that no such obligation could be enforced on members who distrusted the franc. Indeed, the franc area has become such a patchwork quilt (with borderline cases where it is hard to say if a country is in or out of it) that it is sometimes asked whether it really constitutes a "zone" any longer. On the whole, however, it continues (but only because members consent freely to this) to exhibit the four main features of a monetary bloc: a fixed parity between various member-currencies and the pilot-currency, free transfer inside the zone, a common exchange control vis-a-vis the outside world, and a common pool of gold and foreign currencies.

It is this last point that is important here. How does the franc zone ensure the pooling of reserves, which no longer occurs regularly in the sterling area? Simplifying a complex picture, there are two sorts of overseas members; the 13 African states plus Madagascar whose currencies are guaranteed, to

varying extents, by France; and another group of nations who are completely sovereign in managing their money (Algeria, Morocco, Tunisia, Mali and Guinea). The former of course are bound by written undertakings to cede all their foreign exchange earnings on the central money market and to draw all their foreign currencies from there; this is the natural price they pay for France's unlimited guarantee for all their dealings both inside and outside the franc zone. But of course these undertakings would soon be denounced if the overseas members did not find the system to their advantage, which they do find as long as the central reserves are big enough to meet all their needs and are constituted, moreover, by a currency whose value is unquestioned abroad. This is shown by the fact that the other group of nations, though at liberty to do otherwise, in practice do all their foreign business through the Paris exchange market, i.e. turn their surpluses into francs and buy dollars with francs when they need them. That they do so, that they "play the game" and keep the franc zone a practical reality, is not due to any rules or regulations, but solely to their confidence in the pilot-currency, which they recognise to be more convenient for international business than their own money and to be as good as gold or dollars.

In truth there is no central pool, kitty or common till in Paris; there is simply a single exchange market to which all members of the franc zone have recourse, and an Exchange Stabilisation Fund which balances that market by buying all excess currencies offered for sale and selling currencies to meet unsatisfied demands. The Fund, that is to say, just settles differences, but as long as all members have unrestricted access to this market and do all their buying and selling of currencies there, it comes down to the same thing as a joint pool. These details are emphasised in order to underscore the circumstance that the pooling of reserves is a matter of free choice, based on confidence in the master-currency of the zone.

(To be concluded)

Fast and Slow-Growing Items in World Trade

JOSSLEYN HENNESSY

LONDON:

IT HAS often been argued that the U.K.'s share in world exports has fallen since the war largely because her exports are too concentrated on commodities the demand for which is expanding slowly and not enough on commodities for which demand is expanding fast. Since not only the U.K. but some other countries also export relatively more slow than fast-growing items, an analysis of the facts, published in a recent issue of the National Institute Economic Review (2, Dean Trench St., Smith Sq., London S.W. 1) should be of wide-spread interest to economists, particularly to those in central planning offices.

With a wealth of statistical tables, the National Institute subdivides three commodity categories — machinery, chemicals, and transport equipment — into fast and slow-growing items. Figures were taken for the U.K., the U.S.A., Belgium, Luxemburg, France, Germany, Italy, the Netherlands, Japan and (except for chemicals) Sweden, for the years 1954 61. These countries between them account for the great bulk of world exports of manufactures, excluding those from Communist countries. In what follows the "world" is shorthand for "the total of the nine-countries". The National Institute ascertained the percentage of U.K. exports of machinery, transport equipment (notably aeroplanes, in which the U.K. is a leader) and chemicals, which is classed as fast growing and compared it with the world percentage.

Small Difference

The statistics reveal that Britain's export pattern in fast and slow-growing items was fractionally less fast-growing, and her import pattern fractionally more fast-growing, than the 'world' average. But the differences are small: the effect of changing to the 'world' average pattern for 1954-55 would have been to increase the rise in U.K. exports from 52 to 53 per cent and reduce the rise in imports from 130 to 126 per cent. The effect of this, on U.K. net exports would have been an increase of 36 instead of 33 per cent — whereas the average 'world' rise in net exports of machinery, transport equipment and chemicals was 52 per cent. So, even if imports are brought into the sum — and it is open to question whether they should be — this commodity pattern analysis does not go far to explain either Britain's falling share in world trade or her balance of payments weakness.

Secondly — whether we take exports alone or whether we include imports as well — the U.K. pattern of trade moved closer to the 'world' average over this period. Such fractional bias as there may have been was, if anything, slightly reduced.

The main positive conclusion is that there is some evidence of a disadvantageous pattern in exports of machinery, taking this commodity group by itself. It is more doubtful whether the U.K.'s relatively high imports of fast-growing chemicals point to any technical backwardness; the Italian and German import patterns are virtually the same as that of the U.K.

It might perhaps be argued that the U.K., as a country whose imports of food and raw materials are exceptionally high, should aim to have a trade structure which is more advantageous than the 'world' average — a pattern like that of Western Germany or the United States, for instance. It is true that both these countries did have a higher-than-average proportion of their exports in the fast-growing sector. But the difference between their export pattern and that of the U.K. is still not big enough to have made much difference to the U.K.'s export record. If the U.K. had enjoyed the German 1954-55 proportion between fast and slow-growing exports, she would have had a 54 per cent rise in exports, and if she had had the United States pattern she would have had a 56 per cent rise, against the actual figure of 52 per cent.

Comparison with US

If we include imports as well, then the comparison with Western Germany is hardly changed: the proportion of fast-growing items in her imports was relatively high. The comparison with the United States does not alter, because fast-growing items formed an exceptionally low proportion (43 per cent) of U.S. imports in 1954-55. In 1954 55, the United States had hardly begun to import cars: and by 1960-61, her import pattern was much nearer to the average.

Turning to the wider question of the variation in export success between industrial countries, it seems rather that different countries have done well or badly right across the board — in fast and slow-growing products alike — and that this is more important than the initial bias of their trade, or any shift in bias during the period. The most obvious explanation of relative performance is the relative movement of prices, and there is considerable statistical evidence of this.

This is not to say, however, that technical progress is unimportant. It is always possible that those countries which have gained an advantage in relative prices have also gained an advantage in improved products of kind which the National Institute's analysis by 40 groups of products does not reveal. In the past decade, a favourable trend of prices in an industrial country has usually been the result of abnormally

rapid strides in productivity (rather than abnormally slow increases in wages). Since this entails a high rate of improvement in industrial techniques, in equipment and in organisation, it is likely to be associated with a high rate of improvement in products.

That would mean that within the U.K.'s broad categories of products, new, fast-growing, sub-species were being introduced at a high rate; this might happen within categories which, as a whole, were found to be slow-growing or fast-growing. In other words, a more refined analysis of individual products might show that, associated with the apparent importance of prices, gains in technical progress, affecting the range and quality of products, were important too. But progress of this kind is virtually impossible to assess from general statistical analysis: it requires detailed studies of narrow sections of industry, and these scarcely provide a basis for valid generalisation. On present evidence one can only say that broad differences in the composition of exports between fast and slow-growing groups do not seem to be important, whereas relative prices, which may or may not be associated with other factors, do.

The Role of Inventories

GUY SIMS FITCH

WASHINGTON:

A DRAMATIC SHIFT in inventory policy has contributed greatly to the strength and durability of the current economic expansion in the United States. American business men have kept their stocks low despite steadily rising sales, and they evidently intend to continue on the same course.

This situation was revealed in a survey of leading executives by "Business Week" Magazine and reflects an important change in management philosophy. Strict inventory control always has been considered sound practice in a period of economic weakness. But in the past this control usually gave way to a rapid build-up of stocks to meet the current and anticipated upsurge of demand as gathering economic weakness gave way to rising economic strength.

Now, however, tight inventory policy is considered proper and desirable during prosperity as well as recession. Even in today's favourable economic climate, business men seem to be putting more emphasis on controlling stocks. This new policy does not imply that companies will be cutting their inventories this year. Since the beginning of the year, almost every company represented in the Business Week survey has revised its 1964 sales forecast upward, and this may necessitate some increases in supplies on hand. But companies evidently intend to keep their monthly inventory-sales ratios at the same low level that has prevailed since the current upswing began more than three years ago. Inventories have fluctuated generally within a narrow range of 1.6 to 1.8 times the quantities required per month.

This new inventory stability has obvious implications for the entire economy. In the first place, it reduces the risk of recession. Previous post-war dips were triggered to a large extent by a switch from heavy inventory building during upswings to inventory cutting as the increase in stocks threatened to outpace production and sales gains. The term "inventory recession" is all too well-known.

Obvious Implications

This has not happened during the present expansion, and it is not likely to happen. If there is to be a downturn in the future — and the prevailing evidence indicates there will not be one this year or next — it will have to come from something other than inventory policy.

Secondly, the new inventory stability reduces the risk of inflation. The rapid inventory build-ups of past upswings tended to put pressure on prices, particularly on commodity prices, as business men first reacted to increasing demand and then began to accumulate more stocks as a "hedge" against possible future shortages, price rises and credit tightening.

The relative calm in inventory policy this time, however, has tended to remove that kind of pressure from commodity markets and from the entire price structure. In fact, this calm has continued even in the face of some actual price rises and some tightening of supplies and credit.

Why has there been this marked change in business attitudes towards inventory policy? Many experts see it linked with important changes in what can be called the management climate in the United States.

There has been in recent years, for instance, a more intelligent application of operational research techniques. Through these techniques American management has weighed more accurately than before the costs against the benefits of high inventories. In addition, the growing computer science has enabled business men keep a closer check on supply-demand trends, and hence on the need for inventory changes.

These developments, combined with an increasing knowledge about economic trends and business swings, have made it possible for business men to make decisions more quickly and soundly, and to get by with smaller stocks than they otherwise might have thought they needed. In the process, business men have been able to avoid many of the past errors, usually made when economic conditions were good, which contributed to the very excesses that helped choke off an expansion. American business evidently has no intention of repeating those mistakes, particularly in the realm of inventory management, as it demonstrates again its capacity to learn from the past and to adapt to new and changing conditions.

"We have fought against rising prices and won the battle."

The Tyranny of Sales Tax

By Our Special Correspondent

NEW DELHI:

THE SARAIYA COMMITTEE on Sales Tax, constituted by the Union Government last year at the suggestion of the Board of Trade to study the incidence of sales tax on commodities exported from India and to suggest measures for the grant of appropriate relief in the interest of stepping up exports, has opined that the incidence of sales tax works as a built-in handicap to the development of exports and export trade, therefore, should be freed from this burden as is the case in many advanced countries. The measures taken by the Government of India so far to promote export industries, such as entitlement to foreign exchange for importing essential raw materials, components, etc., the Committee thinks, cannot dispense with the basic remedy of cost reduction in which the removal of the burden of tax plays an important role.

The Committee does not favour grant of ad hoc relief in regard to sales tax, both inter-State and intra-State; it feels that this may act as an unintended subsidy in some cases while some deserving cases may not benefit materially. Ad hoc relief, the Committee, however, points out, may serve the purpose for that portion of the incidence which is incalculable and invisible. It has to be supplemented by other direct measures for avoiding the incidence.

The Committee has made recommendations in regard to the following five aspects of the incidence of sales tax on exports: (1) incidence of local sales tax borne on sales prior to the sale in the course of export; (2) incidence of Central sales tax on sales prior to the sale in the course of exports; (3) incidence of local sales tax entering into the cost of production of manutactured or processed goods which enter into the export trade; (4) incidence of Central sales tax entering into the cost of production of manufactured or processed goods which enter into the export trade; and (5) other invisible incidence.

Some Exemptions

With regard to the first aspect, the Committee has recommended that two sales prior to the sale in the course of export should be exempted. If any non-maritime State finds insuperable administrative difficulties in introducing this system, it should, as an alternative, adopt a system of rebate or set-off on commodities actually exported. Here too relief should be available in respect of at least two sales prior to the sale in the course of export. If any Administration can conveniently extend this concession even to earlier stages, such an extension should be welcomed.

With regard to the second aspect, the Committee has recommended that the selling dealers in the State of origin should be granted a rebate of sales tax in respect of their sales resulting in exports, by the State of origin.These dealers should be enabled to make the adjustment in their returns without being called upon to pay the tax initially. They would have to produce proof of actual export in support of rebate during the assessment.

The Committee has further suggested that the concession by way of exemption or rebate should be available in respect of sales to registered exporters. For this purpose the Central Government should enlist exporters with a minimum annual turnover of Rs. one lakh under a statutory regulation. In respect of sales of exporters not on the registered list, if exemption or rebate is not given, refund of tax actually paid may be allowed on producing proof of exports.

As regards incidence of local sales tax borne on raw materials, components, etc., entering manufacture, the Committee has recommended the grant of refund or rebate on a readily ascertainable basis in the same proportion as the value or quantity of goods produced to those exported.

Regarding refund of Central sales tax paid on raw materials, components, etc., entering into manufactured goods, the Committee thinks that a system similar to that recommended for local sales tax may be somewhat unworkable. For relief from this burden and the burden of unexpected or incalculable elements, the Committee recommends an ad hoc relief at the rate of one per cent of the f.o.b value in the case of manufactured and processed goods. For the unexpected and incalculable elements entering into the prices of other goods, an ad hoc relief at half a per cent of the f.o.b. value of the goods exported has been recommended. Such relief, the Committee suggests, should be paid by the Central Government.

Compensation from Centre

The Committee further recommends that where, as a result of the implementation of its recommendations, the States suffer any significant loss of revenue, the Centre should give adequate compensation to ensure that the commitments of the States for development are not adversely affected.

Among the other miscellaneous recommendations made by the Committee are: (1) in the case of goods where 80 per cent or more of the indigenous production is exported, the complicated administrative processes for levy, collection, refund, set-off, etc., can be avoided if all sales of such commodities are exempted from sales tax, provided that the loss of revenue due to that would be comparatively insignificant; and (2) the concessions should be available even for two sales prior to consignments abroad which eventually result in sales in the foreign country.

Besides the incidence of sales tax on exports, the Committee also considered the plea of the trade and industry for substitution of sales tax by an additional excise duty on the pattern adopted in the case of cotton textile, tobacco and sugar. While appreciating the force of the arguments put forth by the trade and industry in this regard, the Committee, however, has expressed the view that "the problem is not susceptible to a simple solution". With the existing distribution of the sphere of taxation between the Union and the States, sales tax, it points out, is now the chief elastic source of revenue to the State Governments. The State Governments, therefore, are understandably reluctant to agree to give up their right to levy sales tax on any commodity. The experience of the States in this regard has also not been uniformly happy. The receipts of several States from additional excise duties in lieu of sales tax have not kept pace with the general growth of their sales tax revenue in the corresponding period. There has also not been so far evolved a satisfactory formula under which the distribution of receipts from additional excise duties would be acceptable equally to the more populous States with a backward economy and those where the per capita consumption of such goods is much larger. Taking all these factors into consideration, the Committee feels that it would not be a practical proposition to extend to other commodities the scheme of replacing sales tax by additional excise duties.

The Committee also does not think that the sales tax system can be made uniform throughout the country in the circumstances prevailing today. It concedes that uniformity in the principles, policies, legislations and practices of sales tax would considerably reduce the impediments to the free flow of inter-State trade and commerce. But each State having adopted a particular system of taxation to suit its special needs and economic conditions varying from State to State, bringing about of uniformity in sales tax is a difficult job. Uniformity for its own sake, the Committee further feels, may also not necessarily encourage exports.

The report of the Committee will be considered by the Board of Trade at its meeting on May 5, 1964, in New Delhi. The Government decisions will follow thereafter.

**

With the adoption by the Lok Sabha this week of the Finance Minister's Bill seeking to set up an Industrial Development Bank in India, a major step has been taken towards accelerating the industrial development of the country. The Bank will be a subsidiary of the Reserve Bank of India and is proposed to be established initially with an authorised capital of Rs. 50 crores. The authorised capital will be increased later to Rs. 100 crores.

The Bank will act as a central co-ordinating agency, concerned, directly or indirectly, with all the problems relating to the long and medium-term financing of industries. It will have a much greater freedom in regard to its policies or day-to-day functions than is enjoyed by the existing industrial financing agencies such as the Industrial Finance Corporation, the Re-finance Corporation for Industry, the Industrial Credit and Investment Corporation of India and the National Industrial Development Corporation. The Bank will supplement the capital or other resources of the existing agencies by refinancing their loans and will also be granting direct loans to some specified industries.

Another important function of the Bank will be to undertake special investigations for testing the commercial feasibility for any important proposals. It will render technical assistance to various authorities and undertakings interested in industrial development.

The Industrial Development Bank of India Bill also provides for the creation of an Industrial Credit (Long-term Operations) Fund and a Development Assistance Fund. The former, like the National Agricultural Credit Fund, will be fed by allocations out of the annual profits of the Reserve Bank of India and will be used for supplementing the resources of the Industrial Development Bank and other financial institutions. The Development Assistance Fund is to be created out of allocations to be made by the Central Government for this purpose from time to time. It will be placed at the disposal of the Industrial Development Bank for use in financing certain essential industries which on purely monetary considerations or in the light of the standards or criteria which are normally adopted by the credit institutions, may not be able to obtain any financial assistance. It is hoped that through the creation of the Development Assistance Fund, a number of enterprises which may be of vital or strategic importance to the country but which an ordinary banker or commercial institution interested only in increasing or maximising profits, may not be willing or able to finance, will be brought into existence.

A provision has also been made in the Bill empowering the Development Bank to discount on behalf of industrial enterprises themselves or on behalf of the banks which will be financing them, certain kinds of usance bills which would mature within a period of five years and which may be floated or created for financing industrial enterprises.

**

The Working Group for Machine Tools, it is understood, has tentatively estimated the requirements of machine tools during the five years of the fourth Plan at about Rs. 372 crores. The demand for other metal working machinery and accessories during this period has been put at Rs. 74 crores. Yearwise, the demand for machine tools has been placed at Rs. 53 crores in 1966, Rs. 62 crores in 1967, Rs. 72 crores in 1968, Rs. 85 crores in 1969 and Rs. 100 crores in 1970. The corresponding estimates for the other metal working machinery and accessories are Rs. 11 crores, Rs. 12 crores, Rs. 14 crores, Rs. 17 crores and Rs 20 crores, respectively.

The Group has recommended that we should aim at meeting at least 75 per cent of the requirements of machine tools in 1970 from indigenous sources, as against approximately 40 per cent at present. In view of the fact that creation of capacity in this line of manufacture requires a long planning and gestation period, the Group has suggested that the target for machine tools manufacturing capacity under the fourth Plan should be fixed at Rs. 95 crores—Rs. 50 crores for the public sector (Rs. 40 crores for Hindustan Machine Tools and Rs. 10 crores for the Heavy Machine Tools Plant, Ranchi, and Praga Tools, Andhra Pradesh) and Rs. 45 crores for the private sector.

Regarding production during the current Plan period, the Group feels that output in 1965-66 can increase to Rs 33 crores, as against the target of Rs. 30 crores, provided adequate foreign exchange is released immediately for import of essential capital equipment. Failure to do so, the Group opines, will lead to a shortfall in production. Besides pleading for release of more foreign exchange, the Group has also suggested streamlining of the licensing and other procedures such as clearance of capital issues, decisions on collaboration arrangements with foreign manufacturers, import of essential components etc., in the interest of raising machine tools production during the next two years.

The Group will be submitting a detailed report in the near future making specific recommendations regarding group-wise requirements of machine tools during the fourth Plan period.

**

An agreement has been signed this week between the Government of India and the Export Credits Insurance Corporation of Canada for a loan to India of $37 million to cover the foreign exchange component of the $74 million Atomic Power Plant to be set up at Ranapratap Sagar. Expected to commence operations in 1970, this plant will help in meeting the power requirements of the rapidly developing areas in Rajasthan.

The loan forms part of the special credits allocated by the Canadian Government under the aegis of the Aid-India Consortium. It is to be repaid in 20 years, the first instalment falling due after a grace period of 5 years. The loan carries

an interest of six per cent per annum.

The Union Department of Atomic Energy will act as the prime contractor for the plant and will be responsible for erecting it. The engineering and consultancy services will be provided by Atomic Energy of Canada Ltd. Montreal Engineering Company Ltd., has been engaged as engineers for the project. This company will also act as the procurement agent for purchases to be made in Canada. Capital equipment to be supplied by Canadian manufacturers includes major nuclear components, turbo-generators, switch-gear and sub-station equipment. Half of initial uranium fuel charge will also be supplied from Canada.

No Blanket Licences for Glass Industry

From our Correspondent

BOMBAY:

THE PROBLEMS of the development of glass industry received careful thought at the annual general meeting of the All-India Glass Manufacturers' Federation. Glass industry in India holds a peculiar position of a mixture of very ancient and very modern units and the main problem of the industry appears to be that of increased costs of production and of a static condition in the production of certain types of products. Besides, the industry has export potential which has not been fully exploited. Mr. I. H. Padamsee, leader of the delegation to study the possibilities of exports of glassware in South-East Asia, in his observations, stressed this point that though some of our glass products compared favourably with that of the Japanese, their prices were about 35 per cent less compared to our prices; this unfavourable competitive position could be removed only through an all-out effort to cut down manufacturing costs and to step up the quality of the products in which Japan excelled in the export markets. Regarding export prospects, he said that Ceylon offered the biggest market for all our items. The demand for scientific glassware, neutral glass vials and blood transfusion bottles was expanding in all countries and Japan was the only competitor in the field both in quality and in price. Therefore, it is imperative that the representatives of the glass industry should visit these markets to popularise Indian products which are hitherto unknown in many places and fruitful business contacts could be established through this process.

Revision in Import Policy

Mr. S. S. Kumar, Director-General of Technical Development, revealed at the same meeting that the Government of India was thinking of revising the conditions governing import entitlements for the glass industry. In view of the present tight foreign exchange position, it might not be possible for the Government to accede to the request of the industry for blanket licences for Rs. 5,000 for import of any goods needed by the industry. However, he said, a few units which might be given import licences for a lesser amount, would be allowed to get goods necessary for the growth of the industry. He was of the view that the performance in recent years of the industry was quite satisfactory, and there was better future for improving production and exports. He, however, admitted that the industry had done little to popularise glassware which was now facing competition with substitutes like plastic goods and suggested the need for publicising the products of the indusrty in a more organised manner. In his Presidential address, Dr. S. R. Lele reviewed the growth of the industry and said that while in the last 20 years, the production had more than doubled, in respect of individual products a static stage has arrived, particularly in the production of containers. The introduction of alminium and plastic strip packing seemed to have hit that section of the industry hard. He revealed that two small glass factories located in the interior were responsible for about a third of our total exports and added this could be an inspiration for all manufacturers to strengthen their exports.

An interesting suggestion made by Mr. B. B. Sarkar, Chairman of the Glass Panel of the Development Council, was that great importance should be attached to training men for the industry in countries like the U.S. and the U.K. to improve the techniques employed in product development. It was high time that the Federation took a step in the direction and he suggested the need for a co-operative research centre for tackling the problems of the industry and improving production techniques.

★★

New industrial units are fast appearing on the industrial map of Maharashtra. Here are details regarding three of the units which were set up recently. Mr. G. D. Patil, Deputy Minister for Industry and Planning, Maharashtra, inaugurated a Rs. 10-lakh plant for the manufacture of table-ware cutlery by Kishco Cutlery Manufacturing Co., the first of its kind in India. This has been started with the collaboration of the Japanese firm, Seki Cutlery Manufacturing Company Ltd. The Minister said that Government would help the industry in obtaining the required raw materials. But he advised the company not to depend entirely on the Government but to make efforts to get them by earning import entitlements through the export of manufactured goods. In his view, since the import of cutlery items was not allowed, there was a good market for them at home as well as abroad. The factory has, at present, plans to produce 7,200 pieces per day on an eight-hour shift basis in the first instance. Later on, it will have three shifts. Along with the manufacturing plan, an electro-plating plant has also been installed.

Mr. C. Subramaniam, Union Minister for Steel, Mines and Heavy Industries visited last week the factory of Kores (India) Ltd. at Thana, on the first anniversary of its opening. He characterised the industry as a very important venture not only because of the technology involved in the manufacture of its products but because of the highly qualified staff employed. Its success had till now depended upon the quality control exercised at every stage of production. He suggested that the factory should continue to expand the sphere of its activity and enter into the manufacture of new and more sophisticated products. The factory, one of the biggest units of its kind in Asia, imports only 25 per cent of the raw materials it needs and has a complement of 550 workers. It expects to export Rs. 10 lakh-worth of materials this year to Middle East, the Far Eastern countries and Africa.

The third industrial venture in the State which has received prominence is the Vidarbha Paper Mills Ltd. which goes into commercial production next month. This is the first 'joint-sector' undertaking to take shape in Maharashtra. It is also the first small paper unit undertaken in pursuance of the Government's policy of encouraging small units in the field. It has the added significance of being located in a rural area. Started with an estimated cost of Rs. 24 lakhs, the paper mill will employ 150 persons and produce 1,500 to 2,000 tonnes of paper every year. A wood pulp plant is also being set up so as to make the factory self-sufficient in this regard. It is hoped that the concessions announced by the Union Finance Minister would help the unit in the initial stages of progress. Speaking at the 'Yantra-puja' function of the unit at Kanhan, about 12 miles from Nagpur, Mr. S. K. Wankhede, Finance Minister, observed that the problems of the industrial areas in backward regions would receive particular attention in the future and that there would be the necessary organisation at administrative level to ensure this attention. In fact, he said that the State Government was thinking of setting up a special local authority to administer the industrial areas in such backward regions.

★★

The importance of the resources for fishery development in the State of Maharashtra has not been so far realised in a measure as to take concrete steps for utilising them as a base for accelerated economic growth. Usually, fisheries go as an adjunct to agricultural development and even though in the plan period, special allocations have been made for the development of fisheries, the progress is not commensurate with the possibilities. This could be seen from the review of the position in a State like Maharashtra which has an extensive coastline apart from the immense scope that exists for the development of inland fisheries. The fishermen in the State, (nearly 30,000 families) who are generally poor and backward, carry on their vocation in the same old traditional manner. The Estimates Committee of the Maharashtra Legislature has gone into the position and prospects of fisheries in great detail and in its report to the House has recommended constructive measures for a comprehensive programme of fishery development. In the first instance, the Committee has looked at the problems from the human aspect of raising the living standards of the fishermen, of removing the legal impediments in the way of their uplift and in modernising and improving their equipment.

According to the Committee, it is necessary that the entire fisheries department should be re-oriented and streamlined; it should undertake even the promotional activities irrespective of whether the results in the immediate future were profitable or not. If the fishing industry is to be given the necessary impetus and fishermen living on coastal areas are to be rehabilitated, it is also considered necessary to have more fisheries' schools both at the lower levels and at the advanced training level. The third plan has provided about Rs. 4 lakhs for this purpose which is considered to be adequate.

Facilities for Fisheries

Apart from the scope that exists for the production of fish on a large scale, the facilities for marketing would require to be improved and perfected if the fishermen have to reap the fullest advantage of their catches. While co-operative societies are functioning at the primary level, the individual fishermen are handicapped in marketing their goods profitably without necessary storage and preservation facilities. The Committee, therefore, has recommended a federal society with government participation and adequate resources to usefully undertake activities connected with marketing. There is no doubt that the fishing industry, in the course of expansion, could offer a base for the development of industries like refrigeration, manufacturing of nets, boats and other accessories necessary for the carrying of the industry on a more organised and commercial basis. The Government, in this connection, will have to extend financial assistance to all such promotional schemes either through co-operative efforts or otherwise. The Committee has also suggested the transferring of the Central Government's freezing plant at the Sassoon Dock to the Maharashtra Government. The fishing trade in the City needs considerable storage facilities and the Committee is of the view that this need would be met to a considerable extent, if the plant is taken over by the State and fully developed. For the repair of the mechanised fishing boats, the Committee has suggested that while it is not possible to provide repair shops at every place, a mobile workshop may be established and this could move to places where the fishing boats are plying. The location of a mobile repairs van in the Ratnagiri district is already under the consideration of the Government. However, in view of the transport difficulties by road to that area, a mobile repairs launch, instead of repairs van, would be more useful.

In regard to development of inland fisheries, the Committee has been informed that four fish breeding stations have been established at Powai (Thana district), Kalsar (Wardha district), Shivni (Bandara district) and at Chanda. The results of the working of these centres have been encouraging and the whole scheme should be extended in a phased manner for purposes of achieving maximum results.

Expansion Plans for Steel

From our Correspondent

CALCUTTA:

THE 1963 annual report of the Department of Iron and Steel of the Union Ministry of Steel, Mines and Heavy Engineering relating to the working of the steel plants under the charge of Hindustan Steel, is full of interesting information. The most heartening thing to note is that production has increased in all the three plants in a remarkable manner. The Rourkela plant produced 532,986 metric tonnes of finished product in 1963 as against 313,417 tonnes in 1962. Bhilai raised its output of finished products from 514,194 tonnes to 640,713 tonnes and Durgapur from 187,806 tonnes to 355,002 tonnes. Of salable pig iron, that scarce commodity and engineering raw material at the moment, Rourkela almost doubled its production from 50,246 metric tonnes in 1962 to 112,906 metric tonnes in 1963. Durgapur raised output sharply from 325,016 metric tonnes to 420,639 metric tonnes and Bhilai appreciably from 334,390 metric tonnes to 395,336 metric tonnes. The increased steel production not only met a bigger proportion of the country's demand, but in some categories domestic steel production not only equalled demand, but also showed a marginal surplus. It is in fact this situation which mainly influenced the Raj Committee to recommend substantial decontrol in steel — a recommendation which has already been implemented, and the free market in steel is not behaving badly.

Of the three steel plants in the public sector, Bhilai maintained production well above the rated capacity in coke, pig iron, steel ingots, blooms and salable steel. The average production of pig iron was 20 per cent more than the rated capacity and that of steel ingots, billets, rails and structural and merchant products ranged from 10 per cent to 20 per cent above the rated capacity from July 1963 onwards. Bhilai, it is also claimed, has completed a large order for rails for the Sudan Railways. Durgapur reached its rated capacity in coke and pig iron; the production of steel ingots, blooms and

billets and the section mill was above 90 per cent of rated capacity. Rourkela was utilising a lower proportion of its rated capacity, but there were enough indications that the "sick child" of the Indian steel industry was rapidly returning to health.

The third Plan expansion schemes for these steel plants have been delayed; there is no great possibility of their materialising by the stipulated time. However steps are being taken to quicken the tempo of work. With the Rs 47 crore loan from the West German Government, orders for all the major items of plant and equipment for the Rourkela plant have been placed and contracts for execution of the civil engineering work have been awarded. The foundation for the blast furnace has already been completed and piling work in the coke oven plant and cold rolling mills is nearing completion. Civil engineering work for the by-product plant, power plant, grey iron foundry, wagon repair shop, etc., is making good progress. The maximum tempo in construction will be reached in 1965 and the various units included in the scheme are likely to be commissioned during 1966. In Bhilai, expansion work started as early as 1962. This plant is being expanded to 2.5 million tons as against 1.8 million tons in Rourkela and 1.6 million tons in Durgapur, so it is to be presumed, albeit on common sense grounds, that the work in Bhilai would take a little longer time, but the report claims that everything is going according to the plan and the plant will yield the additional production by the scheduled time. As for Durgapur, things are less satisfactory. Tenders were finalised rather late and orders for all the expansion units excepting the sintering plant, were consequently delayed. A revised time schedule has had to be drawn up taking into account the actual delivery prospects of equipment, and the expansion work is expected to be completed not earlier than the middle of 1965.

Expansion in Private Sector

While on this subject, it will not be inappropriate to make a reference to the expansion projects in the two private-sector steel plants — TISCO and IISCO — and the progress of work concerning the Bokaro steel project and the alloy tool steels plant at Durgapur, which is to provide a vital missing link in the development of the country's steel industry. It is already well known that Tatas and Indian Iron have been allowed — in complete reversal of the policy dogmatically followed earlier — to expand capacity to 3 million tons and 2 million tons, respectively. Tatas have been even allowed to provide built-in capacity and common facilities for future expansion over and above the 3 million tons. The management is taking steps towards this end. The Indian Iron and Steel Company is to implement its expansion scheme in two phases — to 1.3 million tons in the first phase and 2 million tons in the second. The Government has already approved the first phase and the company is negotiating a loan with the World Bank to cover the necessary foreign exchange cost. The second phase of the expansion scheme has also been approved, but it will be taken up in the fourth Plan period. The concrete thing about the Bokaro project so far is that a new company by the name of Bokaro Steel Ltd. has been formed with an initial capital of Rs. 100 crores, and outside the control of Hindustan Steel. Messrs. Dastur and Company have already submitted a detailed project report for setting up a 4 million tonnes plant at Bokaro to be built in two stages — 1.5 million tonnes in the first stage rising up to 4 million tonnes in the second. The plant will produce flat products like sheets, tinplates, heavy plates, etc., which are now in short supply. The Board of Directors of Bokaro Steel are now considering the recommendations of the technical committee which scrutinised the project report. It is however the intention to buy such equipment indigenously as can be available in the country and to buy the rest on competitive terms from abroad with such credits as may be available. The alloy tool steels project is being built with Japanese credit and a consortium of five leading Japanese firms will be supplying the main equipment. A Canadian firm will supply furnaces for the forge shop, bar and sheet mills. Satisfactory progress is being claimed for the project, although its execution has been considerably delayed. The product-mix of the plant, as it is now planned, is 2,250 tonnes of high speed steel, 8,250 tonnes of carbon tool steel, 4,000 tonnes of alloy tool and die steel, 16,000 tonnes of alloy structural steel, 7,000 tonnes of case hardening steel, 2,500 tonnes of ball bearing steel and 18,000 tonnes of stainless steel. The plant of course will have to be expanded further during the fourth Plan.

★★

The prospect for India's tea industry — a major industry of eastern India — is variously assessed. The steady decline in the value of tea shares on the Calcutta Stock Exchange even before Mr. Krishnamachari's Budget had arrived, reflected the investor's pessimistic appreciation of the industry's future outlook. The significant point about the north Indian tea gardens' output is not that it is smaller, compared with that of 1962, but the average prices during the year were lower than that of the previous marketing season. The lower average price for north Indian tea is on account of increasing world competition, which if anything is likely to increase further in the future. For example, the north Indian gardens produced 255.12 million kilograms of tea in 1963 as against 261.44 million kilograms in 1962. This was also 18.5 million kilograms short of the record 1961-62 crop. But while North Indian estates lost in production due mainly to adverse weather conditions, Ceylon and East Africa considerably raised theirs — Ceylon produced 18.5 million kilograms more at 220.3 million kilograms and East African gardens raised their production by about 1 million kilograms. It is significant that the north Indian gardens exported 148.6 million kilograms in 1963-64, compared with 152.58 million kilograms in the previous season, while over a similar period, Ceylon increased her exports substantially. The distressing thing to note is that India has lost ground in the UK market, not because UK imports have shrunk but because other competitors have gained further ground. India should offer more quality teas if she is to maintain her position as a leading exporter of tea, but this can be made possible only with more planting and replanting in estates. This is what the Indian fiscal system has so far failed to encourage.

★★

Two leading companies in this part of the country — Dunlop Rubber and Union Carbide — have ambitious expansion schemes in hand. Dunlop Rubber proposes to expand its tyre making facilities, although the tyre market has not been experiencing a shortage. The managing director of the company, Mr. M. L. Bexon, has given no details of the expansion scheme, but he gave an account recently of the financial arrangements which the company has made to obtain the additional funds necessary for the project. Bank overdraft facilities have been arranged to meet temporary requirements. The Controller of Capital Issues is being approached for a rights issue. Meanwhile, an agreement has been reached with the Dunlop Rubber Company Ltd. of the UK to advance, the necessary sterling for expansion by way of a loan, and finally, a small increase of 3 per cent has been made in

GROW MORE
SAVE MORE
WORK MORE

tyre prices since September 1963. Mr. Bexon hopes that the expansion project will be completed by the middle of 1965. Union Carbide's expansion project involves increases in the manufacturing capacity of the polythylene and chemicals plant in Trombay, on which the company proposes to spend a sum of Rs. 9 crores over the next two years. This is big expansion indeed. As for the methods of financing, the management has been authorised to issue 849,000 rights ordinary shares at a premium of Rs. 4 per share and in the proportion of three shares for every ten held. Two major loans have been contracted from the Export-Import Bank of the USA (Rs. 3.7 crores) and the US Agency for International Development (Rs. 2.2 crores). These loans are repayable over a ten year period commencing from a date in 1966.

Hurdles to Growth in Cotton Textiles

From our Correspondent

MADRAS:

THE TEXTILE industry is developing in a big way in the Southern States latterly. As it has been realised that there will have to be a considerable increase in installed spinning as well as weaving capacity in order to bring about a significant increase in output of yarn as well as cloth, nearly every important unit in Madras State is erecting additional spindles apart from erecting automatic looms. Even some of the spinning units are taking to the weaving of cloth. The Madura Mills Limited being the biggest spinning unit in the whole country is an instance in point. Apart from the expansion schemes of established units, new spinning mills are also being erected in Kerala and Andhra Pradesh particularly with a view to meeting the yarn requirements of the handloom weavers in these areas. At first, spinning units having an initial capacity of 12,000 spindles were licensed. But later it was decided that their capacity should be raised to 25,000 spindles.

The implementation of the expansion programmes has been delayed only by the difficulty in getting the required textile machinery from indigenous sources. The major engineering units are making serious efforts to step up their output while some others too are having plans for manufacturing looms and other textile machinery. The arrangements for importing equipment, which are not being produced in this country or are not available at an early date, should also prove to be helpful. But it is feared that, without a larger allocation of foreign exchange, the expansion and modernisation programmes cannot be completed in a short period.

Favourable Factors

The grant of additional depreciation allowance for third-shift working should be helpful to the industry and the indication that there may not be a power cut this year may also be regarded as a favourable factor. Mr. D. C. Kothari, Chairman of the South India Mill Owners' Association, however, stated that the industry would have done much better but for the difficulties in getting adequate raw cotton supplies and the pricing policy of the Government in respect of yarn and cloth which did not make it attractive to produce certain categories. Besides, he pointed out that there was no effective utilisation of spinning and weaving capacity. Apart from the difficulties involved in the running of third shifts and the bottlenecks relating to power availability until recently, the cost factor had a discouraging effect. With easier power availability and the additional depreciation for third shift working, there may probably be a larger increase in output of both yarn and cloth in the coming months. But unless there is a determined effort to eliminate the various bottlenecks and help the industry in various ways, the stagnant phase cannot be easily got over until such time as the new capacity was commissioned into production.

Mr. D. C. Kothari also emphasised the need for raising productivity in order to keep in check working expenses. He actually expressed concern over the suggestion for the appointment of a second wage board as the effects of the recommendations of the first wage board have not yet been got over and the exhortations to raise productivity of workers have not so far yielded the desired result. Some progress has no doubt been made as, consequent on the completion of modernisation in a few mills, workers have realised the need for increasing productivity and helping the managements to earn the higher depreciation charges without difficulty. But there is still much to be done.

There is also anxiety to know how the Bonus Commission's recommendations will be implemented because, according to Mr. Kothari, sufficient attention would not appear to have been devoted to the impact of the low level of productivity, rising raw material costs, dearer power and so on. In fact, he even said that the myth of cheap labour has been exploded and the industry is finding it very difficult to compete in export markets with the leading world producers. He, therefore, stressed that in determining the company's surplus, the legitimate requirements of the industry should be borne in mind and that full allowance should be made for the heavy amounts that would have to be paid towards direct taxes. Curiously enough, the Bonus Commission did not agree to the deduction out of the surplus the amount paid towards the Super Profits Tax on the plea that this tax was levied on excess profits and the balance left over would be sufficient for effecting bonus payments as well as ploughing back amounts into the business after distributing dividends. While it is difficult to agree with this interpretation of the Bonus Commission, it has to be pointed out that the Super Profits Tax has been replaced by the Surtax on company's profits and there is also a tax on dividends in the bargain. Again a higher rate of income-tax and super-tax is leviable on the profits of companies in which there was no substantial public interest. As it will be difficult for corporate bodies to distribute bonus on the basis suggested by the Commission in the altered circumstances, it has been argued that, apart from an adequate return on capital and liberal depreciation allowance to take care of replacement costs, the amount paid by way of tax of every kind should also be deducted. The textile industry has need for large sums in order to modernise its overaged plant and machinery. It has been indicated by the Chairman of even an efficient company like Buckingham and Carnatic that the modernisation programme can be implemented only with outside financial assistance.

★★

The problem of water supply for Madras City has once again been seriously discussed. The absence of rain for several months has caused considerable anxiety and it is feared, that, in the absence of an early monsoon, even the regular requirements of consumers cannot be easily met. With a number of industrial units coming up in the northern part of the City, the requirements for industrial purposes also have increased significantly and it is felt that it may not be possible to meet the increasing needs of a growing population and develop industries without putting through some new schemes. It is no doubt accepted that some additional water supplies can be had from bore wells sunk in the river beds. But a permanent solution would have to be found if a critical situation is to be avoided after some years.

Mr. Brahmananda Reddy, the new Chief Minister of Andhra Pradesh, during his recent visit to the City, again stated that his State would be prepared to supply 5 mft of water from the Krishna river. He, however, pointed out that the canal cannot be constructed until the Srisailam project was completed and that Krishna water would be available

only after five years. Whether this project will be taken up in earnest and its implications have been clearly understood, it is difficult to say at this stage. But it is incorrect to proceed on the assumption that the full consumption can be met by tapping underground water supplies and the purchase of irrigation rights of the area covered by the Red Hills Lake.

Water for Industry

Some idea of the large requirements of water even for industrial purposes would be evident from the fact that the oil refinery that is proposed to be set up in North Madras would require 15 million gallons daily while the petro-chemical complex would need another 35 million gallons daily. The water for this purpose is expected to be tapped from the Ponneri area where underground water resources are reported to exist.

Meantime, there is considerable anxiety about the decision that would be taken on the exact location of the refinery and the fertilizer factory. It was at first expected to be announced by the middle of May but the negotiations with the foreign firms have taken much longer time than expected and the actual choice may not be made known until July next. It is now, however, certain that Madras will have an oil refinery having a capacity of 2.5 million tons annually by 1966 and that there will also be a fertilizer factory nearby. The delay in finalising the scheme would seem to be due to the insistence of the Government that the participating foreign firm should confine itself merely to the manufacture of petroleum products while the distribution will be taken care of by the Government. To what extent there will be preparedness on the part of foreign firms to accept this condition is not known. The State Government, however, has selected a number of sites for locating the refinery and an expert team headed by Mr. Nayak, Chairman of the Oil and Natural Gas Commission, recently visited these spots. Further information is needed about the condition of the soil and the facilities for transporting crude oil from the oil terminal to the oil refinery site. In any case, the site will be in North Madras.

For quite sometime the Madras refinery will have to operate on crude oil imported from West Asian countries as conditions in South-East Asia are not quite satisfactory now. Even so, there will be a large saving in foreign exchange on account of the processing of crude oil. Within the country, it would facilitate the situation to a great extent if oil exploration in the Cauvery basin proves to be successful. On account of the non-availability of drilling equipment, the progress of work has been delayed to some extent. But it was indicated by Mr. Nayak that the drilling tests in Pattukottai were satisfactory and there was prospect of striking oil in commercial quantities given reasonable luck in this part of the country. The drilling operations in Karaikal should have commenced a few weeks back, but the equipment earmarked for this area has been diverted by the USSR to another. Arrangements are, therefore, being made to secure equipment from Gujarat. It is also felt that the off-shore areas should be exploited as the experts seem to be of the feeling that oil deposits may be located in parts of the Coramandel coast and Cambay and Cutch. The required surveys are proposed to be undertaken in collaboration with foreign experts as early as possible.

(Continued from page 1030)

unions based on political parties but the management perpetrates it when it begins to recognise them on the basis of their flags instead of their membership.

When a Cabinet Minister starts talking in terms of rolling of heads we may well assume that he is determined to change the unsatisfactory state of affairs under him. Mr. Subramaniam did so while expressing limitations in the personnel policy followed by his Ministry. He said that managers should be recruited on the same basis of "hire and fire" as is done by private undertakings. In the ultimate analysis their performance should determine their stay. Shortcomings in the steel and engineering industry are fairly well-known and some of them as wastages, extravagance, frequent breakdowns and labour troubles have become almost chronic, reflecting not to happily on the competence of the management. it is doubtful if the remedy suggested by the Minister will solve fundamental problems which have thwarted progress not only in steel plants but practically in all public sector projects. They relate to issues like the desirability of appointing civil administrators as heads of industrial undertakings, their decisive powers over those of technocrats, greater powers for managers, and lesser ministerial interference. Mr. Subramaniam favoured payment to public sector managers comparable to remuneration in private undertakings but unless the basic issues are settled, not only the problem of fixing responsibilities would remain unsolved but administrative tensions also would continue to occur in State projects.

Another handicap from which our steel projects and engineering plants appear to be suffering is the dual audit exercised by the chartered accountant and the Auditor-General. It was maintained by the Minister that the Auditor-General's objections over and above the chartered accountant's audit are mostly trivial and often serve as a damper on quick decisions. On the face of it the dual audit seems to be superfluous, though Mr. Subramaniam was hard put to explaining the wide divergence in estimates by his experts which range as high as 54 per cent — certainly not a trivial matter.

Eastern Economist 20 Years Ago

APRIL 28, 1944

WITHIN THE next six or eight months India will be called upon with the rest of the world to participate in a World Trade Conference to define and decide the future of international trade policies. Some tentative conclusions seem to have been arrived at by the General Policy Committee, which has agreed to the principle of multilateral trade agreement subject to certain safeguards and reservations in the interest of India. In defining her attitude to international trade policies India should primarily consult her own long-term economic interests, and where they are likely to be adversely affected she should have no hesitation or compunction in resisting conclusions and agreements not in harmony with her own national welfare, however lofty or noble these international conclusions may appear to be on paper. We need not apologize for this attitude of ours nor fear that we shall damage our position in the eyes of the rest of the world, for each of the big counrties does no less, with this difference, however, that by a process of self-delusion or specious reasoning it identifies its own interests with world's interests, and further is able to impose its views and policies on the rest of the world. Such internationalism in the long run helps no country, and India will be serving the best interests of the world no less than her own if she lays down courageously the principles of trade policy which would be acceptable to her.

The moving finger writes

THE DEBACLE of the Constitution (17th Amendment) Bill, to my mind, has two important lessons. The first one points to the inertia and listlessness which has come to characterize the conduct of government business in the legislature. It has become apparent that the Ministry of Information and Broadcasting is a whole time job and Mr. Satya Narayan Sinha is quite rightly giving his whole attention to it. The question is whether, in the circumstances, he should not at least have a Deputy to share his responsibilities in the Ministry of Parliamentary Affairs. Then there is also the question whether it is proper to postpone indefinitely a decision on the appointment of a Leader of the House for the Lok Sabha. The Prime Minister is certainly in no position now to assume and discharge actively the obligations of this office. It is, therefore, right and proper that a relatively young and active Cabinet Minister who moves around freely among Members of the Congress Parliamentary Party should be nominated for the job.

The second moral to be drawn from the failure of the Constitution (17th Amendment) Bill to summon requisite support for the consideration motion is that far too many Members of Parliament seem to have fallen into the habit of absenting themselves from the House far too frequently and for far too long periods during the day. This is not a situation in which our young democracy or those who would be its philosophers and mentors could take pride. The basic weakness, of course, is in the quality of the membership. I must emphatically state that neither the ruling party nor any of the opposition groups could indefinitely afford to ignore quality at the time of selecting candidates for electoral contests. At the same time, it might be said that, while the raising of the average standard of Members of Parliament is a great political necessity, it is also a fact that party leadership—and this is particularly true of the ruling party—does not take sufficient pains to encourage and give facilities for back-benchers to participate in discussions or otherwise be actively engaged in the work of Legislatures. It is perhaps a natural consequence of human beings being treated as mechanical robots to record a 'yes' or a 'no' as the occasion demands, that, at critical times, the mechanism breaks down. Here again, the Congress Party will do well to energise its leadership and its apparatus generally, if it is at all serious about avoiding the risk of losing the confidence and respect of citizens through such exhibitions of fecklessness as were witnessed on April 27. Incidentally, the view has been expressed that the present working hours of Parliament are wholly inappropriate in the context of the rigours of the Delhi summer and are, therefore, virtually a premium on absenteeism. The question of rationalising the working hours of Parliament is certainly one to be considered earnestly; and it is possible that sessions starting, say, at 5 p.m. and lasting till 10 p.m. or even half an hour longer could produce better results by way of attendance as well as attentiveness. There is, of course, the problem of the dinner hour, but it should not be difficult to solve it.

★★

I have heard some harsh things being said about Mr. A. K. Sen's part in the fiasco of the Constitution (17th Amendment) Bill and I must say that this criticism cannot be wholly ignored. A little filibustering at the right moment could have given the Whips a chance to herd into the chamber the requisite number of party men and the Minister who was piloting the Bill should certainly have been alert enough to arrange accordingly.

Talking of Mr A. K. Sen, it is perhaps necessary that he should go to the United States to secure dollar credit equipment for P & T and it is more or less reasonable that he should want to spend a few days in Europe on his way back home. How then was it considered necessary to put out the story in the Press that only the Stern Daughter of the Voice of God was responsible for Mr. Sen's short and sweet European programme? And if excuses are to be sought, could there not have been a more plausible one than the tall tale that Mr. A. K. Sen would be educating European statesmen on Kashmir? In any case, I should have thought that there is greater scope nearer home for any such exercise in the art of advocacy. Why does not the Law Minister try a little persuasion on Sheikh Abdullah himself? Or, may I add, on some of our newspaper editors?

★★

Mr Swaran Singh is reported to have said that the Government considers that sugar control has come to stay. A statement of that kind ought to be enough to earn the Food Minister his release from that portfolio. Surely, Mr. Swaran Singh's words amount to an abject confession of incompetence on the part of the Government. When Mr. Swaran Singh says that sugar control must continue, he is implying that the continuance of a shortage of sugar is unavoidable. But, then, he is wrong. His predecessor, up to the time of his departure from office, was asserting that the sugar output this year would be well over three million tonnes. Mr. Swaran Singh himself would persist in that whimsy claim that long after actual output trends had clearly indicated that production was unlikely to be more than 2.6 million tonnes. Is it now the Minister's case that the Government is giving up all hopes of a substantially higher level of production, say, three million tonnes or more? For, it is only if production stubbornly fails to improve could there be any sense in talking of the continuance of control.

The issue, therefore, is: Is the Food and Agriculture Minister keen on promoting production or is he only concerned with perpetuating controls? He may, as his words suggest, embrace the easy alternative of continuing the control, but public opinion will not certainly be satisfied that such a course is unavoidable. As a matter of fact, control on sugar is among the more obviously unnecessary and definitely harmful controls that we have. Sugar is not a poor man's necessity, except in very small amounts. And there can be no reasonable objection to allowing its price go up a little provided, as is the case, a slightly higher price could stimulate production in the short period. Today the position is that while control inhibits production, it has not brought relief to a large section of consumers whose interest it is supposed to serve. While sugar at the controlled rate is available in the larger cities (and also, on a more restricted scale, in other urban areas), it is only obtainable at very high grey market prices in small towns and villages. Thus the control fails that section of the population whom it should, in theory, be most particularly designed to serve. The sugar problem is wholly a government-made problem and I have little doubt that there would be enough production for both domestic consumption and exports if only the industry is spared for a time the clumsy attempt of the Government to police it to no purpose.

★★

The "Moving Finger", I am afraid, is likely to move rather erratically during the next few weeks, but I do intend making an attempt not to miss more issues than is strictly unavoidable.

V. B.

Trade Winds

JAPAN ACQUIRES ARTICLE 8 STATUS

THE JAPANESE Government has notified the international Monetary Fund that, with effect from April 1, 1964, it will accept the obligations stipulated under Article 8 of the IMF Charter and accordingly refrain from imposing foreign exchange restrictions for international balance of payments reasons. As an Article 8 nation, Japan will also abolish its restrictions on foreign currency transactions and will purchase Japanese currency held by other countries at their request.

Of the 103 member nations of IMF, Japan is the 25th to accept Article 8 status. The move had long been expected in view of the IMF notice to Japan in February 1963, stating that the Organization's Executive Committee no longer saw any justification for Japan to continue operating under the IMF Article 14. But the fourteen-month lag between the IMF notice and Japan's acceptance can hardly be called excessive when compared, for example, to two years in the case of the Netherlands and 16 months in the case of Italy. However, the belief is that Japan might have held off Article 8 status for a longer period than she did were it not for a number of pressures, international as well as domestic, that made an earlier acceptance desirable. The IMF's recommendations to Norway in 1962 and to Denmark the following year, and Australia's voluntary renunciation of foreign exchange controls brought about a growing trend towards Article 8 status that Japan, as one of the ten most industrially advanced of the IMF nations, could hardly ignore. An early acceptance of Aritcle 8 status was also warranted by the domestic preparations gearing Japan to fuller participation in international economic affairs, such as the progressive lifting of import restrictions preparatory to Japanese membership of the OECD.

In accepting Article 8 status, Japan received approval for a number of exemptions. One of these relates to a continuation of $500 per person ceiling for tourist visits abroad. Another is the continuation of Japan's open account payments agreement with the Republic of Korea. As far as the latter is concerned, the continuation of similar arrangements was approved by the IMF between the Netherlands and Indonesia when the Netherlands accepted Article 8 status. Other exemptions approved for Japan cover iron ore carriers chartered for one year and longer, technical assistance agreements, motion picture imports and certain capital transactions.

When on March 18, 1963, the Government of Japan raised the discount rate to forestall undue financial pressure as a consequence of Article 8 status, the general feeling indicated that the national economy was in a position strong enough to meet its new obligations. Already Japanese officials are looking ahead to September when Japan, for the first time, will be host to the joint annual meeting of the IMF, the IFC and the World Bank. With the expected participation of Kenya, top officials of the Finance Ministries and, the Central Banks of the 103 countries will meet in Tokyo.

INDUS BASIN DEVELOPMENT FUND

In pursuance of an understanding reached last November between the President of the World Bank, Mr. George D. Woods and the Pakistan President, Mr. Ayub Khan, a Supplemental Agreement to the Indus Basin Development Fund Agreement of 1960 has come into force with effect from April 6, 1964. The Supplemental Agreement provides the Indus Basin Development Fund with additional foreign exchange resources which aggregate $315 million and will be provided mainly by contributions in grants from the Governments of the United States, Canada, the U.K., West Germany, Australia and New Zealand. Proceeds of the United States Government loan to Pakistan would provide about $51 million while the proceeds of a loan from the World Bank and/or a credit from the International Development Association would provide about $59 million for the Fund. The Government of Pakistan would undertake the local currency expenditures that were not covered by the rupee contributions provided for under the 1960 Agreement. The first charge on the Fund, as now augmented, will be the cost of constructing the Dam on the Jhelum River and the Link Canals and Barrages specified in the 1960 Agreement. In addition, the Fund will finance the cost of a study — to be organized and administered by the World Bank — of the water and power resources of West Pakistan, which would provide the Government of Pakistan with a basis for development planning in the water and power sectors of the economy within the context of their successive five-year Plans.

EXPORT TO CHAIN STORES

A careful study of forign markets would reveal that chain stores are by far the best potential customers of India's handicrafts and handlooms. But, as such goods are of a fancy nature, the chain stores and other business enterprises engaged in their trade run considerable risk — the sale of such goods being uncertain depending upon consumer preferences. With a view to mitigating the effect of this risk, the foreign chain stores propose that there should be a two-way traffic between Indian goods and foreign goods. They agree to place larger bulk orders for Indian goods provided Indian importers also agree to take articles from these chain stores to the extent of half the value of goods exported by India. This view has been expressed by several parties in different countries. It is noteworthy in this connection that the acceptance of this condition will enable India to earn forcign exchange to the extent of 50 per cent of the value of goods exported. On the other hand, the importation of goods to the extent of 50 per cent of the value of exports will also result in some benefits. At present many of such goods are smuggled into India. Their regulated imports will mitigate smuggling and save foreign exchange. As the import of fancy goods is subject to fairly heavy import duties, their imports will add to the Government revenues.

The adoption of the chain stores scheme will thus result in stimulating India's exports to several markets in developed countries. After the initial introduction of these goods in the new markets, it may be possible at a later stage to make exports without linking them with imports.

NEW MONETARY FOUNDATION

In recognition of the services rendered by Mr. Per Jacobsson, the former Managing Director of the International Monetary Fund, a Foundation has been set up with a view to bringing fresh insight into the present-day international monetary problems. With this objective, the 'Per Jacobsson Foundation' will invite each year the best qualified individuals, with both academic and practical backgrounds to lecture on international monetary problems before appropriate audiences in the United States and elsewhere. The Foundation will print these lectures and give them wide publicity. The former US Ambassador to NATO, Mr. W. Randolph Burgess will be the Chairman of the Foundation. Other members of the Board of Directors will be Mr. Eugene R. Black, former President of the World Bank, Mr. Marcus Wallenberg, Vice-Chairman of the Stockholms Enskilda Bank, and as 'ex-officio', the Managing Director of the IMF, Mr. Pierre-Paul Schweitzer, and the General Manager of the Bank for International Settlements, Mr. Gabriel Ferras. Offices of the Foundation will be located in the IMF Building in Washington.

DOLLARS FOR FERTILIZERS

Two agreements were signed in Washington last week, providing two United States development loans totalling Rs. 23.6 crores ($49.7 million) for one of India's largest fertiiizer plants to be built at Visakhapatnam, Andhra Pradesh. The loans will be extended to Coromandel Fertilizers, Ltd., a new company organized by an Indo-American consortium. The new plant, expected to be in operation in the 1967, will produce 365,000 tons of ammonium phosphate and 16,500 pounds of prilled urea annually. When in full production the factory is expected to supply more than a third of the estimated fertilizer consumption of Andhra Pradesh and also meet some of the requirements of Mysore, Madras, Orissa, and Madhya Pradesh. These fertilizers will be particularly suited for the major crops of the area such as rice, sugarcane and tobacco. The new plant will result in an annual saving of foreign exchange of about Rs. 10 crores.

Coromandel Fertilizers, Ltd., has been organized by the EID-Parry Ltd. of Madras, the California Chemical Company, a wholly-owned subsidiary of the Standard Oil Company of California, and the International Minerals and Chemicals Corporation of Illinois. The two American companies will invest $6.08 million in foreign exchange (Rs. 2.8 crores) in the shares of Coromandel and will bring to the project extensive and successful experience in operating a number of fertilizer plants in the United States. The remainder of the financing, Rs. 9.29 crores will come from the EID-Parry Ltd. and the Indian public, who will own a majority of shares of the new company.

Of the two agreements signed, one is for a loan from the US Export-Import Bank totalling up to $27 million (Rs. 12.9 crores). The second is from the US Agency for International Development (USAID) for an amount up to $22.5 million (Rs. 10.7 crores) under the Cooley Amendment of the Food for Peace (PL 480) programme.

LOAN FOR TRUCK MANUFACTURE

The World Bank has agreed to give a loan of $90 million (about Rs. 45 crores) to India for the purchase of components and raw materials required for the manufacture of commercial trucks. Mr. R. V. Raman, Joint Secretary in the Department of Heavy Industries, is leaving for Washington on May 1, to finalise and sign the loan agreement. During this trip, Mr. Raman will also explore the possibility of receiving US collaboration for some of the fourth Plan projects which the Government wants to go into production in the early part of the Plan. He will also visit the UK on a similar mission.

The working groups set up for fixing targets for various industries in the fourth Plan have recommended, in their interim reports, the setting up of certain projects which have also been approved in principle by the Planning Commission as well as the Finance Ministry. This list of projects includes a structural factory at Bokaro, a 10,000 tons structurals plant at Ranchi (under the Heavy Engineering Corporation), plants for the manufacture of machinery required by fertilizer and the chemical plants, and a foundry forge plant. Mr. Raman will explore the possibilities of receiving American and British collaboration for these projects.

IRON AND STEEL PRICES

The Iron and Steel Controller, Calcutta, has announced that the concessional prices of different categories of iron and steel materials for export purposes, as per notifications dated June 20, 1963, November 17, 1962 and June 1, 1963, will continue to be applicable even after February 29, 1964. This will, however, be subject to the following conditions:

(i) In regard to despatches of steel including billets at concessional prices, producers should continue to charge the exporters, the concessional prices which were in force on February 29, 1964, plus an amount per tonne equivalent to the increase in the excise duty for the category concerned, after February 29, 1964.

(ii) Where the supply of steel is against a replacement quota, the increase in excise duty will not be recovered from exporters, but will be paid to the producers from the equalisation fund.

(iii) Producers will have to recover from the exporters, excepting in cases where supplies are for replacements, the concessional export prices as well as the additional excise duty which the exporters will be able to recover as drawback.

(iv) Subsidy will be paid to the producers from the equalisation fund to the extent of the difference between statutory notified prices for controlled categories (or prices notified by the Joint Plant Committee for decontrolled categories) and the amount recovered from the exporter.

SUGAR PRODUCTION BY COOPERATIVES

The production of sugar by the co-operative sugar factories is compared, in the following table, with the total production and the production of the private sector:

From Nov. 1 to Feb.29 — Figures in lakh tonnes

	1963-64	1962-63	Increase Quantity	Increase Per cent
Co-operative Sector	4.20	3.21	0.99	30.84
Private Sector	15.01	13.52	1.49	11.02
TOTAL	19.21	16.73	2.48	14.82

It would be observed from the above table that the production of co-operative sugar factories up to the end of February 1964, recorded an increase of 30.84 per cent over the corresponding period last year; the corresponding increase in the private sector was only 11.02 per cent and for the industry as a whole only 14.82 per cent.

During the last season (1963-64) eight co-operative sugar factories manufactured 0.81 lakh tonnes of raw sugar. This season 18 co-operative sugar factories, (16 in Maharashtra and 2 in Andhra Pradesh) have offered to manufacture about 1.47 lakh tonnes of raw sugar for export on FAS (Free Along Side) i.e. excluding loading charges price basis. The Government of India have accepted only 1.23 lakh tonnes offered by 14 co-operative sugar factories in Maharashtra.

S.T.C. TO IMPORT CAUSTIC SODA

The State Trading Corporation will import 12,000 to 15,000 tons of caustic soda (solid, technical grade) from the USA under AID loan No: 082. The material will have a minimum of 96 per cent sodium hydroxide contents. The prices (quoted on FAS, FOB, C & F, CIF basis) will not include the commission payable to Indian agents as the same would be settled separately in Indian rupees. The tenders which the Corporation has invited from the U.S.A. will close on 4th May, 1964. The details have been published in the AID Small Business Circular No. 64-204 dated 13th April, 1964, issued by the Agency of International Development, Office of the Small Business, Washington.

Company Affairs

INDIAN ALUMINIUM

INDIAN ALUMINIUM Co Ltd., has completed its increased production capacity and has achieved higher levels of sales and earnings in 1963. Mr. H.V.R. Iengar, Chairman, while addressing the annual general meeting held recently, indicated that total value of sales at Rs. 13.89 crores was 32 per cent higher than last year. Gross profits also improved as also net profits, despite the higher tax charges in 1963. Primary aluminium production increased by 10 per cent to over 25,000 tonnes, in spite of a prolonged power cut in Alupuram. The output of semi-fabricated products increased even more steeply to 15,000 tonnes from less than 13,000 tonnes in the previous year.

The Chairman informed the shareholders that the company was still carrying out the expansion of the Alupuram smelter and the foil mill at Kalwa, the first benefits of which are expected only after 1965. To finance this expansion the company increased its authorised capital to Rs. 10 crores by the creation of additional 4,000,000 ordinary shares and increased the issued capital of the company by rights issue of 801,276 new ordinary shares of Rs. 10 each at a premium of Rs. 15.50 per share. Moreover public issue of 7 per cent debenture stock for Rs. one crore was made early in 1963 and the Commonwealth Development Finance Co. Ltd., was issued £100,000 sterling debenture stock completing the issue of £500,000 sterling debenture stock. There was also a bonus issue of 1,200,889 fully paid ordinary shares of Rs. 10 each in the proportion of one for four. The Chairman was of the opinion that the actual requirement of aluminium might be more than has been planned to be produced by the end of the fourth Plan. The company, therefore, proposes to secure the permission from the Government to expand on the West Coast. Following discussions with the Minister of Steel, Mines and Heavy Engineering the company proposes to submit an application to set up a smelter with a capacity of 30,000 tonnes which will form nucleus of a much larger scheme of integrated aluminium production in that region.

Mr. H. V. R. Iengar drew attention to two elements of cost of production — power supply and labour productivity — which needed to be considered very seriously. It has been the experience of the company during the last few years that power cuts reduced its productivity considerably and consequently raised costs. Throughout the first half of 1963 it suffered long spells of power cuts at its Alupuram smelter which resulted in a loss of 950 tonnes of metal production. Similar losses were recorded during the previous two years and in the current year also 25 per cent power cut was enforced from February and has been increased to over 40 per cent from March. These interruptions in power supply cause serious technical dislocations apart from reducing output, and consequently cause the costs to go up. The chairman added, that the State Governments had a tendency to levy duty on electricity consumption which again means higher costs. Electricity being a major raw material for the aluminium industry, it is very significant that the sanctity of long term contracts is preserved for reasons of sound economy.

The Chairman observed that low labour productivity in India was confirmed in a study which he conducted a few years ago by comparing certain Indian plants with similar sized plants in other countries. It is true that output per worker is influenced by a large number of factors but one must agree with the Chairman that an important influence on productivity is the human factor involved in management and labour relations. He felt that understanding through collective bargaining and mutual consent was becoming ineffective and sometimes considerable damage was done before some understanding was reached. He has, therefore, made a very sound suggestion to conduct a fresh study of the problem "by a body such as the National Productivity Council, which, happily, has a tradition of joint approach to problems of productivity by trade unions, employers and Government, with the assistance perhaps of outside experts". The Chairman was hopeful that something useful may emerge out of the discussions with the National Productivity Council.

BUCKINGHAM AND CARNATIC

Mr. D. W. Law, Chairman, the Buckingham and Carnatic Co. Ltd., while addressing the annual general meeting of the company indicated that gross sales exceeded those of the previous year, in spite of a loss of nearly ten days' production due to a stay-in strike. The company, however, could not maintain its export sales which during the year ended December 31, 1963 were around Rs. 1.17 crores as against Rs. 1.64 crores last year. Restrictive import policies in Ceylon led to lower exports and demand was also lower in Malaya and Burma. Another reason for this decline, according to the Chairman, was that cotton mixture fabrics like terylene-cotton blends, which are easier to wash and require little or no ironing, are in greater demand in most of the sophisticated export markets. He felt, therefore, that conventional cotton piecegoods manufacturers should increase their output of mixture fabrics, and accordingly this company has made considerable progress in this field.

The Chairman expressed satisfaction over the improved situation in respect of raw cotton. The carry-over at the end of August 1963, he said, improved to 1,950,000 bales as compared with 1,450,000 bales at the end of August, 1962. The cotton crop output for 1963-64 is estimated at around 58 lakh bales and this quantity, though quite up to expectations, is not enough for the increasing demand at a time when additional spindles and looms are being installed at various places. The Chairman, however, added that urgent measures are being taken to improve the overall yield of cotton per acre, and he suggested that more attention should be paid to incentives and scientific farming.

In line with other textile producers in the country, Buckingham and Carnatic Co., has under active consideration plans for the progressive modernization and expansion of its plant. Particular attention is being paid to the modernisation of certain dye-houses processes and to the provision of increased capacity for generating process steam. Modernisation is even more necessary for a company which wants to increase its export. Consequently, it intends to install modern, high speed machinery so as to increase productivity and reduce costs to be able to compete in the world market. The Chairman was of the opinion that imported textile machinery is necessary for this purpose and he hopes that the Government will assist the company to obtain such machinery by releasing the foreign exchange required.

KAMANI ENGINEERING

Mr. R. H. Kamani, Chairman, Kamani Engineering Corporation Ltd., informed the shareholders at the annual general meeting that the company had attained a state of sustained growth so that it could look forward to a continuous process of increasing investment and returns. Profits before providing for depreciation etc. increased from Rs. 36.38 lakhs last year to Rs. 41.84 lakhs during 1963-64. Profits during 1961-62 were around Rs. 24.30 lakhs. The company had achieved these favourable results, in spite of a difficult situation in respect of raw material supply. Mr. Kamani pointed out that considerable difficulties were being felt regarding timely delivery of matching sections during the last two decades and hoped

that the Joint Plant Committee, set up recently, would adjust the production programme to the requirements of the industry. He referred to a recommendation of the Raj Committee that certain quality of steel should be allowed to be imported to ensure timely availability of matching sections. He hoped that such imports would be allowed on the basis of the individual fabricating capacity and the producers allowed to exchange controlled categories of steel among factories in order to meet the shortages to a certain extent.

The chairman outlined the distinctive achievement of the company as it has completed five major transmission lines covering about 600 miles in five States — Gujarat, Orissa, West Bengal, Andhra Pradesh and Mysore—and it was indeed a matter of considerable achievement that 240 miles of 132 kV trunk lines from Dhuvaram power station in Gujarat and 100 miles of 132 kV lines in Orissa passing through extremely difficult terrain were completed in record time. The chairman also informed that three power generating sets for Trisuli Hydro Electric Project in Nepal were supplied by the company and a transmission line was being constructed for the project. Another notable achievement of the company was the contract for the installation of a Ropeway with a big haulage capacity of 450 tons per hour which had been secured from Indian Iron & Steel Co. Ltd. in collaboration with the leading German firm of Pohlig. This is going to be one of the largest ropeways in the world and will be operating over a distance of 40 miles. The civil engineering work on this project has already started and the project is expected to be completed by the end of 1966. It is significant to note that Kamani Engineering is perhaps the only exporter of transmission line towers and other structures, and in spite of considerable competition it expects to secure orders from Nigeria for 132 kV transmission line towers. Mr. Kamani also indicated that two large orders had been secured from National Power Corporation, Manila, Philippines, in the face of Italian and Japanese competition. This is a tribute to the efficient functioning of this company.

BANGALORE WOOLLEN MILLS

After the emergency, demand for Angola produced by the Bangalore Woollen, Cotton and Silk Mills Co. Ltd., increased considerably with the result that during 1963 its gross sales were over Rs. 8.5 crores. Mr. D. W. Law, chairman of the company, while addressing the annual general meeting held recently, informed shareholders that substantial section of the mills worked on three shifts in order to complete Government's requirements within the specified time. Another positive effect of substantial significance was that 'Varsity' a terylene-woollen, suiting which was introduced during the end of 1962, made satisfactory progress. In the field of exports the performance was not so bad. Exports of Cotswol and Angola to various markets, including the USA, Canada and the USSR, were considerable and the prospects seemed to be attractive for their sales in the United Kingdom.

To meet this pressure of demand the company has carried through a programme of expansion and modernisation. The 34 additional looms expected during 1963 arrived in time and were installed. Materials ordered to modernise parts of the carding and spinning departments also arrived by the end of the year. The Chairman indicated that negotiations with the labour association in connection with the modernisation of plants in these departments were progressing. Several new machines for improving the efficiency of the dye-house were installed, thus enabling this section to maintain proper level of efficiency. Mr Law also indicated that the changeover from coal to oil firing was complete by the middle of 1963 which has resulted in considerable cleanliness, although the cost of oil firing is only fractionally higher than coal firing.

Following the announcement towards the later part of 1963 that mills would be allowed to increase their loom capacity by 10 per cent and their spindleage by 7½ per cent, the company proposed to seriously consider the comprehensive expansion and modernisation of its plant. The chairman rightly indicated that at a time when even the latest equipment is becoming out of date, it needs considerable care to purchase machinery, provided the necessary foreign exchange was available, so that the company can compete effectively in export markets.

The chairman expressed satisfaction over the financial position of the company which was a reflection of the continuous expansion and modernisation of the plants. The company consequently was able to pay a final dividend of Rs. 18 per share, which brings the total ordinary dividend for the year to 24 per cent, gross, — 6 per cent more than for 1962. This increased dividend, the chairman indicated, was justified in view of the performance during the year although the company has followed a policy to conserve funds for expansion and modernisation.

CAPITAL ISSUES

Four companies have been authorised to raise fresh capital amounting to Rs. 6.50 crores. Of these, three are issuing equities and the fourth is floating debentures. One of the companies is offering part of its equity capital for public subscription. The new issues include a Central Government Undertaking.

The consent of the Controller of Capital Issues is valid for 12 months in all cases.

The following are the details:

Heavy Electricals (India) Limited, Bhopal, a Central Government Undertaking, is to issue further capital of Rs. 3 crores, divided into 30,000 equity shares of Rs. 1,000 each for cash at par. The capital will be utilised for civil engineering works including transport vehicles, purchase of plant and machinery, training of engineers etc.

Birla Jute Manufacturing Company Limited, Calcutta, is to issue debentures of Rs. 2 crores in denominations of Rs. 1,000 each carrying interest not exceeding 7½ per cent per annum. The capital will be utilised for part financing in setting up a cement plant at Chittorgarh and Oxygen and Acetylene plants at Birlapur, West Bengal.

Insulator Manufacturers Limited, Calcutta, will be issuing Rs. 1 crore in 10,00,000 equity shares of Rs. 10 each for cash at par. 51 per cent of the capital will be subscribed privately and 9 per cent will be offered to the public. The money will be utilised in the manufacture of HT and LT insulators.

Nirlon Synthetic Fibres & Chemicals Limited, Bombay, is to issue Rs. 50 lakhs capital in equity shares of Rs. 100 each and to be subscribed entirely privately for cash at par. This consent is in supersession of previous consent dated September 26, 1962 for issue of Rs. 106 lakhs equity capital.

The capital will be utilised partly for reimbursing the outlay on existing Nylon Plant and the balance for purchase of land and initial expenditure for the expansion project.

LICENCES ISSUED

The following licences were issued under the Industries (Development and Regulation) Act 1951 — during the week ending 18th April, 1964. The list contains the names and

addresses of the licensees, the items of manufacture and annual installed capacity:

IRON AND STEEL CASTINGS AND FORGINGS

Barkar Engineering & Foundry Works Ltd., Thaper House, 124, Janpath, New Delhi (Bihar) — Grey Iron Castings 3000 tons per annum.

ELECTRICAL EQUIPMENT

English Electric Co. of India Ltd., D-3, Gillander House, 81, Netaji Subhas Road, Calcutta-1 (Madras) — Instantaneous, Time current, Voltage and auxiliary relays, Differenital and Buchholz relays 30,000 Nos. per annum.

PLASTICS

The Metal Box Company of India Ltd., Barlow House, 59-C Chowringhee, Calcutta-20 (Calcutta, West Bengal) — (After expansion annual capacity) Thermoplastic closures and components 60 tons; Blow moulded bottles 3.36 million Nos.; Polythene Layflat tubes and films 2.80 lakhs lbs.; Polythene bags 34.2 million Nos.

INORGANIC HEAVY CHEMICALS

Bengal Chemical and Pharmaceutical Works Ltd., 164, Maniktala Main Road, Calcutta-11 (Choudwar, Orissa) — (Annual Capacity) Sodium Stanate 8280 Kgs.; Zinc Chloride stick 8280 Kgs; Sodium Aluminate 360 M.T.; Magnesium Tricilicate 84 M.T.; Zinc carbonate 84 M.T.; Magnesium carbonate 36 M.T.; Copper Naptha (soluble) 162000 Lt.

DRUGS & PHARMACEUTICALS

Biological Products Private Ltd., 18/1, 18/3, Azamabad, Hyderabad-20 (Andhra Pradesh) — 4-Acetamido Benzaldehyde Thiosemicarbazone 30 tonnes per annum. Rallis India Limited, T.C.F. Division, Rallis House, 21, Ravelin Street, Bombay-1 (Maharashtra) — Nandrolone (Parenteral) 1,92,000 Xone ml. ampoules per annum. Sandoz (India) Ltd., 3, Wittet Road, Ballard Estate, Bombay-1 (Maharashtra) — Syntometrine Ampoules 1 ml. 4,00,000 ampoules per annum; Calcium Gluconate tablets with Vitamin D2. 15,00,000 tablets per annum.

May & Baker Ltd., Bhandup, Bombay-78, (Maharashtra) — (Annual Capacity): 'Phenedyl' capsules 1,20,00,000; 'Embacetin' Brand Chloramphenicol capsules 20,00,000 capsules; 'Embacetin' Brand Chloramphenicol suspension 1,500 litres; Chloramphenicol / Dihydrostretptomycin capsules 10,00,000 capsules; 'Majeptil' Brand Thioproperazine Methanesulphonate tablets 6,00,000 capsules; 'Majeptil' Brand Thioproperazine Methane-sulphonate solution 40 litres; 'Terfluzin' Brand Trifluopera zinc 35,00,000 tablets; 'Terfluzin' Brand Trifluperazine solution 20 litres; 'Tixylix' Brand Linctus 32,500 litres.

Glaxo Laboratories (India) Private Ltd., Dr. Annie Besant Road, Worli, Bombay-18 (Maharashtra)—(Expansion envisaged per annum) — Tablets of Prednisolone 30,00,000 tablets; Ointment of Prednisolone 1,368 Kilos; Bendrofluaxide 45,00,000 tablets; Betnelan Tablets (0.5 mg.) 1,02,00,000 tablets. Betnesol eye/ear Drops 0.1 per cent 3 ml. 36,000 units Betnesol/N eye/ear Drops 3 ml. 84,000 units; Betnesol Ointment Eye/Ear 0.1 per cent 3g. 48,000 units; Betnesol N Ointment Eye/Ear 0.1 per cent 3g. 84,000 units; Betnesol Skin Ointment 0.1 per cent 3 g.—24,000 units; Betnesol N Skin Ointment 0.1 per cent 5 g. 60,000 units Betnesol Injection 60,000 units; Betnesol N Nasal Drops 1,320 units.

Geoffrey Manners & Co. Ltd., Magnet House, Dougall Road, Ballard Estate, Bombay-1 (Maharashtra)—(Annual Capacity) Equagesic tablets 6 million Nos; Intravenous Injections of conjugated estrogens 1,200 Gm.; Analgin tablets 12 Million tablets; Analgin Injections 1,800 litres; Analgin Drops 1,200 litres; A.P.A.P. tablets 12 million tablets; A.P.A.P Elixir 6,000 litres; Antacid tablets 12,000,000 Nos.

COTTON TEXTILES

India Woolen Textile Mills (Private) Ltd., G.T. Road, Chheharta, Distt. Amritsar, (Punjab) — 13,000 spindles for the manufacture of cotton yarn. Sree Akkamamba Textiles Ltd., Venkatarayapuram, Tanuku, Andhra Pradesh (Tanuku, Andhra Pradesh) — 100 automatic looms for the manufacture of cotton cloth. Amitabh Textile Mills Limited, Premnagar, Dehradun (Lucknow, Uttar Pradesh) — 13,464 spindles for the manufacture of cotton yarn; Digvijay Spg. & Wvg. Co. Ltd., Lalbaug, Parel, Bombay-12 (Maharashtra) — 2,72,500 Kgs. of Non-Woven fabrics per annum. The Tata Mills Ltd., Bombay House, Bruce St., Fort, Bombay-1 (Maharashtra) — 4,17,500 Kgs. of Non-Woven fabrics per annum.

PAPER BOARD & STRAW BOARD

Arun General Industries Ltd., 15, India Exchange Place, Calcutta-1, Proposed Name: Arun Board & Paper Mills (Bezwada, Andhra Pradesh) — Straw board & Duplex board 3,000 tonnes per annum; Pulp 3,000 tonnes per annum.

OTHER RUBBER GOODS

Dunlop Rubber Co. (India) Ltd., 57-B, Free School Street, Calcutta-16 (Ambattur, Madras) — Large solid and rubberising of wheels, rims, bogies, rollers 6,336 Nos. per annum.

CHANGE IN NAMES (Owners or Undertakings)

(During the week ending 18th April, 1964)

(Information pertains to particular licences)

From M/s. Andhra Electric Steel Ltd., Calcutta to M/s. Andhra Steel Corporation Private Ltd., Calcutta. From M/s. Andhra Pradesh Glass Works Limited, Hyderabad to M/s. Associated Glass Industries Limited, Hyderabad.

LICENCES REVOKED OR SURRENDERED

(During the week ending 18th April, 1964)

(Information pertains to particular licences)

M/s. Alembic Chemical Works Co. Ltd., Baroda — Oxytetacycline capsules, etc. M/s. Alembic Chemical Works Co. Ltd., Baroda — Obeandomycin capsules, etc. M/s. Doon Scientific Glass Works, Dehra Dun — Borosilicate Glass Tubes and Rods, Scientific Glassware, Borosillicate Pressedware and ovenware.

THE CALCUTTA ELECTRIC SUPPLY CORPORATION LIMITED

(Incorporated in England)

Notice is hereby given that the Board of Directors of this Company have declared payment of a Final Dividend on the Company's Preference Stock for the year ended 31st March, 1964 at the rate of £2-14-8.16/49d. per cent less Income Tax at 7s. 9d. in the pound equal to £1-13-6d per cent. Payment will be made on 29th May, 1964, to those stockholders whose names are registered in the Company's Stock Register on 11th May, 1964.

Applications for transfers received in this office before 12 O'clock noon on Monday, the 11th May, 1964 will, if otherwise satisfactory, be registered at that date for the purpose of participation in the above dividend.

BY ORDER OF THE BOARD,
D. P. M. KANGA,
AGENT.

VICTORIA HOUSE,
CALCUTTA, the 24th April, 1964.

THE INDIAN SMELTING & REFINING COMPANY LIMITED

'Industry House' 159, Churchgate Reclamation, BOMBAY-1.

Cable : 'ISARC'

BOOKS BRIEFLY

The Case of Case-Studies

Cases in Indian Administration: Published by the Committee on Case Studies, The Indian Institute of Public Administration; Price Rs. 7.50.

Reviewed by N.S.J.

ADMINISTRATION IN India has, as in Great Britain, a strong amateur tradition. The higher civil service has always been something of a mandarinate with a background of liberal education carrying on the tasks of ruling with a becoming contempt for them. An attitude of dabbling and dilettantism, of ad hoc coping and improvising as one goes along is of the essence of the outlook. There were, of course, the tiresome rules, but the baboos would take care of them and see to it that one did not slip up too badly. The attitude was not unlike that of the French symbolist poets one of whom said, "As for living, our servants will do it for us." In other words, and in the language of the text book, administration was more an art than a science. The cultural conquest of the rest of the world by the United States has changed this easy going view of life. The Americans with their irrepressible itch for reducing everything to a problem to be licked have converted many a gentlemanly vocation into a grim kind of science. For a people to whom everything from bee-keeping and poultry farming to physics and philosophy is a subject to major in, management and administration cannot long remain outside the pale of systematic study. There is much naivete, both academic and of other kinds, in this approach. It often leads to the most solemn dissertations on trivialities reading which it is difficult to keep a straight face. Its influence on language has been disastrous, the jargon, the pompousness and the passive voice trying to impart to the subjects a weight they cannot bear and in the process making the English language uglier than it need be.

Practical Consequences

And yet, the practical consequences of this approach to problems are so evident in the increased efficiency of American industry and even administration, that we cannot long ignore it with supercilious scorn. There is, to be sure, much hocus pocus in all this, and part at least of the inflation of this kind of expertise is Parkinsonian. And yet, there is enough substance in it to make Britain, the last bastion of the amateur tradition and academic conservatism to succumb to it. The six new universities planned are consciously slanted the American way and even Oxford has relented enought to think of a course of studies in business management. In India too, the attitude has made a significant dent not only in the amateur tradition but also in the general slovenliness of doing things. Institutions like the Indian Institute of Public Administration are a symbol of our final acceptance that there is room for this kind of pedagogy.

Among the ideas under original American inspiration tried out by the Indian Institute of Public Administration is that of case studies. The general idea is to take up specific "burnt out" administrative decisions and examine them as in a post-mortem operation. The idea has its obvious uses, though the claim made for it in the introduction in the book are rather extravagant. It is said that the aim of these case studies "is to provide a deeper and wider understanding of the functions of the Indian Administration in its institutional frame work." They also aim at "the building up of a body of systematic knowledge about the administrative process in India." Reference has also been made to the possibility of a "theoretical framework" based on the hypotheses, thrown up by these case studies. For, these hypotheses, "tested by a large number of case studies of similar type and not refuted, would provide a systematic body of knowledge." All this sounds perilously like pseudo-science to me, especially the last part that hints at inductive reasoning based on the principle of verification and elimination of the apparent exception. In my view, the only utilities than can be legitimately claimed for these studies are the practical ones of the exemplary or the cautionary morals of particular decisions, and such insights into decision-making as are given by seeing the whole picture of the action and interaction that precede particular final decisions. Anything wider than this is futile to look for unless the Institute of Public Administration is planning to do for administration what Machiavelli did for politics in "The Prince", or Kautilya in Arthashastra. Such a manual would no doubt be of extraordinary interest and even use, but I doubt whether it is what the Committee on case studies had in mind when they wrote the introduction.

Worthy Aim

But the more modest aim of these studies, that of arranging a kind of conducted tour of the backrooms of decision-making is certainly a worthy one. But even here certain inherent limitations are to be recognized. There are the difficulties in obtaining access to the really valuable cases from a bureaucracy that is understandably cagey about letting strangers loose in its archives. For unsuspected skeletons may emerge from cupboards discreetly kept locked. In fairness, however, it must be said that four of the five cases discussed in these pages may be considered even in post mortem embarrassing and inconvenient enough to Authority to testify to its readiness to co-operate in the venture. Secondly, for obvious reasons, these studies do not present the total reality of the cases. Inevitably, they deal with recorded actions and no attempt has been made to obtain from persons concerned clarifications that might have thrown more light on the various facets of the decisions. The studies thus ignore what the authors themselves call in characteristic jargon "the values and goals, human relationships, group pressures etc" that either the decisions. Decisions are after all taken by men and women and when personal motivation is excluded, a good part of the mechanics of decisions will become meaningless. Such motives need not necessarily be improper. For even actions of officials of sea-green incorruptibility are not taken in a psychological vacuum. There are the clash of wills, the departmental jealousies and cross purposes in the exercise of power by the representatives of what has been called the "anonymous empire". The bureaucrat is faceless only in allegories.

Another kind of reality that the studies inevitably ignore is the considerable amount of action and decisions that do not get congealed in the record. The pulls and pushes of the many secondary actions, the personal interviews, the telephone calls that put in a word or a spoke (depending upon one's attitude to the case, the sneaky preview of files, the interested passing on of information, the whole human drama, in fact, is excluded from these studies. This is the kind of reality that is the staple of the Secretariat Superintendents' conversation, even, as it has been sometimes alleged, in their sleep. There is a whole world of illumination to be found in this kind of "shop", which will reveal an almost existential involvement in administration, and which the case studies ignore. The defeating of this man's promotion or that man's increment, or the working with devious cunning the interests of one's wife's fourth cousin's brother is another facet of this reality. There are then the stresses and strains of provincialism, the nuances of sub-caste affiliations to be studied. Impressionistically, it may be stated that none of these is strong enough to allow the perpetration of major administrative injustices, though they may sometimes be powerful enough to win for one's friends and relatives many minor and

not wholly deserved gains. But this impression needs verification.

All this is only another way of saying that the Secretariat still awaits its Dickens and Sir Charles Snow, the one to explore the basement and the other the corridors of administrative power. Since the case studies have far less ambitious aims, it is a little unfair to blame them. Nor indeed am I blaming, though I do wish to emphasize the importance of these elements. In any event, a percipient reader can, especially if he knows the ways of the Secretariat, read between the lines all the drama. I have mentioned earlier, especially if he knows some of the principals in the case. One of the most fascinating things about this book is the continuous occasion it gives for such reconstruction of this other kind of reality. Indeed, a really clever writer can provide for much material of this sort without once openly offending the code the Committee on Case Studies has prescribed for the authors.

But within the limits the authors have set themselves, there is a lot of wisdom to be gleaned. Taking the case of Decontrol of Foodgrains in 1952, the sequence of events illustrates what difference a genuine flair for administration at the top can make for the country's well being. Successive food ministers have not been able to cut through the ideological smog that was clouding thinking in high places until two persons both with strong personalities and a sure instinct for administration turned the searchlight of commonsense on the question. The quickness with which the incubus lifted once Rajaji and Kidwai acted firmly has lessons of inestimable value for the present.

Administrative Technique

The second case of the Grant of Extension to the Inspector General of Forests is by far the most important from the point of view of what may be called the technique of administration. It is also the case in which we would have been most grateful for a view of the other kind of reality I spoke of earlier. The case is important not only in itself but for the circumstance that it led collaterally to the abrogation by the Government of certain self-imposed restraints on itself. Briefly, in 1946, Government in a fit of austere self-discipline, imposed upon itself an obligation that constitutional provisions did not either then or later lay on it. This was the necessity to consult the Federal Public Service Commission (as it then was) in all cases of granting of extensions of service beyond the date of customary superannuation to officers in the senior services. The clash of opinion between Union Public Service Commission and the Government over the question of granting extension to a particular encumbent of the post of the Inspector General of Forests resulted in the Government's decision to withdraw the rule about prior consultation.

As to the merits of the particular case in which extension was eventually granted against the UPSC's wishes, it is difficult to be dogmatic, though as an exercise in persuasion the UPSC's was the better performance. The constantly shifting grounds of the arguments of the representatives of the Government showed that they were erecting principles as they were going along and as the case developed. This is not necessarily indicative of administrative bad faith, for there are no immutable first principles of administration. Those who have some knowledge of government's workings know that it is happening all the time. (The case study, by the way, illuminates also how to do it plausibly!) But the greatest weakness of the Government's case is undoubtedly its refusal to settle for the "re-employment" of the officer and its insistence on an extension of service, which imposed greater financial obligations on the Government. This unwillingness to fall in with the wishes of the UPSC throws grave doubts on the seriousness of the Government's arguments in favour of extension based on the officer's indispensibility. The UPSC was willing enough, after initial reluctance, to concede the officer's irreplacability and suggested the idea of re-employment which would have secured his services for the Government without violence to the principles that the UPSC argued for. As far as can be discovered from the case study, there has been no convincing reason why this way out suggested by the UPSC was not taken.

Apart from the merits of the case, why did the Government think it expedient to change the rule about prior consultation? The ends of the particular case would have been met by Government over-riding the particular advice of the UPSC. It has in theory the right to do so and it does exercise this right in practice sometimes. But the withdrawal of the rule about consultation in such circumstances is a serious matter. Mr. Muttalib's observations on this point are somewhat obscure. He says, "If the soundness of the executive order is to be judged by the reduced number of cases of non-acceptance, the Government assessment of the situation seems to be almost faultless — if during the first four years there were 13 cases of non-acceptance, (including six cases of extension), during the six subsequent years Government elected to depart from he advice of the commission in only four cases". This seems an odd comment. The first question is: "Government's assessment of what?" If it is the Government's assessment of the soundness of the decision to abrogate the executive order of 1946, then the kind of comparison that Mr. Muthalib institutes is totally irrelevant. Surely no meaningful inferences can be drawn from a comparison of total acceptances in two periods in one of which extensions figured and in another of which they did not. The more useful investigation would have been, first, the number of extensions granted by Government after the watchful eye of the UPSC was blinded unceremoniously, and second, the merits of such decisions. Judged by this criterion, the general impression is that what the Government has done, either by intention or by accident, is to free itself from an inconvenient fetter. It must be admitted, however, that there is no data available with the public to verify this impression, though one circumstance confirms it obliquely. The recent increase of the age of superannuation to 58 has had many reasons advanced in its favour. Among the unavowed one is undoubtedly the desire to obviate the very considerable patronage in the form of "extensions" that both Government and individuals in it possessed. The exercise of this patronage was assuming the proportions of a farce or scandal, depending upon the way one looks at these things, and had to be "regularised". Such an honest and sensible way of coming to terms with facts is to the credit of the Government but it answers the question about the soundness of the withdrawal of the executive order pretty conclusively.

Passing the Buck

Apart from these questions of principles, the percipient reader will glean from this study many an important lesson that he will find useful before he earns his pension. Among these are how to pass the buck to another, how to stall and how to sabotage quietly a proposal you do not agree with and even how to manage ministers without their suspecting that they are being managed. These lessons, of course, are in invisible ink between the lines.

The study of the Extension of Bokaro Thermal Plant brings home the need for looking ahead in power planning. The Public Hospital case illustrates two archetypes of officials. The one, pettifogging and rule-bound, who ties himself and others with endless yards of red tape and who is not above needling his betters by obsequious but insistent pointing out of irregularities. The other, with dash and energy, contemptuous and probably ignorant of rules, and not above cutting a corner or two in cutting the red tape. It is impossible that one man should combine both qualities and it is difficult to say that one is necessarily better than the other. Administrations all over the world have solved the problem by having both types in them each keeping within bounds the extravagances of the other. The last case study gives an interesting account of the evolution by trial and error of the administrative unit for Community Development in Mysore.

ASSOCIATION MEETING

Erroneous Sugar Policy will Retard Development

In his Presidential Address delivered at the 31st Annual General Meeting of the Indian Sugar Mills Association held at New Delhi on the 27th April, 1964, Rai Bahadur Seth G. M. Modi said :

The food and agricultural sector of which sugar is an integral part embodies efforts and aspirations of a vast majority of our people. In the matter of Plan priorities also which reflect the country's basic approach towards planned economic development, this sector has been accorded highest priority. The problem of food and agriculture is really complex. Land which has been neglected for years together without replenishing its fertility has to be exploited. Our agricultural operations at present are mainly dependent on the vagaries of nature. Only 16 per cent of the land is irrigated and production mainly depends on the bounty or fury of nature. In these days of scientific development, we should not merely be exposed to the mercy of nature but should take positive steps to provide adequate supply of water, fertilisers, drainage etc. The funds earmarked for the development of agriculture and irrigation over the First, Second and Third Plans have not been fully utilised. This is not desirable because, for development of agriculture and irrigation, foreign exchange hardly presents any problem and all requirements in this behalf can be met from internal resources.

Cane Development has also suffered, especially in the North due to dependence on weather conditions. There is urgent need for provision of adequate water supply in sugarcane areas through tubewells. The rate of supply of water from the tubewells at present works out to nearly Rs. 70 per acre in U.P. against Rs. 32 for supply of water through canals. This high rate has prevented the growers from taking full advantage of the tube-wells already installed by the State Government. Cost of chemical manure being about Rs. 46 per bag, its utilisation is beyond the reach of cultivators. The price should be reduced through an appropriate subsidy by the Government. Adequate drainage facilities should also be provided.

The basic problems of cane development have been with us for all these years but have remained unsolved. Without effective participation of the Central Government this problem may not be satisfactorily solved. Since sugar is a Central subject, it is most appropriate that larger and direct responsibility is assumed by the Government of India in the matter of cane development also to ensure quick results. The Central Government's participation in the intensive cane development schemes initiated in U.P., Bihar and the Punjab is welcome.

Most of the existing factories were put up during 1932-33 with a daily cane crushing capacity of 600 to 800 tonnes and their subsequent progress has been entirely dependent on the availability of quality cane. Since cane cost accounts for 70 per cent of the cost of sugar production, such of the factories as were fortunately placed in the matter of cane supplies expanded their plants while others located in areas of cane shortage have been marking time and have not been able to keep pace with the general development. They continue to be small size units with higher cost of production and are sometimes classified as uneconomic. Cane yields per acre and sucrose content continue to stagnate around the level obtaining when the facories were put up. Functioning under such handicaps if some factories have not been able to expand, it is hardly desirable to call them uneconomic or obsolete. While revising the price for the current season on the basis of actual working results of factories, Government should take into account the uneconomical working of the small units and compensate them adequately. The taking over of such units by the Government will not solve the problem. Provision for rehabilitation of such units in the price structure itself, as allowed in the case of cement factories, should solve their problems.

SUGAR OUTPUT

It is estimated that sugar output in the current season 1963-64 will be around 26 lakh tonnes which is less than what we need and had hoped for. Last year though sugar production was only 21.6 lakh tonnes, due to a very large carry over of 10 lakh tonnes from the preceding season, it was possible to export about 5 lakh tonnes and also distribute internally about 26 lakhs tonnes; but the carry-forward stocks at the end of last year were very nominal being barely 1.5 lakh tonnes.

Government, therefore, rightly decided upon various measures to maximise sugar production during the current season. Cane price was generally raised to Rs. 1.75 per md. and factories in gur competition areas were authorised to pay a minimum cane price of Rs. 2 per maund. Rebate in excise duty was granted to factories to enable them to start early and this concession also applied for the remaining part of the season. Simultaneously, Government also imposed restriction on inter-State movement of gur and khandsari and assumed powers to regulate cane supplies principally to the factories. This integrated policy embracing the three sweetening agents was indeed boldly conceived.

Initially the aforesaid measures had their desired effect on gur and khandsari prices which tended to decline. By November, 1963 as many as 129 factories had started against 86 during the corresponding period last year and production was higher by 70,000 tonnes. But as the season progressed, gur and khandsari prices again resumed their upward trends and the failure of winter rains and draught in certain areas of the North caused damage to the standing cane. There was large scale diversion of cane from factory areas to gur and khandsari and it is estimated that the industry lost about 5 to 6 crore maunds of cane as a result of such diversions. It is appreciated that the Food Ministry has been vigilant and has taken prompt measures from time to time to enable the factories to counteract competition from gur and khandsari. In March 1964, factories in U.P. were authorised to raise cane price by another -/6/- per maund. This helped the factories, particularly those in certain districts of West U.P. to prolong their crushing operations for some time and produce an additional output of about 50 to 60 thousand tonnes of sugar.

The measures taken by the Government have a limited impact and are not broad-based. They do not provide a lasting solution to the problem of securing equitable distribution of available cane supplies among the three users. For this, it is essential that the factories should be ensured freedom and flexibility in their working camparable to that enjoyed by gur and khandsari. Since the factories have no resources of their own, this freedom and flexibility to factories is possible only through an appropriate sugar policy by Government.

SUGAR MARKETING BOARD

The setting up of a Marketing Board in Sugar will perpetuate controls on the sugar industry and will upset the parity between the alternative users of cane which would inevitably affect sugar output adversely. The conditions under which a Sugar Marketing Board operates in Australia are basically different to Indian conditions. In Australia sugar factories consume all the available cane and there are no alternative users. Moreover, here we have wide disparities in the operating conditions of factories and consequently evaluation of their costs will not be simple. Its creation would result in a shaded market for the industry and will destroy all initiative to improve efficiency and the quality of sugar. With its restrictive effects on production, interests of the consumers will also suffer and they will be required to pay higher prices. It will also sap initiative in the industry for expansion and extension which will again go to hamper production in the long run. The Indian Sugar Delegation which visited Australia and Indonesia in 1955 recommended that the question of setting up a Central Body for sugar should be postponed until economic conditions reached a certain degree of stability. Conditions prevalent today are far from stable and do not justify the introduction of the Marketing Board.

COST INCREASES

An economic price structure is equally important for maintaining production and ensuring development of the industry. The Government are adopting the regional Tariff Commission Cost Schedules for computing control rates Costs have gone up in diverse ways since the preparation of the schedules on the basis of the cost data for the season 1957-58. Unless all such cost increases are taken into account and provided for fully in the cost structure, the industry cannot be assured of a fair price. The Indian Sugar Mills Association has submitted a detailed memorandum to the Government with necessary data in support of each item of cost where increases have taken place. Government should examine the data expeditiously to be able to provide for the same in the price finally fixed for the current season 1963-64. This is of vital importance to the industry.

LOW PROFITABILITY

The uneconomic price structure generally allowed to the industry has undermined its financial stability. The level of profits presently accruing is far from satisfactory. The Reserve Bank Study published in its monthly Bulletin of June '63, the Analysis of 1962-63 Financial Results of a large number of sugar companies in the North and the 'Financial Express Index Number' of Equities reveal that the sugar industry is making extremely meagre profits by any standards. It is beyond the means of factories to set apart adequate funds for rehabilitation, expansion etc. Were it not so, we would not be confronted with the acute problem of small units. Adequate profits must be assured to the industry.

SUGAR EXPORTS

The emergence of India as a sizable exporter of sugar in the World Market has been a most welcome feature of the sugar economy in recent years. Sugar exports are no more conducted to merely balance demand and supply within the country. They form an important part of our export drive to earn foreign exchange. In 1963 about 5 lakh tonnes were exported and the foreign exchange earnings are estimated to be over Rs. 32 crores. Raw sugar was produced in the country only last year. The immediate success that we achieved in producing raw sugar is indeed heartening. About 40 factories produced nearly 2.60 lakh tonnes in the last season and most of it was shipped to Japan, USA and Canada. We are now recognised as important suppliers of raw as well as white sugar.

In the current year, however, there is likely to be a setback in the export performance. This is entirely due to lower production in the country. It is likely that our total exports this year may be less than 3 lakh tonnes although the World Sugar Market has been quite firm for sometime past and this was the best opportunity for us to earn the maximum amount of foreign exchange. This slight set back is, however, a temporary phenomenon and with production increasing appreciably in the years to come, exports would be stepped up to at least 5 lakh tonnes per year if not more.

FUTURE PROSPECTS

Bright prospects lie ahead of the sugar industry. Demand for sugar in the country is continuously rising. During the third Plan period the rate of increase in demand has been placed at 1 lakh tonnes per annum while during the Fourth Plan it is expected to go up to 2 lakh tonnes. In keeping with this increasing demand, the Development Council has placed the 4th Plan production target at 45 lakh tonnes and there are indications that this may further be stepped up to 50 lakh tonnes. We have a vast export market to absorb surplus output and the industries dependent on sugar for raw materials such as alcohol based industries, are steadily progressing.

In the above context, it is regretted that while the Finance Minister has allowed certain important industries a rebate in corporate tax, sugar has not been included in the list of industry in whose case this concession would be applicable. This concession must be allowed as the development in this industry has a direct impact on the agricultural economy and sugar is a sizable foreign exchange earner.

NEXT SEASON'S SUGAR POLICY

Government should announce the next season's sugar policy as early as possible. Cane price for the next season has already been announced and it is hoped that the Government would give favourable consideration to the request for authorising the factories in the Northern and Central regions to pay a minimum price of Rs. 2 per maund as in the current season. Equally necessary is the announcement of Government's Policy with regard to other connected matters like early start etc. This would facilitate prior planning which is so necessary to achieeve the best results.

The Century Spinning and Manufacturing Co. Limited

Registered Office:

Industry House, Churchgate Reclamation, Bombay.

NOTICE is hereby given that the Sixty-seventh Annual General Meeting of the Shareholders of the Company will be held on Wednesday, the 27th May, 1964 at 4-30 P.M. at Industry House, Churchgate Reclamation, Bombay, to transact the Ordinary and Special Business mentioned in the Notice which is being posted to the shareholders alongwith the Explanatory Statement required Under Section 173 of the Companies Act 1956, the Balance Sheet, Profit and Loss Account and the Directors Report for the year ended 31st December, 1963.

N.B.:— A Member entitled to attend and vote is entitled to appoint a Proxy to attend and vote instead of himself and the Proxy need not be a Member.

NOTICE is also given that the Register of Members and Transfer Books of Equity Shares of the Company will be closed from Saturday the 2nd May, 1964 to Friday the 22nd May, 1964 both days inclusive.

The Directors have recommended payment of a final Dividend of Rs. 13 per equity share (subject to deduction of tax under the Income Tax Act) for the year 1963, to be paid out of the Dividend Equalisazation Reserve.

The Dividend when sanctioned will be made payable at the United Commercial Bank Ltd. Churchgate Reclamation Branch, Bombay from 3rd June, 1964 to those shareholders whose names stand on the Register on 22nd May, 1964, to whom dividend warrants will be posted.

BY ORDER OF THE BOARD
R. S. VENKITESWARAN
Secretary.

COMPANY MEETINGS

MANAGEMENT DEVELOPMENT IN HINDUSTAN LEVER

Speech delivered by Mr. P. L. Tandon, Chairman, at the Annual General Meeting of Hindustan Lever Limited, held at Bombay on Tuesday, 28th April, 1964.

Even more than capital and raw materials has a rapidly developing economy to think of its resources of management. For ultimately how well the economy grows will depend upon the calibre of its managers and their attitudes. We, in India, have been fortunate in this respect. Growth of trained management has been rapid and much attention has been paid to this need, and how big is the problem may well be judged from a simple calculation. Out of two million jobs estimated to be created in each year of the Third Plan, even at a ratio of 2 per cent of them being managers we shall need to train 40,000 new managers every year. This is indeed no small task, more so when it is considered that a manager not only must possess a basic discipline such as engineering, accountancy or marketing but to be really effective also receive training in how to be a manager: we have to develop in him besides his function the skills and attitudes of management.

We have always been conscious of this task, and how we view it and what we do about it is the subject of my speech today, as I feel you may be interested in knowing something about this most important aspect of our Company.

Although founded by the genius of one man, our parent company has always been professionally managed. This has been a strong tradition with us and one we have valued in Hindustan Lever. We have always bestowed a lot of care on the proper selection, training, development and promotion of men and women; we have looked ahead at our needs, foreseeable and unforeseeable, and tried to provide for them before they arise. Nearly twenty years ago, as an instance, we appreciated the need for Indianising our management, and the process was handled with care but with boldness till it ceased to need any further impetus some years ago. Over twenty years ago we began our Management Trainee selection scheme, which over the years has with attention and assimilation of new techniques improved until today it stands high by international standards. Opportunity for men from the general staff to rise to management has been another of our conscious efforts.

We have today 341 managers, of whom 178 or 52 per cent have risen from the ranks; a total of 11 or 3.2 per cent are expatriates; our selection and training department in 1963 recruited 26 managers and put through training courses 25 managers as well as 17 non-management staff; 5 from the staff were promoted to management. Our management strength forms 5.2 per cent of our total employees. Although essentially a manufacturing and marketing company, we have 27 women managers, who interestingly possess a diversity of specialised skills like psychology, operational statistics, scientific research, accountancy and home economics.

Management development with us is a complex of activities whose purpose, simply stated, is to ensure three things. First, to anticipate our requirements over the next five to ten years; second, to select, recruit and train men and women to fill those requirements; third, to develop attitudes and values in individuals that prepare them to meet their responsibilities at the standards we consider desirable. All this, ultimately, like capital expenditure, budgeting, annual estimates and erational plans, is the responsibility of the Board, assisted the active participation of all our managers and operated by the Personnel Department, which has a member on the Board.

MANAGEMENT FORECASTING

It takes time to make managers, especially to befit them for higher responsibilities; but we do not believe in age as a determining or even a particularly important factor, in fact it seldom enters our calculations. It is our experience that it takes about ten years to prepare a young manager to take over senior responsibility. If he has the ability and responds to development, with the opportunities that are constantly opening up in a growing and decentralised concern like ours, we would in fact be disappointed were he not able to receive his first shot of a senior independent charge in his early thirties. For all this much forward planning is necessary, especially where the future winners are concerned, for they have to be picked, groomed and trained for twenty years or more. And we may lose some in the process.

The instrument of forecasting is the Management Review which is prepared every year for the next five years. It is much like the Cash Forecast. It evaluates in terms of managers the needs of our business which will arise out of expansion, new projects, new products and organisational changes. This need is then equated with our internal resources, what will be generated by way of promotions from the staff to management, the losses that are likely to occur through retirements and losses through anticipated and unexpected separations. The exercise ultimately throws up our net requirement, which in a growing country and an expanding business must happily be always on the plus side.

The advantages of this exercise are three. In analysing our needs we make sure that they are genuine and not Parkinsonian; and in quantifying them we know when they are likely to arise and how we will meet them. Otherwise it can easily become a case of people retiring or new vacancies arsing without their having been provided for well in advance. We begin thinking of the replacement of retiring men some years ahead of the event. Men are nominated and tried, more so for senior positions. Planned transfers and cross-postings are also a part of development, often into functions different from their original skill or training. The third and important advantage is that the promotion potential within the firm gets carefully looked at. As it is the first priority to promote from within, each department in stating its needs will carefully consider how it can meet them from its own resources.

The Management Review is normally brought up to date every year, but sometimes circumstances may need an ad hoc study. Its preparation and follow up, like the Cash Flow, keep our management resources under constant study.

SELECTION AND RECRUITMENT

The five-year plan is reduced to an annual operating plan of recruitment and the Board is kept in touch with its progress. Every quarter a statement of the total strength of the Company is prepared showing staff in each category, retirements, separations, promotions and recruitment, and this is examined by each department, its director and finally by the Board.

From where do we get our managers? First, always, we look within. Who is ready to be made a manager and who is ready to move up? The process of following initial selection of staff with a good original record, observation, training and grooming should ensure a regular flow from within and a ladder for the men and women with the right qualities to climb to the higher levels.

Secondly, we recruit young trainees, fresh from the Universities with good degrees in humanities or sciences for the general side, in engineering and technology for production, qualified accountants for finance and audit. Experience may help, but we primarily look for a good mind and a likely ability to possess and develop the set of attitudes that we consider important for our business. These may be called "management-like qualities"; not easy to define but meaningful when they are there, and the cause of management failure when they are missing.

We resort to direct recruitment when it is necessary. In actual practice this is mostly confined to specialists as in our agricultural operations, animal feeding-stuffs, research, economics, statistics, engineering, medical and legal fields where we do not have specialist resources within the Company. But sometimes even in non-specialist jobs if we have not got a suitable qualified person, rather than lower the standard we will go outside.

Despite all the care we take in selecting, 20 per cent of our trainees do not make the grade. This may sound a high proportion and is costly, but one we would not like to see reduced through a sacrifice in our standards or through overcaution. These are young men who are basically able and well qualified but have either not taken to business or have not developed the attitudes we need. The answer perhaps lies in a keener follow-up on our part; to carefully isolate these attitudes; to try and build them into our training and of course to ensure that those training the trainees are themselves conscious of them. This is a task that we are now attending to. Were I to attempt defining them I would say that they are, positively and negatively, a dedication to our business, keenness for achievement without a desire for power for its own sake, a deep social sense, and ability to get on with the job without wasting time on the frills. In short, we prefer solid ability to just virtuosity. I am of course taking for granted the usual qualities of intelligence, industry, integrity, self-confidence, etc. We like poise and ease but put no premium on background as a veneer. We have also managed to be respected by those who recommend candidates to us, for we will carefully look at everyone who knocks on our door because we are anxious to take in talent, but we make no concessions to influence.

Some interesting features of our selection procedure may be worth mentioning. All applications—and we receive nearly 1,000 for every person selected — are screened for conforming to basic requirements of age and qualifications. Those who meet the requirements are sent a printed application form which, apart from details of the school and university career and any jobs held, asks for some data that would throw up academic and extra-curricular interests and hobbies, ideas about his career and any leadership experience at school and college. These are again screened by experienced persons, and the promising candidates are invited for a preliminary interview at the Head Office or one of our branches. Those who show promise are then invited to our Head Office at Bombay for final selections, which are held in two parts.

In the first part of final selections, a group of six to eight candidates is brought together to a conference table and given a choice of subjects and a case study which they discuss in the presence of four senior managers, who however only act as observers. The group is "leaderless" and has to organise its own discussion and provide opportunity to each member to display his qualities of mind as well as leadership and being led. Our consulting psychologist, who knows us and our requirements well, is also present at these group discussions, which he follows up with an interview at which each candidate is put through some psychological tests.

In the second part of final selections, the most promising candidates are put up before a senior board of at least two directors, the Personnel Director and some senior managers. From this group we finally select and offer appointments to as many as reach our standards, though we are always willing to take some risk with otherwise promising material. This must account for some of our losses. I should like to add that we try to make our selection procedure as objective and impartial as possible, particularly so that it leaves those who are not selected with a feeling that the process was fair. Secondly, the psychologist has not a decision making function; his role is confined to the use of technical methods of assessing such aspects of personality requirements as are relevant to the job. The information that is gained through his tests is considered along with other impressions formed of the candidate. The psychologist's opinions are helpful to the selection Board but not decisive. All opinions of the psychologist are treated as confidential.

We find from experience that the group method of selection has several advantages. It provides for greater scope for studying the different aspects of a candidate's personality. A group can be given certain tasks which cannot be given to an individual. The men are seen together and are therefore easier to compare. Rejection is also less painful in a group method, and although the unsuccessful may not always agree with the decisions of the selectors, group inter-action will usually make it abundantly clear as to who stands out. In fact the candidates when questioned individually, will usually pick the right ones themselves. Lastly, the procedure is economical.

TRAINING

Whatever the methods and techniques followed in the selection procedure, personal interviews, group discussions, psychological tests, etc., selection is only the first stage in the total process of acquiring and developing managers. After selection begins our real task.

Training is given individually and on the job. We have found from experience that young intelligent trainees do not like to spend months in circulating around the various departments of the Company watching how others do their jobs; instead they like to get down to a job themselves and so our training programme is now job-oriented. Also, this is the best way of judging their performance and potential at an early stage. After a very quick familiarisation programme lasting only about four weeks in a Division, they are put to work in it. Let us take the marketing side, which absorbs the largest number of trainees. The young man will go into the field and work under a salesman for a month, after which he will work independently as a salesman for three to four months. He then works under a sales supervisor for a month and then independently as a supervisor for another three months or so. By now he has been "blooded" and can hold his own in the field. The men who work under him later should recognise that behind what he expects them to do lies experience and ability to do it himself, and well. After this spell of about nine months in the field he works in a junior management capacity in branch administration where he learns to deal with the field work from the office end. After some months of this he is seconded to a sales manager and

helps him run an area. At the end of one and half years of all this training he is given his first managerial responsibility and appointed an Area Sales Manager. From then on he will go as far as he deserves.

All through the training his seniors devote a good deal of their time and attention to his progress, and the Board constantly receives reports on his progress. His Director will meet him regularly, and the Chairman occasionally. The progress reports are discussed in detail in a committee of the Vice-Chairman, his own Director and the Personnel Director. His training finished, a recommendation will be put up for confirming him in the covenanted grade of management; and the Chairman will usually personally hand him the covenant. He is from now on the Company's most valued investment, and we are deeply disappointed at our occasional failures, though they have to be faced in the interests of the Company as much as for his own sake.

Training never really stops. We have designed our own courses, principally to give the managers a broader picture of our operations and its environments and to sharpen their managerial skills. These courses are always residential and there they meet men and women from other sides of our business. The courses can be general or functional, as in marketing, finance, O. & M. To many of them we invite as participants men from our associate Unilever companies in Africa and Asia. We also send our managers to courses, seminars and conferences held outside the Company to provide the stimulus of meeting people from other organisations and particularly from Government and its undertakings. We send them to the Administrative Staff College at Hyderabad, the new Institutes of Management of Calcutta and Ahmedabad, the regional and the All India Management Associations, the National Productivity Council and to other more strictly functional courses.

Unilever's training facilities in the United Kingdom and its specialist courses in Australia and America are also open to us. We have also sent men to Henley and Harvard. Lastly, we send a few men every year to the United Kingdom for specialised training with Unilever companies in that country and on the Continent.

We find all this training, carefully planned for both its content and timing, an integral part of the growth of a manager. It has to be judiciously controlled though, to stop it from becoming a fad. Each name for outside training is examined carefully by the Board and each manager is made to realise that he can get out of a course only in proportion to what he himself puts in.

A very useful aspect of training is the encouragement we give to our managers to accept various extra-mural responsibilities. In a developing economy, it is natural that demands should be made on our managers by Government and other organisations and it is only right that we should make our contributions in the fields in which we have special knowledge or experience. We are, therefore, always prepared to help as long as the demands made on us are consistent with the priorities and requirements of our own business. We believe that this kind of assistance is to mutual advantage and, in the ultimate analysis, we gain as much from such efforts as we give because it adds to the knowledge and experience of our managers.

PROMOTION

Promotion is always and invariably on merit, irrespective of age or length of service. We frankly believe in the logic of the best man for the job because only then will the job be done best. But evaluating merit is not an easy task. We therefore do not leave such evaluation entirely to the time when the need for promotion arises but make it a continual process so that when the time comes it is quite obvious who the man is; in fact normally he has already been groomed for it. Evaluation with us is a constant process, consisting of progress reports, thorough training, personal contacts by the seniors and by annual personnel reports, discussions at the monthly Board meetings, job evaluations, short lists of promising men; all this helps to ensure unbiassed and objective judgment.

How do our managers respond to this system which takes away the crutch of "automatic" promotion? They accept it implicitly when they join us and, in fact, they often tell us that they regard this as one of the best reasons for joining us. The system, which they themselves will have the responsibility to operate, assures a fair assessment, and cases of unfair promotions are almost unknown. There may be two views on a quick or unexpected promotion but nearly always the sense behind the decision soon becomes obvious. The capable rise rapidly, so that they don't lose the fine cutting edge; some are inevitably left behind — arithmetic must work inexorably, for after all the shape of a management structure must be pyramidical. Those left are well looked after and have a very useful function in which their interest is kept alive through training and sometimes a change of job. In fact it is not that many are left behind but that some must get further and faster. To use an American phrase: There cannot be all "Chiefs and no Indians" (the American kind).

You may have noticed that I have frequently mentioned the Board in connection with selection, training and promotion of managers. This indicates not the control the Board exercises over these processes but the interest it takes in what I have already referred to as our most valuable asset. Management Development, as I have tried to describe it, is an integrated operation which has a quality of wholeness like marketing or manufacturing; and not merely the application of a series of isolated techniques. How well we grow, how successfully we meet the challenges will depend in the end on how well we select and prepare each man for his job and inculcate the right attitudes. I have tried to present to you the thinking and practice on this subject, but let me be clear. We are, of course, aware that what we are trying to do can be improved upon. To effect such an improvement is our constant endeavour.

MAHINDRA & MAHINDRA LIMITED

Speech delivered by the Chairman, Mr. Keshub Mahindra, at the 18th Annual General Meeting of the Shareholders of Mahindra & Mahindra Ltd., held in Bombay on 23rd April, 1964.

Ladies and Gentlemen,

It is a proud privilege for me to be addressing you for the first time and to be able to extend to you a warm welcome to the Eighteenth Annual Meeting. In their report to you, your Directors have expressed their deep feelings at the sad and sudden death of our Founder Chairman, the late Mr. K. C. Mahindra. Many of you in this room who knew him intimately over the years, will agree with me, that his greatness lay in his sensitivity towards people—which produced in all of us a deep sense of affection for him. He looked forward to meetings such as these, for they provided him an opportunity to share his thoughts with you on many issues. His speeches were the products of a mind which had a unique appreciation of knowledge and a remarkable gift of language and judgement. His appraisals invariably germinated food for thought.

Today I can think of no better way of paying adequate tribute to his memory and to the memory of the late Mr. J. C. Mahindra, than to narrate to you the story of the growth of your Company. It was in 1945—that our late Chairman together with his brother, laid the foundations of your Company. The first ten years were spent in formulating long term objectives, procuring talent, laying down sound management controls and training technical and managerial personnel. This was the time spent in exploring and choosing. Financial resources were being harnessed for the period of growth. These were the foundations laid for establishing manufacturing industries basic to the country's economic development. The record of the last eighteen years bears testimony to their zeal, devotion and tireless efforts.

Machinery Manufacturers Corporation was the first venture with public participation. This Company was formed with the object of manufacturing carding engines for the textile industry. The history of this Company may be known to many of you. In the years that followed serious setbacks had to be faced and met. The lack of a well defined protective policy, as well as initial resistance to an indigenously manufactured produce aggravated the situation. It is, therefore, of considerable satisfaction, that after years of struggle for survival, today the Company continues to be the largest producer of carding engines in the country. After fifteen years of operation, the maiden dividend was declared two years ago. It was perhaps this experience which made the Founders hestitate initially in inviting public participation in our new ventures.

Over the years a wide range of products were chosen for manufacture. The Automobile Division which forms the principal activity of the Company, now has an installed capacity to manufacture 10,000 Jeeps per year. This has been possible through an association with a large group in the U.S.A. and we have the privilege of having their President on our Board of Directors. The dependence on imports for components is fast diminishing and with continuing progress in the field of ancillary production, it is anticipated that an indigenous content of 90 per cent will soon be achieved. The Division is fully staffed with skilled technicians, and through its intensive training programmes for operators and engineers, it is to a great extent self-generating in its requirements of personnel. New factories are under construction at Kandivili, and it is envisaged that well integrated units will be ready for occupation by early next year.

Recognising the advantages of linking substantial investment with the procurement of technical "know-how" from abroad, your Company promoted a number of other units, which today serve our economy. In partnership with organisations in the U.K., various companies were formed to manufacture a range of products such as trailers, sintered products, air-cooled diesel engines, water meters and instruments. In collaboration with a German firm, a company was formed to produce synthetic resins, enamels and varnishes, while in association with an American company a unit has been set up to produce elevators.

Steel has always played an important role in the affairs of your Company, and while the import of steel sustained the Company during its formative years, a need was felt to establish a manufacturing unit in the country. To this end in collaboration with a leading French firm a Company has been floated for the manufacture of alloy steels. This, as you are all aware, is a large project involving considerable capital outlay. A second large project is the manufacture of tractors in collaboration with one of the largest corporations in U.S.A. This Company has been formed and shares will be offered to the public in the course of this year.

Looking back, it was in 1955 that shares were offered to the public for subscription. At that time the Company was privately owned by the family. Before the public issue, an offer was made to all employees of the Company who had five years service or more, to participate in the share capital. It is gratifying to remember that nearly all employees took advantage of the offer.

The First Public Issue was made with an offer of about 47 lacs of capital. The response from the investing public was overwhelming. Over the years there have been two further rights issues, incidentally both were over-subscribed, bringing the capital of the Company to the present level of Rs. 253 lacs and the number of shareholders has increased from 1860 to over 5500 today.

While the role of capital is not to be underestimated, it is labour which gives its meaning in industry. I think of labour in its integrated sense, embracing all members of an industrial enterprise, whatever their functions. Without the effort of labour to plan and to execute, capital remains stagnant. Corresponding with the increase of capital, our own labour strength in the parent Company has increased from 1200 in 1955 to nearly 5000 today. Labour in the Company looks to the future for increased earnings, for opportunities to better their way of living and for chances of promotion. Over the last four years, over 800 vacancies have been filled through promotions from within—sufficient assurance that ample opportunities exist in your Company for advancement. Better pay, good service conditions and a share in the prosperity of the Company have been the benefits accrued to labour. In response, the Company has their assured loyalty and a desire and enthusiasm to meet the ever growing need for better skill and more productivity.

In all our varied manufacturing activities we have always laid emphasis on quality control and I can say, that the quality of our products has ensured consumer satisfaction. Nor does our responsibility end with the sale of the product—the importance we have given to after sales service

has instilled a sense of confidence in the consumers, which must reap rich dividends in the future.

It is your faith and confidence that has made possible this growth. Great care has been exercised by your directors to ensure fair and reasonable dividends. Keeping in mind the need for liquid funds for expansion and diversification, your Directors have favoured a stable policy of dividends. The operations of the Company over the years have fully justified expectations, reflected by the profits earned from year to year. The shareholders enjoy an added sense of security that the reserves of the Company have increased to 80 lacs while the investment portfolio stands at 63 lacs. In conformity with the views expressed by many of you, a modest beginning was made in offering you shares in the new steel company. I hope that with continuing growth, there will be further opportunities for you to invest in new companies or in the expansion of the existing units—so that you may share in the prosperity of your Company—a share which rightly belongs to you.

The economy has reached a difficult stage in its development. The country through the Five-Year Plans is in the process of reappraising the methods by which desired social objectives can be achieved. You may well ask whether this transitional period will have any effect on our industrial philosophy. I can only answer you by affirming that practically every unit in the group is in the process of expansion and that we have our sights fixed on more ambitious targets in the future. We would be failing in our duty if we did not continue to contribute to the growth of the community to which we belong. In these endeavours we do not doubt that there will be vast difficulties. The large commitments we have already undertaken are a measure of the confidence we have in the future.

In reminiscing over the past, I may have taxed your patience. The encouraging and the guiding hand of the late Chairman is no longer with us. I am, however, fortunate in having the wise counsel of my colleagues on the Board which will make my task less burdensome. I have the loyalty of our employees and I hope your confidence. I am sure that you would like to join me in welcoming our two new Directors, Mr. Iengar and Mr. Hydari—they need no introduction from me.

You will be glad to know that for the five months of the current financial year that is to the end of March 1964. our operations in all divisions of our Company have been satisfactory. Production of Jeep vehicles averaged 900 vehicles per month and deliveries have kept pace with this production. The Steel Division has maintained its rate of booking and the Machine Tool Division anticipates a considerable volume of business during the year. I would not like to conclude before thanking all the staff for their loyalty and devotion to work during the year.

I thank you.

Note: This does not purport to be the record of the proceedings of the Eighteenth Annual General Meeting of the Company.

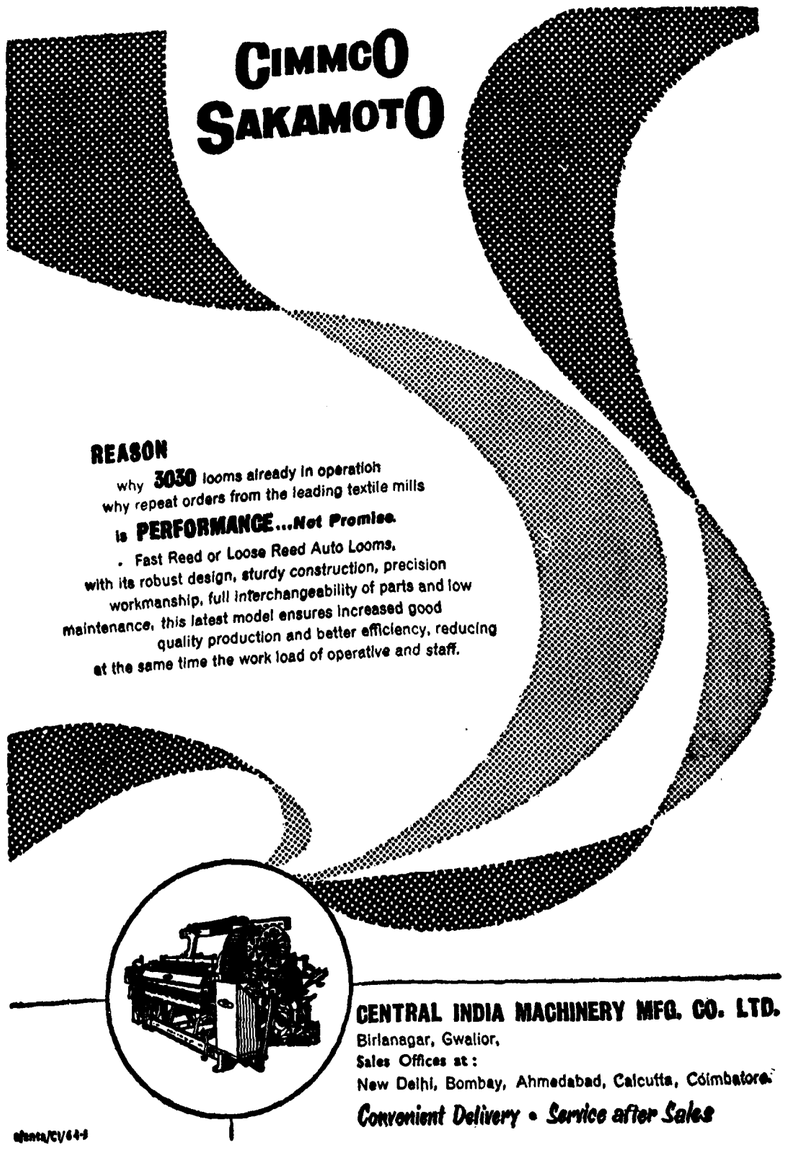
KAMANI ENGINEERING CORPORATION LTD.

Speech of the Chairman, Shri R. H. Kamani, on 23rd April 1964

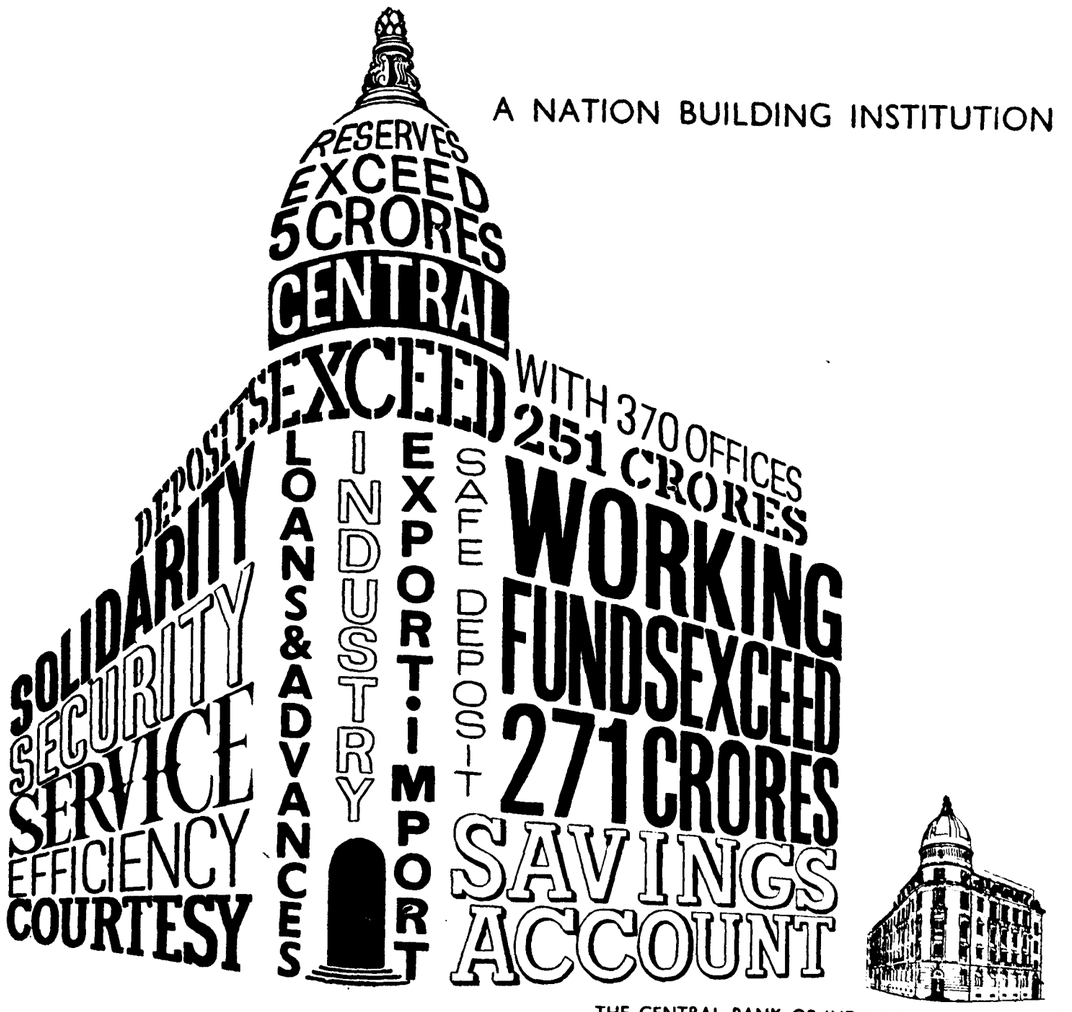
Following is the summary of the speech of Shri R. H. Kamani, Chairman of Kamani Engineering Corporation Ltd., delivered at the 16th Annual General Meeting of the Shareholders on the 23rd April, 1964 at the Office of the Company at Bombay.

Welcoming the Shareholders, Shri R. H. Kamani, Chairman of Kamani Engg. Corporation Ltd. presented the Directors' Report, Audited Profit & Loss Account and the Balance Sheet and proposed the same to be adopted.

It was a matter of great satisfaction for Shri Kamani and the Directors that the company had attained a state of sustaining growth and it could look forward to continuing enjoyment of the fruits of the investment and faith of the Shareholders in the Company. He found that the new tax proposals were to a certain extent favourable to the basic industry, as in case of this company to whom a tax relief of 10 per cent in Income Tax and Super Tax and of 20 per cent in Sur Tax was available under these proposals. The latest concessions granted by the finance Minister allowed an additional depreciation of 50 per cent on the major portion of the plant and equipment which were normally working on three shifts.



COMPANY'S WORKING :



Mr. Kamani, deviating from the usual practice of specifically pointing out details of the Accounts already included in the Directors' Report, the Balance Sheet and the Profit & Loss Account, highlighted all round improvement in matters of profits and sales which were the highest in the company's history. The profits before providing for the depreciation and the Managing Agents' remuneration had increased from Rs. 36.38 lakhs to Rs. 41.84 lakhs which recorded a rise of nearly 14 per cent. The profits had risen in previous two years from Rs. 24.80 lakhs by more than 68 per cent, which has enabled the directors not only to increase the dividend from 9 per cent to 12 per cent in 1962-63 and to maintain 12 per cent but also to add to the reserve fund a further amount of Rs. 9 lakhs, inspite of their considerably increased burden of taxation during the same period.

RAW MATERIALS:

Referring to the raw materials position, the Chairman stated that as a result of emergency a very large portion of indegenous steel was being diverted towards high priority defence requirements; which made the supply position more difficult than ever. Certain categories of steel had been decontrolled recently on the recommendation of the Raj Committee in the hope that it would help ease the supply position. It had, however, inevitably resulted into some confusion and difficulties in supply as also into steep rise in prices. The Joint Plant Committee appointed on the Raj Committee's recommendation had twice increased the prices and at present the Indian Steel prices were the highest in the world. Shri Kamani could not overemphasise the need for stabilising these prices at a reasonable level, as they had a very great effect on the economy of the country.

Shri Kamani further pointed out the difficulties regarding timely delivery of matching sections which were being felt for last two decades and he earnestly hoped that the Joint Plant Committee and the main producers would adjust the production programme to the demands of the industry. He also hoped that the export oriented industry like this, would get steel at

concessional prices as was the case in every exporting country in the world.

Further, the Raj Committee had recommended import of certain quality of steel particularly some special sections, to ensure timely availability of matching sections keeping the prices at a reasonable level. Shri Kamani hoped that this recommendation will be implemented. He further sugested that the industry should be given regular quotas to import such matching sections on the basis of individual fabricating capacity and that the government should permit exchange of controlled categories of steel amongst factories in order to ease to a certain extent the difficulties of getting timely supply of urgently needed steel sections.

Shri Kamani also felt that the ultimate effect of the implementation of the Raj Committee Report will be in the interest of the country and of advantage to this company.

TRANSMISSION LINE TOWERS & STRUCTURES

Shri Kamani expected the demand for transmission line towers and structures to increase in direct proportion to the rapid increase in generating capacity of electric power, which was expected to be raised from 5.7 million KW in 1961 to 23 million KW in 1971. He, however, cautioned that the installed capacity, including the newly licensed capacity was more than the prospective demand in 1971, and any addition to the existing capacity will be detrimental to the economy of the industry.

'TRACTAMOUNT' ROAD ROLLER

In view of the increased demand, the factory had undertaken a programme of increased production of the improved model of these rollers and it was proposed to add some new items of implements to this line of manufacture.

ERECTION :

The Chairman was happy to report to the Shareholders that the company had completed five major transmission lines totalling to about 600 miles in five states viz. Gujarat, Orissa, West Bengal, Andhra Pradesh and Mysore, and that it was a matter of considerable achievement that 240 miles of 132 kV trunk lines for Dhuvaran power station in Gujarat and 100 miles of 132 kV lines in Orissa passing through extremely difficult terrain were completed in record time. Construction works were going on in full swing all over the country—in Andhra, Assam, Bihar, Gujarat, Maharashtra, West Bengal etc.

Shri Kamani informed that three power generating sets for Trisuli Hydro Electric Project in Nepal were supplied and a transmission line was being constructed for the project. This was a gift to the Government of Nepal from the Government of India.

Yet another notable achievement, as mentioned by Shri Kamani was the contract for the installation of a Ropeway with a big haulage capacity of 450 tons per hour, secured from Indian Iron & Steel Co. Ltd., in collaboration with the leading German firm of Pohlig. It would be one of the largest ropeways in the world and would be operating over a distance of 40 miles. The civil engineering work on this project had already started and the project was expected to be completed by end 1966. The orders on hand for supply of towers and erection were, at present, about 30% more than during the previous year.

EXPANSION :

In order to meet the increasing demand of towers as also to retain the foothold in export market our expansion scheme had been launched in Rajasthan which is expected to be completed within coming two years, when the capacity would increase by 30,000 tons per annum, and would greatly assist in meeting the demands of the northern regions like Rajasthan, the Punjab, Uttar Pradesh, Madhya Pradesh and adjoining territories, besides helping increase exports. The Govt. had already given clearance to the company's application for import of necessary machinery and plants of the value of Rs. 45 lakhs.

It was rather early to indicate the profitability of the scheme but Shri Kamani assured the Shareholders that the expansion programme will involve no reduction in the amount to be distributed as dividend and will be to the best advantage of the company. Once the production starts, the profits would proportionately increase.

RAILWAY ELECTRIFICATION :

The first contract for Railway Electrification in Eastern Zone having been completed, the company had participated in tenders for similar work in other zones and there were good hopes for securing further substantial business, Shri Kamani reported.

EXPORTS :

In the country today, Kamanis were the only exporters of transmission line towers and other structures, and inspite of numerous difficulties all the pending orders were successfully completed. The order from the Nigerian Government for 132 kV transmission line towers was under execution. Shri Kamani was sure that the Shareholders would be happy to learn that two large orders valued at over Rs. 28 lakhs had been secured from National Power Corporation, Manila (Philippines) inspite of keen competition from well known international firms including the Italian and the Japanese. These orders when completed during the current year would bring the total export efforts of the company to approximately Rs. 88 lakhs.

Referring to the various difficulties felt by the Company in execution of export orders, the Chairman commented that it was a difficult and unattractive proposition as timely delivery of matching sections, shipping space at reasonable rates, facilities of prefinancing etc. were not available. In order that quick delivery and longer credits demanded by foreign indentors be met, he suggested that higher priority should be given to steel for export orders and concessional prices should be charged, as was being done all over the world. He earnestly hoped that Government would seriously consider these suggestions in order that not only the export level is maintained but also be substantially raised during the coming years.

RESEARCH :

Various types of structural designs to effect economy in weights had been evolved, as a result of which Kamanis were the first in India to design, supply and erect 450 ft. high masts for All India Radio.

AGENCY BUSINESS :

The Agency business has shown good results with an increase of about 25% over last year's, mainly due to very large orders for insulators.

Recently the company was awarded an order for three power generating sets for Hydro Electric Power Station for Kuttiadi Project in Kerala.

LAHORE ASSETS :

Shri Kamani referred to the Directors' Report and stated that necessary legal proceedings had been instituted for the recovery of the company's property in Lahore, as the same had been released from the Custodian of Evacuee Property, Pakistan, and he was hopeful of getting it back.

He attributed the progress achieved by the company to the sincere efforts and willing co-operation of the workers and the members of the staff as also encouragement received from time to time from the Central and State Governments and the backing of the Shareholders and thanked them for the same.

Note: This does not purport to be a report of the proceedings of the Annual General Meeting.

THE BUCKINGHAM & CARNATIC CO. LTD.

CHAIRMAN'S SPEECH

Presiding at the Forty-third Annual General Meeting of the Shareholders held at the Company's Office at Madras on Tuesday, 28th April, 1964, Mr. D. W. Law said:-

GENTLEMEN,

It is my pleasure to welcome you to the Forty-third Annual General Meeting of The Buckingham & Carnatic Co. Ltd. Since you have had an opportunity to study the Directors' Report and the Accounts for the year ended 31st December, 1963, I shall, with your permission, take them as read.

TRADING CONDITIONS AND THE HOME MARKET:

Gross sales once more exceeded those of the previous year emphasising the continued demand for your Company's products and indicating that output was maintained at a satisfactory level. Sales would have been still higher if the Mills had not lost the equivalent of 10 days production in June due to a stay-in strike. The additional turnover has not resulted in a higher margin of profit as costs have risen and selling prices for the home market are still controlled. The effect of increasing costs cannot, therefore, be offset by greater margins and the present margins can only be maintained by greater efficiency in plant operation and economy in the use of stores.

EXPORTS:

Foreign exchange earnings unfortunately show a marked fall when compared with 1962. Export sales total Rs. 1.17 crores as against Rs. 1.64 crores in the previous year. The Ceylon market, once the major market for your Company's products, again did not come up to expectations due to restrictive import policies and the acute shortage of foreign exchange. As in the previous year, demand from Malaya and Burma was also disappointing and at the moment there are no prospects of the Burma market improving. Efforts are being made to obtain a greater share of the Malayan trade where for so many years your Company's cloths have been in constant demand.

Other erstwhile satisfactory export markets are commencing to establish their own textile industries, thus affecting Indian mills. In an endeavour to find new outlets, members of the Company's Sales staff have made lengthy journeys overseas and it remains to be seen whether their efforts will bear fruit. Initial reactions are encouraging.

There is no doubt that cotton mixture fabrics (especially Terylene-Cotton blends) which are easier to wash and require little or no ironing, have made their mark in the more sophisticated export markets, thus reducing the demand, to an extent, for conventional cotton piecegoods. Your Company is making progress with such mixture fabrics, but whether export business will result is problematical.

Indian mills can only continue as major exporters if they can lower their costs, improve their quality and cater for changing fashion demands more quickly.

COTTON:

The 1962-63 Indian cotton crop was very good and the carry over at the end of August 1963 improved to 19¼ lakh bales as compared with 14¼ lakh bales at the end of August 1962. In September 1963, Government suspended the Compulsory Survey Scheme introduced at the beginning of the previous season, because the current season started with a larger carry over and the progress of the crop was encouraging.

We now know that the 1963-64 cotton crop is a good one, and at present it is estimated at around 58 lakh bales. Quantitywise, the crop is up to expectations, but with all-India mill consumption figures proving to be very much higher than expected the supply position is by no means easy, particularly as additional spindles and looms are being installed in various parts of the country. As a result, raw cotton prices are high.

To make good the shortage of this essential raw material, it is most important that urgent measures are taken to improve the overall yield of cotton per acre, which continues to be well below that of other major cotton growing countries, and the stage has now come when intensive and scientific farming must be undertaken. The Central and State Governments are alive to this problem, and it is hoped that before the end of the third five-year Plan a substantial improvement in the quality and quantity of cotton grown in India will have been achieved.

FINANCIAL INFORMATION:

The financial position of your Company continues to be strong though owing to unusually heavy deliveries of cotton during the last two months of the year, the Bank overdraft was substantially higher than at the close of 1962. Your Board are now actively considering ways and means of financing the substantial programme of modernisation and expansion to which I shall refer later in my speech. It may be necessary for outside aid to be obtained, the extent of the financial burden possibly being beyond the Company's internal resources.

The usual amount of Rs. 5 lakhs has been allotted to the Debenture Redemption Fund bringing the total amount now set aside to Rs. 60.44 lakhs.

Shareholders will notice that the accounts, with the permission of Government, have been drawn up this year in a more modern form which is designed to present at a glance the salient features regarding the Company's financial position. Details have been relegated to notes and schedules.

LABOUR:

Last year I made a reference to the Settlement reached with representatives of labour on the rationalisation of the Spinning Departments and to the negotiations for rationalisation in other departments which were then in progress.

In May 1963, after the settlement on Rationalisation in the Spinning Departments had been in operation for over two months, a Settlement was reached before the Labour Commissioner on the re-organisation of the Engineering Department and the revision of wages of the workers therein. This Settlement was based on the Award of the Industrial Tribunal, Madras, in respect of textile mills in Coimbatore and Madurai and was in some ways more favourable to our workers than the Award of the Industrial Tribunal. However, implementation was obstructed by an unrecognised Union which incited the workers of the Engineering Department, who had gained substantial benefits from the Settlement, to stage an illegal stay-in strike. Despite this obstruction, the productive departments of the Mills were kept working for over two weeks. When this unrecognised Union failed in its attempt to bring the Mills to a standstill, other minor Unions stepped in and brought about an illegal stay-in strike in the Spinning Departments, and the Company was obliged to close the Mills. With Government's help, however, and the co-operation of the vast majority of the workers, who were anxious to work, the Mills resumed operations some days later.

The regrettable state of affairs that results from inter-Union rivalry was also seen in many textile mills in Coimbatore immediately after the bonus dispute had been settled through the good offices of the Chief Minister of Madras — and I hope that steps will soon be taken by Government to eliminate the threat to industrial peace presented by the uncurbed activities of minority Unions.

Barring the unfortunate closure of the Mills in June last year, I am glad to report that industrial relations have been generally satisfactory. Absenteeism, however, showed no significant improvement.

During the year an agreement was reached with labour whereby an enhanced retirement gratuity becomes payable. The total estimated liability not provided for amounts to Rs. 1.20 crores. Provision will be made out of profits for liabilities accruing in future which are estimated at about Rs. 5 lakhs per annum while the question of meeting out of Reserves payments in respect of past services, is now receiving consideration.

The report of the Bonus Commission has recently been released and I can only say that the majority report is unrealistic and unsympathetic to the needs of industries in a developing economy. If this country's five-year Plans are to prosper, the need to rehabilitate and modernise existing plant and machinery and to ensure a return on capital sufficient to attract the investing public, both at home and from overseas, cannot be disregarded. The majority report of the Bonus Commission makes no provision for rehabilitation or modernisation as a prior charge when arriving at the distributable surplus before granting bonus — and even the rate of return on capital, which was considered to be fair and reasonable by the Labour Appellate Tribunal in 1950 has in effect been reduced. The representative on the Commission of the employers in the Private Sector has submitted a Minute of Dissent with regard to these particular issues, and I hope that Government will give due weight to it before taking action on the Commission's report.

DEVELOPMENT:

In common with many Textile Mills in India, much of our machinery is old and your Directors have under active consideration plans for the progressive modernisation and expansion of the plant. Particular attention is being given to the modernisation of certain dyehouse processes and to the provision of increased capacity for generating process steam.

In order to increase the Company's export business it is intended to install modern, high speed machinery, so as to increase productivity and reduce costs. Imported textile machinery is necessary for this purpose and it is hoped that Government will assist the Company to obtain such machinery by releasing the foreign exchange required.

DIVIDEND:

Your Directors have again recommended a final dividend of Rs. 12 per share bringing the total ordinary dividend for the year to 18 per cent gross. The increased dividend paid for 1961 and 1962 has thus been maintained, but I would again remind shareholders of the need to conserve funds and would point out that in paying a total dividend of 18 per cent for the year, the transfer to General Reserve has been reduced from Rs. 8 lakhs in 1962 to Rs. 2.50 lakhs this year.

FUTURE PROSPECTS:

In 1964 costs again are expected to rise but as against this, the Emergency Insurance Fund Levy is unlikely to be the burden it was in 1963 when it cost your Company over Rs. 8 lakhs.

The Tariff Commission appointed to investigate the industry's selling prices has not so far issued its report. As each day passes there is a stronger case for permitting mills to raise their selling prices and it is to be hoped that the representations made to Government by the textile industry will be listened to with sympathy.

ACKNOWLEDGEMENT:

The results achieved, in spite of the loss of production in June, are due to the continuing loyalty and endeavours of the Officers and Staff of your Company, who, as I said last year, in spite of fresh problems and complications have continued to serve with that efficiency and steadfastness which we have come to expect. You will no doubt wish to join me in thanking them for their services during 1963.

In conclusion, I would like to record my thanks to my colleagues on the Board for their loyal support and co-operation.

Note: This document does not purport to be a report of the proceedings of the General Meeting.

THE BANGALORE WOOLLEN, COTTON & SILK MILLS CO. LTD.

Presiding at the Eighty-first Annual General Meeting of the Shareholders held at the Company's Office, Agraharam Road, Bangalore City on Monday the 27th April, 1964, Mr. D. W. Law said:-

GENTLEMEN,

I have pleasure in welcoming you to the Eighty-first Annual General Meeting of The Bangalore Woollen, Cotton & Silk Mills Co. Ltd. The Directors' Report and the Accounts for the year 1963 having been in your hands for the prescribed period, I shall, with your permission, take them as read.

TRADING CONDITIONS AND THE HOME MARKET:

The year under review was exceptional due to the very considerable demands for your Company's products by Government and since the cloth concerned, Angola, is an expensive one, Government's demand had the effect of increasing the gross value of sales of all qualities to over Rs. 8.5 crores. Substantial portions of the Mill machinery worked on three shifts in order to complete Government's requirements within the specified time. As a result of this pre-occupation, the output of Cotswol and cotton qualities was reduced and we had perforce to disappoint many of our faithful customers.

In the Cotton Section selling prices continue to be controlled and thus the only method of maintaining margins is to increase efficiency and effect economies wherever possible, in spite of the rising cost of spare parts and vital stores.

Last year, I mentioned that "Varsity" a Terylene Woollen suiting which was introduced towards the end of 1962 had made satisfactory progress, and I am glad to confirm that the future envisaged for this cloth 12 months ago has materialised, and as soon as raw materials and manufacturing capacity permit, production will be further increased.

The Silk Section, although small, continues to play its part and make its contribution to the prosperity of the Company. As usual, difficulties were experienced in procuring

raw materials and it is to be hoped that the silk supply position will be better this year.

EXPORTS:

Active steps are being taken to improve exports both of Union and Cotton fabrics but, unfortunately, Ceylon, which until 1961 had been one of the best of overseas markets, has been forced to curtail imports thus affecting your Company's exports of cotton piecegoods to that Island.

Trading conditions in Malaya have also not been encouraging, but exports of Cotswol and Angola to various markets, including the U.S.A., Canada and the U.S.S.R., were not inconsiderable, and I hope in 1964 business with these countries will still further develop. The United Kingdom is also showing an interest in these two cloths and recent reports from our Sales staff indicate there are prospects for both cotton piecegoods and union fabrics in certain European countries and in West Africa. The necessity to export and to earn foreign exchange has our constant attention.

COTTON:

The 1962-63 Indian cotton crop was most encouraging and the carry over at the end of the season improved to 19¼ lakh bales, which was better by 5 lakh bales than in the previous year. Government, in September 1963, suspended the Compulsory Survey Scheme introduced in the previous season because the current season commenced with a larger carry over and crop progress was encouraging. It is estimated that the 1963-64 commercial crop will approximate to 58 lakh bales which is satisfactory, but with mill consumption increasing, quite apart from the installation of additional spindles and looms, the supply position is not without its difficulties. The long term solution to the country's ever increasing demand for cotton is to improve the yield per acre. Both Central and State Governments are aware of this necessity and efforts are being made in this direction by further utilisation of fertilisers and the scientific development and distribution of seed cotton.

IMPROVEMENTS:

The 34 additional looms expected during 1963 duly arrived and have been installed, thus completing the union establishment. Conversion materials ordered to modernise parts of the Carding & Spinning Departments have arrived and by the end of the year, negotiations with the Labour Association in connection with our modernisation plans in these departments were well advanced.

Several new machines for improving the efficiency of the Dyehouse were installed, thus enabling this important section of the Mill to keep up to date and to operate in an economical manner.

The changeover from coal to oil firing was finally completed on May 28th, 1963. The difference in the appearance of the Mill now that coal is no longer used is most marked. The cleanliness resulting from oil firing has already had its effect both on morale and on the quality of your Company's products. The cost of oil firing the boilers is only fractionally higher than when coal was used.

GENERAL:

Included in the Profit and Loss Account under the heading "Provision made in previous years no longer required" is a sum of Rs. 6,75,184. This figure represents the excess provision for the cost of electrical energy between 1955 and March 1963 when the rate at which your Company was charged by the Mysore State Electricity Board and its predecessors was in dispute. This excess provision is, therefore, shown as income in the 1963 Accounts. I am glad to report that a fresh Electrical Energy Agreement with the Mysore State Electricity Board, which is valid for 5 years, was signed on the 30th September, 1963.

FINANCIAL POSITION:

The Company's financial position continues to be excellent which is as well because the cost of our expansion and modernisation plans, which will be implemented during the next few years, is considerable.

Shareholders will notice that the accounts, with the permission of Government, have been drawn up this year in a more modern form which is designed to present at a glance the salient features regarding the Company's financial position. Details have been relegated to notes and schedules.

DIVIDEND:

A final dividend of Rs. 18 per share has been recommended, bringing the total ordinary dividend for the year to 24 per cent gross, which is 6 per cent more than for 1962. Your Board considers that, on the year's results, this increased dividend is justified, but would draw shareholders' attention to the need to conserve funds for expansion and modernisation.

FUTURE PROSPECTS:

It is to be hoped that this year there will be some relaxation in the price control of cotton piecegoods enabling mills to recoup some of the increasing costs of raw materials and stores, for, as you know, mills' selling prices have been pegged since the end of 1960. During the latter part of 1963 it was announced that mills would be allowed to increase their loom capacity by 10 per cent and their spindleage by 7½ per cent. Your Company, intends to take advantage of this announcement and a comprehensive expansion and modernisation programme is under active consideration. World technique in textile machinery manufacture have recently advanced so rapidly that there is a danger of new equipment becoming outdated soon after it is installed. The choice of which machine to purchase, provided the necessary foreign exchange is available, is thus a most important factor which is receiving the most careful consideration for, apart from the assistance the indigenous textile machinery manufacturing industry can give, it will be necessary to purchase the latest and most up-to-date equipment from overseas in order that your Company, and the Cotton Textile Industry as a whole, can compete effectively in export markets.

LABOUR:

It gives me pleasure to report that the cordial relations which have existed between the Management and Labour in these Mills in the past, continued throughout the year, but once again successive absenteeism has been a factor affecting production and this serious social problem is retarding the country's advance due to the many man-hours lost.

ACKNOWLEDGEMENT:

Once again I am confident you will wish to join me in expressing a tribute to all the officers, staff and employees without whose efforts the satisfactory results achieved would not have been possible.

During the year your Company suffered by the deaths of Mr. Bennett and Mr. Nagesha Rao, both officers of considerable experience whose services we have enjoyed for many years.

At the end of March this year, my colleague, Mr. R. E. McLellan, who was the Director in immediate charge of your Company since 1958, retired after over 30 years service with the Binny Group. I would like to place on record our appreciation of his contribution to this Company over this long period during which your Company has progressed from strength to strength. Mr. McLellan has fully earned his retirement and I wish him and his wife all happiness in the future.

In conclusion I would like to express my gratitude to my colleagues on the Board for their loyal support and co-operation throughout the year.

Bata

INDIAN ALUMINIUM CO. LTD.

Address to members of the Company, by the Chairman, Mr. H. V. R. Iengar, at the twenty-sixth Annual General Meeting held in Calcutta on April 27th, 1964.

I have pleasure in welcoming you to the twenty-sixth Annual General Meeting of the Company.

I think it will be in accordance with both the pattern set by tradition for Chairman's speeches and with my own conception of what such speeches should contain if I adopted as a general theme today the responsibility of an organization such as Indaluco in the developing economy of our country. But I would like first to deal with our performance in 1963.

As industrialization of the country proceeds, the market for our products continues to grow, and large areas of demand remain unsatisfied or undeveloped. In these continually favourable conditions, and benefiting from the completion of increases in capacity undertaken in previous years, the Company achieved new levels of sales and earnings in 1963. The total value of sales at Rs. 138.9 million was 32 per cent higher than in 1962; gross profit improved to Rs. 38.2 million from Rs. 24.0 million, and net profits were also markedly higher at Rs. 16.0 million compared with Rs. 12.6 million for 1962. The latter increase was achieved despite the higher tax charges in 1963 which reflected a reduction in Development Rebate, the impact of Super Profits Tax, and the company tax incurred in respect of the bonus issue. Taken together, all these figures are evidence of our sustained growth and amply justify our past investments in new productive units.

Whilst primary aluminium production rose by 10 per cent to over 25,000 tonnes, despite a prolonged power cut in Alupuram which reduced this smelter's output, and to which I will refer again later, there was a sharper increase in production of semifabricated products which rose to over 19,000 tonnes, from under 13,000 tonnes in the previous year. This increase in semi-fabricated output was made possible by the expansion at Belur completed in 1962 and by overcoming teething trouble encountered when the new equipment was first put into production. Output from our other plants continues to be very satisfactory.

To meet part of the capital requirements for the current expansion of the Alupuram smelter, and for the foil mill under construction at Kalwa, the first benefits of which are not expected until 1965, a number of security issues were made during the year. The authorized capital of the Company was increased to Rs. 100 million by the creation of an additional 4 million ordinary shares, and the issued capital of the Company increased by rights issue of 301,276 new ordinary shares of Rs. 10 each at a premium of Rs. 15.50 per share, part of which is still to be called.

Additionally, a public issue of 7 per cent Debenture Stock for Rs. 10 million was made on January 11, 1963, and the Commonwealth Development Finance Company Limited were issued £100,000 Sterling Debenture Stock on March 30th, completing an issue of £500,000 Sterling Debenture Stock agreed to in 1962.

Finally, on December 30th, there was a bonus issue of 1,200,889 fully-paid ordinary shares of Rs. 10 each in the proportion of one for four. Whilst this issue did not increase the amount of shareholders' funds employed in the Company, it brought the issued capital more into line with the true shareholders' investment.

On the basis of the results for 1963, and in view of the satisfactory level of activity experienced at the beginning of this year, your Directors felt justified in recommending a total dividend for 1963 of 17½ per cent on the augmented ordinary share capital. Simultaneously, the allocation to general reserve has raised it from Rs. 19.5 million to Rs. 31.5 million.

You will wish to know the immediate effect of the Budget proposals on the Company. Allowing for uncertainty of interpretation, the estimated net effect of the proposed changes will reduce the provision for Company taxation in respect of 1963 by about Rs. 2 million, which will appear as a credit in the 1964 accounts.

The Company will benefit from the rebates to be allowed against income and super-tax and also against the new surtax. The Finance Minister's general policy of encouraging the development of particular industries includes the aluminium industry, and will facilitate future expansions.

We welcome the Finance Minister's intention to continue the Development Rebate for key industries beyond April 1st, 1967. It is important to an industry such as ours in which new productive units require large amounts of capital and relatively long construction periods, to be assured of some stability in the fiscal climate. The Minister's assurance in regard to continuation of Development Rebate will be helpful from this point of view. Nevertheless, the proposed tax on bonus share issues and the 7½ per cent tax on distributed profits both seem certain to have an adverse effect on the capital market and to make the task of those who find it necessary to raise fresh capital considerably more difficult.

Looking into the future, our Company will continue to make progressive efforts towards supplying metal and fabricated products at reasonable prices, permitting us to pay good wages to our workers and to earn and distribute satisfactory profits. Beyond the pursuit of these interests, however, we feel a further responsibility to make such contribution as we can towards the expansion of aluminium production so badly required in India.

When the Emergency arose as a result of the Chinese invasion, Indaluco offered immediately (a) to step up the production of aluminium in Alupuram by an extra 5,000 tonnes although, from certain points of view, this was not an ideal location for increased smelter capacity; (b) to make special alloys required by the Defence Services; and (c) to loan to Government, without any obligation, some highly qualified technical members of the staff, to enable Government to decide on the planning of the industry in the light of the rapidly changed Defence situation. All this was intended to be a measure of short-term assistance. On the long-term, the Company assessed what its place in the economy should be against the background of the requirements of metal in the country in future.

On the best assessment we can make the country will require, by the end of the fourth Plan, very much larger quantities of metal than have been planned for at present. Your Directors realized that, if the Company should take its appropriate place in the context of metal required in the future, it should make an earnest effort to expand its operations. Naturally, they hoped that while the siting of new operations would be based, primarily, on the sources of power and of bauxite, it could be so adjusted as to lead to rationalisation of the Company's own transport structure which at present, due to historical reasons, is not entirely rational. All the arguments suggested that the Company should concentrate on getting permission from Government to expand on the West Coast.

I am glad to inform shareholders that we have had satisfactory discussions with the Ministry concerned, viz., the Ministry of Steel, Mines and Heavy Engineering, who have now asked us to submit an application for an Industrial Licence. We are submitting an application shortly. The intention is that, initially, we should put up a smelter with a capacity of 30,000 tonnes, but this will form a nucleus of a much larger scheme of integrated aluminium production on the West Coast.

Despite the strong demand we foresee, it is obviously desirable that production costs should be brought down, and

it is the policy of Indaluco to make every endeavour in this direction. I wish to draw your attention to two elements of cost over one of which the Company has no control and over the other only limited control. The former is a matter of power supply and power costs; the latter of the productivity of labour.

Throughout the first half of 1963, we suffered long spells of power cuts at our Alupuram smelter, which resulted in a loss of 950 tonnes of metal production. In 1961 and 1962, similar power cuts had resulted in a loss of 150 and 400 tonnes respectively. There had been intermittent power cuts at Alupuram even before this period but we had reasons to believe that with the augmentation of power-generating facilities in the State there would be no recurrence of such power cuts. But the situation appears to be worsening. The extent of the 1963 power cut was more severe than any in the previous years and in the current year also a 25 per cent power cut has been enforced from February which has further been increased to over 40 per cent from March. These interruptions in power supply not only seriously affect production but cause technical dislocations which take considerable time and expense to remedy. Consequently, costs go up. However, we have an assurance from the Kerala Government that every effort is being made to increase generating capacity further and it is expected that by the end of 1965 the necessity to impose power cuts will be obviated to a great extent.

There is also the tendency on the part of State Governments to levy duty on electricity consumption, which has the effect of increasing the contracted price for power. As electricity is a major raw material for the aluminium industry, aluminium producers seek to enter into long-term contracts with suppliers of electricity (State Governments, in our case) to ensure continued supply of power at rates which may sustain the industry on a long-term basis. It is, therefore, obvious that the sanctity of such contracts should be preserved not only as an act of faith but for sound economic reasons. Without belittling the omnipotence of the legislature, it seems necessary to point out that legislative powers, where they seek to vary or abrogate contractual relations, should be used, if at all, with great discretion and in the real interest of the community at large; never as an expedient to raise some additional financial resource.

Apart from power cuts, an important factor which is preventing a reduction in costs is low productivity in India. A study which I had had made some time ago showed very unfavourable comparisons between our own plants and similar sized plants overseas. I am not suggesting that the comparisons necessarily reflect adversely on the efforts of workers. Production per employee is influenced by a large number of factors other than the efforts of workers. Such other factors would include mechanization, size of the productivity unit, adequacy of raw material supplies and transport, production planning, management and scientific knowledge and so on. My submission is that each of these aspects should receive close attention and scrutiny, for thus only can we achieve internationally competitive standards of productivity and maximum economies of production.

An important influence on productivity is the human factor involved in management/labour relations. Last year, in my address to you, I had mentioned that it was imperative that we secure the co-operation of trade unions and industrial workers in order to achieve a standard of productivity which is comparable to those outside India. Your management has been unsparing in its efforts to develop such standards of productivity. I have pleasure in informing you that following the understanding we have reached with the Union in Hirakud there has been significant improvement in production and efficiency. I am also happy to inform you that our Alupuram Union has recognized the necessity for further increasing productivity and rationalizing work standards and has agreed with the management to make every effort to man the new smelter with the existing personnel, as far as possible. I consider this a significant step demonstrating an enlightened trade union attitude.

In a democratic society, industrial disputes are bound to occur and it is common knowledge that such disputes are invariably resolved in course of time. It is also obvious that the most enduring way of resolving these disputes is through collective bargaining and mutual consent. And yet I find these processes becoming increasingly ineffective and slow. Sometimes a great deal of damage is done both to the industry and the workers by such procrastination. In the majority of cases, the delay hardly improves the bargaining position of either of the parties and only contributes to a national wastage of effort. It seems that both sides must train themselves to negotiate in "good faith". Exaggerated demands in the hope that an understanding would be reached somewhere at the "half-way point" should be eschewed. There should be sufficient appreciation of the fact that a co-relationship exists between wages, production and costs. Collective agreements are, no doubt, the results of give-and-take but methods which the parties pursue should be based on goodwill, a scientific approach, and must demonstrate a regard for the public interest. I feel that if these considerations are kept in view, a tradition of healthly, mutual negotiations will be established in the country and will prove beneficial both to industry and the workmen.

On this problem of human relations as affecting productivity in industry views appear to have become stratified. The different parties concerned, viz. the Governments, both the State and the Union Governments, the Trade Unions of different persuasions, and different employer organizations have taken up positions, involving some rigidity of posture. It may be that a solution has to be many-sided; it may involve re-thinking on the part of all three parties. It seems necessary that a fresh look should be given to see where a break-through is possible. A solution may arise out of a fresh study of the problem by a body such as the National Productivity Council which, happily, has a tradition of a joint approach to problems of productivity by Trade Unions, employers and Government, with the assistance perhaps of outside experts. Your management has discussed the problem—not as a problem affecting Indaluco but as affecting Indian industry generally—with the National Productivity Council and has also offered to finance a research project up to a lakh of rupees. I hope something useful will emerge out of our discussions with the N.P.C.

Before I conclude, I have to make reference to a sad fact, of which I am sure all of you are aware. Mr. K. C. Mahindra, who was at the helm of the Company's affairs for over twelve years, died on October 31st, 1963. As an industrialist, a philanthropist, and an elder statesman, Mr. Mahindra was well known throughout India and many obituaries have been written mentioning these traits. Your Company's relations with him were, however, more intimate. He guided the policies of your Company and set the pace for its continued growth and for its high standards of efficiency. In many of his addresses before you, he pledged the Company's resources to the development of the aluminium industry in India. In his last address to you, he made a prophetic observation. Referring to the expectation that India would reach the stage of a self-sustaining economy by the end of the Fourth Plan, i.e. 1971, he said: "In our own sphere of industrial operations, I make bold to state that the Indian Aluminium Company would reach this stage five years ahead; I mean that expectations are that your Company would by 1966-67 achieve sufficient strength to stand on its own and generate enough technique, enough management, and enough resources to follow through further expansions." Probably, his hopes have already been realized, but let us, in mourning his loss, resolve to fulfil all his expectations through dedicated service to the Company, the industry, and the country.

Finally, I wish to thank on your behalf the management and all the employees of the Company—the staff and the workers—for their efforts and co-operation which contributed to the satisfactory results of 1963.

THE CENTRAL BANK OF INDIA LTD.

NATIONALISATION OF BANKS WILL HAVE DISTURBING EFFECT UPON FOREIGN ASSISTANCE, SAYS SIR HOMI MODI

Summary of the Speech delivered by Sir Homi Mody, Chairman, Central Bank of India Ltd., at the Annual General Meeting of the Shareholders on Tuesday, April 28, 1964.

"On the whole, it would be correct to describe the year under review as one of economic stagnation", observed Sir Homi Mody, Chairman of the Central Bank of India Limited, at the Annual General Meeting of the Bank on Tuesday, the 28th April. There was a decline of a little over 3 per cent in the total agricultural production, the set-back in the main cereals like rice and wheat being as much as 7.5 per cent, which, viewed against the background of a relentless growth in the population, was a matter for much concern. Sir Homi said that this cannot be allowed to be explained away by casual references to natural phenomena. The fault really lay in the doctrinaire land policies forced on the country, mainly for ideological reasons. Some hundreds of crores of rupees had been spent in the last ten years on Community Development and Extension Projects. That they should have yielded next to no results indicated the failure of both planning and execution.

Although industrial production had recorded an improvement of about 8.5 per cent, it was less than the rate of increase envisaged in the Third Plan. The growth of national income was feeble and halting and there was an upward pressure on the general price level. The mid-term appraisal of the Third Plan had come as a rude reminder of the basic defects of Government's planning policies. Undue concentration on heavy industry, Sir Homi remarked, had become an obsession with the architects of our Plans and had imposed on the common man a heavy burden of privations, which he was required to put up with in the present, in the fond hope that some day, his progeny would enjoy the fruits of his sacrifices.

Turning to the Budget of the Central Government, Sir Homi recalled how at the last Annual General Meeting he had emphasised that any scheme of fresh taxation based on the grossly inaccurate estimates which were being presented annually to Parliament could not but be unfair and oppressive. Last year's figures, he said, told the same old tale, an estimated deficit of Rs. 16 crores having been converted into a surplus of Rs. 88 crores! Yet, every Budget ignored this trend and proceeded to levy fresh burdens on the helpless tax-payers. Meanwhile, Government's administrative expenditure, not all of which could be considered productive, mounted, and inflation and the resultant fall in the real value of the rupee continued to inflict greater and greater hardship on the common man.

When the present Finance Minister assumed office, much was expected of him and it was believed that he would make a realistic approach to the whole scheme of taxation and give substantial reliefs. Instead, the present Budget proposals merely rectified some anomalies, put the income-tax rate structure on a somewhat more scientific basis, leaving the totality of the burden alone and actually increasing it by Rs. 40 crores, of which the share of the Corporate Sector was estimated to be Rs. 11 crores. It is impossible to understand how the economy of the country could recover and how the capital market which had dried up could ever come to life in these conditions. "When one comes to the specific proposals for taxation," observed Sir Homi, "one does not need to be an economist to appreciate the dire consequences of some of the burdens the Finance Minister is seeking to impose. The grand design is becoming clear — the further crippling of the Private Sector, and the elimination, by rapid stages, of whatever remains of the much-abused Capitalist class, to which India owes so much of her economic development. He would indeed be a very foolish person who will not see in these drastic socialist moves a grave threat to the stability and progress of the country."

Dealing with the monetary and banking spheres, Sir Homi referred to the impressive increase of Rs. 430 crores in the volume of money supply with the public. Scheduled Banks' deposits had also increased by Rs. 210 crores to touch Rs. 2,352 crores at the end of the year, the major portion of such increase being accounted for by Demand Deposits. Similarly, Scheduled Bank credit which stood at Rs. 1,422 crores in December 1962 expanded by as much as Rs. 158 crores during the year under review. To enable the banking system to meet the ever-increasing demand for credit from all sectors of the economy, the Reserve Bank found it necessary, at the commencement of the current busy season, to liberalise the borrowing quotas allowed to Scheduled Banks. Unfortunately, this facility turned out to be short-lived. The pace at which Scheduled Banks' advances have moved upwards has been so rapid that the Reserve Bank has now thought it necessary to apply the axe somewhat ruthlessly. Not only have the basic borrowing quotas been reduced, but the rate of interest has been so stepped up on each successive slab, that the effective cost of the total borrowings from the Reserve Bank has risen substantially. Coming as it has done, when the busy season has reached the highest peak, this action has placed the Banks in a difficult position.

The suggestion made by the Reserve Bank that, in their efforts to mobilize deposits, Banks should re-examine the pattern of interest rates had created a controversy in banking circles. The Inter-Bank Agreement on maximum rates of interest on deposits had been working satisfactorily and had helped to keep down the general cost of deposits for the banking industry as a whole and in preventing unhealthy competition. In such a context, the present suggestion of the Reserve Bank, though well-meant, had already given rise to a move on the part of some Banks to opt out of the Agreement. This was an unfortunate development, observed Sir Homi, and it was necessary that every effort should be made to check it. The Indian Banks' Association would shortly be meeting at the highest level to thrash out the difference of opinion that had arisen

Sir Homi then referred to the cry raised in ill-informed quarters in this country for the nationalisation of Banks. It was satisfactory to note, Sir Homi said, that the spokesmen of Government have expressed their opposition to this move for naionalisation which had found little public support, and he hoped that the ghost would soon be laid at rest He recalled how a similar threat of nationalisation which Banks in Great Britain faced in 1934 was successfully met by the united opposition of the Chairmen of all the major Joint Stock Banks. Sir Homi warned that if any move was initiated in this coun-

try to nationalise banks, it would have, among other things, a profoundly disturbing effect upon foreign aid and foreign participation in our various industrial projects, whether in the public or the private sector. Indian banking was already under the rigid control of the Reserve Bank, and the recent amendment of the Banking Companies Act had only added to its many fetters. Incidentally, it seemed to be extra-ordinary that legislation of such a far-reaching character should have been rushed through Parliament by Government with the help of its cast-iron majority, without any worthwhile consultation with the interests primarily concerned.

Referring to a Note published recently on the inter-locking of directorships of Banks and other companies, Sir Homi felt that no right-thinking person could agree with the inference drawn by the author that it had the effect of consolidating corporate power as against the State and Society. The safeguards that existed at present against concentration of economic power in the hands of a few were more than adequate, and there was no justification for forging fresh weapons so far as Banks were concerned. If there was anything that the Note had brought out, it was the unpalatable fact tha we had in this country only a limited number of persons possessing all-round business experience and financial standing. It would be foolish to prevent Banks from utilising this available talent. There was also no substance in the contention that Bank shares were concentrated in the hands of only a few persons, giving them undue power. So far as the Central Bank was concerned, out of a total of 24,828 shareholders, the individual holding of as many as 23,030, that is, nearly 93 per cent ranged from one share to one hundred shares only.

Sir Homi denied the sweeping charge levelled against commercial banks that they were not responsive to the financial requirements of small-scale industries and pointed out how the Central Bank, for instance, had been increasingly engaged in financing small-scale industries and had every intention of supporting this sector of the economy.

Referring to the complaint that commercial banks had neglected to provide direct term-credit to agriculturists, Sir Homi explained that this allegation failed to take account of the basic facts concerning the role of commercial banking and the inherent deficiencies in the general set-up of our rural economy. In India, agriculure had been looked upon more as a means of subsistence than as an economic or commercial proposition. Some of the factors which stood in the way of Indian commercial banks venturing into the field of farm credit were the diversity of inheritance laws and land tenures in various regions, the fragmentation and uneconomic size of individual holdings, the incapacity or unwillingness of the vast majority of agriculturists to keep regular and separate accounts and the absence of a scheme of crop insurance. Where agricultural activities like plantations had been organised on business lines, the larger Indian Banks did not hesitate to finance them. He also pointed out that commercial banks had been providing finance on a substantial scale to agriculturists for marketing their produce, which was quite an important economic function. Commercial banks were likely to evince greater interest in medium-term agricultural credit, now that the Agricultural Refinance Corporation had been formed, if they had the backing of crop insurance and provided the State Governments helped them actively in the follow-up and recovery of such advances, as in the case of co-operative institutions.

Referring to the Balance Sheet and the Audited Statement of Accounts of the Bank, Sir Homi pointed out that although the total Deposits had crossed the Rs 250-crore mark, the rate of increase was lower than in the previous year, due partly, to the closure of the Bank's Rangoon branch following nationalisation of banking in Burma. The Central Bank's share in relation to the total deposits of all Scheduled Banks, however, continued to remain at over 11 per cent.

The closing figure of the Bank's Advances at Rs. 187 crores represented an increase of over Rs. 12 crores, compared to the previous year. The Bank's share in the total volume of Scheduled Bank credit was nearly 12 per cent. The demand for Bank finance remained relatively subdued till almost the end of December, but thereafter, it came with a rush, placing the banking system under a heavy strain.

Sir Homi invited the attention of the shareholders to the fact that the previous year's gap of Rs. 27 lakhs between the market and book value of the Bank's holdings of Government Securities which had operated against the Bank had now been converted into a difference of Rs. 75 lakhs in the Bank's favour at the end of the year.

The improvement of Rs. 1.36 crores in the Bank's gross earnings over the previous year had been more or less neutralised by the increase of Rs 68 lakhs in payment of interest and of Rs. 59 lakhs in staff emoluments, exclusive of bonus. Sir Homi observed that the rate of increase in salaries and allowances of the staff had been disturbingly high, and expenditure under these heads continued to absorb a large share of the Bank's total earnings, the proportion being as high as 34 per cent in 1963.

Sir Homi also voiced his concern at the rate at which overtime allowances paid to the Bank's staff were going up in spite of additions to the staff. In Western countries, Banks had achieved a considerable measure of advance by modern methods and machinery. In India, apart from the difficulty of importing accounting machines and their components in sufficient quantities, there was a stiff resistance on the part of large sections of Bank employees to any attempts at mechanisation. The fear that machines would displace men and result in the retrenchment of staff arose from a short-sighted view. Banking business in India is constantly expanding and acquiring new dimensions, and even if mechanisation was introduced on a substantial scale, there would still be a growing demand for more and more men. Sir Homi hoped that the staff would give dispassionate consideration to this aspect of the matter and co-operate with the Management in introducing new methods so essential for the streamlining of the Bank's manifold operations.

Besides the interim dividend of Rs. 2.40 per share already paid out, it was recommended that a final dividend of Rs. 2.60 per share, subject to tax, be paid out of the Special Reserve, as was done last year.

Sir Homi paid a glowing tribute to the services rendered by Mr. N. K. Karanjia who had retired after a long and distinguished career of 45 years. He welcomed Mr. F. C. Cooper who was appointed General Manager on Mr. Karanjia's retirement and wished him a successful term of office. Sir Homi also expressed his warm appreciation of the very valuable services rendered by the Vice-Chairman, Mr. C. H. Bhabha, in looking after the affairs of the Bank and in developing its business. Sir Homi ended by observing that "the contribution which a Bank of our size and status can make to the economic growth of the country is immense, and if we continue to enjoy the confidence of the business community and if all of us give of our best to the service of the institution, we have every hope that the Central Bank will long continue to occupy the proud position it holds in the banking system of the country."

NOTE: This does not purport to be a record of the proceedings at the Annual General Meeting.

DARE HOUSE at PARRY'S CORNER

Soon after he had founded his business in 1788, THOMAS PARRY acquired a site for his office and godowns at the corner of Esplanade and First Line Beach, strategically situated, as close as it was then possible to approach Fort St. George. It was not long before this corner became known as Parry's Corner which name it bears to this day.

On January 1, 1819 PARRY took into partnership JOHN WILLIAM DARE—"not only a fine businessman but also a great character"

DARE HOUSE, the Head Office of the E.I.D.—PARRY GROUP is named after him.

One-hundred and twenty-six years have passed since JOHN DARE'S death in 1838. Eventful years of steady progress for PARRY'S!

The E.I.D.—PARRY GROUP of today consists of E.I.D.—PARRY LTD., PARRY & CO., LTD., and a number of subsidiary and associated concerns, in all nine companies of substance, contributing to the country's economy through the manufacture of sugar, confectionery, fertilisers, industrial and potable alcohol, acids, chemicals, carbonic acid gas, sanitaryware, etc.

The GROUP provides employment to more than 10,000 people. The strong position it has achieved today gives it courage and confidence further to increase and broaden its activities to keep pace with the country's Five-Year Plans.

An Academic Exercise

THE REPORT of the Committee on distribution of income and levels of living (headed by Professor Mahalanobis), presented to the Lok Sabha recently, is a disappointing document in more ways than one. In the first place, it is an incomplete report in the sense that only the first part has been finalised while the second part is still under preparation. Secondly, it has failed to arrive at any definite conclusions which may provide guidance to the Government for formulating its future policy regarding the terms of reference. Thirdly, the report has no soul of its own. In fact one hears, while scanning through its pages, three different and distinct voices crying themselves hoarse. The first is that of the pure scientist who seems to be throwing his hands up in despair all the time because he does not find facts and figures (even after more than three years' continuous labour!) from where he might draw "valid conclusions". Then, there is the voice of the biassed participant who is determined to arrive at a pre-conceived conclusion—even though the facts hardly exist to justify it—that "concentration of economic power in the private sector is more than could be justified as necessary on functional grounds". There is the third voice, and a sober one, but equally emphatic in its assertion, that there is no concentration of economic power in this country. There are some big units which operate efficiently and their bigness is justified on the basis of the sound principle of economy of scale. In the midst of these voices, the reader is left to fend for himself

The report bemoans over and over again that the data available to the committee was inadequate and that is why full justice to the terms of reference could not be done. The chapter dealing with national income, for example, explains that no direct method of aggregation in the preparation of national income estimate was feasible in this country as "very few or practically no households keep complete accounts". The national income and other accounts were being estimated in an indirect manner which introduced elements of error ranging up to 10 per cent in the aggregate, according to the final report of the National Income Committee. In some of the sectors the element of error was as high as 33 per cent. The inferences to be drawn from such data are undoubtedly of a dubious nature. Similarly, while discussing the income tax statistics, the Committee has drawn attention to the various conceptual difficulties. In other words, even the income tax assessees constituting less than one per cent of the total population of the country, cannot be studied in an objective manner.

The same limitation applies to the income distribution data obtained from the various sample surveys. The Committee has made special mention of the high degree of illiteracy, the large number of "different languages, communities and classes" and serious limitations emerging out of not only the sampling errors but also from "reporting and non-response errors". In regard to distribution of wealth also, the Committee came to the conclusion that it was difficult to collect comprehensive information on asset holdings of the population as the households did not keep regular accounts. Again, in its concluding observations regarding the distribution of income and wealth, it has stated in categorical terms that "we do not have the required data for drawing valid conclusions concerning the changes in income distribution which might

have taken place over the two Plan periods."

Regarding concentration of economic power, again, the report has stated that the necessary data are not available and wherever information is available, it is of a highly limited nature suffering from various defects. Here is a quotation from the report: "In studying the extent to which the operation of the economic system has led to concentration, it would have been useful to have had statistical data running over the entire period of the first two five-year Plans. Unfortunately, such data are not available, for the most part, in regard to concentration; and even when available as in the case of income-tax and allied data, it is difficult to use them without qualification. Moreover, it appears that no trend as such could be identified in terms of either bettering or worsening of the situation in respect of the broad pattern of distribution".

Whatever the limitations from which the national income figures suffered, the Committee attempted to arrive at rough estimates of the general improvement in the level of living of the people. It came to the conclusion that as against a rise of 44 per cent in national income, consumption rose by 36 per cent only. A part of this increase was absorbed in providing for the new entrants into the population during the decade; the balance induced a rise in per capita consumption of the population which worked out to an average rate of 1.1 per cent per year. On the distribution of the increment in consumer expenditure, the Committee could not get any data and hence had to content itself with the broad observation that on the basis of a general feeling, it had come to the view that both in the rural and urban areas the people were "better fed, better clothed and better housed" at the end of the second Plan than at the beginning of the first Plan. It did not discern any clear indication of a significant change in income distribution over the decade. Broadly, it came to the conclusion that the stimulus provided to national income during the planned era had given a dynamic touch to the economy which was well on the road to the attainment of the take-off stage.

The Committee has analysed the findings relating to the structure of public companies as revealed by the Reserve Bank Study as well as the one undertaken by Dr. R. K. Hazari. The table alongside compares the results of the two inquiries for 1951 and 1958. It shows that the loans have come to occupy a greater role in the financing of the public limited companies. The share capital has lost some of its importance because its proportion has declined from 35 per cent to 28 per cent in the period under review in so far as the "20-complexes-study" by Dr. Hazari are concerned. The role of the reserves also has declined from 22 per cent to 16 per cent while the loans have recorded the maximum gain from 20 per cent to 30 per cent. Similar shifts have been confirmed by the Reserve Bank of India Sample as well. The Committee has rightly come to the conclusion that the big units have been able to raise loans primarily because of their creditworthiness. In other words, the financial structure of the corporate sector is such that "it tends to support the large and established enterprise against the small and struggling entrepreneur".

In the following paragraph the Committee has completely shattered the bogey of the harmful effects emerging out of the expansion of the complexes: "There is such a thing as the economy of scale, which works in favour of big business, on purely economic grounds; and economic considerations are certainly relevant especially in the context of our scarce resources and the imperative need for our making the most economic utilisation of these resources. In many industries, the size of the domestic market is small in relation to the size of the plant at which maximum average costs begin to obtain; and any attempt to reduce the degree of concentration by breaking down economic-size units into a large number of uneconomic size plants would only lead to economic waste". It has given, thus, ample justification to prove that the manner in which some of the complexes have grown in this country does not constitute any anti-social policy. It was nowhere stated in India's Plans that the well-run and well-established units shall not expand through their own resources or through the resources borrowed from the market. In fact, but for the role played by these units much of the 44 per cent increase in national income whose distribution the Committee was studying would not have been there.

If any charge of concentration of economic power can be levied, it is at the door of the public sector and not of the private sector. The Committee has demonstrated that the relative expansion of the public sector in industry is much faster than that of the private sector. During the first three five-year Plans, the contribution

of the public sector will increase from less than 2 per cent to nearly 25 per cent in organized manufacturing industries. Similar is the case in mineral production wherein the share of the public sector will increase from less than a tenth, to over a third. In the sphere of investment as well the third Plan investment is likely to be around Rs 1530 crores as against Rs. 1050 crores in the private sector. This is an unmistakable trend of shrinking the relative share of the private sector. The fear has rightly been voiced recently by chairmen of some of the private sector companies that a new danger is looming large in the Indian economic scene because of the concentration of economic power in the State and especially in the hands of a few bureaucrats who are in control in the public sector units.

The charge of concentration of economic power in the private hands is disproved by the facts collected by the Committee itself. The Committee has drawn attention to the countervailing measures which are being taken by the Government in order to contain the activities of the private sector. The State regulation of industries in the private sector has been tightened. The expansion of new industries is governed by an industrial policy which has given encouragement to medium-sized firms competing with the large enterprises. Legislation has also been initiated so as to eliminate abuses and malpractices. A number of new institutions have been set up recently in order to attract new entrepreneurs and to encourage small-scale industries. In other words, the Committee itself has marshalled enough facts to give the lie to the tainted paragraphs in its own report which have, however, lent a paradoxical colour to it.

Two concrete suggestions have been made by the Committee, one relating to the establishment of a suitable machinery to organise the collection of data so that it may be possible to answer the questions which the Committee had failed to tackle and the other regarding the setting up of a commission to study the problem of monopolies. The second suggestion of the Committee has already been accepted by the Government by the establishment of a Monopolies Commission. The other suggestion is still being studied by Government. It needs to be remarked here that if all the existing organisations, both official and non-official, failed to collect data to throw light on the problems posed to the Committee, it is highly unlikely that any other single organisation on a small scale will be able to deal with these problems. Perhaps a much bigger machinery will be needed than the country can currently afford. There is a limitation to expenditure relating to fact-finding errands also.

The New Challenges

A SURE SIGN of a dynamic economy is the degree of interest that company managements take in subjects like training their personnel, especially managerial personnel, and increasing production-consciousness by inculcating interest among workers and trade unions in such concepts as productivity. The selection of these subjects as the main theme of their addresses to shareholders, at their respective annual general meetings, by Mr. P. L. Tandon of Hindustan Lever, Ltd., and Mr. H. V. R. Iengar of The Indian Aluminium Company, Ltd., must, therefore, be welcomed as a refreshing departure from the beaten track. Mr. Tandon devoted practically the whole of his speech to a discussion of the importance of resources of management to a developing economy with, of course, particular reference to how Hindustan Lever has been tackling the subject in so far as its own personnel are concerned. Mr. Iengar, however, dealt with productivity as one of the several factors, among many, affecting production in his company, but this need not be construed to mean that he minimized the importance of productivity. On the other hand, he vividly brought out the vital importance of productivity by drawing on his own comparative study of productivity in India and other countries.

Time was when the public—including the shareholding public—never cared to bother about who ran a business undertaking and how he or they did it. But times have changed. The exacting demands of modern times, on the one hand, and the impact of increasing interest in company management, even of private companies, by the State, on the other, make it difficult for the old time business executives to carry on as before. Business executives today are seldom the sons or nephews of oldtimers, except where they have gone through the mill, as it were, and have had specialised or practical training, preceded, more often than not, by a course of theoretical study in a reputed university in India or abroad. Very often, although an undertaking may have been the outcome of the genius of one man, it is not the same man nor, necessarily, his descendants that happen to carry on the business of the undertaking today. These are not days of born managers in all conscience. More companies now-a-days are manned by professional managers than ever before. The professional manager is slowly coming into his own. His number is still small, but the professional class that has begun to come up, it is gratifying to find, is one of the best, judged by any international standards.

The absence of a strong and adequate professional class of managers is a lacuna common to both the public and the private sectors (including what may be described as the family sector). An idea of the large number of managers that the country would require

was provided by Mr. Tandon. "Out of two million jobs estimated to be created in each year of the third Plan, even at a ratio of two per cent of them being managers," he said, "we shall need to train 40,000 new managers every year." To train so many managers is, indeed, no small task.

Mr. Tandon no doubt mentioned the Administrative Staff College at Hyderabad, the Institutes of Management at Calcutta and Ahmedabad and the regional and the All-India Management Associations, but, shrewdly, he did not hazard any view on whether what these organisations have been doing is adequate from the point of view of the country's requirements. Rather he chose to leave his listeners to draw what inference they felt like drawing by merely touching on how Hindustan Lever has been dealing with the problem of preparing its own managerial talent. Even this is not an insignificant business, considering that the company has over 340 managers and recruits over 25 managers every year The importance that the company attaches not only to recruitment of the right type of personnel but also to their proper training and to the principles and the procedures to be followed in this behalf is something that those who are never tired of asking the State to take over anything and everything from farming to banking will do well to reflect upon. If a company, even if it be of the large size of Hindustan Lever, sets so much store by anticipating the company's requirements of managers over a five-year period, selecting and training young men and women and developing in them attitudes and values satisfactorily to meet their future responsibilities, what should be the measure of responsibility of our planners in the matter of preparing managers? Are they even aware of the enormous magnitude of the problem? It is time they at least started to think of the problem in respect of the fourth Plan.

If we have to achieve internationally competitive standards of productivity and maximum economies of production—both are a must if our export targets that rise from plan to plan are to be reached—all the factors that affect productivity, such as mechanisation, size of the unit, adequacy of raw material supplies and transport, production planning, management and scientific knowledge and so on, not merely the effort of workers, must receive close and careful attention and scrutiny. In order to achieve a standard of productivity comparable to those outside India, as Mr. Iengar said, it is imperative to secure the co-operation of not only industrial workers but also their trade unions. Once the workers and the trade unions recognise the importance of increasing production not from just the narrow angle of manufacturers' profits but from the broader point of view of the interests of the country as a whole, it should not be difficult to augment the country's output. INDALO's own experience should be an eye-opener. But this country's misfortune is there is as yet too much politics and too little of the breadth of outlook that permits of a proper appreciation of national interest among our trade unions and labour leaders.

TEST LAUNCHING

Highlights of the Week

T.T.K. MEETS THE PRESS

A RELAXED Finance Minister met the journalistic fraternity at a Press Club Luncheon at New Delhi on May 2 — and it was very much of a family gathering with TTK playing his familiar role of "Uncle". It might be, as he described it, a game of "pull devil, pull baker" when Ministers meet newsmen, but on this occasion it was certainly a one-sided game and the devil (meaning the local Press) got the worst of it. The forty-minute meeting that there had been between Sheikh Abdullah and Mr. Krishnamachari excited curiosity, but questioning, though persevering, bent futilely against Mr. T. T. Krishnamachari's diplomatic silence. He blandly said that out of the 40 minutes which he spent with Sheikh Abdullah, he himself might not have taken up in talking more than four minutes. Rather thoughtfully he went on to say that they did not discuss Kashmir.

There is, however, one remark of the Finance Minister which, had some significance, and which needed to be mentioned. At one place he remarked casually that although Ministers' residences are supposed to be provided with furniture worth Rs. 32,000, the furniture actually provided would not fetch Rs. 6,000, if auctioned. Here, there is a clear hint from the Finance Minister of the Government of India that the difference of Rs. 26,000 is getting lost somewhere in the labyrinthine viscera of the Central PWD.

The Finance Minister said that China might attempt another attack on India in 1966 because the Chinese expected that conditions in India in 1966 would be more propitious for another attack. Their logistics would also improve by 1966. He said he was basing his statement on both information and his own reading of the situation. The increased defence expenditure after the Chinese invasion had not done serious damage to the Indian economy. He expected India to do well by the end of the fourth Plan and "manage" that Plan much better than the second and the third.

The Price Line

The Finance Minister exhibited extreme concern about the rising prices. He was of the opinion unless people were prepared to accept some amount of discipline — some control over wholesale trade and some form of rationing — it was not possible to arrest the rising prices. While he was not defending the Government in the matter of prices, he said that any scheme evolved for controlling prices must get the co-operation of the States.

About the recent visit of about 40 leading industrialists from the USA, he said that some good must come out of it. From the discussions he had with them he felt that they were earnest about investing their capital in India. Their assessment on the Government's economic objectives was extremely fair. Asked whether his proposal to attract more foreign capital to India would not lead to the foreign lobby becoming more active, Mr. Krishnamachari replied, "I will not subscribe to that statement".

About unearthing black money, he said that if one went through this year's Finance Bill, he would find a good number of provisions relating to this matter. He had not framed these provisions in plain language. Had he done so, they would have met with great opposition from members like Prof. Ranga and Mr. M. R. Masani. Although there was a long way to go to bring out black money, the provisions in the Finance Bill would "make things moving". Regarding the stock exchanges, he said that there was no proposal to set up an inquiry commission.

He said that he had not read either the text of the summary of the Tek Chand Committee's report. Prohibition had done enormous good to the people in the rural areas, while in the urban areas it was an increasing evil. How to get rid of the evil in the urban areas and retain the good in the rural areas was the problem.

About the Russian offer of assistance to build the first stage of Bokaro, he said that the Russians had earlier indicated their willingness to assist India in building a steel plant in the fifth Plan. Now they would be helping India in setting up a steel plant in the fourth Plan.

He said the Government was attempting to reduce disparities in income by increasing the lower levels of income without an increase in prices. Taxation alone, he cautioned, could not reduce disparities completely. An attempt had been made to reduce disparities in living standards by introducing expenditure tax and wealth tax.

It would be a good thing if employees were also shareholders of the firm in which they worked. He felt that shares could be issued to employees out of the profits (bonus) given to them.

About the restrictions on foreign travel, he said that because of foreign exchange shortage, it was not possible to be very liberal in allowing people to go abroad. But the Government allowed journalists to go abroad. While the "P" form could not be removed, the issue of "P" form would be liberalised.

Asked whether after his return to the Cabinet, he had come closer to the Prime Minister, Mr Krishnamachari replied, "We are all close to the Prime Minister". He said, "I suppose so" when another correspondent asked whether Ministers in the Union Cabinet were close to one another.

ANOTHER BHILAI

THE DAMPENED hopes of India's steel production catching up with the rising steel demand once again revived with the announcement in the Lok Sabha on May 1, by the Minister for Steel, Mines and Heavy Engineering that the Soviet Union had expressed its willingness to assist India in the building of the integrated Bokaro steel plant. Since the withdrawal of its request from the US Government, after the adverse Congressional decision on aid for Bokaro, the Indian Government had been exploring from various avenues financial and technical assistance for India's fourth public sector steel plant. Some tentative proposals had, in fact, been put forward for consideration of the Government by private steel building interests in the US, the UK, Japan, France, West Germany and Italy. But with more than one interest participating in an integrated plant of the size of Bokaro, there was a danger of its becoming another Rourkela, whose not-so-pleasant memories with regard to the difficulties of co-ordination amongst the collaborating companies, were still fresh with the Government. The search for a partner in Bokaro has now come to an end with the promised assistance from the USSR.

Although the assistance that the Soviet Union has initially offered will be for Bokaro's first stage, which envisages pro-

duction of 1.5 million tonnes of ingot, the plant will ultimately have a capacity of four million tonnes. The project will be largely on the pattern envisaged by the Dasturco report, but some marginal modifications will have to be made on the advice of the Soviet experts who are expected shortly in India for discussions and finalization of the project. The total foreign exchange cost of the project, according to this report, will be Rs. 300 crores, while the US team of experts had estimated it at about Rs. 500 crores. The first stage of the project, which, according to the Dasturco report, is expected to be completed before 1967-68, is estimated to be completed at a cost of Rs. 100 crores. Machinery and equipment will be supplied by the Soviet steel complexes in Zhdanav, Donbas and Magnitogorsk from where the machinery for Bhilai came. Some of the machinery for the first stage is likely to be produced at the Heavy Engineering Plant at Ranchi which is also being built with Soviet assistance. Thus, if the subsequent expansion is made with the help of indigenous equipment produced at Ranchi, it can be expected that the ultimate foreign exchange cost of the project might be still lower than the Rs. 300-crore estimate. It was disclosed by Mr. Subramaniam in Parliament that the Soviet credit for Bokaro will be made available on similar terms as were provided for Bhilai. These terms, in India's present circumstances, are extremely favourable. The Soviet Union had granted the credit for Bhilai at the annual rate of interest of 2.5 per cent on a 12-year deferred payment basis, and the repayment was to be made in terms of exports of Indian traditional goods to that country.

With the major hurdle of securing foreign assistance having been successfully crossed, the Government should not be lulled into complacency. The provision of auxiliary facilities, such as the development of sources of raw material, improvement of transport, supply of power and water, is no mean job, and the authorities will have to take effective steps for a speedy development of these facilities. The rehabilitation of persons who will be displaced following the construction of the Bokaro plant is another important job, and it is heartening to note that the Government is already attempting to resolve it. Mr. Subramaniam has assured that the displaced persons would be allotted land both for housing and for cultivation. It is also proposed to train one member of each of the affected families for employment in the plant.

While announcing in the Lok Sabha the Soviet offer of assistance for Bokaro, Mr. Subramaniam did not forget to appreciate the interest shown by the private foreign steel interests, and said that the possibilities of utilizing their friendly offers would be explored later, as Bokaro was not the only steel plant which India proposed to build in the near future. There are firm indications now that this country, to achieve the fourth Plan target of 16 million tons, will be taking up immediate steps for the setting up of two steel plants at Visakhapatnam and Bailadila-Vishakhapatnam regions, each with a capacity of 1.5 million tons. The feasibility reports of these projects are already with the Government for consideration.

BOND OF FRIENDSHIP

ON MAY 4, 1964, King Mahendra of Nepal laid the foundation-stone of the Rs. 52 crore Gandak barrage at Bhaisalotan near the tri-junction of Bihar, Uttar Pradesh and Nepal. Present at the function were India's Prime Minister, Mr. Nehru, Mrs. Indira Gandhi, the Irrigation and Power Minister, Dr. K. L. Rao, the Minister of State for Agriculture, Dr. Ram Subhag Singh, the Governor of Bihar, Mr. A. S. Ayyangar, the Chief Minister of Bihar, Mr. K. B. Sahay and the Chairman of the Council of Ministers of Nepal, Dr. Tulsi Giri and his cabinet colleagues, Mr. B. L. Pradhan, Dr. Nageshwar Prasad and Mr. K. N. Bishta. The project will take four years to complete and will bring about extensive benefits on either side of the Indo-Nepalese border. The preliminary work on the project was started as early as December, 1959 when an agreement for the purpose was signed between India and Nepal though much progress could not be made till the agreement was finally reviewed and amended in February 1964 when India's Minister for Irrigation and Power, Dr. K. L. Rao, visited Kathmandu. India will bear the total cost of the project. The Government of Bihar will share the major cost i.e. Rs. 36.56 crores, the balance of Rs. 15.44 crores being the responsibility of Uttar Pradesh.

Beneficiaries of New Project

The Gandak irrigation system will have a western canal of 120 miles and an eastern canal of 155 miles (of which 18 and 50 miles respectively will run through Nepal) with a gross area 'under command' of 30,00,000 acres in Bihar, 8,00,000 acres in Uttar Pradesh and 1,40,000 acres in Nepal. It has been estimated that irrigation benefits from the project will ensure additional annual yield of crops valued at Rs. 23 crores in Bihar and Rs. 80 lakhs in Nepal. The bulk of the additional yield, both in Bihar and Nepal, will be in respect of paddy and sugarcane

According to the terms of the agreement, India will build, by 1968, a 15,000 kW. power plant in Nepalese territory. The plant will be operated by India and until such time as Nepal develops the capacity to consume 60 per cent of the power generated by the plant, India is likely to utilise a greater portion of the power. The power from the plant will be supplied up to Hitauda in Nepal, 40 miles from the Indian border of Raxaul and 80 miles from Kathmandu where an industrial estate is coming up. Another power project, being built in Nepal with Indian aid, namely the Trisuli Project, will supply power to Kathmandu and Hitauda, thus providing scope for the setting up of a power grid in Nepal.

As a preliminary to the main construction work of the Gandak project, 30 miles of metalled road from Bagaha railhead to the barrage site, an airstrip and a store-yard with railway siding facilities at Bagaha have already been completed. The work on the main Gandak canal is also in progress and nearly 25 miles in Saran District and 50 miles in parts of Champaran and Muzaffarpur districts of Bihar, have been dug. Speaking on the occasion, Prime Minister Nehru announced that, with the concurrence of the Nepalese authorities, the Government of India will construct in Nepal, at its own cost, roads from Hanuman Nagar to Rajbiraj and from Fatehpur to Kanauli Bazar and power transmission lines from the Kosi power house to Biratnagar and Rajbiraj.

A Dull Week in Lok Sabha

By Our Parliamentary Correspondent

NEW DELHI :

WITH ALL the major legislative business planned for the Budget session having been finished by the Lok Sabha by Friday last and there remaining only such measures as the Drugs and Cosmetics (Amendment) Bill, the Taxation Laws (Continuation and Validation of Recovery Proceedings) Bill, the Dargah Khawaja Saheb (Amendment) Bill and the Wakfs (Amendment) Bill to be discussed and adopted, the Lok Sabha proceedings this week, by and large, were a dull affair. Some life, however, was injected into the deliberations by the political issues—the Kashmir problem, the Bhutan issue, the activities of Naga hostiles and the difficulties being faced by Indians in Africa. The Rajya Sabha passed two important Bills — the Goa, Daman and Diu Judicial Commissioner's Court (deciared as High Court) Bill and the Industrial Development Bank of India Bill—besides discussing the affairs of the Council for Scientific and Industrial Research and the oil policy of the Union Government.

The Drugs and Cosmetics (Amendment) Bill, seeking to extend some of the provisions of the parent act to the indigenous systems of medicine, including control on the manufacture of Ayurvedic and Unani drugs, received general support from the Lok Sabha. But some members expressed misgivings that the powers being conferred on inspectors for checking adulteration might lead to harassment of the Ayurvedic and Unani drugs manufacturers as no standard of purity had been laid down for these medicines. The Deputy Minister for Health, Dr. D. S. Raju, in his reply to the debate, made the important announcement that the Union Government would consider building model factories in the public sector to manufacture Ayurvedic drugs. He also indicated that a separate similar Bill would be introduced in Parliament in the near future in regard to homoeopathic medicines. The Taxation Laws (Continuation and Validation of Recovery Proceedings) Bill, seeking to regularise the procedure of collection of direct taxes in cases where the appellate authorities had revised the original tax demands; the Dargah Khawaja Saheb (Amendment) Bill, making solicitation or receipt of "Nazars" or offerings at the Dargah by unauthorised persons punishable with a fine upto Rs. 1,000; and the Wakfs (Amendment) Bill, providing for the establishment of a Central Wakf Council to advise the Government on questions of policy to be followed by the boards to be set up under the Wakfs Act, 1964 and seeking to remove the distinction between muslims and non-muslims in the matter of benefits of wakfs, were adopted by the House without much discussion.

Kashmir Issue

The misgivings expressed both inside Parliament and outside about Union Government's talk with Sheikh Abdullah on the future of Kashmir brought forth an assurance from the Prime Minister that nothing would be settled or agreed to about Kashmir without prior reference to Parliament. He indicated that the talks he had had with Sheikh Abdullah had been confined to wider issues: the immediate issues which had been exercising the minds of the Members of Parliament had not yet come up for discussion. About Naga hostiles, the Minister without Portfolio, Mr. Lal Bahadur Shastri assured the House that the Union Government would deal with them firmly and proposed to send a protest note to Pakistan over these hostiles having been allowed to bring arms and ammunition for that country. Both Mr. Shastri and the Minister of State for Foreign Affairs, Mrs. Lakshmi Menon, also allayed the fears of the House about Chinese subversive activities in Bhutan and asserted that the Maharaja of Bhutan had full control over the situation after the assassination of Mr. Jigme Dorji. India, Mr. Shastri added, however, was keeping in close touch with the developments in Bhutan. Concern was expressed by the members of the Lok Sabha over the difficulties being faced by Indians in many African countries. Many members accused the Government for doing nothing to protect the rights of Indians there. They alleged that the Indian Missions in Africa had failed to perform their duties. The Deputy Minister for Foreign Affairs, Mr. Dinesh Singh, pleaded that the question of Indo-African relations should not be confused with the position of people of Indian origin in Africa. He repeated the Prime Minister's advice to Indians in Africa that they should decide whether they wanted to return to India or to adopt the nationality of the country they were living in. If they opted to remain in Africa, they should identify themselves with the people there; if not, they should be given facilities to return to India.

CSIR Praised

In the Rajya Sabha, participating in the debate on a private member's motion for the appointment of Parliamentary committee to equire into and report on the implementation of the Scientific Resolution of the Government of India, various members criticised the working of the Council for Scientific and Industrial Research and deprecated the tendency of "empire building" even in scientific institutions. It was suggested that scientific research should be tuned to indigenous needs and larger funds should be made available for this purpose. One member also urged preparation of a national index of the work being done in the various national laboratories, universities and other research centres so that there was no duplication of efforts. The Education Minister, Mr. M. C. Chagla, defending the working of the CSIR, estimated that a sum of about Rs. 20 crores in foreign exchange had been saved up to 1962 because of the research and processes carried out in national laboratories. He agreed that there was need to step up research activities, but did not feel convinced that the Scientific Resolution needed to be amended. Mr. Chagla revealed that in the fourth Plan period, the Government proposed to set up laboratories for conducting research in marine engineering, agriculture, chemicals, oral contraceptives, electrical appliances, packaging and fishing technology. The motion was, thus, talked out.

The Goa, Daman and Diu Judicial Commissioner's Court (declared as High Court) Bill met with some opposition in the Rajya Sabha on the ground that the Government should have consulted the Goa Assembly before bringing forward this measure seeking to give the Goa Judicial Commissioner's Court the status of a high court for certain purposes of the Constitution. Mrs. Lakshmi Menon defended the Bill pointing out that it had been brought forth to remove the hardships of the people in these former colonies of Portugal. These territories had a different system of administration for nearly 400 years and it will take some time to bring it in line with the legal, political and economic conditions prevailing in the rest of the country. About the future status of Goa, to which some members had referred in their speeches critically, she said that the Government wanted to decide this issue at an appropriate time after holding proper consultations with the people of the territory. The present ruling party in Goa, she maintained, had not secured an absolute majority either in the assembly or in the number of votes polled, and, therefore, could not claim that the majority of the Goanese had voted for the merger of Goa with Maharashtra

The oil policy of the Government came under discussion

in the Rajya Sabha during a short debate on the Oil and Natural Gas Commission (Amendment) Bill. The Communist members criticised this policy alleging that there had been a shift in it recently in favour of inviting foreign private capital for setting up new refineries. The Minister of State for Petroleum and Chemicals, Mr. O. V. Alagesan, however, denied this charge and reiterated that the Government of India stood by the policy of fostering the development of public sector in the Indian oil industry. He expected that the Government would soon establish its own sources of crude supply from abroad and referred in this connection to the efforts being made to secure some off-shore oil concessions in Iran. Mr. Alagesan indicated that the Government might have to invest about Rs. 500 crores in petro-chemical industries during the fourth Plan period.

The Lok Sabha adjourned on May 6 and is meeting again in a special session from May 27 to June 5 for legislating the controversial Constitution (Seventeenth Amendment) Bill which fell through during the Budget session on account of its failure to secure a simple majority of the total strength of the House.

Question Hour

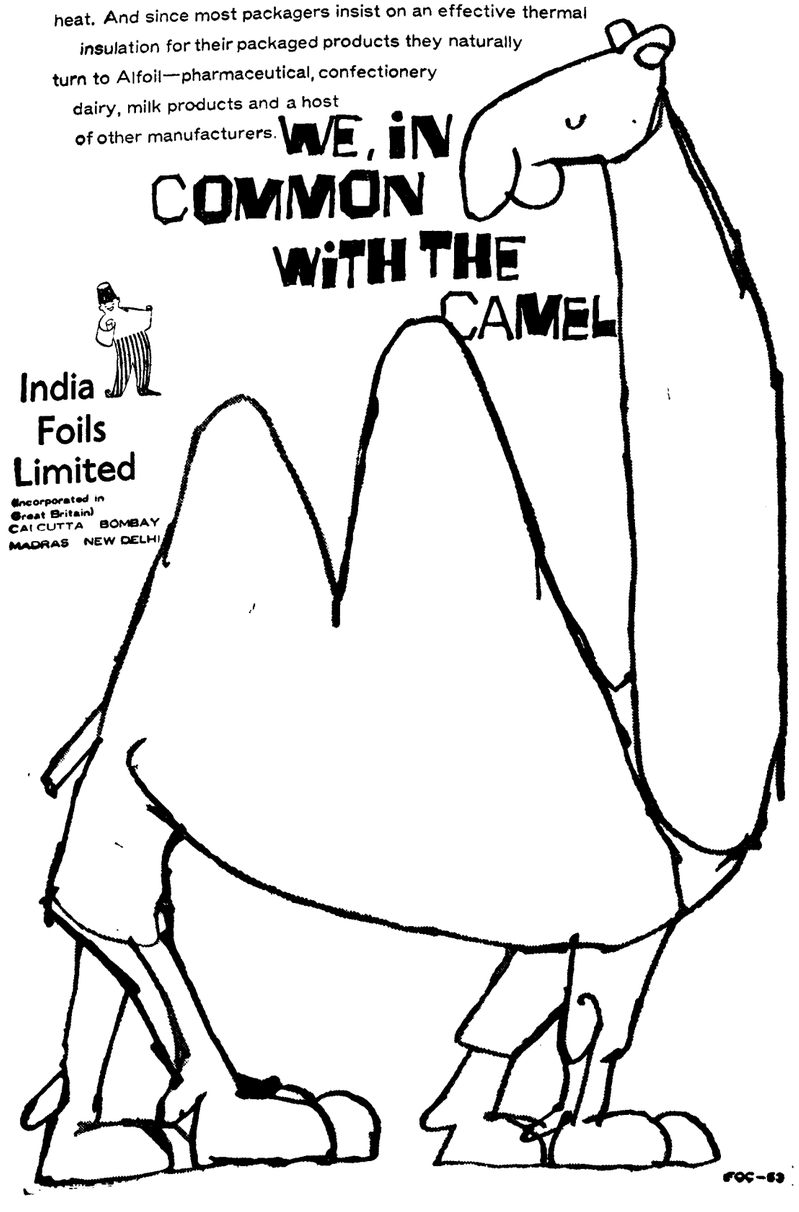
HEL Working: The Union Minister for Steel, Mines and Heavy Engineering, Mr. C. Subramaniam, informed the Lok Sabha on May 1 that according to the information available with him, there was no fresh trouble at the Heavy Electrical Factory at Bhopal. All the sections of the factory had started functioning after the recent shut-down. It would, however, take some time to attain normalcy. The Deputy Minister, Mr. P. C. Sethi, said that the initial difficulties in the way of stepping up production at this plant were being removed gradually. Stocks of raw materials had been built up for three to twelve months' requirements. This was a continuous process depending upon diversification and expansion of production. The heavy forgings and castings required for the manufacture of hydraulic turbines had been ordered from the U.K. Tenders for the supply of forgings and castings for the manufacture of steam turbines would be invited from various supplier countries. Mr. Subramaniam stated that it was intended to have a separate forgings and castings unit to supply the requirements of heavy electrical plants.

HSL Loss: Mr. Subramaniam also told the Lok Sabha on May 1 that the loss of Rs. 23.91 crores incurred by the Hindustan Steel Limited in 1962-63 did not represent a physical loss by way of excess of expenditure over income. This resulted after making a provision of Rs. 30.59 crores on account of depreciation and Rs. 17.46 crores for payment of interest on Government loan, which was due to be paid for the first time in April, 1963. Accounts for the year 1963-64, Mr. Subramaniam added, had not yet been closed. The financial results of this year, however, were expected to show significant improvement over those of 1962-63. Steps had been taken to minimise the loss by adopting such measures as maximising production, improving yields, etc.

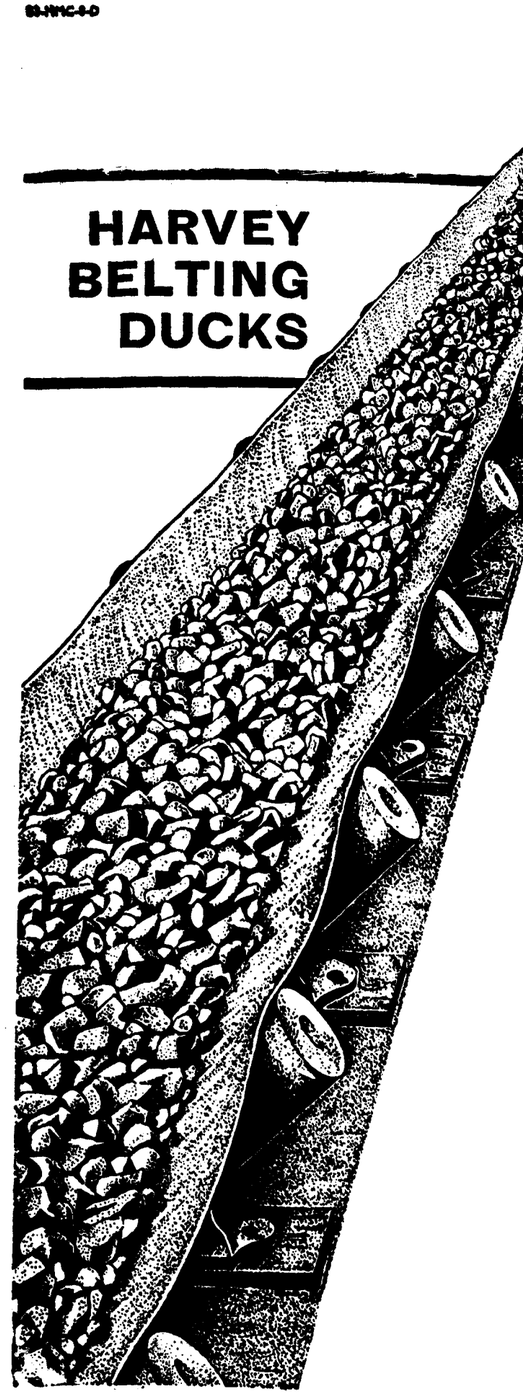
Crop Insurance: The Minister of State for Agriculture, Dr. Ram Subhag Singh, told the Lok Sabha on April 28 that the Union Government was studying the question of enacting Central legislation for introducing crop insurance. The principle of crop insurance, he added, had already been accepted by the Punjab Government. The proposal was not meeting with any resistance from the other States also; they too were keen on implementing it. As some risks were involved in an insurance project of this kind, the Union Government was studying the matter in consultation with Life Insurance Corporation. The scheme would be finalised shortly and put up for Cabinet's approval. Dr. Ram Subhag Singh indicated that it was the intention of the Union Government to provide technical assistance to the State Governments and also to meet 50 per cent of the cost of administration of crop insurance schemes.

Consumers' Crops: The Deputy Minister for Labour, Mr. C. R. Pattabhiraman, told the Lok Sabha on April 28 that the Government was considering a proposal to introduce legislation to make it compulsory for employers to set up consumer stores or fair-price shops by amending the Factories Act. The idea was to cover industrial establishments having more than 300 workers. About 60 per cent of such establishments in both the public and the private sectors had already opened co-operative stores for their employees. Mr. Pattabhiraman also disclosed that a scheme for establishing federations of consumer co-operative societies at the State level had been circulated among the State Governments. The States had been told that such federations might be established with a minimum of 10 wholesale societies.

Provident Fund Act: Mr. Pattabhiraman also told the Lok Sabha of April 27 that the Government had decided not to extend, for the present, the Employees Provident Fund Act to establishments employing less than 20 persons.



Sulphuric Acid Plant: The Minister of State for Petroleum and Chemicals, Mr. O. V. Alagesan, told the Lok Sabha on April 29 that the Pyrites and Chemicals Development Co Ltd., a Government of India undertaking, had planned to set up a 400-tonne per day capacity plant at Sindri for the production of sulphuric acid directly from Amjhore pyrites. The Company was also investigating a suitable process for extraction of elemental sulphur from pyrites. For this purpose the Finnish Outkumpu process was under study.



Nahorkatiya Fertiliser Plant: Mr. Alagesan also informed the Lok Sabha on April 29 that the schedule for the Nahorkatiya fertilisers factory had gone behind by about a year. The delay had been caused partly by the emergency and incessant rains, but mainly by the difficulties experienced in connection with the designing of compressor and moving machinery foundations on soil with poor load-bearing capacity. The collaborators for this project, the Minister added, were not satisfied with the soil conditions. A second examination in this regard had been undertaken. If as a result of this re-examination, soil was found to be defective, it might be necessary to shift the project away from the present site. The factory, according to Mr. Alagesan, was now expected to be commissioned by the end of 1966. It is estimated to cost Rs. 16 crores, out of which an expenditure of Rs. 6.9 crores would be in foreign exchange.

Oil Drilling: The Minister for Petroleum and Chemicals, Mr. Humayun Kabir, told the Rajya Sabha on April 27 that drilling for oil in the Port Canning area, near Calcutta, would be undertaken by the Oil and Natural Gas Commission in November this year. The Government, he further stated, had no definite information about the possibilities of obtaining gas in the Hooghly delta region. The matter, however, was being pursued.

Motor Vehicle Taxation: The Minister for Transport, Mr. Raj Bahadur, told the Lok Sabha on April 28 that the States were being persuaded to rationalise motor vehicles taxation with a view to minimising the burden as much as possible. In pursuance of a recommendation made by the Transport Development Council in March, 1960, the Union Government, he added, had decided not to pursue the question of fixing a ceiling on motor vehicles taxation for the present. The Minister further stated that the system of single-point taxation as between two States had been implemented by all the States except Madras and Mysore. A Study Group has been set up to go into the manner and the method in which taxes on motor transport could be realised on the basis of single-point taxation. The question of abolition of the octroi had been taken up by the State Governments. They were examining the manner in which the local bodies could be compensated for the consequential loss of revenue.

We are completely immune to a heat stroke. The camel of course does not feel the heat because he is a plain unfeeling animal. We, being of a more scientific turn of mind, rely on reflectivity to beat the heat for us—the naturally high heat reflective properties of aluminium foil which reflects back as much as 95% of radiant heat. And since most packagers insist on an effective thermal insulation for their packaged products they naturally turn to Alfoil—pharmaceutical, confectionery dairy, milk products and a host of other manufacturers.

HARVEY BELTING DUCKS

KEEP VITAL PRODUCTS ON THE MOVE!

In any industry you can think of, Harvey Belting Ducks can (and do) play a vital role. They are widely used in the manufacture of Conveyor Belts - which keep essential products on the move in mines, quarries and factories - and Transmission Belts for a variety of power drives.

Today Harveys' Madura Mills are India's largest producers of industrial fabrics. Through the years they have built up a reputation for unbeatable quality that has made Harvey Belting Ducks the first choice of leading manufacturers.

Harveys can weave industrial fabrics to a variety of specifications...however rigid. They have the men, machines and knowhow to produce a range of quality Belting Ducks, and other fabrics like Canvases and Tyre Cords. Recently Harveys expanded their industrial weaving capacity. They can now meet all your requirements in this field...to your complete satisfaction.

OUR POPULATION PROBLEM—VII

Abortion – Legal or Illegal?

R. CHOPRA

OF ALL the methods, artificial or natural, which are in use for controlling the number of births, perhaps the most controversial is artificially induced abortion.

At present, legally speaking, the position is that most of the countries do not allow 'women a general legal right to interrupt pregnancy. Abortion is considered a serious offence, and in many countries punished by prison sentences of barbarous severity. To assist in or to connive at it is also punishable. From the moment that a woman has conceived she ceases to be a free agent; she must bear the fruit. This is the law as it stands".*

In spite of abortion being illegal and strictly forbidden from the religious, moral and national etc. angles, it is a fact that millions of women all over the world break it (the law) every year. Since abortions had to be induced privately, the exact figure was not obtainable, but to judge from the miscarriages and other indications which came to the doctors' eyes, it must have been extremely high and it was rising steadily. The fall in the birth-rate which had set in since the turn of the century in almost all Western countries was by no means due exclusively to the use of contraceptive devices and methods, but in very large measure to interruption of pregnancy. All specialists agreed on that."**

Estimates show that in the USA where it is quite widespread, in many towns the number of abortions was almost as high as that of births. In Paris, France alone, as early as 1910, it was 1,00,000. At about the same period, the Director of the Berlin University Clinic for Women calculated that nine-tenths of all miscarriages were artificially induced and that the annual figure for abortions in Germany reached 3,00,000; other experts said 5,00,000.**

It is certain that in India also the practice is widely prevalent, though statistical figures are not available.

Soviet Law on Abortion

The history of the legal status of abortion in the Soviet Union is most interesting. Marxists had always branded abortion as a product of unhealthy economic systems. Yet, on the demand of the women, who insisted on being allowed to interrupt an unwanted pregnancy, the Soviet Union legalised abortion in 1920 on the condition that it be induced by a doctor in a public hospital.

In 1936, along with the tightening of the divorce laws, abortion also was made illegal in order to increase the population. It was, however, still permitted where continued pregnancy constituted a serious threat to the life or health of the mother; or where a serious transmissable disease was present in either parent.

Once again in 1955, abortion law underwent a change when the ban on abortion was completely abolished, i.e., artificially induced abortion was no longer illegal. Even under the new law, the operation was legal only if performed in a public clinic properly equipped for the purpose. Secret abortion was still punishable.

Communist China, as mentioned in an earlier chapter, as a part of the latest all out campaign to reduce the growth of its population, permits abortion as a last resort to avoid child birth, although officially it is illegal. Such anomaly, however, can exist only in Communist countries!

Sweden, Finland. Austria and Switzerland permit abortion if the continuation of the pregnancy would endanger the woman's life or affect her health severely. Before sanctioning it, however, the doctor incharge of the case must get the further approval of an official specialist consultant. Abortion under any other circumstances is still illegal and heavily punished.

Japan's Notable Case

Japan is the one notable example of the countries outside the Iron Curtain where abortion is completely legal. As the UN report No. IV on Population Studies "The Population of Asia and the Far East, 1950-1980" puts it:

> "The reduction in the frequency of births has been brought about partly by the widespread practice of legalised induced abortions and partly by a rapid dissemination of contraceptive practices. Both of these developments have been favoured under the Revised Eugenics Protection Law adopted by the Japanese Diet in 1948, and aided by various health activities including the co-operation of the practising physicians and family planning clinics established in some 800 health centres, industrial plants and community groups. Widespread publicity for contraceptive knowledge has been given in the press and other media, particularly women's magazines, in a highly literate population".
>
> "According to available estimates, the number of induced abortions reached a peak of nearly 2 million in 1950—a figure almost comparable with the number of live births in the same year — and declined afterward to perhaps not much more than 1 million in 1958, probably as a result of more widespread acceptance of contraceptive methods".

In India, the Prime Minister recently declared that abortion will never be legalised as it is harmful to the health of the mother. It is, however, agreed by all experts that illegal, secret abortion, usually crudely induced by quacks is much more harmful than legal abortion carried out in properly equipped clinics by qualified persons. In fact, the Soviet Union faced an exactly similar dilemma in 1920 when the demand for legalising abortion became insistent. The government consulted the doctors. Some were against, while others thought that placing abortion under State control was better than exposing the women to the perils of secret illegal operations. This argument won the day and the law was passed.

The question of legalising abortion in India, therefore, needs to be re-examined. The explosive rate of increase of population must also be taken into consideration. Even if abortion is not legalised under all circumstances as in Japan, it should, at least, not be considered illegal under certain circumstances. The health of the mother, presence of serious transmissable disease in either parent, number of previous births and incapability of the parents to bring up the child could be made grounds for sanctioning abortions. Abortion could also be legalised in the first month of pregnancy when it is relatively safe. Needless to say that legalised abortion

*"A History of Sexual Customs" page 343.
**Ibid page 344.

would go a long way towards reducing the birth-rate in the country.

Some Additional Factors

The major factors that contribute to the reduction in the birth-rate namely contraceptives, sterilization and abortion (the last if legalised) have been discussed in separate chapters. There are, however, other factors also which directly or indirectly affect the birth-rate given the right approach and emphasis. Some of them are discussed in this chapter in the following paras:

1. Legislation is required at the Centre to increase the minimum age at marriage to 20 or 22 years for all women irrespective of religion, race, caste or creed. The Union Government recently sought the views of the States on a bill which is pending before the Lok Sabha seeking to raise the marriage age for boys from 18 to 21 years and for girls from 15 to 18 years. The Uttar Pradesh Cabinet has agreed to the step on the grounds that economic and social changes in the country called for this change. The age should, however, be raised to 20 or 22 years for women. Passing the law, however, is not enough. The Sharda Act, passed in 1930, is still being violated with impunity as mentioned in an earlier chapter. During the currency of the PCP it should be ensured by all concerned that the new law, if passed, is rigidly observed. Deterrent punishments should be awarded to its violators. The increase in average age of women at marriage by even 5 years will reduce the birth-rate by as much as 20 per cent.

2. Laws should be passed to make the teaching of the subject of sex and family planning in relation to economic growth compulsory in all schools and colleges to all students over the age of, say, 13 years. Although freedom of the Universities is desirable yet birth-control is too vital to the country to allow the Universities a choice in this matter.

3. Number of students in medical colleges should be increased. Considering the stress laid on sterlization in the successful completion of the PCP, it is very essential that an adequate number of qualified doctors are available. The target of 10 lakhs or more sterilizations per year and a cash compensation of Rs. 100 per case to the doctor would attract many people to practise medicine in the country-side. The Government and the Universities should also consider making it compulsory for all young graduate doctors to work for six months, at least, under the PCP and other welfare programmes. They would, of course, be given suitable remuneration.

4. No relief should be given in income tax on getting married or producing the first child as is being done at present. Though this step will have very limited effect on the population as a whole, it might help in reducing the number of marriages or at delaying marriage and consequently reducing the birth-rate, if properly publicised.

5. Officers of the Indian Armed Forces have to obtain special permission if they want to get married before a certain age or rank. Women in certain jobs are also similarly forbidden from marrying and in certain cases are required to resign on getting married. This practice could be made universal in the country both in the public and the private sectors. Preference should be given to unmarried persons, all other things being equal, for all categories of jobs. Minimum age at marriage at least 2 to 3 years above the legal age, should be fixed for all categories of employees, men as well as women.

6. It is prohibited by law, or will be very shortly, to publicly campaign or agitate for the secession of any State or part of the country from the Indian Union. Similarly, for the duration of the PCP at least, all public utterances etc., against Family Planning by individuals or groups (political, social, religious etc.) should be declared unlawful. It is obvious that any public controversy on the subject of Family Planning during the PCP will be disastrous.

7. All political parties and other social, religious etc. groups should be persuaded to actively encourage and propagate Family Planning amongst their followers. Although it is not possible and nor is it desirable to make this compulsory, a code of conduct in this matter can be drawn up and accepted by all. During election campaigns, religious and social discourses, the advantages and virtues of Family Planning should be publicised. Since everyone in the country will benefit by the success of the PCP it is really in the interest of all of us to give it as much publicity as possible.

8. All Ministers, MPs, MLCs, MLAs and other elected leaders should pledge that they will support and actively work for the success of the PCP. While the various Houses are adjourned the MPs, MLCs and MLAs and even Ministers should make it a point to tour, at least their constituencies and explain to the people the advantages of Family Planning. These leaders are personally known to a large section of the people and are known by reputation to all. They could contact the people in their constituency personally or in small groups and introduce the local Family Planning Worker to them and publicly express confidence in his mission and pledge support to him. This could be done, say, once a year between 1966 and 1976. Such a step would help the PCP immeasurably.

9. Other leaders and senior officials, business men and industrialists should also pledge to publicise Family Planning in their jurisdiction, industries or districts and amongst their followers, employees or subordinates.

10. Wide publicity should be given to the various inheritance laws under which the female off-springs get a share in ancestral property. If properly approached, it could contribute significantly towards reduction in the number of offsprings.

(To be continued)

Eastern Economist 20 Years Ago

MAY 5, 1944

THE FOOD situation of Bengal continues to cause concern and anxiety to the public. Lack of news about conditions in the mofussil has tended to create outwardly an atmosphere of complacency, but this is so only on the surface. Scratching a little beneath the surface it becomes obvious that serious apprehensions still continue to trouble the public mind. News is scanty, but available reports do point to the unsatisfactory state of things as regards food supply. The issue before the public is not merely whether famine would or would not recur; the issue also is whether we are going to have a real improvement of the food situation. Judged by this positive test the food situation in Bengal does give cause for anxiety. Shortages and high prices of foodstuffs continue to be reported from different parts of the province. To add to the apprehensions of the people responsible Ministers continued to speak in disquieting terms about the food situation. When the Civil Supplies Minister of Bengal, was asked in Lucknow (during his recent visit to the place) whether rice grown in Bengal was sufficient to feed her people, he replied laconically: "Nobody can say. There is a tremendous influx of labour from outside and a number of rerugees from Burma and Arakan." How can the Government hope to solve the food problem with such amazing ignorance? The visit of the Bengal Governor to New Delhi, where he is expected to discuss the food situation of Bengal with the Viceroy, has also given rise to many anxious speculations here.

Rational Industrialization

JOHN A SHUBIN
(Professor of Economics, New York University)

A LARGER under-developed country, or a common market of developing countries, of ample resources is endowed with a growth potential which makes self-sustaining economic growth readily attainable. To attain economic growth on a high-productivity basis planners must concentrate resources and the slim supply of capital for the systematic introduction of advanced agricultural methods and the factory system to take up under-utilized resources and to displace unproductive forms of output; and planners must rationalize and develop industries along lines of balanced geographic specialization of production.* The resulting rise in production and in per capita income augments savings and the capital-formation potential and accelerates the pace of industrialization and agricultural development.

PERSPECTIVE PLANNING

To formulate a long-range integrated development plan, economists must assess a country's resource endowments, population growth, export potential, and the supply of investment capital. Planners must employ "perspective" planning to clarify the economic goals and to guide over-all growth 15 to 25 years ahead. Such planning outlines the main social and economic changes and projects goals in terms of national income, population growth, and the size of economic sectors†. A long-range plan continuously maintains a perspective of a given scope which outlines the direction of development appropriate to the country and its economic goals.

To state it more precisely, perspective planning outlines the direction and the pace of growth by projecting economic development and output targets for the years ahead: It projects the development of education and social services and the development and expansion of transportation and power, agriculture and consumer-goods output, and the export volume. From the foregoing projectons it derives the demand for primary materials (metals, cement, pulp). On the basis of the productive capacity required to put out the foregoing goods, it derives the demand for capital goods (essentially the plant capacity required for output of industrial machinery, equipment, metals). The prior expansion of the capital-goods industries in conjunction with growth of transportation and power provides the basis for accelerating the growth of consumer-goods and agricultural output. The latter would call for the erection of plants to put out fertilizers, insecticides, tractors, and so on, necessary to expand farm output.

Planners can more precisely determine future output targets and the needed productive capacity on the basis of a projected input-output table and a pre-determined regionally-balanced geographic specialization of industry (national division of labour). On the basis of projected output targets for final goods (a "final bill of goods"), planners can formulate an input-output table for the economy.‡

Once the general pattern for projected development has been determined, planners aim to ensure that the pace of growth is adequate and that the development of the different sectors of the economy are mutually consistent and in balance. For this purpose planners split up a perspective plan into a number of detailed medium-term (typically five year) plans to facilitate programming of co-ordinated economic development. The selected medium-term planning interval should be of sufficient duration (four to seven years) to span the fruition of major investment programmes and the maturation of a stage of economic development in the process of long-term growth.

INTEGRATED DEVELOPMENT OF THE ECONOMY

Planners must approach the problem of economic growth as a whole from the conception and formulation of an integrated development plant to its practical implementation in terms of erection of integrated productive capacity. Economic growth and gain in the productivity depend not on the magnitude of capital formation and the direction of development alone, but the rationalization of industry and the integration of the national economy, if planners are to attain self-sustaining economic growth. The growth potential (and the essential logic) of a national economy is the productivity inherent in its economic integration. If a country is to attain sound long-term growth, planners must improve transportation to enlarge the scope of the market and promote the mobility of productive factors and they must locate national industries (rationalized for high productivity) on the basis of balanced geographic specialization so as to intensively exploit the country's growth-and-productivity potential inherent in its national division of labour. When industry location conforms to rational geographic specialization, each area specializes and concentrates its human and material resources for the output of those lines of goods that obtain the most efficient allocation of resources, then through exchange, each area enjoys low-priced goods, a higher per capita income. (The productivity gains of regionally-balanced geographically-specialized industries are amplified in a later section of the study).

Planners can obtain rationally-balanced geographic specialization of industry and promote growth from the knowledge of hindsight (e.g., note the benefits of the European

---

* Initially planners should rationalize industries of national (and international) scope (as compared to "local" industries) those that put out products that can be shipped to distant markets and are of the scale that permits them competitively to supply large markets, international as well as national markets, e.g., optimum-size enterprises that put out steel, machinery, cars, radios, watches, scooters, pharmaceuticals, etc.

† Social and economic institutions and programmes that promote development along progressive lines and a rise in per capita income include, of course, family planning to check population growth, spread of public education, effective public administration, effective central banking, and so on.

‡ An analysis of input-output tables for industry (or industry groups) is a study of inter-industry relations. In the process of production, each industry absorbs a certain quantity of inputs (materials, machinery) from other industries to attain a given level of output. An industry's inputs relative to output (expressed as "input ratios") are comparatively constant. An industry's input ratios (cost ratios) can show the inputs required for a given level of output. By taking into account anticipated changes in products and processing facilities, analysts can project an industry's input ratios for a number of years ahead.

common markets) and through economic analysis appropriate to a developing country for rationally locating industry. Planners must not only locate industries programmed for establishment in the years immediately ahead, they must, at the outset, locate future industries of national scope a decade or more ahead, if they are to obtain a high-productivity dispersal of industries (*centres of specialized production*).*

Professional planners introduce high-productivity methods of output and attain rapid growth by (1) rationalizing industries and obtaining ("carving out") a large volume of standard-type work for efficient output by specialized plants, (2) locating industries in advance to obtain balanced national division of labour (i.e. promoting the emergence of specialized production centres of optimum size), and (3) programming vertically-related segments of capacity (erecting groups of projects related on the basis of derived demand) for co-ordinated economic expansion.†

Planners essentially achieve balanced economic development by programming vertically-related industrial segments of capacity in line with a pre-determined rational location pattern which obtains not only economies of scale, but permits the synchronized erection and emergence of the infrastructure (transport facilities, power supply, and the like) specially required by emerging industries for full utilization of installed capacity at the outset. The foregoing approach for integrated economic development is merely operationally valid economic planning for early self-sustaining growth — planning which provides ample time for engineering high-productivity projects for integrated development, avoids imbalances and bottlenecks, stretches investment funds, and conserves planning effort.

Planning and Programming Integrated Economic Development

In a larger country (or a common market), planners accelerate the development of capital-producing and growth-supporting sectors of the economy. By initially focussing on the development of the capital-goods industry and agriculture, planners more readily attain self-sustaining growth. The prior establishment of the capital-goods industries (steel, machine-building, machine-tools) and export industries creates the economic base that supplies plant and equipment for erecting future capacity, including agricultural capacity (fertilizer plants, tractor plants). If they are realistically to assess development capability, planners must estimate the capacity to produce capital goods and the potential to import capital goods. A pre-determined location pattern for specialized production centres provides a basis for more accurately computing derived demand for capital goods, as well as a basis for shifting the direction of development (adaptability in expansion).

Planners should so develop the transportation system and the industrial sector as to permit varying the pace and direction of capital formation. They improve the economy's adaptability for development by creating machine-building capacity designed to vary its lines of output (vary the product mix). In this way they obtain greater adaptability to accommodate shifts in the direction of industrialization, permit exploitation of profitable resource discoveries and technological innovations, permit effective erection of capacity that involves indivisible plant facilities, and quickly eliminate unanticipated production bottlenecks.

BALANCED ECONOMIC GROWTH

In the earlier stages of economic growth, producers intent on erecting large-scale enterprise, are confronted by the inadequacy of market demand. Producers could initially find markets through displacing items imported in quantity (import substitution), through exporting on the basis of comparative advantage, and through selling to developing countries on the basis of complementary agreements to operate optimum-size industries for mutual benefit. Producers, too, would find opportunities to launch projects of high-productivity designed to remove existing (or anticipated) bottlenecks that impede essential economic activities or the full utilization of resources.

The limited size of markets (limited purchasing power) for goods in under-developed countries would seem to restrict the adoption of mass-production methods of output. This would be so if economic development were conceived in terms of "equilibrium" economics and its sister "micro-economics". The programming of related enterprises, though unprofitable if launched separately, becomes economically viable if developed jointly. Planning for dynamic growth and programming in "depth" assures that necessary complementary investments will occur so that any single project will not be considered too risky to be undertaken. Since planners can group projected enterprises that are complementary in that they create a market for and mutually support each other, industrial programming calls for simultaneous emergence of vertically-linked or otherwise related enterprises. Because of the complementarity among such investment projects, an over-all enlargement of demand (expansion of the market) occurs through simultaneous emergence of related productive capacity. The erection of vertically-related and complementary enterprises overcomes demand-inadequacy and attains, at the outset, high-productivity output from scale economies; simultaneous launching creates a mutually derived demand for large volume output and, via the market media, propagates scale economies.

The opportunities for ushering in mass-production enterprises increase substantially when analysts rationalize industries to obtain ("carve out") a large volume of standard work for output by optimum-size plants, and when they programme simultaneous erection of vertical segments of capacity in line

* Planners can visit any advanced country and seek out live exhibits of specialized crop areas and specialized manufacturing centres for output of radio sets, business machines, and so on. They should particularly study specialized manufacturing complexes of minimum economic size.

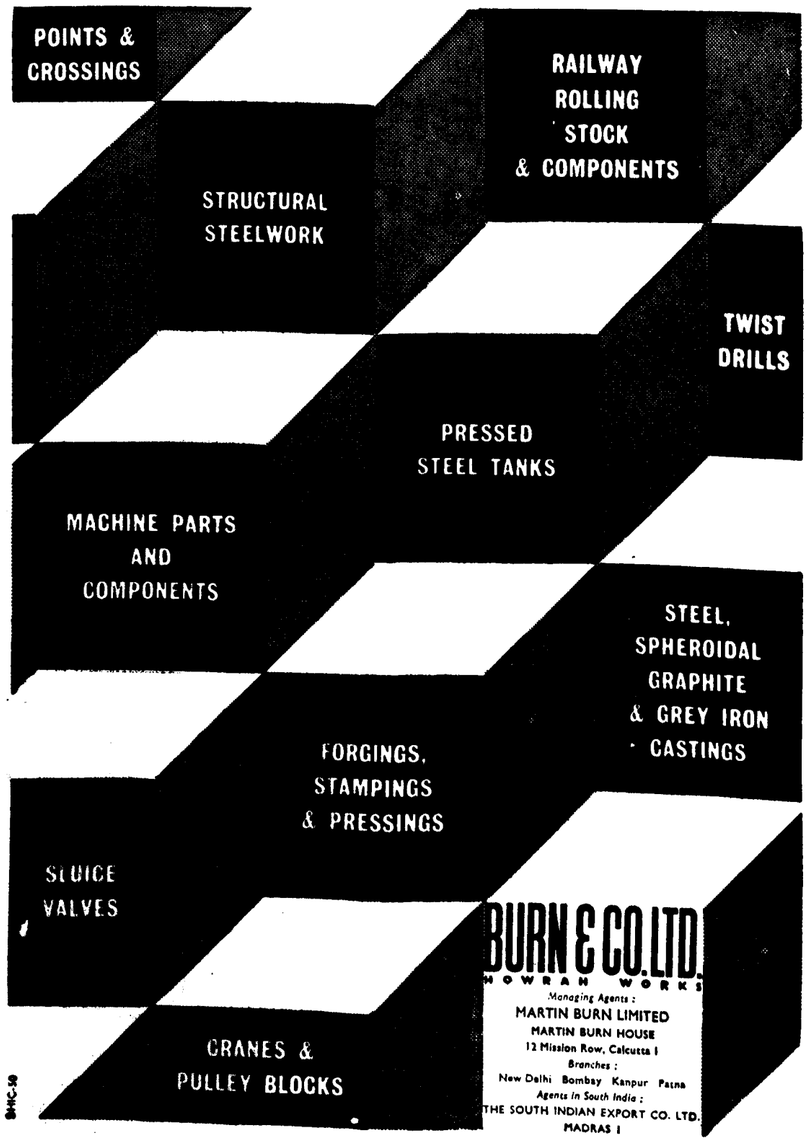
† Planners essentially overcome, in under-developed countries, the "inadequacy of market demand" (which limits the introduction of mass-production technology) through techno-economic analysis and planning integrated development, as is indicated above and amplified in pages that follow. A five-year "integrated" development plan would generally tend to "fall through" (leads to industrial imbalances, installation of high-cost capacity, inflationary pressures), if it essentially does not programme rationalized industries and does not erect vertically-related segments of capacity in line with a pre-determined rational location pattern for integrated national division of labour.

THE AUTOMOBILE INDUSTRY . . . .

needs the users' co-operation

Even the best of machines has its frailties. A motor vehicle is an intricate piece of mechanism. It requires a certain amount of care in its operation and in its maintenance.

Every automobile manufacturer gives to the purchaser a warranty against faulty material and defective workmanship. The manufacturer's warranty does not, and cannot cover any assemblies or components which have been subject to misuse, negligence or accident.



In order to maintain a car in its most efficient and economical running condition, regular and thorough servicing is essential, including not only periodical lubrication, oil changes, etc., but also regular mechanical maintenance. In the case of Hindustan Motors, each new car delivered is accompanied by a Maintenance Voucher Book providing 3 free services and subsequent maintenance services at nominal cost. Purchasers are urged in their own interest to make regular use of these services offered by the manufacturer's dealers, owners will thus protect the substantial investment represented by the car they purchased.

The Automobile manufacturers are often blamed for defects which are beyond their control. They appeal to the users of their products for full co-operation in the matter of upkeep of their vehicles.

ASP.HM/73

with a pre-determined location pattern composed of specialized production centres designed for scale economies.

DESIGNING OF INTEGRATED DEVELOPMENT PLANS

For the long pull, professional planners formulate a development path for accelerating the pace of growth, and they systematically forge a "perspective" economic structure (a sector mix) on a pre-designed rational national-division-of-labour configuration that productively integrates the national economy. The master planning of successive and dovetailed development schemes (fashioned into five-year plans for convenience and formality) essentially involves an analysis of industry output targets in conjunction with a pre-designed location pattern consisting of specialized production centres, and concocting the best strategy for programming for early fruition at low investment a number of related-vertical segments of capacity (programming simultaneous emergence of integrated capacity).

Planners must design a plan for integrated development and programme groups or related industries that are mutually supporting and mutually validating. A development programme would essentially erect complementary projects, linked in a demand-related (input-output) patterns. Enterprises scheduled for establishment would be linked to supplier industries and to consumer industries that are also programmed for simultaneous emergence. A vertical segment of capacity would thus consist of establishments at earlier and at later stages of production in the same "line" of industrial output.

When planners design in advance a pattern for rational geographic specialization of industries, analysts can clearly identify vertical segments of capacity for programming development that will obtain high productivity. In carrying out a five-year development plan, professional planners essentially programme integrated segments of capacity (whenever possible, "economic-size constellations") composed of specialized industrial complexes spotted on sites in line with a pre-determined location pattern. By programming a group of related vertical-capacity segments as a unit, planners co-ordinate the pace of growth of the various economic sectors; and by programming an inter-related segment of capacity (a single constellation) as a unit planners integrate the constituent projects of the segment.

Planners phase development by expanding (or filling in) capacity at production centres of an integrated constellation of industrial complexes. Programming and phasing a vertical-capacity segment may involve expanding an industrial complex to optimum size, erecting duplicate plants of economic size, erecting duplicate industrial complexes, or erecting a more specialized complex (or plant) and converting an existing complex (or plant) to a narrower range of work in line with a re-allocation of production, that is, splitting a line of production and allocating the work to two more narrowly specialized complexes.

The constituent projects of an industrial segment of capacity must be effectively engineered and prepared for requirement of investment funds, plant specifications, infra-structure, etc. The infra-structure of long-gestation time should be programmed for earlier inauguration so as to attain simultaneous completion with allied plants, thereby avoiding delay in inaugurating production on a commercial basis.

PROGRAMMING OF TRANSPORT AND ENERGY

Planners should, at the outset, identify locations that will require a substantial supply of industrial power or other infra-structure involving long gestation so that they may programme their earlier inauguration to obtain balanced economic development. To mitigate imbalances in industrialization (avoid situations of both under-utilization and over-capacity), transport and energy should be programmed for earlier inauguration so as to attain the co-ordinated emergence of power, transport and industry. Since in our scheme of planning, industries are located in line with a pre-determined pattern, the ease of advanced programming of power, transport, and other infra-structure of long gestation assures synchronized supply of such services to the emerging industries as needed.

Under integrated development, the simultaneous programming of industries that are linked in the processing stages in the same "line" of production propagates vertical external economies from supplying-industries to consumer-industries. Optimum-size producers of material generate vertical economies that enhance profitability for user industries. Programming integrated industrialization also, of course, obtains high capacity utilization of industrial establishments, mines, power plants, and transport facilities.

The Rationalization of an Industry

To attain accelerated industrialization, industrial planners must (1) rationalize industries and design production units of economic size, (2) group techno-economically related production units to make up specialised industrial complexes of economic size and, then, (3) on the basis of a resource survey and analysis, locate industrial complexes along the lines of rational geographic specialization so as to obtain integrated national division of labour and balanced dispersal of industries.

Through an analysis of an industry's structural features, industrial planners can rationalize production and design industry for high productivity, low incremental investment, and ease of programming and development. To design a rational structure for an industry (as outlined in the pages below), industrial planners successively analyze and design an industry's structural features — this includes the delineation of an industry, labour force, material and inventory behaviour, product line, production specialization, optimum size, specialized complexes, and location.

An industry's field of activity is identified by the kinds of goods it puts out. Its field may also be designated in terms of technology (metal-working industries, wood-working industries) and in terms of stages of production — extractive, early-stage, intermediate-stage, final-stage and production. Industries differ with respect to degree of structural homogeneity. A highly homogeneous industry would consist of plants that use the same kind of materials and processes to turn out identical or closely similar products (e.g. meat, whiskey). The less homogeneous the industry (drugs, electronics), generally the more difficult is it to analyze.

For purposes of industrial development, analysts define an industry as a group of plants engaged in the same type of productive activity — engaged in the output of the same or closely related products or services. Analysts delineate industries on the basis of product similarity and production homogeneity (on the basis of the supply side of economic activity) rather than on the basis of close substitutability of the demand for goods. In their initial survey, they would broadly delineate the industry (e.g., rubber industry, beverage industry), and, then, further in their analysis, narrowly delineate it (tyres, beer); and they generally take into account substitute products and complementary products.

An **industry's size** and type of product put out (industrial

machines, antibiotics) indicates its contribution to economic development and to the rise in GNP. An analyst uses "value-added" in production (in real terms) to measure an industry's size and to project development, since the value-added index takes into account an industry's changes in product-mix and the addition of new items to its line of output, but excludes the material and service inputs from other industries. He also, of course, uses capital investment, number of workers employed, physical output, and value of output to programme development and appraise economic effects.

LABOUR FORCE AND OCCUPATION STRUCTURE

An industry's occupation structure (classes of skills employed), determined by the nature of its production processes, may consist of a narrow range of skills, as in the case of brewery industry, or it may consist of a wide range of job grades, as in the case of the metal-working industries. Industrial engineers employ job evaluation techniques to rank an industry's occupations (formulate an ascending hierarchy of job grades) so as to arrive at consistent occupational differentials from the lowest to the highest job grade. They usually determine occupation differentials on the bases of the degree of skill, effort, responsibility, and favourability of the working conditions involved in each job. Such a hierarchy of job grades facilitates the determination of occupational wage differentials usually considered by labour and management to be a rational basis for setting a scale of wages for job grades.

Some skilled and technical occupations tend to be tied to certain industries, though many types of occupations are common to a number of industries. Technologically related industries located in the same area acquire a supply of skilled labour by early inaugurating worker training. Since growing industries attract young workers, they can enjoy the advantages of a well-trained, vigorous work force. To disperse the benefits of industrialization, expanding industries could recruit workers from the various regions of the country.

Some industries tend to locate in areas of skilled labour supply. Economists identify an industry as being "labour-oriented" in location when the proportionate cost of labour is relatively high in unit cost and an adequate supply of labour is relatively important for maintaining efficient production. With the planning of industrial growth and the increasing mobility of labour, a labour-oriented location should not be a significant factor in locating industries. By locating industries well in advance of their erection, planners obtain ample time for establishment of schools to turn out the required skilled labour and technicians, so that the labour "bottlenecks" need not adversely influence location decisions or retard industrial development.

MATERIAL AND INVENTORY BEHAVIOUR

An analyst assesses the importance of material supply and inventory of an industry's stocks in terms of the share of material cost in unit cost, the diversity of items required, and the investment in stock relative to sales volume (the stock-sales ratio).

Typically, the quantity of materials necessary for goods in process depends on the production interval and the rate of output; the quantity needed for finished stock depends on the amount required to meet satisfactorily the delivery needs of sales commitments. The amount required for raw-material stocks depends on the procurement lead-time (delivery time), carrying charges, and the stock level necessary to maintain an uninterrupted rate of output. An industry's short-run demand for materials and the amount carried in stock depend not only on the variations in the rate of output and sales, but on the interest rate and the trend in the price of materials (e.g. inflation).

An industry's long-term demand for materials and the amount that would be carried in stock (the stock-sales ratio) depend on the industry's growth, the degree of vertical integration of production, the improvement in transportation, the degree of standardization of materials, the effectiveness of inventory-control system employed, and the number of producers in the industry. If the industry comprises many small producers and small distributors, the overall material stock levels will obviously be enormous. In such cases total investment in inventory stocks may exceed the investment in plant and equipment.

An industry's long-term supply of material depends on the richness of the material resources, the cost of expanding capacity for output of material, and the availability of substitute materials. If output capacity can be economically and quickly enlarged the effective supply of materials tends to be relatively elastic.

Some industries tend to locate at the source of materials. An analyst identifies an industry as being "material-oriented" when the cost of transporting materials is relatively high, and when locating plants at the source of materials would appreciably lower the cost of material input.

MARKETS AND DISTRIBUTION CHANNELS

An analyst identifies an industry's market area as the area to which it supplies product; and he breaks down an industry's over-all market into separate market segments when there are separate groups of buyers who use the product for different purposes and whose demand patterns differ. The petroleum industry's market, for instance, may be segmented according to each of its products — petrol, kerosene, diesel oil, and so on. The market for diesel oil may, in turn, be segmented into that of the farm-machinery demand for oil, the railway demand, and so on. A product's various market segments may differ with respect to length of distribution channel, pricing practice, and seasonality of demand. The seasonal demand of one market segment may offset the seasonal demand of another segment.

An analyst elects that distribution channel which attains low-cost marketing and a large volume of sales. He may elect a single channel or he may elect a multiple-channel system, e.g., sale directly to users, to retailers, and to wholesalers who resell to retailers. Producers who put out industrial goods find it economical to distribute directly to users or to wholesalers who distribute to users. Most producers of industrial goods find it economical to sell directly to the users of machinery because of the high unit cost of the items and the need to provide technical servicing and installation of equipment. Producers of consumer goods generally find it economical to distribute through wholesalers. Such distributors attain efficiency through specialisation and bulk buying, shipping and storage. In order to attain low-cost marketing of items of diverse manufacturing sources, an analyst often finds it profitable to set up a demand-related product line (e.g. hardware items) in order to attain effective marketing.

Some industries locate accessable to a major market area. An analyst identifies an industry as being "market-oriented" when locating accessable to a major consuming area attains low-cost distribution and technical communication and customer servicing as in the case of marketing machinery.

Industrial analysts aim to design industry structures and programme industrial expansion so as to obtain declining long-run cost in production. Initially, they distinguish between short and long-run costs.* An industry's long-run cost of production derives from and is dependent on the size of output capacity — long-run cost in rationally structured industries declines because of economies of scale associated with enlarged capacity.

As a rationally-organised industry expands, long-run costs decline (productivity rises) not only because of internal economies of scale, but the decline in input prices (payments) for materials, equipment and services (stemming from external economies) and the adoption of innovations. Keenly aware of the sources of productivity (the determinants of long-run costs) analysts, at the outset, design and locate industry for high productivity.

To design an industry structure for high productivity (as is outlined in pages below), analysts must (1) set up process-related production lines, (2) apply sufficient research and engineering effort for the design of products and processes, (3) apply the principles of product simplification and maximum interchangeability of components in the design of products (stipulating high-utility economy models, wherever feasible), and (4) minimize the input of scarce materials and capital and specify processes that obtain the least-cost combination of productive factors. To fully exploit the productivity inherent in industries, planners stipulate (5) the progressive division and specialization of production, and (6) the rational location of an industry's divisional units to make up specialized production centres.

PROCESS-RELATED PRODUCT LINES

Early-stage industries typically convert, through integrated facilities, crude materials (oil, coal) into certain primary and secondary products—their material-related product coverage (joint products) is generally put out in somewhat fixed proportions. For most manufacturing industries, however, planners have considerable latitude in setting up rational product lines for efficient specialized output.

In setting up rational product lines, planners aim for process-related product lines. By grouping products and components on the basis of process relatedness (grouping items that are put out by the same or similar processes), planners subdivide and segment an industry's production along process-related product lines, simplify production, and extend the application of mass-production methods of output. The segmenting of an industry into appropriate product-line divisions so that each can employ efficient specialized processes to turn out a narrow line of items is obviously the primary means for producing on a high-productivity basis.

For industries of a relatively broad product coverage (electrical goods), planners would, on the basis of projected output, set up a number of process-related product lines. They would set up separate product-line divisions for large-volume items for output on more specialized processes. They may further break down a line of output according to the size of the product — heavy and light electric motors, or heavy and light machine tools. Diverse small-volume items would be set up into broader process-related product-line divisions for output on less specialized facilities. By applying the foregoing production approach, planners would obtain not only high productivity output, but lower incremental investment for erecting plant and lower stock ratios, as well as simplify the burden of management.

Industrial planners are well aware that the level of costs is somewhat pre-determined by the amount of research and engineering effort devoted to product design and to the selection and development of economical processing methods. They stipulate sufficient research and engineering effort so as to obtain economical output for the long run. The larger the potential volume of output, the greater the research and engineering input that can profitably be absorbed.

The greater the input of research and engineering effort the lower the cost of output and the greater the utility (quality) in the product. Engineers seek not only to obtain minimum cost output for the anticipated volume of output but maximum consumer-utility features (quality, durability, ease of maintenance) in the product. They aim for functionally sound products and they design and build quality into the product. In the final analysis, it is the amount of product utility and durability (the "bundle" of utility) obtained from the input of productive effort that measures the economical allocation of resources.

ECONOMY MODEL PRODUCTS

Wherever feasible, planners should stipulate the adoption of high-utility, economy-model products for output—low-cost simplified version rather than the high-cost, de-luxe version of the product. Designed for low-cost output and sale at a lower price range, economy-model products (for motor vehicles, scooters, and so on) attain a larger sales volume. An economy model makes low-cost output possible through use of simpler operations and inexpensive processes, less input of materials and skilled labour, and a larger volume of output which further lowers the unit cost of production. The resources conserved would be applied to the output of other types economy-model products.

To enlarge the gain in productivity, planners promote the adoption of **product-simplification programmes** and industry-wide **standardization** whereby engineers analyse and appraise product lines to eliminate needless product variety and model sizes in order to reduce waste, improve production efficiency, and simplify maintenance and repair. The elimination of superfluous product variety and product features reduces the level of inventory stocks and permits longer production runs and a greater specialization of facilities.

Industrial planners promote maximum adoption of **interchangeable components** and parts designed for absorption into the assembly and output of similar as well as different kinds of final products. Enterprising engineers can systematically develop standard-type components and parts designed to assemble into a large number of different kinds of final products—a single efficient diesel engine and other components, for instance, can be designed for use in buses, trucks, tractors, and stationary engines. By employing a broad "perspective" product-design approach, engineers can, in fact, attain an extensive absorption of standard components and parts into the final assembly of a number of different final products.

A wide application of the principle of interchangeability of components achieves productivity gains through longer production runs, greater adoption of mass-production methods of output, lower over-all level of stocks, and improved quality in the product.

MINIMISING INPUT OF SCARCE MATERIALS AND CAPITAL

Industrial planners should stipulate the adoption of efficient production methods that minimize the input of capital and other scarce factors. Engineers would design products and select production methods so as to minimize the input of scarce and high-priced materials and to specify the use of suitable lower grade materials and appropriate substitute materials. They would take pains to avoid "over-specifica-

* Short-run unit cost of production derives from and depends on the rate of output. At a lower rate of output, units costs are high; at a high rate (near optimum), unit costs are low largely because of the spread of overhead costs over a larger volume of output.

tion" (the over-designing) of components and seek out processing methods that conserve material.

Engineers would design products that call for labour-intensive processes in place of capital-intensive processes; for example, in place of pressings, they may specify welding processes, wherever technically feasible. Engineers, too, would specify efficient machine methods of processing only for the production line alone, but would specify less capital-intensive methods and facilities for the handling of materials, inspection operations, and other operations that service production. By adopting a multiple-shift policy for plant operations, managers intensify the use of plant facilities and reduce the capital cost per unit of output.

Though the market for many manufactured products may be somewhat narrow and opportunities for adoption of specialized production methods seem to be limited, industrial planners are aware that they can extend the application of mass-production methods by promoting (as earlier outlined) the adoption of process-related product lines, economy-model products and simplified production, and a wide use of interchangeable components.

Industrial planners further reduce capital input by promoting adoption of optimum-size plants and by grouping techno-economically related enterprises to make up specialized industrial complexes which obtain intensive use of feeder plants, auxiliary plants, and overhead services (as is outlined in subsequent discussion). By means of the foregoing production approach, planners obtain and "carve out" a large volume of standard-type work for output on a mass-production basis.

PLANT SPECIALISING AND MULTIPLE-PLANT SYSTEMS

By employing an approach which attains a larger volume of standard-type work (process-related items) for output, engineers obtain a greater division of labour—the production process can be broken down into relatively simple operations which readily permit the mechanization of operations.

In order that they may effectively select production machines, engineers study the product's specifications to determine an efficient sequence of operations to put out the product. In their procedure, engineers ordinarily, first, select the required machines to equip the production lines and, then, select the needed service equipment (materials-handling devices, inspection devices) that facilitates the operations in the fabrication and assembly-lines.

Engineers aim to equip a production line with a series of well-designed work stations and machines to obtain speed in output so as to lower the capital-cost and the labour-cost per unit of output.

Plant facilities (capital inputs) are **divisible** in factories where they can be added in small increments as individual machines to enlarge output capacity. Such divisible production facilities are exemplified by factories where a battery or somewhat duplicate machines or duplicate production lines turn out the work, as in the case of tyre-moulding machines, die-casting machines, milling machines. The cost of small machines is hign relative to capacity as compared to that of large machines.

Capital input is **indivisible** in production processes where it must be added in big increments, as in processes that involve an integrated facility (a refinery, a pulp mill), a tightly-integrated fabrication line, or a highly-mechanized assembly line. A plant's largest indivisible production equipment and its output capacity tends to determine the plant's optimum size; and the output capacity of the largest "indivisible" plant tends to determine the optimum size of an industry's multiple-plant unit.

When a producer in an industry involving a long over-all production cycle, at the outset, subdivides his production cycle into appropriate phases and sets up specialized plants, he essentially adopts mass-production technology and attains low units costs. Each plant would carry work-in-process up to a given point and a successive plant would take over for further processing — operations in each plant would terminate at the completion of the conversion of materials, completion of the fabrication of a part, or at the completion of an assembly.

If the latter inherently large-scale industries of high inherent productivity are set up as (fragmentized into) "small-scale industries" or "medium-scale industries" composed of a large number of scattered enterprises, they are, in fact, set up for high-cost production (for low productivity) and absorb a large over-all investment.

ECONOMIES OF SCALE

When planners programme industrialisation along the lines of geographic specialization of production, they create economies of scale (productivity) A producer enjoys 'external economies when he acquires low priced input factors supplied by a rationally specialized industrial system. A producer reaps external economies of scale as he buys input factors at lower prices (lower cost) — procures components and machinery at lower prices or better quality at the same price. A producer reaps such economies when industry locations conform to rational geographic specialization, when plant locations obtain intensive use of the economic overhead facilities (transportation facilities, technical schools), when industry achieves greater standardization of materials and plant facilities, and when industrial research obtains technological innovations for commercial exploitation.

A producer obtains 'internal-economies' not from "bigness" (capital concentration) per se, but from the adoption of process-related product lines and product-design approaches that yield sufficient volume of standard-type work for mass-production output, from large-quantity purchasing that lowers the input prices for materials, from mass-marketing that lowers distribution costs, from full-time use of managerial experts who obtain operating efficiency, and from internal technological improvements that lower costs.

HORIZONTAL AND VERTICAL INTEGRATION

When a producer sets up a horizontal combination (a multiple-plant unit composed of duplicate plants), he may obtain additional economies through greater bulk-purchasing of materials and lower over-all inventories, lower-cost distribution of goods, and fuller utilization of technical and managerial specialists and of service units, such as tool-and-die shops, maintenance shops, and facilities for disposal of wastes or for output of by-products. Since the magnitude of such economies differ among industries, analysts should, in each case, determine the amount of economies that can derive from a horizontal combination.

Enlargement of capacity through erection of duplicate plants (horizontal expansion) sometimes permits profitable vertical expansion — vertical integration of sequential plants linked to yield specific economies. When a producer brings additional sequentially linked and allied plants under his managerial control, he achieves greater vertical integration of production; in "fully-integrated" industries management controls operations from raw material output to the completion of the final product. Vertical integration, perforce, does not yield economies in production; it may merely yield monopoly profits through control of scarce materials. Opportunities for economies from vertical integration differ among industries — they tend to grow out of enlarged output, usually capacity enlargement through horizontal expansion.

Parts and components that were cheaper to buy when they were procured in small quantities may become cheaper to produce by the consuming enterprise when the items are absorbed in larger quantities; a producer may find it profitable to erect a feeder plant of economic size to supply his needs. On the other hand, on the basis of projected emergence of specialized plants of optimum size for efficient output of standard-type fabricated items and key components (control devices, fractional motors, plastic items), a producer may find it cheaper, in the long run, to buy these items than to produce them.

Through analysis, planners can ascertain the extent to which vertical integration can yield economies in a given industry. Analysts may find that vertical integration in certain industries obtains economies from greater specialization of sequential plants, elimination of some preparatory and terminal operations (heating of materials, inspection, packaging and handling), more uniform quality in materials, and lower inventory stocks. Where it is economically feasible, vertical integration can substantially lower unit costs and enlarge values added in production and the ratio of profits to sales.

OPTIMUM-SIZE PRODUCTION UNITS

From a technical standpoint, many processes and production techniques call for a certain minimum volume of output, below which costs will be excessive. Producers of machinery and equipment, moreover, offer only specified industrial sizes of equipment. Engineers must attain a sufficiently large volume of standard work for output to overcome the indivisibility of high-capacity machines and permit adoption of mass-production processes and the erection of efficient-size production units.

Analysts identify an industry's sources of scale economies as a basis for rationalizing operations and adopting mass-production industrial establishments of economic size. As outlined earlier, analysts rationalize an industry's production to obtain a large volume for mass-production output by setting up a process-related product line for each divisional unit, applying sufficient research effort, designing economy-model products (whenever possible), maximizing interchangeability of components, minimizing input of scarce factors, and setting up optimum-size plants.

When the production cycle is somewhat lengthy, engineers breakdown the over-all process into appropriate phases and set up separate plants for each. The constituent plants would include process-specialized plants for the fabrication phases of production and product-specialized plants for assembly phases or some economical balance of the foregoing. Engineers enlarge capacity in the horizontal direction (duplicate production lines) and in the vertical direction (add sequential plants) when analysis indicates that such enlargement would reap significant added economies from the intensive use of auxiliary plants, elimination of terminal operations, lower stock-ratios, and the like.

An "optimum-size" production establishment is one that obtains the lowest unit cost output in a given state of industrial technology. An industry's optimum-size divisional unit tends gradually to increase due to progress in technology (e.g., introduction of higher-speed machines and high-capacity equipment) and the inclination of certain products to become more complex, calling for longer processing as in the case of industrial machinery. The optimum-size divisional unit would obviously differ from industry to industry because of differences in plant divisibility, length of production cycle, and sources of scale economies. The optimum-size unit, for instance, would be larger (usually a multiple-plant complex) in the industries that put out bulky, high-value goods through indivisible facilities, lengthy production cycle, and integrated capital-intensive processes that yield substantial internal economies of scale. The investment required to erect an optimum-size production unit would be relatively smaller when economy-model products (say, typewriters, radio sets, sewing machines) are to be put out.

Whereas the optimum size of a plant tends to depend on the output capacity of the more expensive high-speed machines or equipment in the production line; the optimum size multiple-plant unit tends to depend on the capacity of its largest (in scale) optimum size plant. Analysts identify the optimum size divisional unit of an industry as that which fully employs (at rated capacity) the constituent indivisible units of high output capacity, such units as that of an integrated facility, a fabrication or assembly process, an expensive auxiliary plant, or, at times, an expensive distribution system.

Analysts often find that there is a size beyond which further enlargement obtains only modest gains in scale economies — obtains little reduction of long-run costs over a wide range of output capacity. Analysts, thus, identify a minimum economic-size production unit as the scale beyond which long-run cost tends to decline slowly (or tends to level off) over a wide range of output, as is the case in many manufacturing industries.*

Industrial engineers can design an "aborted" version of the minimum economic-size production unit .... a scale that permits adoption of high-capacity processes for the main phases of production and the adoption of less mechanized methods (including general-purpose machines) for the balance of the operations. Subsequent expansion to optimum size would involve higher incremental investment, including discarding of some equipment, than would have been the case had a true minimum economic-size establishment been initially erected. Planners, as a general policy should promote industrial expansion on the basis of optimum-size, or, at least, minimum economic-size units. A minimum economic-size unit, one pre-designed for horizontal or vertical expansion to optimum size, would involve relatively low incremental investment.

VALID SMALL-SCALE INDUSTRIES

Industries in which production technology yields an optimum-size unit at a relatively modest capacity-size are the economically valid "medium-scale' or "small-scale" industries. The mere physical possibility of producing at a small volume is not an economic or a rational basis for designing and promoting "small-scale" industries, small "ancillary" industries, or what not. Such a policy merely promotes low productivity, low-quality output, and a waste of capital resources.

The gestation time for programming and erecting a project depends on the amount of special facilities that must be built to order and the time required to design and erect plant, break in a work force, and eliminate processing flaws. The effectiveness with which planners pre-design industrial expansion programmes for speed of implementation influences the

* For discussion see John A Shubin's "Managerial and Indus trial Economics" (New York, N.Y., The Ronald Press Co. 1961) pp. 158-196.

gestation time and the incremental capital-output ratio.

Professional planners essentially phase and programme the expansion of industries on the basis of economic-size production units in the output of process-related product lines. They would in each case stipulate whether expansion should be on the basis of plants (or multiple-plant units) of optimum-size or minimum economic size, or on the basis of specialized industrial complexes of economic size consisting of two or more techno-economically related production units from different industries, each of which may be of (or below) minimum economic size.

For industries of relatively short over-all production cycles and divisible facilities, planners can programme comparatively small capacity increments on the basis of duplicate minimum economic-size (or optimum-size) units, with plant layout pre-designed for expansion at low investment.

For industries of indivisible facilities, planners would generally find that they must programme units of optimum size. Two or more techno-economically related units of optimum (or minimum economic) size from different industries, when located and set up as an industrial complex for common use of economic overhead facilities, would reap productivity gains from joint use of service units, auxiliary plants (waste-disposal or by-product plants), a common labour pool, training schools, and the like.

Planners may, in place of an optimum-size unit, set up two separately located units of minimum economic size with built-in provision for expansion. They would, for instance, find it advantageous to set up two units at separate locations in cases where each can support (through joint use of economic overhead facilities) production units of other industries that would not otherwise have been economically viable industrial projects. The foregoing technique for designing industry divisional units must take into account resource situations and other location considerations discussed below.

Rationally Balanced Geographic Specialization of Industry

On the basis of a resource survey and an economic analysis for regional comparative advantage, planners determine the fields of specialized production for each area that efficiently allocate resources. It is primarily through geographic specialization of rationalized industries that the economy obtains the most profitable allocation of resources.

If they are to rationally conceive the development of the economy and fully exploit the growth-and-productivity potential inherent in national-division-of-labour, planners must design the long-range growth plan to develop and integrate the national economy through balanced geographic specialization of industry. As planners successively design and rationally locate one or more industrial complexes of minimum economic size of each industry, they create specialized production centres which make up the country's geographic specialization of industry. An industrial complex of minimum economic size would be one that attains internal economies of scale and attains external economies of scale from intensive use of local infra-structure. An industrial complex of optimum size, however, would be one of bigger scale with somewhat lower long-run unit costs.

Professional planners locate industry complexes of economic size so that each area can specialize in that field of output that most efficiently employs the area's human and material resources. A divisional unit of an industry may consist of a single industrial complex of economic size (a steel complex, a motor cycle-and-scooter complex), one that essentially obtains the inherent economies of scale. When the planned output volume does not permit erection of a single-plant establishment of minimum economic size, or when an industry divisional unit, on the basis of projected output volume, does not yield an industrial complex of minimum economic size, planners, on the basis of techno-economic relatedness, set up and rationally locate a specialized industrial complex consisting of two or more process-related divisional units of different industries.

As compared to an "even" regional distribution of industrial capacity (often "fragmentized" capacity) currently programmed for erection, rationally-balanced geographic specialization of industries (industrial complexes of economic size, or groups of technologically-related and complementary producers of economic size) attains high-productivity output and a number of specific economic benefits that accelerate economic growth:

(1) Geographically specialized industries (logically-located complexes of economic size) can readily support an adequate research staff and laboratory which can design improved products, introduce cost-cutting innovations, and attain a flow of technological innovations that keeps the industry competitively abreast in trade.

Geographic specialization of industries (rationally-located industrial complexes) (2) permits industry-wide adoption of mass-production technology (including by-product output) that reaps internal economies of sale; (3) creates a pool of skilled labour and technicians and readily supports an adequately staffed training school, hospital, and the like; (4) attains an intensive utilization of specialized local infra-structure true that reaps external economies; (5) attains lower transportation costs through bulk-buying of materials and bulk-shipping of finished goods; (6) attains decidedly lower industry-wide stock-sales ratios thereby lowering the ICOR; (7) attains more uniform operations in the face of seasonal variations in business because an industrial complex can more effectively forecast sales, attain better quantitative change in the product mix to stabilize the level of output and more efficiently schedule long-term equipment overhauls for periods of slack production; and (8) requires less investment to expand capacity of high productivity or converts production facilities to the output of a remodelled (or a new) product; (9) industrial complexes, when located in a complementary environment (economically suited to the area) in terms of crop specialization and local industries, create an impact sufficient to stimulate economic progress in the area. Planners take into account the foregoing points for an evaluation of an industrial programme for high productivity and as relevant criteria for designing a rationally-balanced location pattern for industries.

ECONOMIC ANALYSIS AND APPROACH TO LOCATION

Planners identify the ideal location for an industrial establishment on the basis of the lowest long-term (the future) cost of production and distribution of goods. Location decisions must take into account the future size of the market, the future cost of input factors and transportation, and the particular advantages of proximity to allied or complementary industries. For this purpose, planners must analyze an industry's cost behaviour to identify the primary location determinants. By computing the comparative advantage of alternative locations on the basis of an industry's future (the relevant) cost of operations and distribution of goods,* analysts determine the net impact of the different location-determinants (the location "pulls").

When the material required is perishable or bulky and the share of transportation cost for receiving materials would be high relative to value added in production, the industry (identified as material-oriented or resources-based) seeks a location accessible to source of materials. Resource based industries are usually "weight-losing" (the goods put out by plants weigh less in the end than the material input) due to reduction of material during processing. Because it avoids costly transportation, location of plant at the source of materials markedly lowers the material input costs.

When finished goods are perishable or bulky and the share of transportation cost for shipping goods to market would be high relative to value added in production, a "market-oriented" industry seeks a location readily accessible to its major market area. An industry is also decidedly market-oriented if it calls for market accessibility (often location at its major market) for effective technical servicing of, and communication with, customers and for proper guaging of the shifts in customer needs (as in the case of tool-and-die shops and machine-building plants).

In an economically advanced country, industrial engineers generally locate an enterprise on the basis of the lowest unit cost for producing and marketing the product; the locating of an enterprise usually involves a comparatively small capacity accretion relative to the size of the industrial sector, though the capacity of the new plant may be big. This location process, appropriate to an advanced economy, essentially adapts a small increment of capacity to an existing industrial environment and pattern of geographic specialization of production which has evolved as producers in high-cost locations are gradually eliminated (or induced to relocate) by the competitive process, where industry is not monopolistic and a sellers' market is absent.

The economic approach for locating industrial plants in a developing economy under rational planning would differ from that of an advanced economy. For instance, many of the "external" pulls that influence plant location in an advanced country become "internal" industrial inter-relationship. This is because analysts design industrial complexes and typically programme and erect vertically-related segments of capacity in line with a pre-determined rational location pattern for industry. Planned integrated development involves relatively dynamic development which creates its own economic environment for optimum production. An analyst creates an optimum economic environment for production by the **"simultaneous" location** of industries and industrial complexes on the basis of mutual comparative advantage of inter-related specialized centres of production.

INDUSTRY LOCATION UNDER DYNAMIC CONDITIONS

If they are to realistically locate industries for geographic specialization and high productivity, planners must not only locate industries programmed for immediate development, they must, at the outset, locate future industries of national scope a decade or more ahead. In their location study, analysts proceed as if each industry were developed to optimum; they take industries in their developed state (taking into account latest emerging technology) to determine the future rational location of industry (the future national division of labour).

Professional planners develop a rationally balanced geographic specialization (a location pattern) for industries through (1) survey and analysis of the country's particular resource distribution and the assessment of the potentialities of modern transportation, (2) designing industry specialized complexes (or establishments) on the basis of their techno-economic inter-relationship and in conjunction with the geographic situation of resources, and (3) mutually locating industry establishments and specialized industrial complexes on the basis of long-term comparative advantage, computed for the relevant time horizon and in terms of future costs. Through an intensive study, planners can obtain a highly productive, regionally balanced location pattern, one which can be economically superior to that of advanced countries. They can, for instance, avoid excessive geographic concentration of industry, while obtaining specialized production centres of economic size.*

SEQUENTIAL PROCEDURE

Conceiving the country's national division of labour as an integrated entity, planners project (say, into the 1980's) the main outlines of the national transportation and power system, locate major resource-based and early-stage industries, and then mutually locate intermediate-stage and late-stage industries on the basis of analysis of inter-relationship of activities and computations that would obtain for the future sector-composition of the economy.

Because the location pattern of resource-based industries and specialized agricultural areas (the "independent" locations) tends to pre-determine the location of many intermediate and late-stage industries (the "dependent" locations), planners essentially observe a sequential procedure (a chain reaction path) for locating industries, systematically back-tracking in their study; and they take into account the fact that major resource-based industries and agricultural areas are important markets that influence the location of some market-oriented industries. Though the locating procedure is to a degree both sequential and circular, there are many industries that must be dispersed on a productivity basis, ascertained through economic analysis.

In the earlier stage of economic development the spotty availability of lower-cost power tends to exert an undue long-term influence on the location of industry. The transmission of power is expensive when it is to supply a smaller industrial project, and a small local generating station provides costly power. From a survey of fuel sources and hydro-power sites, planners project power supply and the future power grid. As power output rises and the range of the high-voltage transmission increases, the emerging power grid lowers the cost of electricity, improves the reliability of supply and permits greater flexibility in locating industries. Planners identify areas of future low-cost power in large volume as potential location for aluminium reduction plants, electro-chemical plants, and other industries that call for inexpensive power in big quantities.

Planners ascertain the potential agricultural capacity, taking into account irrigation and reclamation, and indicate the priority for developing capacity. On the basis of climate

* For discussion of methods for determining future costs see John A Shubin's "Managerial and Industrial Economics" (New York, N.Y., the Ronald Press Co., 1961), pp. 305-309.

* In place of "locate when you programme projects and consider regional climate of opinion", a staff of location scientists (industrial economists, geographers, engineers) would obtain a rationally-balanced geographic - specialization - of - industry pattern as an alternative to the regional fragmentization of industrial capacity on an "even" basis (particularly manufacturing capacity). If many of the establishments evenly distributed for "balanced" growth are not economically viable or progressive, the economically irrational distribution of industries is essentially not even.

and soil, they determine the long-term geographic specialization of agriculture, delineating for each area the optimum specialization of production on the basis of more advanced methods and the necessary conversion from current to optimum specialization. Planners would identify the areas of higher-yielding specialized lines of crop, livestock, or dairy production (the resource-related product line) and determine optimum-size processing plants (including by-product output), low-cost marketing system, and the share of output to be transported to distant markets.

They identify local production centres composed of textile mills, sugar mills, canneries, pulp mills, meat packing plants, dairies or other agro-based industries. By projecting future transportation and the output of rich areas, planners identify the main local production centres that would be favourable future sites where suitable manufacturing establishments can be located for high productivity. Planners, too, would consider locating adjacent to agro-based production centres one or more suitable complementary establishments (beverage plants, fertilizer plants, cement plants) for more intensive use of local infra-structure and for greater growth momentum.

RESOURCE-BASED INDUSTRIES

Some raw materials are somewhat widely distributed (are ubiquitous), as in the case of brick clay, limestone, and silicon; while other raw materials are available only at certain places (are localised), as in the case of coal, iron ore and bauxite. The relative influence of raw materials on the location of an industry depends not only on the anticipated cost of transportation and how economically materials can be shipped, but on the degree of bulkiness and perishibility and on the extent to which plant processing brings about "weight-losing" during the transformation of materials into a more finished state. Weight-losing materials tend to attract resource-based industry to the location of the source of materials.

A survey and an identification of a region's resource endowments enables planners to indicate the kind of specialised production that is possible. Planners would rate resources on the basis of richness, accesibility in terms of projected transport technology, and feasibility for exploitation by plants of economic size.

Location planners note that, as a general rule, when complementary resources for output of primary materials (iron ore and coal for output of steel, or bauxite and cheap power for output of aluminium) and the material-consuming industries are in close proximity, or can be arranged for "close proximity" in terms of future transport technology, the vertically-related productive capacity can readily be established on an economic basis. The related industrial capacity (the industrial projects) must, of course, be programmed and erected as an integrated segment of capacity to obtain at the outset high utilization of the installed capacity.

In selecting economical locations for projected intermediate-stage and late-stage industries, planners thus take into account the future supply of required materials, i.e. the availability and location of resource-based industries. In jointly locating the foregoing vertically-related industrial establishments, planners take into account the benefits of proximity to technologically complementary industries in adjacent areas. Planners determine the final location of vertically-related establishments on the basis of comparative advantage for the proper time horizon and, in this way, formulate future geographic specialization of industries.

In many regions, for example, a number of commercial deposits of limestone for cement output are generally available; deposits selected for exploitation, however, depend on the location of markets. Thus, whereas sites of cement plants are raw material-oriented, the regional location of plants is market-oriented. Projected locations of cement-consuming industries (areas of future construction and industrial activity) identifies the limestone deposits where cement plants would be sited. Future cement plants would, therefore, find their ideal location where supplies of raw material and fuel are in close proximity to each other and to a future large market for cement. The analyst would, of course, determine future "close proximity" on the basis of the share of shipping cost relative to value added in terms of the future transport technology. Hence, when complementary resources and consuming industries can be located for close proximity, future resource-based industries and material-consuming industries can be established on an efficient basis.

The geographic arrangement of the aluminium industry involves locating the vertical stages in the over-all production cycle, that is, locating the mining of bauxite, production of alumina, electrolytic reduction for the output of aluminium, and fabrication of final products.

Good quality bauxite deposits are generally available at only a few locations. Planners locate mining facilities on the basis of richness and economy of extraction; and they identify the ports from which alumina (or bauxite) would be received if some of the material is to be eventually imported.

Because bauxite is a weight-losing material and it is cheaper to transport alumina, planners locate alumina plants close to bauxite mines. If bauxite deposits are located inland and a significant share of the alumina is to be exported, the best location for an alumina plant may be at the nearest coastal shipping point. The choice of locating aluminium reduction plants is much wider than hitherto because power can be more economically transmitted over considerable distance. If aluminium is intended primarily for export, planners would locate aluminium producing plants at coastal sites accessible to cheap power sources. For the domestic production, they would locate reduction plants close to the centre of the major markets so long as power is cheap. Planners locate aluminium fabrication plants at transportation centres within the markets they are intended to serve.

Where the geographic and industrial environment is permissive, vertical integration of the aluminium industry would reap economies from the lowering of overhead and maintenance costs, elimination of some transportation, and the movement of metal from the reduction to the fabrication plant in the molten state, thereby eliminating the need for fuel and facilities for remelting.

THE STEEL INDUSTRY

Areas where ample deposits of coal and iron ore of suitable quality are in "close" proximity on the basis of future shipping costs are potential areas for steel works. Planners take into account accessibility to sources of steel supply when they determine the lowest-cost future location of the major steel-consuming industries (motor vehicles, tractors, machine building), some of which would be market oriented. By locating future steel-consuming enterprises and taking into account future transportation costs, planners identify which of the potential steel-producing centres should be elected as sites for future steel work and what kind of semi-fabricating and steel-finishing capacity should be provided.

Because resource-based industries typically involve the processing of materials (pig iron, oil) through vertically-integrated facilities for conversion into a number of products, analysts would check the facilities and infra-structure of such industries for possible linking to support other types of plants. For this purpose, they review the processes of different manufacturing industries to see which can be profitably located with the plants of resource-based industries for joint use of auxiliary plants and local infra-structure as well as for joint exploitation of common raw materials and by-product materials.

THE HEAVY ENGINEERING INDUSTRY

For instance, heavy engineering operations (output of railway rolling stock, cranes, excavators) are, in part, an extension of the semi-fabricating and metal-finishing operations of steel works. Planners link to steel complexes the process-related product-line divisions of the heavy engineering industries to obtain specific benefits from vertical integration and economies from the joint use of local infra-structure. The steel-and-heavy-engineering complexes that are to supply structural steel, heavy boilers and other heavy fabricated items of geographically-scattered markets must be accessible to centres of transportation.

The cost and efficiency of transportation influences the location of industries and the kinds of specialized industrial complexes that can be set up. An expanded system of economical transport for the country not only widens the supply of raw materials, but enlarges the scope of markets and broadens the dispersal of larger-scale enterprise and industrial complexes of economic size. An early development of an economical transportation system would, therefore, promote a wider spatial distribution of enterprise of economic size.

Though the cheaper the cost of transport the more broadly dispersed can be the centres of specialized production, initially, however, the investment for expansion of transport competes to a degree with investment for industry. In developing the economy, planners must balance the long-term gain from investing for a well-developed transportation system and more mass-production type industry (low-cost production) against the gain from investing for development of a larger number of more local-type enterprise (higher-cost production) and fewer transport facilities.

"LOCAL" VALUE ADDED IN PRODUCTION

When planners locate plants at some distance from the source of material supply and the market, plant operation must obtain sufficient economies of scale and substantially greater "local" value-added in production so as to offset (or more than absorb) the proportionately larger cost of transportation. Industries that obtain economies of scale and greater "local" value added in production can more readily absorb transportation cost. Industrial planners can, to a considerable extent, select appropriate industries and set up industrial complexes and local suppliers of materials so as to enlarge local value added in production, as well as reduce transportation expense through bulk shipping and handling and reduce inventory stock ratios.

Well-designed industrial complexes in some fields of output (drugs and cosmetics) would involve small transportation cost for a number of peripheral locations that would be economically suitable. For certain fields of output (home electric appliances), analysts can specially design industrial complexes for peripheral locating at low transport cost for the receipt of materials and for shipping goods to scattered markets.

The more extensive and economic the transportation system, the wider can be the dispersal of specialized production centres and the greater the value added in production through effective merging (grouping for economic gain) of national industries with the production centres of local industries. For instance, smaller industrial complexes of economic size could be spotted at centres of agro-based or local production. Therefore, the more developed the transport system, the more regionally balanced the national division of labour and the effectively integrated the national economy. Moreover, a well developed transport system, particularly trucking, reduces the inventory stock ratio and the incremental capital-output ratio for industry and obtains greater flexibility for shifting the direction of economic development.

Analysts classify (or cross-classify) the different industry production divisions on a techno-economic basis — i.e., on the basis of process relatedness, similarity of labour skill and material input, infra-structure needs, and demand relatedness (common distribution channel). On the basis of the foregoing techno-economic relatedness, analysts first group and make up "technically" - specialized complexes for projected industries; from these they then design and locate "geographically" - specialized industrial complexes on the basis of the over-all resource situation and the projected spatial distribution of agricultural specialization and extractive production already determined. They seek out and merge industry production units that are process-related, or are otherwise complementary, to make up industrial complexes (specialized production centres) to obtain scale economies from geographic specialization and intensive use of local infra-structure.

LOCATION OF COMPLEXES

Analysts typically locate industries of short production cycles and indivisible facilities on the basis of optimum-size plants. Analysts locate two or more techno-economically related optimum-size plants from different industries when they can advantageously obtain common use of economic overhead and reap productivity gains from joint use of auxiliary plants (waste-disposal or by-product plants), a labour pool, etc. In place of a large optimum-size multiple-plant unit, analysts may set up two units of minimum economic size with provision for expansion. This is because they often find it advantageous to set up two units of minimum economic size at separate locations where each can support (through joint use of economic overhead) other enterprises that would not have otherwise been viable projects of minimum economic size.

As compared to several separately-located enterprises (some being of uneconomic size), the constituent enterprises in a specialized industrial complex not only enjoy higher productivity stemming from scale economies, but enjoy a lower stock-sales ratio, greater adaptabili y for changes in the product mix, and a lower incremental capital-output ratio in expansion or in adoption of new products and revision of production facilities to match.

An industrial complex may be loosely integrated for joint use of local infra-structure to obtain external economies or it may be closely integrated for joint use of processing facilities and auxiliary units to obtain internal economies as well. Complementary constituent enterprises of a specialized complex obtain high productivity because they draw on the same feeder plants for components and draw on tool-and-die shops, maintenance shops, pools of skilled labour, technical schools, hospitals, and the like. Industrial centres may range from relatively small, narrowly-specialized complexes of minimum economic size to large broadly-specialized complexes of minimum economic size; and their production facilities may differ

in the degree of adaptability or convertibility for output of related products.

MARKET-ORIENTED INDUSTRIES

In locating later-stage industries, planners must take into account not only the locations of projected industries that will supply basic materials, but the location of projected "customer" industries and final consumer markets. For example, the location of the chemical and the aluminium industries would take into account the location of customer industries.

After identifying industries that will, for some time, remain too modest in size for operation on an economic basis, analysts group two or more techno-economically related units of such industries, rationalize production to obtain a larger volume of standard-type work for output and, then, design a specialized complex (a specialized production centre). An analyst would, for instance, review the "perspective" output targets for motor vehicles, tractors, and self-propelled farm-machinery, review targets for watches and precision instruments, review targets for pharmaceuticals, insecticides and dyestuffs, and review targets for various lines of machine tools. He would likely find, that, because of their techno-economic relatedness of each, he could design one or more specialized complexes of economic size for each group

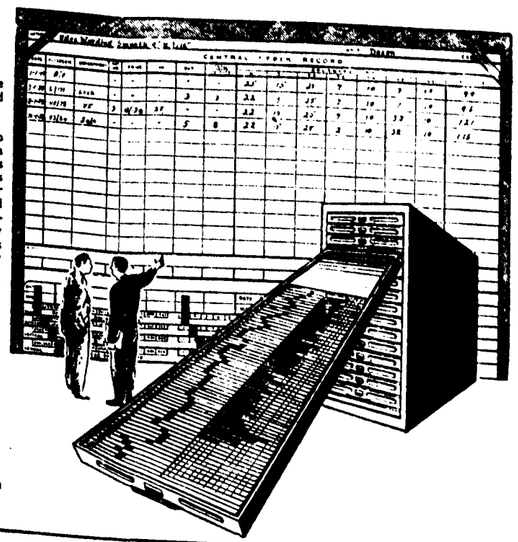
The complexes in the engineering industries group would, for example, permit tooling up of fabrication plants for long production runs in the output of components. The projected feeder plants would supply items to the different assembly plants, each of which would produce a separate line of products. Each product-line divisional unit would likely, of course, be separately managed

An analyst will note that a projected geographic centre specializing in a given line of machine-building attracts related engineering industries that seek locational access to low-cost suppliers of tooling, components, and fabricated parts. The centre would, for instance, attract a division of the machine-tool industry to supply the required specialized machinery to the localised cluster of plants as well as to national markets.

As analysts continue in their locating procedure, they evolve, an emerging constellation of engineering industries (spatially related industrial complexes) for mutual economic advantage, as well as for both accessibility to sources of material supply and accessibility to the over-all market for their finished goods.

A specialized industrial centre for output of machinery, motor vehicles, tractors and farm machinery, would, for example, influence the location of supplier enterprises that produce such key components as electric generators and motors, meter-gauges, roll and ball-bearings, gears, axels, etc. In this regard, and to further pursue the art of obtaining ("carving out") a large volume of standard-type work for output by widely dispersed high-productivity complexes of minimum economic size, planners should prepare a special-purpose input-output table for projected national industries in order to identify the inputs of major fabricated parts and key components. Engineers could then group process-related components and, wherever technically feasible, re-design the items to absorb the same material and to obtain the interchangeability of components as they do for electric motors and roller and ball-bearings. They would set up rational product lines to obtain a large volume of standard-type work for output by feeder plants of economic size.

Industrial planners, thus, essentially group techno-economically related enterprises to make up specialized industrial complexes of economic size and locate the complexes to minimize the future combined cost of transporting materials to the industrial sites and shipping finished goods to the market areas. In the long run, the best location for an industrial complex of economic size often depends on minimizing the future combined cost of transportation.



The mutual locating of complexes of related industries for maximum economic advantage (the designing of an integrated constellation comprised of related complexes) reduces transport cost per ton, lowers the stock-sales ratio, and obtains scale economies in other ways. Since they "feed" one another, the specialized production centres that make up a constellation are largely "self-contained" for purposes of internal production and consumption and they conform to geographic specialization of production by supplying products of high unit value to national and international markets

VISADEX
THE DASHBOARD OF BUSINESS

Work the VISADEX way to get the best out of your men, machines and materials.

VISADEX can tell you what you need to know at a glance. VISADEX offers you a fluent indexing system by which records are kept on cards, while colour signals spotlight what things are in stock or needed, whether production is ahead of or behind schedule, sales are increasing or decreasing, where to intensify advertising, which department requires more personnel, who owes you and how much . . . VISADEX, in short, affords greater control at less cost, besides keeping records secure.

Our VISADEX Representative will be happy to show you, without obligation, how simple VISADEX is to operate—either with Card Packets or Board Card-holders—and how easily it can meet your specific requirements.

WINDOW ON THE WORLD

Sterling Area and Franc Zone—II

From our Special Correspondent

PARIS:

THE RELATIVELY greater cohesion of the franc zone compared with the sterling area, it was argued here last week, is not due to rules and regulations, not to a greater willingness to collaborate in one former empire than in the other, nor even to the more rapid decline of "imperial trade" inside the sterling bloc. It is due to the impressive solidity of the franc on world exchange markets, compared to the recurrent bouts of weakness to which sterling is subject. Two conclusions follow. Firstly, the present unity of the franc zone cannot be taken for granted but will last as long as the French currency maintains its pre-eminence on exchange markets; conversely, the fate of the sterling area is not sealed, but could be transformed by a recovery of confidence in the pound sterling. Secondly, it is not the unco-operativeness of overseas members of the sterling area that is weakening the pound, but the other way about: they will collaborate more consistently when the British currency inspires more confidence.

This enables us to see at once the fallacy of one suggestion for promoting more confidence in sterling: namely, that London publish not simply the United Kingdom's gold and dollar reserves each month but also those of the whole sterling area, including metal and currencies held by overseas members in individual reserves. For a start, not all members reveal their holdings of dollars, etc., though most do declare their gold stocks to the IMF. If the figures became available, they would make the resources of the sterling area look a lot healthier than they do now, when only sums left in London in the common pool are declared. But there would be no point in pretending that a common pool existed when it did not. If members are holding gold and dollars outside the common kitty, it is because they distrust sterling. The distrust of third parties (and even less their own distrust) would not be diminished by pretending that this was not so. The only justification for publishing a total of reserves inside a monetary bloc would be that all members used a single exchange market for all their transactions, ceding their currency gains there and buying the moneys they required there. Otherwise, the Common Market Six could publish their total reserves each month, whereupon it would appear, on paper, that they exceeded those of the USA; this is true, but economically meaningless as long as the Six do not cede gold and dollars on one market.

Boost Internal Trade

Other remedies for the slow dissolution of the sterling area are held to be a more rapid increase of trade within the area than between members and the outside world, along with a short-term credit arrangement between Commonwealth banks, similar to the Basle agreement. Whatever assistance these might be, it would be less than the contribution to be made by Britain herself, by increasing her competitiveness in comparison with the Continent and by accelerating British industrial expansion and exports. In other words, nothing will really replace a strong pound as the kingpin of the monetary bloc, and when that is obtained the other things become unnecessary, as the present situation of the franc zone, firmly based on the solid French money, sufficiently reveals. Besides, those other measures would require that London make demands on the overseas members for the sake of propping up the sterling area, whereas the mood of all less developed members of monetary blocs (whether it be the sterling, franc or dollar zone) is one of suspicion, so that they will co-operate only when it is painless and profitable to do so. This is the case when the pilot-currency is beyond question on world exchange markets, whereupon the advantages of doing business through a highly developed, single exchange-market plainly outweigh the sentimental objections to relying on the former imperial capital.

Such objections have been voiced, inevitably, in the African countries that now continue to work within the framework of the franc zone, and they would have been fatal to that zone were not the conveniences of buying and selling currencies in Paris so evident. If the French had had to rely, in order to keep the franc zone in operation, on wheedling and coaxing such as is recommended to London in regard to the overseas sterling area capitals, the system would have collapsed long ago; one can imagine the retort of Guinea, Mali and Algeria to requests that they make sacrifices for the sake of the franc zone. Folk who think that London would get a better response from its sterling area partners, without making the pound as solid as the franc is, are deluding themselves.

Franc, Hard Currency

The overseas members of the franc zone are constantly on the lookout for signs that membership of the zone is hampering, in any degree, their economic independence. As long as the franc is a hard currency, they find in reality that, far from hampering them, it actually promotes their commerce with the outside world and with each other, leaves them master of their trade policy and allows them to diversify their exchanges. Thanks to the decentralisation of authority inside the zone, the individual African capitals fix their own import needs and allocate foreign currencies to meet them, issue licences and determine quotas. Each state has complete freedom to negotiate trade pacts with countries outside the zone and they have all made full use of that freedom: they signed 60 trade pacts with outsiders last year, and more have followed since African governments began to establish their own diplomatic posts around the globe. Membership of the franc zone leaves them at liberty to impose protective tariffs or fix quotas for goods from elsewhere in the zone, notably from France. In general, their trade shows the same diversion away from the old imperial channels to a more multilateral pattern as is seen in the sterling area.

These things should go without saying, because if they were not true the African members of the franc zone would not be truly independent. But they are mentioned to show that an identical transformation is occurring inside the franc zone as inside the sterling area, and yet in the one case is perfectly consistent with the persistence of a monetary bloc. The only explanation is that this persistent unity is rooted in the advantage of using a highly developed money market and a currency enjoying untarnished prestige. As long as French reserves are high (and at the present moment they are $4457 million, alongside Britain's $2740 million, although the franc zone's volume of trade is significantly lower than the sterling area's) and the franc beyond question, both France and the former colonies and protectorates derive benefit from monetary co-operation. Let the franc weaken, however, and France would find the franc zone a deadweight burden and the other members would discover all sorts of impediments to their economic freedom. This is currently the situation in the sterling area. The currency needs of the overseas members are felt to be a drain on Britain, while those members are suspicious of the obligations of monetary co-operation and seek to build up private gold and dollar reserves.

The comparison of the sterling area and the franc zone, then, is a particularly suitable case to show the mainspring of a monetary bloc — for none would suggest that the French have shown superior wisdom either in winding up their empire

or in arranging their financial affairs than have the British; the contrary rather could plausibly be argued. But the fact is that for five years the franc has been stronger than sterling, in fact as strong as the dollar. The viability of the franc zone, and doubts about the sterling area, spring from that source alone. It is true that the existence of monetary blocs is a relic of imperialism, in that the empire provided the framework for a community of interests in the past, at a time of monetary instability and balance-of-payments troubles; hence there is no Deutschemark area though the West German currency has been as solid as a rock these 15 years past. Such blocs can persist however, after the winding up of empire, only if the pilot-currency fulfils its role unequivocally, as a better money than that of the newly independent nations.

If that condition is met, former colonies are not slow to avail themselves of the advantages of an expert exchange market in the former imperial capital, and will find no restrictions on their economic freedom in using it to buy and sell all their foreign currencies. If it is not met, and one cannot say that sterling has filled the bill in recent years, no amount of coaxing, trade preference, credit agreements and the like will serve. Hence the irrelevance of many plans to restore the fortunes of the sterling area, which do not take as starting point the strengthening of the pound by measures to be taken in Britain itself. An unquestioned pilot-currency has no difficulty in transforming the old imperial connections into a contractual and purely voluntary monetary co-operation.

The point has application beyond the monetary sphere. Both the two great ex-imperialist powers have been agitated lately by debates about how far they should make sacrifices to preserve the connection with their former colonies, and how far they should put their own interests first. In Britain the issue came up acutely in regard to the Common Market; in France it is kept alive by the opponents of development aid. The truth seems to be that there is no contradiction between these two aims. By strengthening its own economy and maintaining the prestige of its own currency, as a first duty, the former imperialist can preserve its "sphere of influence", for it offers former colonies facilities they find nowhere else, and at no cost to their independence. On the other hand, mere goodwill and imperialist nostalgia will save nothing, while rules and regulations will only be resented, if the leader of the zone suffers its economic and monetary prestige to be impaired.

Postwar Capital Movements

JOSSLEYN HENNESSY

LONDON:

THE PAST, present, and future of the sterling area was the subject of stimulating studies some time ago in the Treasury Bulletin for Industry, and the Reviews of the Westminster and Midland Banks.

The TBI shows that the element of discrimination in imports which distinguished the defence mechanism of the sterling area in war-time has disappeared and that today the sterling area has become once more what it was in prewar days — a group of countries which, in their financial relations, have no political ties, but which keep their balances in London and do a large part of their business in sterling, because they find it useful to avail themselves of London's banking facilities, and because between 30 and 40 per cent of world trade is conducted in sterling.

Recondite research has enabled the Midland Bank to produce a mass of new statistics showing for the first time where and in what amounts sterling is held overseas, in what types of funds (Bank deposits, Treasury bills, Bills and Notes etc.), what the sources of supply of sterling are, what its hidden reserves, and so on, which should be of exceptional interest to Ministries of Finance, bankers, financiers, and economists.

Of somewhat more sinister interest is an article by Mr. A. R. Conan (formerly of the Commonwealth Economic Committee) in the Westminster Bank Review, which has attracted widespread comment in the UK economic press. Mr. Conan says, in effect, that the current insistence in most countries that the surplus or deficit on current account is the major factor in balance of payments problems is to put the cart before the horse, and is as out of date as the pre-Keynesian insistence on a budget surplus. What we should be looking at is the balance on capital account.

In the early postwar years, it was argued that it was the loss of income from liquidated overseas investments which created the UK's balance of payments difficulties. But these losses were, in fact, soon made good by new capital exports, which now total £4,500 m. (so that in 18 years the UK has, in monetary terms, invested as much as she did in the whole of the previous century). Already by 1958, UK overseas investment income was £700 m. compared with £328 in 1938 (adjusted to 1958 values). Even the net overseas investment position after deducting Government external debt and foreign capital invested in the UK has long re-attained prewar level. The UK's recovery of creditor status suggests that loss of it cannot be a major factor in lack of confidence in sterling.

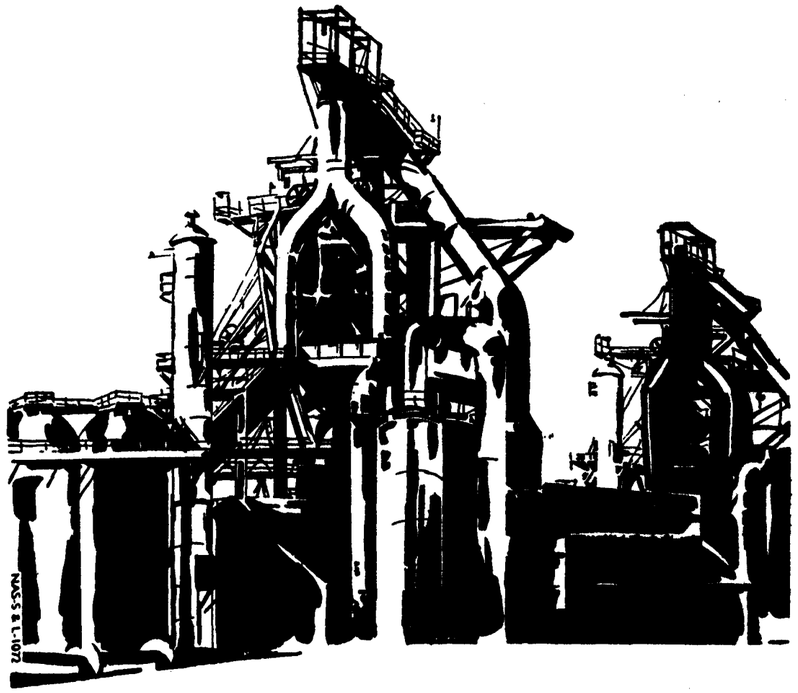
Although income from foreign investments was thus higher than ever before, balance of payments difficulties persisted, and the next argument was that the surplus on current account was insufficient to finance overseas investments and to increase the reserves. Therefore it was vitally necessary to step exports up. This is the theory that Mr. Conan sets out to rebut.

For Mr. Conan, it is the massive exports of long term capital which are the villains of the piece. Since the war, the flow of capital into the sterling area has exceeded £6,000 million, about half of which has come from the U.K. and about half from the U.S.A. and non-sterling sources. Since the total pre-war sterling area debt was less than £3,500 million, it follows (a) that the cost of servicing the post-war debt is about twice the pre-war cost and (b) that the service — estimated at £200 million per annum — of the £3,000 million borrowed from outside the sterling area is a recurrent and ever increasing drain on the area's central reserves — the "sterling balances" — in London, which constitute the greater part of the U.K.'s external indebtedness.

Although the total of these balances has varied little since the war, movements of capital have transformed their character. At the end of the war, the Rest of the Sterling Area's balances totalled £2,400 million. Since then the U.K's cumulative surplus with the R.S.A. has been over £4,000 million. What kept the R.S.A's balances form disappearing was the enormous flow of capital into the sterling countries, which created new liabilities for the U.K. as well as new assets.

U.K. capital exports have thus sustained the assets of the overseas sterling area. For the area as a whole, such capital movements are domestic transactions which do not affect its relations with the non-sterling world. But other capital movements do affect these relations, in particular London's reserves are replenished by capital imports from non-sterling countries. The trouble about this is that the overseas sterling area does not earn a surplus with the non-sterling world, so that the level of the U.K.'s reserves depends mainly on capital receipts. This is risky because the capital inflow may dry up, investment may be repatriated, and there is the ever increasing cost of servicing it.

Hitherto, the orthodox solution for this has been that the U.K. must increase its export earnings on current account to



S. & L. AND STEEL PLANTS

S. & L's experience over many years at the great steel plants at Jamshedpur, Burnpur, Durgapur and Bhadravati place them in a unique position to serve the growing Steel Industry.

Recognised as the leading manufacturers in India of fabricated pipework, S. & L. offer a complete service from design to commissioning, with all materials and workmanship of the traditional high standards associated with S. & L.

S&L **STEWARTS AND LLOYDS OF INDIA PRIVATE LTD.**

Regd. Office: 41, CHOWRINGHEE ROAD, CALCUTTA-16. PHONE: 44-2311
Branch Office: Himalaya House, 5th Floor, Palton Road, Bombay

replenish the reserves and pay for the costs of servicing foreign investment in the sterling area. Mr. Conan thinks this unrealistic: the U.K. does not usually earn a surplus with non-sterling countries and its normal surplus with the sterling countries is financed by reducing the sterling balances. In such conditions, capital movements are the major influence on the reserve ratio. The flow of capital from the U.K. reduces the ratio because it increases liabilities: on the other hand, the reserves are maintained by imports of non-sterling capital into the U.K. and the overseas sterling area.

The U.S.A.'s recent history seems to support Mr. Conan's argument. Between 1958 and 1962, the U.S.A.'s cumulative current account surplus was $10,000 million. Yet this has been wholly inadequate to finance private and government capital exports, which have caused heavy U.S. gold losses and increases in short-term liabilities.

The U.S. government's view that the balance of payments cannot be controlled solely via the current account, and its move to discourage capital exports, is in line with Mr. Conan's arguments, and the U.K. Labour party's itch to control everything within reach suggests that, if it is returned to power, the U.K. will quickly do more than "discourage" exports of capital.

I hate to draw a moral, but it looks as though India's planners should now assume that the 1950s were the golden age of capital imports. If this forces them to give spectacular industrial projects a breather and to concentrate on building up an agricultural surplus, this ill wind may yet blow some good.

Prices and Productivity

GUY SIMS FITCH

WASHINGTON:

THE PROBLEM of maintaining price stability in a sustained and buoyant economic expansion is drawing increased attention in the United States. Awareness of the problem, one hastens to add, is not to be confused with alarm. Rather, it reflects what Walter W. Heller, Chairman of President Johnson's Council of Economic Advisers, calls a "prudent concern about the price and cost pressures that typically crop up in the American economy at or near full employment". To the extent that prudent concern embraces prudent action, it helps keep inflation's potential threat from becoming a present reality. Mr. Heller has had a good deal to say on this subject, most recently when he participated in a meeting of the Mid-west Economics Association at Chicago, Illinois. Here, in his own words, are answers to some of the major questions being asked about price-wage trends:

Why is there concern about prices now?

"Such concern is, in a sense, a measure of the success of expansionary economic policies. It is precisely because the U.S. economy has shaken off its lethargy and is well on the way back to levels of employment and capacity utilization we can be proud of, that we are looking to our price stability laurels".

Price Stability Laurels

Just what are those laurels?

"The record of the past three years is one of enviable price and cost stability. Indeed, for half a decade — since 1959 — prices in the United States have been on a plateau. In March 1964 our wholesale price index was a shade below the average for 1959. The consumer price plateau has a slight slope — about seven per cent higher than in 1959. But much of this increase has been offset by improvements in the quality of consumer goods and services."

What is so exceptional about this?

"Our recent price stability has not only bettered our own past records but has been superior to that of any other industrial country in the world. Part of the credit must go to moderation in wage increases, which have stayed close to the bounds of productivity. This has greatly enhanced our international competitiveness without blocking the rise in real wages at home."

How has the American economy fared during this period of price stability?

"What is most gratifying is that this period covers 38 months of economic expansion since early 1961. We have experienced a 17 per cent rise in real gross national product over a three-year period, with a 22 per cent rise in current-dollar GNP. In the process, the spectre of 'inevitable' creeping inflation has quietly faded from the scene. To keep him off stage — without the unwelcome aid of excess unemployment and idle capacity — is the important and more difficult task that lies ahead.

How could the present price-wage balance be upset?

"General price increases in industries where costs are stable and profits high and rising could well touch off wage increases in excess of productivity gains, which in turn would raise unit labour costs and provide justification for further price boosts, and the price-wage spiral would be on its way. Alternatively, the spiral could originate with excessive wage claims."

What forces are working against such a development?

"Although increased demand may make it easier for employers to pass on labour costs increases to consumers, there are important counterpressures. Foreign competition, public opinion, the administration's clear stand against unwarranted price increases — and business men's awareness that price increases will come back to haunt them in the form of higher wage demands — all are constraints on price raising".

Role of Public Opinion

How does public policy enter this picture?

"Awareness of the part that discretionary price and wage making can play in generating and contributing to inflation has been growing in the United States since the 1940's. Both Presidents Truman and Eisenhower engaged in occasional 'moral suasion' efforts to discourage price and/or wage increases. But these were typically ad hoc exercises, not regularized policy. However, these earlier trial runs did build acceptance of the concept that the public has a legitimate, vital and inescapable interest in the outcomes of key private wage and price decisions. The 'guidepost' policy of the Kennedy and Johnson administrations is an attempt to regularize the expressions of this interest and imbibe it in a systematic policy that can be made effective without compulsion".

Just what are these guideposts, and how do they operate?

"The guideposts express a sensible view of how the wage and price system can adjust to continuing advances in productivity in a non-inflationary manner. Their import is sufficiently clear that the parties to particular private decisions can tell, within tolerable limits, whether contemplated price and wage changes are consistent with them."

What controls do these guideposts impose or envisage?

"The guideposts contain no element of control — or of incipient control. On the contrary, they represent a strategy for encouraging voluntary exercise of social responsibility by private decision-makers instead of invoking the kind of mandatory 'incomes policy' that would be unacceptable to us in this country."

How effective can such a strategy be?

"We in government are hopeful that this strategy will prove successful. Its record since 1961 has been encouraging. The business and labour communities are keenly aware of the test to which private decision-making is being put. And we have a President — firmly dedicated to the success of the policy — who has not been and will not be hesitant to remind them."

Seven Per Cent Growth in Fourth Plan!

By Our Special Correspondent

NEW DELHI:

ACCORDING TO the indications available, the overall financial outlay of the fourth Plan is likely to be fixed at Rs. 20,000 crores — Rs. 12,000 crores for the public sector and Rs. 8,000 crores for the private sector. The Planning Commission is having a full-dress meeting on May 10 to adopt the draft frame of the fourth Plan. The meeting will be presided over by the Prime Minister.

Although various exercises have been carried out by the Commission in regard to the sector-wise break-up of the fourth Plan outlay, these are said to be only of a tentative nature to be finalised when approval is granted at the May 10 meeting for the rate of growth to be achieved during the five years ending 1970-71. The current thinking appears to be that instead of fixing targets for various sectors of the economy in the first instance on the basis of their desirability and availability of resources for them and then projecting the rate of growth, the process should be reversed in the sense that first the desired rate of growth should be fixed and then sectorial targets should be dovetailed into it. The consensus of opinion is said to be in favour of the fourth Plan aiming at an annual overall growth of 7 per cent, 13 per cent in the case of industry and a minimum of 5 per cent in the agricultural sector.

High Priority for Agriculture

In view of the difficulties being experienced on the food front and the necessity to provide increasing quantities of agricultural raw materials for industries, agricultural development is again to be accorded a high priority during the fourth Plan period. In regard to industry, the Planning Commission is understood to be of the view that it would not be advantageous to shift the emphasis from the development of heavy and basic industries to that of consumer and light industries. But for containing the expanding price spiral, some consumer industries may have to be accorded a slightly higher priority than was provided to them during the third Plan. For mitigating the rigours of unemployment, the development of small-scale industries is also likely to be attempted at a faster rate. The rate of growth in their case may have to be doubled from 4 per cent per annum under the current Plan to 8 per cent per annum during the next one.

Another important point that is being emphasised is that while fixing the size of the fourth Plan, greater stress should be laid on the physical aspect than on the financial outlays. Rigorous checks are to be applied before outlay figures for industrial projects to be included in the fourth Plan are finalised

**

At a meeting here this week, the Board of Trade considered the reports of two important committees — the Saraiya Committee on Sales Tax and the Merchant Committee on Commercial Arbitration. The Board endorsed the recommendations of the Saraiya Committee and desired hat early decisions should be taken by the Government on them. In regard to the Merchant Committee recommendations, the Board felt that the Government should first invite on them the views of the important organisations of trade and industry in the country and then take its decisions. The Merchant Committee has suggested inclusion of a clause for arbitration in all foreign trade contracts between Indians and the nationals of other countries, though not on a statutory basis. It has further recommended evloving of a model contract form containing provisions which are usually found in most foreign trade-contracts abroad.

Among the other important matters considered by the Board were: (1) the strategy to be adopted for developing trade with the developing countries of Africa, Asia and Latin America; (2) the fourth Plan programme of exports; and (iii) the problems of the tea plantation industry and cinema film export.

Trade With Under-developed Countries

The Board expressed concern over the decline in exports to African countries and felt that specific efforts have to be made to determine the commodities which could be imported by India from the underdeveloped countries of Asia, Africa and Latin America to enable these countries to import more from India. It recommended the setting up of a committee with the Foreign Secretary as chairman, to review and evolve a strategy of trade with the under-developed countries on the basis of reciprocity and mutual benefits based on the available products.

In regard to the fourth Plan export programme, the Board felt that greater emphasis will have to be laid on increases in production for export in the agricultural, plantation, mineral as well as industrial sectors, besides continuing the current efforts on export promotion and sales. Emphasis would alo have to be placed on the development of new products, reduction of cost and improvement quality.

For fixing export targets under the fourth Plan, both commodity-wise and aggregate, the Board suggested that further discussions should be held in the Planning Commission with the representatives of the different Export Promotion Councils, Commodity Boards and members of the Board of Trade. The Planning Commission should then finalise the fourth Plan export programme in consultation with the Board of Trade.

In view of the vital importance of the tea plantation industry in the export field, the Board recommended that a committee be set up under the chairmanship of the Finance Secretary and with representatives of the State Bank of India, tea associations, scheduled banks and others, to go into the problem of finance for this industry. For stepping up exports of cinema films, the Board suggested that the Indian Motion Pictures Export Corporation should undertake registration of all contracts entered into by the exporters in this line. The Corporation should also support competent and reputed producers by taking over export rights of their selected films under production.

The Board expressed concern at the continuing difficulties experienced by business men and exporters regarding travel abroad for exploring export markets. The Board suggested that business men should be given more opportunities to visit and participate in trade fairs and exhibitions so that they could acquaint themselves with the modern trends in export products. The Board proposed that periodic meetings of the concerned parties and trade interests should be arranged for resolving difficulties of this kind.

**

There remains still a considerable lag between the aid made available by the friendly countries for the third Plan, and its utilization. Of the Rs. 2055.55 crores total aid received by India during the current Plan up to January 31, 1964, from 19 countries, the World Bank and the IDA, assistance to the tune of only Rs. 896.58 crores had been utilised up to that

date. The biggest contributor of aid was the United States, followed by the Soviet Union, the World Bank and the IDA, West Germany and the United Kingdom. The aid made available by these countries and the utilization of this assistance up to January 31, 1964 was as follows:

(Rs. Crores)

Country	Aid provided for third Plan	Utilization up to January 31, 1964
USA	724	420
Soviet Union	308	92
World Bank & IDA ..	289	126
West Germany	235	110
UK	150	74

The other major aid-giving countries were: Japan Rs. 97.54 crores; Italy Rs. 46 crores; Canada Rs. 43 crores; France Rs. 38 crores; Poland Rs. 29 crores; Czechoslovakia Rs. 23 crores; Yugoslavia Rs. 19 crores; the Netherlands Rs. 13 crores. The aid received from Czechoslovakia, France and the Netherlands had not been utilised at all up to January 31, 1964. Only Rs. 2 crores assistance had been made use of out of Italy's contribution and about Rs. one crore out of Poland's contribution. The Yugoslav aid had been utilised up to January 31, 1964 to the tune of barely Rs. 9 lakhs.

Austria, Australia, Belgium, Denmark, New Zealand, Norway and Switzerland were the other countries which had provided aid for the third Plan in varying quantities.

**

After a technical examination, the Union Ministry of Steel is understood to have decided to drop the proposal to manufacture pig iron from Kerala ilmenite which is at present used in India mainly for the production of titanium white and to some extent for the manufacture of RC-welding electrodes and titanium alloys. The possibility of ilmenite being used for extracting high-grade pig iron through electric smelting was being explored in view of the Quebec Iron and Titanium Corporation having perfected a process for this purpose. Dastur & Co., whose advice had been sought by the Government of India on this question, however, is understood to have opined that although it was technically feasible to manufacture pig iron from ilmenite, it would not be an economic proposition. Dastur & Co. is said to have further stated that manufacture of pig iron would also not be the best use of ilmenite deposits.

The Kandla Free Trade Zone is expected to be inaugurated on October 2, this year. The Secretary to the Central Board of Revenue, Mr. L. M. Kaul, has been appointed a special officer to expedite the work in connection with the setting up of this zone.

The plans are to carve out an area of approximately 300 acres near the Kandla port where some 200 manufacturing units covering various export-oriented industries could be put up. Imports of raw materials and intermediate goods into the zone and exports of finished products from here will be allowed free of all duties. It is proposed to set up a Committee to chalk out a detailed plan to ensure that the privileges enjoyed by the industrial units here are not misused by smuggling out raw materials and finished products to other parts of the country. If the experiment of the Kandla Free Trade Zone proves successful, it is hoped to establish another similar zone in south India, probably at Cochin.

**

The President has ordered the constitution of the fourth Finance Commission under the chairmanship of Dr. P. V. Rajamannar, a retired Chief Justice of Madras High Court. The other members of the Commission are: (i) Mr. Mohan Kumaramangalam, a former Minister in the U.P. Government; (ii) Mr. D. G. Karve, a retired Deputy Governor of the Reserve Bank of India; (iii) Prof. Bhabatosh Datta, Director of Public Instruction, West Bengal; and (iv) Mr. P. C. Mathew, Special Secretary, Ministry of Finance. Mr. Mathew will also act as the Secretary of the Commission.

Function of Finance Commission

The Commission is required to make its recommendations under Article 280 (3) of the Constitution in regard to (1) distribution between the Union and the States of the net proceeds of taxes; and (2) the principles which should govern the grants-in-aid from the Centre to the States. The President, however, has also directed that it should make recommendations on the following matters as well:

(1) the assistance that may be granted by way of grant-in-aid under Article 275 to such States as are in need of assistance. (In recommending this assistance, the Commission will be expected to take into account the revenue resources of the States during the fourth Plan period other than those to be raised by way of additional taxation; the expenditure on the maintenance and upkeep of Plan schemes completed during the third Plan; the moneys required for the servicing of the debt, including the debt to be incurred in the fourth Plan; setting apart of the proceeds of estate duty on property other than agricultural land; specified limits for the repayment of the States' debt to the Centre; and the scope of economy consistent with efficiency to be effected by the States);

(2) the changes, if any, to be made in the principles governing the distribution among the States, under Article 269, of the net proceeds in any financial year of the estate duty in respect of property other than agricultural land;

(3) the changes, if any, to be made in the principles governing the distribution of the grants to be made available to the States in lieu of taxes on railway fares;

(4) the changes, if any, to be made in the principles governing the distribution of the net proceeds of the additional excise duties levied in replacement of the States sales-tax on textiles, sugar and tobacco;

(5) the effect of the combined incidence of States sales-tax and Union excise duties on the production, consumption, or export of commodities or products, the duties on which are shareable with the States and the adjustments, if any, to be made in the states' share of Union excise duties as a result of the increase in the States sales-tax on such commodities or products over a limit to be specified by the Commission.

The scheme of devolution which will be recommended by this Finance Commission will cover the five years from 1966-67 to 1970-71 which correspond with the period of the fourth Plan. The Commission is expected to make its report well in time for the preparation of the budget for the financial year 1966-67.

**

The Union Minister for Steel, Mines and Heavy Engineering, Mr. C. Subramaniam, is understood to have told the Informal Consultative Committee of Parliament attached to his Ministry, this week, that a corporation would be set up during the next few months for handling ferrous scrap exports. Indigenous users of ferrous scrap will be represented on this corporation. The idea behind the move, it is learnt, is to avoid unnecessary competition among scrap exporters. The corporation will function under the aegis of the Ministry of International Trade.

Exports of ferrous scrap at present are allowed through established exporters who have exported scrap during any of the three years ending March, 1964. The overall export quota is fixed by the Iron and Steel Controller after taking into consideration the availability and domestic requirements of scrap. Exports of heavy melting scrap, which is in short supply in the country, are not allowed. The varieties permitted for export are sheet-cuttings, borings and turnings, tool steel scrap etc.

The Union Government is understood to have told the Orissa State Government that the proposal of the latter for setting up a steel plant at Keonjhar cannot be entertained for the next Plan. This site, however, might be considered for putting up a pig iron manufacturing unit during the fourth Plan which may be converted into a steel producing plant during the fifth Plan period.

Quality Through Statistical Control

From our Correspondent

BOMBAY:

INAUGURATING the Management Conference of the Statistical Quality Control organised by the Indian Statistical Institute, Dr. C. D. Deshmukh, who is the chairman of the policy advisory committee of the SQC, observed that the time had come for the country to take a significant step forward in applying statistical quality control. About 80 industrial units were regularly advised on statistical quality control and there were a number of units which had SQC cells. It was difficult, however, to assess how far the movement had spread. Illustrating the experience of other countries, he told the conference that Japan produced low quality and low-priced goods in the pre-war days but had now emerged as a nation producing quality goods for the international market. Even Soviet Russia, which had all along devoted itself to fulfilling targets of maximising production and had relied on inspection, had now realised that technical control alone was insufficient. He compared the conditions in India to that existing in Soviet Russia in respect of having too many inspectors and supervisors.

Regional Coordination Suggested

Mr. G. D. Somani observed that the textile industry was the first in India to adopt SQC. But there were many industries which had not taken to SQC. He said that sub-standard goods may find a ready place in the protected home market but not abroad. He therefore suggested regional coordinating committees for effectively reviewing the work of statistical quality control and also reducing the work of the local centres of the Indian Statistical Institute. The example of pharmaceutical industry was quoted by Dr. G. S. Kasbekar, Managing Director of the Hindustan Antibiotics Ltd., to indicate the need for quality control. He said that the production of the pharmaceutical industry was increasing rapidly—from Rs. 10 crores in 1954 to Rs. 90 crores in 1964 and to an estimated Rs. 150 crores in 1966. The industry could not take the risk of sub-standard production, especially the antibiotic industry which used raw material of biological origin. Mr. H. D. Shourie, Director, Ministry of International Trade, emphasised that quality control was primarily a management responsibility. What was needed was education and training in the methods, to top and middle management, engineers and technicians. It was his view that quality control has not been accepted by Indian management. He pleaded for a comprehensive programme on a national scale to spread the movement as in Japan. That country had trained 18,000 men and women in quality control between 1954 and 1958 and about 2 per cent of the gross expenditure of industries was spent on research. The conference has appointed a subcommittee to examine how quality control could be introduced in all the major industrial units in the country and also to determine the nature of rewards that would induce the units to adopt quality control methods. The question of compulsorily enforcing quality control on units of certain class and size would also be considered.

**

The lack of coordination and assessment of regional imbalances in respect of industrial capacities are well-known. A case in point is that of the estimated demand for asbestos cement products made by the Centre. It is understood that Maharashtra Government has questioned the correctness of the estimates of demand made by the Centre and has called for a re-appraisal of demand if there should be a regional balance in the progress of this industry. The State Government has expressed the view that the supply position of A. G. sheets and pipes was so difficult that even important State Government schemes had to wait for over a long period of a year and more, to procure a small fraction of their requirements. If the demand, region-wise, is re-assessed, perhaps much larger gaps may have to be filled up than what have been envisaged in the estimates by the Union Government. There are at present 7 factories manufacturing asbestos cement products in the Maharashtra State having an aggregate capacity of about 2,80,000 tons per annum. Of the 7 factories, only one is situated in the Greater Bombay. The demand for asbestos sheets, as estimated at present, is 4,50,000 tons per annum. It is expected to rise further to 5,50,000 tons by the end of 1965-66 for which, according to the note, the capacity of 6,00,000 tons would have to be created. The State Government has, therefore, recommended that in the Western Region, to fill up the gap of 37,472 tons, the applications for the expansion of capacity of the existing unit at Ahmedabad for 36,000 tons and a firm in Goa for setting up a capacity of 24,000 tons should be accepted and licences granted, even though they may be new entrants in the field.

In the view of the State Government, there is no reason why new entrants should be excluded from the field in the western region alone. The policy of the Central Government appears to be that additional capacity in the field of asbestos cement products should only be granted to existing units and that new entrants should not be encouraged as special knowledge of the use of asbestos is not likely to be available with them. It appears that this policy has not been followed in respect of licensing of units in certain other states.

**

The All-India Automobile and Ancillary Industries Association has represented to the Ministry of International Trade that immediate steps should be taken to restrict imports of fuel and oil hoses, to stimulate off-take of indigenous products. The association has pointed out that indigenous manufacturers are in a position to meet the country's full requirements. The principal consumers of these hoses are the manufacturers of motor vehicles, but supplies of indigenous hoses are also regularly being made to other industrial consumers, notably manufacturers of tractors, stationary diesel engines and air compressors. The current requirements of fuel and oil hoses in the country are estimated at 317,000 pieces per annum both for original fitment as well as replacement.

GROW MORE
SAVE MORE
WORK MORE

Against this, the capacity licensed in the organised sector alone is considerably in excess of the current demand and only one half of the capacity is actually being utilised. The association has also demanded the revision of the basis of allocation of scarce raw materials like copper and zinc to priority consumers from the point of view of the end-use. Under the present system of allotment, units in existence in a particular year are eligible for allotment and the year specified changes from State to State, creating complications for the industrial units started after the prescribed year.

What is Wrong With Agriculture?

From our Correspondent

CALCUTTA :

A SENIOR OFFICER of the Reserve Bank is currently touring the eastern States to make a first-hand study of the region's agricultural credit requirements. The Bank's keener interest in this aspect of the eastern States' economy is probably awakened by the fact that the level of food production in this part of India has been the least satisfactory achievement of planning. According to a recent note of the Union Ministry of Food and Agriculture, agriculture in the region shows about the slowest pace of progress compared with other regions of the country. The States concerned (Assam, Bihar, Orissa and West Bengal) have been able to utilise only 42 per cent of the total plan allocations for the years 1961-64 (Rs. 52.90 crores out of Rs. 127.22 crores). Only jute of all crops has done reasonably well, but all others, particularly food crops, have been faring badly. Not only has the production level remained static over the first three years of the third Plan, but in some cases, output has actually declined. While this is the situation concerning food production, population in the area has increased rapidly, making a correspondingly greater demand on the region's food supplies. Over and above this, on account of the defence forces stationed in three of the four States, the essential supplies of foodgrains, vegetables, fruits, meat and poultry have become more inadequate than they otherwise might have been.

Neglect by States

The responsibility for this slow progress, the State Governments would say, lies with weather, but the findings of the Union Ministry of Agriculture are otherwise. The latter thinks that the States have neglected their work, especially in such matters as the distribution of fertilisers and seeds, which most of them have not been doing efficiently. In the case of Assam, for example, the State Government apparently has not thought it necessary to encourage retail sales of fertilisers by giving suitable commissions. This is just one instance of the many failings of the distribution machinery in that State. The farmer can hardly get his requirements in time under the present arrangements. Credit facilities for the farmer are also inadequate. Another serious deficiency of Assam's agricultural planning is that local bodies have not been given enough scope for taking a closer interest in the food production drive although they are the most suitable agency for promoting the objective.

As with Assam, Bihar's effort to popularise the consumption of fertilisers has been half-hearted. Against the plan target of 400,000 tons for 1965-66, the estimated consumption during 1963-64 was only 1.28 lakh tons. The progress of schemes to make green manures and composts has been equally slow. The State, however, has succeeded in producing enough improved seeds, but here again, no adequate organisation exists to distribute the seeds among the farmers properly. Even the organisation to test and certify the quality of seeds before they are distributed is lacking. It shows how seriously the State Governments have taken to the food production drive. Not only funds, but the right attitude is also lacking.

Orissa's rate of fertiliser consumption is even slower. The third Plan has fixed a target of 200,000 tons to be consumed annually from 1963-64 onwards, but the latest figure of consumption is only 28,000 tons. The main reason is the lack of suitable organisational arrangements, but the State Government fixes the responsibility on the rate of the margin which the Centre has allowed for local distributors. The Centre has now agreed to giving a larger margin. It remains to be seen whether the State Government will do its own part of the job of promoting fertiliser consumption. Most of the States are allowing a subsidy of 25 per cent on phosphate fertilisers according to the conditions of Central assistance, but the Orissa Government has not been giving any such subsidy. Cotton production in Orissa has also been sadly lagging behind the Plan targets. The reason in this case is the paucity of qualified technicians. The Centre has advised the State to recruit some from outside and names have been suggested. Like its other sister States, Orissa too has paid scant attention to developing the right institutional framework for implementing its agricultural plans. Little use has been made of local bodies in spite of their closer interest in local problems, and unless this serious deficiency is rectified, there is not much chance of Orissa catching up with the arrears, let alone forge ahead.

Suggestions for West Bengal

West Bengal too has not done all it could to popularise fertiliser consumption in the State. Selling points set up are insufficient to handle the entire distribution arrangement. The State must increase their number soon and the godowns necessary for the purpose will have to be constructed promptly. She also does not have enough green manure and compost for her farms, and the Centre has advised West Bengal to raise more green manure by importing seeds from the neighbouring States. A particular handicap for the food production drive is the woefully inadequate number of tubewells in the State. The progress of sinking tube wells has been so slow that it often makes one wonder whether the State can really implement a bigger third Plan than has been determined for it already. Reaching financial targets (that is, spending more) is one thing, but achieving results is another.

Individual responsibilities apart, there is a lot that these eastern States can do in mutual co-operation to raise food production in the region. The Central Ministry of Food and Agriculture has advised them to pool their resources in tractors and improved agricultural implements. They have also been advised to draw up a co-ordinated programme for marketing and connected facilities such as cold storage, etc., so that defence needs can be met better without unduly cutting into the supplies for civilian consumption. In view of the Centre's and the Reserve Bank's special interest in the food production drive in the region, it is to be hoped that these four States will show a better performance than does their record for the three years given in the table below:

FOODGRAIN PRODUCTION (in '00,000 tons)

State	1960-61	1961-62	1962-63
Assam	16.8	16.9	15.5
Bihar	72.9	72.9	72.3
Orissa	39.5	39.7	39.2
West Bengal	58.4	51.7	47.9
Total	187.6	181.2	174.9

Caltex "STOP LOSS" reduces your paper work by 10% to 60%

If your purchase order costs are anywhere near today's high industry average, it can pay you to look into Caltex's "Stop Loss" Programme. You'll find numerous ways to reduce purchasing department time and expense.

Too often, purchasing costs rise because each department in a plant specified the lubricants it wants without reference to the purchases of other departments. This duplication results in a flood of purchase orders . . rising clerical costs . . . paper backlogs.

Caltex "Stop Loss" is a complete plan for organizing and centralizing lubrication on an efficient basis. There is no other programme like it. "Stop Loss" will help eliminate interdepartmental duplication, limit inventories to actually needed lubes, and reduce the number of lube purchase orders issued each month by 10% to 60%.

Company executives can obtain a free copy of this booklet by writing on their official letterhead to their nearest Caltex office.

CAL. SL G. 2/64

such as to evoke admiration from Mr. Krishnamachari, who is apparently dissatisfied with the way in which the States have been pressing the Centre for more and more funds. The latest Audit Report covering the financial year 1962-63 shows how careless a State Government can be in managing its finances. The State is over-burdened with debts, its total debt outstanding at the end of 1962 having risen sharply to Rs. 72 crores from Rs. 53.72 crores in 1960. It has been having to depend upon the ways and means advances from the Reserve Bank for running its administration. For example, under an agreement with the Reserve Bank, the State has to keep a minimum balance of Rs. 10 lakhs on Fridays and Rs. 8 lakhs on other days. The State Government's minimum balance during all the months of 1961-62 was below the agreed figure. Consequently, it had to borrow from the Reserve Bank as ways and means advances at 3 per cent interest and at a higher rate for sums borrowed above the limit prescribed for such advances. In this way, the State Government has been having to pay a large sum by way of interest, which obligation could have been largely avoided. On the other hand, there have been many cases of irregularities, fraud and misappropriation involving fairly big sums of money which too could have been avoided with better supervision on the part of higher officials.

**

According to a press report, the oil exploration project which Stanavc (New Esso Standard Eastern) abandoned in West Bengal on the ground that the possibilities of any oil discovery did not exist, is to be revived again. The Central Government, or precisely, Mr. Humayun Kabir, the new Minister for Oil, is apparently inclined to believe that Stanvac did not persist long enough for its efforts to be rewarded. Another reason could be that if a large-sized oil refinery is to be located in Haldia, a justification for it must be found in the shape of possible oil discoveries in the Ganges basin. In any case, the decision to locate a refinery in Haldia is amply justified on several other grounds. Already many foreign parties have offered to collaborate in the project, including such diverse sources as the United States, the U.S.S.R., Kuwait and some private parties. The Union Government is fairly confident of securing very favourable terms from the prospective collaborators. In fact a certain amount of competitive bidding seems to have taken place. In the meanwhile, the Centre has formed a committee with the representatives of the West Bengal Government and the Calcutta Port Trust, with the instruction that it should report as early as possible on the suitability of the site with particular reference to harbour facilities, water supply and communication. The committee has already got on to the job and a report is likely to be submitted within four weeks. The project is likely to involve a capital cost of Rs. 10 crores for a refinery capacity of 2.5 million tons. The Central Government is also anxious that preliminary work to set up the petro-chemical complex in Haldia should start as early as possible. While the petro-chemical planning group is reported to have recommended that the complex of industries may be started in 1970 (the refinery is scheduled to go on stream by 1967), the Oil Minister, Mr. Kabir, wants the industries started at least two years earlier. The complex is estimated to cost Rs. 63 crores in the first phase when it will produce naphtha crackers amounting to 3.8 lakh tons, and Rs. 20 to 30 crores in the second phase in which is included a synthetic rubber factory. The end-products of the Haldia complex, as the planning group visualises, will be as follows: polythelene (50,000 tons), ethyl alcohol (20,000 tons), E.P.T. rubber (20,000 tons), ethylene oxide (20,000 tons) and a few other allied products.

Priority for Power Generation

From Our Correspondent

MADRAS:

MR. BRAHMANANDA REDDY'S observations, when he met businessmen in Madras City recently, have been well received. The Andhra Pradesh Government has latterly been pursuing an active policy of helping entrepreneurs to promote new industries. The support given to a number of textile mills, Coromandel Fertilisers and Hindustan Polymers are instances in point. As the lack of entrepreneurial talent and inviting said to be overcome by encouraging local talent and inviting industrialists from other parts of the country, it has been decided that large sums should be spent on the construction of power projects. The shortage of power more than any other factor has been responsible for the slow progress recorded on the industrial front so far. In the course of the current year, an additional capacity of 100 mW is expected to be added. While there will be a doubling of power generation to 500 mW by the end of the Third Plan, the outlay of Rs. 79 crores for 1961-'66 will be increased after the State is helped to reduce its heavy commitments in respect of the Nagarjunasagar Project. For the Fourth Plan, it is estimated that there will have to be a minimum outlay of Rs. 175 crores as the installed capacity will have to be raised to 1,000 mW. The Srisailam Project, Nagarjunasagar first stage and the Kothagudem and Ramagundam power projects will contribute to a great extent to the increase in capacity. The Ramagundan Thermal Station is to be erected by Dr. Dharma Teja at a cost of Rs. 16.5 crores on a turn-key basis. The payment will have to be made by the State Government in rupees as well as foreign exchange from the date of completion of the project over a period of 15 years. The amount will carry an interest of 5 per cent annually. Dr. K. L. Rao who was in Hyderabad recently indicated that the negotiations were in the final stages Dr. Teja himself is now in this country awaiting the signing of the agreement. If this agreement proves successful, he might undertake similar projects in Madras and elsewhere.

The availability of power will have to be ensured in adequate volume in the next two years as several large-sized industrial units are expected to be completed. Coromandel Fertilisers Limited, which has come on the market for raising equity capital for about Rs 4 crores out of the issued capital of Rs 8.6 crores, has a plan for completing its mammoth factory, which will cost over Rs 32 crores, by the end of next year. The Andhra Pradesh Industrial Development Corporation is one of the important underwriters for this issue along with the other Central statutory corporations. Of the three raw materials, naphtha, phosphate rock and sulphur, the latter two minerals will have to be imported while naphtha will be supplied by the Caltex refinery at Visakhapatnam. Even though there is dependence on imports of raw materials, it has been estimated that there will be a saving of Rs. 11 crores on account of the production of 135,000 tons of ammonium phosphate and 16,500 tons of urea.

The project of Hindustan Polymers Limited also, as already stated, is ambitious in character, being started under influential auspices. There will be participation by foreign interests in a big way and molasses available in Visakhapatnam area will be used for producing industrial alcohol which would be the basic raw material for producing poly-

mers, plasticisers etc. This issue too is expected to come on the market shortly.

★★

The commissioning of the fifth unit having a capacity of 50 mW at Neyveli Thermal Station a few days back has come about at an opportune moment. Even though the Neyveli thermal station itself will be in a position to supply more than 250 mW of power daily and will be accounting for more than 50 per cent of the firm power of the Madras State grid, there is some anxiety about the water storage in the hydel reservoirs. It is even now hoped that, if there are heavy showers in the catchment areas of the hydel reservoirs and the monsoon sets in early, the power cut can be averted. Meanwhile, the position in Kerala is rather critical as a power cut of 40 per cent is now in force and the position with regard to availability is not expected to improve significantly before the beginning of 1966.

With the completion of the first stage of construction of the Neyveli thermal station, it is now hoped that the first stage of expansion to 400 mW will be completed in a short period. The sixth set having a capacity of 50 mW is expected to be in operation by the end of this year and the seventh set of 100 mW by the end of 1965 or early 1966. In the fourth Plan, there will be a further increase in capacity to 600 mW.

New Station in the Offing

In view, however, of the important place occupied by the Neyveli industrial complex, it has been suggested that a blue-print should be drawn up for erecting an entirely new station in a different area, having a capacity of 1,000 mW ultimately and getting its requirements of lignite from the second mine-cut. Exploration work is now going on to find out in detail how the lignite deposits can be mined and what exactly is the extent of overburden. It has been indicated that the expenditure on the second mine-cut, the erection of a second station and the expansion of the fertiliser factory besides other schemes will cost about Rs. 137 crores. The requirements of the 1,000 mW station will be about 4.8 million tons of lignite annually while the Salem Steel plant may require for its part 1.5 million tons of lignite. In view of the successful generation of power and the likelihood of the fertiliser project being completed by the middle of next year, along with the briquetting plant, there is now confidence that further development during the next Plan period can be carried out more expeditiously. Indeed, the Neyveli Lignite Corporation has a special responsibility in this regard as the completion of the three integrated projects—thermal station, fertiliser factory and briquetting plant—in the first stage has been unduly delayed and the Estimates Committee recently indicated that this delay was on an average 2 years and has been responsible to a great extent for the inflation in costs. The earlier estimates too were not properly drawn up and it was found that the briquetting plant cost very much more and the township also required much larger expenditure even though the amenities were designed on a conservative basis. Apart from the difficulties involved in tackling the problems relating to the mining of lignite, there was also a lack of comprehension of the economics of the integrated project. When there was a pruning of the expenditure of further projects in the middle of second Plan, the briquetting plant was accorded a lower priority. But this is no excuse for the delay in the construction of the fertilizer project as the required plant and machinery had been imported from Italy and Germany a long time back. The main reason for the delay in the implementation has been due to unimaginative insistence on the use of indigenous steel for fabrication of some portion of the equipment even when it was clear that Rourkela would not be in a position to supply the Neyveli Corporation's requirements. All these are now past history. But the authorities can make sufficient amends for their earlier sins only by planning more thoroughly and executing the expansion projects expeditiously in the coming years.

The expansion plans on the mining side particularly have assumed special significance in the present context as the announcement of the offer of Soviet assistance for constructing the Bokaro project has given rise to the hopes that the other steel projects also will take shape shortly. As the Union Minister for Heavy Industries and Steel has indicated that many friendly countries have offered to provide assistance for erecting steel plants, it is hoped that medium-sized units can be established at Visakhapatnam and Salem. The report in respect of the Salem project is expected to be completed by the Indian consultants in a short period. But it is now hoped definitely that the Salem Steel project will take concrete shape in the next Plan period and Salem iron ore and lignite could be used to yield the best results.

★★

At a time when prices for coffee in the international markets have been firming up, it is comforting to know that the Indian crop for 1963-64 might be even 72,000 metric tons, against the very early estimate of 56,000 metric tons. The prevalence of favourable weather conditions and efforts to increase output on account of a satisfactory offtake, have been responsible for the comfortable position. With larger availability and satisfactory export sales, it is felt that Indian coffee can fetch much larger foreign exchange earnings in the coming months. One would have expected that there would be a softening in prices in the internal market. But even the availability of plantation grades has not significantly improved while Robusta grades are moving into consumption without much difficulty. Prices for Robusta coffee too in the international markets are satisfactory and there is pressure on the leading producers that the export quotas should be increased. Indeed, it is feared that if prices rise further, there would be a drop in exports. It is not known whether Indian coffee will benefit by the latest developments. But there should be larger sales to the non-quota countries which include the East European Communist Bloc. The prevalence of drought conditions in Mysore and elsewhere might affect the next crop. But it is still felt that with sufficient rains, even though late, the crop for 1964-'65 may be large so that in 1965-66 it can be expected that the Third Plan target of 80,000 metric tons would be achieved.

Trade Winds

A NEW PEAK IN EXPORTS

ACCORDING TO a review prepared by the Ministry of International Trade, India's exports in 1963-64 totalled Rs. 795 crores — highest on record — showing an increase of more than Rs. 81 crores over the previous year's total of Rs. 714 crores. The most encouraging feature of the increase was that "more commodities were sent to more destinations". The higher value of exports was accounted for by an increase in the volume of goods exported rather than any fortuitous gain in prices. The items showing increase included sugar, jute manufactures, engineering goods, chemicals, art silk fabrics and plastic goods. Exports were, however, lower by nearly Rs. 4 crores in respect of tea and about Rs. one crore each in the case of essential oils, hides and skins, and mica. But the declining trend in cotton fabrics exports, however, was arrested.

ADDITIONAL CAPACITY FOR CAUSTIC SODA

In view of the continuous shortage of caustic soda in the country, the Govenment of India has started considering fresh applications for additional capacity, particularly from the units which can implement their schemes at an early date. It has been realised by the Government that a shortfall in the target of this basic industry will create serious difficulties for a number of other industries.

Earlier, as soon as a total capacity of 4.2 lakhs tons was licensed against the third Plan target of four lakhs tons, the Government started rejecting further applications without taking into consideration the likely failure of some of the approved schemes. Towards the end of 1962, the Government received more than a dozen applications for setting up new or additional capacity. Out of these, about half-a-dozen schemes were turned down by the Government on regional grounds and an equal number on the ground of inadequate utilisation of chlorine. Moreover, the industry was put on the "banned list" on the ground that a capacity of 3,48,180 tons was likely to materialise by 1964.

A number of schemes have, however, failed as usual and it is now feared that, unless more capacity is licensed, there might emerge a serious gap of about one lakh tons between the demand and the indigenous production of caustic soda by 1965-66. With a view to bridging this gap the Government has, as a first step, permitted Mettur Chemical and Industrial Corporation Ltd., to expand its capacity for caustic soda by 7,000 tons per annum taking its total capacity to 120 tons per day (40,000 tons per annum) after the scheme is fully implemented.

IRON-ORE EXPORT BOARD

The Ministry of International Trade proposes to set up a high-power inter-ministerial Board to co-ordinate various developmental activities with a view to achieving the iron-ore export target of 25 to 30 million tons by 1972 as also to meet the internal demand. The Board will have a full-time chairman with the status of a secretary or additional secretary to Government and will include secretaries or other senior officials of the Ministries of Mines, Railways and Transport. The Board would report periodically to the Cabinet, the Planning Commission and the concerned Ministries. Giving this information to the Informal Consultative Committee of Parliament, the Union Minister of International Trade, Mr. Manubhai Shah, said that in 1962-63, India's exports of iron-ore were only nine million tons. During 1963-64, with the development of an additional half million tons railway capacity on the Hospet-Hubli line and other measures in hand or under contemplation, it was estimated to increase these exports to about 11 million tons. This would be in addition to the export of six million tons from Goa. Ways and means had, therefore, to be found to mine, move and sell an additional 13 million tons from different Indian ports. This called for a well planned development of the mines, transport capacity, modernization of ports and the gradual acquisition of an ore carrier fleet.

WOOLLEN TEXTILES EXPORT PROMOTION SCHEME

The export promotion scheme for woollen textiles and goods, excluding carpets, rugs and druggets, has been revived with effect from May 1, 1964. The scheme had been suspended by the Union Government on March 31, 1964. The revived scheme will, however, operate with the following modifications:

(1) Exports of worsted yarn and other types of woollen yarn including shoddy yarn except carpet/woollen yarn produced from Indian wool will be excluded:
(2) Import entitlements in respect of carpet/woollen yarn made out of Indian wool will be ten per cent of the f.o.b. value;
(3) In respect of all other items covered by the scheme, the total import entitlement will be calculated at the rate of 75 per cent of the f.o.b. value of the exported goods, or of the value calculated in accordance with a schedule to be prescribed by the Textile Commissioner, whichever is lower;
(4) Exports will be subjected to pre-shipment inspection; and
(5) Entitlements will be made available only to manufacturer exporters.

FIRST DRAW OF PREMIUM BONDS

The first draw for prizes in respect of Premium Prize Bonds, 1963, will be held at Bombay on May 11, 1964. The Premium Prize Bonds, 1963, were sold during the period January 1, 1963 to December 31, 1963. The prizes will be as follows:

RS. 100 DENOMINATION

3	prizes of Rs. 50,000 each	..	Rs. 1,50,000
6	prizes of Rs. 25,000 each	..	Rs. 1,50,000
15	prizes of Rs. 10,000 each	..	Rs. 1,50,000
30	prizes of Rs. 5,000 each	..	Rs. 1,50,000
284	prizes of Rs. 2,000 each	..	Rs. 5,68,000
568	prizes of Rs. 1,000 each	..	Rs. 5,68,000
Total : 906			Rs. 17,36,000

RS. 5 DENOMINATION

2	prizes of Rs. 15,000 each	..	Rs. 30,000
4	prizes of Rs. 10,000 each	..	Rs. 40,000
20	prizes of Rs. 5,000 each	..	Rs. 1,00,000
50	prizes of Rs. 2,000 each	..	Rs. 1,00,000
492	prizes of Rs. 1,000 each	..	Rs. 4,92,000
844	prizes of Rs. 500 each	..	Rs. 4,22,000
Total : 1412			Rs. 11,84,000

INTER-ZONAL MOVEMENT OF WHEAT PRODUCTS

The Government of India has made certain relaxations in the restrictions on the movement of wheat products within the country. Licensed roller flour mills will be allowed to export fines, namely, 'maida', 'suji' and 'rawa' across zonal barriers. Licensed roller flour mills alone will be able to send these fines from one zone to another. But the roller flour mills have been asked to ensure that their production of fines during any month should not exceed the production during the corresponding month of last year by more than five per cent. The Inter-Zonal Wheat and Wheat Products (Movement Control) Order, 1964, is being suitably amended. The Government of India are also advising the States of

Madras, Andhra Pradesh, Mysore and Kerala to allow the export of 'Atta' by licensed roller flour mills to other parts of the country under permits granted to them. The quantity so exported in any month by any mill should not, however, exceed the quantity actually exported by the mill during the corresponding month of last year.

IRON AND STEEL PRICES

According to the following statement prepared by the Iron, Steel and Hardware Merchants and Manufacturers' Chamber of India, the ruling prices of all decontrolled categories of iron and steel are below the permissible selling prices:

(Rupees per metric ton)

Category	Controlled rates of producers as on April 13, 1964	Central sales tax, town duty and handling charges	Stockists' remuneration	Total permissible selling prices	Market rate

FOUNDRY INDUSTRY

Addressing the All-India Conference of the Indian Foundry Association in New Delhi on April 30, 1964, the Union Minister for Railways, Mr. H. C. Dasappa, assured the manufacturers that the Government would meet the shortage of pig iron by imports as a short-term measure. The units that were being licensed for stepping up production by one million tons would solve the problem in the long run, he added. The Chairman of the Association, Mr. K. Prosad, pointed out that there were over 2,000 foundry units in the country with a capacity of 2.5 million tons on single shift basis and employing about 4,00,000 persons. In addition to meeting the entire home demand, excepting for some special items not produced in the country, the industry, he emphasised, had been contributing to the foreign exchange earnings of the country since 1959. The exports of foundry goods amounted to Rs. 37.6 lakhs in 1963 notwithstanding the fact that for the last two years the industry had been facing an acute shortage of pig iron — the commercial foundries getting the material only to the tune of 12 to 15 per cent of the installed capacity.

PROTECTIVE FOODS DEVELOPMENT PROGRAMME

The Government of India has constituted a Food and Nutrition Board for the purpose of securing expeditious and effective implementation of the programme of development and popularisation of subsidiary and protective foods. The Food Secretary to the Government of India will be the ex-officio Chairman of the Board whose membership will include the Agricultural Commissioner to the Government of India, the Director of the Central Food Technological Research Institute, Mysore, the Director of the Nutrition Research Laboratory, Hyderabad, the Director General of the Council of Scientific and Industrial Research and one representative each of the Union Ministries of Community Development and Co-operation and Health.

The average Indian diet is poor in proteins and deficient in several vitamins and minerals. The use of protective foods such as milk, fruits and vegetables, eggs, fish and meat, is invaluable in diversifying the pattern of food consumption and promoting balanced nutrition. Surveys carried out during the last 30 years reveal that the average intake of cereals in India has ranged between 16.62 and 16.59 ozs. per adult per day. The daily average for the rural areas has been more than 17.5 ozs. per adult. In a number of instances the daily intake has been as high as 25 to 30 ozs. per adult. If this dependence on cereals could be reduced even by a small percentage, the need for imports from overseas would be proportionately reduced. Such root crops as sweet potato and potato, and fruits like bananas and papayas give a very high yield per acre — 3 to 4 times as much calories per acre as cereals — and are acceptable foods of high nutritional value.

MARKETING OF RAW JUTE

In accordance with the Government's decision to continue the jute price support operations during 1963-64, the State Trading Corporation made purchases of raw jute through co-operatives on the basis of minimum operational price of Rs. 30 per maund for 'Assam bottom variety' at STC's godown at Calcutta. Under the scheme, 96 marketing co-operative societies made necessary arrangements to operate in 89 markets and nearly 300 feeder centres. These arrangements covered all the important jute growing areas in Assam, West Bengal, Bihar, Orissa, Uttar Pradesh, Andhra Pradesh and Tripura and the co-operatives purchased 1,61,000 maunds of jute under the scheme up to the first week of April 1964. Besides making purchases under the price support scheme, co-operative marketing societies in West Bengal, Orissa, Assam and Tripura also procured jute from the growers as a part of their normal marketing activity. The total quantity so procured was about 2,50,000 maunds. The jute bought under this arrangement is being sold in Calcutta partly by National Agricultural Co-operative Marketing Federation and partly by the State Marketing societies directly.

INDO-KOREAN TRADE

The first Trade Arrangement between the Republic of Korea and India which was signed in New Delhi on April 29, provides for the exchange of such commodities as non-ferrous metals like zinc, lead and tungsten ores and concentrates from the Republic of Korea and engineering goods, machinery, ferro-manganese, chemicals, pharmaceuticals, etc., from India.

TEXTILE MACHINERY FROM U.K.

According to the Union Minister for International Trade, Mr. Manubhai Shah; Textile machinery worth about Rs. 10 crores is proposed to be imported from the U.K. by the State Trading Corporation of India. The purchase list would include spinning, weaving and finishing machinery.

Company Affairs

JAYA SHREE TEXTILES

JAYA SHREE Textiles and Industries Ltd., has reported excellent working results during the year ended December 31, 1963. Both gross income and gross profits were substantially higher in 1963 than in 1962. With the existing units working efficiently and with the ambitious programmes now being launched to diversify and expand the manufacturing activities, the directors have struck an optimistic note about the future prospects of the company.

The flax plant at Rishra is working satisfactorily; during the year under review this unit received substantial orders from various government departments, especially from the Defence Department. The plant is being gradually modernised and permission has also been obtained to instal 50 flax looms.

As there was undue delay in the delivery of imported and indigenous machinery, the cotton spinning mill at Rishra was unable to achieve the full rated capacity. Production, however, is picking up and with the commissioning of the spinning mill, the cotton weaving department has become self-sufficient. It has also been decided to expand the installed capacity of the mill from 15,200 to 25,000 spindles. The cost of the expansion programme is estimated at about Rs. 50 lakhs and it is expected to be completed within a year

Land has been acquired at Midnapore for putting up a cotton mill and the building is already under construction. As a result of the delay in getting the necessary import licence, this unit will not go into production before the end of 1965.

The directors have decided to raise additional capital to finance the new schemes undertaken by the company. At present equity capital of the order of Rs. 24.59 lakhs is being raised by offering "right shares" in the ratio of one share for every three existing equity shares held by the shareholders. It has also been decided to issue preference shares worth Rs. 24.59 lakhs and debentures to the tune of Rs. 22 lakhs. Necessary permission has been obtained from the Controller of Capital Issues for raising capital in both the cases.

The annual report presents a graph showing the size distribution of the shares held by the different classes of shareholders. It is interesting to note that as many as 3,187 shareholders, each holding less than 500 shares, claimed 52.07 per cent of the total, proving that the majority of the shares were not controlled by a few hands.

The year 1963 was one of steady progress for the company. Net sales increased by about 35 per cent from Rs. 220.23 lakhs in 1962 to Rs. 296.57 lakhs in 1963. Gross profits have also shown an improvement from Rs. 41.07 lakhs in 1962 to Rs. 52.81 lakhs in 1963. Appropriations included Rs. 9.49 lakhs for depreciation (Rs. 8.11 lakhs), Rs. 13.25 lakhs for general reserve (Rs. 1.25 lakhs), Rs. 2.69 lakhs for development rebate reserve (Rs. 8.60 lakhs), Rs. 20.00 lakhs for taxation (Rs. 16.55 lakhs), Rs. 44,996 as directors' commission (Rs. 26,026) and Rs. 2.82 lakhs (Rs. 1.77 lakhs) as secretaries' and treasurers' remuneration.

CENTRAL BANK OF INDIA

While addressing the shareholders at the annual general meeting held recently, Sir Homi Mody, the Chairman of the Central Bank of India Limited, reviewed some of the current controversies such as the concentration of economic power, nationalisation of banks, and the sweeping charges made against the commercial banks that they were not responsive to the financial requirements of small-scale industries. He expressed satisfaction that the Government spokesmen had opposed the move for nationalising the banks and warned that if any such step was taken, it would have a profoundly disturbing effect upon foreign aid and foreign participation in industrial projects, whether in the public or private sector. On inter-locking of directorships of banks and other companies, he felt that the safeguards that existed at present against concentration of economic power in a few hands were more than adequate and there was no need for any new weapons. Facts, he said, would disprove the allegation that the bank shares are owned by a few hands. In the case of the Central Bank, out of 24,828 shareholders, the holding for as many as 23,030, that is, nearly 93 per cent, ranges from one share to 100 shares, demonstrating that the small shareholders held the major share of the equity capital. The recent amendment of the Banking Companies Act had, according to him, further reduced the chances of any abuse of voting power by restricting the voting right of any single shareholder to 1 per cent of the total voting rights of all shareholders.

Against the criticism that the commercial banks were not catering to the credit requirements of small-scale industries, Mr. Mody said that this was not supported by facts. The Central Bank, for instance, advanced Rs. 5.5 crores on June 30, 1963 to small-scale industries which did not compare unfavourably with the figure of Rs. 8.5 crores loaned by the State Bank to this sector of the economy. As regards medium-term credit, he gave the opinion that after the formation of the Agricultural Refinance Corporation, there was greater interest in medium-term agricultural credit. The commercial banks would need the backing of crop insurance and the assistance of State Governments in the follow-up and recovery of such advances, as in the case of the cooperative institutions.

PENGUIN TEXTILES

Penguin Textiles Limited, approached the capital market on May 7 for raising capital to the extent of Rs. 18 lakhs, consisting of Rs. 12 lakhs in Equity shares and Rs. 6 lakhs in Cumulative Redeemable Preference shares of 9.5 per cent (taxable). The public issue has been underwritten by the Industrial Finance Corporation of India, Andhra Pradesh Industrial Development Corporation Ltd. and Parnar Finance Private Ltd. The capital outlay of the project is estimated at Rs. 72.25 lakhs which will be met by share capital (Rs. 30 lakhs), loan from Andhra Pradesh State Financial Corporation (Rs. 20 lakhs) and deferred payments to machinery suppliers (Rs. 22.25 lakhs). The company proposes to set up a textile mill at Uppal Kancha, near Hyderabad, in Andhra Pradesh with an installed capacity of 12,096 spindles. Land has been acquired and building construction is in progress. Orders for the required machinery have been placed with indigenous and foreign suppliers. The plant is expected to be commissioned during the third quarter of the next year.

DHARAMSI CHEMICAL

The Dharamsi Morarji Chemical Co. Ltd. showed encouraging working results during 1963. Its sales went up from Rs. 2.33 crores in 1962 to Rs. 2.90 crores in 1963, a rise of more than 24 per cent. The increased turnover was mainly due to the improved performance of the fertilizer factory at Kumhari whose contribution to total sales jumped up by almost 92 per cent from Rs. 44.01 lakhs to Rs. 83.65 lakhs. The gross profits recorded a handsome rise and stood at Rs. 40.31 lakhs, representing a rise of Rs. 9.02 lakhs or nearly 29 per cent over 1962. This is the second year in succession that the profits have shown an upward swing after the steep fall in 1961. The directors have decided to maintain the dividend for the year at 16 per cent but it is on a higher capital as a result of the rights issue in March 1963.

Allocations include Rs. 17.80 lakhs for depreciation (Rs. 15.37 lakhs), Rs. 81,000 for development rebate reserve (Rs. 1.62 lakhs), Rs. 2.10 lakhs for managing agents' remuneration (Rs. 1.54 lakhs) and Rs. 6.75 lakhs for taxation (Rs. 4 lakhs).

A sum of Rs. 6.50 lakhs (Rs. 5 lakhs) has been transferred to general reserve No. 1 and Rs. 6.51 lakhs (Rs. 5.17 lakhs) to general reserve No. 2.

SOUTHERN STRUCTURALS

The shortage of plates, components, electrodes, gas, electricity, and other items experienced by Southern Structurals Limited, slowed down the out-turn of railway wagons during the year ended December, 1963. The value realised from sales of wagons consequently declined during the year to Rs. 116.6 lakhs from Rs. 150.9 lakhs in the previous year. Luckily the performance on the structurals' side was much better, thanks to the Avadi project being given the highest priority. In April 1963 alone the company delivered 830 tonnes of structurals, a figure which had not been surpassed by any fabricator in the South. The proceeds from structurals jumped from Rs. 10.00 lakhs in 1962 to Rs. 97.16 lakhs in 1963. The improved working results enabled the company to declare a dividend of 9 per cent (taxable) as compared with 6 per cent (taxable) in the previous year.

The amounts set aside include Rs. 4.27 lakhs (Rs. 3.60 lakhs) for depreciation, Rs 1.35 lakhs (Rs. 60,000) for development rebate, Rs. 12.42 lakhs (Nil) for taxation, while a sum of Rs. 18,000 (Rs. 18,026) has been written off as preliminary expenses and Rs. 23,000 (Rs 22,857) as brokerage and underwriting commission.

TRANS WORLD AIRLINES

Trans World Airlines Inc. expects to spend more than one billion dollars towards jet aircraft and equipment within the next 10 years, according to an announcement made by the President Charles C. Tillinghast, Jr., at the annual general meeting of the shareowners held in Kansas City, Missouri. The billion dollar equipment programme includes both expected and current orders for subsonic jets as well as commitments for supersonic jets.

The preliminary data for the first quarter of 1964 shows that the Airlines has increased its percentage share of the available market; its percentage of the domestic trunk traffic handled by the Big Three improved from 25.3 in 1963 to 27.2 in the first three months of 1964. Internationally its share of LATA traffic also went up, during the same period, from 17.3 per cent to 17.7 per cent.

A spectacular improvement is recorded in the working results of the Airlines for the first quarter of 1964. The total revenue for the first time in the history of the company, touched the record figure of 113.5 million dollars for the first quarter 1964 as compared with 96.1 million dollars in the corresponding quarter of 1963. Expenses, too, increased during this period by 9.2 million dollars to 111.2 million dollars, a rise of 9.0 per cent.

CAPITAL ISSUES

Two companies have been authorised to raise fresh capital amounting to Rs. 1.20 crores. They are issuing equities and preference shares. One of them involves foreign collaboration and has offered part of its equity capital to public through prospectus. The consent of the Controller of Capital Issues is valid for 12 months in both the cases.

Lamp Caps and Filaments Limited, Bombay, will be issuing Rs. 80 lakhs capital — Rs. 37.50 lakhs equity and Rs. 12.50 lakhs preference —to be issued for cash at par. The money will be utilised in the manufacture of caps for lamps.

Warner - Hindustan Limited, Bombay, a new company, is to have capital of Rs. 70 lakhs — Rs. 50 lakhs in equity and Rs. 20 lakhs in preference. Out of this, equity capital of Rs. 25 lakhs and the entire preference capital of Rs. 20 lakhs will be offered for subscription to Warner-Lambert Pharmaceutical Company, USA, and equity capital of Rs. 12.25 lakhs is available through prospectus. The capital will be utilised for the manufacture of intermediate chemicals (pyridine and its derivatives), pharmaceutivals (drugs and medicines), cosmetics and toiletries.

LICENCES ISSUED

The following licences were issued under the Industries (Development and Regulation) Act, 1951 during the week ending April 25, 1964. The list contains the names and addresses of the licensees, the items of manufacture and the annual installed capacity.

IRON AND STEEL CASTINGS

Gujarat Engineering Industries Limited, Naroda Road, G.P.O. Box 15, Ahmedabad; (Proposed name) Gujarat Engineering Industries Ltd. (Ahmedabad, Gujarat) — Steel Castings 4,800 tons per annum. Kamani Industrial Corporation Ltd., Kamani Chambers, Nicol Road, Ballard Estate, Bombay-1, (Proposed name) Kamani Industrial Corporation Ltd. (Udaipur, Rajasthan) — Cast Iron Castings 4,800 tons per annum

COAL AND THEIR DERIVATIVES

National Coal Dev. Corporation Ltd. "Darbhanga House", Ranchi (Bihar) — Coal 7,59,996 tonnes per annum after expansion

IRON AND STEEL PIPES

Northern Foundry Private Limited, 51, Regal Building, Parliament Street, New Delhi-1 (Ambala, Punjab) — Cast Iron Spun Pipes 18,000 tons per annum

RADIO RECEIVERS

Mulchandani Electrical & Radio Industries Ltd., Sukh Sagar, Sandhurst Bridge, Hughes Road, Bombay-7 (Maharashtra) — Paper and Polyester Capacitors 6 Millions Nos per annum.

DRUGS AND PHARMACEUTICALS

Bengal Chemical & Pharmaceuticals Works Ltd., 6, Ganesh Chander Avenue, Calcutta-13 (West Bengal) — Caffeine 6.1 tonnes per annum.

COTTON TEXTILES

Rahuri Taluka Sahakari, Kapoos Ginning & Pressing Society Ltd., Shrishivajinagar, Rahuri Factory Sub Post Office, Rahuri Distt. Ahmednagar. (Rahuri, Distt. Ahmednagar, Maharashtra) — Cotton yarn 25,000 spindles; Shri Ram Chandra Chintaman Patil, Chief Promotor, Aurangabad Zilla Sahakari Sutgirni Ltd., Suresh Bhawan, Kirana Chawdi, Aurangabad (Aurangabad, Maharashtra) — Cotton yarn 12,000 spindles; Madras Spinners Ltd., 8/146-B Trichy Road, Singanallur, Coimbatore-5 (Kerala) — Cotton yarn 13,000 spindles; The Tuticorin Spinning Mills Ltd., Tuticorin (Madras) — Cotton Cloth 100 Automatic looms; Chakolas Spinning & Weaving Mills Ltd., Kalamassery P.O. (Kerala) — Cotton yarn 4544 spindles; Asarwa Mills Ltd, P.O. Asarwa, Ahmedabad (Gujarat) — Cotton yarn 2000 spindles; Chowgule and Co. Ltd., Marmugao Harbour, (Goa) — Cotton textiles 500 Automatic looms; Palani Andavar Mills Ltd., Udamalpet, Coimbatore District (Madras) — Cotton yarn 25,000 spindles; Dunbar Mills Ltd., 21 Strand Road, Post Box No. 121, Calcutta-1 (West Bengal) — Cotton yarn 12,040 spindles; The Indian Cotton Spinning Mills, Vijalpore Road, Navsari (Gujarat) — Cotton yarn 5000 spindles.

SOAPS

Foods Fats & Fertilizers (P) Ltd., 67-Godown Street, Madras-1 Tadepalligudem, West Godavari Distt., (Andhra Pradesh) — Soap 720 tonnes per annum.

CHANGE IN NAMES (Owners or Undertakings)

(During the week ending April 25, 1964)

(Information pertains to particular licences)

From (Original undertaking) M/s. Indian Jharia Colliery, P.O. Jharia (Manbhum) Distt. to (New undertaking) M/s Indian & Central Jharia Colliery, P.O. Jharia (Dhanbad) E. Railway; (New owner) Shri Devram K. Chauhan, P.O. Jharia (Dhanbad) E. Railway.

LICENCES REVOKED OR SURRENDERED

(During the week ending April 25, 1964)

(Information pertains to particular licences)

M/s. Konarak Industries, Cuttack — Bicycle Chains; M/s. Swastik Rubber Products, Limited, Poona — Rubber and canvas conveyor beltings and Fire resistant conveyor belting.

COMPANY MEETING

ASIAN CABLES CORPORATION LTD.

Address of Shri Girdharlal B. Kotak, chairman, delivered at the 4th Annual General Meeting of the shareholders of the company, on the 30th April, 1964.

Friends,

Last year, I spoke to you that the Company was expected to show better results in the year under report. That expectation has been largely fulfilled. Though we have not been able to show the plus side in the Profit & Loss Account., we have been able to progress very much farther than last year. With the receding threats of aggression on our country's Northern Borders, conditions in the market which were so depressing last year, have been reviving.

You must have noticed that the Company has made a small loss of Rupees Fiftynine thousand (actual Rs. 58,962), during the year under report after providing for depreciation amounting to Rupees Six lakhs (actual Rs. 5,99,702), as against the loss of Rs. 11,52,448 last year. Your Directors are aware that the Company could have shown better results. But as they have briefly mentioned in their Report a number of factors combined together and had a cumulative effect on the working of the Company. I would like to refer to this not as an excuse, but with sincere intention to keep the shareholders informed of difficulties which a nascent industry has to face.

The large scale Chinese invasion in October 1962 on our Motherland created panicky conditions in the market and the demand suddenly slumped. The impact of this continued to be felt throughout the major part of the year under report when the economy of the country was under heavy strain.

The retardation of progress in the generation of power during the first three years of the Third Five-Year Plan restricted the creation of demand. But the Plan is now gathering momentum and it is expected that it will catch up with the target in the fifth year of the Plan.

While the prices of cables remained unchanged, the rise in the manufacturing costs due to increases in prices of raw materials used in manufacturing also restricted the margin of profit.

The substitution of aluminium for copper in majority of cable lines, has to an extent slowed down the sales. There is a natural resistance from the customer to the new metal This switch-over has naturally affected the flow of sales.

During the year the Company's products had been registered with the Government, and D.G.S. & D. have now put our cables on the Rate Contract at par with the leading manufacturers who have been in this field for a long time. This is indeed very encouraging. During such short existence of our Company, we are fortunate to serve almost all types of clients in all parts of the country

An interesting feature of the Company is the entry into Export Field. In spite of many handicaps, the Company has made a beginning in exporting our cables. Efforts are being made to increase the export. For this purpose, the Company exhibited the goods manufactured, in foreign exhibitions at Moscow, Kuwait, and Leipzig. One of your Directors, Shri S. H. Kotak has represented our Company in these Exhibitions and he has been able to get results by securing substantial orders.

I am very happy to declare that the Collaborators have since made full payments of Rs. 53,64,200 towards their contribution much earlier than the first call notice was issued. My special thanks are due to them on this account, as this amount has proved to be very useful towards foreign payments to machinery suppliers, pending receipt of actual import licence and sanction of loan by the Industrial Credit and Investment Corporation of India Ltd. But for this timely assistance by our Collaborators, we would not have been able to book the orders for machinery at a price which is about 15 per cent to 20 per cent lower than the prevailing price today; this has also enabled us to get priority in delivery of the machinery.

You will be happy to know that the Government has been pleased to grant to your Company during the year under review, licence for expanding the capacity of magnet wire manufacture from 360 to 1200 tons per annum. The Company has also received a new licence for the manufacture of 500 tons per annum of paper and cotton covered winding wires and strips. We have already applied to the Government for the licence to import the equipment required for the expansion, and the import licence is expected soon. Such increased capacity is expected to improve profitability of your Company.

The building construction programme of factories for Power Cable and Magnet Wire is in full swing, and is expected to be completed by middle of July this year. No time lag is expected between the receipt of equipment and completion of the factory buildings. We expect the trial runs by the end of this year .

The Industries Commissioner, Government of Maharashtra, has already accorded his sanction for granting us additional supply of one lakh gallons of water per day. All preliminary arrangements for getting the supply are now complete and it is expected that this additional supply will be made available to us just when we go into production. The Tata Hydro-Electric Power Supply Co. Ltd., from whom we get our supply, have also, on recommendation from the Government, agreed to supply us necessary additional power.

I am really thankful to the assistance rendered by the financial institutions like the Industrial Credit and Investment Corporation of India Ltd., the Industrial Finance Corporation, and our Bankers, for their timely assistance and help whenever required. I must thank the Managing Directors and other Directors also for standing as guarantors to these institutions for the loans advanced by the financial institutions; this in itself is a considerable contribution besides the able management of the Company.

CRANKSHAFT GRINDING WHEEL

A crankshaft grinding wheel must be dimensionally perfect, correctly balanced and uniform in hardness. These essential qualifications also make it one of the most difficult abrasive products to manufacture!

Carborundum Universal have the technical skill and equipment to meet the challenge - successfully! Their top quality crankshaft grinding wheels are in operation in India's leading automotive factories.

Bigger and Bolder Fourth Plan?

IT WAS George Bernard Shaw who made one of his characters say that "we learn from history that men never learn anything from history." That is true of our planners as well who have consistently refused to profit from their past experience. Almost two to three years before the initiation of a Plan, study groups are set up to analyse "scientifically" the statistical information available so as to formulate the targets. Much heated argument follows at various levels and after considerable sophisticated and jargon-riddled discussions, a new Plan is approved by the Planning Commission, the National Development Council and finally the Parliament, dedicating it to the people whose standard of living it is supposed to lift. This has been repeated thrice already. A similar fourth exhibition is currently on and the newspapers are vying with one another in publicising its different facets. The first whiff of realistic air somehow demolishes the house of cards which the planners call a five-year Plan document. It happened to the second five-year Plan. It is happening right before our eyes to the third as well. In the same way, the fantastic targets which are being fixed currently on grandiose assumptions may not (and if history is any guide, will not) stand the impact of realities in the first two years of its operation. There seems to be something basically wrong with planning in this country. It has remained so far a process of hit and miss — more "miss" than "hit" — and it is time that someone talked frankly and unreservedly to the planners to lend a touch of realistic commonsense so that the fourth Plan and the subsequent ones may not be drafted on utopian lines.

Planning is a continuous process; it is not that one plan ends at a certain point of time while another begins. It is a process whereby each five-year Plan is dovetailed into a long-term pattern of growth extending at least ten to fifteen years into the future. There has been great interest in the art of target fixation—long-term as well as short-term—conducted by the Planning Commission ever since its inception. When the first five-year Plan was drafted, the target of total national income for 1975-76—to impart perspective to the Plan—had been fixed at about Rs. 23,000 crores at 1960-61 prices or around Rs. 24,000 crores at 1960-61 prices. (See table overleaf). Again at the time of formulating the second Plan, the Planning Commission had another try at the same game of perspective planning and fixed the target for 1975-76 at Rs. 27,270 crores at 1952-53 prices or a little more than Rs. 29,000 crores at 1960-61 prices. That means between these two exercises in forecasting, the target of income was raised by about Rs. 5,000 crores. At the time of drafting the third Plan, another exercise in perspective planning was attempted and the target for 1975-76 was raised to Rs. 33,000-34,000 crores. In the latest attempt at projections, once again, the Planning Commission has set its sights still higher at Rs. 37,300 crores in 1975-76. The not very happy performance of the first three five-year Plans, instead of dampening the exuberance of the perspective planning division in its forecasting adventures, has further emboldened it to raise the targets. It seems, there is an obvious political slant in this practice of target fixation which is undertaken more to dazzle the common man than to look into the future through the highly refined instruments and techniques which have been developed by the research institutions.

What should be the size of the fourth five-year Plan? In so far as the total outlay is concerned, the perspective planning division is reported to have recommended an outlay of about Rs. 30,000 crores. (A detailed description of the various co-ordinates of the fourth Plan are given in this issue on page 1155). This is equivalent to the total outlay in the

second and the third Plans just as the total outlay in the third Plan was equivalent to the sum of the total outlays in the first two Plans. There is no doubt these fabulous figures will cause joy to many but the crucial question is whether the size of this Plan is within our capacity to raise resources. It will require increasing the investment level from 16.2 per cent in 1965-66 to 20.7 per cent of the national income in 1970-71. Nearly 7.5 per cent of the investment will be absorbed in maintaining the *status quo* in per capita income level. It is the investment over and above the basic 7.5 per cent which will result in bringing about improvement in the standard of living of the people.

The important element in the determination of the size of the fourth Plan is neither the total outlay nor its rupee component but the extent of external resources which we can mobilise. There is a big question mark regarding the possibility of raising about Rs. 3,200 crores of foreign aid in order to finance a Plan of the size of Rs. 20,000 crores; if a bigger Plan of the size of Rs. 22,000 crores is approved (as is being suggested in certain circles), the foreign exchange component will have to be still larger. In other words, even if the economy is in a position to raise all the rupee resources for the implementation of the various projects outlined in the Plan, it cannot go through successfully without raising the vitally-needed foreign exchange. Thus, the size of the Plan hinges upon the total aid which the friendly nations will be willing to commit. According to present indications, the Consortium of nations, which has so far assisted us in financing our Plans, has not thought in terms of raising their level of assistance above that of the third Plan. If they should stick to this decision, the fourth Plan will have to be of a much smaller size than currently envisaged. It may lie anywhere between Rs. 16,000 crores to Rs. 18,000 crores in terms of outlay.

In agriculture, the second and the third Plans have failed to bear fruit according to expectations. But for a brief spell during the first five year Plan when agricultural production attained new heights due to favourable monsoons, the picture in this vital sector of the economy generating nearly half the national income has been dismal. The mid-term appraisal of the third Plan indicated that the target of 100 million tons of foodgrains for 1965-66 would not be achieved; now the Dhebar Committee, appointed by AICC, has given the cautious opinion that production in 1965-66 may not rise beyond 92 to 94 million tonnes as against the current level of output of 80 million tonnes. Even to reach that level within the next two years may prove a herculean task without Providential help. The gross area under irrigation as a percentage of total area under food crops has remained almost static during the last decade indicating that the dependence of Indian agriculture on weather has not been reduced. Unless the agricultural sector shows real improvement and the monetary expansion is matched by the supply of foodgrains, the Indian masses may not receive any benefit from the so-called planning conducted from Yojana Bhavan.

The Committee has suggested that the Chief Minister or the Minister-in-charge should be held responsible to the Congress Parliamentary Board for the failure in agriculture and "necessary consequence of failure to discharge the responsibility should follow". But in the same breath, the Committee has also recommended that the Government should acquire the commanding position in grain processing and trade so as to assure adequate return to the farmer. It has also recommended that the margins to be charged at different levels should be fixed and the policy of licensing of wholesalers should also be effectively implemented.

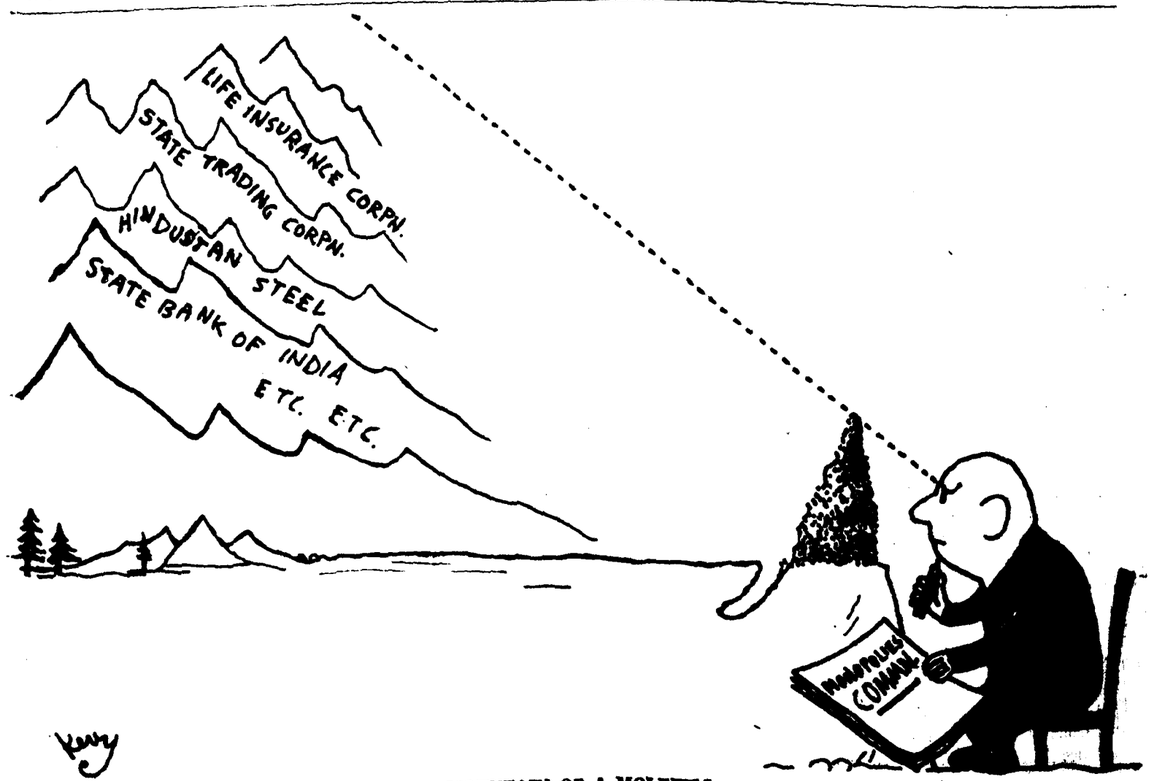
This approach of the Committee coupled with the recent opinion expressed by the Union Finance Minister Mr. T. T. Krishnamachari, regarding selective controls, shows their lack of faith in the targets which have been dangled before the country in the draft of the fourth Plan prepared by the perspective planning division of the Planning Commission. It has recommended that in view of the likely reduced target of foodgrains production in 1965-66 at 90 million tonnes as against the third Plan target of 100 million tons (and Dhebar Committee's estimate of 92-94 million tonnes), the corresponding target for the fourth Plan should be fixed at 122 million tonnes. If there were realism in the fixation of these targets, the talk of controls, fixation of margins etc. would be redundant. It is because there is no faith in the highly imaginary goals fixed by the Planning Commission that these restrictive measures have been proposed. On the other hand, no one has drawn attention to the tremendous waste of the funds which has occurred in the first three Plans for Indian agriculture. It is through better and judicious utilisation of these funds alone that an improvement in output can be brought about. In fact, the problems of Indian agriculture have been discussed threadbare in recent years and it is not necessary to repeat here that the consumption of fertilizers needs to be increased, that mechanisation, wherever possible, needs

NATIONAL INCOME FORECASTS: 1965-66 — 1975-76
(At 1960-61 Prices)

(Rs. crores)

	1965-66	1970-71	1975-76
Projections based on:			
First Plan	13,622*	17,544*	23,736*
Second Plan	18,468**	23,198**	29,179**
Third Plan	19,000	25,000	33,000 to 34,000
Fourth Plan (Preliminary estimates)	18,000	26,000	37,300

* The corresponding figures for 1965-66, 1970-71 and 1975-76 at 1950-51 prices are 13,200, 17,000, 23,000 crores of rupees respectively.



** The corresponding figures for 1965-66, 1970-71 and 1975-76 at 1952-53 prices are 17,260; 21,680; 27,270 crores of rupees respectively.

to be introduced, that farmers need to be provided with better seeds and they need incentives for making agriculture a profitable proposition. These are facts which have been stated over and over again and mere talk about them will not raise output. Also it is necessary to fix targets of production not only at the State level but also at the District level and the official concerned should be made responsible to achieve them.

In industry, again, the last two Plans had laid emphasis on basic and heavy industries with the result that output of producer goods has enjoyed preference over consumer goods. In an article in *Eastern Economist* dated May 17, 1963 (page 1018), it was shown that the output of producer goods in 1962 improved by 14 per cent over 1961 while during the same period production of consumer goods rose by 2 per cent only. The same story was repeated in 1963. It is this neglect of the consumer goods and the shortfall in food production which are at the root of the present trend in rising prices. The monetary expansion on development and defence has not been matched by the necessary increase in foodgrains and other consumer goods which could provide the necessary cushion.

In the target fixation for industry and mining, there is complete divorce between what is feasible and what the planners wish to achieve. In the case of fertilisers, for example, the proposed target is 2.5 million tonnes as against a million tonnes in the third Plan. There has been considerable failure in this vital sector in the third Plan. The actual achievement may not be more than 0.6 million tonnes at the end of the third Plan. To assume that production would be more than trebled in the next five years is again shorn of all practical considerations. Similarly, in the case of coal mining, the proposed target for the fourth Plan is 140 million tonnes — more than double the production at 67 million tonnes in 1963. These targets seem to have been fixed more to give an impressive look to the Plan than from the belief that they could be achieved.

The target for exports has been pitched at Rs. 1,200 crores per annum which again has not taken into consideration the tremendous hardships which the exporters had to face even to record the modest increase of Rs. 81 crores in 1963-64. Our exports have not looked up in recent years because of certain basic problems some of which do not lie within the control of the Ministry of International Trade. The rising costs coupled with complaints regarding the quality of our goods and the tariff barriers of the countries which have the buying capacity for our goods, have so far thwarted all our attempts to increase our exports. There is

MOUNTAIN OF A MOLEHILL

need for careful analysis not only commodity by commodity, but also country by country to determine the level to which our exports can be raised.

That the planners have refused to learn from their past performance has also been indicated by the manner in which the allocation of outlay for the public sector is being determined. The public sector has a sorry tale to tell in regard to its performance, especially in regard to the profitability of its units. Despite the unhappy experience, the fourth Plan is envisaged to allocate 55 per cent of the outlay to the State sector. Again, regarding the resources to be ploughed back from public sector units, the estimate has been presented that about Rs. 650 crores from public sector projects will be available by way of surpluses. This is again flying in the face of facts and the Commission will be well advised in looking over its calculations which seem to have been made more on dogmatic principles than on any sound economic basis.

The demographic explosion in this country has occurred at such a fast pace that much of the increase in output has been used up in providing for the new entrants. India's current population is estimated at 460 million — a figure much larger than the total population of the Indian sub-continent (including Pakistan) in 1947. This aspect has been explained at length in a series of articles entitled "Our Population Problem" in *Eastern Economist* in recent weeks. The Government is seized with the urgency of the problem but has come out with the unique solution of setting up of a separate ministry of family planning in the fond hope that perhaps the multiplication in population would be checked by multiplication of ministries. It needs to be noted that family planning measures are not short-term ones. Any step taken today will start bringing about fruits a decade later. To expect any shortcuts to it, is to live in a dreamland. There is need to evolve a purposive policy to tackle this ticklish problem.

While the fourth Plan will demand substantial sacrifices on the part of the people, it should not fail to provide them with the minimum requirements. The common man hardly understands the intricacies of a 6 per cent or a 7 per cent rise in the national income of the country. He is more concerned that his barest requirements of wheat, rice, sugar, milk etc. are provided. He has the least interest in the statistical juggleries operated in the Planning Commission.

Hesitant Growth in General Insurance

ALTHOUGH THE protagonists of nationalisation of general insurance in this country have been criticising the trend towards amalgamation of general insurance companies, evidence is daily accumulating, both in this country and abroad — the UK and Japan in particular — in favour of such amalgamations. Notwithstanding the increase in the total volume of general insurance business in India and the steady decline in the total number of companies engaged in the general insurance field, the average net premium per insurer in the country is still hardly Rs. 24 lakhs. When the Commercial Union and the North British and Mercantile merged some years ago, in the UK, their total net premium incomes were Rs. 90 crores and Rs. 53 crores respectively! In general insurance, a sizable total net premium income, far from establishing the existence of monopoly conditions or concentration of economic power, reflects the efficiency of economies of scale.

According to the Insurance Year Book 1963, just published by the Controller of Insurance, there were 148 insurers on December 31, 1962, but this number fell to 142 as on December 31, 1963. Of the former, 78 were Indian insurers, while 70 were non-Indian insurers (in 1963, the respective figures were only 76 and 66). Whereas in 1962, the 78 Indian insurers accounted for a total net premium income of Rs. 26.54 crores, the 70 non-Indian insurers earned a net premium income of only Rs. 9.06 crores. These figures are relevant to disprove another contention of the leftists, namely, that non-Indian insurers have been underwriting a substantial portion of the general insurance business in India. This is an argument which they often press into service to demand nationalisation of general insurance.

It is significant that the gross premiums written direct outside India by Indian insurers in 1962 amounted to 10.19 crores. This is a distinct improvement over the position in 1957, when this figure was only Rs. 6.5 crores, considering that the total net premium income of non-Indian insurers in India has been more or less stagnant at below Rs. 10 crores as in 1957. Those who talk of nationalisation of general insurance will do well to take note of this trend, if only to pause for a while about the possible repercussions of any such move on Indian insurers' business abroad.

A point that could easily escape one's notice has been made by the Controller of Insurance in the latest Year Book. It is that the index number of general insurance business in India (Base Year: 1956) recorded a rise of only 11.2 in 1962 as against a rise of 15.3 in 1961. Unless there is something wrong in the computation of this index number, this would seem to suggest that there has been a slackening in the rate of growth, despite the overall increase in absolute terms. If this be the case, there would appear to be need for an examination of the causes. Perhaps one of the causes is the fear of nationalisation. And, if that is so, the sooner this Sword of Damocles is removed, the better it would be for a steady and sustained rise in general insurance business. General insurance is an indispensable handmaid to economic growth and, as such, it is the responsibility of those that direct economic growth to see that no obstacles are placed in the way of the smooth

Highlights of the Week

ANIMATED SUSPENSE

WHILE THE Indian Education Minister, Mr. M. C. Chagla, and the Pakistan Foreign Minister, Mr. Z. A. Bhutto, last week had been engaged in the U.N. Security Council in a legal bout over the Kashmir issue, Sheikh Abdullah had his parleys in the Indian capital with the Prime Minister, the key Cabinet Ministers and the other prominent leaders, at Sevagram with Acharya Vinoba Bhave and at Madras with Mr. C. Rajagopalachari. As expected, the Security Council again failed to throw up any new idea to resolve the Kashmir problem. But the Sheikh is stated to have achieved some measure of success in his talks with the Indian leaders. It has been claimed by him that he and Mr. Nehru have been able to evolve a basis for a negotiated settlement over Kashmir and are currently working on some formulae which should satisfy not only India and Pakistan but also the aspirations of the people of Kashmir. No details of these formulae have yet been given out, but according to the Sheikh, they aim at maintaining the secular character of India and should inculcate a sense of security among the members of the minority communities both in this country and in Pakistan. The Sheikh will be visiting Rawalpindi shortly to get the reactions of the Ayub Government and the other prominent leaders of Pakistan to his proposals. He will then visit New Delhi again for further talks with the Indian leaders.

Although the Sheikh-Nehru talks, thus, have ended on a hopeful note, there are certain disconcerting features which would raise many an eye-brow. The Sheikh goes to Pakistan as "Sheikh Abdullah" or as a "human being". He hesitates to call himself an Indian. Is it an indication that he stands for independent Kashmir? The Sheikh's attempts at equating Pakistan, an aggressor in Kashmir, and India, which sacrificed so much in blood and money for the defence of this Himalayan State, too cannot be palatable for the Indian public. The communal disturbances that have occurred in this country have been as a sequel to what has been going on in Pakistan and to equate the two countries on this score as well is hardly justifiable. Further, the Sheikh has been challenging the very basis of Indo-Kashmir relations, alleging that the accession of this State to India still remains provisional. The Union Government has stoutly countered this claim. Although at the Press Conference he addressed in New Delhi on May 12, the Sheikh was not so insistent on this position, it remains to be seen whether the solution he is attempting for the Kashmir impasse takes cognizance of the Government of India's contention. Despite these disturbing facts, however, every right thinking person on this sub-continent will wish the Sheikh success in his efforts to bring India and Pakistan together. Without restoration of cordial relations between the two countries and without a contented Kashmir State, it may be difficult to contain the expansionist China.

BAN THE BOTTLE

THE PLANNING Commission's Study Team on Prohibition has, in its report, pointed out not only the importance of persuasive measures, but has also stressed that where it is not possible to enforce strictly the various prohibitive measures it will be in the larger interests of the society to relax such measures because, when a particular regulation is broken with impunity, it generates a corrupting chain reaction which spreads to various other activities that are not necessarily connected with prohibition. The team has, therefore, recommended that, on grounds of addiction, permits for hard liquor should be issued to persons who are above 40 years of age. For the age group of 30 to 40 it has recommended the issue of permits for mild drinks only. Persons below 30 years of age have not been recommended any permits. The team has strongly disapproved of 'the glamour of drinking' that is prevalent in high society. It has also advocated that public opinion against drinking should be roused.

The Study Team was set up by the Planning Commission in April 1963. Besides its Chairman, Mr. Tek Chand, an Ex-Judge of the Punjab High Court, the team consisted of Mr. L. M. Shrikant, Secretary of the Gandhi Smarak Nidhi and Dr. A. M. Khusro of the Institute of Economic Growth. The voluminous report embodies "an integrated set of practical measures" to reduce illicit traffic in liquor and to combat other evils of drinking. The suggested measures include: the adoption of new scientific appliances for the detection of inebriety: the de-glamourisation of drinking by the officials and by people of higher social strata; the avoidance of the misuse of spirituous medicines and other similar preparations; the prevention of misuse of molasses; the activation of public opinion against drinking and for this purpose the galvanization of the media of mass communication; the economic containment of illicit activity by reduction in the profit margins of those engaged in such activity; and the conditional and controlled liberalisation of toddy in certain areas. The report says that if these recommendations are accepted by the authorities, it will be desirable for the Government of India to set up another committee, after a suitable period of time, to assess the progress of the "integrated programme".

Loss in Revenue

Referring to the financial aspects of the prohibition programme, the Team says in its report that "the total revenue loss of all dry areas is Rs. 40.1 crores and the cost of prohibition enforcement approximately Rs. 5.4 crores, making a total financial loss of about Rs. 45.5 crores." The Team has further estimated that if the wet States in the country were to introduce total prohibition, the loss in excise would aggregate Rs. 80 crores only and that the same could be more than offset by some increases in sales tax, taxes on luxuries and central excise duties.

Estimates of the magnitude of illicit distillation as well as of the nation's drinking bill have also been made by the study Team. These estimates suggest a figure of Rs. 146 crores as the annual drinking bill of the country, of which the value of illicitly distilled liquor may be Rs. 43 crores in dry areas and Rs. 9 crores in wet areas. The illicit distillation in wet areas, according to the report, accounts for only 20 per cent of the supplies whereas in the dry areas it has increased by three to four times, as nearly all that is produced there is of illicit variety. The report further highlights the fact that the profits from illicit distillation in dry areas are as high as 200 to 1000 per cent of the profits from licit distillation in wet areas; that is why, no system of administration can face squarely the challenge of eradicating illicit distillation.

With a view to securing effective enforcement of prohibition, the Team has suggested amendments in penal, civil, special procedural and evidence laws. It has also recommended the enactment of new provisions. The lacunae in the existing laws have been indicated. As regards the administrative setup in the States, the Team is of the opinion that the enforcement of laws should rest with the police and not with any separate prohibition force. The Team, however, proposes to further pursue this subject in the second volume of its report which is still under preparation and is expected to be ready in a few months' time. The Team has also recommended that 'prohibition' should gradually be introduced throughout the country within a period of 12 years ending 1975-76 and has particularly mentioned the States of Punjab, Rajasthan, Bihar and West Bengal for such coverage. It has found the working of prohibition in Madras and Gujarat to be quite satisfactory. As regards Maharashtra, the Team has examined its new liquor policy and, while appreciating the broad strategy

of the policy, finds itself in disagreement on some points. It feels that the State Government's granting of permits for the consumption of alcoholic beverages irrespective of age and economic and social circumstances can prove calamitous. The Team refuses to accept the alleged magnitude of illicit activity in the State at its face value and finds a certain amount of defeatism in the Maharashtra Government's new policy.

With a view to meeting the challenge of illicit distillation the Team has recommended that the sale of toddy under "controlled conditions" should be considered seriously except by those States which are satisfied with their enforcement of total prohibition and where leakages are unimportant. Among other things, the Government has been advised by the Team to produce, under its own auspices, toddy with five per cent alcoholic content. It has also been suggested that the strength of toddy should be stabilised by means of refrigeration as fermentation increases its alcoholic content. The price of toddy should be kept low as it will wean away a large number of people from drinking the hard product of illicit distillation.

TEXTILE EXPORTS

IT IS difficult to understand why it should have been left to the US Government to come out first with the news of the new two-and-a-half-year Indo-US Agreement on Textile Exports from this country. The new agreement takes the place of an earlier agreement that expired at the end of March last. Unless it was the mutual intention of the two Governments to make a simultaneous announcement, the Indian Cotton Mills' Federation (ICMF), which negotiated the agreement in February itself, could very well have issued an official handout outlining the terms of the new agreement at least on April 1, 1964, when it came into force.

The circumstances in which the US came to impose restrictions on imports of Indian textiles are by now common knowledge. It was not very long after the conclusion of the Geneva Long-term Agreement on Cotton Textiles, in fact within less than a year — nine months, to be precise — that the US sought to invoke Article 3 of that Agreement relating to "disruption" of the importing country's (US) mill industry and put restriction on our exports of textiles to that country, under four specific categories. India's efforts to convince America that her action in invoking Article 3 of the General Agreement was inconsistent with the preamble of that Agreement proved futile. However, as a result of the negotiations between the US authorities and a textile delegation from India, India was given an annual overall quota of 30 million sq. yards of mill-made cloth under four different categories. The position under the present agreement is that both the overall quota and the number of specific categories have been raised, the former from 30 million sq. yards to 37 million sq. yards and the latter from four categories to five categories with a sub-ceiling under each of these five categories.

India had reasons to expect more favourable terms than she has had not only because of all the tall talk in Geneva about placing very little or no restrictions on exports of manufactures or semi-manufactures from developing countries to economically advanced countries but also because of the removal of the erstwhile handicap of American cotton mills which had to pay a higher price for American cotton than users of American cotton in other countries, including India, who export to America textiles manufactured out of this cotton. A new law recently passed by the US Congress provides American textile interests with a subsidy which makes the cost of domestic cotton used by them the same as it is to foreign buyers. This means that American cotton textile manufacturers can compete in their domestic market on equal terms (in so far as the cost of the main raw material is concerned) with textile manufacturers from abroad. There can be no quarrel with this argument, although it must be added here that the cry of American textile manufacturers, what with all their modern and automatic equipment, against unhealthy competition from Indian cotton mill manufactures sounds as hollow as the now all too familiar cry of Manchester textile interests off and on against the inroads of Indian textiles. But the fact must be faced that the types of cotton goods exports to the US from this country change so often, depending, of course, on the fast-changing tastes of American consumers, that the US authorities are hard put to it to distinguish the impact of one type from that of another type on the US textile industry. Hence perhaps their resort to the line of least resistance to justify restrictions on textile imports.

CAMPHOR: COSTS AND PROFITS

WHEN, the other day, the Chairman of Camphor and Allied Products Ltd., which has produced camphor on a commercial scale for the first time in India, disclosed in Bombay that the Company would market its product at around the same price at which the State Trading Corporation has been selling imported camphor, some eyebrows were raised as much as to suggest that the Company should not do so. The presumption here was that the Company was out to make maximum profits, but, after the Chairman gave a break-up of the costs of manufacture and described at length the high cost of indigenous raw materials (relatively inferior in quality as compared to the imported variety) and labour, the position came to be better appreciated. The fact is that, even when in a more or less monopolistic position as the new Indian camphor industry happens to be today, it cannot afford to exploit its position to make fantastic profits these days, for a variety of reasons.

Those who frequently shout at the alleged high profits being made by the private sector should note what Mr. Manubhai Shah, Minister for International Trade, told the Rajya Sabha on May 6, whilst explaining the reason for the higher profit margin of the State Trading Corporation in respect of certain scarce imported consumer commodities. This margin is intended, according to him, "to mop up a portion of surplus profits available in those commodities, owing to their short supply and high ruling market prices." As to the actual margin, the Minister for International Trade disclosed that, while, in a large number of cases, the margin charged by the S.T.C. ranged between 0.4 per cent and 10 per cent, the margin in the case of betelnut was 35 per cent over the landed cost! About the varying margin of profits Mr. Shah said: "On imports, the margin of profits varies from commodity to commodity, depending upon its availability in foreign markets, its essentiality, the prevailing market prices, the relative availability of the indigenous products, etc."

What Mr. Shah has stated shows not only his perfect understanding of the market mechanism but also what everyone engaged in trade, whether in the private sector or the public sector, does and has to do, unless one is prepared to go out of business. But the S.T.C. seems to go one step further. Apparently it does not mind entering any line of trade where surplus profits are available. The object of the S.T.C. stepping in any line, it has been thought all along, is to do something that the private trader may not or cannot do, as, for example, trade with socialistic countries, as also to ensure that, by playing the role of the good Samaritan, rising prices are kept under check. Surely this is not the result that will follow if and when the S.T.C. chooses to trade in a commodity which is in short supply and tries to mop up a portion of the surplus profits available in regard to that commodity. Anyway, the candid statement of Mr. Shah has served further to underline the dawning realism in official circles that it is wrong to suppose that business or commercial undertakings are debarred from making profits. But making unduly large profits by a public sector body, even if the prevailing circumstances are propitious for so doing, is worse than making losses due to inefficiency. The latter is bad enough, but it has at least the merit of reflecting the prevailing conditions, whereas exaggerated profits may distort and deceive one as to the precise degree of efficiency at the time.

Filibuster Holds Up Pay Raise for MPs

By Our Parliamentary Correspondent

NEW DELHI:

CONTRARY TO the rushing through on April 24 by the Lok Sabha of a non-official Bill seeking to increase the salary of the Members of Parliament from Rs. 400 to Rs. 500 per month and their daily allowance from Rs. 21 to Rs. 31 and providing for a certain number of free air trips to members living over 700 kilometres from Delhi, a practically identical Bill introduced in the Rajya Sabha by a Congress member last week encountered stiff opposition from the Communist, Jan Sangh, Socialist and Republican members. Its passage was blocked by a filibuster performance of the Communist spokesman, Mr. Bhupesh Gupta, whose 130-minute marathon exhortation, punctuated by frequent interruptions from Congress benches, prevented many anxious members from participating in the discussion. The House, however, passed after brief debates, the Taxation Laws (Continuation and Validation of Recovery Proceedings) Bill, the Bill seeking to rename the "naiya paisa" as "paisa" from June 1 next, and the Advocates (Amendment) Bill seeking to remove some difficulties in the functioning of the Bar Council, as adopted earlier by the Lok Sabha. The Kashmir issue continued to exercise the minds of the members.

Ethics Challenged

Mr. Bhupesh Gupta challenged the very ethics of the move to raise the emoluments of the Members of Parliament on the score that as a result of the rise in cost of living, they were finding it difficult to make both ends meet. He exhorted the members to show to the nation that they practised what they preached and argued that the legislators could not ask the people, already groaning under the burden of ever-rising prices, to tighten their belts when they themselves sought an increase in their pay. He suggested that the whole question should be considered in the light of the low per capita income in the country. The Jan Sangh spokesman, Mr. D. P. Thangade opined that if the cost of living had gone up, the remedy should be not to raise emoluments, but to bring down prices. The Socialist spokesman, Mrs. Sarli Devi, characterised the Bill as anti-people. The Republican member, Mr. B. K. Gaekwad, in his unfinished speech, also opposed the Bill and stated that even if it were passed, he would not take the extra money.

Besides the mover, Mr. M. P. Bhargava, who called for increased emoluments for Members of Parliament in view of the rising cost of living and owing to the fact that Parliamentarians in India received the least as compared to their counterparts in the other countries, only one other Congress member, Mr. Abid Ali, supported the Bill and that too in a negative way. He challenged that the Communists were not sincere in their opposition to the move; if they were sincere, let them swear not to have a car until everyone in the country had at least a bicycle and not to eat cakes until everyone had secured his bread, he argued. The other Congress member, Mr. Akbar Ali, who participated in the discussion, neither supported the Bill nor opposed it. He was, however, glad that it had not been moved by the Government.

The necessity of introducing a separate Bill in the Rajya Sabha to increase the salary and daily allowance of M.Ps. arose because of a lacuna having been left in the Bill as adopted by the Lok Sabha on April 24. The Bill as passed by the Lok Sabha envisaged members writing to the Speaker only if they did not want to take the increased emoluments. Mr. Bhargava's Bill filled this lacuna by seeking to authorise the Chairman of the Rajya Sabha also to entertain such notices.

The debate on the Bill seeking to rename "naya paisa" as "paisa", though brief, was acrimonious and at times amusing. The Jan Sangh member, Mr. A. B. Vajpayee, considered the switch-over to decimal coinage as a retrograde step and derided the Bill by suggesting that the "naya paisa" should be named "Nehru Paisa", as, in his opinion, the introduction of decimal coinage was the only tangible achievement of the Government in the post-independence period. Another Jan Sangh member, Mr. V. M. Chordia, light-heartedly opined that the "naya paisa" coin should be made of stone so that the pocket could be weighty. Some members, however, displayed greater seriousness in this regard and they suggested that this coin should be made bigger in size. The Minister of State for Finance, Mr. B. R. Bhagat, agreed to consider the possibility of enlarging the size of the "paisa". The Taxation Laws (Continuation and Validation of Recovery Proceedings) Bill received general support from the House; the members participating in the short discussion on it urged the need to take concerted and expeditious steps to collect Government dues. The Advocates (Amendment) Bill also was generally supported, but some members questioned the wisdom of continuing certain conventions of judiciary such as wearing of black gowns by lawyers and their using the word "My Lord".

Pledge Reiterated

Although the attempts made by various Rajya Sabha members to elicit some information about the talks which the Prime Minister had been having with Sheikh Abdullah, did not succeed as Mr. Nehru expressed his inability to say much on the issue as long as the parleys did not conclude, they did bring forth a reiteration by the Prime Minister of his earlier statement in the Lok Sabha that nothing would be accepted or agreed to in regard to Kashmir without getting the approval of Parliament. Regarding Pakistan Foreign Minister, Mr. Z. A. Bhutto's plea in the Security Council that Sheikh Abdullah should be invited to the UN for putting forth his case, Mr. Nehru stated that the question did not arise. He, however, did not rule out the possibility of permitting the Sheikh to visit Pakistan if the latter wanted to.

The Rajya Sabha adjourned sine die on May 8.

Before the Lok Sabha ended its Budget Session on May 6, an important statement was laid on the table of the House disclosing that although the law and practice in India generally satisfied the various provisions of the 1962 ILO convention on basic aims and standards of social policy, India could not ratify this convention at present because of practical difficulties such as: (1) legally prescribing a minimum age for employment and barring of employment of children in any occupation during school hours; (2) grant of special benefits to migrant workers from other countries in addition to their normal wages so as to enable them to meet the needs of their families left behind; and (3) gradual reduction of the

48-hour week to 40-hour week without reduction in wages.

India, however, would be ratifying another ILO convention — on equality of treatment in the extension of social security benefits to nationals and non-nationals alike. But in this case too only the obligations to provide medical care, sickness and maternity benefits to non-nationals working in India would be accepted for the time being. It was not possible to accept the obligations under this convention for the provision of old-age, employment injury, survivors and invalidity benefits to non-nationals because of foreign exchange difficulties.

Question Hour

Diesel Oil and Kerosene: The Minister for Petroleum and Chemicals, Prof. Humayun Kabir, informed the Rajya Sabha on May 4 that the Government was aware of the use of kerosene in place of diesel oil in diesel engines. He said that this not only resulted in loss of revenue to the exchequer, but also damaged the engine. The Minister informed the House that the Government had asked the Indian Institute of Petroleum to go into the problem and find out what methods could be devised to check it. Also, the Government was appointing an oil price inquiry committee to find out the possibility of reducing the price of high speed diesel and motor spirit in order to curb the temptation to use kerosene in place of diesel oil. The consumption of inferior kerosene in the country had gone up by 38 per cent in 1963 as compared to the previous year, while it had gone up only by 15 per cent in 1962 as compared to 1961. The import of superior kerosene had gone down by 250,000 tonnes in 1963, while the figures for 1961 and 1962 stood at one million tonnes during each of the two years. The import of inferior kerosene, however, has gone up successively from 1,50,000 tonnes in 1961 to 1,82,000 in 1962 and 1,87,000 tonnes in 1963. The Minister assured that with the commissioning of the Barauni and Koyali refineries, the indigenous supply position would improve.

Fertilizer Plants: Mr. O. V. Alagesan, Minister of State for Petroleum and Chemicals, informed the Lok Sabha on May 6 of the interest shown by the team of US business men, who visited India recently, in collaborating with Indian parties in fertilizer projects. Reviewing the progress in the setting up of new fertilizer plants, the Minister said that considerable progress in securing foreign financial participation and technical collaboration had been made in the case of three fertilizer plants, two of which were to be set up at Vishakhapatnam and Kothagudem. He said that every attempt was being made to see that fertilizer prices were kept as low as possible.

Mechanized Ore Loading: The Deputy Minister for Transport, Mr. Ahmed Mohiuddin, outlined in the Lok Sabha on May 5, the plans for mechanized services at certain selected ports for the export of iron ore covering Vishakhapatnam, Paradeep, Madras, Mormugao and Mangalore. At Vishakhapatnam, a Rs. 7-crore mechanical ore-loading plant, capable of handling ore at the rate of 2,600 tons per hour, work on which is already in progress, is expected to be commissioned by the end of this year. An all-weather port at Paradeep with mechanical ore-loading facilities to handle two million tons of iron-ore annually is being built at a cost of Rs. 20 crores. A scheme for the installation of a Rs. 250-lakh mechanical ore-loading plant at one of the berths in the new wet dock has been drawn by the Madras Port Trust. The mechanical ore-loading capacity of the Mormugao port is proposed to be developed so as to handle about 10 million tons of ore per annum. The Rs. 15.42-crore Mangalore port project has provision for the installation of a mechanical ore-loading plant at one of the berths. An entirely new project with a total estimated cost of Rs. 30 crores is being undertaken at Haldia. While tenders for various works and equipment for the construction of this project are being invited, the Government of India have approached the World Bank for a loan of Rs. 14 crores to cover its foreign exchange requirements.

Foodgrain Prices: The Minister for Food and Agriculture in the Lok Sabha on May 5, and the Minister for Food in Rajya Sabha on May 7, replying to questions, ruled out the possibility either of introducing rationing or of state trading in foodgrains anywhere in the country. Mr. Swaran Singh assured the House that the Government was keeping a careful watch over the trend in foodgrain prices and, if necessity arose, it would not hesitate to impose a ceiling on prices. The Minister further said that prices of wheat had come down considerably. He felt that the strategic controls imposed by the Government, viz., control on movement and enforcement of licensing regulations, were likely to have a considerable check on the behaviour of prices. Mr. Thomas, in the Rajya Sabha, said that the Government was considering the fixation of maximum prices of wheat and rice but the details had not yet been worked out.

Assets in Burma: The Prime Minister informed the Lok Sabha that the total assets of Indian nationals taken over by the Burmese Government were roughly estimated to be of the value of Rs. six crores. He added that the Burmese Government had promised equitable compensation for concerns nationalised by it. The Indian Embassy in Rangoon was pursuing with the Government of Burma the question of speedy payment of such compensation.

Scooter Output: Mr. C. Subramaniam said in the Lok Sabha on May 4 that the present production of scooters was not commensurate with the licensed capacity of 71,000. He added that existing manufacturers had been assisted with foreign exchange for the import of capital goods to enable them to raise the indigenous content of their vehicles to over 90 per cent by the end of the current year. This would help in increasing production and would thereby improve the supply position of scooters during the next one or two years.

Eastern Economist 20 Years Ago

MAY 12, 1944

IN A PLANNED or directed economy, we start from the dictum that "what is physically possible is also financially possible." Whatever the advantages of private enterprise and market mechanism may be, the decisive advantage enjoyed by a planned economy is that, after the initial period of preparation, it can devote almost any fraction of the national income to capital formation and consequently can speed up the rate of economic development almost to any extent it chooses. Thus if the propensity to save in a capitalist economy is 10 per cent, on the assumption of absence of trade cycle and hoarding propensities and the global Ratio 2, we would expect that the general rate of economic development would be 5 per cent per annum. But a planned economy can choose to devote, say, 30 per cent of the national income to capital formation. That is to say, 30 per cent of original national income-and 30 per cent of increment of national income per annum is devoted to capital formation; and the aggregate investment as between consumers' goods industries and basic industries is also divided in the same ratio 7:30. In such circumstances, provided the strains during the first few years can be tided over either through planned stinting or foreign credit, thereafter national income, level of consumption as well as rate of investment will all simultaneously increase at 15 per cent per annum, so that in spite of the fact that every year a much larger proportion of national income is saved, general level of consumption also increases at a higher rate than before.

OUR POPULATION PROBLEM—VIII

Modern Aids to Motivation—Are They Essential?

R. CHOPRA

"SINCE I cannot read and collect information from newspapers and books on what is happening in our country, I use my ears and listen to the radio, I use my eyes and watch the television. So I do not remain ignorant of the things my friends who can read may be talking about".

The above was spoken by an illiterate but basically intelligent and mature person, when questioned about his substantial knowledge of current and other affairs. He was not rich enough to own the television or even the radio but was interested enough in his community's and country's affairs to make use of the sets in the community centre.

The chapter on television advertising in the book "Advertising and Publicity" by Peter Chandor begins in the following manner:

"Television, because of its greater intimacy within the home, gives rise to problems which do not necessarily occur in other media and it is essential to maintain a consistently high quality of television advertising". So begins the Independent Television Authority's publication, "Principles for Television Advertising", and at once it strikes home to the reader that here is an extremely powerful advertising weapon that must be handled with great care. That mahogany-veneered cabinet, firmly established in the sitting-rooms of about three million homes (in U.K.), is an open pulpit for all who wish to display their wares in the comfort of the family circle.

T.V.: Magic Carpet

Newsweek magazine in its issue of August 19, 1963 calls the television "Small screen, Super weapon" and goes on to say about the marriage of T.V. and politics:-

> "Twenty-one years shy of 1984, television has blossomed into a super weapon in the world's political arsenal. The medium has, in fact, altered the art of politicking. It changes and distorts, brings out certain qualities and blots out others. It hurts the orator and helps the personality. And it is the political newcomer's magic carpet: it takes him to the farthest corners of his territory and makes him a familiar sight.
>
> The art of politicking on television is still emerging — no major schools exist to train the T.V. speechmaker — yet it is being practised and polished almost everywhere. Cubans are treated to three-and-a-half-hour video harangues by Fidel Castro. There are fewer than 10,000 sets in Kenya, but Prime Minister Jomo Kenyatta used T.V. to announce Kenya's coming independence. T.V. has helped quell rebellion in France and elect a President in the U.S."

And further on it says —

> "Egypt's Gamal Abdel Nasser has been more subtle, but at least as effective. Today he has the most efficient T.V. Set-up in the Arab world, with three T.V. channels, and public T.V. sets installed in villages throughout the Nile Delta"

President Charles de Gaulle of France has said: "I might have had trouble saving France in 1946 — I didn't have television then".

Even since the invention of television in 1936, it has blossomed forth into the most powerful media for entertainment, education, politicking etc. The newspaper requires that the masses be literate, oratory from the platform or lessons in a classroom can reach a very small audience. The radio, though much more effective than the newspaper and a lecture hall, and has done much in bringing even illiterate masses under its influence, had to depend on the spoken word for delivering its message.

Television supersedes them all. It makes use of both the hearing and seeing faculty to educate or entertain its viewers. Illiteracy was no longer a barrier to knowledge with the invention of the radio. Television provides a ringside seat to all its viewers, hundreds of miles apart, to the world of art, science, education, politics, high adventure and even fantasy.

Sir Francis Bacon once said: "Studying in a University is half education, travelling completes it". The written or spoken word or the radio could give half education to its listeners. Television completes it. Literally everyone in the world can become informed about any subject without stirring out of his sitting room or community centre.

Special Scope in India

India has a vast illiterate population but economic progress cannot be delayed till all become literate. The word of mouth, newspaper, books etc. have their place — and very important too — in educating the people, awakening them from centuries of slumber. But they are limited more or less to the literate minority and those living in or near towns or accessible villages. By providing community radio sets a bigger percentage of the population has been reached. Television, if introduced, will banish ignorance for ever from every nook and corner of the country. Thanks to the discovery of transistors, television or radio can, for the first time, be called truly wireless. Thanks further to the rapidly advancing electronic science and space technology (*telstar* etc.) and the consequent improvement in communications, the entire world has become a vast neighbourhood.

The overall task of the P.C.P. is to achieve universal acceptance of the desirability of planning and controlling the family size soon. An essential condition for the achievement of this objective, is the awareness among people that voluntary planning and control of family size can and will provide better opportunities for all children and greater happiness for their parents.

The television and, to a lesser extent, the radio, therefore, is the best answer yet to the problem of rapid dissemination of the knowledge and technique of Family Planning.

Can anyone suggest a better media for this job?

It is estimated that at least 10 lakh televisions and 20 lakh radio sets should be installed by 1966 if the P.C.P. is to be launched as a truly mass programme. Such a mass introduction of T.V. in the country which has no experience in it so far, will present problems but they will not be insoluble. We should not hesitate to ask for help from the highly developed countries for both personnel and financial aid in the setting up of the industry, T.V. producing and relaying stations, installation of the T.V. sets and setting up of the repair facilities. Considering that electric power is not available at many places, emphasis should be placed on the installation of transistorised T.V. and radio sets.

Originally the entire T.V. and radio network thus set up

shall be used exclusively for the P.C.P. Later on when the targets of population control are achieved and the desirability for family planning universally accepted and practised, the same T.V. and radio network and facilities can be used for other purposes. Education, techniques of advanced agriculture, entertainment are some of fields where T.V. can be very effectively used. Actually its applications is limitless.

The financial implications of such a network are given elsewhere. But it will be readily seen that once the P.C.P. is successfully completed and the T.V. allowed to be used for other, including commercial, purposes it will pay for itself many times over. It should become the nucleus for the rapidly expanding T.V. industry in the country in years to come which will, no doubt, be the case. There are 12 million sets in the U.K. out of a total of 100 million sets in the world. India with its vast population will have many times the number of sets that U.K. has.

Other media for propagating Family Planning will also be extensively used. Meetings, seminars, camps, distribution of pamphlets, books, exhibition of films etc. will all be used as widely as possible by the P.C.P. Personnel and other voluntary workers.

Training and Research

Training of the P.C.P. personnel in the proper methods of motivating the population etc. in groups as well as individually, has to be undertaken with immediate effect if we want the programme to start with full force with the fourth five-year Plan. As the organisational tree of the P.C.P. has many levels from the Village upto the Central level involving over 2,25,000 workers it is very essential that the right type of training is imparted to the workers at the appropriate level.

Obviously such a large number cannot be thoroughly trained in the short time at our disposal. It is felt that the training should be broken up into two parts; preliminary training before 1st April, 1966 and advanced training during the period 1966-1970. In addition to this, it will be the personal responsibility for everyone in the P.C.P. Organisation at every level to ensure workers directly under him are trained and educated for the work they are doing in the best methods of doing that job while they are performing their duties.

It would, therefore, be desirable, in addition to expanding the present training facilities available, to take the following steps:-

(1) Select and immediately train an adequate number of Family Planning Administrators both in the country as well as abroad in any country (notably the U.S.A.) which offers training facilities. The first few batches of trainees should also receive a short but intensive course to enable them to become instructors to train other ranks of Family Planning Workers.

(2) The training of Village/Field Level Workers and above is most essential. As it is not possible to impart adequate training in the short time at our disposal, the initial training should be short and preliminary but intensive. The trained instructors would train these workers in small batches of, say, 15-25 for a period of 1-2 months. The lectures would be typed and distributed to the trainees preferably in the language they are familiar with. The typed notes will also act as guides in the actual job till proper guides and manuals are printed.

(3) A committee of experts must be organised who will define the job at each level in detail. Guides and manuals shall be prepared explaining, in detail, the scope of the job at each level and how to execute it. As mentioned earlier, due to shortage of time, the preliminary training will only acquaint the workers with their jobs. These guides and manuals and, later, circulars will help in training the men on the job. This practice is commonly followed in industry with excellent results.

(4) The training in the classroom will be supplemented in the field by lessons, lectures etc. over the T.V. network when the latter is established.

(5) The workers at Block level and above will be responsible for ensuring that those working under them are properly trained, while on the job.

(6) Later on when the P.C.P. is well under way groups of workers at various levels must be given advanced training in the light of experience gained.

(7) The training of so many persons in the short time that we have, would require a lot of classroom and hostel accommodation. It is neither possible nor desirable to put up new buildings for the purpose. We have schools, colleges and even universities in practically every small town or district. The Family Planning Schools should be located in them at strategic places with due regard to the requirements of the region. Later on, three or four or more Family Planning Training Institutes may be put up.

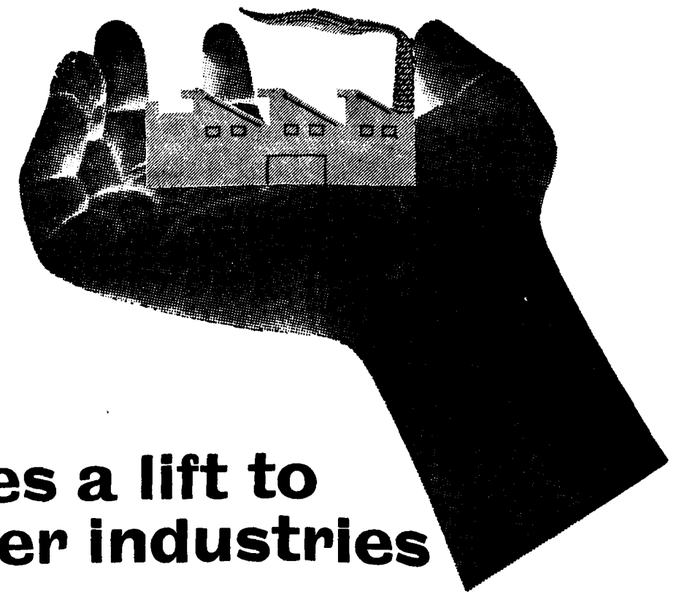
(8) Training of persons for the specialised agencies for the purpose of propaganda, advertisement, demographic and statistical data, accounts, personnel, welfare, office work etc. including the installation, operation and repairs of audio-visual and other aids should be undertaken by specialists in these fields.

(9) Medical colleges should immediately introduce in their curriculum the subject of Family Planning with special emphasis on its bio-medical aspect including sterilization of both men and women. This is very essential since we would require thousands of trained doctors and nurses for the success of the P.C.P.

Some Recommendations

As far as research in motivation, communication, demographic and statistical methods and bio-medical fields is concerned the following points are worth quoting. They are a part of the Conclusions arrived at in the book "The Growth of World Population". The recommendations are specifically for the U.S.A., but could be very useful for our purpose also.

(1) "Support of graduate and post-doctoral training in demography and in social and bio-medical sciences concerned with population problems should be increased."



(2) "Research laboratories for scientific investigation of the bio-medical aspects of human reproduction should be expanded". The chapter on "Bio-medical Factors" gives an idea of the work that is already being done or will be taken up shortly by investigators in the U.S.A. to perfect better and better methods of contraception. I suggest that instead of duplicating facilities in India for bio-medical research, we should send our research scholars to the U.S.A. to work there. We can also make funds available for the expansion of the facilities in the States. Alternately, similar facilities can be set up in India with help from the U.S.A., where research can be carried out in close collaboration with the American research workers.

(3) "International co-operation in studies concerned with voluntary fertility regulation and Family Planning is highly desirable and the United States Government" (and the Indian Government too) "should actively participate in fostering such co-operation, working in co-ordination with appropriate agencies of the United Nations system whenever possible, and with other inter-governmental and non-governmental organisations wherever appropriate".

India, being the biggest democratic country in the world and because of its domestic and foreign policies, is in a most

(Continued on page 1147)

THE AUTOMOBILE INDUSTRY . . . .

gives a lift to other industries

Within the short span of little over a decade of its establishment in India, the Automobile industry has set in motion a large variety of industries. Steel and aluminium, lead and copper, petrol and rubber, glass and plastic, textile and leather, electric components and intricate mechanical parts, to mention only a few, have all sprung to a new life to feed the basic automobile industry.

Today the indigenous content of a motor vehicle such as the Hindusthan Ambassador, for instance, comes to roughly 80%. Over one third of this indigenous content is made up of components produced by local ancillary industries. This represents some 3628 rupees or 24% of the "on the road" price of the car in Calcutta. Each car produced, therefore, directly helps a host of other industries.

Not that alone. In the case of cars manufactured by Hindustan Motors, the Government benefits to the extent of 5140 rupees from each car produced, in the form of direct and indirect taxes, thus helping to promote additional public works projects envisaged in the Five Year Plans.

In the U.S.A. where the annual production of motor vehicles has reached approximately 9 million cars and trucks, the automobile industry consumes 43% of the country's sheet steel production, 90% of petrol, 65% of natural rubber, 58.5% of upholstery leather, 48.6% of lead and 31.7% of zinc. As our automobile industry develops, its contribution to India's industrial prosperity may well reach a corresponding scale.

CAR PRICE STRUCTURE:

Government taxes, direct and indirect :	33%
Raw materials, manufacturing and overhead expenses, salaries and wages, depreciation, profit etc. :	25%
Indigenous ancillary components :	24%
Imported components :	11%
Dealer's commission including distribution, service, advertising etc.:	7%

Utilisation of External Assistance

ANALYST

ACCORDING TO the data published by the Rao Committee on the utilisation of external assistance, of the total amount of Rs. 2856 crores, for which loan agreements were concluded till the end of December 1963, Rs. 1672 crores only were received by this country while Rs. 1184 crores representing slightly over two-fifths of the committed loan are yet to be made available. That the problem of slow utilisation of credit has been there for the last few years would be evident from Table I below which shows the amount of loans committed, orders placed and amount drawn from 1956 to 1963. The problem has engaged the attention of the Government rather late, as even at the end of the first and second Plans, about half of the committed aid had not been used. Another fact that emerges from Table I is that there is delay also in the placing of orders and that during the period, the orders placed fell short of the committed aid by about a quarter and that even on orders placed the rate of drawal from the credit has been slow. At the end of March 1963, the orders placed amounted to Rs. 1842 crores whereas nine months after that, i.e., at the end of December, the total amount drawn is only Rs. 1672 crores, that is, a difference of Rs. 170 crores.

TABLE I

(In crores of Rs.)

	Amount for which agreements concluded	Orders placed	Amount utilized
31-3-1956 (End of Ist Plan)	226.9	..	126.4 (55%)
31-3-61 (End of IInd Plan)	1526.4	..	851.0 (56%)
31-3-63	2527.0	1841.8 (73%)	1397.2 (55%)
30-9-63	2667.9	2120.3 (79%)	1574.6 (59%)
31-12-63	2856.3	2197.6 (77%)	1672.4 (59%)

As a large part of the orders must have been placed well before March 1963, the delay in the drawal of Rs. 170 crores may be due to two reasons, viz., the protracted paper work involved in drawing the loan and the disallowance of some orders placed by us. The procedure for the drawal from the credit therefore needs simplification. We may turn towards an examination of the present procedure of the drawal of credits in general, and the special problems in relation to certain specific credits. It need not be pointed out that any delay in the drawal of the credit, not only postpones the benefits that will accrue to us by its use but also results in increasing the cost of the loan to us. This is because on most of the loan agreements agreed to by us we have to pay a commitment commission from the day of the conclusion of the agreement irrespective of the fact that drawal from it takes a few months to commence. Although in the case of most of the loan agreements this commitment commission is only a fraction of 1%, in some cases, it is fairly high, in case the foreign lending institution borrows the money from its capital market and delay occurs in our drawing the money from the institution.

The delay in utilisation of credit after placing of orders arises because of the procedure under which loans are drawn. There are two methods of drawal—the letter of commitment procedure and the reimbursement procedure.

Letter of Commitment Procedure:—The letter of commitment procedure is an undertaking by the lending country/institution to the banker of the suppliers that at the request of the borrower through a letter of credit, the banker is to make payments to the suppliers and that the amounts so paid will be reimbursed to the banker by the lending country/institution. This procedure is in vogue in respect of the credits made available by the International Bank for Reconstruction and Development (I.B.R.D. or World Bank) and some of the loans from the United States Agency for International Development (US AID). A variation of the letter of commitment procedure is the "Direct Payment" method under which payments to the suppliers are made directly out of the credit. This system is in operation in respect of the U.K. and IBRD credits.

Reimbursement Procedure: — Under this system payments to the suppliers are made initially through normal banking channels from free foreign exchange. After payments have been made the individual importers are required to supply to the borrower, who in this case is the Government of India, connected documents, e.g. receipted invoice, a certificate of origin of the goods etc. These documents are later presented to the lender to claim reimbursement of the amount already paid to the suppliers. Under the reimbursement procedure, there is an initial outgo from the foreign exchange reserves of the importer's country, which is subsequently recouped from the loan account.

Both these procedures have certain limitations and have the effect of increasing the cost of the credit to the country. Under the letter of commitment procedure, the importer in India has to bear all the cost of opening of the letter of credit; besides he has to satisfy the banker that the item in question is eligible to be financed under the credit. Even then, in some cases it does happen that the item in question is disallowed with the result that the matter has to be taken

(Continued from page 1144)

fortunate position in the sense that all the advanced countries have become convinced of our genuine desire to better the economic condition of our people within the framework of democracy. These countries are also convinced that India's greatest problem is its rapidly growing population. I am confident that once we launch the P.C.P. with all due sincerity and publicity, we will be able to secure the support of the entire economically developed world not only for research but also for the actual implementation of the P.C.P. and other projects. P.C.P. will convince everyone that we want economic advancement and a democratic way of life. Without P.C.P., even the most sympathetic people abroad are convinced that it is just a matter of time before the pressure of population forces us to shed our democratic way of life. All experts agree on this.

(To be concluded)

up with the higher authorities or dropped from the credit, resulting in both cases in the delay of the arrival of the ordered equipment. The reimbursement method, although more popular among suppliers, as the import in question is effected initially under normal banking channels and from the foreign exchange reserves of the country, has also defects in that it increases the cost of credit and also postpones the use of credit. The increase in the cost of credit arises out of the fact that like the letter of credit procedure, payments have to be made to the banker to make the payment; besides certain documents are also to be obtained from the banker for which also some commission has to be paid, either directly or indirectly, and all the documents have to be submitted to the Government who scrutinizes it and claims reimbursement. Since the initial payment is made from the foreign exchange reserves, which earn a certain interest from the Bank of England, the initial diminution of these reserves has also the effect of reducing the country's income from this short-term investment. Again under the reimbursement procedure, there are always certain payments that are disallowed by the lending authorities either on the ground that payment involved therein was too small to be processed or because the item in question is a doubtful one for being eligible under the credit.

Untied Credits

The most important reason why the above procedures are insisted upon by the lending authorities is due to the tying of the aid to certain projects or to certain categories of imports from the country giving the aid. Since the credit given is a form of aid, the question arises as to why it is necessary to tie this aid at all. In any case, tied loan postpones the availability of the aid and increases its cost. Both these features have the effect of removing to some extent, the "aid" character of the loan. The increase in the cost arises not only because of the payment of "commitment commission" for a longer period and the furnishing of procedural documents, but also because of the condition that the aided money should be used only for purchases from the lending country. In some cases it is even insisted that the purchases should be insured by an institution of the lending country and transported in that country's ships. It is not always possible to ensure that the lending country has the cheapest and best quality equipment and its ships are available to transport it as soon as delivery is guaranteed. The American authorities, who have given us the bulk of the aid, require that the use of American assistance should be based on tenders confined to American firms. In cases in which global tenders were invited in the first instance retendering in the USA became necessary when it was decided to use American assistance. Now, this insistence on inviting tenders only from American firms may be out of two reasons. If Americans have to bid with other international firms, they may be prepared to bid low, or may not be prepared to compete at all. In any case it is apparent that a higher price will have to be paid by the "aided" country in using American assistance.

All this raises an important question which the aid-giving countries should give serious consideration. Is it not possible to get rid of this practice of tying aids to projects/purchases from aid-giving countries? That the aid-giving countries cannot prevent the misuse of the funds merely because of the cumbersome procedural requirements is evident from the fact that the aid received by a country like India is only a small part of her foreign exchange reserves. To the extent to which the country herself might have used her foreign currency for the aided project, the aided money for the project is an amount which the country can use in whatever way she likes. Most of the projects aided by foreign countries are those which we might have financed from our own reserves or by putting further restraints on other imports. Hence, a considerable part of the aided money is being well used by us not because of the procedural requirements, but because of our anxiety to secure development. If giving up of this condition of tying aid can be secured only by paying a higher rate of interest, there will not be any objection so long as the rate is not unduly high. A slightly higher rate of interest and untied loan has the advantage of permitting a high degree of flexibility in the use of loans and will make it known clearly the cost of each credit. At present it is impossible to know the real cost of each loan. Since the purpose of all these loans is to aid the developing country, it is only fair that the country knows the real cost of each loan.

It is not conceivable that in the near future, this suggestion of giving completely untied loans will be acceded to by the aiding countries. In fact, it is even sometimes contended that aid is being given so that the aiding country might find a market for its equipments. Be that as it may, what steps can we take to expedite the use of credit within the conditions imposed by the aid-giving countries. It is in this direction that the Rao Committee had made several practical suggestions*. It is encouraging to see that all these suggestions have been accepted by the Government. Most of the recommendations are of an administrative nature, and so it is not enough if these recommendations are accepted, but a careful watch should be kept on its execution. Apart from implementing these recommendations, serious effort should be made, pending the time when aiding countries decide to give untied credits to get the following restrictive provisions that are found in some loan agreements removed.

(i) The aid-giving institution reserves the right to nominate the firm that is to prepare the project report;

(ii) The World Bank and the IDA require that orders should be awarded to the lowest tenderer, and they do not permit the grant of preference to indigenous suppliers. Under Indian conditions, there are a number of instances in which Indian suppliers charge somewhat higher prices in terms of rupees but require less foreign exchange for undertaking an order.

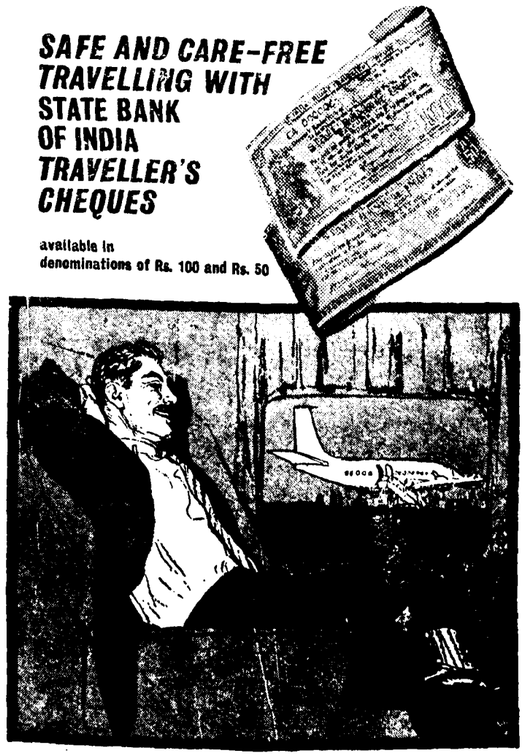
(iii) The American authorities require that the use of American assistance should be based on tenders confined to American firms and are not prepared to accept the results of global tenders in awarding the contract to the lowest American tenderer even though he is not the lowest global tenderer.

(iv) In a number of instances, there are minimum value restrictions on ordering against external assistance.

(v) Shipment should be done in the country's vessels.

(vi) All consultancy services contracts have to be approved in advance.

(vii) The equipment in question should be insured by the export credit organisation of the aiding country.



These seven are the major conditions imposed by some of the aiding countries and all of them have the effect of increasing the cost of the aid.

* Details of the recommendations were published in 'Eastern Economist', dated April 24, 1964 on page 967.

United California Bank offers you all the services of a fully staffed International Division in Los Angeles and San Francisco and over 160 offices throughout California. Our affiliation with Western Bancorporation International Bank in New York, experts skilled in many fields, and correspondents around the world provide immediate contact with every important world trade center. WINDOW ON THE WORLD

Kennedy Round: First Blows

From Our Special Correspondent

GENEVA:

AS IF TO PROVE in advance that its proceedings are going to be incomprehensible to the general public, the Kennedy Round opened here with a bizarre discussion on two points of detail, one of timing, the other of vocabulary. The first question was whether lists of exceptions (products regarded as too sensitive to be exposed to a reduction of tariffs, and thus to be excluded from the negotiations) had to be presented by each party before September 10. The other was whether an across-the-board reduction of tariffs by 50 per cent was the "basis of the negotiation' (this was the Americans' formula) or a "working hypothesis" (this expression was defended by the Common Market Six). Under the apparent aridity of these disputes are concealed important matters of principle, which will in large part decide the upshot of the conference.

Disagreement about the deadline for presenting lists of exceptions stems from a difference in negotiating tactics. The Americans hoped to use a sort of salami technique, carving up the debate into successive slices, with the aim of wresting concessions from the Europeans on one matter before revealing what they themselves would yield on the next matter. So they wanted the issue of "tariff disparities" settled before fixing a precise date for showing their hand on the question of exceptions. On the contrary, the Common Market Six argue that all the issues involved are interrelated, so the conference must aim at a global package deal and not a succession of partial agreements. Hence the need to know early in the discussion which products were to be excluded from tariff-cutting, so that parties could see what concessions it was worth making.

Behind the Six's negotiating formula is an attitude of caution, if not distrust. They feel that the Americans have deliberately over-simplified the whole problem by putting all the emphasis on tariffs, leaving in the shade such matters as non-tariff obstacles to trade. This creates the danger that, in a first phase of the negotiations, the parties might exchange equivalent tariff concessions, and then find that in a second phase the Americans' concessions were emptied of all content by their refusal to dismantle non-tariff impediments to imports into the USA. To avoid that, the Six suggested that from now to the end of the year the conference should carry on parallel negotiations about all the subjects in dispute: the extent of tariff reductions, the exceptions, non-tariff protectionism, trade in farm produce, etc. Then, when all these matters had ripened, a global deal should be sought in the first half of 1965, so that the talks could be completed by next summer.

Conflicting Interests

The timetable might not be honoured, but this is no doubt the way the conference will go. A thousand and one conflicting interests are involved and it will be impossible to separate them, disposing of one subject after the other. At the end of 18 months or two years, the parties will have to weigh up the net benefits of an intricate compromise, balancing a gain on tariff reductions against a loss of protection for certain farm products, and so on. Naturally, this is unsatisfactory for a country like India, whose interest is quite specific: to see that its exports do not go on to the list of exceptions and thus escape the reduction of tariffs, whatever it might be. Whether tariffs are cut 20 per cent or 50 per cent is less important; either way, it will be so much gained because that reduction will be extended to Indian exports (without her having to make any reciprocal concession). But if the goods India can hope to sell in the West are excluded from the cut in tariffs (thanks to collusion between US and European manufacturers of similar goods, anxious to avoid Asian competition), India gains nothing. And that could well happen in the course of a complex package deal, Western countries trading exceptions between themselves for the sake of an arrangement in some field that does not concern India, e.g. trade in temperate zone foodstuffs.

The debate about whether a halving of tariffs is a "basis" or a "working hypothesis" is more arcane. Let us say from the outset that the commonest opinion here is that the upshot of the Kennedy Round will be a mutual reduction of tariffs varying between 25 and 30 per cent, not because any party is aiming at that (all would like a bigger reduction in duties imposed on their own exports) but because that will be the highest common denominator of their conflicting demands. If all parties are willing to work for the biggest reduction possible (and even the French seem to be in that frame of mind) without taking the 50 per cent figure as a sacred minimum (and even the Americans do not do that), then whether a halving of tariffs is a "basis" or a "hypothesis" becomes a mere matter of vocabulary, as Mr. Mansholt of the ECM Commission says it is.

Basis of Bargaining

However, on some quite specific issues this distinction could imply a real difference. If a 50 per cent reduction is the basis of the bargaining, a high-tariff country like the USA could take this to mean that it was never obliged to do more than halve its import duties; in that case, a low-tariff country (for the particular item in question) would refuse to lower its duties by more than 25 per cent. On the contrary, if a halving of duties is a working hypothesis, it remains open for the high-tariff country to cut its exorbitant duty by 60 or 70 per cent, whereupon the low-tariff country could consent to lower its duty on the same product by, say, 40 per cent. It would agree to this because the disparity between the two tariffs would have been narrowed. If this seems a rather abstruse difference, one must note that in fact it vitally concerns third parties, other than the USA and the Common Market. In the jargon of the Kennedy Round, such third parties are referred to as "the Swiss case" because the issue comes up clearly in regard to Swiss watches but it has much wider application.

Take for example a case where the import duty on a product is 80 per cent in the USA and 40 per cent in the Common Market, but where in reality most world trade in that product is not between the USA and the Common Market, but between some third country and the Common Market. The Six would argue that the disparity between American and European duties (80 per cent against 40 per cent) requires special treatment: the Americans halve their duty while the Europeans reduce theirs by a quarter only. The situation for the third party then would be that it gained little from the fact that the American duty fell from 80 to 40 per cent, because the USA is not its main market, while the obstacle that really interested it, the common external tariff of the Six, only fell from 40 to 30 per cent. Since that same third party would be halving its import duties on numerous other products, which it bought from the Common Market, it would be making a bad bargain in gaining a lesser reduction in tariffs charged on its exports.

The case arises, as noted, in regard to Swiss watches; the actual figures are not those cited, but they are in that sense.

The Swiss naturally suspect that the Common Market is invoking the pretext that the USA has a higher duty on watches in order to evade halving its own duties on watches. So they urge that cases of disparity between US and Common Market tariffs not be taken into account unless the high-tariff nation (here, and usually, the USA) is the main supplier of the lower-tariff nation (here, and usually, the Common Market). In all other cases, duties would be halved on both sides no matter how great the disparity. In that way the Swiss could hope to see Common Market duties on their watches reduced by 50 per cent.

"The Additional Criteria"

The Six so far reject this extra proviso that disparities only count when one of the two main parties (USA and Common Market) is the main supplier of the other; in the jargon of the conference such provisoes are known as "the additional criteria". They cannot deny that "innocent third parties" (another piece of Geneva jargon) might be harmed when a theoretical disparity is invoked to avoid cutting European duties on goods actually imported from elsewhere than the USA. But they argue that trade channels are not frozen and a country that is not a main supplier today could become so later, specially if the importer reduces his tariffs.

Hence the interest of their suggestion that a 50 per cent reduction be a simple working hypothesis, that might be exceeded in instances of disparity by the higher-tariff country. For example, the Common Market could reduce its duties on Swiss watches by almost half (thus satisfying the Swiss and giving them fair exchange for their concessions), provided the Americans reduced their duties on the same goods by much more than half. The reason of course would be that by securing a really massive cut in the US duty, the Six could hope to deflect the imaginary flood of Swiss watches waiting to pour into the Common Market, to the USA; and moreover, their own watchmakers (who are behind the bid to keep duties on Swiss watches as high as possible) could look for markets in the USA too. That is why they would consent to lowering their tariffs on watches by almost half.

Now this case concerns many products other than watches, and it illustrates to perfection one of the main ideas in the heads of negotiators on both sides in Geneva this month: the design, that is, to deflect the exports of third parties to the other side of the Atlantic. For many of the goods in question during the Kennedy Round, US firms do not fear Common Market competition, nor vice versa, but both sides want the other to bear the shock of imports from third countries in the event of a significant lowering of tariffs. Such manoeuvres could have either of two upshots. Both sides might be so much afraid of outside competition that they would agree to leave tariffs intact by making the goods in question figure on the list of exceptions. Or else they would agree to slash tariffs very heavily (more than 50 per cent), each in the hope of outdoing the other and leaving it exposed to outside competition. Which solution predominates will determine how far the Kennedy Round assists the commerce of nations other than the USA and the Common Market.

Return of the Dollar Gap?

PAUL EINZIG

LONDON:

THERE HAS been a remarkable increase of optimism about the prospects of the dollar in usually well-informed circles in London. It is expected that the balance of payments of the United States will show quite a spectacular improvement during 1964. These expectations are based on the contrast between the stability of prices in the United States and the rising trend in the principal European countries. The cost of living in the United States has been exceptionally steady during the last two years or so, and wage increases have been absorbed by increase of productivity due to technological progress. On the other hand, prices and wages in Europe have been rising and are still rising. Consequently, but for the heavy burden of foreign military and economic aid, the American balance of payments would have turned distinctly favourable by now.

Notwithstanding the efforts of the Administration to maintain foreign aid, Congress is determined to cut it year after year in order to restore the financial power of the United States, which has been impaired by the persistent decline of the gold reserve and simultaneous increase in foreign short-term holding of dollars. At the same time, the United States authorities are determined to prevent over-lending abroad. During recent years foreign loans were issued in New York by countries with a favourable balance of payments and the proceeds of such loans further increased the short-term liabilities of the United States in relation to foreign countries.

Towards the middle of 1964 the Washington Administration decided to call a halt to this trend. The announcement of the Government's intention to introduce an Interest Equalisation Tax was sufficient to divert the bulk of foreign long-term borrowing to European financial markets. Even though it is still doubtful whether that tax would be adopted in the form in which it had been intended, it is certain that the authorities will devise means by which to prevent the New York market being flooded with foreign loans.

It is the declared policy of the US Treasury to encourage the development and expansion of rival foreign loan markets in Europe in order to avoid overloading. This, together with the improvement of the trade balance and the reduction of foreign aid, is likely to bring about a fundamental change in the international monetary scene. Since the second half of the 1950s the dollar gap gave way to a situation in which dollars were no longer a scarce currency. Both official and private holdings of dollars, both liquid and long-term, have increased considerably. But now it is once more possible to visualise a return of the dollar gap. The change is not likely to take place overnight. It may take some time before a series of surpluses on the balance of payments will mop up the many billions of loose dollars held all over the world. But the gradual advent of the change is only a question of time.

Restraint on Aid

The United States authorities and American opinion, having become thoroughly alarmed by the technical weakening of the dollar in recent years and by the immense difficulty of reversing the trend, are likely to favour a policy of pressing home their advantage. The improvement of the trade balance is not likely to be used for resuming the former liberal policy of foreign aid. Nor is the Washington Administration likely to yield to pressure by New York banks to restore the former freedom of issuing long-term loans. The official policy will aim at increasing the gold reserve and reducing short-term liabilities to foreign holders of dollar assets. It is only after considerable progress has been made in both directions that the United States is likely to revert to some extent to her former generous and liberal policies in the sphere of international finance.

Meanwhile it would be expedient for all countries to face the probable return of the dollar gap and to adjust their policies in accordance with that expectation. Borrowers should endeavour to make arrangements with European lenders on the assumption that the suspension of free lending by New York is not a purely passing phenomenon. Fortunately the financial markets of London, Frankfurt, Paris, Amsterdam, Zurich and Brussels are willing, and even eager to take up the business relinquished by New York. There has been a noteworthy revival of issuing activity in these markets. So far it was confined almost entirely to issues for Western European countries — Italy, Portugal, the Scandinavian countries and Austria — and to Japan.

There seems to be no reason why India should not benefit by this revival of the European capital markets. Ever since the achievement of its independence, India has aimed at obtaining foreign capital from Governments and from official international institutions. This has been a world-wide trend. But the world-wide trend now seems to be changing back to the traditional methods of obtaining capital through the capital markets of the West. It is in the interest of India not to be left out of this new current. Indian opinion must realise that foreign aid from the United States is on the decline and that the American authorities are likely to discourage foreign issues in New York for a long time to come. Official policies should adapt themselves to this change.

The Role of Profits in National Economic Policy

GUY SIMS FITCH

WASHINGTON:

THE RECENT profits performance of American business is truly impressive. Corporate profits after taxes moved up from $22,000 million in 1961 to a record $27,000 million in 1963, and they appear well on their way to another new high of $30,000 million in 1964. This improvement in the profits picture reflects largely the improvement in the U.S. economy itself. There is hardly an economic indicator of any consequence that has not shared to a greater or lesser degree in the sustained upward movement of the past three years. This does not mean that profits are either excessive or exploitative. Even before taxes, which take roughly half their total, corporate profits still account for a little more than 10 per cent of the national income — a smaller share, in fact, than 10 or 15 years ago. And profit margins, traditionally low in the United States, still represent less than six per cent of sales for most corporations.

Profits Essential for Growth

Nevertheless, the spectre of "profitless prosperity" — an all-too-accurate catch-phrase during much of the 1950's — has almost faded from the scene. For the business man, this is a matter of obvious and considerable import. To him, profits are very much an objective of company policy, providing the source of both existence and growth. For the government, with its primary interest in national economic policy, the role of profits is essentially a derived one, a means to an end. From this vantage point, profits sometimes are an instrument of policy, sometimes a result; sometimes a guide; sometimes a target. The specific role at any given time will respond inevitably to the changing national priorities assigned to various economic objectives in the light of evolving economic circumstances. Thus, profits enter growth policy as a stimulus to private risk-taking and innovation, as a source of funds for expansion, and as a guide to the efficient flow of resources. They enter balance of payments policy as an incentive to the productivity advances that bring lower costs and a stronger competitive position in world markets. As a source of higher domestic rates of return on investment, they also help to keep capital at home and attract capital from abroad. They enter full-employment policy as a contributor to total demand for goods and services through increased investment, and as a by-product of the very success achieved in such policy generally. They enter distributional policy to the extent that they strengthen the position of one economic group—small business, for instance, or the needy in the picture —relative to another. They enter price policy as a stimulant to cost-cutting modernization and the productivity gains that permit businessmen to hold or even reduce their price lines. It is important to note, in this regard, that the pressure to raise prices to enhance earnings is strongest when earnings are low or have been declining, weakest when earnings are high or have been rising. In 1964, earnings are high and rising.

We see, then, that profits have a part to play in an efficient modern economy. Walter W. Heller, Chairman of President Johnson's Council of Economic Advisers, has some cogent comments to make on this point. "The day has long since passed," he said, "when governmental attitudes or policy on profits can be judged—or determined—in terms of gross desires to be benign or beastly to business, to deify or denigrate profits as such." Profits are best viewed perhaps from this functional perspective, regardless of the kind or extent of public policy a government may deem necessary or desirable to help promote the primary objective of advancing the well-being of the people. This is applicable not only to the United States, with its own peculiar mixture of public and private policy, but to countries everywhere, the less-developed and the developed alike.

Decision on Fourth Plan Outlay Postponed

By Our Special Correspondent

NEW DELHI:

THE PLANNING COMMISSION at its full-dress meeting on May 10, held under the chairmanship of the Prime Minister, is understood to have remained content with only broadly deciding that the fourth Plan should be of a much bigger size than the current one and that the development of agriculture, rural economy, basic and heavy industries, power and transport should continue to receive top priority.

No decision could be taken at this meeting on the size of the fourth Plan as such, presumably because of the contention of the Union Finance Minister, Mr. T. T. Krishnamachari, that the Plan should be hinged to the availability of foreign exchange, and his hesitancy to accept that resources would be available for financing a Plan involving an outlay of about Rs. 20,000 crores, as suggested by the Perspective Planning Division. It was, however, agreed at the meeting that the Perspective Division's broad outline should form the edifice on which the fourth Plan should be built. The various Working Groups of the Planning Commission have been asked to scrutinise the Perspective Division's estimates with a view to making them more realistic.

The Planning Commission will be holding two more meetings, one on May 31 and the other some time next month, before arriving at some definite conclusions on the size of the fourth Plan. The matter will then be referred to the National Development Council in the first week of July. The broad framework of the Plan, thus, may be available in October.

Advance Action

Even though the thinking on the fourth Plan is taking time to crystallise, advance action on a number of schemes which are bound to be included in this Plan in view of the shortages being experienced currently or which are likely to arise, is proposed to be continued. The Planning Commission will be intimating to the State Governments soon many such schemes especially in the fields of agriculture, power and transport.

The Perspective Planning Division's outline of the fourth Plan is stated to include in an overall outlay of Rs. 20,000 crores, an investment of Rs. 6,440 crores in industries, Rs. 3,200 crores in agriculture and irrigation, Rs. 2,300 crores in power and Rs. 4,050 crores in transport.

The Rs. 6,440 crores investment in the industrial sector is to be shared by the public and the private sectors in the ratio of approximately 55 : 45. The investment in the metallurgical industries is placed at Rs. 1930 crores — Rs. 1,530 crores in the public sector and Rs. 400 crores in the private sector. Next in importance come the chemical industries on the development of which an expenditure to the tune of Rs. 950 crores is proposed — Rs. 200 crores in the public sector and Rs. 750 crores in the private sector. The investments envisaged in the other important industries are as shown alongside.

Nearly a sum of Rs. 200 crores has been included in the Rs. 6,440 crores outlay for the industrial sector for the development of village and small industries.

The main break-up of the proposed Rs. 3,200 crores investment in agriculture and irrigation is as follows: major and medium irrigation works (all in the public sector) Rs. 1,120 crores; minor irrigation Rs 470 crores; soil conservation Rs. 210 crores; land reclamation Rs. 70 crores; farm equipment and tractors Rs. 162 crores; diesel engines Rs. 100 crores; cold and ordinary storage Rs. 160 crores; animal husbandry and dairies Rs. 11 crores; forestry Rs. 125 crores; fisheries Rs. 75 crores; flood control, drainage, anti-water logging and anti-sea erosion schemes Rs. 100 crores.

Nearly 80 per cent of the Rs. 2,300 crores investment proposed for power development has been allocated to the public sector. It is hoped to raise the power generation capacity from 12.4 million kW. at the end of 1965-66 to slightly over 23 million kW. in 1970-71.

The important components of Rs. 4,050 crores investment suggested for the development of transport and communications are: railways Rs. 1,500 crores (excluding a replacement outlay of Rs. 500 crores); road transport Rs. 900 crores; shipping Rs. 150 crores; port development Rs. 150 crores; lighthouses Rs. 20 crores; inland water transport Rs. 20 crores; air transport Rs. 150 crores; communications Rs. 200 crores; manufacture of trucks and buses Rs. 110 crores; other transport requirements and tourism Rs. 110 crores.

★★

Eight joint Central Teams on Agricultural Production will be visiting the States in May-June this year with a view to ensuring close collaboration between the Central and the State Governments in the formulation and effective implementation of the 1964-65 agricultural production programmes. Similar teams visited the States in April-June last year also.

The scope of the study of these teams this year is being extended to include the implementation of the development programmes relating to animal husbandry, dairying, fisheries and forestry. Last year they concentrated their attention on agricultural crops only.

In order to make this year's visits and joint reviews effective and fruitful, concentrated attention will be paid by the joint Central Teams to a few selected aspects of agricultural programmes. These are: (i) progress of implementation and preparation for the Intensive Agricultural Area Programme during the Kharif season 1964; (ii) action taken on the recommendations of the Working Group on Inter-Departmental and Institutional Co-ordination and the Joint Central Teams which visited the States last year; (iii) action taken on the decision arrived at at the Regional Conferences on Agricultural Production Programmes held in January and February last; (iv) arrangements for distribution of seeds, fertilizers etc.; (v) utilisation of irrigation potential; (vi) provision of electricity for agricultural purposes at cheap rates; (vii) implementation

(In Rs. crores)

Industry	Public Sector	Private Sector	Total
1. Machinery & Engineering	440	420	860
2. Mining	400	185	585
3. Fertilizers	320	115	435
4. Oil Exploration & Refining	345	25	370
5. Electrical Equipment	200	100	300
6. Transport Equipment	70	200	270
7. Cement	20	165	185
8. Textiles	(Mostly in the private sector and partly in the co-operative sector)		180
9. Sugar	(Mostly in the co-operative sector and partly in the private sector).		165

of the development programmes for animal husbandry, dairying, forestry and fisheries; (viii) implementation of the action programmes on agricultural credit; (ix) problems connected with the preparation of district, block and village plans for agricultural production; (x) details of schemes sanctioned out of additional allocations proposed to be made for agricultural programmes for 1964-65; and (xi) the progress of formulation of proposals for the fourth Plan in the agricultural sector.

Each team will consist of senior officials and technical and administrative personnel drawn from the Planning Commission and the Ministries of Food and Agriculture, Community Development and Co-operation and Irrigation and Power. In many of the States, Central Ministers from the Ministries of Food and Agriculture, Community Development and Co-operation and Irrigation and Power and Members of the Planning Commission will join the Teams in their visits and discussions. Members of the Planning Commission's Panel on Agriculture will also meet the Teams during their visits to the States and have discussions with them on local problems. State Governments have been asked to invite progressive farmers to meet the Teams at the State headquarters.

Outlay for the development of agriculture during 1964-65, it may be recalled, has been stepped up over the 1963-64 outlay, by about Rs. 20 crores. Additional allocations for minor irrigation, soil conservation, intensive development programmes etc., are also contemplated. Foreign exchange allocation for fertilizers has also been increased.

**

Of the nine offers of collaboration received by the Ministry of Petroleum and Chemicals for setting up the Madras Refinery — from BOC - Shell International, Esso Standard Eastern, Philips Petroleum, Caltex, Mobil, ENI, Japanese Oil Consortium, the French Oil Company (BAP) and the National Iranian Oil Company (in partnership with the American International Oil Company) — four proposals — those of BOC - Shell International, Esso, Philips Petroleum and the National Iranian Oil Company — are understood to have found favour with the Working Group set up by the Ministry of Petroleum and Chemicals to hold preliminary discussions on these offers. The Working Group's recommendations will be shortly forwarded to the Negotiations Committee, consisting of the Cabinet Secretary and the Secretaries of Union Ministries of Petroleum and Chemicals, Finance and International Trade, for final selection of the collaborators for this project.

The main consideration that appears to have weighed with the Working Group for recommending to the Negotiations Committee for further consideration of the collaboration arrangements proposed by BOC - Shell International, Esso and Philips Petroleum is said to be the comparatively cheap prices quoted by these companies for crude supplies. In the case of the BOC - Shell International offer, the proposed flexible management pattern is also considered to be of great advantage. The successful working of the partnership between the Union Government and the BOC in Oil - India is stated to be a further point in favour of this offer.

Besides the low crude oil supply quotation, Esso's proposal is thought to be attractive in view of the petro-chemicals complex proposed along with the refinery. The proposal of Philips Petroleum is being commended to the Negotiations Committee with the stipulation that this company should agree to revise the Cochin Refinery agreement also in the light of the arrangements which may be agreed to for the Madras Refinery.

The collaboration offer of the National Iranian Oil Company is said to have found favour on the ground that its acceptance may pave the way for the Oil and Natural Gas Commission securing oil exploration concessions in Iran.

**

The Union Government has set up a three-member Working Group to suggest a suitable price structure for petroleum products, which should replace the present arrangement instituted on October 1, 1961 on the recommendations of the Oil Price Enquiry Committee, popularly known as the Damle Committee. The current arrangement expires on March 31, 1965. The Working Group has been asked to submit its report by December 31, 1964, so that the Government can have enough time to consider it before giving effect to the revised price structure from April 1, 1965.

The Working Group is headed by Mr. J. N. Talukdar, a former Chief Secretary to the West Bengal Government. Its other two members are Mr. S. S. Shiralkar and Mr. N. Krishnan, Joint Secretary and Chief Cost Accounts Officer of Union Ministry of Finance, respectively. Mr. N. R. Law, Under Secretary in the Ministry of Petroleum and Chemicals, has been appointed as the Secretary of the Working Group.

The Working Group has been asked to examine and report upon :

(1) the manner of determination of ex-factory prices of refined petroleum products, including bitumen produced by the refineries;

(2) the manner of determination of landed prices in respect of similar products which may be imported;

(3) the determination of marketing and distribution charges of both indigenously produced and imported petroleum products; and

(4) the determination of ceiling sale prices of oils, greases and specialities.

The Working Group has also been asked to consider the possibility of linking the prices of petroleum products of individual refineries with physical supply areas and the desirability of having uniform or pooled prices for the whole of the country or for different zones which may be carved out for this purpose.

**

The Aid-India Consortium, it is learnt, will be meeting in Washington on May 26 to pledge assistance for the fourth year of our current Plan. According to the indications available here, the Consortium this time may provide slightly more aid than it did in 1963-64. India has asked for a minimum assistance of $1100 million for 1964-65. The aid actually required for implementing the development programmes intimated to the Consortium, however, aggregates $1140 million —Power $130 million; Railways $75 million; Transport and Communications $50 million; Iron and Steel $45 million; Mines and Fuel $60 million; Industries $350 million; Food and Agriculture $40 million; Education, Health and Scientific Research $40 million: Commodity aid (including refinancing) $350 million.

The minimum requirements figure is understood to have been placed at $1,100 million on the expectation that nearly half of the assistance sought will be available in an untied form.

**

The Union Government has announced its decisions on two important recommendations of the Second Pay Commission. By virtue of the first decision, the Central Government employees drawing a monthly salary below Rs. 400 have been given, with effect from February 1, 1964, an increase in dearness allowance ranging from Rs. 3.50 to Rs. 15 per month. The benefit of dearness allowance has also been extended to the employees drawing a basic monthly salary between Rs. 400 and Rs. 600. The new rates of dearness allowance compared with the allowance at present admissible are given in the table on the next page.

The revised dearness allowance scheme will benefit about 2.3 million civilian Central Government employees and is anticipated to cost the exchequer nearly Rs. 14 crores a year.

The second decision relates to the Central Government Employees' Children's Education Allowance Scheme. Under this decision, the Government will now reimburse its employees drawing a monthly salary up to Rs. 600, the tuition fees payable and actually paid by them for the education of their children in middle and higher secondary schools, provided the children are educated at places other than the place of duty of the employee concerned, at rates not exceeding those approved by the State Government of the area for Government and aided schools. Primary education being free in all the States, no allowance is to be paid for the children studying in the primary classes. Railway employees and the Defence Services personnel other than officers who are already governed by a separate contributory scheme in this connection, will also be entitled to the benefits of the revised Central Government Employees' Children's Education Allowance Scheme. The additional burden of administering this revised scheme on the exchequer is estimated at Rs. 4.3 crores per annum.

Pay Range (Rs.)	DA admissible at present (Rs.)	DA admissible from 1-2-1964 (Rs.)	Increase (Rs.)
70-109	17	20.50	3.50
110-149	20	25.50	5.50
150-209	35	42.00	7.00
210-299	40	50.00	10.00
300-315) ..) ..	Amount by which pay falls short of	Rs. 350 minus pay	10.00
316-320) ..	Rs. 340	35.00	11.00 to 15.00
321-380	20	35.00	15.00
381-384) ..) ..	Amount by which pay falls short of	35.00	16.00 to 19.00
385-400) ..	Rs. 400	Rs. 420 minus pay	20.00

581-600	Nil	Rs. 600 minus pay	19.00 to 0

Maharashtra's Fourth Plan

From our Correspondent

BOMBAY:

IN THE COURSE of the two-day talks on the Plan which Mr. Asoka Mehta had with the Chief Minister of the State, the size of the Plan for Maharashtra was fixed at almost double the level of the third Plan. There was general agreement that the emphasis in the fourth Plan should be on agriculture in the State. The discussions covered agriculture, irrigation, co-operation, education, water supply, backward class welfare, working of some of the schemes and the impediments experienced in the effective implementation of the same. Mr. V. P. Naik, Chief Minister has stated that the State Government had pressed the need for a special allocation of steel for pipelines to implement the Upper Vaitarna and the Bhima water supply schemes. The Government of the State has also stressed the need for cheaper insecticides and fertilisers to improve agricultural productivity in the State and further, they have asked for assistance in augmenting rural water supply and the allocation of a sizable quantum of foreign exchange for the execution of irrigation schemes.

Besides the discussion on planning, it is learnt that the new prohibition policy was also touched; the Deputy Chairman will shortly invite the Chief Ministers of States to examine the Tek Chand Committee Report on prohibition. Since Maharashtra has departed from the policy pursued hitherto, it is interesting to examine the recommendations of the Report to see how for the State can maintain its stand on the new policy. In fact, the State Government has not been able to take a decision in regard to free sale of alcoholic beverages containing 3.5 per cent alcohol, pending the consideration of the Tek Chand Committee Report.

**

At the second quarterly general meeting of the Maharashtra Chamber of Commerce, Mr. Lalchand Hirachand, President, made a pointed reference to the need for a more precise evaluation of the progress of industrial growth in the State. He suggested that the State Governmen should investigate as to how many substantial licences were issued in Maharashtra and how many industries were actually established. The results of such an investigation, he said, would give a clear picture of the rate of industrial growth. Mere issue of licences does not imply a corresponding rate of industrial growth. He also referred to the Master Plan for Bombay, which, he said, should be given wider publicity to ascertain the views and suggestions of the public keeping in mind the necessity of perspective planning for this growing and congested city.

**

Whatever may be the political attitudes and policies, any trend which helps to contribute to the economic advancement particularly through industrialisation should be welcomed. The Government of Goa, Daman and Diu, has decided to lift all restrictions of non-Goans in the matter of granting of licences for setting up industries and other establishments in the territory. This was revealed by Mr. V. S. Karmali, Minister for Information. Previously, these restrictions were imposed by the Military Governor in order to give protection for Goans. The lifting of the restrictions would enable non-Goans to purchase properties in Goa. The Minister also disclosed that permission would be granted for running private lotteries and raffles on the condition that the proceeds of such institutions were used for charitable, educational and welfare purposes, and not for private profit. The removal of restrictions on the issue of licences is considered a very effective and desirable move in promoting the industrial advance of the Union territory.

**

The automobile interests in Bombay do not subscribe to the view of the Union Minister for Steel, Mines and Heavy Engineering that the supply position of scooters would improve in the future, unless immediate steps are taken to permit increased imports of components which are not manufactured in the country. The present production of scooters is much below the licensed capacity of 71,000. With the 10 per cent cut of imports after the declaration of national emergency, in respect of all automobile vehicles except commercial trucks, there has been a proportionate fall in production. The licensed capacity of scooters was raised to the above figure only recently from 51,000. Even the previous capacity has not been reached as the production of scooters, motor-cycles, three-wheelers and mopeds for 1963-64 was just 27,130, little over half the licensed capacity; of these scooters numbered 15,444. Thus, the question of stepping up of scooter production does not arise until the necessary components are made available. If the revised capacity is to be reached, obviously, a more practical view of the position should be taken, and the problems of the industry should be fully examined. It should not be forgotten that even if increased imports are allowed, there is a time lag in reaching higher production levels. The position in regard to automobile industry reveals lack of co-ordination in the import licensing policy where foreign com-

ponents are indispensable in the manufacture of the end-product.

**

The development of ports and harbours may have to receive increasing attention and priority in the fourth Plan of Gujarat. The State has a vast coastline with a large number of intermediate and minor ports. Out of the 18 intermediate ports and 200 minor ports in the whole country, the State accounts for 8 of the former and 42 of the latter. The ports of Gujarat handle two million tons of cargo against a total of five million tons handled by the intermediate and minor ports in the whole of India. Thus, the potential for developing the ports is significant. However, having regard to the organisational, technological and financial limitations, it would be necessary to resort to selective development with reference to the existing and potential needs of the traffic. In the Rajkot division, intermediate ports like Okha, Porbandar, Veraval and Bhavnagar have great scope for increasing traffic and it is therefore necessary to give priority in developing them to the maximum extent possible. An immediate and pressing problem of several ports is their siltation, which places a serious handicap in the way of their maximum use. Provision of dredgers and dredging is, therefore, required to be made on a sizable scale.

In the first Plan, an amount of Rs. 1.6 crores was spent on the Gujarat ports. But, this was only to make up for arrears of the neglect in the war years. However, certain basic investigations which were undertaken during this period enabled the Government to formulate engineering schemes for augmenting the port facilities. The essential repair and replacements of flotilla were also undertaken. But apart from this no further progress could be made. In the second five-year Plan period, investigations for more improved engineering works, such as for the break-waters at places like Porbander and Veeraval, hydrographic surveys and certain model tests were carried out. But, even in this period only those schemes were undertaken which more or less could make good the deficiencies in the existing facilities so as to make the ports serve the traffic needs better than before. No substantial provision could be made for significant increase in the port handling facilities. It is expected that an amount of Rs. 4 crores would have been spent in the period, including the expenditure incurred from Saurashtra Port Development Fund.

The third Plan has provided for an expenditure of Rs. 1.9 crores for the development of these intermediate ports and several minor ports in the State. All these would seem to be inadequate looking not only to the urgent need of utilising the intermediate ports and some of the minor ports but also to the defficiency in the facilities now made available. Therefore, a much faster pace of development may have to be envisaged in respect of the ports in Gujarat.

K. K. Birla: Talk of Monopolies is Meaningless

From our Correspondent

CALCUTTA:

IS THE MONOPOLIES Commission chasing a shadow? Mr. K. K. Birla's answer to this question of the day is in the affirmative, and without any qualification. While addressing the annual general meeting of the Indian Chamber of Commerce, Mr. Birla rightly pointed out that the latest "socialist" measure to track down monopolies in the private sector is based on a misconception of the term "monopoly" itself. Some industries by their very nature have to be necessarily of large size; this is a question of modern technology and economies of scale and has nothing to do with the suspected manipulation of "wicked capitalists" to hold the community to ransom. Mr. Birla cited the example of the motor-car industry in India. It would be ridiculous if a hundred factories were to be licensed to make motor-cars in the country, particularly when the market for the product is so small. Most of the other major industries like textiles, sugar, jute, tea, electric motors and so on are so widely dispersed that there can be no question of monopolistic tendencies arising in them. In the iron and steel industry, it is the Government which now has the upper hand, and if the private sector has only two units it is because the Government, in terms of its industrial policy resolutions, has debarred other entrepreneurs from entering the field. "As a matter of fact", Mr. Birla pointed out, "the complaint has rather been that, whereas in other countries there are only four or five important producers of a particular item, in India, on the other hand, most of the important manufacturing concerns of the world are represented by some collaboration agreement or the other."

The boot, in fact, is on the other leg — in the public sector. Over the past decade one monopoly after another has come up in this sector; life insurance, airways, ore exports are likely to be followed by sugar distribution. As Mr. Birla again pointed out, during the last few years, the public sector has grown so rapidly that it now practically dominates the country's economy. In the first Plan, investment in organised industry and minerals in this sector was only Rs. 60 crores as against Rs. 340 crores in the private sector. In the second Plan, public sector investment rose to Rs. 870 crores, while the share of the private sector relatively declined to Rs. 675 crores. In the third Plan, the process moved even faster — the original investment target of Rs. 1,520 crores in the public sector of industry was subsequently raised to Rs. 1,800 crores, while the private sector's share was raised by just Rs. 100 crores to Rs. 1,200 crores. It is certain that the pattern will be repeated in the next Plan. The private sector obviously has been given a less important place in the country's scheme of economic development. Monopolies are a bad thing, even if they are run by the State. The Indian Airlines Corporation is not exactly a model of efficiency, nor is the Life Insurance Corporation, nor any other organisation which runs under State ownership. 'In these circumstances, the constant talk of monopolies in the private sector has no meaning," Mr. Birla emphasised. "On the contrary, it will be an irony that when the country needs so much industrialisation those who owing to their experience and resources are in a position to serve the country are denied such opportunities. But even assuming the existence of monopolies in some stray industries, what was the necessity of appointing a monopolies commission, when the Development Wing of the Government of India itself could have studied the problem and adopted appropriate methods to solve it by denying the so-called 'monopolies' further industrial licences"? Mr. Birla asked.

The other obsession of the Government is to check the concentration of economic power in private hands. This too is based on a wrong appreciation of the facts. The rich are not really getting richer, although there is a great disparity in income and wealth, but this is more due to the character of the economy in which so much unemployment and underemployment exist rather than to the acquisitive instincts of the "upper ten" of the Indian society. Mr. Birla quoted some statistics which are illuminating. The number of wealth tax assessees with a wealth of over Rs. 50 lakhs was 191 in 1960-61, but it dwindled to 165 in 1961-62. On the other hand, in the income group not exceeding Rs. 15,000 a year, the total number of assessees increased to 820,441 in 1961-62 from 422,328 in 1957-58. In other words, their number has almost doubled in about five years' time. As against this, the number of assessees with an income of above Rs. 2 lakhs has fallen from 650 to 543 in the same period. Those who still believe that the rich have any scope for adding to their riches will do well to take a careful look at the present structure of personal taxation. What with the gift tax, the high rates of estate duty, the capital gains tax, the expenditure tax and above all, the very steep rates of income-tax, no person in India can conceivably accumulate much wealth, much less get richer and richer. As Mr. Birla said, it has become impossible for the society to produce a Henry Ford or a Nuffield starting from scratch. To quote Mr. Birla again, if a man earns, he has to pay a heavy income tax; if he spends, he has to pay expenditure tax, if he saves he has to pay a heavy wealth tax; if he gives away, there is a high gift tax; and if he dies leaving any savings in the form of wealth he has to pay a heavy estate duty. Mr. Birla then went on to add: "Owing to the atmosphere of despondency that has been created in the country by the expropriatory tax structure, there is no possibility of any new big enterprise coming into existence as a result of public support. It is not a happy thought to reflect that the useful pattern of shareholding which has been developing in our country for so long, whereby larger and larger numbers of people have been participating in the corporate sector, will soon get reversed and public participation in corporate enterprise will drastically diminish."

Well-Pointed Facts

As for the growth of old and established firms, Mr. Birla did well to point out some relevant facts. If an industrialist, renowned for efficiency, honesty and good management, starts an industry, the shareholders naturally extend substantial support to him. If he is able to promote more companies, that only shows the trust and confidence the general public have in him. "It will be an irony to decry such an industrialist and say that rich as he was he is getting richer or that economic power is being concentrated in his hands. In decrying him, we are really decrying the investing public." Concentration of economic power today is really in the hands of bureaucrats, just as political power is concentrated in the hands of Ministers and their deputies. Concentration of political power is no less bad than concentration of economic power, but concentration of any of these powers is really bad "when a man misuses his position and privileges and betrays the confidence of the investing public." In any case, the talk of concentration of economic power in private hands is irrelevant in the Indian context. The so-called big business in India is really not so big as is commonly supposed. If international standards are taken, there is in fact no such thing in this country. Indian companies are mere pigmies in comparison with the giant companies of Europe and the U.S.A., and no Indian company finds a place in the list of even the first 450 companies of the world.

**

The recommendations of the Bonus Commission, although still under the Government's consideration, have caused a lot of uneasiness among industrial circles here. The Engineering Association of India, representing one of the major industries of eastern India, has just drawn the attention of the Government of India to certain objectionable features of the Commission's report. The report defines bonus as a share of workers in the prosperity of the concern. By this the Commission appears to have endorsed the outmoded principle of profit-sharing — a principle which militates against productivity and efficiency. The Association, therefore, points out that if workers are to get bonus irrespective of efficiency, it is certain that production and productivity cannot be stimulated. The Commission has recommended a minimum bonus of 4 per cent of the workers' annual earnings including dearness allowance even when there are losses. The Association feels constrained to point out that the practice of giving annual profit-bonus to workers, irrespective of profit or loss, is against the very concept of bonus as formulated by the Commission and a contradiction in terms. Bonus can be paid only when there is profit; otherwise it would only load a concern with liabilities which would discourage venture capital and unnecessarily increase the entrepreneurial risk. Moreover, in the present context of balance of payments difficulties and the need to minimise exports, the cost structure of industry should be rationalised and made competitive in order to enable the country to retain its hold on foreign markets, and expand it.

The Association takes particular objection to the "set-off" and "set-on" formula which is meant to guarantee the minimum bonus in good years and bad. This, the Association points out, is not conducive to higher efficiency or productivity for the simple reason that workers, once they are assured of their minimum bonus, have no incentive to co-operate with the management for achieving production targets or improve their own productive standards. The formula obviously deserves to be rejected. Industry is not allowed to treat super profits tax (now surtax) as a prior charge on profits. This tax is a direct levy, and it is difficult to see the logic of the Commission in disallowing this as a prior charge. It is equally illogical of the Commission to have summarily rejected industry's claim for a specific rehabilitation allowance as a prior charge in the bonus formula. A large part of machinery and equipment in different industries has been rendered obsolete and replacement costs are steadily rising. The normal depreciation allowances, which are now available, are not sufficient for the simple reason that costs of plant and machinery have greatly risen over the years. Under the Commission's formula, a concern can retain only 40 per cent of the available surplus after distributing 60 per cent of the same as bonus. Out of this 40 per cent, it is required to meet such liabilities as (a) super profits tax (now surtax), (b) additional return on capital and reserves, (c) repayment of indebtedness (including deferred payments, debentures, and redeemable preference shares), (d) provision for gratuities, (e) reserves for contingencies, (f) finance for rehabilitation requirement, modernisation and obsolescence. It is obvious that in the process of meeting this formidable array of obligations out of the retained balance, nothing is likely to be left over for rehabilitation.

Disincentive for Investment

As return on capital, the Commission has allowed only 7 per cent as a prior charge on profits. This rate is unrealistic because it does not take into account the established trends in the capital market. As far back as 1950 when the bonus formula was evolved by the Labour Appellate Tribunal, the fair return on capital was conceived to be such that the investing public would be attracted to industry by a steady and progressive return on capital which industry may be able to offer. This return on paid-up capital was fixed in 1950 at 6 per cent tax free which is equivalent to 8.7 per cent taxable. By fixing the return on paid-up capital at 7 per cent taxable, equivalent to 4 per cent tax free, the Commission has in fact decreased the rate of return from its 1950 level. This can hardly be expected to act as an incentive to further investment. Since then not only have the rates of borrowing gone up, but because of the credit squeeze by the Reserve Bank, business men have to resort to private borrowing paying as high a rate of interest as 12 per cent.

How realistic is the Commission's prescribed margin of return can be judged against the following facts: Government securities now yield about 4 per cent tax free; fixed deposits

in banks yield 5 per cent or more; banks lend at about 7 to 8 per cent or even more; even the Reserve Bank charges 6½ per cent to scheduled banks beyond the quota limit. The Association, therefore, urges that at least 10 per cent should be allowed as a return on capital considering the present cost of money. The Deputy Chairman of the Planning Commission, Mr. Asoka Mehta, who can hardly be accused of having sympathies with private enterprise, has declared that at least 10 per cent should be taken as the reasonable rate of return on capital if industry is to maintain a steady rate of growth.

New Wings to Fly

From Our Correspondent

MADRAS:

THE AIRCRAFT industry is developing in a big way in this country and the Southern States will be playing a prominent part in manufacturing components of various kinds in five centres in this country located in five different States. The MIG Project, which will be constructed with Soviet assistance and which will have three units, one each in Maharashtra, Orissa and Andhra Pradesh, has given a push to the development of the aircraft industry. Already, the factory at Bangalore has made tremendous strides and it is expected that there will be a doubling of the turnover of Hindustan Aircraft Limited to Rs. 20 crores during the current financial year from Rs. 11 crores in 1963-64. It must be said that the credit for the pioneering effort in this industry goes to this factory which has been gradually improving the technique of manufacturing components and parts and which has given rise to the confidence that the complicated production of aircraft parts and their assembly can be easily undertaken in this centre. Even now the indigenous content in Orpheus, which is the engine powering the H.F.-24, has an indigenous content of over 60 per cent while this percentage would be achieved, if not exceeded, in the case of the airframe in a short period. While large-scale production of this transonic aircraft will be undertaken, it is being examined whether, with suitable modifications to both the frame and engine, the aircraft can be made to achieve Mach-II speed. It has been stated that the airframe would be quite suitable to achieve also supersonic speed if the Orpheus engine itself can be made to power the aircraft with the reheat process. This arrangement will no doubt be followed as a last course. It is being explored whether an entirely new engine can be produced so that dependence on outside sources for securing supplies of Supersonic aircraft can be eliminated. It may be that, during the forthcoming visit of the Defence Minister to the USA, it would be possible for our Government to negotiate for the supply of one or two squadrons of Supersonic aircraft, but with the new consciousness in the country that there should be a greater measure of reliance on indigenous sources, it is emphasised that the manufacture of defence equipment should be carried out on a planned basis and completed in a period of five years.

MIG Project

While the MIG project is fast assuming shape, in spite of the speculation for a time that the scheme might be abandoned because of the unsuitability of the Russian fighters for operation under Indian conditions, it is felt that for the development of the supersonic aircraft at Bangalore, US assistance should be sought. If a new engine can be developed or if the equipment could be supplied so that the range of production could be diversified and aircraft produced in large numbers achieved in a shorter period, the requirements in terms of both military and civil aircraft can be secured from within the country as far as possible. It is indeed a matter for gratification that most of the tooling has been done at the Bangalore factory and there would be, after some time, dependence mainly on raw materials rather on components and parts.

Since there will be a number of units in operation in different places and there is need for co-ordination of the activities of the various units and utilising effectively available capacity, it has been decided that there should be one corporation looking after the administration of these units. An announcement to this effect was made when Mr. Raghuramaiah visited Bangalore recently. Air Vice-Marshal Ranjan Dutt, who is now looking after Hindustan Aircrafts Limited, will be the Managing Director of the new Corporation, Aeronautics India Limited. In order to divest the Bangalore factory of its other activities, the Coach-Building unit will be attached to the new Central Government undertaking that is proposed to be established in the Kolar Goldfield area for manufacturing heavy earth-moving machinery. It is the intention of this undertaking to provide employment for those that might be discharged by the Kolar Gold Mining Companies. It may be recalled that there was a proposal sometime back to suspend gold mining in areas where it was not considered profitable and to provide alternative employment to workers that might be retrenched.

**

Industrialisation in this part of the country is taking place at a rapid rate in other directions as well. While the Surgical Instruments Factory in Madras is fast being completed and regular production might be commenced sometime next year, at Tiruchirapalli the Heavy Boiler Factory, being erected with Czechoslovakian assistance, has progressed beyond expectations and there is now confidence that the whole scheme could be completed early next year and supplies of heavy boilers to the thermal generating units made available by the end of next year or early in 1966. Civil construction work on the main factory buildings has progressed to such an extent that even the casual visitor would be able to have an idea of the massiveness of this new project. In Neyveli, too, the fertilizer project is being rapidly completed and one of the two streams might be ready for trial tests by the end of this year. The briquetting unit will, of course, be easier of construction as multiple units are involved and production can be commenced even while other sections are being finished.

There is, however, anxiety to know when and where new pig iron plants will be established in Andhra Pradesh, Madras State and Mysore. A Japanese team is presently visiting this country in order to explore the possibilities of constructing a number of units having a capacity of at least one lakh metric tons each. The experts of the team claim that Japan has evolved a process which will be more economical than that suggested by Norway. If this new process is adopted, smelting by electricity, along with low grade coal like lignite, can be found economic. There is at present an acute shortage of pig iron. Even though efforts are being made to construct the blast furnaces under the expansion schemes in the three public sector steel unit earlier, in order to increase the output of pig iron, there will be need for a large number of medium-sized units in different States where the necessary resources are available. Thereby, freight costs can be considerably reduced besides achieving the much desired dispersal of capacity. It has also been represented to the Centre that in the Bellary-Hospet region a large-sized steel plant should be erected in order to utilise the rich iron ore reserves which are estimated at over 1,000 million tons. It is not known whether the Government would be able to take a decision about the location of a steel plant in this region if Goa is chosen as one of the sites for a new steel unit. But there is every scope for producing pig iron based on the electric process as the required quantity of coal could be imported. It may, however, be found that the movement of ore to Goa would be more economic in the long run.

Trade Winds

PROFIT MARGINS IN PUBLIC SECTOR

Replying to a question in the Rajya Sabha, the Minister of International Trade, Mr. Manubhai Shah, disclosed that generally, the distribution margin on items handled by the State Trading Corporation and the Minerals and Metals Trading Corporation varied between half per cent and 10 per cent (limited to only half to three per cent in the case of exports) and covered distribution expenses and other incidental charges including profits. In the case of scarce commodities such as mercury, camphor, cloves, betelnuts, etc., the main objective of the corporations was to canalise imports and distribution in order to mop up the difference between the ruling prices in the market and the landed costs.

The margin of distribution charged in respect of imports is illustrated as under:—

Item	Distribution margin
Fertilisers	about ½%
Copper	about 2%
Zinc	about 2%
Steel	about 4%
Tools and alloy steels	about ½%
Dye intermediates, pharmaceutical intermediates, sodium nitrate, caustic soda, sodium sulphate and miscellaneous basic chemicals.	below 10%
Newsprint	about 1%

TRADE WITH DEVELOPING COUNTRIES

The Board of Trade, at its meeting in New Delhi on May 5, 1964, expressed concern over the decline in India's exports to African countries in 1963-64 (eleven months, April to February) when they totalled Rs. 42 crores only as compared to the total of Rs. 45 crores in 1962-63 (April-February). It was recommended at the meeting that a committee be set up, with the Foreign Secretary as the Chairman, to go into the question of trade expansion with the developing countries of Africa, Latin America and Asia. It was disclosed at the meeting that the largest increase in India's exports in 1963-64 (eleven months, April to February), the largest increase of Rs. 47 crores, was in respect of Asia and Oceania, of which again the ECAFE region alone had accounted for Rs. 42 crores. Exports to America (Canada, the U.S.A., Latin America, etc.) increased from Rs. 145.6 crores to Rs. 156.1 crores, showing a rise of Rs. 10.5 crores. Exports to West European countries were also higher by Rs. 10 crores, of which the countries forming the European Economic Community accounted for over Rs. 8 crores. The exports to East European countries recorded an increase of Rs. 12 crores, of which the Soviet Union's share alone was Rs. 11 crores.

EXPORTS OF JUTE MANUFACTURES

The increased exports of jute manufactures from 7.8 lakh tonnes in 1962-63 (April-February) to 8.4 lakh tonnes during the corresponding period of 1963-64, more than offset the decline in the export price from Rs. 1,758 to Rs. 1,740 per tonne, thereby increasing the country's export earnings from Rs. 137 crores to Rs. 145 crores. The export earnings would have been still higher but for the decline in the export of jute bags from 2,56,000 tonnes to 2,43,000 tonnes. Fall in the price of jute bags from Rs. 1,422 to Rs. 1,388 per tonne also contributed to the lower value of their exports from Rs. 36.4 crores in 1962-63 (April-Feb.) to Rs. 33.7 crores in 1963-64 (April-Feb.). The decline of 13,000 tonnes in the export of jute bags was largely due to the less purchase by Nigeria (26,000 tonnes), followed by Thailand, Indonesia and Egypt by 7,000 to 8,000 tonnes each. Part of the decline in exports to these countries was offset by increased exports to the U.S.S.R. by 16,000 tonnes and to Syria by 15,000 tonnes. Exports of jute bags were also higher in the case of Chile, West Germany, Italy, Sudan and the U.K. Exports to Cambodia, Ghana and Netherlands remained, more or less, stationary at the last year's level. Exports of jute cloth rose from 4,42,000 tonnes valued at Rs. 92 crores to 4,66,000 tonnes valued at Rs. 98 crores. Of this increase, the U.S.A. alone accounted for 11,000 tonnes followed by the U.S.S.R. 8,000 tonnes and Argentina and Canada by another 7,000 tonnes each. Exports to the U.K. remained, more or less, stationary while those to Australia and Turkey were somewhat lower.

MONOPOLIES INQUIRY COMMISSION

The Monopolies Inquiry Commission which was appointed by the Government of India in April, 1964 (vide "Eastern Economist" dated April 17, 1964—page: 862a) has notified that all those interested to place their views on the subject before the Commission may send *memoranda* to the Secretary, Monopolies Inquiry Commission, 7, Tughlak Lane, New Delhi, by July 15, 1964.

DREDGERS TO BE BUILT IN INDIA

The Mazagon Docks Ltd., Bombay, and the Garden Reach Workshops Ltd., Calcutta, have signed collaboration agreements with a Scottish firm for the construction of non-propelled bucket dredger and twin screw hopper barges. The firm of Simon Lobnitz of Glasgow will supply designs and drawings for the construction of the vessels as also the specialised dredging equipment and other items which cannot be built in India. The non-propelled bucket dredger, capable of dredging 1,000 cubic yards of mud or silt per hour from a depth of 45 feet, will be built by the Mazagon Docks, Bombay. The hopper barges will be manufactured at the Garden Reach Workshops in Calcutta. They will be twin screw diesel-powered vessels, each with a capacity of 1,000 cubic yards.

RISE IN PRODUCTION OF MESTA

According to the Directorate of Economics and Statistics, Ministry of Food & Agriculture, the All-India Final Estimate of Mesta, 1963-64, puts the current year's area and production of Mesta at 952,000 acres and 1,805,000 bales (of 400 lbs. each) respectively. As compared with the Partially Revised Estimates of 937,000 acres and 1,684,000 bales for 1962-63, the Estimates for 1963-64 show an increase of 15,000 acres or 1.6 per cent in area and of 121,000 bales or 7.2 per cent in production. This increase has, however, been offset to some extent by the decline in area reported mainly by West Bengal. The increase in production is accounted for mainly by Bihar and Andhra Pradesh and is attributed to the corresponding increase in area under the crop and the favourable weather conditions. The yield per acre during the current year work out to 758 lbs. as against 719 lbs. of last year showing an increase of 5.4 per cent.

DRILLING EQUIPMENT PARTS

The Government of India has announced that import duty on specified articles and component parts, imported for use in connection with the exploration of mineral oil or gas, will be levied at the concessional rate of ten per cent ad valo-

rem. The list includes drilling bits, core barrels, core bits, turbo drills and bits, drilling speed testers, blow out preventors, formation testers, packers used in oil wells, gas and air compressors, de-sanding units, cementation units, bunkers and ancillary equipment, well-head fittings, oil gas separators, high pressure valves and other allied fittings, de-salting equipment, oil pumping sets, gasoline equipment, swabbing equipment, high pressure flow lines, pressure release and relief valves, bottom hole samplers, bottom hole pressure and temperature recorders, tubings draw works, mud pumps, shale shankers, swivel, hook, rotary tables, crown block and travelling block and derrick.

IRON ORE EXPORTS

The Minerals and Metals Trading Corporation of India exported 4,35,000 tonnes of iron ore in April, 1964 as against 3,39,000 tonnes exported in April , 1963. The April, 1964 shipments of iron ore included 52,000 tonnes from Goa. Exports to Japan aggregated to 2,57,000 tonnes while the remaining 1,78,000 tonnes were exported to Czechoslovakia, Rumania, Yugoslavia and Poland.

EXPORT CLAIMS SETTLEMENT PERIOD REDUCED

Addressing the Southern India Chamber of Commerce in Madras, Dr. S. P. Chhablani, Managing Director of the Export Credit and Guarantee Corporation Ltd., disclosed that the period of settlement of export claims had been reduced by the Corporation to four months instead of six months. He said that underwriting of export risk by the Corporation was the surest way of realising the exporters' claims. Referring to the progress the ECGC had made since its inception in January, 1964, Dr. Chhablani said that it had secured business worth Rs. 8 crores and had lost only Rs. 24,000 by way of defaults.

REFRACTORIES PROJECT

In collaboration with West Germany and the U.K., a Rs. 2.82 crore refractories project will be set up near Ranchi in Bihar. The project envisages the manufacture of 32,000 tonnes of refractories a year from locally available raw materials. The Bihar Government will underwrite shares to the tune of Rs. 10 lakhs.

EXPORTS OF PHARMACEUTICALS

According to Mr. R. N. Thakkar, the leader of the Trade Delegation sponsored by the Basic Chemicals, Pharmaceuticals and Soaps Export Promotion Council of Bombay, there is a good scope for the export of India's drugs, pharmaceuticals, dyes, alcohols, insecticides, chemicals and cosmetics to Uganda, Kenya, Ethiopia, Sudan, Kuwait and Aden. He, however, stressed the need for conducting occasional studies of the market conditions in these countries as well as the need for better packaging and the removal of disparities in shipping freights. According to the Secretary of the Delegation, Mr. P. K. K. Vydiar, the Delegation itself booked orders worth Rs. 2 lakhs of which 50 per cent were for chemicals. Orders for toilets and cosmetics were of the order of Rs. 75,000.

TEXTILE MACHINERY IMPORTS

In order to enable the units in the textile industry to submit their applications for the import of permissible items of textile machinery from Italy, along with performa, invoices etc., the Textile Commissioner has extended the last date for the receipt of applications to May 31, 1964.

POZNAN FAIR

The 33rd Poznan International Fair in Poland will open on June 7 and close on June 21, 1964. The fair area this year will be larger, covering 1,04,000 sq. metres. The largest exhibitor will be Poland which is giving special attention to the exhibition of heavy industrial goods. In all, 57 countries will be represented in the fair including 25 countries of Europe, 11 of Africa, 10 of America, 8 of Asia and 3 countries of Australia and Oceania. The list of exhibitors contains 191 firms of West Germany representing almost all branches of industry, 72 firms of Austria, 81 of U.K., 44 of Yugoslavia, 20 of Hungary, 20 of the G.D.R., 18 of the U.S.S.R. and 14 of Czechoslovakia. India is also participating in the fair.

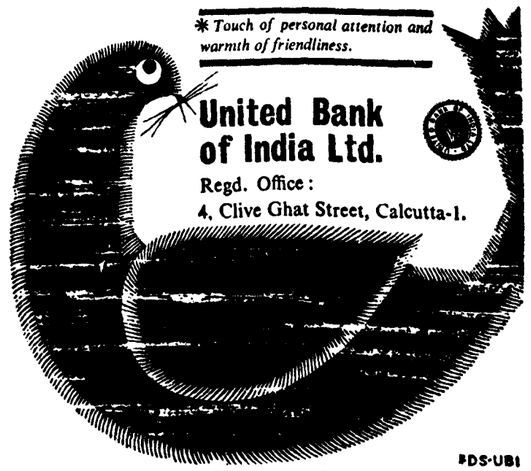
The forthcoming fair is expected to carry a display of the following types of items: complete industrial plants and equipment for light and heavy industries in such fields as mining and industrial automation; electronic equipment including calculating machines and measuring instruments and apparatus; mining and smelting machinery, automatically steered machine-tools, outfitting equipment for ships, building and public works machinery, rolling stock, aircrafts, motorcars and agricultural machinery. The fair Authority has also set up a special office for the dissemination of technical information. The office will have at its disposal a selected team of experts who will organise lectures and symposia in which international experts representing particular technical branches will participate.

IMPORTS FROM IRAN

The Union Government will grant, during April-September, 1964 period, ad hoc licences for imports from Iran to eligible established importers who have to their credit past imports in the prescribed basic period. The licences will be issued with the monetary ceiling fixed for each item. The necessary applications for licences will be received by the Import Trade Control authorities at Bombay and Delhi upto May 21, 1964. The licences will be valid upto September 30, and will have to be returned by October 15. The basic period is 1951-52 to 1961-62 in the case of imports of dates, red oxide, medicinal herbs and crude drugs, dyeing and tanning substances all sorts n.o.s. excluding wattle extracts and the articles specified in S.N. 5, Part five; wattle extract, wattle bark, bark for tanning excluding wattle bark; gums, resins and lac all sorts n.o.s. excluding olibanum and frankincense, and it will be 1951-52 to 1960-61 in the case of dry fruits and asafoetida. Licences will be valid for imports from Iran either by sailing vessels or land route. Raisins of Iranian origin will also be allowed to be imported by steamships from Iranian ports. Such imports will be on c.i.f. basis. (n.o.s. stands for "not otherwise specified").

CZECHOSLOVAK CREDIT FOR INDIA

An agreement providing for Czech credit, equivalent to Rs. 40 crores, to India was signed in Prague on May 11, 1964. The projects that will be helped by the new credit include the expansion of boiler plant at Tiruchirapalli and the Heavy Electricals Plant at Hyderabad, the creation of additional foundry and forge facilities in some of the existing foundries, two new machine tool plants, one tractor and power tiller factory and one 220 MW power plant. Components worth Rs. 14 crores will also be imported under this credit arrangement. The loan will be repid (with 2.5 per cent interest) in rupees which will be utilised for the export of Indian goods to Czechoslovakia. The repayment period will be 12 years in respect of projects and 8 years in respect of imported components.



THE BANK WITH SERVICE PLUS*

Even birds have the saving instinct. They know that a little at a time adds up into a store that helps in future. More than birds men need saving although it is not always an easy matter.

Saving with the United Bank is a pleasant habit.

* You may open a Savings A/C with only Rs. 5
* Your Saving earns interest @ 3% per annum.
* You may draw by cheques.
* You may draw 200 times in a year and as much of your money as you may need.

* *Touch of personal attention and warmth of friendliness.*

Company Affairs

JAY SHREE TEA AND INDUSTRIES

JAY SHREE TEA and Industries Ltd., has reported satisfactory working results during the year ended December 31, 1963. A remarkable improvement in sales was recorded during the year; it almost doubled from Rs. 4.09 crores in 1962 to Rs. 8.08 crores in 1963. The spectacular rise in sales was, however, not followed by a corresponding rise in gross profit which increased marginally by about Rs. 2.6 lakhs to Rs. 65.4 lakhs. Net profit was a shade lower at Rs. 18.1 lakhs as compared with Rs. 18.5 lakhs in the previous year. The directors have, however, decided to maintain the dividend at 12.5 per cent.

Substantial exports to the U.S.S.R. and U.A.R. and higher production accounted for the rise in sales. It is worth mentioning here that the Tea Gift Caddy exhibited by the company in the Autumn Fair had the unique distinction of winning the Leipzig Fair International Gold Medal for finest Indian Black Tea. The Government of India had approved the company's purchase of three estates in Cachar, having an area of 2,050 hectares under tea cultivation. One more tea estate in Kerala, with about 270 hectares under tea, was acquired by the company towards the close of 1963.

There was some improvement in the working of Jay Shree Plywoods during the year under review but due to shortages of timber and skilled workmen, coupled with keen competition in decorative plywood markets, the factory is currently not working at full capacity. Conditions are expected to improve in the course of the current year. The off-take of products from Jay Shree Chemicals and Fertilisers was better during the year and further progress is expected in this year.

The company has received industrial licences for two plywood units, one in Andaman and Nicobar Islands and the other at Bastar in Madhya Pradesh. The work on the Andaman unit has started and the unit is expected to commence production by the beginning of 1965. Investigations are in progress for the other unit. It has also obtained an industrial licence for the manufacture of 8,250 tons of alum per annum at its chemical plant at Khardah. Steps are being taken to implement the scheme. The company has, however, dropped the proposal to set up a hard board unit in Madhya Pradesh.

The capital of the company was increased during the year by issuing 2,18,666 Bonus Equity Shares of Rs. 10 each and Preference Capital by Rs. 24.80 lakhs, by issuing 24,800 'B' Redeemable Cumulative Preference Shares of Rs. 100 each. The preference issue to the public was oversubscribed. The company has obtained permission to issue 2,91,558 Right Equity shares at the reduced premium of Re. 1 per share (as against Rs. 3.50). The directors have not taken a final decision about this issue.

Appropriations included Rs. 23.24 lakhs for depreciation (Rs. 17.30 lakhs), Rs. 1.55 lakhs for development rebate reserve (Rs. 3.25 lakhs), Rs. 3.68 lakhs for managing agents' commission (Rs. 3.89 lakhs), Rs. 5.87 lakhs for general reserve (Rs. 5.00 lakhs) and Rs. 21.50 lakhs (Rs. 22.50 lakhs) as provision for taxation.

INDIAN TOOL MANUFACTURERS LTD.

The Indian Tool Manufacturers Ltd., will be entering the capital market on May 18 by offering for public subscription 15,000 Redeemable Cumulative Preference shares of Rs. 100 each, carrying a fixed return of 9.3 per cent (taxable) per annum. The shares are redeemable at par at the end of 12 years from the date of allotment. The subscription list will close on May 26 or earlier but not before May 20.

The company has an authorised capital of Rs. 75 lakhs and subscribed and paid-up capital of Rs. 25 lakhs. The present issue is for Rs. 15 lakhs. Messrs. Navalchand T. Shah & Co., Rasiklal Maneklal & Co., Chimanlal J. Dalal & Co., Kantilal Purtapshi, Narottam B. Javeri, Dhirajlal Maganlal Purshottamdas, and Harkisondas Lukhmidass, who are also Brokers to this issue, have agreed to underwrite the issue.

The company, which was set up at Bombay in 1937, is currently manufacturing a wide range of products such as Twist Drills, Reamers, Cutters, Taps, Tool Bits, Micrometers, Cemented Carbides and Carbide Tipped Tools. The capacity was first expanded in 1956 and is presently undergoing another substantial expansion. The company's products will find a ready market because of the rising demand for machine tools in the coming years.

PHILIPS

Despite serious shortages of raw materials, power and foreign exchange, Philips India Ltd., has reported all-round progress during the year ended December 31, 1963. Sales for the first time crossed the Rs. 10 crore mark and stood at the record figure of Rs. 10.63 crores, bettering the previous year's performance by as high a margin as Rs 178.37 lakhs (a rise of about 20 per cent). The high standards maintained by the company's products combined with the intensive sales promotion campaign pursued by the selling and service organisations have made this increase in sales a reality. Gross profits too have shown an appreciable rise, increasing from Rs. 1.20 crores in 1962 to Rs. 1.66 crores in 1963. The adjusted profits as a percentage of total capital employed showed a significant improvement from 18.41 to 20.18 while the net earnings as a percentage of net worth shot up from 11.17 to 14.53.

The year under review witnessed the stepping up of production of light products in the company's factories in Bombay and Calcutta. While the factory in Bombay manufactured a large number of lamps, fluorescent lamp starters and burners for gaseous discharge lamps, the unit in Calcutta successfully implemented its production programme for fluorescent lamp fittings and various accessories. The installation of a new capping mill at the unit in Bombay, besides increasing the efficiency at the finishing stage, had also succeeded in speeding up the manufacture of lamps.

The expansion plan to produce tungsten and molybdenum wire had reached the final stage and it is expected that tungsten coil will be made available in the course of the current year. Land had been acquired at Kalwa in Bombay and the company intends to manufacture here different types of lamps and their components and various other products.

Production of radio sets and components recorded an appreciable increase during the year under review. Apart from the existing range of components, the manufacture of miniature electrolytic condensers was also started. This marks an important step forward in the development of miniature components which are so vital for the growth of the transistor technique in the radio industry. A limited number of radio sets and components were exported during the year, earning valuable foreign exchange for the country.

Continuous efforts are being made to reduce the requirements of maintenance imports by stepping up the indigenous content of the products. A graph, published in the Report, shows how the imported cost per product is being reduced year after year. Whereas in 1957 it stood at about 39 per cent, in 1963 this was reduced drastically by two thirds to 12 per cent.

Of the other manufacturing projects taken in hand by the company, mention needs to be made of the new unit which was opened in Bombay to produce electronic measuring instruments and other industrial and scientific apparatus. It has already succeeded in turning out a number of electronic measuring instruments during the year. The company has also received an industrial licence to manufacture wireless communication apparatus known as "Trans-receivers" at the factory in Calcutta for meeting defence requirements.

To implement the expansion programmes, the company is making use of the existing arrangements for foreign loans to finance the imports of capital goods. Consent was received from the Government in 1962 to issue new equity shares to the tune of Rs. 16.66 lakhs. The proposal is being examined and the directors hope to place before the shareholders a scheme in this respect in due course.

Appropriations included Rs. 25.22 lakhs for depreciation (Rs. 20.96 lakhs), Rs. 11.04 lakhs (nil) for general reserve, Rs. 5.50 lakhs for development rebate reserve (Rs. 6.15 lakhs) and Rs. 117 lakhs (Rs. 85.5 lakhs) for taxation.

MAHINDRA AND MAHINDRA

The central theme of Mr. Keshub Mahindra's address to the shareholders of Mahindra and Mahindra Ltd., at the annual general meeting was the historical growth of the company—from its infancy to its present gigantic stature—during the last 18 years. Within this brief period the company enhanced remarkably the scope and range of its manufacturing activities.

Machinery Manufacturers Corporation, the first venture with public participation, was formed with the object of manufacturing carding engines for the textile industry and it still continues to enjoy the proud privilege of being the largest producer of carding engines in the country. The Automobile Division, which forms the principal activity of the company, now has an installed capacity to manufacture 10,000 jeeps per year. The dependence on imports for components is fast diminishing and with matching progress in the field of ancillary production, it is anticipated that an indigenous content of 90 per cent will soon be achieved. New factories are under construction at Kandivli and these units are expected to be ready by early 1965.

In collaboration with reputed firms in the U.S.A., the U.K., France and Germany, the company is producing a wide variety of products. For instance, in association with famous firms in the U.K., the company is manufacturing a large number of products such as trailers, sintered products, air-cooled diesel engines, water meters, and instruments, while in partnership with a German firm, it is producing a good number of items like synthetic resins, enamels and varnishes.

The company continues to extend its activities to new lines of manufacture. A new company has been recently floated in association with a leading French firm for the manufacture of alloy steels while a unit has been set up in collaboration with an American company to produce elevators. A big project which has currently been taken in hand is for the manufacture of tractors. The factory is presently under construction. Consent has been received from the Controller of Capital issues and shares will be offered to the public in the course of the current year.

The performance of the company is encouraging from every angle. Practically every unit in the group is in the process of expansion and more ambitious targets have been fixed for the future. Production of jeeps is currently running at the average rate of 900 vehicles per month and deliveries are also keeping pace with production. The steel division has maintained its rate of booking and the machine tool division expects a considerable volume of business during the current year. All in all, the company's record for the past 18 years has been one of sustained growth and rapid expansion. It goes to the credit of the late Mr J. C. Mahindra that he built up such a sound and stable organisation which has a built-in capacity for expansion and growth.

COROMANDEL FERTILISERS

Coromandel Fertilisers Ltd. approached the capital market on May 11 with a public issue of Rs. 3.95 crores. The subscription list will close on May 22 or earlier but not before May 14. The authorised capital of the company is Rs. 8.50 crores. The present issue is for Rs. 8.48 crores. Out of the present issue, California Chemical Company, U.S.A., International Minerals & Chemical Corporation, U.S.A., and E.I.D. - Parry Ltd. have been allotted shares worth Rs. 1.16 crores for consideration other than cash. They have also agreed to subscribe capital worth Rs. 3.37 crores. The balance of Rs. 3.95 crores is now offered for public subscription for cash at par. The entire public issue has been underwritten.

The company proposes to set up a new industrial undertaking for the production of complex fertilizers and urea with a capacity for producing ammonium phosphate of various grades equivalent to 365,000 tonnes per year "in terms of 20-20-0" and 16,500 tonnes of prilled urea per annum. The factory is to be located at Visakhapatnam which is considered as an ideal site for the fertiliser factory. Apart from the harbour facility for the import of raw materials, plant and equipment, naphtha, the main indigenous raw material to be used will also be available in plenty from the nearby refinery of Caltex Oil Refining (India) Ltd. The plant is expected to commence production during the last quarter of 1966.

The capital outlay is estimated at Rs. 32.47 crores and it is to be met by share capital (Rs. 8.49 crores), loans from Export Import Bank and A.I.D. (Rs. 21.24 crores) and Rs. 2.74 crores as overdrafts from banks.

RAYMOND WOOLLEN

Better working results have been reported by Raymond Woollen Mills Ltd., during the year 1963. Sales recorded a spectacular improvement from Rs. 375.54 lakhs in 1962 to Rs. 510.61 lakhs in 1963, an increase of 35.9 per cent as compared with a modest rise of 17.27 per cent in the previous year. The big rise in turnover was largely due to sales against heavy defence orders which accounted for Rs. 2.38 crores as compared with only Rs. 36 lakhs in 1962. Sales to the civilian market were however curtailed by about 40 per cent on account of the cut in the import of raw materials. But exports increased from Rs. 15.19 lakhs to Rs. 26.77 lakhs. Pre-tax profits recorded an appreciable rise, increasing from Rs. 50.44 lakhs to Rs. 60.86 lakhs. The company also made satisfactory progress in developing business in nylon hosiery articles such as stock, ready-made garments etc.

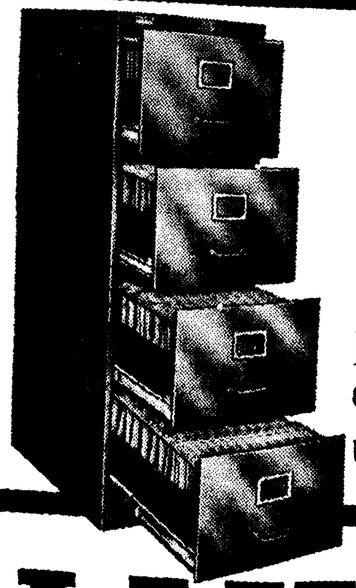
The modernisation schemes which are under active consideration include the setting up of a wool combing division in collaboration with Sir James Hill and Sons Ltd., U.K. It also proposes to undertake the complete modernisation of its worsted spinning section in replacement of the existing looms.

Allocations included Rs. 4.65 lakhs for managing agents' remuneration (Rs. 4.02 lakhs), Rs. 9.70 lakhs for depreciation (Rs. 6.41 lakhs), Rs. 1.80 lakhs for development reserve (Rs. 95,000), Rs. 2.50 lakhs (nil) for deferred taxation reserve, Rs. 11.80 lakhs for general reserve No. 2 (Rs. 10 lakhs) and Rs. 34.50 lakhs (Rs. 30.30 lakhs) as provision for taxation.

DUNLOP : RIGHTS ISSUE

The directors of the Dunlop Rubber Co. (India) Ltd., have decided to apply to the Government of India for consent to issue 5 lakhs of ordinary shares of Rs. 10 each at a premium not exceeding Rs. 10 per share. The new shares will be offered to the existing shareholders in the ratio of one share for every three held. The additional capital raised will be used for the expansion of the company's existing works.

CAPITAL ISSUES



Three companies have been authorised to raise further capital amounting to Rs. 74 lakhs. Of these one company is issuing bonus shares and the rest are issuing equity plus cumulative redeemable preference shares on rights basis.

The consent of the Controller of Capital Issues in all cases is valid for 12 months.

Escorts Limited, Delhi, a public limited company, will issue further capital of Rs. 22,40,000 divided into 2,24,000 equity shares of Rs. 10 each, as bonus shares on capitalisation of its share premium account to a like extent. The consent is subject to, inter alia, the condition that the bonus shares will be issued after the equity shares have been called and paid-up in full in the ratio of one bonus share for every five equity shares held, to all the equity shareholders of the company.

Mysore Kirloskar Limited, Harihar (Mysore State) is to issue a further capital of Rs. 30 lakhs, divided into 15,000 equity shares of Rs. 100 each and 15,000 redeemable cumulative preference shares of Rs. 100 each carrying a dividend not exceeding 9.5 per cent per annum, to be issued on rights basis. The proceeds of the issue will be utilised for financing substantial expansion of the company's foundry capacity.

The General Industrial Society Limited, Calcutta, a public limited company engaged in the manufacture of jute goods etc., is issuing further capital of Rs. 21.60 lakhs divided into equity shares of Rs. 10 each, for cash at par, to the existing shareholders as rights in the ratio of one new share for every two shares held. The proceeds of the issue will be utilised for partly meeting cost of a factory to be established in Mirzapur district for the manufacture of aluminium foils.

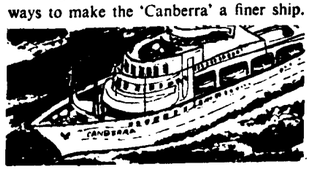
SOMEONE, SOMEWHERE HAS A SPECIAL ELECTRICAL PROBLEM

And AEI goes into action



The requirement: a microscope capable of magnification well over a million times. AEI's answer for the National Metallurgical Laboratory, Jamshedpur: the EM6. An electron microscope capable of direct magnification up to 120,000 times, the image it produces can be enlarged by photography well over a million times. The EM6 is being used to observe minute disorders in the arrangement of the atoms in a metal, an invaluable aid to metallurgists in their search for the Why and How of metal and alloy fatigue. Another highly sophisticated AEI instrument, the MS-3 Mass Spectrometer, is installed in the research laboratories of The Indian Association for The Cultivation of Science at Calcutta. It is used in the chemical and isotopic analysis of gases and volatile liquids; this institution is also equipped with AEI's RAYMAX-60 Diffraction Apparatus, used for quick accurate analyses of specimens. Precision AEI instruments like these are serving science, the world over.

720 mile journey for oil

Three million tons of crude oil a year will soon be piped from the jungles of Assam to the refineries being built at Noonmati and Barauni. As a result, production of crude oil in Assam is expected to increase six times to three million tons per annum. The 720 mile pipeline makes 78 river crossings as it cuts through jungles, swamps and paddy fields. Radio signals giving temperatures, pressures and rates of flow along the pipeline will be received at a central headquarters. It will switch on by remote control the electrical motors operating valves and engine controls. Two independent communications systems will ensure absolute reliability. AEI is supplying part of it—a multi-channel carrier system and voice frequency telegraph equipment.

Ship to capture public imagination

'Canberra', the P.&O. Orient Lines' 45,000 ton passenger liner, is the newest and brightest addition to a proud fleet. Revolutionary in design, electricity has helped in many ways to make the 'Canberra' a finer ship.

Two of the world's largest marine propulsion motors, 42,500 shaft h.p. each, give her a swift, quiet 27½ knots. Electric drive allows the synchronising of propellers, so reducing vibration. AEI has supplied this equipment and also the auxiliary turbine generators for the ship's power supply system, more than 90 miles of cable, and the turbine-compressors used in the air conditioning plant.

Imagine 7,000 horses in Bombay's docks

Last year, nearly three thousand ships entered Bombay docks to load and unload over 117 lakh tons of cargo. Without the cranes that swing these vast amounts of merchandise between wharves and ships, by day and night, the docks would come to a standstill. The cranes must be completely dependable. And that largely depends on the quality of their electrical equipment. As dock traffic increases, so new cranes must be installed. Seventy-two have been commissioned; they are equipped with AEI motors and control-

gear totalling 5,868 h.p. AEI will soon provide yet another eighteen sets of motors (totalling 1,314 h.p.) and controlgear for new cranes in Bombay's Alexandra Docks.

40 years is a responsible age

In India, AEI's activities date back about forty years and include association on the steel works at Durgapur, the important heavy electrical project at Bhopal and the Bhakra dam project. AEI has been man-

facturing electrical equipment in India for over twenty years and a wide range of products is now serving industry and the home.

We don't usually indulge in name-dropping, but...

In our case it's justified. AEI is no newcomer. Its origins go back *more than sixty years.* Today, Associated Electrical Industries Limited embraces such famous names as British Thomson-Houston, Metropolitan Vickers, Siemens Edison Swan, Henley's, Ferguson Pailin, Birlec and Hotpoint. Worldwide, AEI operates 60 factories and employs 100,000 people. It produces everything electrical from lilliputian transistors to the world's biggest turbine generators.

Principal products worldwide

Steam and gas turbines and generators • Hydro-electric generators • Marine propulsion equipment • Electric drives for rolling mills and mine winders • Electric furnaces • Traction and railway signalling equipment • Transformers and switchgear • Power and telephone cables • Motors and their control gear • Electronic apparatus and radar equipment • Particle accelerators, electron microscopes and mass spectrometers • Industrial controls, instruments and meters • Semiconductor devices and power rectifiers • Private and public telephone exchanges and other telecommunication equipment • Lamps and lighting fittings • Heating equipment • Electro-medical apparatus • Nuclear power station equipment • Domestic appliances.

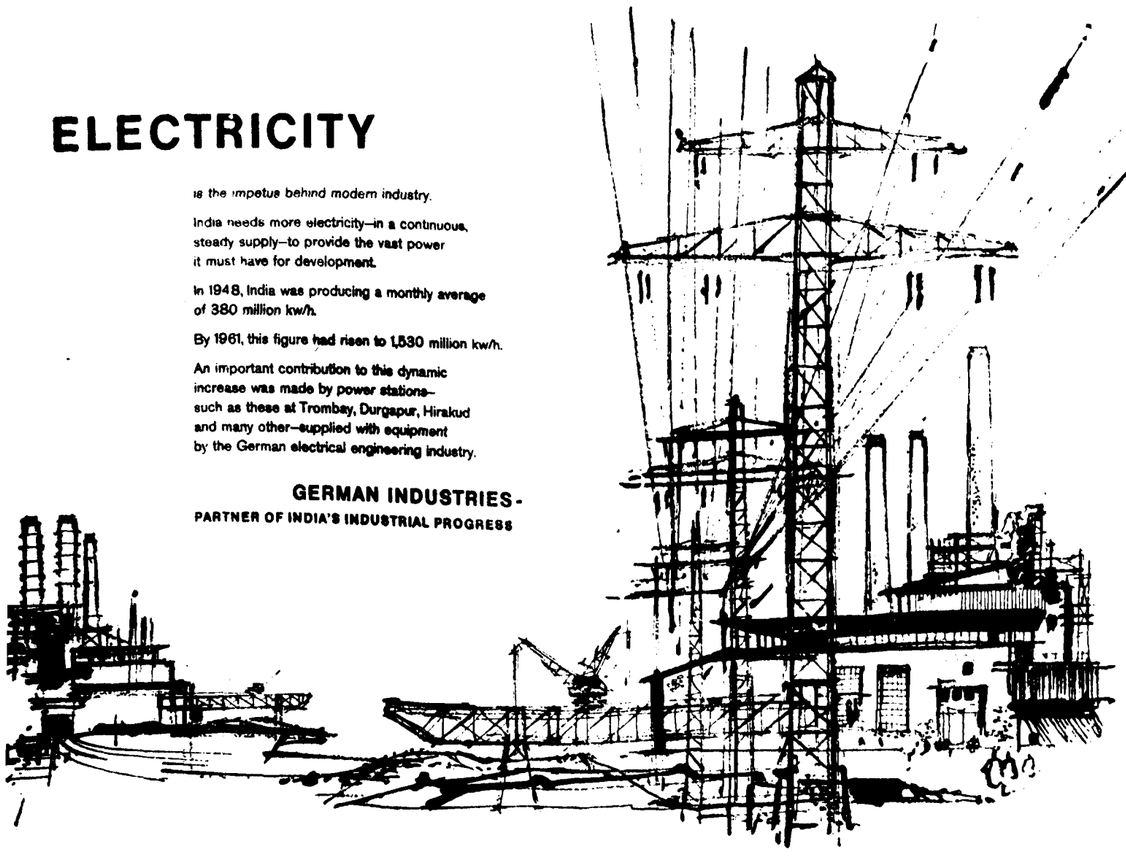
AEI

ASSOCIATED ELECTRICAL INDUSTRIES LIMITED Represented in India by ASSOCIATED ELECTRICAL INDUSTRIES (INDIA) PRIVATE LIMITED 12, Rajendra Nath Mukherjee Road, Calcutta 1.

82-AIP-16A

AEI Largest Supplier Of Electrical Equipment To India

ELECTRICITY



is the impetus behind modern industry.

India needs more electricity—in a continuous, steady supply—to provide the vast power it must have for development.

In 1948, India was producing a monthly average of 380 million kw/h.

By 1961, this figure had risen to 1,530 million kw/h.

An important contribution to this dynamic increase was made by power stations—such as these at Trombay, Durgapur, Hirakud and many other—supplied with equipment by the German electrical engineering industry.

The Controlled Economies

Economic Trends in the Soviet Union: By Abram Bergson and Simon Kuznets, (Editors) Harvard University Press, Cambridge, Mass, 1963; Price $9.75.

Communist Economy Under Change: By Margaret Miller, Ljubo Sirc and Tersa Mania Piotrowicz; Andre Deutsch, London; Price 25s.

Reviewed by B. M. BHATIA

STARTING ALMOST at the bottom among the European nations in 1928, the Soviet Union, with the help of her five-year plans, had taken long strides in the development of her economy before World War II. Her net national product (in rouble prices of 1937) had risen from 137.2 billion in 1928 to 248 billion in 1940—an increase of 81 per cent in 13 years or an average annual increase of 6.2 per cent. The largest contribution to this increase in national income was made by industrial production which rose (in 1937 prices) from 26.3 billion roubles in 1923 to 93.1 billion roubles in 1940. In the industrial sector the emphasis was largely on the heavy industry. To the Soviet economists and administrators, the establishment of heavy industry was the 'sine qua non' of economic progress. Russia built up, therefore, during the first three plans period, an impressive capital structure. The capital stock of the country employed in manufacturing industry rose from 28.6 billion roubles in 1928 to 130 billion roubles in 1940 (in terms of 1937 prices).

Decline in Living Standard

But with all this seeming progress, the standard of living of the people instead of showing improvement suffered a decline. The index of per capita consumption (1937 : 100) fell from 103 in 1928 to 96 in 1940. This excludes "consumption" of communal services. If that is taken into consideration, we find a slight improvement in consumption, the index rising from 91 in 1928 to 96 in 1940.

Two factors mainly contributed to this result. The first was the failure of agricultural output to increase rapidly despite collectivization and mechanization. The index of gross agricultural output, both crops and livestock, rose (1913 : 100) from 124 in 1928 to 141 in 1940. Taking livestock separately, instead of increase there was a decline in the output, the index falling from 137 in 1928 to 114 in 1940. With the increasing incomes and employment in the industrial sector and stationary or even declining food production it was natural that the country should suffer shortages and rise in prices in food stuffs. Secondly, the Soviet planners in their zeal for rapid industrialization concentrated mainly on the development of heavy industry almost to the neglect of consumer goods industry. Thus while there was some improvement in the output per capita of cotton fabrics, the per capita output rising from 17.7 metres in 1928 to 20.3 metres in 1940, the output of woollen fabrics remained stationary at 0.6 metre per capita while that of shoes, soap, linen fabrics and cigarettes declined. Similarly there was an acute shortage of urban houses, the availability of urban housing space per capita declining from 5.8 square metres in 1928 to 4.5 square metres in 1940. With a view to building a strong industrial base and ultimately raising the living standards, Russian leaders forced a life of austerity on the Russian people before 1940.

These trends in her economic development were interrupted by the War. Russian territory was the battle ground in the war between Soviet Russia and Nazi Germany; the loss of men and material suffered by Russia during the war was colossal. However the victory helped her to acquire political power and prestige which was unprecedented in her history. Not only Russia emerged as the second largest political and military power in the world but she also assumed the leadership of East European countries which had been liberated by her from the Nazi yoke. This provided a new ground for experimentation in the theory and practice of economic development through planning; the East European countries adopted Russian pattern of planning for development of their economies.

The Soviet Union itself faced enormous economic difficulties at the end of the war. The war had caused great destruction and brought privations to her people. Her immediate concern was to rehabilitate the national economy rather than work for a more rapid rate of economic development. Even this task was accomplished quickly and by 1950 not only the national product (in 1937 prices) had moved up to 248 billion roubles from 204.5 billions in 1940 but the industrial capital which had fallen to 111 billion roubles in 1945 (as compared with 130 billions at the beginning of the war) rose to 191 billion roubles. As against a fall of 3.8 per cent per annum in 1940-45, industrial production rose by 9.2 per cent per annum in the five years following the end of the war. The rate of growth after 1950 was even more impressive. According to official Soviet Statistics, the national income in 1950-61 increased at the rate of 10 per cent per annum. During the same period industrial production increased at the rate of 11.5 per cent while agricultural production rose by 4.8 per cent only.

Difficulties in Agriculture

Over the last five years, however, Russia has been facing difficulties in the agricultural field and apart from creating scarcities and raising prices, this had led to slowing down the pace of her economic development. Thus in the period 1950-58 national income rose at the annual rate of 10.9 per cent but during 1958-61 this rate came down to 7.6 per cent. The factor that principally contributed to this decline was the fall in agricultural production from an annual rate of increase of 5.8 per cent in 1950-58 to 1.9 per cent in 1958-61. This had a disastrous effect on the country's food supply. In the current year, Soviet Russia is faced with an estimated shortage of 30 million tons in foodgrains with the result that she has been obliged to make large purchases of foodgrains abroad and pay for these by exporting gold.

This impressive story of the growth of the Soviet economy forms the subject matter of "Economic Trends in the Soviet Union". The book represents the collective effort of eight research workers in the United States of America in studying various facets of the Soviet economy. The study was sponsored by the Committee on Economic Growth of the Social Science Research Council under whose auspices a Conference was held at Princeton, New Jersey, on May 6-8, 1961. The present volume brings together the papers read

and discussed at that conference. Among the more important contributions are those of Abram Bergson (National Income), Norman M Kaplan (Capital Stock), Powell (Industrial Production), D. Gale Johnson (Agricultural Production) and Simon Kuznets (A Comparative Appraisal). The last contribution is of particular interest to the student of economic development for it compares Russian experience with that of other countries in matters of over-all rates of growth, changes in industrial structure resulting from economic development, rate of capital formation, consumption expenditures and foreign trade proportions. The book is an authoritative reference work on the growth of the Soviet economy and is a welcome addition to the growing literature on the subject.

An Exercise in Polemics

The second book, "Communist Economy Under Change", is an exercise in polemics. The central theme of the book which consists of four independent studies in "the theory and practice of markets and competition in Russia, Poland and Yugoslavia" is that socialist planning is economically inefficient and administratively impracticable; that market forces of demand and supply assert themselves as much in the socialist as in the capitalist countries; and that the market functions of adjustment of demand and supply in the case of individual commodities and services and allocation of resources to various lines of production are better performed by what Adam Smith called the "invisible hand" than by regulation and control from an organ of the State. All these conclusions are sought to be established by reference to the experience of three socialist countries, viz., Soviet Russia, Yugoslavia and Poland.

In the first essay on Markets in Russia we are informed by Dr. Miller that "the current debate about planning methods clearly indicates the growing recognition within the Soviet Union that methods applicable to the earlier stages of industrialization when the 'laws' of economics were swept aside by the politically inspired decision to industrialize as quickly as possible at any cost, are no longer suitable for an economy that has become more mature and vastly more complex than it was 30 years ago" (p. 21). True but in establishing her case against centralized planning, Dr. Miller unconsciously concedes that Russia achieved spectacular results in economic development within a comparatively short period of time under her five-year plans. In his zeal to prove his point Ljubo Sirc makes the following astounding statement about growth in the Yugoslav economy in the period 1947-58. "... however, capitalists had had a free hand in Yugoslavia they would have achieved the same growth rate as the Communists by increasing investment by about 60 instead of 480 per cent." (p. 192). This calculation is based on a table on p. 190 that gives the rates of saving, growth of national income and capital coefficient in the Yugoslav economy. According to this table the capital coefficient (K) was 1.7 per cent in 1923-39 and 4.9 per cent in 1947-58. It is, however, forgotten that Yugoslavia was an agricultural country before the war and therefore capital output ratio, as is usual with a peasant economy, was low in that country all that time. After the war Yugoslavia had to build up an industrial base and set up heavy industry in which the gestation period as compared with light consumer goods industry, is long. The fact that Yugoslavia has suffered shortage of consumer goods, as a result of concentration of effort in the initial stages of her economic development, does not validate the conclusion that "Communist economies are not only incapable of transforming high investment and growth rate into high consumption; they cannot discover (as market economy does) what the real wishes and needs of the people are" (p. 193). This is too sweeping a generalization which in the face of Russian example even Western economists will find hard to digest. The book is full of similar statements which make it a highly tendentious piece of writing.

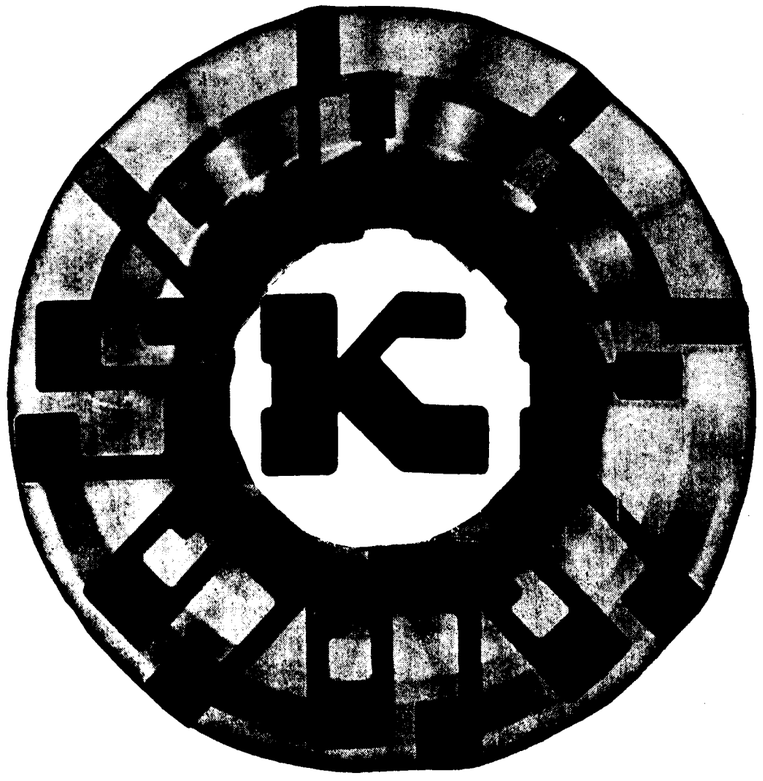
However planners and students of economic development in all countries will find much of interest to them in the book. The weaknesses of centralized planning and the problems that the planners are likely to face in under-developed countries in the initial stages of economic development are brought out clearly in the first three essays of the book. India has adopted democratic planning as a means for economic development. This is an experiment in a new system of planning, which is being watched with interest all over the world. Does it provide an effective alternative to socialist planning that has been adopted by Soviet Russia and by the countries of Eastern Europe? Is it possible to achieve comparable rates of growth under democratic planning? Can we, within the frame work of democracy, keep down the levels of consumption and raise the rates of savings and investments? These are some of the questions which planners in India must be able to answer in the affirmative if they wish to establish the superiority of democratic system of planning over the pattern of planning, adopted by the socialist countries. As things stand at present, while we have failed to secure comparable rates of growth with socialist countries, we are facing almost identical problems that the planners in the socialist countries have faced—failure on the agricultural front, shortage of consumer goods, rise in prices and failure of the consumer to benefit from large investments made under the plans. Is it not a case of having worst of both the worlds?

READERS' ROUNDTABLE

Santhanam Committee Report

Dear Sir,

The Santhanam Committee Report on corruption is not available for sale to the public. It is said that barely 500 copies were printed, thus laying the Government open to the charge that it did not wish this report, which has many unpleasant things to say about the Administration and Ministers, to be readily available to the public. This is not the first time that the public is faced with a similar problem of obtaining important Government documents.



On the other hand, the working of the Publications Division, "a Government Agency for the production, distribution and sale of pamphlets, books and journals, dealing with matters of national importance with a view to provide to the general public, at home and abroad, authentic information about the country," provides a study in contrast. Expenditure on this agency (exclusive of printing, etc.) amounted to Rs. 29.24 lakhs in 1962-63 On 17 journals which it published in 1962-63, losses amounted to Rs. 4.83 lakhs. Advertisement revenue declined from Rs. 1,82,170 in 1961-62 to Rs. 1,57,542 in 1962-63.

On 16 of these journals, the cost of production amounted to Rs. 9,99,681 while the sales and advertisement revenues were only Rs. 5,20,272. Of about 14½ lakhs copies printed, only about 8½ lakhs were sold, and about 5½ lakhs were distributed free, about 43,000 being balance on hand.

The recent report of the Comptroller and Auditor-General, which gives these figures, also points out that of 122 publications printed prior to April 1, 1960, more than 30 to 98 per cent of copies valued at Rs. 10 lakhs were still in stock.

In view of the heavy burden of taxation imposed on the country, and the growing demand for utmost economy in Government expenditure, is it not high time that these wasteful activities of the Publications Division were reviewed? Let the Government easily make available to the public reports it needs, and curtail output of unsaleable journals and publications.

NOTICE

BHARAT COMMERCE AND INDUSTRIES LIMITED

NOTICE is hereby given that the Eighteenth Annual General Meeting of BHARAT COMMERCE AND INDUSTRIES LIMITED, will be held at 15, India Exchange Place, (4th floor) Calcutta-1 on Monday, the 15th day of June, 1964, at 4 P.M. to transact the following business —

ORDINARY BUSINESS :

(1) To receive and, if approved, adopt the Report of the Board of Directors and of the Auditors, the Audited Balance Sheet as at 31st December, 1963 and the Profit and Loss Account for the year ended on that date.

(2) To appoint a Director in place of Shri S. M. Dahanukar who retires and being eligible offers himself for re-appointment.

(3) To appoint a Director in place of Shri A. V. Birla, who retires and being eligible offers himself for re-appointment.

(4) To declare dividends on Preference and Ordinary shares.

(5) To appoint Auditors for the current year and fix their remuneration.

SPECIAL BUSINESS :

To consider and if thought fit to pass with or without modification the following resolutions as —

ORDINARY RESOLUTIONS —

(A) RESOLVED that the company doth hereby approve of the appointment and/or re-appointment of the undernoted parties as Sole Selling Agents of the company for sale of staple fibre yarn produced by the company for a period of five years each, commencing from the dates and on terms and conditions as mentioned in the respective agreements placed on table and initialled by the Chairman for the purpose of identification :—

(a) **For re-appointment —**

(1) M/s. Balabux Birla & Co., Ludhiana.

(2) „ M. Satyanarayan, Bombay.

(b) **For appointment —**

(1) M/s. Laxmankumar Birla & Co., Amritsar.

(B) RESOLVED that, in supersession of the ordinary resolution No. (d) of the Sixteenth Annual General Meeting of the company dt. 22th May, 1962, the Board of Directors be and are hereby authorised to contribute, subscribe and/or to provide for charitable, political and other purposes from time to time any amounts, provided that, the aggregate of which in any one year does not exceed two lacs and fifty thousand rupees or five per cent of its average net profits as determined in accordance with the provisions of sections 349 and 350 during the three financial years immediately preceding, whichever is greater.

SPECIAL RESOLUTION —

RESOLVED that the Memorandum of Association of the company be altered —

(a) by adding a new sub-clause numbered (40) after sub-clause (39) of clause 3 of the Memorandum of Association of the company as follows :

(40) To support, donate, contribute, subscribe, to give and to pay in cash or in kind for any political purpose to any individual or body of individuals and also to contribute, donate and subscribe to any charitable, religious, educational or other public institutions, trusts, funds, clubs, societies or individual or body of individuals and

(b) by re-numbering the existing sub-clauses (40) and (41) as sub-clauses No. (41) and (42) respectively of clause 3 of the Memorandum of Association of the company.

For and on Behalf of the Board,

HARDATTA RAI SUGLA

Managing Director

Registered Office:
9, Parsee Church Street, Calcutta-1.
13th April, 1964

NOTES :

(1) A member entitled to attend and vote is entitled to appoint a proxy to attend and vote instead of himself and a proxy need not be a member.

(2) The Share Transfer Books of the company shall remain closed from the 18th May to 15th June, 1964, both days inclusive.

(3) The dividends when declared in the meeting shall be payable to those shareholders only whose names shall appear in the company's registers as on 15th June, 1964.

(4)) Explanatory statement pursuant to section 173 of the Companies Act, 1956 has been forwarded to the members of the company along with notice of the annual general meeting.

The Artillery of Words

AT BOMBAY last week was witnessed a unique spectacle wherein the powerful guns of the Congress Party, mounted on their high pedestals, let loose a barrage of "words, words and words". While resolutions were passed regarding the communal situation and the amendments to the Congress Constitution, the centre of attraction was the Dhebar Committee Report which had outlined the ways and means by which the Bhubaneswar Resolution could be put into practice. The spate of speeches indicated that within the Party there were many strands of opinion even on the basic meaning of "Democracy and Socialism" and the manner in which the avowed policy of the Party was to be implemented. The only achievement of which the Party could rightfully boast was that another pedantic report had been added to its archives.

The Report has, in view of the successive failures of the food crops to reach the targets fixed by the planners, made certain recommendations for breaking through the stalemate. It has suggested that the responsibility for failure in agriculture should be fixed either on the Chief Minister or the Agriculture Minister in a State. If in a certain State the agricultural targets were not attained, the Chief Minister or the Minister-in-charge should step down in favour of people who would deliver the goods. Will this kind of compulsion bring about some tangible results? Those who have watched carefully the duels between the various factions of the Congress Party at the State level are convinced that this formula is not likely to work out successfully. The manner in which power at the State level is sought will make it unworkable. Perhaps, the most sarcastic criticism came from Mr. A. P. Jain, ex-Union Minister for Food and Agriculture, who has had a first-hand experience of the problems of agriculture. The fact that Mr. Jain described the Report as "a paper report" showed that, in his opinion, the Committee had failed to grasp what was really involved in stepping up India's agricultural production. That is why he suggested that Mr. Dhebar should give up his present assignment to take charge of agriculture in Gujarat so that he could show how the stipulated targets could be achieved. Mr. Jain reiterated that the basic considerations for promoting agricultural production were adequate supply of fertilisers, seeds and steel for agricultural implements to farmers. Unless the fertilisers and seeds were supplied in adequate quantities no one could bring about a miraculous change in the agricultural scene. The likely failure to achieve the target of fertiliser production in the third Plan was indeed a contributory cause for the shortfall in agricultural output. He made another interesting suggestion that instead of deputing I.C.S. officers in the Agricultural Departments, there was need to post people with knowledge of agriculture who could pull this sector of the economy out of the present malaise. Again, his suggestion for keeping the Union Minister for Food and Agriculture for a reasonably long period at his post needs to be commended because, in fairness to the Minister, he must be given sufficient time to study the problems thoroughly.

The Committee has recommended that an autonomous body under the Union Ministry of Industries should be established so as to concentrate on the implementation of the programme of rural industries. It is forgotten, however, that the first three five-year Plans also laid stress on rural industries; the Committee has ignored to have a close look at the performance of rural industries which continue to be primitive in character. Because of the outmoded methods of working, the return on additional funds invested in rural industries is not commensurate with the resources

involved. The inefficiency of these industries is the biggest factor working against them. This is a lesson which the enthusiasts of rural industries have refused to learn.

In regard to industrial development, the Committee has suggested that within the next decade or so, it should reach a stage where a high rate of growth and investment could be maintained with minimum reliance on external assistance. There can be no difference of opinion in regard to this exhortation but in the same breath, the Committee has put a rider by saying that additional capacities of mass consumption like cloth should be in the co-operative or State sector on a decentralised basis. While it has been demanded that in the sector of consumer goods industries, production should be oriented to the needs of the common man, the Committee has shut its eyes to the failure of the co-operative and the State sectors in fulfilling the aspirations of the people. The Committee has, thus, set the laudable objective of hastening the industrial development of the country, but has also imposed conditions which will, instead of accelerating, retard the process. It has failed to see the inherent contradiction in its own recommendations. When people put on blinkers while looking into the future, the vision is bound to be distorted.

The Committee has also given its opinion on the concentration of economic power — a subject on which only a few weeks ago the Mahalanobis Committee had already publicised its findings. It has suggested that for preventing big business houses from getting bigger, it would be necessary for the Government not to issue any licences for new projects and extending industrial concentrations. This particular suggestion was completely devoid of all understanding of the way industrialisation has been carried out in this country ever since Independence. It is through judicious creation of reserves and ploughing back of profits that many of the units have been able to expand their activities so as to derive the advantage of the economy of scale. It is an acknowledged principle that the cost of manufacture per unit continues to be reduced till the manufacturing unit reaches the optimum size. If production remains below the optimum level, the cost of manufacture remains high and the consumers have to suffer. In other words, it is in the national interest that all units which are not operating at the optimum level should be allowed to expand so that they can bring down their costs. There is no economic wisdom in putting a restraint on their expansion

There was no mention in the Bhubaneswar Resolution of the nationalisation of banks. The Dhebar Committee Report has, therefore, refrained from discussing this issue. It has, however, recommended that the Reserve Bank should set up a proper machinery for detecting cases of abuse and should take suitable action against commercial banks indulging in malpractices. In the lending policy of the banks, basic and small industries, new entrepreneurs and agricultural operations should be given priority, it has suggested. But there is the Menon-Malaviya axis in the Congress Party which must harp on its pet theses and nationalisation of banks seems to be on the top of their list. Irresponsible speeches made by these leftist leaders serve only one purpose and that is to scare away the private foreign capital. Whereas the Committee (and Mr. Dhebar personally in his reply to the debate) advocated in strong words that the inflow of foreign capital was essential for the speedy growth of the economy, the noises made by the leftists in the Congress Party do a great disservice to the country and to the economy. Their misguided speeches act as irritants in industrial expansion.

Having realised that the target of 100 million tonnes in foodgrains output will not be attained by the end of the third Plan, the Committee has recommended that production should be raised to at least 92-94 million tonnes. It seems that the Committee has hardly any faith in its own recommendations. That is why it has also suggested that the Government should acquire a commanding position in the trade in foodgrains in order to prevent profiteering and hoarding. If even the reduced target stipulated by the Committee were achieved, the foodgrains supply position would be relatively comfortable, taking into account, of course, imports under PL 480. According to present indications, it is clear to everyone that the shortages of food are likely to persist. If the demand is to remain ahead of supply, it is not explained how by bringing food distribution under State control, supply would be stretched to meet demand. Middlemen are being made a scapegoat in this misreading of the whole situation. A shortage in supply will remain a shortage whether trading remains in private hands or is passed on to the public sector.

The Committee has also dilated upon the housing situation in the country. It has come down heavily on the plot-holders in urban areas who do not build houses for one reason or the other. The inconsistency in this approach of forcing the plot-holders to build their houses has become manifest in Delhi where the administration has already taken measures suggested by the Committee. While the plot-holders — thousands of them — have exhibited willingness to build their houses, they are not able to procure construction materials, particularly cement, which is under the control of the State. Even before the application of the present rigorous regulations in Delhi, it was known to the students of economics that the administration will not be able to meet the demand for construction materials. This once again is a manifestation of a dogmatic approach without any practical understanding of the situation.

Target Practice in Coal

HOW COMPLETELY unrealistic our planners can be is once again evident from the ambitious target of coal production which the Planning Group on Coal has recommended for the fourth five-year Plan. With current production at 67 million tonnes they suggest that it be raised to 154.5 million tonnes (88 million tonnes by the private sector and 66.5 million tonnes by the public sector) in 1970-71 or an increase of 130 per cent in 7 years. This will amount to an average increase of about 18.5 per cent a year against the average of 9 per cent since 1955. Apparently, the Group which consists of representatives from the Ministries of Steel, Mines and Heavy Engineering, Railways, Irrigation and Power, Finance and the Planning Commission, failed to evaluate properly factors such as the past performance, current slackness in demand, lopsided production and financial limitations of the industry. What final shape this target assumes will be seen in a few weeks but one does expect that at least after 15 years of planned development, the National Development Council would give the country a consistent, comprehensive policy on coal which not only lays a basis for realistic progressive production but also provides for immediate steps for conservation of limited stocks of metallurgical coal and a rationalist approach to price policy.

The production experience of coal during the third five-year Plan can hardly be considered as encouraging. The first year i.e. 1961-62 started with a slight decline in production from the second Plan achievement of 55.51 million tonnes (which itself had a shortfall of over 4 million tonnes), and by 1963 the target had been officially scaled down from 98.6 million tonnes (97 million tons) to 89.88 million tonnes. It is no secret that because of the slackness in demand the Government now does not expect even the revised target to be achieved and believes that coal production may be only about 85 million tonnes in 1965-66. In view of the fact, however, that output in 1963-64 has not exceeded 67 million tonnes the steep increase of 18 million tonnes during the next two years also seems to be rather unlikely. It will not, therefore, be surprising if actual production at the end of the third Plan turns out to be between 75 to 80 million tonnes.

It will be wrong to think that the slackness in demand has been the only cause for frequent changes in production targets. The Government's approach to consumption and production patterns is not entirely free from blame and confusion in official circles is deeper than it is generally realised. Evidence of this is found in the Report of the Estimates Committee which pointed out that since the finalisation of the third Plan to March 1963 diverse estimates of demand were being made by the Government from time to time. Earlier in April 1962, the same Committee was told by the Working Group on Coal Production and Transport comprising representatives of the Ministries of Mines and Fuel, Railways and the Planning Commission that the target of coal production in the last year of the Plan would have to be revised upwards from 97 million tons to 101 million tons while production in the last quarter of 1965-66 would have to be raised to 26 million tons i.e. at the annual rate of 104 million tons. Three months later, the Ministry of Mines and Fuel furnished a statement to the Committee saying that while the target of coal production was 97 million tons, the Ministry was working for a schedule of 99.98 million tons in order to take care of possible shortfall in production against individual targets. In August 1962 the Working Group worked out the production pattern for the third Plan and suggested a revised production target of 98.3 million tons for 1965-66. Now, though the shortfall in demand has been with us for more than a year, the Planning Group on Coal has failed to appreciate its impact on production in the third and the fourth Plans and has come out with its fantastic figure of 154.5 million tonnes. Nobody disputes that planning is a continuing process of adjustment and development but in the case of coal it seems to be only a continuing process of errors or at best a changing catalogue of ambivalent ambitions.

The production of coal was recorded at 55.51 million tonnes in 1960-61. It declined to 55.23 million tonnes the next year but jumped to 63.83 million tonnes in 1962-63 and is estimated at 66.8 million tonnes for 1963-64. Thus only one year i.e. 1962-63 registered an increase of 8.6 million tonnes out of which additional production of 2.84 million tonnes was attained in a period of three months from November 1962 to January 1963.

Eastern Economist 20 Years Ago

MAY 19, 1944

THE PROSPECTS of the abolition of quantitative trade controls immediately after the war may safely be said to be nil. The war is going to leave for readjustment a legacy of disparate price levels, different degrees of inflation, altered balances of payments of varying strength, and an excessive diversion of resources to war industries for all the nations. Under those uncertain conditions control of foreign trade and exchanges will be an absolute necessity. The long-term prospects for uncontrolled foreign trade are none too bright either. The recent speech of Sir John Anderson, the British Chancellor of Exchequer, in the House of Commons debate on the new monetary plan is perhaps the greatest blow the cause of free trade has sustained in recent years. Sir John made it clear beyond the smallest doubt that there was no obligation on Britain's part to abandon imperial preference in consideration of lease-lend facilities and refrain from entering into "reciprocal trade agreements with other countries or groups of countries either in the monetary or the commercial field"; nor would Britain attach less than the first importance to the maintenance of "traditional relations with countries which have stood by us." Russia, whose place in the European and world economy is going to be very important, is not likely to give up her State monopoly of trade in order to conform to laissez faire regulations. If every important and powerful nation is thus going to retain the control of foreign trade, common prudence suggests that in sheer self-defence India should adopt a similar course. In doing so India will not surely be pursuing a policy of isolation.

by working round the clock for all the seven days of the week. This high rate of production could not be maintained for long and was soon given up, indicating serious drawbacks in production trends. For instance, though coal output in general has increased, the output of metallurgical coal has remained almost stationary at 17 million tonnes — total increase during a period of three years from 1961 to 1963 being not more than 0.45 million tonnes. The production of Selected Grades A and B actually registered a fall from 6.4 million tonnes in 1961 to 5.5 million tonnes (estimated) in 1963. Similarly, Selected A and B Grades of non-coking coal showed a downward trend from 10.5 million tonnes in 1961 to 8.5 million tonnes (estimated) in 1963—a fall of 2 million tonnes. Thus we have been witnessing a strange paradox that while the production capacity of steel plants has been growing during the last three years the output of metallurgical coal has not shown any material increase. As a matter of fact, production of coking coal has been ahead of demand and more than 5 million tonnes of metallurgical coal are being consumed every year for non-metallurgical purposes. It is wrong to allege, therefore, as has been done by official spokesmen that the glut is only in the production of lower grade coals. The output of Grade III coals, which has created a general impression about the glut in supply, rose from 5.5 million tonnes in 1961 to 7.9 million tonnes (estimated) in 1963, their contribution to the total production being only 9.9 per cent in 1962 and 10.6 per cent in 1963.

The surplus in coking and non-coking coals has been attributed to a slump in demand which occurred because of the delay in the construction of new projects like the Bokaro plant and the thermal power station and non-expansion of existing projects at the level originally envisaged. The important consumers who have reduced their requirements significantly are:

Steel Plants	.. ..	4.37 million tonnes
Railways	.. .. ..	1.34 " "
Textiles	.. .. ..	1.29 " "
Paper Mills	.. ..	0.44 " "
Power	.. .. ..	1.80 " "
TOTAL	.. .. ..	9.24 million tonnes

As a result of the difficult transport position in 1960-61 and 1961-62, the Government granted exemption of excise duty on oil to certain consumers to encourage them to switch over from coal to furnace oil. The substitution is said to have resulted in a reduction of coal demand of about 4.7 million tonnes (3 million tonnes in the case of power houses and 1.7 million tonnes in case of cement factories). Assuming that the entire loss of demand is recovered— an unlikely proposition— there would still be a shortfall of demand of about 4.5 million tonnes by important consumers. The Government is hoping that the slump is only temporary and the demand will catch up but there is also the fear that the glut in supply may continue affecting further production of coal at all levels and depressing prices, particularly those of lower grade coals.

Already, the coal-miners have been critical of the Government's approach to fixation of prices and have openly accused coal administration of discrimination in favour of Selected Grades of Coking Coal. It is felt that any depression through continuing glut in the supply may cause general adverse repercussions. There was little justification for sanctioning price increases in favour of superior grades only especially when the country has been having a surplus of about 5 million tonnes of metallurgical coal every year and using it for non-metallurgical purposes. The Minister for Steel, Mines and Heavy Engineering recently admitted in Parliament that coking coal was being diverted for other uses and that this was "waste of very valuable reserves." But new incentives under the present conditions would mean only new or increased diversions of these stocks — stocks which the Government well knows may not last for more than 25 years — to industries which can very well use medium and high grade coals. Apart from the fact that this attitude reflects poorly on Government's assertions to conserve limited stocks of coking coal for steel plants, it betrays the unsoundness of the price policy regarding coal. The analysis of cost structure made by the Coal Price Revision Committee (1958) clearly established that the cost of extracting coal is related not to the quality of coal but to the cost of production effort involved in mining the coal. If the cost and labour involved in extracting coal of different grades in similar conditions are the same, exclusive price increases in the case of Selected Grades of Coking Coal become completely unwarranted. Official defence that these increases would discourage non-metallurgical industries from using coking coal is manifestly a poor logic and lacks conviction.

Too Many to Do Too Little

THE PUBLIC sector in India has grown enormously during the last fifteen years. It is essential that a sector of the economy where substantial public funds are involved should normally remain in the continuous gaze of those who are responsible for its proper functioning. Most of the units have, however, been found lacking in some of the basic elements of efficient operation. The complicated but expensive units are left to the management which is largely impersonal in nature and does not feel sufficiently involved. Excessive reliance on individuals who do not have stakes as well as ability matching the fortunes invested in these huge units creates an atmosphere of callousness which only the State-run units can afford. The Fifty-Second Estimates Committee Report, commenting on the personnel policies of public undertakings, has provided evident proof of this attitude. The Committee has devoted its 190-page report entirely to the state of the personnel manning these undertakings and the most significant fact brought out by the report is the employment of excessive staff for long periods of time. Most of the units have the tendency to employ in the initial stages the staff that is required for full production. This overstaffing leads to low productivity, high cost of production, disproportionate expenditure on residential colonies and various avoidable labour problems.

Providing concrete instances the Committee states that the three steel plants of Hindustan Steel alone employed a surplus staff of over 22,000 workers, and with the exception of Bhilai, they could not even offer satisfactory explanation for this state of over-staffing. The Bhilai steel plant continued to employ nearly 6,000 unskilled workers even when they were rendered surplus on the completion of the construction work. It was under some sort of pressure that the project authorities chose to provide alternative employment to these persons. In this context the Committee provides evidence that in the USA a million ton steel plant would employ about 6,000 men as against about 19,000 employed at present in Rourkela. Similarly the fertiliser plant at Sindri employs nearly 9,000 workers as against 1,000 workers employed on comparable plants in some foreign countries. This fact is of particular significance because Sindri is one of the older enterprises and it did get time to devote sufficient attention towards the standards of efficiency. Even on the score of unemployment it is unfair to load any plant with excess man-power and evade the responsibility of finding for them alternative avenues. The Committee has made, therefore, a meaningful observation about such units. "Having committed the initial mistake, they find it difficult to subsequently increase workload of employees or lay them off, with the result that they are obliged to carry the extra strength".

From another angle the state of over-staffing means that several useful technicians are prevented from being utilised at many other units where personnel shortage in various sections is almost chronic. They can, for instance, be utilised to man new projects The Committee has, therefore, rightly recommended that the newly developed public undertakings should keep the staff strength at levels slightly below the figures suggested by the consultants for each stage of the project and in no case should any staff be employed over and above the estimates of consultants without the approval of the Government. In fact whenever a unit is proposed to be established the personnel available with the already established units that can be spared should be absorbed in the first instance which would mean the utilisation of valuable experience apart from solving the problem of over-staffing.

Another significant aspect of top management about which the Estimates Committee has expressed its opinion is the increased reliance on the Civil Service to man the top posts in these undertakings. In the initial stages there could have been some justification for putting the civil administrators at the top posts but with the passage of years these units should have evolved a regular scheme of executive development which would enable them to provide trained and seasoned executives to step into positions of responsibility. A new project of a large size faces numerous difficulties at the initial stage and the problems are by no means easy to be overcome even by a seasoned administrator. It is, therefore, quite justifiable on the part of the Committee to be critical of the continuance of Civil Service personnel in the top cadres in these undertakings. The administrators do have judgment and executive ability but hardly any business acumen or experience so very necessary for the top management.

The Committee also hints that the Civil Service personnel do not many times put their heart into the job because when found less suitable they can always go back to their original assignments. This is all the more true about those individuals who work on deputation. At the moment nearly 3,500 deputationists from Government service are functioning on the staff of these undertakings and the Committee has naturally advised that this practice should be kept to the minimum. Besides being expensive, this practice is not conducive to efficiency. "Such officers as have no stake in the undertaking can hardly be expected to put in their best. They fail to develop a feeling of attachment to the undertaking and do not identify themselves with its problems". In fact this practice also holds up the prospects of the regular employees and those who could be employed on permanent basis. The presence of individuals from Government departments also spreads inefficiency because they tend to introduce the traditional pattern of layers of officers for each department. This hierarchical system of administration devised for Government departments to provide checks and balances is neither desirable nor necessary for industrial and commercial enterprises.

The Committee has pointed out that the practice of changing top personnel has been followed too frequently. This indeed is a wasteful measure because the experience and intimate knowledge acquired by the individuals is lost in no time. This problem has been accentuated by the fact that as many as 4,857 technical and managerial personnel left the public undertakings on their own during the last three years to join other public or private undertakings. While it is not possible to impose a ban on such movement, it cannot be denied that it leads to lower efficiency. If the tendency of drift of personnel is to be checked the Committee felt that the public undertakings should try to create a good image of themselves. It has also recommended that the

individuals for the posts should be selected carefully and appointed for a minimum term of say, five years, so as to enable them to fully implement the plans and programmes entrusted to them and to contribute to the efficiency and economical working of the enterprises. It is added that the tenure of these posts should be linked up with the performance of the individual concerned. It should always be possible for Government to remove inefficient people in key posts before the expiry of their terms and give sufficient encouragement to those who prove their efficiency.

Another way of developing an efficient cadre is to start a scheme of training the selected officers. As the Committee suggests, the estimate of the likely requirement of top men for the next five years should be prepared and action taken to select suitable persons from all possible sources — public undertakings, Government service — and given a specialised training for a period of about two years. The officers who prove useful should be drafted for employment in the public undertakings for the rest of their service and if necessary the terms of their appointment should be made attractive.

On the subject of salaries the Committee does not hold the view that remuneration for higher jobs in public sector should be brought at par with the private sector. It believes that the conditions of service and responsibility of the officials in the public sector are not comparable with those obtaining in the private sector. "The risk and uncertainties which management face in regard to capital, production, cost, demand, pricing, profit etc. in the private sector are not comparable to those in the public sector". It seems that the Committee agrees that the top management in the private sector is required to be more imaginative and competent to face unconventional situations which are not likely to be faced by the public sector top management. The Committee, therefore, concludes that the top management in the public sector need not be as expensive as it is in the case of the private sector. Logically it follows that the public sector management need not be as competent as the private sector top managers have got to be. The Committee also feels that the public sector which is emerging as the biggest employer should set the pace for other employers by pegging the salaries rather than compete with the private sector in this regard. One does not, however, understand the assumed arrogance of the public sector becoming the biggest employer and, therefore, setting the standards of salaries for top managements. Once it is agreed that the top management in the public sector is not required to handle similar situations which arise in the private sector, the talk about pegging the salaries is meaningless. The public sector with its limited ambitions about efficiency can continue to be run by comparatively low-paid top management so that the difference between the top and the bottom employees is less and incidentally the Government is able to pursue its socialistic goals.

EASTERN ECONOMIST BUDGET NUMBER

March 6, 1964

THE BUDGET NUMBERS of "Eastern Economist" are a popular and valued annual feature of the Journal. This year's Number should be of special interest and importance in view of the complexity as well as ingenuity of the economic and fiscal policies presented through the Central Budget.

An attempt has been made in the Budget Number to analyse the various aspects of the Budget proposals and study the Budget documents with a view to bringing out the larger and deeper implications of Government policies for the future course of the national economy. The result is an objective and critical evaluation of the economic situation and outlook at a significant turn in the course of national development.

The Budget Number is illustrated with graphs and diagrams and it features a special section in which important budget documents have been reproduced for record and reference. Priced at Rs. 5 per copy, the Budget Number is available to subscribers without extra charge.

Highlights of the Week

AFTER NEHRU WHO ?

EVER SINCE the illness of the Prime Minister, his succession has become a poignant question in the Indian political scene. For the first time Mr. Nehru gave a concrete reason why he had refused consistently to name his successor, in a television interview which was exhibited in New York on May 18 and had been recorded in New Delhi a few weeks earlier. He cited the example of Sir Anthony Eden in the U.K. who had been nominated by Mr. Winston Churchill and who did not last long because of the cruel pressure of political events. If Mr. Nehru nominated someone, he was afraid his nominee might not be able to retain the leadership. That was the precise reason why he wanted the choice of the successor to be left to the people.

A pertinent reference was made by the interviewer to Mrs. Indira Gandhi, asking the Prime Minister if she could succeed him. The Prime Minister gave the opinion that it was "very unlikely" that she would take his place and that it was not correct to say that he was grooming her for that high post. When later these remarks of the Prime Minister were conveyed to Mrs. Gandhi, she reacted in these words: "I think he is right in what he said in that I have no such idea. I would not call it an ambition because to me that does not seem to be a good thing. Different types of people want different things — and it is just not what I want for myself". The interviewer persisted in eliciting further light on this aspect when he said, "Would it not be a question of who has the necessary equipment to carry the tremendous burden? I am sure you have it". Mrs. Gandhi's answer was non-committal. She said: "Well, I am not conceited enough to think that I am the only person who has it — even if I do. But a lot of other things depend on who will succeed. I know that I will not enter into this at all". In reply to the further question whether, if the Prime Ministership was thrust upon her, she would shirk responsibility, Mrs. Gandhi said: "It cannot be thrust upon me if I do not want it".

A similar reply exhibiting no keenness to become India's Prime Minister was given by Mrs. Gandhi in the last week of April in Washington. She had participated in a "Meet the Press" television programme where she had been asked almost similar questions and her reply had been that 90 per cent she was inclined to refuse the Prime Ministership. The impression was created that she would agree to be the Prime Minister if she was persuaded to do so. The Prime Minister's interview has also highlighted the same aspect that whereas he was making no effort on his part to train her for the post of the Prime Minister, it was left to the people and the party to select her as India's future Prime Minister. The Prime Minister's judgment in regard to succession seems to be correct because if the successor is thrust upon the public and is not the spontaneous choice of the people, it may tend to create some sort of hostility. Mr. Nehru has seen that if Mrs. Indira Gandhi were to take his place, it would not materialise through his efforts. She will have to be acceptable to the party and the people.

KASHMIR DEBATE

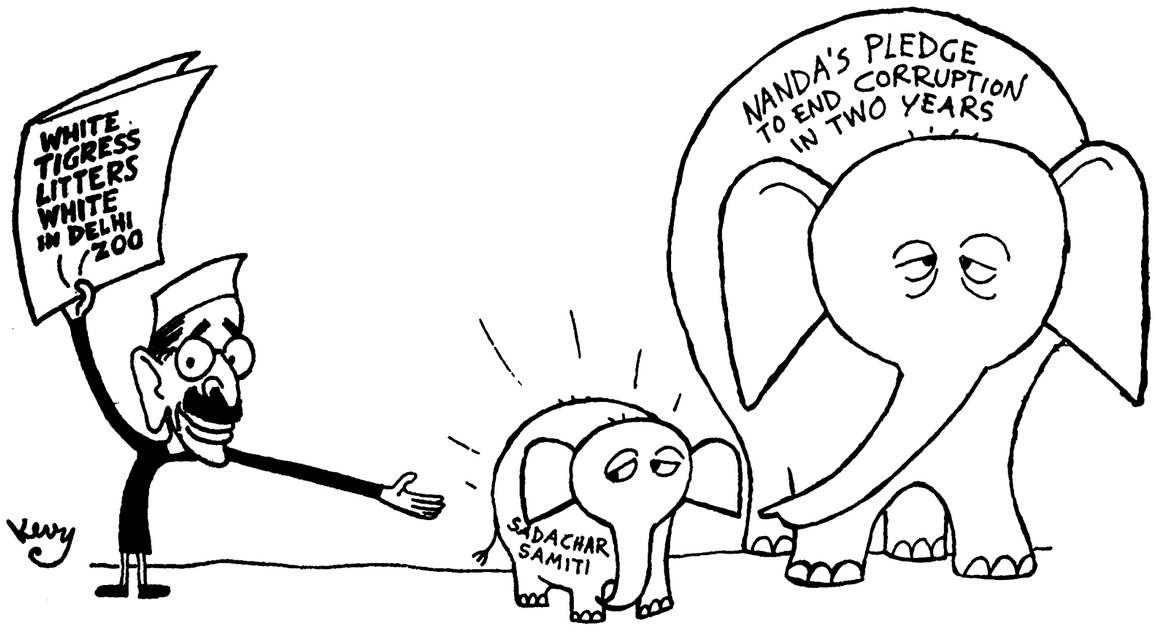
THE DEBATE on Kashmir in the Security Council was wound up on May 19 by the President, Mr. Roger Seydoux of France, who expressed the hope that the two countries would establish good relations between themselves and would attempt an amicable solution of the dispute. The Security Council members had expressed the desire that the two countries should resume contacts as soon as possible so as to resolve the differences through negotiations. Mr. M. C. Chagla, India's Minister for Education, who represented this country in the Security Council, said that direct negotiations between the two countries could be useful and fruitful only if both the parties approached the problem with goodwill and if Pakistan accepted India's basic position that Kashmir was an integral part of India and nothing should be done which would affect India's secular character. Regarding the suggestion made by some members that Mr. U Thant should assist in bringing about a solution, Mr. Chagla said that any intervention on the part of the Secretary-General uninvited and without the consent of both the parties would hinder and hamper the negotiations which were proposed to be started in the near future.

It has become patent that any lasting solution of the Kashmir problem will have to be acceptable to India, Pakistan and the people of Kashmir. Sheikh Abdullah is planning to visit Pakistan next week. According to his present programme, he will visit Delhi first and will then fly to Lahore on May 24, from where he will proceed to Rawalpindi in President Ayub's plane. Sheikh Abdullah also indicated recently in Srinagar that in an effort to find a solution acceptable to all the three parties, he may have to make more than one trip to Pakistan. Commenting on his forthcoming visit to Pakistan, he said that the purpose of his visit was to "cement the bonds of friendship between the two countries".

Mr. Jayaprakash Narayan, the renowned Socialist leader, has advocated a bold line of approach in tackling the Kashmir problem. He has recommended the establishment of some sort of a Confederation between India, Pakistan and Kashmir which ultimately might involve a gradual loosening of India's association with Kashmir. This line of approach, however, has countered stiff opposition from influential sections in the Congress Party itself. It is argued that if we let the people of Kashmir and Sheikh Abdullah have the feeling that the issue of Kashmir is still an open one, it could lead to sinister consequences. In any case, the various formulae which Sheikh Abdullah is carrying with him to Pakistan and which are still a mystery for the Indian public, are not likely to bring about the desired amity in the sub-continent because there seem to be some revolutionary elements in them for which the public both in India and Pakistan has not yet been made ready. In the meantime, it is perhaps wiser to keep one's fingers crossed.

OUR CRAFTSMEN ABROAD

EVEN AFTER making due allowances for the impatience of developing countries in this era of rising expectations, one cannot absolve the planners in India of their share of responsibility for failing, at any rate in the early stages, fully to appreciate the need for a large army of skilled craftsmen to cope with the problems of an economy about to enter the take-off phase. It must, however, be added that they did not take very long to realise this and adopt suitable measures to ensure the results desired. Perhaps the most notable of these measures was the establishment of a Central Training Institute for Instructors at Kurla (Bombay). The association of the U.S. Government with this Institute, nay with the entire training programme launched by the Directorate General of Employment and Training, Government of India, which the U.S.A.I.D. Director, Mr. C. Tyler Wood, recalled at the function for distribution of prizes to winners of the All India Skills Competition, has been a very happy one. It is not only indicative of the enthusiasm shown by America in the training



of Indian craftsmen but alsc of the positive participation of that country in the programme. Mr. D. Sanjivayya, Union Minister for Labour and Employment, appropriately reminded his hearers that the phenomenal development of American industry was really possible because of the skill of the people of that country in the industrial field.

In their natural anxiety to achieve spectacular results, all developing countries, including India, are apt to concentrate, in the initial stages, on the training of engineers, scientists and managers. However indispensable they are, they cannot by themselves produce results. They may design and guide, but the actual implementation, the translation in practical terms of their designs and ideas, lies with craftsmen of all types — carpenters, plumbers, electricians, smiths, fitters and so on. If there is some dearth of engineers and managers, there is a very great dearth of craftsmen and possibly an utter absence of the highly skilled type, particularly of those that could work on the more sophisticated machines. It is of the utmost value, also urgency, to this country, therefore, to remove this lacuna, to be able to keep in step even with the scant industrial advance that we have made. One could go further and say that this plinth and foundation of craftsmen is far more important today than even monumental projects. With some luck and sufficient foreign aid and collaboration, we might create Bokaros and Bhilais, but to keep them running, we must have a whole army of skilled craftsmen. All praise must go accordingly to those who have not only made a beginning possible but have also been farsighted enough to give it a splendid start by providing books, equipment and even professors to train instructors.

We do not know whether all the 51 instructor trainees from 17 States who participated in the All India Skills Competition have had the benefit of instruction from the team of American professors from the William Hood Dunwoody Industrial Institute of Minneapolis. Nor are we aware whether even the three successful trainees who have been selected to go to the States for a 12-week study-cum-training trip have had that privilege. If they have already had some training at the hands of U.S. professors, they would be in a position more readily and easily to absorb all that their brief stay of 12 weeks in the States might permit. To some extent, the provision for in-plant training of these prize-winners for a period of six months before they leave India should take care of preparing them for the purpose. Any such in-plant training should, as far as possible, be in factories where American machinery and also American technicians are working. This would serve to provide the Indian trainees with at least some measure of the atmosphere and the type of people with whom they will be called upon to work.

Imbibe Discipline

It would be too much to expect these trainees to imbibe in just 12 weeks all that there is to learn in the American industrial set-up. Nor is that necessary. What they need to observe and learn and, what is more, speak of their confreres, on their return to this country, is the discipline and the conscientiousness of the American worker. While there are trade unions to take care of proper conditions of work and wages and all that for him, the American worker takes pride in his work — such as modern mechanised factories can offer — and is extremely mindful of the time he gives to his employer. There is no disposition here to rob the employer of his legitimate time. He comes to the factory at the appointed time, does the work assigned to him dutifully and diligently and for such time as it is stipulated and is off thereafter. Because of this there is maximum productivity and meagre idle capacity in U.S. industries generally. It is to these aspects, more than to a tour of the ultra-automatised plant or complex, that we hope the three Indian trainees will address themselves during their stay in the States.

DELHI'S BABY WHITE ELEPHANT

OUR POPULATION PROBLEM—IX

Control Plan: Targets and Performance

R. CHOPRA

THE PLAN is to be launched on a country-wide scale along with the fourth five-year Plan, i.e., on April 1, 1966 and will end with the fifth five-year Plan, i.e., on March 31, 1976. This does not mean that before launching and after the end of the Plan, family planning will not be advocated. It only means that the targets set herein must be achieved within the ten-year span i.e., 1966-1976. The entire population must be brought under the purview of the scheme at the start of the fourth Plan so that the actual increase in population can be reduced from the present rate of 2.4 per cent to 0.3 - 0.4 per cent. In short, birth-rate should more or less match death-rate by 1976 so that the population becomes stable afterwards.

I have deliberately mentioned the rate of increase and actual increase of population and not the birth-rate. As an example of the limitations of the term birth-rate, consider the target of the Director, Family Planning, for bringing the birth-rate down from the present figure of 40 per 1000 to 25 per 1000 by 1973. By that time it is expected that the death-rate would also drop. The net increase in population will thus continue although at a reduced rate than at present. The reduction of the birth-rate, therefore, has a limited meaning. **The PCP, however, aims at minimising the actual increase of the total population.**

It is estimated that the excess of births over deaths at the start of the programme, if the present trends continue, will be of the order of about 1.2 crores. Taking 1.2 crores as the basis, the programme aims at reducing the excess of births over deaths to as near to 0.2 crores or less as possible by 1976. Actually it would even be possible to reduce the total population after a certain stage if the programme succeeds.

Required Reduction

To achieve the targeted figure of 0.2 crores or less annual increase in ten years it will be essential that in each year the number of births should reduce by **10-15 lakhs compared to the preceding year.** Considering the jurisdiction of each Village/Field Level Worker, it is apparent that the number of births which is nearly 100-112 for a population of 2500-2800 (at the rate of 40 per 1,000 people) at present gives a net surplus of 60 births over deaths, should be cut down to a surplus of 10 or less births over deaths by 1976. In other words, the target for reducing the yearly increase of population per Village Level Worker should be **5 to 6 compared to the preceding year.**

On the basis of 43.8 crores population in 1961 and annual increase at the rate of 2.4 per cent it can be calculated that the population will be 49 crores in 1966. Assuming a reduction in the surplus births over deaths of 10 lakhs per year for ten years as mentioned above, the population, in 1976, can be estimated and compared with the population if unchecked growth is allowed. The table opposite gives the population estimates for every year.

Hence, in 1976, i.e., at the end of the PCP the population will be 55.5 crores instead of 62.10 crores i.e., 6.6 crores less. The rate of increase after 1976 will be 0.3 to 0.4 per cent instead of 2.4 per cent. In other words, after 1976 the population would be practically stable and any increase in the gross national income would proportionally show an increase in per capita income and consequently the standard of living. At present, and if the present trend continues, most of the increase in the gross national income is neutralised by the enormous growth in population. More details of the financial implications are given later on.

The other targets are —

(1) On an average 10 lakh men/women should be sterilised every year. Considering that there are 2 lakh Village/Field Level Workers, each Village/Field Level Worker will have a target of 5-6 sterilisations per year.

(2) As marriage is the first step towards producing children obviously any reduction in the total number of marriages taking place each year has a direct bearing on the number of births. It would, therefore, be worthwhile to find out the number of marriages which take place on the average every year in the country or in each Village/Field Level Worker's jurisdiction and set targets for a reduction in this number. It may be possible, with the right approach, to make life-long bachelorhood more desirable or at least postpone marriage for a few years.

Financial Implications

The Population Control Programme as detailed in earlier chapters is extremely ambitious. It is perhaps the largest and most expensive single peace-time project ever planned anywhere in the world.

The cost of the organisation, contraceptives, sterilisation, publicity and other miscellaneous matters both recurring and non-recurring would run into hundreds of crores during the 10 years the programme will last. But the alternative, i.e. unchecked growth during this period and providing the targeted per capita income to the millions in excess of the estimated population at the end of the fifth five-year Plan, would be at least 3 times as costly.

This is not all. The PCP aims at not only a reduced population by 1976, it will stabilise the population after 1976 for

(Figures in crores)

Year	Population with P.C.P.	Population without P.C.P.
1966	49.0	49.0
1967	50.1	50.2
1968	51.1	51.4
1969	52.0	52.65
1970	52.8	53.95
1971	53.5	55.30
1972	54.1	56.35
1973	54.6	57.75
1974	55.0	59.15
1975	55.3	60.60
1976	55.5	62.10

all times to come. This will ensure that every penny invested in the sixth and subsequent Plans will go to improve the living standard of the population. On the other hand, if left unchecked the growing population would require a large slice of the investment in the sixth and subsequent Plans just to provide the extra millions with a living.

Let us estimate the cost of the P.C.P. as envisaged over the ten years from 1966-76:-

A) RECURRING

1)	The average annual wage bill for the P.C.P. organisation	Rs. 110 crores
2)	Contraceptives	Rs. 50 crores
3)	Sterilisation	Rs. 20 crores
4)	Training	Rs. 5 crores
5)	Distribution of contraceptives	Rs. 5 crores
6)	Administrative and office expenses, repair and maintenance of machinery and plant	Rs. 20 crores
7)	Sterilisation camps, seminars, tours, lectures etc.	Rs. 15 crores
8)	Miscellaneous expenditure	Rs. 20 crores
	Annual expenditure	Rs. 245 crores

For the period 1966-1976: Rs. 2,450 crores.

B) PREPARATORY AND NON-RECURRING

1)	Television and radio stations	Rs. 15 crores
2)	Television sets	Rs. 50 crores
3)	Radio sets	Rs. 10 crores
4)	Cycles to all up to Village Level Workers @ Rs. 120	Rs. 2.40 crores
5)	Scooters/Motor cycles up to Block Level @ Rs. 2,000	Rs. 6 60 crores
6)	Jeeps, cars etc. @ Rs. 12,000	Rs. 12 crores
7)	Residential accommodation etc.	Rs. 40 crores
8)	Office accommodation etc.	Rs. 10 crores
9)	Clinics (jointly with Welfare Organisations)	Rs. 10 crores
10)	Training schools, research, scholarships etc. for Family Planning Organisation	Rs. 20 crores
11)	Factories for contraceptives	Rs. 50 crores
12)	Miscellaneous expenditure	Rs. 24 crores
	Total	Rs. 250.00 crores

C) MISCELLANEOUS AND OTHER EXPENSES

1)	Bonus to P.C.P. Organisation staff at the rate of half the salary over 10 years	Rs. 600 crores
2)	Miscellaneous expenditure	Rs. 100 crores
	Total	Rs. 700 crores

Therefore Grand Total of A+B+C = Rs. 2,450+250+700
= Rs. 3,400 crores

The population estimates with or without the P.C.P. are given in an earlier article. It is estimated that while the population with P.C.P. will practically stabilise at Rs. 55.5 crores in 1976, without P.C.P. it will 62.1 crores and still growing.

Mr. V. T. Krishnamachari in his book, "Planning in India", while discussing the rate of development for the period 1951-76 has estimated that the planned per capita income in 1976 is Rs. 520 for a population of 56.8 crores. The new estimate of population after the 1961 census is 62.5 crores in 1976. Even if we assume the figure of 62.1 crores as estimated in an earlier article, the planners still have to provide enough extra capital investment to promise Rs. 520 per capita to the 5.3 crores surplus population. Assuring capital to output ratio of 3:1 the net extra investment required is 5.3x520x3 i.e., Rs. 8,268.00 crores. If, however, with P.C.P. the population is only 55.5 crores, the net estimated investment to provide Rs. 520 per capita income to 56.8 crores can be reduced by 1.3 x 520 x 3 i.e. Rs. 2,028.00 crores. In other words, total reduction in investment is 8,268+2,028.0 i.e. Rs. 10,296.0 crores.

Net Saving

Subtracting the cost of the P.C.P. from the saving in investment it can be seen that there is a net saving of Rs. 10,296.0 — Rs. 3,400.0 i.e. Rs. 6,896.0 crores. Remember even if the P.C.P. costs twice or even thrice as much as estimated **it will still be worthwhile.**

This is not all. The P.C.P. will stabilise the population by 1976. In fact, at the annual rate of increase of 20 lakhs the population will increase from 55.5 crores to 64.5 crores in 40 years. That is, assuming the population is stationary at 60 crores over the period 1976 to 2016, every penny invested will go towards improving the standard of living of the people. The year 1976 will then mark the "take-off" stage (which is proving so elusive at present). At the annual rate of increase in per capita income of 3-10 per cent, which is not at all difficult to achieve in a self-generating economy, our progress towards the goal of "prosperity within our life-time" will be really spectacular.

The increase in per capita income at 8 per cent as well as at 10 per cent rate of annual increase will be as follows:

Year	Per capita income in rupees @ 8%	10%
1976	520.0	520.0
1980	707.00	759.00
1990	1,529.00	1,976.00
2000	3,297.00	5,122.00
2010	7,124.00	13,260.00
2016	11,284.00	21,400.00

On the other hand a real increase in per capita income after 1976, without the P.C.P., is debatable.

[Concluded]

Shipbuilding in Poland

ZDZISLAW NOWAKOWSKI

IN 1962 POLAND produced 47 sea-going vessels totalling 290,000 DWT for foreign and domestic shipowners. In terms of tonnage completed this puts Poland in tenth place in the world. Its share of world production climbed from 0.9 per cent in 1952 to 1.7 per cent in 1957, and in 1962 topped 2.7 per cent. To reach the "top ten" out of the thirty-odd ship building countries is a substantial achievement considering the virtually total destruction of the shipyards during the war.

The shipbuilding industry, which did not exist before the war, is now the fourth largest branch of engineering in terms of the value of market production and its share of the total production of the engineering industry has risen from 3.1 per cent in 1952 to 7.7 per cent in 1962. This "shipbuilding miracle", as the Lloyd's Register of Shipping called it, has been made possible by investments and also by the large orders placed by the Soviet Union when the industry was finding its feet.

Technical Standards

Up to 1957 the bulk of production consisted of tramps, with a small balance of general cargo ships and simple fishing vessels. Since then a much larger share has fallen to general cargo ships, more complicated types of fishing boats, specialized ships for dry bulk cargoes, and tankers. The following table illustrates the structure of production:

(In percentages)

Kind of Vessel	1950	1953	1955	1959	1962
Tramps	100	70.5	81.0	28.5	3.7
Special ships for bulk cargoes	—	—	—	—	16.0
General cargo ships	—	16.8	9.7	51.0	52.2
Tankers	—	—	—	—	14.0
Fishing vessels	—	12.7	9.3	20.55	14.1

It is worth emphasising the place occupied by Poland in world production of fishing vessels, a category which accounts for a larger proportion of output than in other countries. The technical and operational qualities of Polish fishing vessels have been highly rated by experts here and abroad. In 1959 Poland was the world's leading producer in this class, and runner-up to Japan in 1960-62. Demand for fishing boats is rising, the most sought after being long-range vessels which can exploit distant fishing grounds. It is boats of this kind which are being built in Poland. They include motor trawlers of 150 and 550 DWT, factory and refrigerating trawlers with a deadweight of 1,250 tons and cruising range of 70 days, adapted for stern-fishing and capable of processing fish on the spot into fillets, frozen blocks, oil and meal, and depot ships with a deadweight of 10,000 tons which can service a whole fleet of smaller ships fishing far from their home ports. There have been also considerable changes in the size and speed of the tonnage built. The largest vessels now being built have a tonnage of 20,000 DWT and maximum speeds reach 18 knots.

Technical standards are as high as any in the world; indeed, some types like the depot ships, the factory trawlers and the 6,000 ton timber freighters may be called ships of the future. Keeping up with the latest advances in technology is, of course, essential to any country's reputation as a producer of high quality shipping. This concern with improving the quality of production in Poland in reflected in the degree of electrification of new vessels: on the trawlers, for example, it comes to 660 watts per DWT; also, most of the ships now being built have largely automated power plants, auxiliary boilers, navigational aids, loading installations, etc. Of the 33 types of vessels which are currently in production as many as 20 are prototypes whose design and equipment will make them some of the most attractive ships on the market. Some of their technical features are in fact ahead of world standards.

Exports

The expansion of production and the achievement of high standards created an opportunity for developing exports of ships. Today the Polish industry is the seventh largest exporter in the world: in 1962 137,000 BRT were launched for foreign companies, 4 per cent of world exports in this field. Polish-built ships now sail under the flags of the Soviet Union, China, Albania, Brazil, Indonesia, France, Switzerland, Britain, the United Arab Republic and Cuba. The competitiveness of the Polish industry is best evidenced by the continually upward trend in exports of ships and full order books five years in advance. They play an important part in Poland's balance of payments; their share of the total value of exports has risen from 3.3 to 5.3 per cent in the last ten years. Many measures have been taken to sustain and stimulate this growth. For this reason there are agencies in Poland of Lloyd's Register of Shipping, the USSR Sea Register of Shipping, Norske Veritas and other classification companies whose regulations and advice are followed in building ships according to customers' requirements.

Technical Progress and Investments

The steady growth of production in quantity and quality is the result of a bold harnessing of technical progress and considerable investments. The shipyards are organized on the most modern lines and employ the latest technology. Only welding constructions are used and the welds are strictly checked with the help of defectoscopes and X-rays. The cleaning of plates for processing is done mechanically with special machines. Tracing has been completely eliminated and the traditional mouldlofts which take up so much space and labour have been abolished. In their place optical lotung has been introduced together with a further innovation: plate cutting by special remote-controlled machines.

The most important of the investments which have been made in the shipyards is the construction, now nearing completion, of a dry dock in the Gdynia Shipyard. Here it will be possible to build vessels with a deadweight of up to 65,000 tons. The equipment of the hull construction plant in this dock is far ahead of the world average while the modern methods of production will have few equals anywhere. This

plant has been laid out in a single technological line running from plate yard, processing, prefabrication, section assembly, to assembly of blocks weighing up to 500 tons. In this dock the production cycle will be shortened to less than 2 months. With the present tendency all over the world to increase the size of both tankers and freighters the building of a dock with a capacity of 55,000 tons is of great importance for the future of the Polish shipbuilding industry. The ability to offer ships of this size and the lowering of cost with dry dock contruction will further increase the competitiveness of the industry and open up wider possibilities of sales.

In the eighteen years since the war a large body of skilled workers, engineers, technicians and economists have been trained by the Gdansk Institute of Technology and vocational schools. The total number of engineers employed is about 1,000, some 300 of whom work in design offices. The ratio of engineers to workers in production is fairly high, amounting to 44 per 1,000. There are 3 technicians to every engineer.

Plans envisage the production of 400,000 DWT in 1965 rising to 600,000 in 1970. This increase in capacity has been dictated by the growing demand for fishing and carriage tonnage on the foreign markets already secured by Poland, particularly the Soviet Union, and by the needs of the home fleet The large and continually rising demand for foodstuffs, particularly for fish, will mean a correspondingly growing demand in the world for fishing vessels for many years to come. The shipbuilding industry is very much concerned with keeping abreast of technological advances in the world and also conducts its own research into ship engineering, propulsion, equipment, new materials, etc. For these purposes two research establishments were set up in 1962-63 — the Shipbuilding Institute in the Gdansk Institute of Technology and the Research Centre of the Shipbuilding Industry, staffed by scientists and engineers from various specialities.

How to Step Up Agricultural Production?

VIRENDRA AGARWALA

THE PRESENT rising trend in prices is explained by the inadequate rate of growth in agriculture. Although in the past agricultural production increased, on an average, at about 3.5 per cent per year, in the last two years there has been a considerable setback. In 1961-62 production increased by 1.2 per cent while in 1962-63 there was a decline of 3.3 per cent; the index of agricultural production stood at 136.8 as against the peak level of 141.4 attained in 1961-62. The shortfall in production was particularly marked in the case of rice, wheat, groundnuts and sugarcane. Among the commercial crops, production of jute increased by about 9 per cent while that of cotton was satisfactory. The overall production of foodgrains declined from 81.0 million tonnes in 1961-62 to 78.7 million tonnes in 1962-63. The Planning Commission argued that three weeks long cold spell in Uttar Pradesh was largely responsible for damaging the crop to the extent of 50 per cent. It is true that unfavourable weather conditions are largely responsible for the slow pace in raising agricultural production, but it does not appear to be reasonable to believe that we could have crossed 85 million tonnes this year. It is equally unrealistic to assume that a rise of 35 per cent in agricultural production, on an average of 5 per cent a year, can be attained by 1970-71. The Government has claimed that the production in 1963-64 is far better than that of the record crop year of 1961-62. It would, therefore, be logical to expect the current prices to be lower than those of 1961-62. But, it is difficult to understand why in a bumper year with an overall increase in foodgrains production as well as a steady flow of imports under the PL 480 programme, rice and wheat should still continue to sell at relatively high prices.

Population Vs Production

The shortage of foodgrains was partly made good by larger releases from Government stocks. The total quantity of foodgrains imported into India in 1963 increased to 4.56 million tonnes valued at Rs. 183.6 crores as against 3.64 million tonnes valued at Rs. 141.4 crores in 1962 and 3.5 million tonnes valued at Rs. 129.6 crores in 1961. Thus, total consumption in 1962-63 was 83.2 million tonnes. It is widely recognised that the population is increasing at the rate of 2.3 per cent per annum while production has hardly crossed 2 per cent a year.

It is often complained that under the present set-up some statisticians sitting at a table in New Delhi set the target for agriculture without the farmer being brought into the picture. The Planning Commission explains that the target is neither arbitrary nor unrealistic in the sense that it is determined on the basis of our needs as well as the capacity to produce. It may be interesting to point out that the target of 100 million tonnes included 12½ per cent margin kept for waste etc. which necessarily implies that the Planning Commission considered that 88½ million tonnes of foodgrains would be found enough to provide nutritional diet of 18 oz. per head per day to the growing population which is likely to reach 492 million by 1965-66. The arithmetic of food demand shows that we need at least 98 million tonnes — and if we include 12½ per cent for wastage etc. then, of course, the target should have been 110 million tonnes. We have been planning to be self-sufficient since we attained independence in 1947, but our pious hopes remained slogans as we never succeeded in translating them into action. No amount of planning will ever be successful unless we make the farmer the focal point of our thinking and endeavour.

Agricultural Base

It is widely recognised that a strong agricultural base is the first requisite of national defence. Increase in agricultural production is also essential in supporting, sustaining and increasing the tempo of progress in other sectors of the economy. But unfortunately, the patchy implementation of policies and false priorities are largely responsible for the unsatisfactory state of affairs. The experience of intensive agricultural production in certain selected areas through what are known as 'Package programmes' has shown that in the interest of securing a rapid increase in production instead of dispersing efforts all over the country, attention must be concentrated in the most promising and productive areas. The Government has recently decided to devote its attention to about 80 selected districts covering approximately 1,500 development blocks, which hold out a promise of quick results. It is hoped that their impact will be felt on the next kharif crops. At the level of the State an integrated programme of action is being developed under an officer known as the Secretary-cum-Commissioner for Agricultural Production and Rural Development who has been made responsible for co-ordinating the functions of various departments including Agriculture, Animal Husbandry, Fisheries, Community Development, Panchayati Raj and Co-operation. Gram Sevaks will now be required to be fully devoted to the task of agricultural production under the extension officer in the Agricultural Department. If our workers at the village level are in a position to inspire the rural community and are effective enough to improve their functioning, there is no reason why we should not be able to show exciting results by the end of the third Plan.

The unsatisfactory state of affairs is largely due to a number of factors including the non-availability of fertilizers in adequate quantity and at the right time. Secondly, local funds for matching grants have not been forthcoming. Thirdly, the emphasis on Panchayati Raj has displaced attention from development to administration. Finally, the zeal with which at least some of the land reforms like co-operative farming and land ceiling are being carried out has created a sense of uncertainty in the countryside and diverted attention from the more fundamental issue of raising agricultural production. The proposed Seventeenth Amendment to the Constitution, 'inter alia' enlarging the definition of the word 'estate' so as to include lands held under ryotwari settlement has aggravated the situation.

There is also a big gap between irrigation potential and its utilisation. At present, as much as 20 per cent of the irrigation potential remains to be covered. One of the reasons for the under-utilisation is the lack of field channel and village water courses. To a certain extent, this is due to the lapse on the part of the beneficiaries to construct the field channels. It would be appropriate to undertake more active steps to encourage greater effort on the part of the beneficiaries. If the beneficiaries fail to carry out the obligations in spite of this, the work should be undertaken by the Government. At the same time there should be close co-ordination between agricultural extension staff and the irrigation staff with a view to assuring suitable cropping patterns and adequate supply of water at the appropriate time.

Surprising Conclusion

In total, we have 320 million acres of cropped area. It is surprising to note that the Planning Commission feels convinced that not more than 140 million acres of land can ever be provided with irrigation facilities and the rest, of course, will have to depend on the vagaries of the monsoons. Scientific utilisation of water involves an intensive network of channels to prevent seepage of water to avoid water logging, maximum use of available water resources by avoiding waste and economical and purposeful distribution according to the needs of the crop, the soil and the season. The total additional area brought under minor irrigation schemes in the first two years of the third Plan is estimated to be about 4 million acres. If the programme for bringing 3 million acres under minor irrigation in 1963-64 is fulfilled, it is hoped that 54 per cent of the target of the Plan period will be realised. Special allocations of Rs. 10, 15, 19 and 20 crores have already been made in the first, second, third and fourth year of the Plan respectively for minor irrigation schemes and soil conservation. The States have also been directed not to divert funds from agricultural to non-agricultural programmes, otherwise it is likely to be deducted out of the allocations by the Centre to the States. Major and medium irrigation schemes had to cover 29.5 acres by 1965-66 but they are not likely to irrigate more than 23 million acres.

The Planning Commission explains that 43 per cent increases in foodgrains production was expected due to chemical fertilizers, urban and rural composting and green manuring. The Ministry for Steel and Heavy Engineering had calculated to procure 800,000 tonnes of nitrogenous fertilizers; it is now realised that there will be shortfalls in respect of fertilizers and areas benefited by major and medium irrigation schemes. Consumption of nitrogenous fertilizers was to increase from 230,000 tonnes in 1960-61 to a million tonnes in 1965-66, but it amounted to 193,000 tonnes in 1960-61 (being 370,000 tonnes less than the Plan assumed) and increased to 280,000 tonnes in 1961-62 and to 350,000 tonnes in 1962-63. In 1963-64, it is expected to rise to 450,000 tonnes. It is now reckoned that the total internal production at the end of the Plan may be of the order of 500,000 tonnes compared to 800,000 tonnes initially assumed. For the first three years of the Plan, quantities imported have been 156,000, 204,000 and 225,000 tonnes of nitrogenous fertilizers. For the fourth year, imports are being increased to about 350,000 tonnes. For 1964-65, the Plan has already provided Rs. 30 crores with the assumption that another Rs. 5 crores may be allotted if it is found necessary. The benefit of the chemical fertilisers is, therefore, restricted to not more than a small fraction of the millions of cultivators whose hunger for fertilizers is bound to be aroused by our propaganda for their use.

What incentives have we provided to the farmer so that he may produce more? There are a series of limitations imposed on him in regard to the supply of improved seeds, improved agricultural implements, cement and steel, water-supply, fertilizers coupled with poor marketing conditions. If for agricultural improvement, on an average the investment has to be, say, Rs. 60 to Rs. 100 per acre, what is required is an annual investment of at least Rs. 2,100 to 3,500 crores in agriculture. But the creditworthiness of the present is severely limited by the size and quality of his holding and the standards prescribed for loans, whether advanced by Government or co-operative societies. The Reserve Bank has so far advanced short-term loans to co-operative institutions to the tune of Rs. 150 crores during 1962 and its outstanding medium and long-term loans to them at the end of March, 1962 were Rs. 67 crores. It is a matter of gratification that the Reserve Bank has recently been persuaded to advance loans through co-operative societies to the extent of Rs. 300 crores in 1963-64. It is likely to reach Rs. 450 crores by the end of the third Plan. The sale of fertilizers, seeds and pesticides to farmers through co-operatives has come for a good deal of criticism. The cultivators are suspicious of co-operative societies; they somehow feel that they are merely a device to take away their land from them. One feels acutely the absence of trusted leadership in our rural areas.

Farm Productivity

Slogan mongering is the essence of democratic socialism. But still, if we are keen to achieve a national economy with respect to the basic needs by the end of the fifth Plan, then, all possible efforts must be made not only to bring co-ordination at various levels but also to raise agricultural productivity. It is interesting to point out that whatever increase in farm production has taken place during the last decade has been largely due to an extension of the area under cultivation. The increase in productivity is stated to have played a limited part. Between 1949-50 to 1960-61, agricultural production had increased only by 3.8 per cent per annum while the annual rate of increase in area had been 2.08 per cent. Thus, the increase in productivity was a mere 1.54 per cent. The various measures which have so far been taken to increase agricultural productivity and to educate the cultivator with the latest techniques of crop cultivation have not met with complete success because the staff at the village level does not possess the requisite qualifications. It lacks in proper leadership and initiative and also the responsibility and authority to carry out the tasks allotted to it. Until the level of village level worker and other extension staff is raised the chances of quicker implementation of the schemes to increase agricultural production will remain poor. The human factor at the village level particularly has become the weakest link in the administrative set-up dealing with the agricultural production and it is this link which needs to be strengthened.

WINDOW ON THE WORLD

U.S. Big Business in Europe

From Our Special Correspondent

PARIS :

CASES OF RESISTANCE to American take-overs of Common Market firms have several times been reported from France; the latest (and the affair is not yet settled) concerned an officially inspired bid to foil General Electric's entry into the computer firm, Machines Bull. It is less commonly known that more discreet efforts in the same sense (more discreet because not overtly backed by the authorities) are being made in West Germany, where the massive dollar invasion has at last aroused misgiving. Dr. Abs, the Federal Republic's leading banker, certainly had in mind the Americans when he deplored lately that foreign investments in that country were eight times as great as West German investments abroad and suggested that a "more healthy" balance should be sought. The business community is of a like opinion, and Bernd Huffschmid reports in 'Documents', a review of German affairs, several instances of its resistance to some forms of American investment. The most notable case relates to the Socony Mobil Oil Company's attempt to secure control of the Gelsenkircher Bergwerks, AG, which produces 16 million tons of coal and refines 5 million tons of oil annually, and is thus West Germany's biggest enterprise in both fields.

The German firm had just taken over the chain of Aral petrol pumps, again the country's biggest, when Socony started buying stock with the objective of gaining a majority. Economic nationalism has been less touchy in West Germany in recent years than in Gaullist France, but even there no one was enthusiastic about the prospect of the giant American cartel getting control of so large a share of the country's power industries. A counter-offensive was launched (one cannot say with what backing exactly) and Socony's takeover appears to have been checkmated. Huffschmid cites other instances, concerning less substantial German enterprises, where an identical reaction in the face of American investment prevented controlling interests passing into foreign (i.e. US) hands. If the Government in Bonn still maintains in theory its open-door policy on American investment, business men have become more skeptical about the consequences of this liberalism.

Inferiority Complex

These measures of self-defence against the dollar invasion may seem to reflect an inferiority complex among European firms vis-a-vis their American competitors. One can only say that such a complex would be perfectly justified. The CNPF, the French employers' association, is preparing a study of the relative strength of Big Business in the two sides of the Atlantic which will amply prove the point. It shows that the financial resources, productivity, installed capacity and technological ability of the big American corporations are so immensely greater than those of even the biggest Common Market firms that the certain upshot of John Kennedy's "grand design" for an abolition of tariff barriers would be the economic colonisation of West Europe.

For example, there are 49 American firms whose sales volume (in 1962) exceeds $1,000 million, whereas there are only 14 firms in the rest of the world that achieve that turnover (six of them in West Germany, three in the UK, and two are the Anglo-Dutch combines, Unilever and Royal Du'ch). The biggest firm in West Germany is smaller than the top 28 firms in the USA, while the biggest French company would be number 50 in the US hierarchy. General Motors' sales equal those of the top 13 West German companies rolled together, and are a tenth greater than the gross national product of Holland; its profits alone exceed Renault's sales. Yet, in terms of labour employed, there are more big firms in West Europe than in America: 48 companies here employ over 50,000 people, against 34 in the USA. In other words, the productivity of American industry is notably superior.

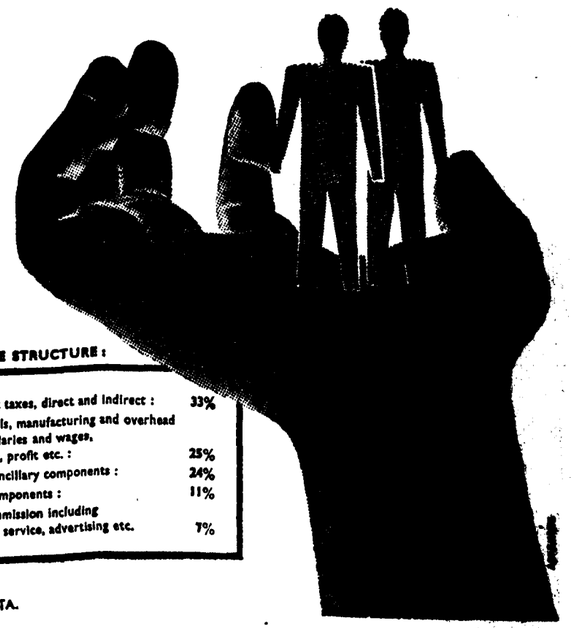
Moreover, American Big Business is getting bigger year by year, despite the anti-trust legislation, whereas the concentration of Common Market enterprise is just beginning timidly. In the past 15 years, the top 200 firms in the USA have increased their share of industry's total sales volume from 30 to 40 per cent. When European firms show signs of nervousness about competing with this race of giants, they are simply being realistic. Apart from the sheer size of the American corporations, with all it implies in human and financial resources, there is the fact that most of them are more diversified than European firms, so that they can well afford to spread their risks and conquer markets by suffering temporary losses in one field that are amply compensated in others. For instance, some one has calculated that if General Motors gave away for free all the automobiles its subsidiaries manufacture in Europe, it would still show an impressive profit.

Research Programme

Securely based on the world's biggest and oldest "common market", the USA itself, endowed with solid protection both overt and indirect, and regarding export business as a mere sideline (exports are 5.2 per cent of American GNP, against over 20 per cent for West Germany or Britain), these mammoths could eat European industry without bothering to spit out the bones, if, as the Kennedy Plan innocently suggests, the Common Market were disarmed by a halving of its already low tariffs. They are investing 3 per cent of the USA's national income in research, against 1 per cent of this side of the water; their Government finances 25 times as much research as does a big European country like France; the firms themselves spend 20 times as much on developing new products as do comparable European companies; and their ownership of the bulk of patents required by modern industry reflects their large technological advance.

Naturally, none of this is regarded as sinful by the European firms who insist on those facts; they are not drawing up an indictment of Big Business, and want nothing so much as to imitate the gigantic American corporations. That is indeed one of the objects of the Common Market, which by creating a community of business interests should hasten the concentration of European industry. But that is where the dangers of the dollar invasion come into the picture. The fusion of European firms is extremely difficult, because it entails the surrender of national traditions and family interests; and the gradual abolition of tariff frontiers does not, all at once, wipe out historical boundaries and archaic mentalities. That such fusion will occur is sure, but it will take a decade or two before it produces units of a size comparable with the American corporations. Now, in those circumstances, the American corporation that offers to manage the process of fusion under its aegis has considerable advantages. One knows of literally a score of cases where small and old-established Continental firms could not agree on the terms of a merger, but willingly signed away their independence when

THE AUTOMOBILE INDUSTRY . . . .



Each vehicle produced offers opportunities for employment of twelve to thirteen persons in the manufacturing, servicing and operational functions of the automobile and road transport industry. In the U. S. A. where the automobile industry is highly developed, one out of every seven wage earners is connected with the automobile industry.

As the automobile industry develops in India, more ancillary industries spring up. As the road transport system takes root, a more intensive movement of men and material takes place. As the communication net-work expands, the country's planned programme of agriculture and community development, irrigation and power, small scale and large scale industries proceeds apace. All these help vastly increase the employment potential in the country.

The automobile industry thus not only opens up opportunities for greater employment, but the income of those employed becomes a source of revenue to the Government. Apart from this, a considerable portion of the price of a motor vehicle goes to the Government in the form of direct and indirect taxes. In the case of the Hindusthan Ambassador car, for instance, this amounts to 5140 rupees or one-third of the "on the road" price of the car in Calcutta. The revenue thus realised helps public works projects to develop and expand the employment potential.

Besides boosting its direct employment, the automobile industry creates increasing opportunities for employment in the ancillary as well as other basic industries.

a boost to employment in India

THE AUTOMOBILE INDUSTRY IS A KEY INDUSTRY

CAR PRICE STRUCTURE :

Government taxes, direct and indirect :	33%
Raw materials, manufacturing and overhead expenses, salaries and wages, depreciation, profit etc. :	25%

an American company volunteered to pilot the combined venture.

Investment of that sort deserves to be put in a class apart. What it brings with it is not so much capital and know-how (these were available in adequate amount in the scattered European firms, taken jointly) as a purely psychological factor: the Americans treat the Common Market as a unit and provide the leadership that the dispersed Europeans have not yet managed to evolve for themselves. The desired concentration occurs — but it is no longer a pooling of European resources that could compete with American industry, but an incorporation of European industry into the empire of an American company.

Stimulus to Investment

It has been argued that the stimulus to American direct investment in Europe is the Common Market's external tariff: US firms wished to invest behind it to ensure that their exports were not disadvantaged. It was then deduced that if that tariff were lowered, in the Kennedy Round, the incentive to such investment would diminish and US firms would prefer to manufacture at home and export to Europe. This would mean that the Europeans had a choice of being dominated in either of two ways: either by an invasion of dollar capital, or, if they reduced their tariffs, by an invasion of goods made in the USA. But the type of investment just referred to, where the American corporation provides nothing but the catalyst for a merger of European firms under its wing, suggests that no such choice might exist: there is the danger of both forms of domination coinciding. Even when European tariffs were so low that it was profitable to export from the USA, there would still be profits for American corporations in managing the concentration of outclassed Continental firms.

It is against this background that one must consider growing European disquiet about the volume, and the direction, of the dollar invasion, and European reluctance to swap "equivalent" tariff concessions at the Geneva negotiations. Given the vast disproportion between the dimensions of American and Continental business, the free movement of capital and freer trade in manufactures both lead to a very unequal struggle. If the Common Market succeeds in generating the desired growth and concentration of European industry, the latter would be ready and able to meet the American challenge in a decade or so. But at this stage it definitely is not. Hence of course the American urgency to establish an "Atlantic partnership", before the European "partner" really exists as an entity. The fact has long been obvious in certain industries such as automobiles (where General Motors and Ford subsidiaries are the biggest gainers from European unification), but it is now clear that the whole Common Market could turn out to be of more benefit to US corporations than for local enterprise.

The Kennedy Round

ASHOK V. DESAI

OXFORD:

AFTER SIX WEEKS of preliminary speech making, the ministerial meetings began in Geneva on May 4. This may be taken as the beginning of business. The Kennedy round, which will be the main item on the agenda, has been discussed publicly as well as in the GATT for many months. The ministers will now have to decide whether they can reach an accord on it, or work out how they can evade an agreement without appearing saboteurs.

The positions around which discussions will take place are well known. The American proposal, which has the support of the EFTA, is for a straight 50 per cent cut in tariffs on industrial products. The EEC Commission wishes to make an exception of the products on which its tariff is less than half that of the US or UK: it would reduce its tariffs on such products by not more than 25 per cent against a 50 per cent cut by them. This treatment of disparities has to be reciprocal, and this has put the EEC in some difficulty, for the more disparities it can claim under a formula, the more disparities other countries can claim against it. Just before Christmas the EEC statisticians had hurriedly worked out a new formula which would permit EEC to claim disparities for some 1000 out of the 2300-odd items on its list of industrial imports. But they failed to notice that it would also permit the United States to claim disparities for about a third of its imports. This formula appears to have been dropped since; under the present one the EEC claims the right to invoke disparities for some 750 items covering a fifth of its dutiable industrial imports.

Obviously, any disparities formula would raise difficulties where the tariffs of non-EEC countries differ greatly among themselves. How the EEC would like to deal with them is o'l cure, perhaps even to the EEC. The general intention seems that where the EEC has invoked a disparity, it would concede a low-tariff third country the right to reduce its tariff by less than a half after bilateral negotiations.

The American tariffs are particularly higher than European ones on chemicals and some capital goods: it is an historical accident that the EEC tariffs on these items fall mostly in the 40-80 per cent range while the American tariffs exceed 80 per cent. Both give substantial and reliable protection to home industries. The EEC wants the USA to reduce the protection to these industries without much of a 'quid pro quo' from other countries. The tariffs concerned are so high that it is doubtful whether their halving would have much effect, and the Americans probably do not stand to lose much. They are, however, very much against the bilateral negotiations which the disparities formula would engender, for the EEC is a powerful bloc and can browbeat individual third countries in negotiations; it can also, by dragging out negotiations, escape having to reduce its tariff altogether. For the same reasons, the EEC is fond of bilateral negotiations, and most countries outside the EEC are against them.

Bilateral Negotiations

The United States have offered to accept the disparities formula on the condition that it would not apply against the US and the UK (a) where a third country is major supplier to the Community, or (b) where the EEC tariff is under 10 per cent. The EEC stands against such automatic criteria and insists on bilateral negotiations to deal with third-country problems. This is the crux of the disagreement, and at present there is no prospect of accord.

This does not worry the EEC much; what does worry it is that nearly everyone else is against it, so that it is likely to be blamed for an eventual failure. The public relations of the EEC are none too good at the moment, and unlike de Gaulle, the EEC Commission does worry about its image. Hence feelers have been sent out of Brussels in the last few weeks suggesting favourable compromises with third countries. A special envoy was sent to London in the last week of April; apparently, however, these moves have had no results hitherto.

On agricultural products, the American and EEC positions are even more at variance. Broadly speaking, the EEC prefers stabilisation at high support prices which will enable it to

produce much of its agricultural requirements, and quotas to be negotiated every three years so that it can control its imports and keep them marginal. The USA wishes to be the main supplier of agricultural products to the EEC, and is therefore against both high support prices and discretionary quotas.

National interest, which is reflected so clearly in the positions taken up by the USA and the EEC on agricultural products, is also implicit in the case of industrial products. For many years since the war, the United States had a chronic payments surplus with Western Europe which led to much grumbling against American tariffs and to the coining of the slogan "Trade, not aid". As it happened, this surplus vanished just before the foundation of the Common Market, and there has since been an equally persistent payments deficit. Since 1960, the EEC countries have been reducing tariffs between themselves, and this has probably directed some of their demand for American exports to sources within the Community, worsening the American balance of payments still further. This has exercised the Americans significantly, and inclined them towards a reduction of tariffs between the EEC and the USA to neutralise the effect of the intra-EEC tariff reductions. This idea was put forward by President Kennedy as a part of a plan for an Atlantic partnership. It was, therefore, anathema to those who wished to forge an exclusive association out of the EEC, and there is inevitably much opposition in the latter to its dilution through lower external tariffs. Thus the American and EEC positions are grounded on their views of national interests as well as their wider political aims.

It is clear, therefore, that a compromise between them will be very difficult, and that a stalemate is the most likely outcome of the Geneva Conference. In any case, the outcome is not imminent: the last day for the submission to the GATT of offers and exceptions — lists of items on which countries are willing to cut tariffs and on which they are not — is 10th September, and a month will be given for studying these lists. Hence negotiations will not begin in earnest until October, and could well go on until next year. Tariff cuts, for what they are, will wait until 1966. The Geneva Conference almost threatens to rival the Panmunjom Conference, the Warsaw meetings between the Chinese and the Americans and the concurrent conference in Geneva on disarmament.

Automatic Limitation

It can, however, be rescued from death through boredom if the EEC can be brought to accept some automatic limitation to its treatment of disparities. Such acceptance is not quite outside the realm of possibility, seeing the strength of opinion against the EEC. This opposition has hitherto been ineffective because it has only resulted in moral pressure; it would stand a much better chance if it reflected itself in the negotiations. One form it could take would be anti-preferential duties to be levied against preferential blocs. A threat of collective tariff discrimination, especially if it were accompanied by the dismantling of Commonwealth Preference, would fix a price to the EEC for the maintenance of its present tariff levels, and give it a material incentive to reduce them. Whether such a proposal makes headway in Geneva remains to be seen.

U.K. Profits Are "Reasonable"

JOSSLEYN HENNESSY

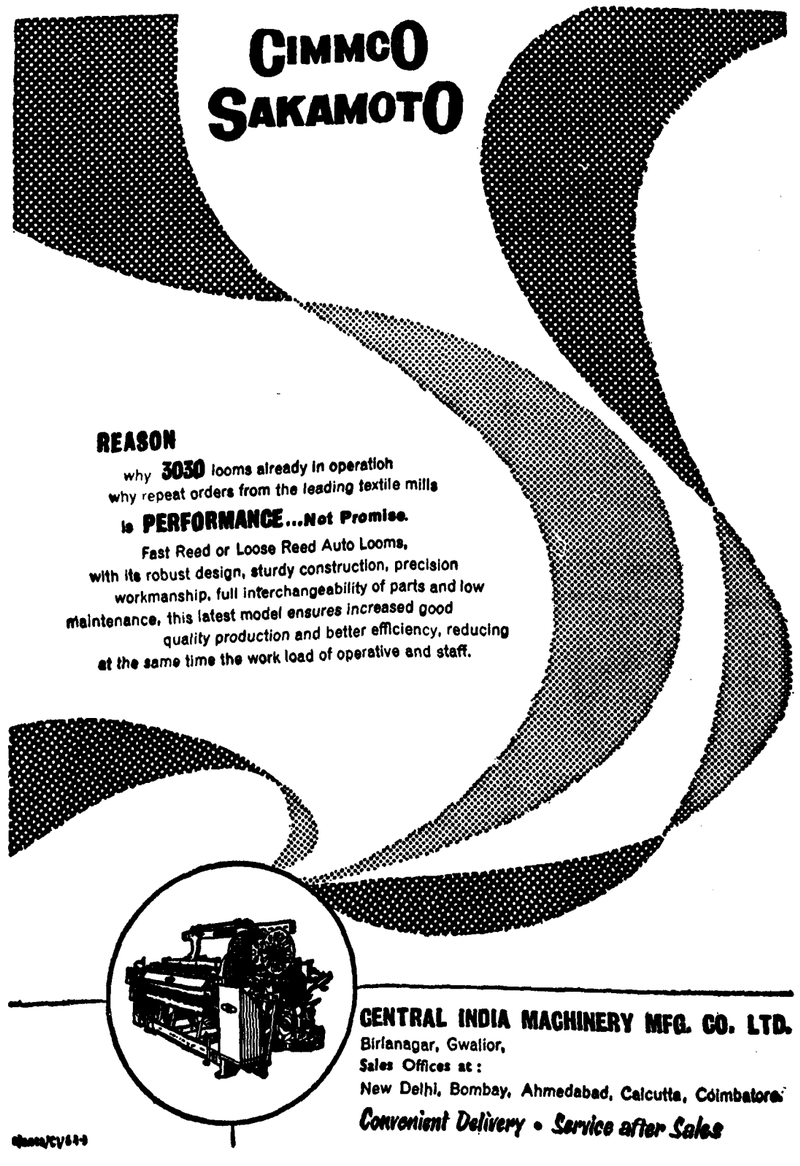
LONDON:

THE LABOUR PARTY has been criticising the increase in dividends paid out by UK companies since 1950 and the decrease in the percentage of their profits taken in taxation. The party urges that not only should profits be taxed more heavily but that indirect taxes should be lowered rather than increased. At first sight, the facts seem to support Labour's assertions. The following table is based on Board of Trade statistics, analysing the results obtained by companies quoted on the stock exchange. The number of these companies varies from year to year, so that, e.g., the gross income of £1,728 million in 1954 was earned by 2,892 companies, whereas the gross income of £2,405 million in 1962 was earned by 1,981 companies, but the trends shown by the percentages in brackets are unaffected.

WHAT THE ACCOUNTS SHOW

£m. (Percentage of Total in Brackets)

	Gross Income	Ord. & Pref. Divds.	Interest on long-term loans	Taxation	Depreciation & other provs.	Retained in reserves
1950	1,316	307(23.3)	18(1.4)	443(33.7)	192(14.6)	356(27.1)
1954	1,728	435(25.2)	32(1.9)	531(30.7)	281(16.3)	448(25.9)
1958	2,075	529(25.5)	61(2.9)	517(24.9)	463(22.3)	505(24.3)
1961	2,478	754(30.4)	76(3.1)	546(22.0)	594(24.0)	508(20.5)
1962	2,405	758(31.5)	87(3.6)	498(20.7)	625(26.0)	438(18.2)



The decline in percentage of gross income taken in taxation undoubtedly reflects the Conservative government's deliberate decision to give industry incentives to increase its investment. Note that the percentage of income devoted to "depreciation and other provisions" rises as the percentage taken in taxation falls.

While the table shows that gross profits have risen by 83 per cent between 1950 and 1962, what it does not show is the relation between profits and the assets employed in earning them. As Mr. Harold Wincott, the well-known financial commentator, pointed out in the London "Financial Times" recently, whereas gross income represented 20 per cent of gross assets in 1950, by 1961 gross income had fallen to 14.2 per cent of assets, and whereas net income was 21.4 per cent of net assets in 1950, it had fallen to 13.8 per cent in 1961. In 1962, the gross return fell to 13.3 per cent and the net to 12.7 per cent.

Average Reward

While the table shows that sums paid out in dividends and interest between 1960 and 1962 rose by 160 per cent, when these sums are related to the real capital employed it emerges that the investor's average reward for financing a very substantial increase in assets amounted in 1962 to 4.7 per cent gross and 5.9 per cent net, compared with 4.9 per cent and 6.1 per cent in 1950. The average company in 1950 employed gross assets of £2,379,000 to earn £476,000 and to pay out £117,500 in dividends and interest. In 1962, the average company employed gross assets of no less than £9,140,000 to earn a gross income of £1,214,000 and pay out £426,000.

The average company's extra £6,761,000 were found by its shareholders, either by direct additional investment, or by allowing profits to be ploughed back. I presume that the Labour party agrees that the investor is entitled to a return on his investment since the party plans to raise savings by means of a State Unit Trust, but the trouble is that Socialists are always irritated by the apparent impossibility of making

All tyres may look alike-BUT

there is a difference with

Firestone

the UK prosperous without allowing investors in ordinary shares to participate in that prosperity. I said "apparently" because twelve years of Conservative government seems, in fact, to have achieved the impossible! The extra dividends and interest — £308,500 — that the average company paid out in 1962 represented a gross return of only 4.5 per cent on the extra £6,761,000 assets employed. To a Socialist, this may seem a "reasonable" profit, but I suggest that it is because the Conservatives have kept profits so "reasonable" that the UK's growth rate lags behind that of Germany and other European countries. Growth comes from changing — not from existing — products and technologies. But no one is going to take the risk of investing in the new, the untried, and the unknown in hopes of a "reasonable" profit; he can get that from an old established company. The investor will only take risks if he sees a chance for highly "unreasonable" profits.

Bright Future Foreseen for U.S. Economy

GUY SIMS FITCH

WASHINGTON :

CONFIDENCE is the word that best describes the nation's economic thinking today. There is hardly a dissent from the proposition that the present expansion is sound and will continue for some time to come. This does not mean that all slow-downs, dips or recessions have been exorcised. But it does underscore the widely held view that US economic prospects, both near-term and long-term, are bright. The latest authoritative voice to be heard on this subject is that of the Twentieth Century Fund, a non-profit organization highly regarded for the soundness of its socio-economic analyses. In a report just issued, titled fittingly enough "The USA and its Economic Future", the Fund sees the nation approaching the milestone of a $1,000,000 million economy by 1975 — only eleven years from now.

Gross National Product

The Fund's study puts the gross national product (GNP) — the total output of goods and services — at $955,000 million in 1975. This would be an increase of more than 50 per cent over the present annual rate of $609,000 million. Using 1962 as a base of comparison, the study envisages gains of 100 per cent or more in such components as personal savings, industrial production and private investment in plant and equipment. It foresees increases of more than 50 per cent in such elements as exports, personal income and consumption and college enrolment, and of more than one-third in average family income. Employment would rise markedly, unemployment would decline steadily from the present 5.4 per cent to 4 per cent of the labour force, and the work week would drop from the present average of 40 hours to an average of 37 hours. Making these projected gains even more impressive is the fact that they have been calculated, where appropriate, on the basis of fixed dollars, taking into account moderate price rises that may occur in the years ahead. Thus, they promise to be real and not illusory. Can the already large and vibrant US economy grow another 50 per cent, in real terms, in the next 12 years or less? To do so would require an annual growth rate of 4.5 per cent a year, which is somewhat higher than the average for the entire post-war period. On the other hand, the economy maintained a 4.5 per cent annual growth rate in the early post-war years, and it has surpassed that rate during the current sustained expansion that began more than three years ago. This rate, moreover, has been accepted by both the Kennedy and the Johnson Administrations as a feasible long-term goal.

The Fund's projections thus appear to be well within the capability of the US economy. This capability is reinforced by recent economic developments. Over the past several years economists have become increasingly aware of changes in the US economy that can easily make for a sustained and rapid growth. These include a faster than usual rise in productivity, or output per man-hour of work; a sharp upswing in the growth of the labour force; and an increasing business interest in expanding and modernizing productive facilities. These changes are already evident. Productivity, which often tails off after an initial spurt during economic upturns, has continued to rise. It is expected to maintain an average increase of better than three per cent a year, abetted by a small but significant shift from consumption to investment in new and improved facilities and equipment. The labour force, which had been growing by about 800,000 a year has now begun to rise by more than one million a year and is expected to be increasing by 1.4 million a year by 1975. Up to now, population growth has tended to act as a drag on the economy, as the large proportion of school-age youngsters, who normally consume without producing, has held back the growth in per capita output. Now, as more youths complete school, and at generally higher levels than in the past, they will become productive workers.

As for the expected investment rise, recent surveys indicate that it may already have begun, with American business men planning to spend 12 per cent more on new plant and equipment this year than last year. Since 1957, business investment remained virtually unchanged at about eight per cent of GNP. Merely getting it up to a 10 per cent ratio would bring the investment total to the study's anticipated $100,000 million by 1965. There is another important point to be made. On the basis of past performance, the Fund's projections could well turn out to be on the modest side. Back in 1955, during an earlier period of strong economic advance, the Fund published a similar analysis entitled "America's Needs and Resources". Its assumption of a 2.5 per cent annual growth rate for the economy proved to be conservative. Its most reasonable estimate was for a 1960 GNP of $473,000 million. The actual figure, despite an intervening recession and an acknowledged lag in economic activity, was $503,000 million.

Non-Ferrous Metals in Fourth Plan

By Our Special Correspondent

NEW DELHI:

THE PLANNING GROUP set up for formulating the fourth Plan development programmes for the non-ferrous metals industry, in its interim report, is understood to have endorsed the Perspective Planning Division's view that the requirements of aluminium, zinc and lead by 1970-71 will grow to as much as 2,60,000 tonnes (including 25,000 tonnes for export), 2,25,000 tonnes and 1,45,000 tonnes, respectively. It has, however, estimated the fourth Plan-end requirements of copper at 2,50,000 tonnes, as against 2,35,500 tonnes estimated by the Perspective Planning Division.

The Group has suggested that with a view to making the country self-sufficient in aluminium, a total capacity of 2,60,000 to 3,00,000 tonnes should be established by the end of the fourth Plan period. Assuming that all the schemes already licensed, including the 25,000 tonnes capacity Madhya Pradesh Korba project, would have been implemented by the middle of the fourth Plan, yielding a total capacity of about 1,88,000 tonnes, it has recommended that a further capacity of 1,00,000 to 1,25,000 tonnes should be licensed at an early date.

The Group feels that the minimum economic unit of an aluminium smelter, to start with, should be of the order of 25,000 tonnes per annum, capable of further expansion to about 50,000 tonnes. This implies that the Group favours expansion of the already licensed units during the fourth Plan period, depending on the availability of essential raw materials. In view of the importance of power in the aluminium industry, the Group has expressed doubts that unless the middlings from the coal washeries in Bengal, Bihar and Madhya Pradesh are supplied to thermal plants at practically no cost, power intensive industries, such as aluminium, may not be attracted to these areas. It, however, has recommended a further expert investigation into this matter before reaching a definite conclusion.

Zinc Projects

In regard to zinc manufacture, the Group has suggested three projects: (1) increase in the capacity of the Metal Corporation of India's zinc smelter, currently under erection at Udaipur, from 18,000 tonnes to 50,000 tonnes per annum, provided, of course, sufficient zinc ore reserves are available in the Zawar mining area; (2) expansion of the capacity of the Cominco-Binani zinc smelter, based on imported zinc concentrates, from the present licensed capacity of 12,000 tonnes per annum to 50,000 tonnes, if continued supply of imported concentrates can be ensured; and (3) setting up of another zinc smelter based on imported concentrates with capacity of 50,000 tonnes per annum. The new zinc smelter, the Group suggests, should preferably be located at a port with a fertilizer plant to utilise sulphur which will be available from the concentrates.

A similar strategy has been suggested by the Group for stepping up lead output during the fourth Plan period. The Group thinks that the combined capacity of the present 6,000-tonne Tundoo lead smelter of the Metal Corporation of India (the capacity of this unit is to be raised to 11,000 tonnes in the near future in terms of a licence granted to it some time ago) and the 12,000-tonne Binani smelter can be expanded to 50,000 tonnes by 1970-71 either with the increased availability of indigenous ore or through importing concentrates from abroad in larger quantities.

As regards copper, the Group is of the view that it should be possible to set up copper manufacturing capacity to the tune of 70,000 tonnes based primarily on indigenous ore and partly on imported concentrates. It has called for expeditious exploitation of Rajasthan's Khetri and Daribo, Sikkim's Bhotang and Dikchu, and Bihar's Rekha and Boamsideshwar copper deposits. If this is done, it feels that the following capacities can be brought into operation by 1970:

	Tonnes
1. Indian Copper Corporation (including 8,400 tonnes based on imported copper)	21,000
2. Khetri	21,000
3. Koliham (near Khetri)	10,000
4. Daribo	1,500
5. Dikchu	1,000
6. Bhotang	800
7. Rekha mines and Boamsideshwar	15,000

The Group has further recommended that the possibility of importing copper concentrates should be vigorously investigated and, if necessary, long-term arrangements may be entered into for this purpose in view of the growing requirements of copper in the country.

The Group has also made a fervent plea for substituting copper, zinc and lead by cheaper metals.

In view of the expanding requirements of magnesium and silicon, the Group has suggested that the manufacture of these two metals to a capacity of 2,000/3,000 tonnes per annum should be undertaken during the fourth Plan period.

★★

In view of the easy availability of coal and the comfortable position in regard to its transportation, the Union Government has decided to remove with effect from July 1, 1964, the distribution controls on soft coke and Grades II and III non-coking coal. From that date no distinction between Grade II and Grade III non-coking coal will be observed for purposes of supply to consumers. The relaxation shall be applicable to the entire coal production in the Singareni fields and the Grades II and III non-coking coal output elsewhere in the country, excepting Assam. Announcing this decision at a press conference here on May 19, the Union Minister for Steel, Mines and Heavy Engineering, Mr. C. Subramaniam, disclosed that if the experiment of de-controlling distribution of Grades II and III non-coking coal proved a success, he would consider a similar step in regard to Grade I non-coking coal as well. Distribution controls on coking coal, however, are not envisaged to be removed for the simple reason that this superior grade coal is being supplied only to the steel plants and its output is pegged to the requirements of the steel industry.

With the removal of the distribution controls on Grade II and III non-coking coal, the entitlement of any consumer to draw his supplies of these categories of coal from various coalfields will be determined by the zonal scheme applicable to each field and the principle of transport rationalisation currently in force. The consumers will be free to enter into agreements with the producers of their choice in their respective authorised coalfields either direct or through middlemen supplying their requirements. They shall not be required to route their applications through the Coal Controller or any other Central and State Government agency. They shall also be free to secure supplies without any quantitative ceiling.

The consumers and producers of soft coke and Grades II and III non-coking coal are being advised to finalise their agreements at an early date so that the railways can make arrangements for moving their coal in the desired manner.

Mr. Subramaniam also disclosed at this press conference that a four-member Expert Committee had been set up for deciding whether the proposed west coast steel plant should be located at Goa or at Hospet. The Committee is expected to report its choice by the beginning of July. This project has gained a slight edge over the one proposed for the Visakhapatnam-Bailadila area and, therefore, may be included in the fourth Plan as a steel manufacturing unit. The Visakhapatnam-Bailadila plant may be put up during the next Plan only up to the pig iron-making stage. The French, Japanese and American steel companies, which had evinced interest in supplying equipment for the Bokaro plant have now shifted their interest to the Goa-Hospet project as supplies for the Bokaro unit are to be made available by the Soviet Union which has promised financial and technical assistance for it. The Union Ministry for Steel, according to Mr. C. Subramaniam, will entertain the supply offers from the French, Japanese and American companies not only for the Goa-Hospet project but also for the other steel plants that are being planned, including the Visakhapatnam-Bailadila and the Salem units.

So far as the Bokaro project is concerned. Mr. Subramaniam said that a technical team from Moscow was expected here next month for detailed discussions with the Government of India. It had asked for some copies of the Dasturco report on the project and these had been despatched. The Russians have promised the use of L.D. process at the Bokaro plant. The development of the foundry/forge plant at Ranchi is likely to be stepped up as this Russian-aided heavy engineering unit will be required to make available some equipment for the Bokaro plant.

Hurdles Overcome

The detailed project report on the half-a-million tonne pig iron capacity Salem project, Mr. Subramaniam said, was expected to be ready in June. The initial hurdles in the way of establishing this third Plan project, thus, have been overcome. This unit will use lignite instead of coal as fuel. When converted into a full-fledged steel-making unit, it will be possible to manufacture some lower categories of special steels.

Mr. Subramaniam also indicated that the talks held here this week with the TISCO and IISCO representatives on the repayment of the Rs. 10 crores Government loan to TISCO and Rs. 8 crores credit to IISCO had yielded fruitful results. Although he declined to give any details of the settlement reached between the Steel Ministry and the two companies on the ground that Finance Ministry's, or even Cabinet's, approval will have to be obtained before ratifying it, he made no secret of his sense of relief that a solution to this ticklish problem had been found. The settlement, it is understood, rules out conversion of the Government loans into the equity capitals of the two companies. Interest on these loans (the loans were granted interest-free in 1956, but were made subject to an interest of 5.5 per cent in 1958) may also be waived. The repayment of the principal may be spread over a fairly long period so as to make the instalments easy. This understanding should pave the way for an early grant of World Bank assistance for the expansion of TISCO to 3 million tonnes and of IISCO to 2 million tonnes during the fourth Plan.

Mr Subramaniam is leaving in the second week of June on a four-week tour of Poland, Czechoslovakia, France and the United Kingdom. In Poland and France, he will discuss the problems of coal mining. In Czechoslovakia, he will hold discussions in respect of the projects proposed to be financed through the second Rs. 40 crore credit extended by that country for our economic development. No specific programme has yet been drawn up for Mr. Subramaniam's visit to the United Kingdom.

★★

The Planning Commission, it is understood, has cleared two projects for manufacturing briquetts from low grade coal in Bengal/Bihar and Madhya Pradesh coalfields. The two schemes are likely to be undertaken during the current Plan itself. Besides producing smokeless fuel for domestic consumption, the two coal briquetting plants will yield many valuable by-products which can be made use of for producing various chemicals.

★★

The Union Government, it is learnt, has decided to allow minority participation by foreign capital in the private sector pig iron manufacturing plants. This slight deviation from the current policy is understood to have been made with a view to stepping up pig iron production so that the installed capacity in the foundry industry can be better utilised.

★★

The Union Government has decided to enter cement manufacture in a big way. A wholly Government-owned public limited company, to be known as the Cement Corporation of India, is proposed to be floated for this purpose in the near future.

The decision has been taken in view of the fact that if acute shortages of cement have to be obviated during the fourth Plan period, an additional capacity to the tune of at least 10 million tonnes may have to be established by 1970-71.

The Corporation will be supplementing and not supplanting the activities of the private sector in the cement industry. Besides going in for cement production, it will undertake survey and prospecting of cement-grade limestone in the country, inadequate knowledge about which is thought to be one of the main factors retarding the development of this vital industry. The Perspective Planning Division, in its paper on the fourth Plan, is said to have provided an investment of Rs. 20 crores for the public sector in the cement industry.

★★

The U.S. industrial and business magnates, who visited New Delhi last month, are understood to have emphasised in their report to the Union Government that if India desired to increase the inflow of foreign investments from the present level of about $60 million per annum to over $300 million a year during the fourth Plan period, the investment climate would have to be improved considerably and made comparable to that prevalent in the other foreign countries which are competing for U.S. capital. The team has suggested a 10-point programme for promoting confidence amongst foreign investors. The ten points are:

(1) Acceptable return on capital employed as compared to competitive opportunities outside India;

(2) Acceptable level of foreign participation in equity and management control, commensurate with contribution of foreign exchange and "know-how";

(3) Reasonable amortisation and dividend policy with greater freedom to reinvest locally for expansion, technological and quality improvement;

(4) Minimum import duty and other controls to assure minimum unit investment and operating costs;

(5) Need for investment in both manufacturing and distribution in relation to regional demand;

(6) Freedom to select raw material sources consistent

with commercially competitive pricing and impact on foreign exchange;

(7) Flexible product pricing policy consistent with acceptable return on investment;

(8) Stable, simple and equitable tax and depreciation policy, avoidance of retroactive tax;

(9) Adequate staffing by foreign technical experts and managerial talent; and

(10) Expeditious approval procedures, based on well co-ordinated planning with equitable allocation of capacity to the foreign private investor.

★★

At its meeting held here on April 18, the Export Inspection Council of India decided that exports of vegetable oils, turmeric, onions, garlic, ginger, potatoes and mushrooms should be brought under the compulsory pre-shipment inspection scheme during the next few months. It also resolved that the voluntary pre-shipment inspection scheme currently in operation for frozen fish, shrimps and sea food should be made compulsory with effect from August 1, 1964. In the case of jute goods exports, the Council decided that the compulsory pre-shipment inspection scheme should be introduced with effect from December 1, 1964. It suggested that the Jute Commissioner should make necessary arrangements in this regard in co-operation with the jute industry.

Testing Facilities

The Council urged that some technically qualified personnel should be engaged to help in setting up a chain of laboratories and test houses throughout the country so that any manufacturer or exporter who wanted to get his products tested could get these facilities at hand. The establishment of laboratories and test houses throughout the country, the Council opined, should be considered as an integral part of the quality control and inspection activity. It approved a four-tier system of laboratories, namely, Central Laboratories, Regional Laboratories, Technical Universities and Research Institutions, and private specialised test houses and agencies for quality control and export pre-shipment inspection.

The Council also emphasised the role of packaging in boosting exports and expressed the view that pre-shipment inspection for exports should also include checking of packaging. The Institute of Packaging, which the Union Ministry of International Trade proposes to establish at Madras, the Council suggested, should co-ordinate its activities with those of the Council.

The Minister for International Trade, Mr. Manubhai Shah, who inaugurated the meeting, emphasised the need for quality control and stated that one of the most important requisites for stepping up exports was the maintenance of quality. He called for a pragmatic approach for introducing pre-inspection in the case of all important export commodities. The particularly sensitive export items, he opined, should be brought under the compulsory pre-shipment inspection scheme at the earliest.

★★

Czechoslovakia has extended another credit of about Rs. 40 crores for India's economic development. An agreement to this effect was signed in Prague last week.

A sum of Rs. 26 crores out of this new credit is to be utilised for financing (i) the expansion of boiler plant at Tiruchirapalli and the Heavy Electrical Plant at Hyderabad, (ii) the setting up of additional foundry and forge facilities at the existing foundries, and (iii) the establishment of two new machine tools plants, one tractor and power tiller factory and one 220 mW power unit. The remaining Rs. 14 crores are to be used for financing imports of components required by the ventures having Czech equipment.

The credit will be repayable in rupees which will be utilised by Czechoslovakia for importing Indian goods. The repayment period for the Rs. 26 crores credit tied to projects has been put at 12 years. The Rs. 14 crores loan for financing imports of components is to be repaid in 8 years. The entire credit carries interest at the rate of 2½ per cent per annum.

★★

The Delhi Study Group has instituted an essay competition with the object of encouraging research on current economic and political problems. Three prizes of Rs. 500, Rs. 300 and Rs. 200 will be awarded to the best writers. The first subject chosen for the competition is the "Role of Incentives in a Developing Economy". The essay is required to be of 2,000 to 5,000 words. The entries are to be addressed to the Convenor, Delhi Study Group, Baird Road Flat No. 4, Lady Hardinge Road, New Delhi, by July 15, 1964. A three-member panel, consisting of Prof. M. Mujeeb, Vice-Chancellor, Jamia Millia Islamia, New Delhi, Mr. G. Rajagopalan, General Secretary, All-India Congress Committee, and Mr. V. Balasubramanian, Editor, "Eastern Economist", has been constituted to act as judges.

Campaign to Produce More

From our Correspondent

BOMBAY:

AS A PART of the plan for increasing agricultural productivity, the Maharashtra Government has launched a massive kharif campaign. Announcing the details supplied to the press, Mr. P. K. Sawant, the Agriculture Minister, said that credit facilities would be provided to all cultivators, irrespective of whether they were members of co-operatives or not, as the Government was anxious that every cultivator should participate in the campaign. Coming within the purview of the campaign will be 50,000 acres of paddy-growing area, 62,47,000 acres under jowar, 40,56,000 acres under bajra, and 50,000 acres under **nachni**. The total area under paddy cultivation in the State is 22,43,000 acres. The area in respect of other crops is as follows: 62,47,000 acres under jowar, 40,55,000 acres under bajra, and about 5,00,000 acres under **nachni**. The average yield per acre is 760 lbs. of paddy, 525 lbs. of jowar, 299 lbs. of bajra and 631 lbs. of **nachni**. The campaign will be devoted to raising paddy seedlings on raised beds, treating the jowar seed, free supply of fertilizers for **nachni** crop and controlling menace of 'aphids' on jowar.

★★

The inadequacy of the road transport system to cope up with the development of the State has been brought to the attention of the Maharashtra Government by the Bombay branch of the Indian Roads and Transport Development Association, in a studied memorandum. A review of the existing road facilities in the State shows insufficiency in road milage and disproportions in road densities in various regions of the State. Road development in the State has lagged considerably behind even the modest 1943 Plan. In 1961, the State had only 23,876 miles of roads, as against the Nagpur Plan target of 44,700 miles by 1963 — the shortfall being particularly high in divisions like Aurangabad. For every 100 square miles of area, Maharashtra has just 27 miles of road (1961), as against the all-India average of 36 miles. The State lags far behind West Bengal, Kerala, Bihar and Madras. The Association has stated that in view of the magnitude of the shortfall in

road milage, road construction targets in the State will have to be considerably stepped up if the Chief Engineers' 1961-81 Road Plan of 34,800 miles is to be achieved on schedule. The proposed phasing of 20-year Road Plan for the State is an addition of 6,700 miles during 1961-66 and 7,700 miles during 1966-71, on construction or improvement of the road system.

To overcome the inadequacy of roads in the State, the National Council of Applied Economic Research recommended a revision of the phasing of the Chief Engineers' Plan — to 8,700 miles during the current Plan, and 10,500 miles during the fourth Plan and an expenditure of Rs. 129.5 crores on roads and bridges during the 10-year period from 1961-71. The Association has also observed that, if roads are widened and modernised to permit the operation of heavy vehicles and truck-trailer combination, the cost of road transport can be reduced by about 40 per cent. It has recommended that the intensity of traffic, which the roads will have to carry in the next 20 years, should be studied and an assessment made of the following factors: (1) How far the improvements now proposed are inadequate for the present traffic needs; (2) what additional strengthening and modernising as also bifurcation into separate stretches for incoming and outgoing traffic in the ghats or other portions will be necessary in order to serve the traffic envisaged; and (3) the total cost involved in carrying out such recommendations.

★★

There are hilly areas in Maharashtra which have so far remained untouched by the three five-year Plans. At the Mawal (hilly) Development Conference opened by the Home Minister, Mr. D. S. Desai, the need for the all-round development of the Mawal (hilly) region in the State was emphasised. The Mawal region was spread over seven districts of the State with a population of three to four millions. In fact the problems are the same as of **Adivasis** in other States and apart from the balanced development of the region, the characteristics of the population, their needs, and adaptability to specific programmes may have to be examined separately. Whatever development had taken place in the area in the form of river valley projects had brought hardships, rather than benefits, to the people of the area. The reason was that not only cultivable land but even forest areas, which constituted an important source of livelihood of the people, had been submerged under the lakes created by such projects. The Minister, however, assured the people that attempts would be made to provide them with gainful employment in small industries. In its resolutions, the conference demanded: (1) top priority in the fourth Plan for the laying of roads and development of other means of communications in the area; (2) the undertaking of contour bunding, **nullah** bunding and small irrigation projects in the area; (3) development of village industries in the region; (4) provision of alternative lands to the people displaced by the construction of dams; (5) provision of facilities for drinking water in the villages; (6) a long-term plan for afforestation of the barren hills in the region.

★★

The housing shortage, despite the fast pace of construction, has become acute in the State, particularly in the Bombay area. The Union Government's Study Group, which discussed this problem with the Minister for Housing, focussed thought on three important and major requirements, viz., a larger allocation for housing in the fourth five-year Plan; a cheaper cost of construction to provide for more tenements and higher subsidies for schemes to house industrial workers, slum dwellers and economically weaker sections so as to reduce rents. The question of expediting the land and cement availability was also examined. The housing programme of the State Government has recorded significant progress and the Study Group, after visiting some of the colonies constructed by the Housing Board, complimented the State Government on the satisfactory results of their effort. The Housing Minister intimated the Group that he would even accept centrally sponsored housing schemes, if there were sufficient safeguards in the event of a national or State Emergency. The advantage of a Central Scheme was that the amounts allocated for housing which remained unspent by some States could be diverted to other States which were capable of spending more on the projects.

The Minister disclosed at another occasion that the Centre had responded to his appeals for more cement to the State in the pre-monsoon months when the demand was at its peak. The State required 500,000 tons of cement every quarter. Maharashtra will now get an additional **ad hoc** increase of 25,000 tons, for the quarter ending June 1964, bringing the total allocation for the quarter to 181,000 tons.

★★

Mr. Satya Narain Sinha, Union Minister for Information and Broadcasting, revealed at a reception given to him by the All-India Radio Merchants' Association that television might come to India sooner than most people expected. A Scottish firm and Philips Radio manufacturers had offered to collaborate in the introduction of television in India. Both offers were attractive, chiefly because they involved very little expenditure of foreign exchange, which had so far been the main hurdle in the introduction of television in India. Should these offers materialise the projects would be undertaken in the private sector. It had been made clear that the price of television sets should be well within the reach of the middle classes. According to the report of a study team, a large number of the existing radio sets, particularly in villages, were lying idle for want of facilities for repairs. He suggested that the trade should find some way to provide these facilities to villagers, which would ultimately benefit the trade.

★★

Mr. O. V. Alagesan, Minister of State for Petroleum and Chemicals, emphasised the need for cost consciousness in the utilisation of plant and machinery and employment of men in the major projects. This was particularly so in projects like fertilisers, which are basic to agricultural progress in the country. Addressing the employees of the Fertilizer Corpo-

"Now, who will get the chance to head the next committee on the same subject?"

ANNOUNCEMENT OF PUBLIC ISSUE.

(This is not a Prospectus but only an announcement of the proposed issue of Equity Capital. Interested persons may obtain copies of the Prospectus from the Company's Registered Office, Underwriters, Brokers and Bankers.)

HINDUSTAN POLYMERS LIMITED

(Incorporated under the Companies Act 1 of 1956 on 29th November, 19[illegible] as a public company *limited by shares*)
(Registered Office : C/o. Shree Ram Mills Limited, Fergusson Road, Lower Parel, Bombay-13)

EXISTING AND PROPOSED ACTIVITIES

The Company proposes to establish at Visakhapatnam in the State of Andhra Pradesh, a plant (i) for the manufacture of 1.5 million gallons per annum of Power Alcohol (ii) with the technical collaboration of Universal Oil Products Company Inc., Des Plaines, Illinois, U.S.A. for the manufacture of 10,000 tons of Styrene Monomer per annum, and (iii) with the technical collaboration of B. X. Plastics Limited, Higham's Park, London, E. 4, England, for the manufacture of 7,500 tons per annum of Polystyrene and its Co-polymers including high impact by a continuous mass polymerisation process.

LOCATION OF INDUSTRY

The location of the proposed plant, well-served by National Highways, Railway Transport and other essential facilities will be on a site [illegible] 30 acres at Visakhapatnam Andhra Pradesh).

SHARE CAPITAL :

AUTHORISED CAPITAL :		
3,00,000 Equity Shares of Rs. 100/- each.	Rs.	3,00,00,000
2,00,000 Unclassified Shares of Rs. 100/- each.	Rs.	2,00,00,000
Total	Rs.	5,00,00,000
ISSUED CAPITAL :		
3,00,000 Equity Shares of Rs. 100/- each.	Rs.	3,00,00,000
SUBSCRIBED CAPITAL :		
(i) 610 Equity Shares of Rs. 100/- each subscribed by Subscribers to the Memorandum of Association, Directors, their relatives, friends and associates on which Rs. 50/- per share have been paid up.	Rs.	61,000
(ii) 30,000 Equity Shares of Rs. 100/- each subscribed by Shree Ram Mills Limited, Bombay, a promoter of the company on which Rs. 50/- per share have been paid up.	Rs.	30,00,000
Total Subscribed Capital	Rs.	30,61,000
PAID-UP CAPITAL :		
(i) 610 Equity Shares of Rs. 100/- each subscribed by and allotted to the Subscribers to the Memorandum of Association, Directors, their relatives, friends and associates which Rs. 50/- per share have been paid up.	Rs.	30,500
(ii) 30,000 Equity Shares of Rs. 100/- each subscribed by and allotted to Shree Ram Mills Limited, Bombay, a promoter of the company on which Rs. 50/- per share have been paid up.	Rs.	15,00,000
Total Paid-up Capital	Rs.	15,30,500
OUT OF THE ISSUED CAPITAL :		
(i) 30,000 Equity Shares of Rs. 100/- each have been subscribed by Shree Ram Mills, Limited, a promoter of the company, (on which they have paid up Rs. 25/- per share) and the same will be allotted to them.	Rs.	30,00,000
(ii) 51,990 Equity Shares of Rs. 100/- each have been subscribed by the Promoters, Subscribers to the Memorandum of Association, Directors their relatives, friends and associates (on which they have paid up Rs. 25/- per share) and the same will be allotted to them.	Rs.	51,99,000
AND 60,000 Equity Shares are RESERVED FOR SUBSCRIPTION as follows :—		
(iii) 20,000 Equity Shares of Rs. 100/- each are reserved for subscription in cash at par by The Industrial Credit & Investment Corporation of India, Limited, Bombay (hereinafter referred to as ICICI).	Rs.	20,00,000
(iv) 20,000 Equity Shares of Rs. 100/- each are reserved for subscription in cash at par by Commonwealth Development Finance Company Limited, London, England (hereinafter referred to as "CDFC") subject to the conditions of the Head of Terms (contract No. 3 below).	Rs.	20,00,000
(v) 20,000 Equity Shares of Rs. 100/- each are reserved for subscription in cash at par by Bakelite Xylonite Limited, London, England.	Rs.	20,00,000
Total	Rs.	1,41,99,000

It is a condition of the Consent of the Controller of Capital Issues that shares privately allotted to the Directors, Promoters, their friends, etc. shall be retained as a long-term investment and shall not be disposed of within a period of one year from the date of allotment.

NOW OFFERED AT PAR FOR CASH FOR PUBLIC SUBSCRIPTION :

1,22,400 Equity Shares of Rs. 100/- each.

NOTE : The total Issued Capital of 3,00,000 Equity Shares of Rs. 100/- each is made up as follows :—

Subscribed Capital.	Rs.	30,61,000
Reserved for Subscription.	Rs.	1,41,99,000
Offer for Public Subscription.	Rs.	1,27,40,000
Total	Rs.	3,00,00,000

BOARD OF DIRECTORS :

1. Shri Kasturbhai Lalbhai, (Chairman), Business & Industry, S/o. Lalbhai Dalpatbhai, Shahibang, Ahmedabad.	Director of : 1. The Atul Products Ltd. (Chairman). 2. The National Rayon Corp. Ltd. (Chairman). 3. The Hindustan Motors Ltd. 4. The Industrial Credit & Investment Corporation of India Ltd. 5. The New India Assurance Co. Ltd. 6. The Ahmedabad Electricity Co. Ltd. 7. ration of India at Trombay, he observed that the public sector projects should think of millions of consumers whom they serve and for whose benefit they exist. He was happy that the biggest nitrophosphate plant in the world, which is being erected at Trombay, would go into full production early next year. He expressed the hope that the Fertiliser Corporation would be able to sell nitrophosphate at competitive prices to cultivators vis-a-vis the imported nitrophosphate. The Trombay unit of the Fertiliser Corporation of India would be producing 90,000 tonnes of nitrogen in the form of urea and nitrophosphate. The trial production is expected to start by October and the project would go into full production by January next year. The Trombay unit is proposing to employ only operators and technicians and not helpers to assist this category of men as is done elsewhere in the country in both the public and the private sectors. He wished the experiment every success and felt that it would blaze a new trail in the history of Indian industry.

What Price Food!

From Our Correspondent

CALCUTTA:

A SUDDEN SPURT in food prices in West Bengal and Bihar at this time of the year when they are normally low, has upset all calculations about maintaining reasonable stability in the foodgrains market in these two States. In West Bengal particularly, this has caused panic among consumers and uneasiness to the Government. Early this year, the West Bengal Government had been busy publicising the figures about a bumper rice harvest in the State and the arrangements it had made to import a substantial quantity from the neighbouring State of Orissa. Simultaneously, it had fixed prices for various grades of rice — at the wholesale and retail level — in the fond hope that the market would stick to the prescribed rates throughout the year. The abrupt rise in food prices at so unseasonally early a period in the year has caught the Government on the wrong foot. For the Government finds that apart from sending its police officials to raid wholesalers' godowns and rich farmers' stocks in the countryside, there is very little else it has the resources to do. Rice dealers here and there have been arrested and in some cases fined by a court of law for exceeding the prescribed margins, but the prices in the retail market remain high, much above the rates fixed by the Government.

Laughing Stock

At one time, the Government was threatening to take over the entire wholesale trade in rice. The rice traders laugh at this threat. At the very least, it will involve at least Rs. 250 crores to take over the entire rice trade in the State, and money apart, the State Government simply has not the machinery to undertake a work of this kind. It has not even succeeded in procuring much rice from the surplus districts because it does not have enough staff to check the land records of the rich farmers to determine as to what should be the surplus stock with them after meeting their norml requirements. At the moment the Government feels baffled by the problem. The Central Government which has been giving much moral support should come to West Bengal's help by rushing in more supplies of food. For in the ultimate analysis, it is a lack of balance between supply and demand which is responsible for the present crisis. Some cornering of stocks may have taken place, but the Government cannot fight them only by police action. If it can build up sufficient stocks and the machinery to run an efficient channel of distribution in competition with private trade, particularly in times like the present, then the elements whom the Government blames for the price spurt will have little scope for their activities. The Government of Bihar is reported to be pressing the Centre to increase food supplies to the State rather than trying to fix prices and enforce them through police action. The latter course only tends to drive stocks underground, as in West Bengal's case it has, and the consumer suffers more.

On grounds of population and the lack of sufficient cultivable land within the State, West Bengal is entitled to a greater measure of assistance from the Centre in such matters as food and finance. A panoramic study of the State's current problems made by the Indian Chamber of Commerce and published in booklet form with due reference to the historical background, shows in clear detail how unmanageable they have been growing day by day. First of all, the population problem. This is also the problem of India as a whole, but this is being felt in this State particularly acutely. As is well-known, West Bengal has the second highest density of population in India (second only to Kerala) — 1,032 per square mile, which is about three times the all-India average. The density however varies widely, depending on the state of development — it is only 539 in Darjeeling district which is relatively inaccessible and where the soil is comparatively infertile, but the figure moves up sharply to 9,000 in the industrial belt of the Bhagirathi-Hooghly area, and then to as high as 73,000 per square mile in Calcutta district. The problem is aggravated by a comparatively high birth rate, which was 18.6 per thousand in 1961. (Over the first sixty years of the current century, the population of the State has sharply moved up to 34.9 million in 1961 from only 16.9 in 1901 and only 26.3 million a decade ago).

West Bengal is most highly developed from the industrial point of view. Yet 53.8 per cent of the population is dependent on agriculture and allied activities as against the all-India average of 69.5. On manufacturing, household industries and construction depend 21.9 per cent of the population of the State; on trade, transport and commerce 10.9 per cent and on other services 13.4 per cent. The all India averages for these occupations are 14.5 per cent, 5.7 per cent and 10.3 per cent respectively. But if Calcutta and Darjeeling areas are taken separately for studying the distribution of the population according to their occupation, it would be found that more people are engaged in commerce than in industry; the bulk of the population depending on non-agricultural pursuits are concentrated in these areas. Quite significantly then, food prices in these areas come under severe pressure when supply tends to run short.

Another serious problem is that of educated unemployment. With independence, education has expanded everywhere, but particularly so in West Bengal, The following comparative figures are instructive. In 1947-48, there were 1,903 high and middle schools in the State with 5.22 lakh students in them; in 1961-62 the numbers almost doubled in each case. The number of colleges has increased from 55 in 1947-48 to 138 in 1962-63 and four new universities have been established. This process of expansion of education, which also means democratisation, would normally be a healthy thing, but the economic system unfortunately has not expanded correspondingly, with the result that a considerable proportion of the newly educated men coming out every year from schools and colleges find it hard to earn a living in the way they would like to. Yet the craze for higher education is noticeably on the increase. This is because the middle classes see little hope in anything else. The late Dr. B. C. Roy tried to find a solution through further industrialisation of

the State, but in spite of the external economies and natural advantages which this State offers for new industries, there is clearly a limit to what more can be done. In the first place, the State is still short of power and secondly, the raw materials which such industries as can be started in the State require are already so short that the new ventures will find it hard to obtain their requirements. However, the industrial complex which is being planned in Haldia around the oil refinery to be built in this auxiliary port area may provide some relief to the educated unemployment problem, but it would be rash to assume that almost the entire problem will vanish with that.

The educated unemployment problem apart, the refugees, particularly the fresh influx from East Pakistan since the communal disturbances last January, have created serious difficulties for the State. The total number now present could well approach a couple of millions, but the economy of the State cannot absorb them. They have greatly added to the urban congestion as the pressure of population on land in West Bengal is already so acute that there is little scope of rehabilitating any significant proportion of the refugees in agriculture, although a majority of them come from farming classes. They create a law and order problem out of sheer frustration, and have definitely made the State's food problem worse than it might have been.

★★

The foundation stone of what is described as India's biggest coal washery was laid near Hazaribagh at Kathara by Bihar's Chief Minister, Mr. Krishna Ballabh Sahay last week. This is a National Coal Development Corporation project which is financed with the 112.5 million rouble credit given by Russians for the third five-year Plan. The cost of the project is Rs. 8.5 crores, and its output capacity will be 1.5 million tons of clean coal, which will be used by the Bokaro, Bhilai and Rourkela steel works. The 1.5 million tons of middlings with ash and moisture content of 50 per cent which will be produced by this washery will be fed into the Pathratu and Chandrapura power stations. (The former of these two power stations, is also being set up with Russian collaboration). The Kathara washery is one of the three which the National Coal Development Corporation is setting up under the third Plan — the other two are to be located at Giridih and Sawang (also in Hazaribagh district). The Giridih washery will be set up with Polish collaboration. Messrs CEKOP of Poland have secured the contract for the erection of the coal preparation plant as also for machinery and equipment. The technical know-how will be provided by CEKOP also. It is expected that this washery will go into production by the end of the third Plan along with the one at Kathara. The Sawang washery may take a little longer, but not very much longer. The tenders for the supply of the plant and equipment are now being scrutinised. The National Coal Development Corporation has at present only one washery in production at Kargali. Under the third Plan programme of development, this washery too is being expanded to a total capacity of 1.5 million tons a year. Orders for the expansion scheme have been placed with the West German firm of S.K.B. The expanded washery is expected to start giving an annual production of 1.5 million tonnes of clean coal from May next year

Apart from the N.C.D.C. plants, the country has a number of other washeries in the country as part of the plan to wash inferior grades of coal for metallurgical purposes in order to get over the country's deficiency in metallurgical coal resources. The coal washery programme as a whole did not start well and many of the early projects were delayed, often unconscionably so, although the Government gave its own justification for it. The Hindustan Steel Ltd. has four coal washeries in Durgapur, Dugda, Bhojudih and Patherdih, while the private sector of the steel industry has two of its own — at West Bokaro and Lodna. All the coal washeries belonging to Hindustan Steel are now in operation excepting the one at Patherdih, which however is expected to be commissioned shortly.

★★

Bihar is about to implement the Union Government's cane development scheme which visualises intensive cultivation of this cash crop around each sugar factory. The cost per factory, it is estimated, will come to about Rs. 1.44 lakhs each year, which will be shared equally between the Central Government, the State, the factory concerned and the other beneficiaries, the growers. Punjab and Uttar Pradesh are also likely to take up the scheme soon. Bihar is a major sugarcane growing State, although in terms of installed crushing capacity and the quantity actually crushed, Bihar now comes after Uttar Pradesh and Maharashtra. Sugar is one of the major industries of Bihar and the State could do much to develop this industry further if it can make the proposed intensive cultivation scheme a success.

Why Waste Water?

From Our Correspondent

MADRAS:

THE MEETING of the Southern Zonal Council held at Trivandrum recently under the presidentship of Mr. G. L. Nanda might prove to be significant in many respects. There is a keen desire among the four States to co-operate closely at the economic level and utilise effectively available material resources. A Committee under the Chairmanship of Dr. K. L. Rao and consisting of the Chief Ministers of Kerala, Mysore and Madras, has been formed to explore ways and means of utilising the waters of west-flowing rivers for purposes of power generation and irrigation. Both Mysore and Kerala have a large number of rivers whose waters are mostly wasted as during their short stretch, before reaching the sea, no large territory could be successfully irrigated. On the other hand, it has been clearly proved that the diversion of waters of some of the rivers could result in the generation of larger quantities of power besides irrigating large areas. The Periyar Power House is an outstanding instance of how the harnessing of the waters in the catchment areas of Periyar in Madras territory could be helpful in generating large blocks of power besides providing valuable irrigation facilities. And the construction of the dam on the Vaigai River for regulating the tail race waters of Periyar Power House has resulted in the stabilisation of agriculture over a large acreage. Likewise, the Parambikulam-Aliyar project has started benefitting the arid tracts in the Coimbatore district besides making available power to the extent of 180 mW. With the co-operation of the Kerala Government a number of hill streams have been connected through a series of tunnels and weirs. If other rivers could be similarly controlled and the surplus waters diverted to Madras, the Madurai, Ramanathapuram and Coimbatore Districts could benefit to a greater extent than now. It is only to be expected that the new Committee will be able to arrive at a satisfactory arrangement.

Good progress is also being made with the interlinking of the grid systems of the four States and it is claimed that, when large blocks of power could be interchanged, the same installed capacity could be made to go a longer way. Meanwhile, the Madras Government has agreed to provide as a special case to the Kerala Government 25 mW of power during

the next summer.

While Madras will be concentrating on the installation of additional thermal capacity in the next few years, Mysore and Kerala will be busy implementing huge hydro electric schemes. Besides the successful completion of the Sharavathi Sabarigiri and Idikki projects, it is expected that other large projects would also be taken up at an early date. It is most encouraging to know that an agreement has been reached between Mysore and Madras regarding the construction of the Hogenekal Project which can yield as much as 600 mW of energy at a capital cost which would be considered very low. The expenditure and benefit are expected to be shared equally between the two States and it is confidently felt that the Madras State Electricity Board can make a substantial contribution in terms of technical personnel. It can even undertake the construction of the project wherever the dam might be located.

★★

Industrialisation in this part of the country is making rapid progress in both the public and private sectors. A few weeks back, the Defence Minister inaugurated the solventless cordite project and also presided over the Diamond Jubilee celebrations of the Cordite Factory at Aravankadu in the Nilgris which is making a very valuable contribution to the manufacture of ammunition material for the Defence Services. Only a few days back, the Defence Minister again took delivery of HF 24 aircraft produced by the Hindustan Aircraft Limited at Bangalore. While this huge factory will manufacture a large number of aircraft and helicopters of different types in the coming years, in collaboration with foreign interests, another mammoth factory is coming up at Avadi, Madras. This installation, which will cost Rs. 15 crores, is being constructed with the help of Vickers of U.K. who are well-known in the line. The first tank is expected to roll out of the assembly by the end of the next year and the prototype of the tank has already arrived and tests are being conducted at the factory. The armament for the tank is being produced by another factory and it is expected that a good part of the components for tanks would be manufactured in the Avadi factory. The bulk of the machinery has already arrived at site and is being erected. The required personnel are also being trained in the U.K. When completed, this factory would be able to produce not only various types of armoured fighting vehicles but also other items of heavy engineering required by the Defence Services. Medium tanks will be of 20-45 tons and light tanks of 13-20 tons, while heavy tanks of more than 45 tons can also be produced. While this huge factory will no doubt be a notable addition to the defence industries, there is also a proposal to start a rifle factory at Tiruchirapalli. For a time, there were doubts about the construction work being undertaken immediately in the near future as the necessary foreign exchange had not been arranged. It was also being argued whether there was any immediate need for establishing a second rifle unit. It is now stated that the construction of this factory will be proceeded with though that on the third unit may not be taken up immediately.

★★

The undertakings in the public sector in other fields are also making rapid progress. In the private sector, too, big units will be coming up in the next few years. During the past week, Coromandel Fertilizers Limited came on the market for raising its capital in equity shares of Rs. 4 crores. But even though the company has been successful in enlisting the co-operation of well-known American interests and there will be no difficulty in implementing this project, which will cost over Rs. 32 crores, the response from the public has not been enthusiastic and the list has had to be kept open for the whole of the stipulated period. Hindustan Polymers also would be raising its capital shortly and it is another institution which will be starting under influential auspices.

★★

Industrial development in Andhra Pradesh has been given a further push by the decision of the State Government to handover the management of Andra Paper Mills to the industrialists who are now looking after the affairs of West Coast Paper Mills which has its huge factory at Dundeli in Mysore State. The Andhra Pradesh Government had been discussing for sometime past the advisability of handing over and getting the expansion plan of the paper mill in Rajahmundry implemented by reliable industrialists who had already good experience in managing paper mills. It has now been decided that the Bangur group should look after the implementation of this mill. A new company, by name Andhra Pradesh Paper Mills Limited, is to be formed with an issued capital of Rs. 2 crores in equity shares and Rs. 1 crore in preference shares. The State Government and the West Coast Paper Mills will be taking up shares to the extent of 1/3 of the issued capital in each case, while the balance will be offered for public subscription. The expansion scheme, which will result in an increase in the installed capacity to 100 metric tons daily, is expected to cost Rs. 7 crores. The required additional resources will be found through loans and bank finance and it has been agreed by the State Government that they would keep pending the loans already advanced to Andhra Paper Mills, under certain conditions. Most of the plant and machinery required for expansion and modernisation have already arrived at site and it is the intention to commission within a year one paper machine while the remaining sections are expected to be ready within 18 months. The mill on the banks of Godavari, which has had a chequered career until now, can expect to do better henceforth, as all the facilities required for the manufacture of paper of different kinds are available in plenty at or near the factory site.

In Kerala, the area around Alwaye is growing in importance. Cominco Binani Zinc Limited, which has also come on the market for raising its requirements of capital, will be erecting its large zinc smelter and by-product plants at Alwaye at a cost of Rs. 5 crores. The company has been fortunate enough in securing the collaboration of Consolidated Mining and Smelter Company of Canada Limited which is one of the largest producers of zinc and lead in the world. It has made zinc by the electrolytic process and by-product sulphuric acid on a large scale for a number of decades. With the introduction of many other processes, the recovery of by-products has been made even more lucrative. The company has been licensed to produce initially 12,000 metric tons of zinc and proportionate quantities of sulphuric acid and cadmium, based on imported concentrates. The quantities of sulphuric acid recovered will be very valuable as it would be possible to dispense to that extent with imports of elemental sulphur. The Canadian interests will be participating to the extent of 40 per cent in the issued equity capital while Metal Distributors Limited, an associate Indian company, will also be taking up shares of Rs. 42 lakhs in equity shares. The share-holders of Metal Distributors will be given preferential allotment in respect of 80,000 shares. The issue to the public of Rs. 84 lakhs is completely underwritten. The foreign exchange required for importing plant and machinery will be secured with the subscription to the equity capital by Cominco and the grant of a loan for over Rs. 70 lakhs by the Exports Credit Insurance Corporation of Kerala. It is expected that, within a short period, the installed capacity will be increased to 20,000 metric tons.

★★

The declaration of a lower dividend of 12½ per cent, taxable, for 1963 against 15 per cent, taxable, for the previous year by Travancore Rayons Limited has come as a disappointment to the stock market. It had been hoped that the dividend would be maintained as there were earlier indications to the

effect that sales had risen by Rs. 30 lakhs in spite of the strike for a prolonged period. The sales actually amounted to Rs. 3.43 crores against the adjusted figure of Rs. 3.36 crores in the previous year. As there was an increase also in the amount of excise duty paid to the Central Government, no net increase could be recorded. But it is gratifying to note that an undue decline in earnings has been prevented. With the likelihood of additional spinning capacity being available in the latter half of this year and an increase in the output of rayon-grade pulp, the prospects for 1964 are regarded as more encouraging.

**

The heavy indirect taxes levied by Mr. Morarji Desai and Mr. T. T. Krishnamachari are having their serious impact on costs and prices. The crippling levy on diesel oil has upset the calculation of fleet operators especially as the tax on motor vehicles has also been raised sharply in several States. The new schedule of tax rates adopted by the Madras Government has been so drastic in its incidence that even the Madras State Transport system, which is being run on departmental basis and which does not pay any direct taxes, has been obliged to suffer a heavy loss in the last financial year. The amount paid by way of tax on motor vehicles alone is as much Rs. 76 lakhs annually while the losses, excluding non-recurrent receipts and the profit earned by the workshop, is well over Rs. 40 lakhs. The increase in bus fares will no doubt enable the State Transport System to wipe out the losses. But apart from the fact that the daily traveller in the cities particularly would be obliged to pay additional Rs. 10 to Rs. 15 every month by way of transport charges and would as a result suffer considerable hardship, the operators in the private sector may not find it profitable to continue their activities. Only the big fleet operators may be able to run their services with an adjustment in fares and freights and be content with a smaller margin of profits. There will, however, be no disposition to expand their activities which has been a feature of the past few years. Indeed, it is reported that one of the leading operators has surrendered permits for a number of routes as the profits left over, after payment of taxes, even with an adjustment in fares, have been considered grossly inadequate. If the development of the transport industry is arrested significantly on account of penal Central and State taxes, it would be found that even State Transport systems, conducted on a departmental basis, cannot be operated without loss. If fares and freight rates were raised further, there will be considerable increase in discontent.

Another instance of high taxation and increasing use of indigenous components resulting in an inflation of costs is provided by the tyre industry. Reliable reports suggest that there will be a further increase in the basic ceiling price by two per cent, on top of the two increases in recent months amounting to nine per cent of the basic selling prices. As the Central excise duty is levied on an 'ad valorem' basis, the actual increase to the consumer would be over 16 per cent from the level prevailing before September last year. The 'ad valorem' basis has been adopted to discourage an indiscriminate increase in selling prices. It has, however, been complained by the tyre producers that the Government is largely responsible for the increase in production costs as synthetic rubber produced indigenously is costing twice the price of the imported product, while rayon fabric produced from indigenous tyre cord yarn costs very much more. The excise duties on these products alone constitute a large proportion of the selling price. As large expenditure is incurred also on purchases of indigenous carbon black and bead wires, the working expenses have risen considerably. While the consumer is thus obliged to pay very much more, the manufacturer is actually complaining that even the increased prices do not offset fully the increase in production costs. The new tyre prices are expected to become effective from June 1.

JAY SHREE TEA AND INDUSTRIES LTD.

NOTICE TO THE SHAREHOLDERS

NOTICE is hereby given that the Eighteenth Annual General Meeting of the Shareholders of this Company will be held on Thursday, the 18th June, 1964 at 3.30 P.M. at 15, India Exchange Place, Calcutta-1, to transact the following business:-

1) To receive and consider the Directors' Report and to adopt the audited accounts for the year ended 31st December, 1963.

2) To declare dividends on Preference and Equity Shares.

3) To appoint a Director in place of Shri D. N. Bhattacharjee, who retires by rotation, but being eligible offers himself for re-election.

4) To appoint a Director in place of Shri M. L. Shah, who retires by rotation and to consider, and if thought fit, to pass the following resolution, a special notice of which as required by Section 281 of the Companies Act 1956 has been received and is also hereby given by the Company to the shareholders :
"RESOLVED that Shri M. L. Shah, who has crossed the age limit of 65 years and who retires by rotation, be and is hereby re-appointed a Director of the Company and it is hereby specifically declared that the age limit prescribed in Section 280 of the Companies Act 1956 shall not apply to him".

5) To appoint Auditors for the current year and fix their remuneration.

6) To transact any other business which may be transacted at such meeting.

By Order of the Board
B. C. BIYANI
Secretary Company Law.

Registered Office:
"INDIA EXCHANGE",
CALCUTTA-1.
The 29th April, 1964.

N.B. : 1) A member entitled to attend and vote at the meeting is entitled to appoint a proxy to attend and vote instead of himself and a proxy need not be a member.

2) The Share Transfer Register will remain closed from 26th May, 1964 to 18th June, 1964 both days inclusive.

3) The dividend warrants for Preference and Equity Shares as sanctioned at the meeting, will be posted to the Registered Shareholders of the Company as on 18th June, 1964, in due course.

EXPLANATORY STATEMENT

Item No. 4 :

Shri M. L. Shah, a Director of the Company, retires by rotation. Since he has crossed the age limit of 65 years, his re-appointment as a Director of the Company requires the resolution of Shareholders specifically declaring that the age limit prescribed in Section 280 of the Companies Act 1956 shall not apply to him. The Company has received special notice from a Member notifying his intention to move the resolution set out in the item. In view of his long association with the Company as a Member of the Board and his experience in business, it is in the best interest of the Company that he should continue to be a Director of the Company.

ANNOUNCEMENT

ALUMINIUM EXTRUSIONS, ALLOY INGOTS, SHEETS, COILS, PLATES, CIRCLES & SLUGS.

Hindustan Aluminium Corporation, Ltd., has pleasure to announce that its Extrusion Press and Alloying Furnaces will shortly go into production, and the company will soon be in a position to supply Aluminium Extruded Shapes and Sections and Alloy Ingots of the LM series (and others, in case of sizable orders). The Rolling Mills are also expected to be installed sometime later, perhaps by the end of 1964, and Plain and Corrugated Sheets, Coils, Plates, Circles, Slugs, etc. would also be available in due course.

Interested parties which have not already indicated their requirements, in full detail, are requested to do so immediately, so that our production may be planned in advance. It would benefit all concerned if parties would please communicate with our RENUKOOT Sales Office, under advice to our CALCUTTA Sales Office. (Parties located in Maharashtra, Madhya Pradesh and Gujarat may also please keep our BOMBAY Sales Office informed of their requirements, and those located in Punjab, Delhi, Rajasthan, Himachal Pradesh, Jammu & Kashmir may also please keep our DELHI Sales Office informed of their requirements.)

Enquiries should indicate the product specifications in detail, the annual consumption of each item in Tonnes, the size of order and delivery schedule likely to suit their requirements, the purpose or end-use for which the material is required, etc.

"Hindalco" is already producing Aluminium Ingots of Commercial, E.C., Properzi and High Grades (upto about 99.8% purity) ; E.C. Wire Bars, Billets, and Re-draw Wire Rods.

Trade Winds

FOREIGN EXCHANGE FACILITIES

ACCORDING TO a scheme approved by the Government of India, more foreign exchange facilities will be extended to manufacturer-exporters for the import of raw materials, components and spares required by them for the production of goods for export. The scheme, which follows the recommendations of the Mudaliar and Mathrani Committees, will be operated by the Export Credit and Guarantee Corporation of India.

Under the proposed scheme, commercial banks dealing in foreign exchange will obtain lines of credit from their principals, branches or correspondents abroad on the strength of assurance from the Reserve Bank of India that necessary foreign exchange will be released to repay the credits by the due date. Against these lines of credit, exporters of proved export performance and recommended by the bank concerned will, on approval by a committee to be appointed for this purpose by the Union Government, be granted import licences for raw materials, components and spares. The exporter will be required to execute a bond undertaking to effect specified exports within a stipulated period. The import licences will be issued only for the value of raw materials/components permissible under the appropriate export scheme and required for the production of the goods to be exported. In the event of any failure on the part of the exporter to fulfil his obligation to effect additional exports, the equivalent amount of foreign exchange will be debited to his entitlement as an actual user, in addition to other penalties under the scheme.

The facilities under the new scheme will be available only to manufacturer-exporters in specified industries. To start with, applications from manufacturer-exporters of only the non-traditional export items such as covered by the Engineering and Chemicals Export Promotion Councils etc. will be considered. The applications will be scrutinised by the inter-ministerial committee consisting of Secretary, Ministry of International Trade; Secretary, Ministry of Industry; Additional Secretary, Ministry of Finance (EAD); and Director-General Technical Development.

ECONOMIC DEVELOPMENT COURSE

Under the auspices of the World Bank a new course in the evaluation of economic development projects will be held in Jaipur, from October 19 to December 11, 1964. Participation in the course will be open to eight South and South-East Asian countries which will include India, Afghanistan, Burma, Ceylon, Malaysia, Nepal, Pakistan and Thailand. The course will be conducted by the Economic Development Institute (EDI) of the World Bank in co-operation with the Indian Institute of Management, Calcutta (IIMC) which is an autonomous organisation operating under the auspices of the Government of India. This is the first course of its kind to be conducted by the EDI outside the bank's headquarters in Washington. It will cover the selection and appraisal of investment projects, financial policy, financial analysis and the measurement of performance of projects in various sectors of the economy. The participants will be provided with an opportunity to become familiar with the methods used by engineers, economists, accountants and others in preparing and evaluating development projects. A substantial part of the curriculum will be devoted to case studies of projects in different sectors, such as power, transport, industry and agriculture.

The course will be conducted jointly by Mr. Ashok Mitra of the Indian Institute of Management and Mr. George Baldwin and Mr. Jack L. Upper of the EDI. The administrative arrangements will be handled by the Indian institute. The EDI was organised by the World Bank in 1955 as a staff college for senior officials from developing countries whose work involved the taking of decisions on economic policy and the formulation and administration of development programmes or projects. In 1963, the activities of the institute were expanded to include a three-month course in project evaluation to meet the need for specialized training in this field. Three project evaluation courses will be conducted at the institute in 1964, one of them in Spanish. Their purpose will be to contribute to the building of a large qualified cadre of persons engaged in the identification, preparation and selection of projects in the developing countries.

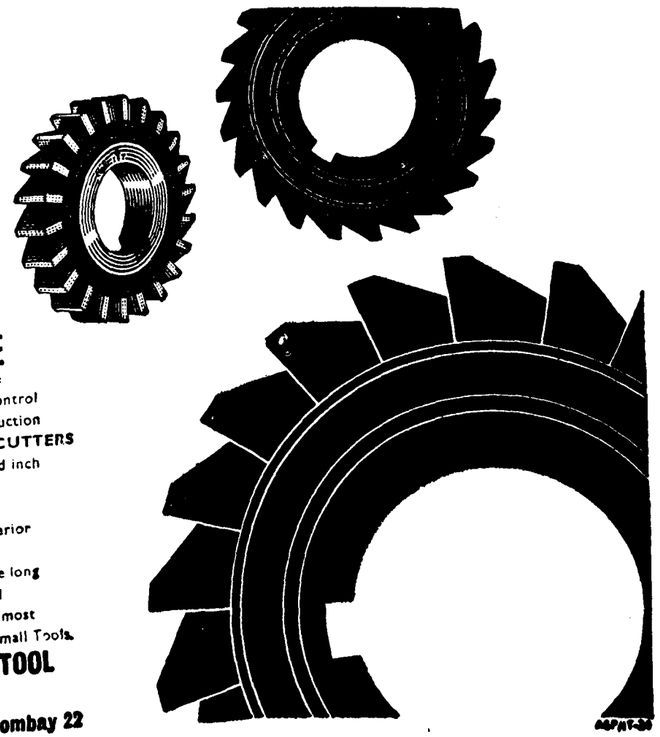
INDO-BRITISH TRADE

According to the Trade and Navigation Accounts of the U.K., during the year 1963, India's exports to the U.K. exceeded her imports by £4.2 million. But, the comparative figures for the first quarters (January-March) of 1963 and 64, showed that India's exports to the U.K. had declined while imports had increased with the unfavourable gap of £1.9 million.

Exports to the U.K. totalled £140.8 million in 1963 and mainly consisted of tea (£62 million), textile yarn, fabrics and made-up articles (£23.2 million), oil-cake and other residues of vegetable oils (£13.9 million) leather, leather manufactures and dressed fur skins (£9.5 million), tobacco and manufactures (£9.1 million), crude animal and vegetable materials (£4.2 million), textile fibres and their waste (£3.2 million) and metalliferrous ores and metal scrap (£1.5 million). On the other hand, imports during the same period totalled £136.6 million and mainly comprised non-electrical machinery (£47.6 million), electrical machinery, apparatus and appliances (£19 million), transport equipment (£16.4 million), iron and steel (£9.5 million), textile fibres and their waste (£5.5 million), chemical elements and compounds (£3.7 million), manufactures of metals (£3.7 million) professional, scientific and controlling instruments, and photographic and optical goods, etc. (£2.9 million) and non-ferrous metals (£2.6 million).

India's imports of machinery from the U.K. in 1963 totalled £66.6 million and included machine tools (£6.6 million), textile machinery (£6.3 million), generators, motors, converters, etc. (£3.9 million), aircraft engines (£3.9 million), insulated electric wires, cables, bars, strips, etc. (£3.7 million), electrical apparatus for making and breaking electrical circuits, etc. (£3.7 million), internal combustion engines (£3.6 million), construction and mining machinery (£3.2 million), heating and cooling equipment (£3 million), mechanical handling equipment (£2.6 million) and steam and other vapour generating boilers and plants (£1.7 million).

SUGAR EXPORTS



India's exports of sugar during 1963-64 (April-February) amounted to 4,10,000 tonnes valued at Rs. 23.7 crores as compared to 3,60,000 tonnes valued at Rs. 14.5 crores during the same period in 1962-63. The proportionately higher export earnings were due to the increase in the export price of sugar from nearly Rs. 400 to over Rs. 575 per tonne. Larger offtake by the USA and Japan, amounting to Rs. 4 crores each, was mainly responsible for the increase in 1963-64 sugar exports. The exports to Syria and South Vietnam were also higher during the year. Exports to the UK were maintained at the last year's level of 10,000 tonnes valued at Rs. 42 lakhs while

ITT

DAGGER BRAND CUTTERS FOR LASTING PRECISION PERFORMANCE

BACKED BY 25 YEARS OF TRADITION and rigid control at every stage of production DAGGER BRAND CUTTERS (available in metric and inch sizes) assure precision performance. They are made of superior quality steel, specially heat-treated to ensure long life, and manufactured in India's biggest and most modern factory for Small Tools.

ZAGREB FAIR

The Government of India will organize participation in the forthcoming Zagreb International Autumn Fair, scheduled to be held in Zagreb (Yugoslavia) from September 5 to 20, 1964. Yugoslavia negotiates a large percentage of its annual purchases at the Fair and the adjacent State-trading countries also take advantage of the Fair to negotiate considerable 'on-the-spot' business. The Indian exporters and manufacturers that participate in the Fair can avail of the trading opportunities offered by India's Trade Agreement with Yugoslavia and of the liberalised import regulations which have been in operation in that country for the last two years. The Government of India will emphasise the display of light and heavy engineering goods and other non-traditional items of export from India. The intending participants are required to forward a list of exhibits (with necessary details) which they wish to display at the Fair, to the Director of Exhibitions, Ministry of International Trade, by June 16, 1964.

EXPORTS OF FOREIGN PRODUCTS

According to the United Nations' Food and Agriculture Organisation the potential market for exports of forest products from the developing countries might increase by as much as $1 billion annually by 1975. In a paper prepared jointly by FAO and the various United Nations regional economic commissions, it has been pointed out that the prospects of the developing countries being able to expand their exports to meet this demand are good. The developed countries can do much to aid such development particularly through bilateral trade and/or development projects.

During the period between 1953-55 and 1959-61 the value of exports of forest products from the developing to the developed countries almost doubled. This was largely limited to the trade flows from Asia to Japan and from Africa to Europe, mainly in unprocessed roundwood. During the same period export earnings from Latin America showed no improvement. Europe is still the main market for forest products exported by the developing countries. Western Europe, according to the FAO paper, is destined to remain the principal market for the developing countries and the additional trade with Europe may amount to at least $300 million annually by 1975. Japan may be the next most important and rapidly growing market where also additional trade may amount to as much as $300 million annually by 1975. Other prospective areas for expanded trade, the paper points out, may be North America, the "centrally-planned economies" and other developed countries which may well provide additional outlets for a further $300 million or more worth of forest products. The paper further points out that, in addition to new export markets, a great potential is offered by the developing countries' own rapidly-rising requirements for forest products and that by 1975, the developing regions will require annually about $3 billion worth of forest products over and above their current needs.

SWEDISH SUBSIDIARIES

According to a survey conducted by the Uppsala University's institute of business administration, the Swedish industry has heavily increased its investments abroad in the post-war era, particularly in the metal and engineering industries. The register of Swedish-owned companies abroad lists 1,084 subsidiaries in 62 countries owned by 256 parent companies in Sweden. Among the subsidiaries abroad, sales companies predominate. About 70 per cent of all subsidiaries are located in Europe, 44 per cent of these in EEC and 46 per cent in EFTA. In Western Germany, Sweden's largest trade partner, there are 135 Swedish subsidiaries. Outside Europe, Latin America accounts for the largest number of Swedish subsidiaries. In North America, there are 108, including 73 in the United States. In the developing countries of Asia and Africa 54 subsidiaries are operating. Of these, 15 are in India, five in Morocco and four in the Congo.

IRON ORE OUTPUT

According to the Indian Bureau of Mines, the production of iron ore in India during 1963 touched the record figure of 20 million tonnes. This means an increase of more than one million tonnes over the previous year's output. Orissa was leading in production, accounting for about 6 million tonnes. Goa produced over five million tonnes, Bihar 3.5 million tonnes, Mysore 2.4 million tonnes and Madhya Pradesh 2.3 million tonnes.

CZECH MACHINERY FOR RANCHI

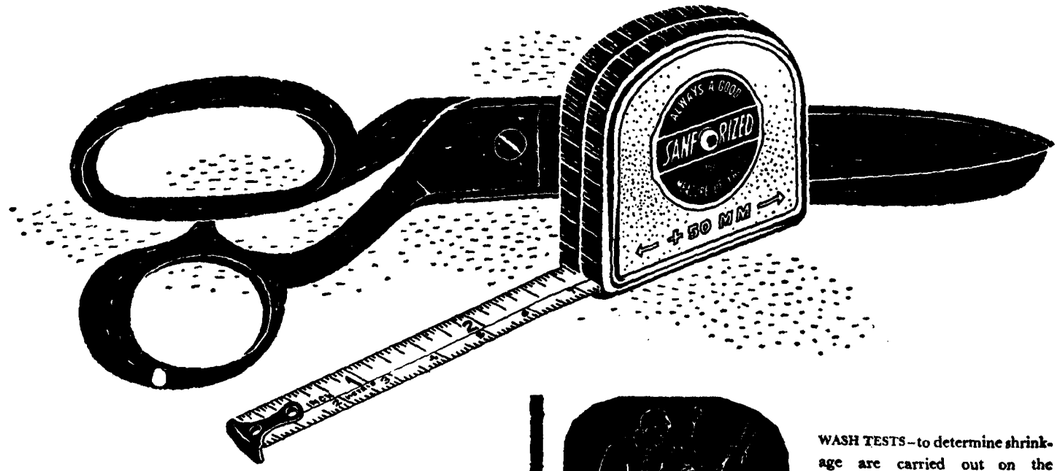
The Indian Heavy Engineering Corporation has placed an order with the Czechoslovak foreign trade corporation 'Techno-export' for machinery to expand the 'metal engineering works at Ranchi. This machinery will include furnaces of various types and a hydraulic forging press of a pressure of 6,000 tons. The press has been produced by the Lenin (Skoda Works) in Plzen.

TEXTILE MACHINERY IMPORTS

With a view to encouraging the speedy modernisation of the textile industry the Government of India has decided to import textile machinery worth Rs. eight crores during the course of the next 18 months. In the face of keen competition from Japan, Hong Kong and China, the modernisation of the Indian textile industry has become an imperative necessity. Some of the British banks have come forward with a credit scheme under which India will be able to pay for the imports over a period of eight to 10 years. The arrangement made by the Ministry of International Trade in this connection is likely to be followed in the case of a few other industries which are at present starved of machinery for replacement and expansion.

SOVIET TRADE WITH DEVELOPING COUNTRIES

In a paper submitted at the world trade conference at Geneva, the Soviet Union has disclosed that within the next 20 years it may increase its imports from developing countries by as much as 12 times the present figures. The following commodities along with possible import targets are included in the paper:—



Cocoa beans: 54,000 tons in 1963, 1,20,000 tons in 1970 and 3,50,000 tons in 1980. Coffee: 29,100 tons in 1963, 60,000 tons in 1970 and 1,20,000 tons in 1980. Citrus fruits: 60,200 tons in 1963, 1,80,000 tons in 1970 and 7,50,000 tons in 1980. Oilseeds and vegetable oils: 2,12,000 tons in 1963, 3,00,000 tons in 1970, and 10,00,000 tons in 1980.

The paper also says that the Soviet Union may considerably expand its exports to developing countries, including such items as machinery and equipment, rolled steel products, raw materials, and chemicals products.

INTEREST PAYMENTS ON U.S. LOANS

India's interest liability for the loans received from the U.S.A. is estimated at Rs. 29.64 crores in 1964-65 and Rs. 31.85 crores in 1965-66. Loans received total Rs. 1,501.79 crores comprising dollar loans of Rs. 983.74 crores and PL-480 rupee loans of Rs. 518.05 crores. The interest liability is of two types — one, in respect of dollar payments, and the other, in respect of rupee payments. Some of the dollar loans given by the Development Loan Fund (U.S. AID) are repayable in rupees. Interest on these loans is also payable in rupees.

The trademark 'Sanforized'—a reliable yardstick for measuring clothes that will not shrink out of fit

'Sanforized'—known to millions of consumers everywhere—signifies a standard of shrinkage control that is identical the world over. To maintain this uniform standard on cloth labelled 'Sanforized'...to assure that fabrics bearing this label will not shrink out of fit in washing...'Sanforized' technical representatives are constantly on the job...visiting mills...checking fabric...helping the textile industry keep quality at a high level.

WASH TESTS—to determine shrinkage are carried out on the catalogued, measured samples of fabric, in each mill as well as in the U.S.A., in fully equipped technical laboratories.

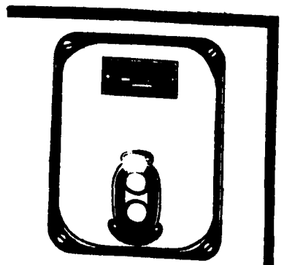
TEST RECORDS—are made after the catalogued samples are re-examined and re-measured. Every mill keeps its own dossier of the results of the findings made by the technical experts.

REPORTS & SAMPLES SENT TO—the Standards Testing Laboratory of 'Sanforized' in the United States. This procedure ensures the world-wide uniformity of shrinkage control and recognition of cloth labelled 'Sanforized'.

REGULAR, ALSO SURPRISE VISITS—are paid by 'Sanforized' representatives, every month throughout the year, to licensees, to examine each mill's records of wash tests and samples of fabrics to be labelled 'Sanforized'.

RANDOM SAMPLES — of fabric labelled 'Sanforized' are selected from the mills' warehouses for testing, to ensure that no out-of-tolerance material has been inadvertently marked with the trademark 'Sanforized'.

Make sure YOU get the full measure of value of the cotton you buy — look for the label 'SANFORIZED' REGD TO ME *and your clothes will never shrink out of fit!*



Issued by Cluett, Peabody & Co., Inc. (Incorporated in the U.S.A. with limited liability) proprietors of the registered trademark 'SANFORIZED'. The trademark proprietors use the trademark 'SANFORIZED', or permit its use by authorised registered users, only in respect of tested fabric which meets the trademark proprietors' strict requirements as to residual shrinkage.

For information: 'Sanforized' Service, 95 Marine Drive, Bombay 2.

Company Affairs

GRAPHITE INDIA

GRAPHITE INDIA LTD. a new company formed to manufacture graphite, will shortly enter the capital market with a public issue of 500,000 equity shares of Rs. 10 each and 25,000 cumulative redeemable preference shares (9.3 per cent) of Rs. 100 each. The authorised capital of the company is Rs. three crores devided into 2,500,000 equity shares and 50,000 cumulative redeemable preference shares. The issued capital of the company will be Rs. 1.25 crores out of which 100,000 equity shares of Rs. 10 each have already been subscribed. The promotors (Bangur Brothers Limited) and their friends have agreed to subscribe for 150,000 equity shares and their foreign collaborators, Great Lakes Carbon Corporation of USA, have agreed to subscribe 25,000 equity shares. The balance is being offered for public subscription. The plant is to be set up at Durgapur and the foreign collaborators will design and supervise its construction. It will have an annual capacity of 6,000 tonnes of electrodes, mold stock and paste capable of being enlarged substantially. The foreign collaborators will also supply the technical know-how and assist in the training of Indian personnel. The total capital outlay of the project will be nearly Rs. 346 lakhs and it is proposed to obtain Rs. 185 lakhs by way of dollar and rupee loans from IFC and AID Cooley funds.

GALILEO INSTRUMENTS

A new company known as Galileo Instrument Ltd., has been formed for the manufacture of electric meters, water meters, gas meters and other allied instruments. It will enter the capital market shortly with a public issue of Rs. 13.5 lakhs. The authorised capital of the company is Rs. one crores divided into 100,000 equity shares of Rs. 100 each. The issued capital will be Rs. 35 lakhs. It has already received a consent of the Controller of Capital Issues. The directors, promotors and their friends will subscribe for Rs. 13.5 lakhs, foreign collaborators will take up Rs. 8 lakhs and the balance will be offered to the public. The company has secured the technical collaboration of the Italian company, Officine Galileo, S.P.A. Florence, for the manufacture of electric meters. It is also trying to obtain collaborators for the manufacture of other instruments for which negotiations are in progress. The plant is to be located at Vishwamitri near Baroda. The State Government has assured power for the factory. It has also been granted licence to import machinery worth Rs. 6.51 lakhs, orders for a major portion of which have already been placed.

DEEPAK INSULATED CABLE

Deepak Insulated Cable Corporation Ltd. has an offshot of a triangular consortium comprising Kirloskar Electric Co. Ltd., Jyoti Ltd., and Bombay Metal Syndicate, will shortly enter the capital market with a public issue of Rs. 17 lakhs in equity shares of Rs. 100 each. The subscription list will open on May 26 and close on June 4 or earlier but not before June 1. The entire public issue has been under-written. The plant is to be located at Bangalore and will manufacture wide range winding wires, conductors and strips. The annual capacity of the plant initially will be 650 tons which will be doubled later on. It has secured the technical collaboration of the Furukawa Electric Co. Ltd., of Japan. The ICICI has agreed to provide a loan of Rs. 15 lakhs by way of foreign exchange to meet a part of the capital cost of the plant and equipment. The capital outlay for the project is estimated at Rs. 60 lakhs. The authorised capital is Rs. 50 lakhs, the issued capital Rs. 30 lakhs, the subscribed capital Rs. 10 lakhs and the paid up capital Rs. 5.15 lakhs. A sum of Rs. three lakhs is reserved for the Government of Mysore. The plant is expected to go into production in the later half of 1965.

GUJARAT MACHINERY

Gujarat Machinery Manufacturers Ltd., proposes to enter the capital market shortly with a public issue. Mr. H. M. Patel, Chairman of the company, announced recently that the issue has been fully under-written except for the amount to be taken up by the promotors, directors and their friends. The company has also approached the Industrial Finance Corporation for a loan of Rs. 35 lakhs. It has entered into a technical collboration agreement with Nikex, the Hungerian trading company for the products of heavy industry, Budapest, for the manufacture of glass lined vessels. Another collaboration agreement has been made with Cekop, Poland for the manufacture of unit heads and other special purpose machine tools. The directors are also examining the possibility of adding one or two other projects to the company's production programme. The Government has approved the collaboration agreements and the company expects to receive shortly an import licence of the value of Rs. 28 lakhs. The production of glass-lined vessels is to begin in the first quarter of 1965.

KUMARDHUBI ENGINEERING

The Kumardhubi Engineering Works Ltd. proposes to issue debentures of Rs. 40 lakhs later this year. Negotiations are under progress with the Commonwealth Development Finance Co. Ltd., London and the LIC. The Government has accepted the company's proposal to expand the output of steel casting to 1,000 tonnes a month and that of the structural shop to 950 tonnes per month. The modernisation and expansion schemes are expected to be completed by 1966. During the year ended November 30, 1963 the company recorded a rise in sales at Rs. 225.22 lakhs as against Rs. 172.64 lakhs a year before. The net profit was also higher at Rs. 17.19 lakhs against Rs. 8.84 lakhs. The directors have proposed to raise the ordinary dividend from 45 nP. to 50 nP. per share, less tax.

ESCORTS ISSUE

The directors of Escorts Ltd., have recommended the issue of equity capital as bonus shares in the ratio of one share for five held by capitalizing Rs. 22.40 lakhs out of the share premium account, at present standing at Rs. 30.95 lakhs. Consent of the Controller of Capital Issues has already been received. The company has shown a pre-tax profit of Rs. 37.99 lakhs for 1963 against Rs. 37.29 lakhs last year. A sum of Rs. 18 lakhs has been provided for taxation. Sales during the year were also higher at Rs. 451 lakhs against Rs. 345 lakhs. A sum of Rs. 20 lakhs has been transferred to general reserve which brings the total reserve to Rs. 78.08 lakhs. This will be reduced by Rs. 22.40 lakhs after the issue of the bonus shares leaving a balance of Rs. 55.68 lakhs. The company has added new industrial unit for the additional products such as automobile shock absorbers, automatic centre buffer couplers, railway pneumatic air and vacuum breaks.

WEST COAST PAPER

The directors of the West Coast Paper Mills have decided to subscribe to the equity capital of the Andhra Pradesh Mills. The unit which is at present working as an undertaking of the State Government will be incorporated as a joint stock company shortly with an equity capital of Rs. two crores and preference capital of Rs. one crore. While the company will subscribe one-third of the equity capital and give technical

co-operation to the new unit, subject to the approval of the Government and shareholders, one-third of the capital will be offered to the public. The balance will be met by borrowing. The plant and machinery have already arrived and one paper machine is expected to go into production within a year; the rest is to be completed within 18 months. The project will involve a capital outlay of nearly Rs. seven crores and when completed it will have an installed capacity of nearly 100 tons per day.

BRITISH INDIA CORPORATION

After providing Rs. 9.37 lakhs for depreciation, Rs. 1.75 lakhs for development rebate reserve and Rs. 23.32 lakhs for interest, the British India Corporation Ltd., has shown a profit of Rs. 2.20 crores for the year 1963 against Rs. 1.35 crores in the previous year. Sales have increased to Rs. 12.82 crores from Rs. 9.28 crores in 1962. Following the rise in profits the directors have recommended a higher dividend of 75 nP. per share against 45 nP. per share in the previous year. The directors, in their report, pointed out that the Corporation received during 1963 valuable import licences and consignments of machinery for the modernisation of its woollen branches. One of the subsidiaries — The Elgin Mills — showed a lower profit at Rs. 18.89 lakhs for the year ended September 30, 1963 against Rs. 32.41 lakhs last year. Cawnpore Textiles, another subsidiary, also shows a reduction in the net profit from Rs. 5.98 lakhs to Rs. 4.65 lakhs in 1963. Brushware Ltd., however, recorded some increase in profits.

LICENCES ISSUED

The following licences were issued under the Industries (Development and Regulation) Act, 1951 — during the week ending May 2, 1964. The list contains the names and addresses of the licensees, location, the items of manufacture and annual installed capacity.

IRON AND STEEL PRODUCTS

Prakash Engineering Co. & Rolling Mills, Freeganj Street, Agra (Uttar Pradesh) — Coil and leaf springs for Railways 3,600 tons per annum.

COAL, LIGNITE, COKE AND THEIR DERIVATIVES

Porascole Coal Co. Ltd., 18, Netaji Subhas Road, Calcutta-1 (P.O. Kajoragram, Distt. Burdwan West Bengal) — Coal: 1st year 2,40,000 tonnes; 2nd year 3,46,000 tonnes; 3rd year 4,86,000 tonnes; 4th year 6,00,000 tonnes; 5th year 6,00,000 tonnes per annum.

INTERNAL COMBUSTION ENGINES

ACME Manufacturing Co. Ltd., Construction House, Ballard Estate, Bombay-1 (Maharashtra) — Engine Valves 2,00,000 Nos. per annum.

MINING MACHINERY

New Standard Engineering Co. Ltd., Carroll Road, Bombay-13. (Maharashtra) — Disc Fitters for Washery - Capacity to be fixed later.

ORGANIC HEAVY CHEMICALS

Andhra Sugars Ltd. (Chemical Division) Venkatarayapuram, P.B. No. 2 Tanuku (Andhra Pradesh) — Ethyl Acetate, 1363 tonnes per annum.

MISCELLANEOUS CHEMICALS

Sandvik Asia Limited, Bombay - Poona Road, Poona-12 (Maharashtra) — Hydrogen Gas 2,40,000 Cu. Metres (N.A.) per annum.

DRUGS AND PHARMACEUTICALS

Rallis India Ltd., Ralli House, 21, Ravelin Street, Bombay-1 (Maharashtra) — A.P.C. with Vitamin C Tablets 1,20,00,000 (S.E.) per annum.

COTTON YARN HOSIERY AND ROPE

G. Basu, 6, Hastings Street, Calcutta-1 (Memari, Burdwan Distt. (West Bengal) — Cotton yarn 12,500 spindles; Shankara Textile Mills Ltd., Davangere (Mysore) — Cotton cloth 90 automatic looms; The Mettur Spinning Mills, 498, Mint Street, Madras-3 (Mettur Dam, Salem Distt. Madras) — Cotton yarn and cloth 18,000 spindles, 100 Automatic Looms; Sundaram Spinning Mills, Post Box No. 25, Komerapalayam P.O. Via Erode (Madras) — Cotton yarn 12,630 spindles; The Gujarat Hosiery Factory, Opp. Krishnan Society, Ellis Bridge, Ahmedabad-6 (Gujarat) — Cotton yarn 1,000 spindles; Silver Cotton Mills Co. Ltd., Near Jagnath Mahdev, Amraiwadi Road, Ahmedabad (Gujarat) — Cotton yarn 1,800 spindles; Kopargaon Taluka Sahakari Kapus Ginning & Pressing Society Ltd., Kopargaon Distt. Ahmednagar (Kopargaon Maharashtra) — Cotton yarn 25,000 spindles; The Ahmedabad Kaiser I-Hind Mills Co. Ltd., Outside Raipur Gate, Ahmedabad-17 (Gujarat) — Cotton yarn 1,300 spindles; V.R. Textiles Private Ltd., Peelamedu, P.O. Coimbatore-4 (Madras) — Cotton yarn 13,000 spindles; Varadhalakshmi Mills Ltd., Hillcrest, Madurai-4 — Cotton yarn 12,904 spindles; Cochin Lakshmi Mills, Mulakunnathukavu, Trichur (Kerala State) (Kerala) — Cotton yarn 12,880 spindles; The Hemalatha Textiles Ltd., Ralli House, 320 Linghi Chetty Street, Madras (Guntur Distt.) (Andhra Pradesh) — Cotton yarn 7,000 spindles. The Aruna Mills Ltd., Naroda Road, Ahmedabad-2 (Gujarat) — Cotton yarn 5,600 spindles; Nataraj Spinning & Weaving Mills Ltd., Indian Chamber Buildings, Esplanade, Madras-1 (Adilakad Distt.) (Andhra Pradesh) — Cotton yarn 12,000 spindles; Indra Cotton Mills Private Ltd., Jagampet Gardens, Chromepet, Chingleput Distt. (Madras) — Cotton yarn 6,780 spindles; Amin Chand Payare Lal Jeevan Vihar Buildings, Parliament Street, New Delhi (Punjab) — Cotton yarn 13,000 spindles; Dunbar Mills Ltd., Nos. 1 & 3, 21-Strand Road, Calcutta-1 (West Bengal) — Cotton cloth 65 automatic looms; Mohd. Umar Maheboob Sardar, Chief Promotor, M/s. The West Khandesh District Industrial Co-op. Asso. Ltd. Dhulia, District Dhulia (Dhulia Maharashtra) — Cotton yarn 12,000 spindles; Ajanta Textiles Ltd., 4, Babar Lane, New Delhi (Uttar Pradesh) — Cotton yarn 12,820 spindles; Hasimara Industries Ltd., 5 and 7, Netaji Subhas Road, Calcutta-1 (West Bengal) — Cotton yarn 13,000 spindles.

SYNTHETIC, ARTIFICIAL FIBRES

Mehra Silk Mills, North Chowk, Varanasi (Uttar Pradesh) — Art Silk power loom 5 Nos.

CHANGE IN NAMES (Owners or Undertakings)

(During the week ending May 2, 1964)

(Information pertains to particular licences)

From M/s. Gandhi Electric Industries Private Ltd., Bommay to M/s. Emco Elecktra Private Ltd., Bombay; From M/s. Jay Shree Textiles Ltd., P.O. Rishra, District Hogghly to M/s. Jay Shree Textiles and Industries Ltd. P.O. Rishra, District Hooghly; From M/s. Adaikappa Mills, Madras to M/s. Thiruvepathi Mills Private Limited, Madras; (Registration Certificate, From M/s. Madura Sugars and Allied Products Ltd., Pandiara Japuram P.O. Madurai District to M/s. Madura Sugars Ltd., Pandiara Japuram P.O. Madurai District.

LICENCES REVOKED OR SURRENDERED

(During the week ending May 2, 1964)

(Information pertains to particular licences)

M/s. P.S.N.S. Ambalavama Chettiar & Co. Private, Ltd., Madras — Steel Buildings for factories, garages, etc., and galvanised transmission towers; M/s. Bharat Electric Company Limited, Trivandrum — G.L.S. Lamps; M/s. Brady Engineering Company Limited, Bombay — Ship, Railway & Industrial Jacks; (i) Name of the Licensee Shri Deokinandan Poddar; (ii) Name of the undertaking M/s. Baidyanath Spinning Mills Ltd., Deoghar — Cotton Yarn; M/s. Ghakimal Hukum Chand, Ludhiana — Cotton Yarn.

THE
INDIAN SMELTING & REFINING
COMPANY LIMITED
'Industry House' 159, Churchgate Reclamation,
BOMBAY-1.

Cable : 'ISARC' Phone : 245006 & 246281|2

Manufacturers of

1. ALLOYING & CASTING DIVISION
* Antifriction Bearing Metals
* Gunmetals
* Leaded Bronzes
* Phosphor Bronzes
* Brazing Solders
* Type Metals
* Tin Solders
* Fine Zinc Die Casting Alloys–'ISMAK-3'
* Cupro Manganese
* Aluminium Base Die Casting Alloys
* Brass & Bronze Rods–Solid & Cored
* Finished Castings–rough & machined.

2. HOT ROLLING DIVISION
* Commercial Quality Brass Sheets
* Commercial Quality Copper Sheets
* Brass & Copper Heavy Base Plates
* Copper Anodes

3. COLD ROLLING DIVISION
* Cold Rolled Industrial Quality Brass Sheathings, strips & Coils from 10 SWG to 45 SWG) in width from 7 mm to 355 mm.
* Cold Rolled Industrial Quality Copper Sheathings, strips & Coils (from 10 SWG to 45 SWG) in width from 7 mm to 355 mm.

BOOKS BRIEFLY

Planning the Growth of Developing Economies

Economic Development: Objectives and Methods: By Paul Alpert; Macmillan, New York; $6.95.

Reviewed by JOSSLEYN HENNESSY

THE PAST DECADE has seen a profusion of books on the problems of the developing countries. Theories of growth have become two a penny. One school insists that as agricultural surpluses preceded the Industrial Revolution in the U.K. and in Japan, developing countries should modernise their agriculture before industrialising, in order to produce a surplus to feed the workers to be transferred from the land to industry. Another rejects gradual development in favour of an immediate "big push", urging that an isolated investment project risks not finding a market for its products, whereas a complex of complementary investments provide markets for each other. Others argue that to plan "balanced" growth with equal emphasis on agriculture and industry (1) overlooks that a gradual transfer of man-power from low-productivity farming to high-productivity industry is essential to growth, and (2) implies massive simultaneous investment in all major activities above the resources likely to be available in an under-developed country. By contrast, the "unbalanced" school argues that investment should not be spread evenly like butter, but laid on in chunks, which create an "imbalance"; this calls for subsequent changed emphasis in investment, just as in the U.K. the growth of, first, the cotton industry and, later, the railways, by their demands for capital goods, raw materials, and intermediary products, and by their multiplication of purchasing power, stimulated the development of other capital and consumption industries.

Parallel Questions

The problems of growth have inevitably prompted studies of parallel questions: (1) How can the advanced countries best help the developing — by private investment, by state loans or grants, by technical assistance? (2) What have been the actual achievements and limitations of aid? Which of the score of alternative channels are preferable? (3) How justified are the fears of some industrialised countries that they are cutting their own throats by promoting competition from cheap labour, and that as the developers develop they will themselves use up the raw materials and primary products that the already industrialised need?

Mr. Alpert has rendered all those concerned with planning and growth, whether in advanced or developing countries, three great services. First, he objectively summarises the current theories of growth, techniques of overseas investment and aid, the problems of low-wage competition and the stabilisation of commodity prices. But this is not a work of mere compilation, and Mr. Alpert's second service is that he has, in each case, checked the various theories and solutions cited against the facts of economic history in the U.K., Europe, the U.S.A., Japan, South America, and elsewhere. Thirdly, Mr. Alpert evaluates the various strategies — communal, regional, national, international — under which development programmes are at present initiated, and offers reasoned arguments for concluding that the relations between advanced and developing countries should not be discussed in terms of conferring and accepting favours, but as part of a drive for economic growth throughout the world from which all countries will gain.

It is extraordinary what resistance persists among many Western industrialists and trade unionists to the elementary point that although, since the Industrial Revolution, the pattern of international trade has continuously changed, the total industrial imports of industrialising countries have steadily risen. As they develop, they begin to manufacture and cease to import the more labour-intensive products. Provided that advanced economies are dynamic and flexible, the loss of markets for such products is more than compensated by rising outlets for more complex and costly consumer and capital goods, in which productivity is higher, which can therefore pay the highest wages, and whose expansion is most profitable for the economy. Conversely, in labour-intensive industries, like textiles, the comparative advantage lies with countries where labour is ample and capital scarce. Why do some advanced countries persist in protecting their comparatively low paid, high cost textile industries, instead of releasing textile workers for employment in high wage, capital goods industries, whose expansion swells the national income?

MODERNISATION OF INDIAN RAILWAYS

Indian Railways: Annual Number, 1964; Edited by Krishan Ghulati.

WELL LAID-OUT, neatly printed and competently handled, this voluminous publication, containing contributions from a galaxy of railway officials, not only throws light on the past achievements of the Indian railways, but also provides a peep into the problems confronting this premier public sector undertaking in the country. In the opening article, the Railway Board Chief, Mr. D. C. Baijal, presents a picture of the steady growth of our railways towards acquiring a personality of their own and points out how as a sequel to their improved financial and physical performance over the past few years, they are now looking forward to serving the nation better in the years to come. Mr. R. Srinivasan, in another article, argues the need for planning the development of railways with a sufficient breadth of vision so that the growing requirements of an expanding economy are adequately met, both in the near future and over the next 10 or 15 crucial years. One will readily agree with him that the development of railways in an economy like ours has to be constantly kept ahead of the requirements. The lesson of the trying experiences of 1960-61 and 1961-62, it appears, has been well learnt.

If the Indian railways have to shoulder increasing burdens of both passenger and goods traffic, it is obvious that they have to be modernised expeditiously. This aspect of the problem has been dealt with in various articles in this issue. Mr. G.P. Shahani dwells upon the question of modernising signalling and tele-communications services of the railways. Mr. S. Chakravarti, Mr. P. N. Murti, Mr. M. M. Suri, and Mr. G. S. Kang talk about the electrification and dieselisation programmes. One important point that emerges from these articles is that the foreign exchange shortage is acting as a drag on the efforts to modernise our railway system. The administration is making commendable efforts to attain self-sufficiency at the earliest, but if these efforts are to be crowned with success, their foreign exchange needs require to be met squarely.

While the modernisation of railways should improve their operational efficiency, concerted efforts need to be made for raising the productivity of railway employees. This question assumes heightened significance in view of the fact that after successive general increases in passenger fares and freight rates in the last few years, further moves in this direction in the near future are bound to encounter opposition. Three articles in this publication by Mr. T. C. Pant, Mr. B. Basu and Mr. I. C. Bahree deal with this issue on quite a comprehensive scale and reiterate the need for extending technical training programmes and provision of incentives.

The publication also contains an interesting piece by Mr. V. K. Sthanunathan on the railways' rating policy wherein he points out that the railways being a nationalised public utility undertaking, their rating policy cannot be strictly governed by commercial considerations.

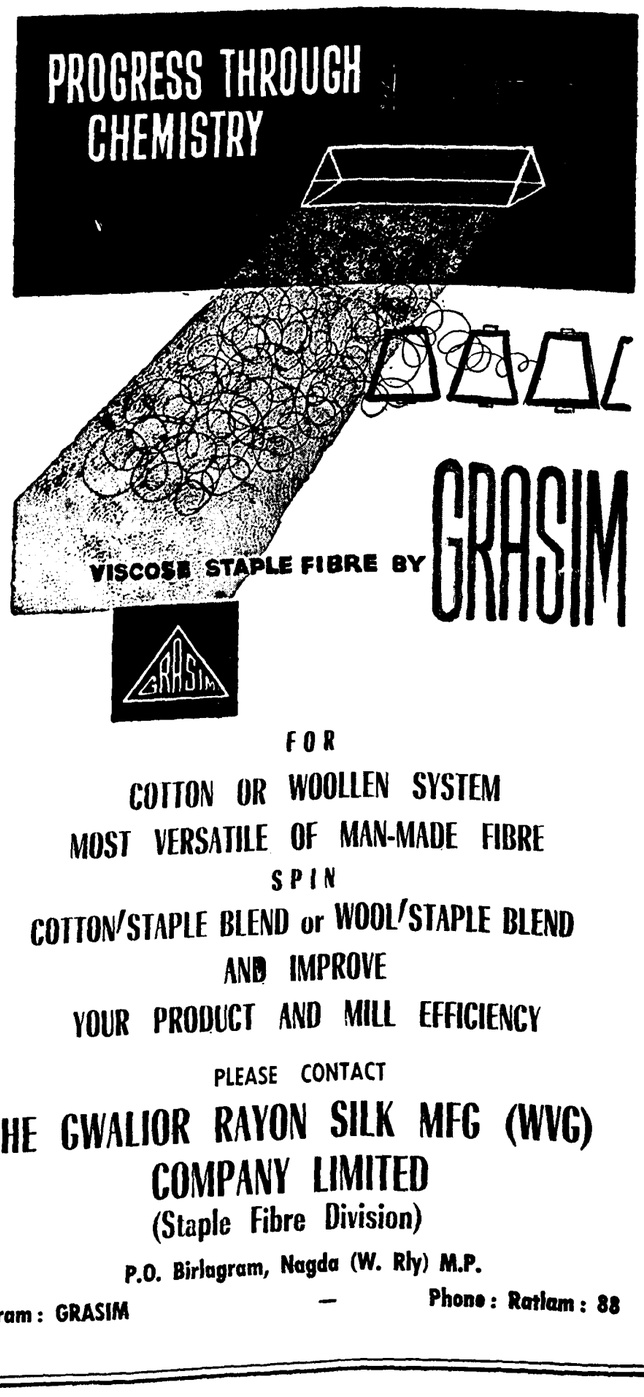
Exports of Engineering Goods

EXPORTS OF engineering goods during 1963 amounted to Rs. 134 million as compared to Rs. 96 million during 1962. Details of the 36 items which have contributed 66 per cent of the total earnings in 1963 are given in Table I. Country-wise exports of engineering goods, accounting for 78 per cent of the total in 1963, are presented in Table II.

TABLE I.

COMMODITY-WISE EXPORT OF ENGINEERING GOODS

(Rs. Lakhs)



Commodity	Performance in 1962	Performance in 1963	Percentage of increase in 1963 over 1962
1. Oil Mill Machinery	16.48	17.59	6.7
2. Shoe Making Machinery	1.48	2.31	56.0
3. Tea Machinery	16.72	21.06	25.9
4. Diesel Engines and Parts	56.95	63.91	12.2
5. Mechanical Pumps	9.10	13.58	49.2
6. Electric Motors, Transformers, Switchgears etc.	1.45	2.80	92.8
7. Storage Batteries	0.29	4.57	1,475.8
8. Dry Batteries	22.44	49.82	122.0
9. Electric Fans and Parts	81.01	90.65	11.9
10. Electric Accessories	6.27	8.14	29.8
11. Electric Fluorescent Tubes and other Electric Lamps	8.79	10.03	14.1
12. Radio and Parts	1.17	4.95	232.1
13. Automobiles & Auto Parts	17.14	41.25	140.7
14. Bicycles & parts thereof	12.05	26.89	123.2
15. Agricultural Implements & Hand Tools	6.78	8.03	18.4
16. Cast Iron Products (all sorts)	36.72	37.80	2.9
17. Structural Fabrication (including doors)	4.49	5.72	27.4
18. G.I. Products other than Buckets and Bath Tubs	0.55	2.92	430.9
19. M.S. Pipes and Tubes	7.25	34.29	372.9
20. Steel Furniture	21.91	26.13	19.2
21. Steel Trunks	19.72	25.26	28.1
22. Crown Corks	5.07	6.50	28.2
23. Tinplate Containers	14.46	17.20	19.0
24. Razor Blades	4.39	28.09	54.0
25. Stainless Steel Utensils	27.26	65.85	141.2
26. Builders Harware (including locks)	16.50	27.51	66.7
27. Cutlery	6.47	7.64	18.1
28. Abrasives and Grinding Wheels	0.44	0.54	22.7
29. Pressure Oil Lamps and Stoves	1.26	1.61	27.8
30. Non-pressure Oil Lamps and Stoves	0.70	0.97	38.6
31. Umbrellas and Fittings	20.99	31.28	49.0
32. Aluminium Utensils	34.92	41.54	18.9
33. Aluminium Sheets, Circles, Ingots etc.	1.29	134.83	10,351.9
34. Brass, Bronze, Copper Sheets, Circles, Ingots etc.	8.87	25.00	181.8
35. Water Fittings	3.54	4.47	26.3
36. Zinc Strips and Ingots	1.69	3.05	80.6
TOTAL	496.61	893.78	80.0

Jawaharlal Nehru

FOR FIVE YEARS more than three-score-and-ten, through the emotional and intellectual adventures of a bright and brimming life, Jawaharlal Nehru had believed in many things and disbelieved in many things more. Among the things that he did not believe in were the prospects of his own mortality. At his last public appearance of any significance which, as we might recall with melancholic pride, was at a conference with the Pressmen of the Capital, just five days before death was to come to him, the late Prime Minister parried the problem of a successor by cheerfully saying that his life-time was not ending so very soon. More than of faith in himself those words spoke of the faith he had in his country; for Mr. Nehru, idolized though he was by his countrymen for years before he became Prime Minister of free India and accustomed to unquestioned authority over the affairs of the nation since then, did not love office for its own sake but cared for it only in that he believed in the capacity of his people to benefit from his leadership.

That leadership has been praised — and not merely in funeral orations; and it has also been criticized during his life-time and will certainly be the subject of continuing discussion not only for the purpose of historical research but also in the more immediate debates of political controversion. This is but natural. Like most of Man's intentions or efforts, Nehru's stewardship of the Indian Republic has had its lights and shadows. In the wake of the shattering strains of partition he yet managed to forge for a bleeding nation a will to unity and an assurance of survival. Against the background of decades of arrested or halting economic progress, the country received from him a policy and programme of positive development of its material resources for the production of wealth and welfare for its citizens. The late Prime Minister described all this as the mighty adventure of building a new India and it would for ever be his chief glory that he let it be heard, often from his own lips, in the great cities as well as the remotest villages of India, that this new India of our making would be a benefit in the widest commonalty shared — a quest, in other words, for the greatest good of the greatest number. But while Nehru identified himself with India, and India in its turn, identified itself, even if with occasional murmers of dissent, with Nehru, he belonged also, to a great extent, to a world much larger than the country of his birth. Indeed, among the giant figures which contemporaneously with him strode across the world stage, the Nehru presence had a universality which he shared possibly only with Mahatma Gandhi and perhaps with Mr. Winston Churchill. To the race of Man as such, tortured by the fears and anxieties of the nuclear age, he brought the conviction that there could be an alternative to despair and that there could be hope through peaceful co-existence.

All that was the sunshine that was Jawaharlal Nehru, but, as we said, every sun casts its shadows. He gave to India a sense of unity, but it was a sentiment which was only in part a conviction of national purpose. It was also to a great extent mere magic over the minds of his countrymen of his dynamic presence and dominating personality. The sense of national unity he inspired and fostered thus remains to be tried and tested in his absence. In economic affairs, while he certainly had the courage and the vision to want to push the nation's economy into the mainstream of modernity and technological advance, he did not succeed in summoning to his aid in an equal measure the pragmatic capacity to organize, direct and achieve as much economic progress as would have been obtained, given the many conditions which potentially favoured powerfully India's attempt to build its economy fast.

Internationally, while his services as a moderator of the cold war have placed the nations of the world under an obligation to him, it is surely an irony of fate that the territory of India itself, in some of its parts, is being

disputed through wars, hot or cold, by its neighbours in the North. As a result, for all the historic grandeur of Jawaharlal Nehru's custodianship of the first 17 years of free India, his country is not in a position now to afford safely to live on his greatness. In his life there was no problem of government or country which was too small for Jawaharlal Nehru to concern himself with; in death, however, he has left his partymen in particular and the country in general to deal as well as they might with a problem so big that he himself would not face — the problem of an answer to the question: After Nehru Who?

Honest Broker?

IN THE WEEKS both before and after Sheikh Abdullah's release, his partisans in this country and elsewhere had done their damnedest to pervert the perspective in which his potentialities for good or evil could have been properly assessed. Sheikh Abdullah had been presented by his propagandists as a sovereign authority with whom the Government of India had no alternative but to negotiate for the future of that part of India which is the State of Jammu and Kashmir. And it has also been made to appear that there could be no settlement in Kashmir except in terms of a settlement with Sheikh Abdullah. All this, however, is and has always been a false and misleading picture. It may be that there is a problem of Kashmir but the nature of that problem is not what Sheikh Abdullah's partisans would have it be.

There is, of course, need for a good and stable administration in the State of Jammu and Kashmir. It has been one of the cardinal as well as characteristic sins of the Nehru Dispensation that just as there was a failure to attempt to secure within a reasonable period of time a judicial decision on the conspiracy charges against Sheikh Abdullah and others accused with h.m, there had also been a failure to intervene in time to put an end to the corruption and incompetence of the Bakhshi administration. Bakhshi Ghulam Mohammed's exit from office under the Kamaraj plan was thus a prelude to the reform of government in the State, but it was once again characteristic of the Nehru administration that until the Hazratbal incident and its explosive consequences had brought matters to a head, no effective step was taken to give to the State an administration untainted by the Bakhshi legacy. The coming into power of the Sadiq government has given the people of Jammu and Kashmir their first real chance of a reasonably clean and efficient administration and it is really a pity that the excitement over Sheikh Abdullah's release and his subsequent political philandering has served to distract the Sadiq administration from its essential and legitimate purpose of settling down to a regular and routine administration of the State.

It follows that the sooner the Sadiq administration decides (and is encouraged) to devote its attention and efforts to good government in Kashmir, the less will be the need to talk of a Kashmir problem. At the same time, it must be conceded that, as a result of historic circumstances, there is an external aspect to the Kashmir situation which cannot be ignored. This would be true in spite of the fact that the accession of the State of Jammu and Kashmir to the Indian Republic is final and that the area of Jammu and Kashmir is an integral part of the territory of India. This external complication is the hostility between Pakistan and this country which has found its fiercest and potentially most dangerous expression in the persistent effort of the former to unsettle the fact of the territorial integration of Jammu and Kashmir with the rest of India. There has been some discussion in this country as well as in Pakistan over whether Kashmir is the cause or whether it is the consequence of the conflict between the two countries. The argument is, in one sense, meaningless. It is clear that unless there is a general rapprochement between India and Pakistan, there is little likelihood of Kashmir ceasing to be a controversial issue between them. It is, at the same time and in the same measure, true again that until the clamorous controversy over Kashmir is stilled, the voice of sweet reason and good neighbourliness is unlikely to be raised or heard. To speak, therefore, of a settlement of Indo-Pakistani differences over Kashmir as a condition which must necessarily precede the coming together of the two countries is as unhelpful as to suggest that those differences could be ended only after India and Pakistan could bring themselves to enter into a fraternal embrace. It would be more to the point if Kashmir were to be considered and dealt with both as an important individual element in and as an integral part of the Indo-Pakistani relationship.

It is here that Sheikh Abdullah, despite the demagogy of his court and his courtiers, might still play a useful role, particularly through his discussions with the leaders in Pakistan. Fortunately, despite an unpromising and even unfortunate beginning in the days immediately after his release, Sheikh Abdullah has benefited sufficiently from his talks in New Delhi to be able to see the question of Kashmir as something much more than a mere extension of his own personal problem of leadership. While he is, no doubt, still exploiting for what it is politically worth, the twin fiction that Kashmir is a nation and Abdullah its prophet, priest and king, he has also shown himself in the more engaging role of a political leader who is convinced that the welfare of the sub-continent cannot be secured apart from constructive co-operation and collaboration between India and Pakistan and who is determined to employ his personal diplomacy for bringing the two countries together. If Sheikh Abdullah believes even part of what he professes, his visit to Pakistan, whatever its immediate or direct results may be, would have been worth while.

Sheikh Abdullah has publicly stated his conviction that the Government of this country and the vast majority of its people sincerely seek to live in friendship and amity with Pakistan. It is, no doubt, his business in Pakistan to find out to what extent there is in that country a reciprocity of the desire for good neighbourliness. It is possible that among his camp-followers in this country there is expectation and hope of a miracle. It may be that it is sincerely believed that Sheikh Abdullah will come back to India with a message or formula which in due course may lead to an ending of the deadlock not only in Kashmir but also, and at the same time, over the entire area of Indo-Pakistani relations. We, for our part, do not care to discourage this or similar optimism — there has been pessimism enough where India and Pakistan are concerned. At the same time, we ourselves would be content to record the small satisfaction that in the person and through the instrumentality of Sheikh Abdullah an occasion and an opportunity have been found for the resumption of a political dialogue between India and Pakistan. One test of the success of the constructiveness of the Ayub-Abdullah talks will be whether they encourage the Government of India to seek or participate in high level talks at diplomatic and political levels. There was from beginning a suggestion and some hope that Sheikh Abdullah's visit to Pakistan might help in bringing about a situation where the Prime Minister of India and the President of Pakistan might find it useful to meet. Sheikh Abdullah has now stated that President Ayub has offered or agreed to visit New Delhi about the middle of June, but the passing away of Mr. Nehru must call for a new time-table. Throughout the last 17 years, Pakistan's policy towards this country has been concentrated on unsettling the fact of Kashmir's accession and our own reaction has been to see in this threat to Kashmir a threat to the secular character and peaceful progress of our country. Quite obviously this is not a situation where third party mediation could be useful or, at the worst, merely harmless. We have not heard it said on any occasion that the United States is willing to let the United Nations pronounce on Cuba. Nor is it the case that the Soviet Union could be enthusiastic over a UN solution for Berlin. As for Formosa, it should be interesting to find Chairman Mao offering to President Johnson to let the Pope give his verdict. Kashmir and all of Indo-Pakistani relations, in other words, will have to be settled ultimately not only with the consent of but essentially through the direct consultations between the two parties themselves.

Banking Trends

IN THE past few weeks so many things have been said by some responsible persons about our commercial banks that those who have no access to relevant and up-to-date details about the working of these banks have ample reason to feel seriously disturbed. Among the complaints against commercial banks, those most frequently heard these days are that although, technically, thousands of people own shares in banks, only a few control them, that these few decide who should have credit and how and where the borrower should use it, that more than 70 per cent of the people never know of banking and its advantages, that banks operate on a low cash basis, that "about Rs. 350 crores out of the estimated deposit of Rs. 2,600 crores goes into speculation", that liberalisation of credit only helps create a seller's market and pushes up prices and that the Reserve Bank has not got sufficient powers, nor used the powers it has effectively enough. Nearly all these are impressions rather than facts and, really speaking, there is no need at all to feel so concerned about the working of our banks as the champions of nationalisation of banks have been trying to make the more gullible believe. Between these champions and some misguided bank employees who feel, probably because the former advocate workers' participation in, or control of, bank management, they are their best friends, there seems to be some understanding that the issue of nationalisation of banks must be somehow kept alive — by raising it on every possible platform and on all conceivable occasions. It is, of course, open to these, as it is to anyone in our Sovereign Democratic Republic, to air their views freely, but there must be some substratum of sense and truth in what they seek to convey to the mass of our people, a great bulk of whom still are illiterate or uneducated. It is worth knowing, for instance, how many of those that have been urging greater control of banks or their nationalisation have cared to peruse the latest issue of "Trend and Progress of Banking in India During the Year 1963"? If they have done so, can they honestly stand by all that they have said?

Normally this is not a publication that we would notice in these columns inasmuch as it is not as uptodate as one would wish it to be, whatever the extenuating reasons or circumstances offered. But we have made an exception on this occasion, as we feel that, in the interest of proper dissemination of authentic details, some of the points made out in this publication need to be highlighted.

Credit restraint has been with us for quite sometime now and the impact of the emergency created by the Chinese incursion late in 1962, superimposed on a planned development programme, could hardly lead to any liberalisation. Accordingly, throughout the year 1963, the accent of the Reserve Bank's policy was on reducing credit availability both in the aggregate and in respect of certain individual lines, as also on raising its cost. This is anything but liberalisation of credit, which has been criticised as having been responsible for pushing up prices. If there was any liberalisation, such was confined to certain special sectors — small-scale industries and co-operatives — and formed part of the Government's own policy.

Much has been said about those connected with banks indulging in speculation, but the official publi-

cation of the Reserve Bank has this to say: "The trend of clean, gold and share advances was in conformity with the advice given in the Governor's circular letter to scheduled banks of November 10, 1962 .... The sharp contra-seasonal drop in advances against gold and silver ornaments (Rs. 24 crores) was a natural corollary to Gold Control measures, while the trend in share advances reflected the depressed conditions in the capital market. Unsecured advances also rose somewhat less than in the 1961-62 busy season. Throughout the busy season, speculative activity in the commodity markets was subdued..."

Had the Reserve Bank been ineffective in the use of its powers, as has been alleged, there would be no need for the weapon of selective credit controls which the Bank has in its armoury and which it has not hesitated to employ whenever necessary. Recently, that is early in March last, when credit expansion tended to become rapid and exceeded Rs. 300 crores (as against Rs. 200 crores over the corresponding period in the previous year) and scheduled banks' borrowings also rose to the level of Rs. 106 crores, the Reserve Bank did not hesitate to modify its credit policy by restoring the tier system that had been abandoned earlier and also stepping up the penal rate of interest on borrowings in excess of statutory reserves. It also directed all banks to review and bring down their portfolio of clean advances, besides exhorting them to reinforce their efforts to mobilise deposits in every way possible. And, contrary to the impressions of some, these directives turned out to be effective.

According to the latest purpose-wise Survey of Bank advances, it is noteworthy, there has been a progressive rise in the share of industry in total bank credit — 34 per cent at the end of Dec., 1955; 53 per cent at the end of April, 1961, and 57 per cent at the end of March, 1963. The share of commercial and financial advances, on the other hand, declined from 55 per cent at the end of December, 1955 to 36 per cent at the end of April, 1961, and further to 33 per cent at the end of March, 1963. Incidentally, as though to disprove the thesis of those who argue that liberalisation of credit pushes up prices, there was actually a decline in bank credit to the sugar industry, which, however, did not prevent rise in sugar prices — in fact, they have been officially raised further this week! This phenomenon is the result of successive decline in sugar output and the consequent depletion of stocks. In other words, prices have been influenced in this case not so much by a plentiful money supply as by a paucity of physical supplies.

Nobody denies that this country is most inadequately served by banks. There were still as many as 1017 towns which did not have banks at the end of March, 1962, but it must be noted here, the growth of banks and banking services is not entirely in the hands of commercial banks. Expansion of banks by opening new branches also is subject to sanction by the Reserve Bank according to a prepared plan, which must be presumed to have taken all the relevant factors into consideration. In 1963, according to published figures, the number of scheduled banks increased by 399, as against 220 in the preceding year, and the rate of deposit growth at 14.7 per cent also was better than in the previous year (13.7 per cent).

Banks, it has been pointed out by one of the spokesmen of the nationalisation of banks school, operate on a low cash basis. If, by this, he means the liquidity position of banks, he cannot be considered to be altogether in the wrong, to judge from the Reserve Bank's dissatisfaction with the progress made by banks during 1963 in the matter of raising their minimum ratio of liquid assets from 20 per cent to 28 per cent, but by the targeted date, namely September 16, 1964, this ratio should be reached, save only in a few exceptional cases. (At the end of December, 1963 there were only 16 scheduled banks with a liquidity ratio of less than 28 per cent).

The role played by commercial banks in supporting the Government securities market, and, lately also, the treasury bill market, seems to go practically unnoticed. In 1963, these banks added Rs. 130 crores to their portfolio of Government securities and accounted for as much as 52 per cent of the share of banks (other than the State Bank and its subsidiaries) in the total gross sales of treasury bills. The greater interest of scheduled banks in treasury bills thus stems partly from the Reserve Bank's credit restraint policy, which, by the way, proves its effectiveness and not otherwise.

Those who still talk of insufficient control of the banking system by the Reserve Bank today apparently do not know how far banking legislation has gone in this country lately. The purpose of the latest amendment to the banking laws of the country, let us remind these, is, inter alia, "to provide further powers to the Reserve Bank so as to ensure stricter supervision and control over commercial banks, in particular to restrain the control exercised by particular groups of persons over the affairs of banks, to restrict loans and advances granted to or guarantees given by banks on behalf of any one company, firm, association of persons or individual and to give greater control to the Reserve Bank over the appointment and removal of banks' executive personnel". There are other restraints too, besides, such as those on voting rights, grant of unsecured advances, remission of debts due by directors, and so on, not to speak of the really stringent system of bank inspection perfected over the past several years, which leave hardly any scope to bank managements even to think of, let alone perpetuate, all the abominable acts alleged in respect of them. To continue to accuse banks still of all manner of misdeeds and lapses is, therefore, only to persist in a puerile pastime that has become fashionable with certain politicians in our country. Most certainly it does not serve any useful purpose.

Highlights of the Week

P.M. MEETS THE PRESS

AFTER ABOUT 7 months, the Prime Minister held his usual press conference on May 22 when various subjects, including Kashmir and P.M.'s talks with Sheikh Abdullah, recent communal disturbances, the price line, future of Goa and talks with China on border, were discussed.

Regarding Kashmir, the Prime Minister refused to go beyond the statement that he had made at the All-India Congress Committee meeting as no further change had taken place since then. Sheikh Abdullah's talks with the Pakistani leaders, he said, should take place without any inhibitions. He looked upon the Kashmir issue not by itself but as one between India and Pakistan. Elaborating his recent statement in the Parliament, he said that in the interests of amity, India and Pakistan had to get together even constitutionally. It was difficult for him to spell out the details as it required a good deal of consideration and some response from Pakistan. While the constitutional changes envisaged by him would be determined by the attitude taken by Pakistan, what he had in mind was that there should be easy access to people from India to Pakistan and vice versa. While India was prepared to have an agreement with Pakistan on the ground of their holding on to that part of Kashmir which they are currently occupying, Sheikh Abdullah had expressed strong disapproval as he did not want a division of Kashmir. When questioned if Sheikh Abdullah accepted the basic issue about Kashmir (about which the Prime Minister had said in A.I.C.C., Bombay that it belonged to India and that it was a part of India) he said that Sheikh Abdullah accepted whatever was done before his arrest. The accession of Kashmir to India had been more or less completed before his internment though some additional things had been added since then.

Regarding the communal disturbances, the Prime Minister said that "there is no communal disturbance in any part of India at the present time". What occurred in Pakistan and India was indeed most unfortunate. He was not aware as to what was happening in East Pakistan except that large numbers of refugees were still coming over — about 3,000 a day — and nearly 3,50,000 refugees had already entered India. Regarding Mr. Tyagi's suggestion that Pakistan should be asked to contribute some land for the rehabilitation of refugees from East Pakistan, the Prime Minister said that the Government had not considered that question at all.

On Goa, the Prime Minister gave the opinion that it was a domestic matter which could be decided at any time. The Ministry of External Affairs was dealing with Goa because of its historical association. Even though a new era had started in Goa and the past was over principally, there were many other matters which had to be dealt with: that is why no haste had been exhibited in either merging it with Maharashtra or making it one of the Union territories.

The Prime Minister was not inclined to comment on the price situation as he thought it was a difficult and complicated question. The recent increase in prices, he said, did require serious consideration. The control of foodgrains prices was discussed only from the consumer's point of view, while the producer's point of view was usually neglected. The incentive to the producer to raise production was also an important aspect. He said that the many ways of increasing prices by the middlemen could certainly be controlled.

The Dhebar Committee's recommendations, he said, had been accepted generally by the All India Congress Committee. They had been sent again to the Working Committee for closer examination. By and large, the Government was agreeable to the Committee's recommendations, but not regarding every detail contained therein. On bank nationalisation, the Prime Minister gave a categorical answer: "There is no immediate question of bank nationalisation".

The Prime Minister then dealt with the case of the Deputy Finance Minister against whom some allegations had been made and the Attorney General had been asked to examine them. The Attorney General's report, according to the Prime Minister, dealt with a number of relatively minor charges which were under consideration of the Government. It was the opinion of the Attorney General that the data given to him was insufficient and, therefore, there was nothing very much for him to decide and that it might be necessary to have further investigation.

Explaining a recent statement of his that if there were no posts in the demilitarised zone, he was prepared to have talks with China on the border dispute, he said that this approach was in no way in conflict with the earlier statement that unless China accepted the Colombo proposals in full, India would not enter into negotiations. The point involved was one of interpretation of the Colombo proposals. If there was an agreement that there would be no posts on either side, it did not go against the Colombo proposals which stated that there should be agreement on the number of posts on either side. No reaction had been received from China in relation to this offer.

Regarding the question of succession, he said that while people were talking about his successor, he thought that his life time was not ending so very soon. The question that he should give some thought to the suggestion that he should retire and act as an adviser to the working statesmen, he gave the humorous reply that whenever such suggestions were made, he did give some thought to them, implying that he had no desire to take any action on such suggestions.

FRUITS OF COMMON SENSE

THE SEVENTH REPORT of the Organisation and Methods Division covering the period April, 1961 to March, 1964, observes that no efforts which the Central O & M Division may make can replace the self-improvement efforts of individual departments which must continually keep under review their own performance, the way their business is transacted from day to day, and the difficulties or bottlenecks which come in the way of speed, economy and efficiency in the disposal of service by studying problems of common interest to a number of different departments or by conducting analytical studies, investigations and comprehensive reviews. But each ministry, department or executive agency has to build up its own 'Efficiency' (O & M) Unit and invest it with competence to study problems of administration and confer on it the requisite prestige and authority to secure acceptance for its carefully worked out conclusions and recommendations.

"Organisation and Method" in India, on the U.K. model, is a service organisation. Its proposals to change existing procedures and organisations have to be discussed at the appropriate levels with the men who are responsible for doing the job in question. The recommendations have to be changed and modified if discussions show that they will not work or contribute to the desired results. Whenever possible, the O. & M. officers make efforts to reach agreement with the departmental officers as they go along. At the end of the assignment, the recommendations of the study team are presented in the form of a formal report. It is then for the management or the head of the administration to decide how far any changes proposed are acceptable, and if so, to implement them. In this respect, the discretion lies entirely with the administrative Ministries

In the words of the President's Committee on Adminis-

trative Management in the United States (Brownlow Committee, 1937): "It is a mistake to assume that the Government can be reorganised once for all. Continuous study of the administrative reorganisation of the huge Federal machine is necessary; new activities are constantly emerging and old activities are constantly changing, increasing, decreasing or disappearing. Unless there is a special agency equipped to investigate problems of organisation, new activities are set up without careful attention to where they should be located and what kind of organisation is required. This results in costly mistakes and confusion. On the other hand, when the need for certain governmental activities declines or disappears, unless there is a special agency constantly studying the organisational requirements, adjustments are made late or not at all."

A beginning was made in this country a decade ago in March, 1954 when the O & M Division came into existence and was located in the Cabinet Secretariat. In March 1964, a Department of Administrative Reforms was set up in the Ministry of Home Affairs for taking action on the recommendations made in the past by various individuals and committees appointed for suggesting measures for reorganising the Government machinery, and for taking initiative in promoting administrative improvements in the interest of efficiency, economy and integrity. To avoid unnecessary duplication of effort, and to make available to the Department of Administrative Reforms staff trained in administrative analysis, the O & M Division has been transferred from the Department of Cabinet Affairs to the new Department.

Creditable Achievements

The Division has some creditable achievements to its credit. Its study relating to the forms to be submitted by the textile industry is typical of the use to which O & M can be put to eliminate wastage involved in useless paper work. Out of 312 forms which this industry used to submit to different Government agencies, 152 were prima facie acceptable to this industry. The remaining forms were scrutinised in consultation with the representatives of the industry and the Government agencies concerned. As a result of the deliberations, 12 returns were eliminated altogether, 15 returns were consolidated into 5, the size of 6 forms, including the form of income tax returns, annual consumption of which exceeded 1,00,000 copies, was reduced by 17 per cent and the frequency of 3 returns was also reduced. It was estimated that paper saving of the order of 1,450 sheets (13½" x 9") annually per unit of the industry would accrue from the implementation of these decisions. Besides, there would be saving in costs on printing, storage and postage and in the time and effort spent in preparing and handling these forms. Studies for simplication of reporting by coal, cement, sugar, jute, iron and steel, rubber goods, drugs and pharmaceuticals, electrical goods and automobile industries are being undertaken. Again, the Central O & M Division, and the O. & M Units of the Ministries undertook a study of the existing returns and reports to examine if they served a definite purpose and whether they justified the expense in terms of costs on materials and manpower needed in their preparation and processing. As a result of this study, it was possible to eliminate as many as 449 reports and simplify, or reduce the frequency of, 166 others.

A survey made by the O. & M Division about three years ago estimated the recorded files of Ministries alone at 42,00,000. Since then, about 10,00,000 files have been weeded out by the various Ministries/Departments and certain major offices. A sample study made during 1961 of the records build-up in one of the Ministries showed that: (a) out of 12,300 files examined, 6,002 files i.e. roughly 50 per cent were due or overdue for destruction even according to the original markings of the Ministry; and (b) 9,648 files (i.e. 79 per cent) of the total files examined could be immediately destroyed, 1,052 files (i.e. 13 per cent) retained till 1965, and only 1,000 files (i.e. 8 per cent) preserved beyond that period.

INADEQUATE ROADS

THE CELEBRATIONS last month of the completion of 111 years of operation of railways in India, and the recent conjectures about the size of the fourth Plan have once again brought to the fore the desirability of greater attention to be paid to the overall development of the Indian transportation system. While the Indian Railways will not be in a position to cope with traffic offerings in the coming years, limitations in the development of water and air transport will obviously leave no option for the country but to fall back heavily on the road transport system, which, despite its vast potentialities, has attracted inadequate attention. Speaking some time back in the Lok Sabha during the debate on the Demands for Grants of the Ministry of Transport, Mr. M. R. Masani painted a gloomy picture of road transport in India. He issued a stern warning that if the current complacency persisted, there might be a transport bottleneck in 1966 almost six times as acute as in 1960-61.

The Government is, of course, not oblivious of the inadequacy of the financial allocations for the road development programmes, and this fact was admitted by the Transport Minister, Mr. Raj Bahadur, in the Lok Sabha. The 20-year road development plan, formulated on the recommendation of the Chief Engineers of the Central and the State Governments, was originally allocated for the third Plan period Rs. 324 crores. Although this figure has been now raised to Rs. 416 crores, it still falls far short of the sum of Rs. 590 crores recommended by the chief engineers for the same period. The inadequacy of these allocations is further heightened if the fact is taken into account that part of these funds is being diverted to the construction of border roads. A fundamental defect in the 1961-81 plan is that it has been modelled on the 'Nagpur Plan', which was formulated in 1943, keeping in view the conditions then obtaining and without the perspective of the demands of a planned economy. At the time of the formulation of new road plan, its planners were also carried away by the popular, though misplaced, belief that the targets of the Nagpur Plan had been more than realized. The fact, however, is that while the targets in overall terms were achieved, the accentuation of the road development activity, necessitated after partition, in States like West Bengal, has left a large number of the other States in a hapless position. The task, therefore, that the current road plan should be set to accomplish is not only the reduction, if not removal, of these 'disparities', but the speed with which it is done. This, however, seems doubtful, for the ten-year plan envisages to achieve by the end of its first half less than one-third of the targets.

The pace of the planned activity, meanwhile, is surely not going to abate. The traffic at the end of the third Plan is estimated to rise to 375 million tons while the haulage capacity of the railways will not exceed 260 million tons in 1965-66. It will naturally shift a sizable burden on to roads, which will face a Himalayan task, since the capacity of road transport by then will not have risen above the meagre figure of 20 million tons. The immediate steps that need to be taken to meet the challenge are the strengthening of a few weak bridges and culverts so as to permit trucks to be loaded to their full capacity, prompt widening of at least the highways to two lanes, the encouragement of truck-trailer combinations, freer licensing of inter-State transport, and assistance to vehicle manufacturers through foreign exchange allocations and otherwise.

A wide network of all-weather roads and an expanding automobile production are the two concomitants of a good road transport system. While the Government claims to have restored a large number of missing links, and improved a substantial milage of low quality roads, besides constructing new roads, the general condition of Indian roads is not very encouraging. Nor is the position on the automobile manufacture front any satisfactory. The third Plan had set a target of 66,000 vehicles, which was later revised to 54,000. The production of vehicles has, however, not looked up since the beginning of the current plan. Thus while production in 1960 was 27,100, the figure for the subsequent year stood at 26,721, and in 1962 the number of vehicles produced was 26,820. The production figure for 1963 is 28,481, which, of course, is a slight improvement over the previous two years, but is much below the figure of 46,000 envisaged for that year. It was contended by Mr. Raj Bahadur in the Lok Sabha that the lag in vehicle production has resulted owing to limited foreign exchange allocations and also because more attention had to be paid towards increasing the indigenous content of vehicles, which in some cases is now as high as 80 per cent. While it is encouraging to note that the indigenous content of vehicles has steadily gone up — many a time, it is believed, at the cost of the quality — it is very difficult to reconcile with what may be described as the Transport Minister's wishful hope, unless allocations for this head are substantially increased, that the pace of production will be stepped up sharply to achieve the figures of 35,000 vehicles in 1964, 42,250 in 1965 and 54,500 in 1966.

GUIDANCE WITHOUT OBSTRUCTION

THE FIFTY-THIRD report of the Estimates Committee released recently has placed the functions of the department of Company Law Administration in proper perspective in relation to the growth of the private corporate sector. Instead of conceiving the Company Law as police force having punitive powers shadowing the performance of the private sector, it has to be interpreted as an instrument to implement the official economic policy in the business field. It is also recognised that the Company Law should guide the private entrepreneur to function competently within the broad social framework formulated by Parliament. The Committee has laid stress on the prime necessity of simplifying the existing law by eliminating its inordinate length, its involved language and the obscurity of many of its provisions. It will, then, be easier both for the enterprise as well as the administration to abide by the spirit of the law.

The Committee has quoted an assurance given by the Finance Minister in 1955 that the red tape in the execution of the Company Law would be reduced to a minimum and an attitude of "positive helpfulness" would be adopted towards the entrepreneurs. This remains even now a distant goal and much progress has not been achieved in this respect. "The Committee are perturbed to note that inordinate delays are taking place in investigations ordered by Government under Sections 234 to 251 of the Companies Act". Out of six cases pending investigation one has been outstanding for more than eight years, three for more than three years, one for more than two years and one for more than one year. Similarly the Committee has expressed doubts as to the practical utility of various forms and returns which are at present required to be filled with the Registrar of Companies. There are, therefore, various regions of Company Law Administration where red tape and duplication can be eliminated so that it may not operate as a serious obstruction for the entrepreneurs. To achieve this the Committee are of the view that close contact should be maintained by important officials of the Company Law Administration with the representatives of business organisations so as to enlist enlightened opinion for adoption of sound standards in company formation and company management.

The Report has made certain significant remarks about the role of shareholders. The number of shareholders in joint stock companies has increased from 450,000 to 500,000 in 1957 and to nearly 670,000 in 1961. This trend has by and large continued to operate in the following years. It appears slightly paradoxical that at a time when well organised unions and associations of all sections of the corporate sector have grown, the "shareholders who are the kingpin of the corporate system, cannot be said to be even loosely organised". There are indeed very few organisations of the shareholders as is confirmed by facts too. The total membership of the eight shareholders' associations in 1963 was 1,300 only as against the total estimated number of nearly 700,000 shareholders in the country. Out of these eight associations, five had a membership of less than 100 each. The Committee has suggested that Government should undertake suitable studies of the practice obtaining in other countries and facilitate the formation of shareholders' associations by drawing the attention of the public to the useful and wholesome role that can be played by such organisations. These associations can be developed into useful agencies for resolving conflict and misunderstandings between the investors and the company managements. It may be added here that one significant reason why the shareholders' associations have not developed is that their interests have been well protected by the promoters who have always held considerable respect for risk capital. It will, nevertheless, be a positive factor towards the maximum participation by the shareholders if their associations become more and more representative.

It is being increasingly felt that company secretaries who hold key positions in the corporate sector should have sound professional training. With that aim in view an Institute for Secretaries was established in 1956 on the initiative of the then Department of Company Law Administration. The Committee has, however, been informed that the institute unfortunately failed to fulfil the expectations of its sponsors and had to be wound up. Later on, the scheme for holding qualifying examinations was drawn up and examinations were held for the first time in March 1961. It is quite evident that examinations without the institution to impart training, could not be of much help. The Committee has, therefore,

TECHNO-ECONOMIC SURVEY

BOMBAY - 1.

suggested that the question of setting up of an autonomous body composed of representatives drawn from the Central Ministries concerned and from leading non-official organisations for the purpose of regulating training of the profession of company secretaries should be considered early.

In fact the Company Law Administration can make considerable contribution to the proper functioning of the private sector within the framework of the Company Law by conducting research on the points of conflict and confusion. It has been suggested that funds which accrue to the administration by way of fees realised from the joint stock companies and which have exceeded the amount of expenditure on the Company Law Administration should be spent on research in corporate matters and in imparting training to accountants, company secretaries etc. The Estimates Committee has, therefore, touched upon the theme that the understanding between the administration and the corporate sector should be increased to the maximum and the areas of conflict should be analysed by taking representatives from various interests so that the Company Law loses its harsh edges which hinder the natural flow of economic growth.

SPURT IN SUGAR PRICES

THE UNION GOVERNMENT has announced revised ex-factory prices of sugar, applicable from May 22, 1964. The revision has been effected in the light of the actual working of the sugar mill industry during the current crushing season.

The net effect of the revision in broad terms is:

(i) an increase of Re. 1 per quintal in the price of sugar produced by factories in Maharashtra, Andhra Pradesh, Madras, Mysore, Pondicherry and Kerala;

(ii) a decrease of Rs. 2 per quintal in the price of sugar produced by the factories in the Lucknow Division of Uttar Pradesh and in Gujarat and Rs. 2.50 per quintal in that produced by Orissa factories; and

(iii) an increase of Rs. 2 to Rs. 14.50 per quintal in the price of sugar produced elsewhere in the country.

The revised ex-factory prices compared to those authorised before May 22, 1964, for the various sugar producing regions in the country are given in the table opposite:

(Rs. per quintal)

Region	Revised Price from May 22, 1964	Price before May 22, 1964
1) East U.P.	120.25	116.00
2) West U.P.		
a) Meerut, Muzaffarnagar and Bulandshahr Districts	131.00	116.50 for factories in the Meerut Division and 115.25 for factories elsewhere in West U.P.
b) Saharanpur and Dehradun District	123.00	
c) Rohilkhand and Agra Divisions	120.50	
d) Lucknow Division	113.25	
3) North Bihar	120.00	118.00
4) South Bihar	134.00	122.00
5) Punjab	132.50	118.50
6) West Bengal	119.00	116.50
7) Orissa	114.00	116.50
8) Assam	127.00	116.50
9) Rajasthan	138.00	116.00
10) Madhya Pradesh	124.50	118.00
11) Maharashtra	116.00	115.00
12) Gujarat	116.00	118.00
13) Andhra Pradesh	118.00	117.00 for factories which had been authorised to pay Rs. 2 per maund of cane and Rs. 115 for others.
14) Madras	116.00	115.00
15) Mysore, Kerala and Pondicherry	116.00	115.00
16) Delhi	131.00	116.50

Bhubaneswar to Bombay

R. V. MURTHY

DIRECTION-WISE one has to go leftward to reach Bombay if one starts from Bhubaneswar. It is not surprising, therefore, to find this direction-finding reflected in the proceedings of the AICC session at Bombay also. At its Bombay session, the AICC adopted a resolution generally endorsing the Report of the Sub-Committee on "Democracy and Socialism", otherwise known as the Dhebar Report. In forwarding the resolution on this Report to the Working Committee, Mr. Dhebar wanted the latter to take necessary steps in the light of the recommendations made in the Report. But the general endorsement of the Dhebar Report followed the reply of Mr. Dhebar to the discussion on the subject, in the course of which he also asked the Working Committee to look into various suggestions made by members. The only suggestions he specifically—albeit feebly—ruled out were those relating to nationalisation of banks and participation of foreign equity capital. He indicated that his sub-committee did not go into the question of nationalisation of banks, because the Bhubaneswar Resolution had not mentioned it, and was not opposed to members re-agitating the question. His defence of foreign equity capital also seemed half-hearted, if not opportunist. In taking the line he did, it seems, he was more influenced by his concern as to whether the country could take the risk of slowing down the development by not taking foreign capital in any form. In other words, on both the crucial questions—nationalisation of banks and participation of foreign equity capital — Mr. Dhebar was running with the hare and hunting with the hound.

Diluted Democracy

The AICC deliberations in Bombay give one the impression that the Congress has decided to take the next step on the march to socialism. Although the Bhubaneswar Resolution spoke in terms of democracy and socialism, the use of expressions like "viable democracy" in the Dhebar Report makes one apprehend whether, in the pursuit of socialism, democracy may not only become viable but also diluted. Certainly, if all the recommendations of the Dhebar Report are implemented — and nearly every speaker on the Report seemed to want the Congress actually to go further — there is bound to be more regimentation and, to a corresponding extent, encroachment on the fundamental rights of the people in a sovereign democratic republic. With the dozen or so restrictions proposed to be placed on the working of scheduled banks, for example, it is idle to pretend that these banks would be left with any worthwhile freedom. Presumably, these restrictions are deliberately designed to drive those in charge of these banks to a frame of mind when, out of sheer despair they might themselves feel like urging the authorities to nationalise banks! The suggestions offered by a few responsible members, some of them ex-Ministers, betray a complete ignorance of the working of commercial banks in a free economy. If commercial banks have to function as some of these suggest, these banks have to close their doors and wind up their offices. Their concepts of credit-worthiness may be all right from the point of view of extending credit to every agriculturist in the country, irrespective of the customary criteria, but then the managements of these banks must first either renounce or be freed from all responsibility to their shareholders. So long, at any rate, as the Industrial Policy Resolution of 1956 continues to hold the field and so long as the Congress continues to owe allegiance to the mixed economy concept, as the Dhebar Sub-committee also seems to do, any such abdication of responsibility on the part of the managements of commercial banks is inconceivable.

No one can afford to quarrel with the Dhebar Sub-committee objective in view and few, if any, will seriously question the desirability of achieving such objectives as ensuring the essential requirements of food, clothing, housing, education and health by the end of the fifth Plan. Everyone will also concede that the organisation and the administration have a moral responsibility to ensure these results, as also to make sure that not only the burdens and sacrifices but also the fruits thereof are equitably distributed. National effort too is necessary for the purpose. But will the approach suggested by the Dhebar Sub-committee meet the needs of the situation? The Dhebar Report itself admits that shortfalls in our plan targets in the past few years are not due to strategy but to implementation. Implementation not only pre-supposes will and determination, but also the presence of proper people with the right attitude and aptitude, if not training. At least two members who had been Union Ministers in charge of agriculture and who spoke on the subject, stated that the administration today is "anti-people" and there is complete lack of co-ordination. Without removing these serious shortcomings, it would be nothing short of making scape goats of the Chief Minister and the Minister in charge of agriculture to hold them responsible for certain given results.

Throughout the Dhebar Report, one notices an almost complete lack of faith in the capacity of the existing agencies to deliver the goods, which is not at all surprising in the prevailing atmosphere. And it is sought to remedy the position by drawing on the co-operatives and the public sector. This presupposes that all that is necessary is to create more co-operatives and to multiply bureaucrats and ignores the vital point that, without requisite attitude and proper training, the addition of mere members will only lead to a situation where too many cooks spoil the broth. When responsible Congressmen like Mr. G. L. Nanda himself admit that many members of the Congress, let alone the public, do not still know, and need to be educated, about socialism and its implications, where will the ruling party find suitable and trained personnel with the missionary zeal to undertake tasks that the existing agencies have been found to be wanting to discharge properly? In order to succeed, any ideology, including socialism, must have a cadre of trained band of devoted workers who subscribe to the ideology and are prepared to spread and implement that ideology. The Congress is still planning to prepare this cadre.

Logical Conclusion

It is all right to talk in terms of taking the country to socialism or some other "ism", only when one is conscious of, and is prepared to accept, the logical conclusion of such an approach. It is doubtful if the Congress is. If it is wrong and dangerous to do anything that might take us nearer to the capitalist countries, as, for instance, by accepting foreign equity capital, is it also not wrong to follow policies like collectivisation (which, we are told, is the only approach in a country where the farmers have small and uneconomic holdings) which will take us nearer to the totalitarian countries? The Prime Minister has said that non-alignment in the political field has paid dividends by making it possible for this country to receive help from both the camps. Is it not, therefore, worth considering whether a similar non-alignment policy in the economic sphere also is worth pursuing?

It may be argued that we may even work for a completely isolated or insulated economy in order to achieve what we want, but this would be to ignore the changes that have been taking place around us since the days of Marx and Engels. As a matter of fact, in one sense, the world seems to be veering round to the views of Adam Smith and his 'Wealth of Nations', and the one world of Wendell Wilkie does not seem so elusive after all. It is against the background of this changing pattern of world thinking that we have to fashion and formulate our economic and political ideas.

Yugoslav Agricultural System*

S. D. THAPUR

AMONG ALL the branches of economics, the one dealing with economic development is attached with great uncertainty and confusion, especially as regards its applied aspect. Rarely have two countries similar socio-economic backgrounds, sense of urgency about development among the people and the wherewithal of planning and execution. In the circumstances any judgment made about the policies pursued in a country has to be very cautious and well set in the backdrop of its traditions and aspirations.

Agrarian reforms in Yugoslavia have been a subject of critical appraisal by many Western economists. It is often believed that the pragmatic approach to economic problems, which Yugoslavia professes to pursue, has really not been taken to its right conclusions (as regards its agricultural policies). The result is a bad state of agriculture, which promises little hope of improvement. To examine this hypothesis, it will be useful to have a short survey of the system of land tenure of the country.

There are a few milestones in the twentieth century economic history of Yugoslavia; the period before the World War I, the inter-war period, the War, Liberation and the accompanying move towards collectivisation of the economy and the current period of re-appraisal or decentralisation. The present agricultural system has the scars of all these upheavals.

Attachment to Land

Although conditions differ in different parts of the country, the history of peasantry in Yugoslavia by and large has been a narration of long ceaseless effort of peasants to make their interests heard and safeguarded by the political powers that would be. All along, the average Yugoslav farmer has been greatly attached to his piece of land. And, even before the abolition of large farming interests, most farmers had won for themselves permanent rights in land. That had resulted in a relatively larger proportion of small farms. Most farms till 1945 were formed by sub-division of the existing holdings, rather than by bringing new lands under the plough. (No figures are available to show the development during the Period 1931 and 1941, but the trend indicated in Table I is expected to have continued.)

Before World War I, excepting the North-Western parts of the country comprising the Republic of Slovenia and the Northern parts of Serbia, there prevailed a very backward form of economy. Not to speak of industries, which are scarce till today in most parts of the country, the very working for the market was little known. Subsistence farming dominated the scene. And, as a consequence of progressive increase in population, farming had largely become an "excuse of employment".

During the inter-war period, conditions deteriorated still further. Pressure of population was increasing, but neither the cultivated area nor industrial employment came to the rescue. Before the World War II Yugoslavia was predominantly an agricultural country with about 73 per cent of its population dependent upon agriculture. Although cereal food supplies were just sufficient to meet domestic requirements, yet considerable segments of the population, especially the farmers in "passive regions", suffered from malnutrition and undernourishment. The unequal distribution of income in different parts of the country had resulted in local jealousies —a definite obstacle in the way of economic development.

The new Socialist Government after the war had to grapple with a number of problems. The crust of the subsistence farming had to be broken. The interests of the backward areas had to be specially taken care of. Productivity of land had to be improved by all possible means. And, the stability of agriculture was to be assured in the circumstances of rapid economic development contemplated for the country.

Source: Quoted by Dr. Tozo Tomasevich in his book, Peasants, Politics & Economic Change in Yugoslavia, 1955.

Factors determining the productivity of land can be grouped under physical, technological and "administrative" (in the sense of land policies). Land in most parts of the country does not have the natural blessings of good terrain, soil, and rainfall. An average Yugoslav farmer is, however, quite tough and hard working. What has handicapped him till date, compared to his compeers in Western Europe, is the smallness of his holdings coupled with the insufficiency of capital and difficulties in adopting better agricultural practices. According to a survey conducted in 1957, only 42 per cent of the private peasants were equipped to till their own land, while 45 per cent had to borrow necessary implements.[1] There is insufficiency of agricultural area in the country per head of agricultural population (1.6 hectares in 1961). Almost 30 per cent of private holdings are less than two hectares in area, and 40 per cent are between two and five hectares (Table II). The problem is further complicated by fragmentation of holdings. According to a FAO report [2], in Yugoslavia as a whole

peasant holdings, on the average, consist of eleven different plots.

The earliest decision that the Socialist Government took was with regard to collectivization of land holdings. But, quite interestingly, its enforcement was not accompanied by the usual communistic rigour. At the height of the movement in 1952, no more than 25 per cent of the arable land was held by the Work Co-operatives and State farms. The law had, nonetheless, resulted in widespread resentment and actual fall in the yield from land. It was soon realized that the mainspring to the solution of the agricultural problem lay more with new socialised farms that had resulted as an expropriation of war-time malefactors than with private farms. Firstly, those were located in comparatively fertile regions of the country. Secondly, they had the wherewithal of large-scale production which was lacking in the small farming areas. Besides, it was realized that the road to large collectivized farms could be built through service co-operatives and co-operative farms rather than direct. Hence, in 1953 the process of collectivization was discontinued.

It was nonetheless the intention of the Government to abolish absentee-landordism and improve the conditions of landless labour. With this objective, changes were effected in property relationships on the basis of two legal enactments. To begin with, agricultural estates were limited to 25 or 30 hectares, and later the maximum limit was reduced to 10 hectares of arable land.[3] Land over the prescribed limits was taken away after a stipulated compensation and distributed among either peasants with very small holdings or landless peasants or peasant settlers. The impact of the laws regarding ceiling on land holdings was not very large, as very few people (outside the group of so-called political malefactors) possessed land more than the ceiling. However, these measures won for the Government the loyalty of those benefited. But, if we look upon them in an empirical way, these measures were not intended to take the private holders fully into a co-operation with the socialised sector to solve the agricultural problem. First, they were unable to create a class of incentive-oriented peasantry. And secondly, the enabling measures of the Government to help a small farmer improve his productivity came late and have been of a halting nature.

As it is now, there is a dichotomy in the agricultural system of Yugoslavia. There are "social holdings"[4] and "holdings of individuals". The former use progressive agricultural techniques and practices, and the latter linger far behind. In 1962, the social agricultural organizations, i.e. socially owned large-scale farms, co-operative farms, co-operative agricultural organizations, etc., possessed a little less than 11 per cent of the arable and 15 per cent of the total agricultural area. They possessed 92 per cent of the tractors, all the cereals and "other use" combines and also the fertlizer distributors. Motor threshers, reapers, movers and sowing machines are the only implements used by private holders in a small way. While the disparity in the use of agricultural implements may be accounted to differences in the size of holdings, lower expenditure on fertilizer per hectare of arable land is a clear indication of lower agro-technical standard on private farms.

Macedonia	55	146
Montenegro	15	51

On the whole, since 1952 the private sector has not been keeping pace with the increasing total investment on agriculture in the economy.[5] No wonder, in the year 1961, "social holdings" with much less share of the area contributed 24 per cent of the total national production of wheat. They contributed 15 per cent of the maize and 47 per cent of sugar beet production. (See table VI).

In most developed countries whereas the settlement and land-use planning phase ended in the late 30's, the assistance to small farmers continued even later. Today, extension work in agriculture is an article of faith with most governments. Through this programme, the co-operation of the meanest farmer is sought to achieve the ends of increased production. It is rather ironical that Yugoslavia, which till late was styled as a political and economic peasant democracy, has cared the least for its farm population till late. Here, the political powers that would be, in the name of rational methods of agricultural work, have always forced down the throats of peasants the politics of doing things, rather than providing the appurtenances of doing them better. That was the condition some half a century ago, and it is no different now, although the long-term objectives in the two situations have changed.

In Yugoslavia there is a set of institutes in each of the states specialising in research on different branches of agri-

3) At present a family with its main income outside agriculture can hold up to 3 hectares of arable land.

4) The statistics regarding the socialised sector are intractable in the official documents, and for that reason have not been covered here.

5) Project - FAO de Development Mediterraneen, 1959, and the Survey on Peasant Holdings, FIS, Belgrade.

culture. For example, one institute may specialise on wine, another on fruits and still another on crops. These institutes carry out research on their own farms, and if necessary on private farms. They report their findings to the State Government, which may later be communicated to the Federal Government. At both these places the administrators rather than agricultural experts decide about the future of the proposals made. Once a particular scheme has been sanctioned, the research institutes communicate the new methods to be broadcast among cultivators to research stations. There are a number of research stations in each state; seven of them in Metohija having an agricultural population of 615,000. These stations have no government farms attached to them. They employ agronomists and veterinary assistants who at most places are attached to co-operatives. These people constitute the real extension staff. From their activities, and from personal enquiries made in the field, it has been found that the main concern of these experts is to see that the new methods are employed in the "Social Holdings". A very easy task indeed. The resistance and motivational problems that are confronted in the private farms rarely exercise their energies.

TABLE IV.

AVERAGE PERSONAL INCOME BY PEOPLE'S REPUBLIC

(In '000 dinars)

	1953	1961
FPRY	130	345
Serbia	110	296
Croatia	139	396
Slovenia	230	957
Bosnia and Herzegovina ..	113	380
Macedonia	104	252
Montenegro	98	277

Sometimes it is told that co-operative institutions rather than these experts make up the extension body. In that case, the position of those peasants who for certain reasons did not like to join a certain co-operative is still more ridiculous. They did not join an institute, but they have to depend upon the same for all help to improve their lot.

The result of such an approach is quite obvious. Excepting the spheres of "Fattened Cattle" and "Fattened Pigs", in all items of agricultural production the yield of land is significantly lower in the private holdings than in the social holdings. This is notwithstanding any rise in the yield of private farms recently. What is intended to be emphasised here is the disparity in yields of the two sectors. Conditions could have been still worse, but for a legal enactment with respect to "Agro-minimas".[6] Under this law all farmers are enjoined to observe certain discipline regarding land use[6a] and the use of fertilizers. But, it is difficult to say whether this law was designed primarily to serve the objectives of extension work, or was conceived as an insurance against food crises. Ordinarily, extension work cannot be understood in terms of compulsion. And, the element of incentives is eroded under a regimented approach.

At present, the condition of an average private land holder in Yugoslavia is poor. This is brought out by the results of 'Surveys of Feasant Holdings'. Since 1952, starting with a modest beginning of 600 holdings, there has been a continuous sample survey enquiry into the peasant holdings in Yugoslavia. In 1963, a total of 2200 holdings were surveyed. Tentative results of the 1962 enquiry reveal that although cash receipts per holding increased by 230 per cent during 1953-62, much of this gain (about three-fourths) was absorbed by increased cash expenditure. All through, there has been a trend of widening divergence between the earnings of those employed on "social holdings" and those described as "peasant holders". It has become very difficult for a peasant holder to make his living from agriculture. Many of them have already taken to non-farm work as a subsidiary source of income. In 1961, about half of the industrial labour force was of "peasant industrial workers". In 1953, 61 per cent of the total cash income on a private farm was derived from work on the holding, and the remaining from off-farm activities.[7] Although no moral, social, or political judgment is attempted on such a course of happenings, yet, one thing suggests itself. Yugoslavia, like any other Communist State, has looked upon the problems of agriculture only from a long-term range. There is an accepted policy of reducing dependence upon land.

TABLE V.

AGRICULTURAL EMPLOYMENT

(Agricultural workers as a percentage of total manpower in different republics)

	1953	1961	(1)—(2)
	(1)	(2)	(3)
FPRY	66.1	52.6	13.5
Serbia	71.5	59.0	12.5
Croatia	61.7	46.3	15.4
Slovenia	49.9	32.6	17.3
Bosnia & Herzegovina ..	66.8	56.7	10.1
Macedonia	67.4	56.5	10.9
Montenegro	66.0	47.8	18.2

6) To supervise the observance of these "minimas" by the farmers, each commune has one inspector. In addition, there are a few technically qualified persons who with the assistance of local people (primarily party members) do this police job. "Minimas", of course, vary from commune to commune.

6a) In February 1951, a law was passed regarding compulsory cultivation of fallow lands in Yugoslavia.

7) Paper on national income distribution in Yugoslavia by R. Bicanic (1955).

This will facilitate adjustments which industrial countries today find hard to achieve by transferring people from farm to industry. No doubt, such a course in Yugoslavia involves privation to those who are not immediately absorbed in industry.

A short survey in a few villages revealed that the earlier hard crust of peasants attachment to land in Yugoslavia is softening. Numerous cases of peasants selling their holdings to co-operatives[8] came to notice. Whether this is an indication of farmers having found security in non-farm jobs, or is consequent to their sheer despondency, is difficult to say. Perhaps, the truth lies somewhere in the middle. Anyhow, the objective of the Socialist Government to carve out big "social holdings" is being realised in the process. And that without coming into direct opposition with petty, extra-security minded land holders.

The question may be asked whether this change has helped the Yugoslav Government in increasing productivity of the land. The Agricultural Statistics maintained by the Federal Republic do show that there has been a significant increase in the yields of major farming crops since 1952, and, excepting rye, the production has crossed the pre-war (1930-39) level. But, the country is still in the throes of unsatisfied demand, emerging from increased population and change from coarser to finer types of cereals. In 1962, 14.3 per cent of the country's imports consisted of foodgrains. This is a position hardly to the liking of many. They would like to compromise with any unwritten policy of avoiding long-run waste associated with the continuation of either small farms or the privately owned large farms.

Most economists in Yugoslavia are for large-scale farms. There is some justification for the view. To talk of incentives to a farmer who is precariously eking out a living from his tiny holding is at times really a mockery of the term. There is a minimum beyond which crop farming can provide at best a hobby of keeping up the 'way of living' for the sophisticated, but cannot mean a business. This minimum will, of course, vary with the physical circumstances and scientific background of the people concerned. But that does not disprove the point. Even on a global scale, if the position of a farmer has not improved 'pari passu' with the industrial worker, the main reason is that farming did not avail of the economies of large-scale production as much as industry: advancing technology in agriculture has often been applied to one inflexible factor, i.e. the farm size.

†According to the Census of agricultural holdings in 1960.

Where one might differ with Yugoslav Government is in its inherent disbelief of the private sector. It is true that there are a few instances where farmers holding big farms in developing countries do not manage their business properly. But, all the same, there is little to prove that the change-over to big state farms works to the best. Too much should not be made of the current enhanced yields on large socialised farms. The factor of cost of production in public enterprises is the weakest link of a socialistic economic structure. A reference to farm management accounts of a few co-operative farms in Yugoslavia showed that full apportionment was not being made for rent and interest parts of the costs. Again, it is possible that if the privileges granted to the "social holdings" are taken into consideration, then the surplus imputed to them may lose much of its glory.

An answer has been attempted by a few of the interviewed administrators in Belgrade that they would also like

to keep in view the aim of emergence of a socialistic spirit. They would justify a little compromise with productivity on that ground. According to them, the motivation of private profitability has to be thinned as much as possible before a humane order of things can emerge. The advice one could proffer to such people is to stop crying for the moon. The idealistic condition when an individual will seek his interests in the womb of total social interests is yet a far cry. And to hurry up its achievement is to invite troubles. One could say that he is prepared to pay a price for this noble goal in terms of lower growth rate. But, one should not forget that the appeal of such sermons falls flat on ears where listeners feel only the iron of poverty in their soul. Again, it is an over-simplification of the issue to say that a "social man" would be born only in a particular politico-economic set-up.

TABLE VIII.

Source: Project-FAO de Development-Mediterraneen (1959).

The argument that in "social holdings" incentives are being maintained through the institution of working councils is equally weak. A quick survey of a few commercial and industrial concerns in Yugoslavia, where such councils have been operating now for quite some time, revealed that all is not well with them. Efficiency of these enterprises hardly compares with what one comes across in free-enterprise economies. Bureaucracy and lack of responsibility on the part of operators hardly befits a business concern. I had personal experiences of this sort in hotels, restaurants and shops. And, the magnitudes of "wastages" reported in industries should only moderate undue faith in "working councils", as a substitute to private initiative and profit motive.

That big farms would be more responsive to the behests of planners has some truth in the present circumstances of subsistence farming. As long as a farmer parcels out his little farm into small crop fields, considering only his domestic requirements, development of any sort is difficult to imagine. But even here one could say that the alternative is not irresistably the "socialised" farms. In a planned economy, before long the instruments of control (primarily financial) would be so perfected that even large-scale private holdings become responsive to plan priorities, as regards the production of different crops.

The confusion that exists at present over the agricultural policy of the Government can largely be explained as due to lack of clarity about objectives. If the goal is collectivised farms, the current measures have certain justification, but

Dena Bank was founded on 26th May 1938. The story of its growth is the story of perseverance and determined efforts to pioneer, develop and bring modern commercial banking to as many people as possible.

Since its inception, Dena Bank has striven to live up to the four cardinal ideals of its revered founder, the late Shri Pranlal Devkaran Nanjee - ***SOUNDNESS, INTEGRITY, EFFICIENCY*** and ***SERVICE***. Today, with its 137 Offices spread all over India, its sphere of activity has enlarged and with it have grown the faith and confidence of those it serves.

Now completing its 26th year, Dena Bank looks ahead to many years of fruitful service to commerce, trade, industry, and the people at large — a fulfilment of its mission that was started in 1938.

THE AUTOMOBILE INDUSTRY . . . .

helps raise national revenue

The automobile industry is currently contributing some 260 crores of rupees yearly to the national exchequer—towards the funds required for providing the nation with free education and medical aid, better housing and cheaper electric power, more irrigation works, greater agricultural production and a host of other public needs.

In the price structure of the Hindusthan Ambassador, for instance, the Government's share constitutes about 33% of the total "on the road" price of the car in Calcutta (or 5140 rupees per vehicle).

Besides the automobile manufacturers, the producers of tyres, batteries, oil and a great many other suppliers all contribute their share in the form of taxes, duties and other fees. The ancillary industries which supply a large portion of the requirements of components of motor vehicles constitute another rich source of revenue to the Government. Cars like the Hindusthan Ambassador today utilise more than 80% indigenous content, of which the ancillary industries supply articles worth some 3628 rupees per car. This represents 24% of the "on the road" price of this car in Calcutta.

A further contribution to the national exchequer is provided by the income tax paid by the increasing number of employees of the automobile and allied industries.

CAR PRICE STRUCTURE :

Government taxes, direct and indirect :	33%
Raw materials, manufacturing and overhead expenses, salaries and wages, depreciation, profit etc. :	28%
Indigenous ancillary components :	24%
Imported components :	11%
Dealer's commission including distribution, service, advertising etc.:	7%

if co-operative endeavours through people's spontaneous and voluntary desire are aimed at, then a stagnant or staggering growth in the private sector is hardly conducive. Only in the circumstances of continuing prosperity, will voluntary co-operatives find the wherewithals to start. The Government by providing all genuine help to private land holders could, of course, speed up this process. Had the Yugoslav Government pursued this policy, the present food picture of the country would surely have been different. The method of working councils, with all its merits, exposes the food of the nation to hazards which by now have become characteristic of the industrial sector there.

1959	250,3	100,8	31,4	29,1	36,8	3,5
1960	271,3	108,1	31,2	33,4	38,1	5,4
1961	305,9	122,8	35,1	37,5	45,6	4,6
1962	342,0	135,1	41,4	40,2	50,0	3,5

1) Cash expenditure on seed, seedling, manufactured fertilizers, small earth work paid and similar.
2) All cash investments for purchase of livestock, land, machinery and for agricultural buildings.

WINDOW ON THE WORLD

West German Tariff Cuts

From Our Special Correspondent

PARIS:

THE FIGURE of 30,000 million Deutschemarks for West Germany's gold and dollar reserves had come to have a symbolic importance since 1960. Currency speculators calculated that once Bonn's reserves exceeded that level, the upward revaluation of the German currency became a live issue. In April 1961 they reached the record total of 32,500 million DM and the mark was revalued. By the end of 1962 they had fallen to 27,700 million DM, but after two consecutive years of payments deficit, they began to rise again last year and by the end of December again exceeded the significant figure of 30,000 million. Arguing that like causes have like effects, capitalists again began to expect a revaluation of the mark, and their despatch of funds to West Germany contributed to the persistent increase in German reserves in recent months. In reality the situation was very different to 1961, and the measures taken by Bonn this month do not include (and will probably make unnecessary) an upward revaluation of the currency.

Unilateral Reduction

The most important of them is a unilateral reduction of import tariffs, designed to facilitate the exports to the Federal Republic of her trading partners and hence to moderate the large and growing trade surplus she scores in commerce with the rest of West Europe. Incidentally, this freer inflow of imports (and at lower prices, to the extent that the big reduction in some duties is passed on to consumers) will bring pressure on West Germany's domestic prices, which currently are rising as fast as French prices have been since the stabilisation operation in France began to take effect. (German retail prices have risen 1.3 per cent in a year; French prices, in the past seven months, have been rising at the annual rate of 1.2 per cent). The major beneficiaries of this reduction of tariffs are naturally the other members of the Common Market. The two 10 per cent duty cuts (meaning 10 per cent of the duties in force in 1957) that West Germany would have had to implement, along with her partners, in accordance with the Rome Treaty, on January 1, 1965 and January 1, 1966 have been brought forward to July 1 next. This is just an anticipation of what was to be done in any event; but since tariffs had already been cut to 60 per cent of the 1957 level, to cut them to 80 per cent means halving the import duties at present being charged. In a further anticipation on the future, all duties on goods from elsewhere in the Common Market that now are under 4 per cent will be entirely abolished on July 1.

So that the discrimination against non-members of the community that this involves will not similarly be brought forward, West Germany will also, at the same date, anticipate the movement toward the common external tariff wherever that means lowering a duty. It does mean that in regard to 300 articles. (The fact that there are so many cases where existing German duties are higher than what the whole Common Market will one day impose is a reminder that the common tariff is not such a bad thing for exporters to the Federal Republic). The consequences of this for the German trade balance and for domestic prices will be the same, though less marked, as for the reduction in internal ECM duties. The difference in treatment meted out to members and non-members of the community is not only justified by the Treaty, which it simply anticipates, but also by the structure of West Germany's trade and, in particular, the sources of its trade surplus. The other five members of the community supply 33.2 per cent of German imports (against 18.7 per cent for the Free Trade Association), so reduction of duties on their goods will have the speediest economic effect. Besides, it is they that have been buying most of the extra German goods exported (Italy and France alone took 57 per cent of the additional German exports last year) and so it is in trade with them that Germany's surplus has been rising fastest. In fact, that surplus more than doubled last year, from 2,600 million DM to 4,400 million DM. The trade surplus earned with the Free Trade Association only increased 15 per cent last year; that surplus is in fact larger than is scored in trade with the rest of the ECM, but that has always been true and reflects dependence on German goods by the Swiss, Austrians and Scandinavians.

Though the reduction of Germany's duties on 300 articles imported from outside the community will enable some non-members to boost their sales there (the British in particular can look for a better market for their steel-products and textiles), the more evident (and earlier) discrimination between members and non-members is resented. To meet that objection, Bonn has suggested that the future common external tariff of the Six be fixed at 25 per cent below the everage of the six national tariffs (and not 20 per cent below, as so far envisaged). That would mean that on July 1, the 300 duties in question would fall lower, scores more among Germany's tariffs on goods from outside the community would be cut — and eventually, when the Six brought their common external tariff into full effect, almost no German duties would have to be raised, while French and Italian duties would be reduced further than is now scheduled.

Long Range Effects

Obviously, in making this suggestion (which Bonn cannot of course implement without the unanimous accord of her five partners), the Germans are not thinking only of their current balance-of-payments embarrassments. They are thinking of the long-range effects of tariff discrimination between the two European trade blocs: duties inside those two communities will in the long run fall to zero, but to the extent that their external tariffs are lower, the preference this entails would be less significant. Existing trade currents between Germany and the Continental members of the Free Trade Association could be maintained, and German exports to those countries would be better able to withstand British competition in such "traditional" markets.

That prospect is appreciated in the other Common Market capitals, where, much more than two years ago, there is awareness of the danger of losing Swiss and Scandinavian custom to Britain in the event that the ECM and EFTA discriminate too much against each other. The French view, for example, used to be that, given that the ECM's common external tariff is already the last protectionist of tariff schedules and is notably lower than the British or American, it ought to be kept as high as possible. At present, the opinion is rather that it ought to be kept as low as is consistent with the existence of a sufficiently marked mutual preference inside the region to encourage genuine economic unity. This is only a nuance perhaps, for no one knows precisely what level of external duties suffice to safeguard the internal unity of a community without disrupting its trade with outsiders, but there is definitely a change of attitude. The German suggestion, therefore, will get a hearing.

Not yet however. Bonn has made a mistake in connecting this issue with its action on tariffs to correct European trade unbalance, for the situation of its partners is at present quite different. All of them — Italy, France and Benelux — are running trade deficits of varying proportions and do not consider this the moment to facilitate imports. They will not even reciprocate Germany's advance reduction of duties inside the region, let alone lower their guard against imports from outside, by anticipating on the results of the Kennedy Round. In Geneva, incidentally, the German proposal has been well received by the Common Market's interlocutors — but it has also served underline the illogicality of the German position, which amounts to liberalising trade in manufactures while resisting liberalisation of trade in farm produce. Yet if there is one thing on which Paris and Washington are in agreement today, it is that freer trade in industrial goods is dependent on freer trade in agricultural products.

The immediate question is whether the German duty cuts will suffice to correct the discrepancy of massive German trade surpluses and growing trade deficits in the other five countries of the Common Market. By themselves they probably would not, but of course they are not "by themselves": the German decision is part of a community effort to control inflation in the Common Market. Combined with the stabilising measures taken in France and Belgium (and much less successfully so far in Holland and Italy), they have every chance of restoring a better balance in the region by the end of this year. Inflation is, for the time being at least, checked in France; German sales there have been rising less quickly than in Britain and Holland in the past six months, and of course much less quickly than in Italy. That latter country is still the community's sick man, and is primarily responsible for draining German exports (or, as Bonn puts it in a phrase that irritates its partners, is "exporting inflation across the Rhine").

While one waits for events to deal with these forecasts, the important thing to note is that this is the first major experiment between nations in collaborating in a joint attack on the complementary maladies. International co-operation in this region has left behind such competitive remedies as interest-rate manipulation and trade restrictions, devaluations and upward revaluations. It happens that the role that has fallen to West Germany in this collaboration well accords with Bonn's liberal orthodoxy, while France's obligations have been met by use of the interventionist techniques favoured in Paris. But the progress toward harmonisation of short-term economic policy is notable.

Central Banks and Euro-Dollars

PAUL EINZIG

LONDON:

THE ANNUAL REPORT of the Bank for International Settlements, due to be issued next month, is expected in banking circles with even more than usual interest, because it is understood to contain some of the findings of the expert committee appointed last autumn for the investigation of the Euro-dollar problem. Although the development of the market in foreign currency deposits has always been followed closely by individual Central Banks as well as by the International Monetary Fund and the Bank for International Settlements, this was the first effort on the part of a representative body of Central Banks to make a comprehensive survey. The Bank for International Settlements is all the more qualified for the task as the Western European countries primarily concerned with Euro-dollar and other Euro-currency transactions, and Japan, one of the principal borrowers of Euro-dollars, are strongly represented on its board and on its executive. Moreover, the Bank itself has been operating in Euro-currencies for years, both on its own account and on account of various Central Banks.

A preliminary draft of the report was circulated among Central Banks in January and some of the findings found their way in the Press. To a large degree these findings appear to have been negative. The committee was unable, for instance, to compile reliable statistics of Euro-dollar and other Euro-currency deposits, even though this was one of the most important aims of its investigations. The main obstacle was the absence of a uniform date for the monthly returns which banks in most countries make to their respective Central Banks. If all banks were to report the amount of their Euro-currency lendings and borrowings as at, say, the 15th day of each month, it would be a matter of simple arithmetic to ascertain the totals outstanding on that day. Actually, the monthly returns of banks are made up for different dates in various countries, so that if the amounts they contained were to be added together the same Euro-dollar deposits are liable to be included repeatedly.

The first step towards ascertaining the facts about the Euro-dollar market would be, therefore, to bring this chaotic state of affairs to an end. During recent years co-operation between Central Banks has made good headway. Surely it would be a simple matter to come to terms on the adoption of a uniform date for the monthly returns of banks.

The committee is believed to have arrived at the conclusion that the Euro-dollar system has come to stay as a permanent part of the international credit system and that, temporary setbacks apart, it is likely to expand, though probably not on the same spectacular scale as during recent years. While recognising its disadvantages and dangers, the committee is believed to have reached the conclusion that on balance the change represented by its advent has been one for the better, as the new device does facilitate the much-needed international distribution of funds. On the other hand, the report is expected to raise a warning voice against excessive or indiscriminate lending of Euro-dollars, also against the growing practice of borrowing short Euro-dollars and relending them for long periods.

It is believed that the report will express itself against lending of Euro-dollars on a large-scale by the Central Banks themselves. As a matter of fact, most Central Banks have already discontinued their formerly prevelant practice of lending in the Euro-dollar market their dollar reserves, whether directly or indirectly through the banks of their own countries. They must have realised that in doing so they tended to weaken their own control over their money markets and the credit structures of their their countries. The Deutsche

Bundesbank, for instance, found that by granting German banks swap facilities on terms on which it was profitable for the latter to invest in Euro-dollars the dollars temporarily acquired from their Central Bank, it placed liquid resources at the disposal of European banks many of which used them for the purchase of D. marks, so that the unwanted funds found their way back to Germany. To avoid this, under the new arrangement the German banks are only allowed to employ the swap dollars for the acquisition of U.S. Treasury bills.

It is understood that the reaction of the various Central Banks to the draft report of the Bank for International Settlements varied according to their particular interests in the new practice. The monetary authorities of countries whose banks and leading business firms were borrowers of Euro-dollars on a large scale could not be expected to hold identical views with the monetary authorities of countries whose banks were lenders on balance. Even so, the fact that both Italy and Japan have reduced their borrowing of Euro-dollar deposits since their Central Banks received the draft of the report is not without significance.

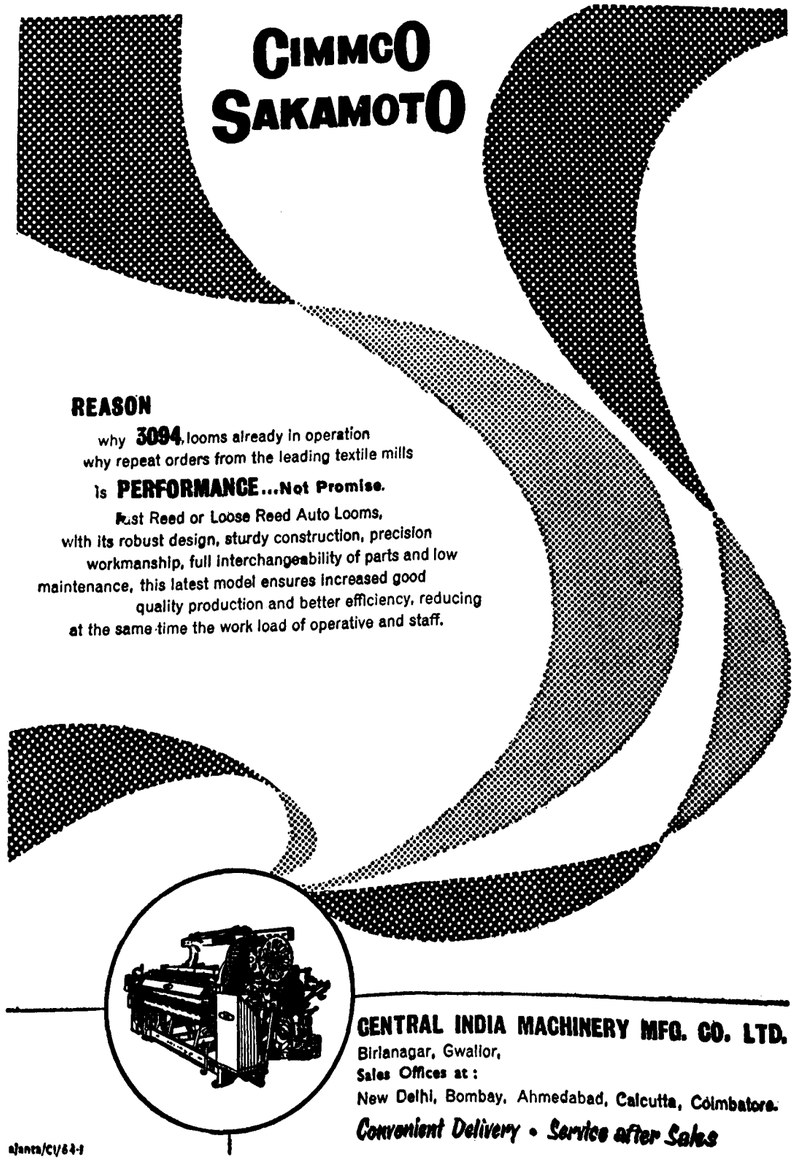
Presumably only those findings of the committee will be published in the annual report on which a large measure of agreement is reached between the Central Banks represented on the Bank for International Settlements. Even so, banks in all countries will no doubt be interested to know the conclusions on which it was possible to reach agreement. Most of them may be inclined to listen to the guidance given from such authoritative quarters, all the more so because, since the losses and immobilisations suffered by some lenders of Euro-dollars as a result of difficulties in Germany and the United States last year, the formerly carefree attitude of dealers in Euro-dollars has in any case given way to a more cautious attitude.

New Tool to Aid Economic Development

GUY SIMS FITCH

WASHINGTON:

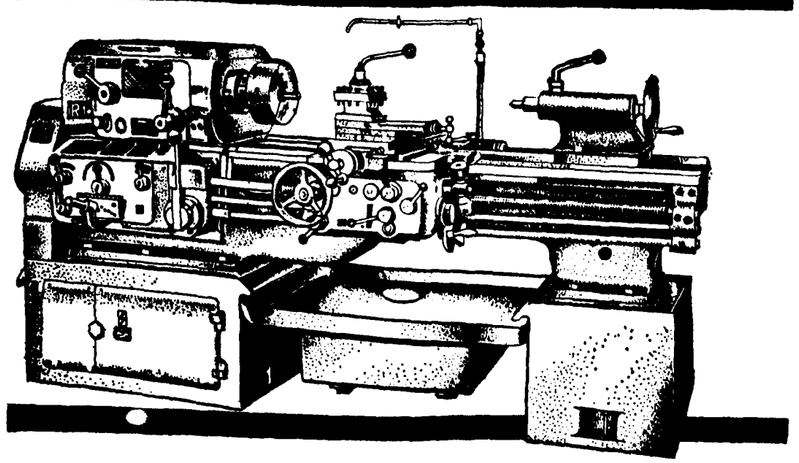
TO AN INCREASING degree, the US Agency for International Development (AID) has been emphasizing the role of private investment and enterprise as an integral part of the economic assistance effort around the world. Reflected in this emphasis is the growing awareness that governments cannot do the entire development assistance job, that private economic sectors have the capital, the resources and the know-how to shoulder a large and essential part of the task. One of the common complaints of business men, however, has been the lack of basic information about worthwhile foreign investment opportunities, paritcularly in developing areas, where the stimulating effects of private investment are most needed. Now, through a new project AID is meeting this complaint and is making it easier for business men to seek out and evaluate such opportunities.



Investment Studies

About six months ago, AID decided to put to effective use the many investment studies of developing areas that too often were gathering dust in its offices, and in other public and private offices around the world. These studies have now been pulled together under AID auspices by a private American research organization; in all, some 2,500 such reports in 18 languages from 1,800 US and foreign sources have been called. Of these, close to 1,500 have thus far been found suitable for compiling into a catalogue of reasonably up-to-date and sound investment opportunities in less-developed countries in Asia, Africa and Latin America. All relevant data concerning each opportunity are abstracted and placed on record cards, which are coded and punched for easy reference and filing. Included is information on such factors as market potential, capital requirements, manpower and material resources, and the general investment climate. Accompanying this catalogue is an index breaking down the investment opportunities by region and country, and by industry. AID is doing all it can to make the catalogue available to as many potential investors, American and foreign, as possible. The catalogues also will be available in Europe, with the 21-nation Organization for Economic Co-operation and Development (OECD), an important focal point. In addition, they will be available in Latin America in Spanish and Portuguese, thereby hopefully stimulating private investment by Latin Americans in Latin America, and enhancing the effectiveness of Economic Development Programmes in that region. It is too soon, of course, to tell how effective this new approach will be. But AID officials already note an enthusiastic response from business men throughout the United States. The project's primary appeal is not so much to the big companies with long international experience, but rather to those companies of all sizes, including small and medium-sized concerns, which have not ventured abroad to any extent. Thus, the project promises to tap new investment capital which otherwise might not have been available to the developing areas.

Catalogue System



One of the problems in this regard has been the relative lag in private investment in these areas. The net value of American private investment abroad (i.e. US investments abroad less investments by foreigners in the United States) totals about $33,000 million, and it has been growing by nearly $2,000 million a year. But at a time when the US Government's economic assistance has been redirected almost exclusively to developing areas, private investment has continued to go largely to the more advanced countries, where opportunities are better known and economic and political conditions often are deemed more propitious. The new catalogue system may point the way to a solution of this problem. It supplements other AID mechanisms designed to stimulate capital investment in less developed lands, such as the investment guaranties and special tax incentives. It also complements major AID programmes in the realm of development and technical assistance, which help build the institutions and the economic climate in which private enterprise and investment can operate effectively and constructively.

AID cannot vouch, of course, for the complete accuracy or reliability of all the investment studies that have gone into the catalogue. But there is presumption of professional competence in their preparation. Furthermore, an interested private investor more than likely would undertake a more comprehensive pre-investment survey, on his own or in co-operation with AID's investment survey programme, before going ahead with an apparently promising lead. Even if the investors were to decide finally not to go ahead with the project, this new study then would be available for other potential investors to see and to judge for themselves, as the catalogue is constantly up-dated and improved.

LISTENING POSTS

Co-ordinates of the Perspective Plan

By Our Special Correspondent

NEW DELHI:

WITH THE critical appraisal of the Perspective Planning Division's paper on the fourth and fifth Plans at the hands of the various Working Groups of the Planning Commission expected to take more time than anticipated earlier, the National Development Council's meeting for deciding on the broad outline of the fourth Plan has been put off by about three weeks to the end of July.

Meanwhile, fuller details are now available of the Perspective Planning Division's exercise on the programmes of development that should be aimed at during the 10 years to 1975-76. The exercise takes into account four basic objectives: (i) the need to ensure by 1975-76, a minimum consumption of Rs. 20 per capita per month to the entire population: (ii) the need to create by the end of the fifth Plan period a self-generating economy capable of sustaining an average annual rate of growth around 7 per cent without assistance from abroad; (iii) the desirability to achieving by 1975-76, a near balance between new employment opportunities and the new entrants to the working force; and (iv) ensuring of a social order which will afford equality of opportunity and which at the same time shall prevent excessive disparity in income and wealth.

Ensuring of a minimum consumption of Rs. 20 per head per month for the entire population by the end of the fifth Plan period (population growth assumed at 2.4 per cent per annum), the Perspective Planning Division has calculated, will require raising of national income from nearly Rs. 18,000 crores in 1965-66 (as against the third Plan target of Rs. 19,000 crores) to Rs. 37,300 crores (at 1960-61 prices) in 1975-76. It suggests that the fourth Plan target may be set at raising the national income to Rs. 26,000 crores. This and the objective (ii) mentioned above imply that the average annual rate of growth during the fourth and fifth Plan periods has to be 7.7 per cent and 7.5 per cent respectively. According to the Perspective Planning Division, the economy can grow at this rate with less and less dependence on foreign aid, if the rate of savings for investment within the country can be stepped up from 14-15 per cent of the national income in 1965-66 to 21 per cent in 1970-71 and thereafter. Along with this, exports will have to be increased to about Rs. 1,220 crores by 1970-71 and Rs. 1,620 crores by 1975-76. Imports will have to be restricted to Rs. 1,360 crores in 1970-71 and Rs. 1,610 crores in 1975-76. The Perspective Planning Division has suggested that the net rate of growth in the agricultural sector should be 5 per cent per annum and in the industrial sector a minimum of 10 per cent. Some of the selected targets proposed for agricultural production and under the fourth and the fifth Plans are given in the next column.

The acceleration in the overall rate of growth of the agricultural sector, the Perspective Planning Division opines, has to be accompanied by changes in the pattern of output. The programmes of agriculture have to be geared increasingly to the development of commercial crops and animal husbandry.

According to the Perspective Planning Division, the overall rate of growth in the industrial sector has to be just double the rate of growth in agriculture. The strategy here has to be not only to develop machinery and equipment manufacturing industries, but also to expand domestic production of various man-made industrial raw materials. A very high rate of growth (nearly 18 per cent per year) has been suggested for the capital goods and intermediate industries during the fourth Plan period. Subsequently, the rate of growth in these industries may fall to slightly over 10 per cent. A substantial expansion is also envisaged in industries producing consumer goods. The rate of growth in these industries, however, has been suggested around 8 per cent — just commensurate to meet the anticipated demands for consumer goods in a consumption pattern allowing for 21 per cent savings for investment in 1970-71 and onwards. A 9 per cent rate of growth has been suggested for the small-scale sector during the 10 years to 1975-76. The following are some of the important targets suggested for the industrial sector (the figures in brackets indicate the capacity and production estimates for 1965-66):

Item	Unit	Production estimated in 1965-66	1970-71 Target	1975-76 Target
a) Foodgrains	(million tonnes)	90.0	122.0	151.0

29. Plastic (PVC Polythene)	350 (90)	600	270 (75)	550

The following targets have been proposed for the more important engineering industries (the figures in brackets are the estimates for 1965-66):

('000 tonnes)

Industry	Capacity Target		Production Target	
	1970-71	1975-76	1970-71	1975-76
1. Steel Castings and Forgings ('000 tonnes)	1,200 (300)	1,500	900 (300)	1,100
2. Commercial Vehicles ('000 Nos.)	150 (54)	200	125 (54)	175
3. Cars and Jeeps ('000 Nos.)	65 (40)	100	60 (35)	100
4. Motor Cycles and Scooters ('000 Nos.)	150 (55)	225	120 (18)	200
5. Passenger Coaches ('000 Nos.)	2.2 (1.9)	2.5	2.0 (1.9)	2.2
6. Wagons ('000 Nos.)	60 (40)	70	55 (40)	60
7. Diesel Locos (Nos.)	350 (70)	350	300 (70)	325
8. Electric Locos (Nos.)	200 (70)	325	150 (70)	300
9. Turbo-generators Steam ('000 KW)	2,600 (1,000)	3,600	2,100 (350)	3,000
Hydro („)	1,700 (850)	1,900	1,250 (250)	3,000
10. Electrical Transformers Upto 33 kV (million KVA)	8.5 (4.0)	15.0	7.5 (1.4)	12.0
Above 33 kV („)	16.5 (3.0)	22.0	13.0 (3.4)	18.0
11. Electric Motors Below 150 kW ('000 kW)	8,000 (2,240)	12,000	6,000 (1,865)	10,000
Above 150 kW ('000 kW)	2,000 (250)	3,000	1,500 (200)	2,500
12. Machinery and Equipment (Rs. crores)	—	..	2,891 (1,233)	4,466

The following production targets (in million tonnes) have been suggested for 1970-71 and 1975-76 for the important minerals (1965-66 estimates are given in brackets):

Coal (89) 140, 210; Iron Ore (27) 60, 90; Manganese Ore (2.1) 3, 3.9; Limestone (27.5) 52, 82; Copper Ore (0.9) 4.9, 8; Bauxite (0.92) 2.5, 4; Gypsum (1.1) 2.1, 3.25; Mica (0.032), 0.042, 0.05; Dolomite (1.2) 3.6, 7; Ilmenite (0.36) 0.4, 0.45; Crude Oil (16) 12, 15; Gold (in kg.) (5,000) 5,000, 5,000.

The demand for power is estimated to grow from 47.5 billion KWH in 1965-66 to 95.1 billion KWH in 1970-71 and 150.6 billion KWH in 1975-76. The total volume of goods traffic is estimated to go up from 197 billion tonne-kms. in 1965-66 to 328 billion tonne-kms. in 1970-71 and 500 billion tonne-kms. in 1975-76. The volume of passenger traffic is expected to increase from 184 billion passenger-kms. in 1965-66 to 261 billion passenger-kms. in 1970-71 and 378 billion passenger-kms. in 1975-76. The railways will be required to handle 226 billion tonne-kms. goods traffic and 121 billion passenger-kms. passenger traffic in 1970-71 and 318 billion tonne-kms. goods traffic and 151 billion passenger-kms. passenger traffic in 1975-76, as against 144 billion tonnes-kms. and 97 billion passenger-kms. in 1965-66.

The following targets have been suggested for the health services:

	Estimates for 1965-66	Target for 1970-71	Target for 1975-76
Hospital Beds (per million of population)	488	712	1,000
Doctors (per million of population	168.6	194.6	251.2
Expenditure on water supply and sanitation (Rs. crores for the 4th and 5th Plans as a whole)	156	250	400
Public expenditure on health Rs. per capita)	4.3	8.9	15.9

In regard to education, it is proposed that by the end of the fourth Plan period all the children between the ages of 6 and 11 years and 50 per cent of those in the age group 11-14 should be provided schooling. By the end of the fifth Plan period, 90 per cent of the children in the age group of 6-14 will be provided education. Enrolment of students for higher education is envisaged as follows:

(In '000)

	Estimated enrolments in 1966	Target for 1971	Target for 1976
Diploma			
Technical	126	218	321
Medical	58	221	300
Degree			
Technical	98	165	265
Medical	45	85	125
General	1,300	1,920	3,000

Some of the other selected targets proposed are: (i) Rural Electrification — 100,000 villages by 1970-71 and 200,000 villages by 1975-76, as against 40,000 villages in 1965-66; (ii) Employment — an additional 44.5 million in 1970-71 over 1960-61 level and an additional 26.1 million in 1975-76 over 1970-71 level; (iii) Housing — commensurate with the growth in population.

This massive developmental effort during the fourth and the fifth Plan periods, according to the Perspective Planning Division, will require a net investment of approximately Rs. 22,000 crores during the five years to 1970-71 and Rs. 34,000 crores during the subsequent five years. The year-wise investment has to steadily go up from approximately Rs. 2,900 crores in 1965-66 to Rs. 5,400 crores in 1970-71 and Rs. 7,800 crores in 1975-76. The investment in the public sector in 1970-71 is envisaged in the neighbourhood of Rs. 3,450 crores. It will increase to Rs. 5,200 crores in 1975-76. The private sector investment is contemplated at Rs. 1,950 crores in 1970-71 and Rs. 2,600 crores in 1975-76. The broad allocation of the Rs. 22,000-crore net investment proposed for the fourth Plan and the Rs. 34,000-crore envisaged for the fifth Plan has been made as follows:

Fourth Plan: Agriculture and Allied Activities Rs. 2,080 crores (public sector Rs. 1,050 crores, private sector Rs. 1,030 crores); Major and Medium Irrigation Rs. 1,120 crores (all in the public sector); Large-Scale Industry and Mining Rs. 6,440 crores (public sector Rs. 3,580 crores, private sector Rs. 2,860 crores); Village and Small Industries Rs. 700 crores (public sector Rs. 300 crores, private sector Rs. 400 crores); Power Rs. 2,300 crores (public sector Rs. 2,250 crores, private sector Rs. 50 crores); Transport, Communications and Tourism Rs. 4,050 crores (public sector Rs. 3,275 crores, private sector Rs. 775 crores); Education Rs. 550 crores (public sector Rs. 525 crores, private sector Rs. 25 crores); Scientific Research Rs. 120 crores (all in public sector); Medical, Public Health and Family Planning Rs. 700 crores (public sector Rs. 675 crores, private sector Rs. 25 crores); Housing Rs. 2,700 crores (public sector Rs. 700 crores, private sector Rs. 2,000 crores): Inventories Rs 1,400 crores (public sector Rs. 650 crores, private sector Rs. 750 crores).

Fifth Plan: (Both public sector and private sector)

Eastern Economist 20 Years Ago

MAY 26, 1944

THE FOODGRAINS Policy Committee, it would be recalled, had recommended that India must import for current consumption a minimum amount of foodgrains which could not be put at less than at the average of net imports for the preceding quinquennium, viz., 1,000,000 tons a year in round figures. In addition, the Committee recommended that the Central Government must forthwith build up a Central Foodgrains Reserve of 500,000 tons in order that it might possess sufficient manoeuvring power to break defeatism and to curb the monopolist who is prepared, for his own profit-making motives, to hold the Government in ransom. Consequently, the Committee pressed for a minimum import of 1½ million tons in the first year and of at least one million tons thereafter. The Government had fully accepted the recommendations of the Committee and had given assurance that it would approach the British Government and press energetically for the necessary shipping and other facilities. However the figures which are now available reveal a very disappointing picture. It transpires that only 364,000 tons of foodgrains were imported by the Government during the thirteen months ended January last. This is equivalent to the yearly rate of 336,000 tons or barely two-thirds of what the Gregory Committee deemed a minimum for a Central Foodgrains Reserve, quite apart from the additional import of one million tons for current consumption. In the light of the poor results of the procurement operations in regard to rice and the disappointing wheat crops, the position is unhopeful and Mr. Amery's admission last month that "the Government of India do not consider that the total amount of foodgrains raised in the country provides an absolutely safe margin for meeting India's full requirements," can be regarded merely as his wonted meiosis of a grave situation. Food must be accorded an absolute priority in the list of consumers' goods and any diversion of shipping space for the import of non-essential industrial consumers' goods instead of import of foodgrains must be deplored.

Agriculture and Allied Activities Rs. 3,400 crores; Major and Medium Irrigation Rs. 1,600 crores, Large-Scale Industry and Mining Rs. 10,000 crores; Village and Small Industries Rs. 1,000 crores, Power Rs. 3,400 crores; Transport, Communications and Tourism Rs. 6,100 crores; Education Rs. 860 crores; Scientific Research Rs. 240 crores; Medical, Public Health and Family Planning Rs. 1,000 crores; Housing Rs. 4,300 crores; Inventories Rs. 2,100 crores.

Besides the net investment proposed above, there has to be during the fourth Plan period a current outlay in the public sector of the order of Rs. 2,170 crores, divided as follows: Agriculture and Allied Activities Rs. 640 crores; Village and Small Industries Rs. 200 crores, Education Rs. 870 crores; Scientific Research Rs. 130 crores; and Medical, Public Health and Family Planning Rs. 330 crores.

The Perspective Planning Division suggests that the public sector investment in 1970-71 and 1975-76 should be arranged as in the table alongside (the figures in brackets indicate the likely pattern of investment in 1965-66).

The investment in the private sector, it has been suggested, should be arranged as follows (1965-66 estimates are given in brackets):

(Rs. crores)

	1970-71	1975-76
Total Investment	1,950 (1,100)	2,600
Financed out of		
1. Corporate Savings	310 (160)	500
2. Non-corporate Savings	1,590 (890)	2,100
3. Direct External Assistance	50 (50)	Nil
Total Investment	3,450 (1,800)	5,200
Financed out of		
1. Balance on Revenue Account	630 (225)*	1,120
2. Surpluses of Public Enterprises†	750 (355)	1,630
3. Market Borrowings	445 (270)	725
4. Small Savings	180 (140)	220
5. Annuity Deposits	60 (70)	40
6. Provident Fund	105 (75)	145
7. Deficit Financing	250 (150)	325
8. Other Miscellaneous Capital Receipts	130 (15)	205
9. External Resources	300 (500)	Nil
11. Gap to be covered by additional taxation	600**	790**

The estimates of corporate savings indicated in the above table assumes that the existing rate of return on capital (approximately 13 per cent) would be maintained and 50 per cent of the net profits earned by the corporate sector would be retained for ploughing back. Although the Perspective Planning Division rules out the necessity of securing foreign aid after 1975-76, it does not preclude normal net inflow of foreign private capital after that year.

*Includes the additional taxation that may be levied in 1965-66.

**Includes the accrual to revenues on account of additional taxation levied between 1966-67 and 1969-70 in the case of the fourth Plan and between 1971-72 and 1974-75 in the case of the fifth.

†Assumes that all public sector undertakings other than railways and P & T will earn a return of 10 per cent. The return for railways and P & T is assumed at 6 per cent.

Dispersal of Sugar Factories

From Our Correspondent

BOMBAY:

INAUGURATING THE 19th annual convention of the Deccan Sugar Technologists' Association at Poona, Mr. V. P. Naik, Chief Minister, said that in view of the well-established superiority of Maharashtra in sugarcane production, there was a strong case to set up more sugar factories in the State. Maharashtra should be allowed to increase her sugarcane acreage in the national interests in preference to less fertile areas like Uttar Pradesh which might even divert some of its sugarcane farms to other crops. The less fertile sugarcane areas could possibly grow more of other food crops. Mr. Naik agreed in principle with the Association President's suggestion for better commercial exploitation of the by-products like molasses and bagasse. The President of the Association, Mr. M. L. Apte, said that consideration had to be shown to the sugar industry and its problems mainly from the point of view of its economic potentialities. He deprecated the State Government's decision to put up 11 new factories as the existing units would have produced better results by expansion. Such mistakes in the past had created problems of inadequate cane supplies. New units should be set up only in regions where there were no factories. Mr. S. N. Gundu Rao, former Director of the National Sugar Institute, Kanpur, addressing the convention said that India could hope to export raw sugar to Canada and the US. Mr. Rao, while on his recent foreign tour, acquainted the US, Canadian and other importers of Indian raw sugar of the merits of the general Indian type (broad spectrum) of raw sugar, a common tailored-type quality suited to different technical requirements of the importing countries. He had undertaken the tour to clear some technical points raised by Canada and discuss about the starch content in Indian sugar. Canada preferred high sucrose quality and Japan, high filtering quality with minimum POL (chemical sucrose), while the US preferred minimum starch and wax contents. Some of these specifications were not explained by the ISMA to its members. He also said that quality of Maharashtra's raw sugar rated high among the Indian varieties and it had good prospects.

★★

The development of industries in and around Bombay city and the rapid growth in the city population have posed a challenge to the capacity of providing telephone facilities during the period. Mr. M. S. Muthanna, General Manager of Bombay Telephones, speaking on the progress made by the telephone system in the city said that the Telex exchange opened in June last, has become very popular and so it had been decided to add another 300 lines to the exchange bringing its total capacity to 500 lines. The expansion was expected to be completed early next year. He said that with the opening of a 4,500 line-capacity exchange at Khar the capacity of the Bombay's telephone system will be 72,650 lines, which means an addition of nearly 24,000 lines during the three years of the third Plan. The capacity is expected to exceed the one-lakh mark before the end of the Plan period. The Khar exchange, a Rs. 69-lakh project, has an initial capacity of 8,000 lines and ultimate capacity of 16,000 lines. The trunk service is being completely modernised by the installation of an automatic trunk exchange. With the completion of the coaxial cable project linking the cities of Calcutta, Bombay, Delhi, Madras and Kanpur, subscribers in Bombay will be able to directly dial numbers in many important cities of the country by 1966.

★★

A seven-men Expert Committee which was appointed by the Gujarat Government to make a detailed study of the industrial potential of Kaira District, has recommended the immediate setting up of a spinning mill with a capacity of 12,000 spindles on a co-operative basis and also a cotton processing unit in the district. The Committee has observed in its report that there are as many as 600 power-looms in Cambay alone. They are facing difficulty in procuring the necessary quantity of yarn. It has, therefore, been strongly recommended that as a solution, a co-operative spinning mill should be set up. It has also pointed out that about 12,000 tons of cotton-seeds are annually available in the district, which justifies the starting of a seed processing unit with a daily capacity of 35 tons. In the considered view of the Committee, Kaira District has vast potential which, if properly tapped, can turn into a busy flourishing industrial area. The district has a population of about 2 million, and is very rich in raw materials and human talent. On this basis, the various important recommendations made by the Committee for the industrial development of the district are: 1) In view of the growing demand of skilled personnel, the Gujarat Government may consider the starting of industrial training institutes at Anand, Cambay and Nadiad. The training may specially be imparted in such trades as fitters in mechanics, electrician turners, welders etc. 2) There is the possibility of setting up one sugar mill in the district. 3) Nearly 40,000 tons of tobacco of Virginia variety is grown in the district; there appears to be the feasibility of one more unit for the manufacture of nicotine sulphate insecticide by using tobacco studs and stems as basic raw materials. 4) There is availability of waste materials like rice bran and paddy husk. At least one unit can take up the production of oil from rice bran by the solvent extraction process. Another unit may also find the material available for activated carbon from paddy husk. 5) Industries, such as instant food canning of fruits and vegetables, cattlefeed and papaiya fruits, will have adequate scope for development. 6) In view of the availability of oilcake in plenty, there appears to be a possibility of an additional unit for making manure mixture and cattlefeed. 7) There is scope for the establishment of a solvent extraction plant with a capacity of 25 tons per day. 8) There is yet 200 tons of milk available daily for collection and, therefore, it is possible to organise one more dairy with a capacity of 50 to 60 tons per day. The Committee has called upon the authorities concerned to give urgent attention to the development of Cambay port, now lying in a stage of neglect.

★★

In the context of continuing Emergency, problems of development and defence are inter-related. Both in the utilisation of resources and technical man-power, these twin objectives of strengthening the base for defence and development have got to be kept in mind. This aspect was clearly highlighted by the Defence Minister, Mr. Y. B. Chavan, at Poona, while delivering the graduation address of the College of Military Engineering. He regretted that the response of engineering graduates to the call of the Army had not been very encouraging. Consequently, the Army had to recruit a large number of non-engineering graduate officers in the Corps of Engineers, Signals and EME. The technical training of these officers had placed a great strain on the College of Military Engineering. Mr. Chavan said the college enjoyed an excellent reputation and was recognised by the University of Poona as an institute for post-graduate studies in certain subjects. It fulfilled a vital role in the promotion of engineering talent. He hoped that soon all Indian universities would recognise its courses as being equivalent to degree courses. The Defence Minister also stressed the need for creating an operational infra-structure in the border areas in the form of roads, tracks, air fields, camps, bridges and other facilities. The border situation required that these facilities should be developed at a much faster rate than before. He said that the forbidding nature of the terrain and the shortage of conventionl building materials posed a formidable challenge to the organisational ability and professional skill of the Corps of Engineers, of which the new graduates would become a part. He asked the graduates to realise the great responsibility they would be shouldering. He had no doubt that they would meet the challenge in a spirit of dedication and determination. The future of the border conflict will depend in a great measure on the manner and spirit of the performance of their tasks.

★★

The Chief Minister of Maharashtra, Mr. V. P. Naik, revealed to the press that Maharashtra has been advised to explore the possibility of impounding the waters of west-flowing rivers in the Konkan for purposes of irrigation and power generation instead of insisting on westward diversion of the Krishna waters. He said that the suggestion would be examined. The State had, however, pointed out that such a proposition would not be feasible if it entailed submersion of large areas of land meant to be brought under the plough. The State had brought to the notice of the Centre that 80 per cent of waters diverted westward would be utilised for irrigation and power production under the various schemes already proposed.

★★

Seldom has any Governor of the Reserve Bank paid such glowing tribute to a bank in public as did Mr. P. C. Bhattacharyya at the opening of the Sion Branch of the Maharashtra State Co-operative Bank Ltd., on May 20. As this is by no means the first branch of the Bank even in Greater Bombay, ten branches having been there before, one naturally felt intrigued and wondered what the significance of the Sion branch could be. Mr. Bhattacharyya, however, did not, prefer to keep anyone guessing. His explanation was: "What gives this occasion more than an ordinary significance is the fact that the progressive opening of a number of such branches by an Apex Co-operative Bank in a metropolitan city, for the purpose of attracting deposits to meet the credit needs of the agriculturists, opens out a new horizon for the co-operative movement in the country".

Is this an invitation to other apex co-operative banks also to follow the lead of the Maharashtra State Co-operative Bank Ltd.? If so, joint-stock banks will not only have to compete among themselves even in urban centres for attracting deposits but also with co-operative banks. What is wrong with this in a free competitive economy, it might be argued. But the joint-stock banks may well insist that they, in their turn, should not be prevented from competing for deposits from co-

operative institutions. There is, at present, a rule that all co-operative institutions, even when they may have a long-standing bank account with a commercial bank, must close that account and switch-over to a co-operative bank. In other words, there is a "close preserve" already in urban areas also for co-operative banks, and if they can cope with the accounts of only these co-operative institutions — their number has been fast multiplying, thanks to the declared policy of the Government — they will be doing a great service. As it is, there is urgent need to improve the efficiency of service in apex co-operative banks, even in the leader in the field. This apart, it is a question for serious consideration whether, in addition to all the large-scale pumping of funds, through the co-operative pipe line by the Reserve Bank, apex co-operative banks should be allowed to drain away deposits from cities (even if it be but a reversal of an age-long trend) and thereby deprive joint-stock banks of their sinews, the call on which has greatly increased. Inasmuch as these banks also have to play a vital role in the economic development of the country, especially in financing industries, many of which are in cities, it seems fair that they should be free to draw deposits from at least their urban branches without too much favoured patronage to co-operatives.

**

Like its parent which began business nearly 60 years ago in a remodelled tavern in San Francisco, the first branch of the Bank of America in India also began in a remodelled office building in Bombay on May 20, but it will soon shift to a posh new building, which is already under construction. Mr. S. K. Wankhede, Maharashtra's Finance Minister, formally inaugurated the Bombay branch on May 19 at a dinner attended by prominent business men and leading bankers. Mr. Roland Pierotti, Executive Vice-President of the Bank and Mr. Louis J. Mulkern, Vice-President, South-East Asia and Australasia Division of the Bank, specially came down to Bombay for the inaugural function.

It is a striking proof of the imagination and enterprise of the Bank of America that it was not at all deterred in its move to start doing business in India by the loud demands for nationalisation of banks heard at the A.I.C.C. sessions in the city only the previous week-end. Like all practical business men, bankers go about their business unmindful of all such ideological contraveries, once they are convinced of the fundamental political stability of the Government of a country and its enormous economic potentialities. True, such things as unduly burdensome taxation as we have in our country today are not liked by bankers, even as they are not liked by any business man, Indian or foreign, but the shrewd men that bankers are, they realise that, eventually, it is the logic of events, circumstances and practical realities that will mould all government policies, including taxation and nationalisation. . The Bank of America is apparently convinced of the bright economic future of this country and is hopeful of growingly closer economic relations between the two countries in the years to come. At any rate, that is the impression one got from the press conference held by the Bank's executives in Bombay last week.

The Bank of America owes its birth in the early years of this century — and practically its rebirth in the thirties — to the genius of that great Californian, Amandeo Peter Giannini, the founder. It is interesting to recall that, way back in 1904, Giannini founded this Bank to offer banking facilities to wage earners and small business men. Unfortunately, the ebullient Congressman, who questioned the propriety of the Government of India in permitting the Bank of America to open its branch in India at the recent A.I.C.C. session in Bombay, did not have the patience to discern this banking philosophy which his own partymen have been preaching today.

Beginning with only £3,760 in deposits, the Bank of America had, on December 31, 1963, total deposits exceeding £13 billion and aggregate resources approximating nearly £15 billion. Today it is the largest bank in the world with internationally based resources totalling £2.5 billion and 24 branches operating in the Middle East, Asia, Europe, South America and Africa.

The Manager of the Bombay branch is Mr. Vir K. Sondhi who, besides his high academic equipment, has already been with the Bank of America for nearly 10 years and has held quite a few positions of responsibility in several of its branches.

Farakka Barrage Fumbles Along

From Our Correspondent

CALCUTTA:

THE FARAKKA barrage is West Bengal's hope for the future. It is designed to serve several purposes of immense value to the State's economy. The main one, however, is that it will save Calcutta port through resuscitation of West Bengal's dying river system. The Hooghly river, or the Bhagirathi-Hooghly as it is otherwise called, which serves Calcutta port, is gradually silting up, and for the greater part of the year, its navigability is already poor. The waters of the river are also getting, increasingly saline posing great danger to the health of Calcutta's teeming population; unless the flow of the river is suitably increased this danger cannot be counteracted. There are other major purposes like flood control and the provision of a direct road link between northern and southern West Bengal, but they are relatively secondary objectives.

The barrage project is an old one, conceived as far back as 1951, but due to one reason or another, it had been cold-storaged until 1961 when the Union Government suddenly announced its decision to go ahead with the project and finish it within a period of eight years — the quickest possible time for a large project of this kind. But if the project had been postponed for a long time it was not because of the usual bureaucratic indecision or Ministerial hesitation and doubts, but because of Pakistan's opposition. Pakistan has serious objection to the project even now, but the Government of India has chosen to ignore it because there is no substance in what Pakistan says. As a reference to the map will show that below Farakka, the Ganges branches off into two major distributaries — Bhagirathi-Hooghly which flows through West Bengal right up to the Bay of Bengal and the other, the Padma, through East Pakistan. By constructing a barrage at this point, India will divert 30,000 to 40,000 cusecs (cusecs: cubic foot a second) of water into the Bhagirathi-Hooghly by a feeder canal, and naturally, the flow in the Padma will be affected correspondingly. Pakistan has contended that this diversion would affect some vital irrigation projects which are essential for East Pakistan's food self-sufficiency drive, but after a thorough expert scrutiny (in which qualified engineers from both India and Pakistan participated) it was conclusively proved that this amount of diversion will do Pakistan no serious harm. Yet that country is nursing a grievance.

Pakistan's objection is mainly political and India knows it. Yet this country might have agreed to prolong the expert scrutiny of the possible harm which the project may do to East Pakistan's economy had not the World Bank, which has lent a substantial sum of money for the development of Calcutta port, brought pressure on the Indian Government to go ahead with the project as soon as possible. In fact, in one of its reports on the Indian economy, the Bank has warned that unless Calcutta port is improved, the development of the city and its industrial belt end for that matter, the country's economic development programme as a whole will encounter serious difficulties.

But since the work on the project has started, things are not going as well as they had been planned. Some top officials have already been replaced, but efficiency of the key personnel is not the only factor which has hampered progress. Lack of ready and convenient supply of power at the project site is apparently the major obstacle. Now that arrangements have been completed to put up a thermal power station of 3,000 kW capacity by the end of this month, the construction work on the project is likely to be expedited. The Farakka Control Board is also negotiating with the West Bengal State Electricity Board to obtain additional power supplies. At a recent meeting of the Farakka body, measures to expedite the work on the barrage project (the barrage is said be the world's longest) were discussed. Some changes in the plans were also considered, one of them being to broaden the road on the barrage so as to take four-lane traffic instead of two as the original design provides. But these changes would mean higher costs. The total cost of the project, as estimated originally, is Rs. 70 crores, but this would have been an underestimate even if no changes had been made in the plans. But with the changes which are to be made, the cost would rise to a still higher level. A final estimate will be shortly made. But the question which will be asked of the Control Board is not whether it is keeping a firm control on costs, but whether it is adhering to the time schedule and what steps it is taking to make up for the delay which has occurred in the construction work.

**

The claims of Haldia and Paradip seem to conflict. It is the declared intention of the Government of India that Haldia will be devleoped into a major port — the latest affirmation came recently from Mr. Manubhai Shah, the Minister for International Trade — not merely as an auxiliary to Calcutta port. But the development of this port is linked with the massive ore export programme which this country proposes to undertake in the near future. According to present plans, Haldia will be required to handle at least 2 million tons of ore annually from a mining area in Orissa. But Orissa's Paradip port is also being developed mainly to handle ore exports on a large scale. While the World Bank was engaged in studying the economics of the Haldia port project, it came across the argument from Orissa that the 2 million tons of ore which Haldia is being designed to handle can be easily handled from Paradip without incurring any additional capital cost on account of equipment. The only thing required is an extension of the railway line to connect Paradip port with the mining area. The Bank, it is said, is impressed with this argument and has postponed for a while the loan which it is considering for Haldia. This has created quite a stir in West Bengal, with at least one newspaper smelling a conspiracy in New Delhi to sabotage the Haldia scheme.

Mr. Manubhai Shah's recent statement gave no indication as to how this conflict between the claims of Paradip and Haldia is going to be resolved. But the Centre has already given its sanction for including the Paradip port project in Orissa's third five-year Plan. This it did last December. Not only has the project been approved, but sanction has also been given to an upward revision in the costs, raising it to Rs. 20 crores from the original Rs. 12.32 crores. The Orissa Government, anxious as it is to develop the port as quickly as possible, is proceeding pretty fast with the work. An agreement has already been signed with a Yugoslav firm for the construction and maintenance of an iron ore berth at the port. The lagoon is already being dredged and it is proposed to pump out 6.5 million cubic metres of ground well before October 1965. By this time, it is expected that the first iron ore berth will be ready to receive cargo ships of up to 60,000 tons. Around the same time, the port as a whole is likely to be ready. The Orissa Government claims that it will be the deepest port in the country going down to 48 feet all over the lagoon, which will make it possible for oil tankers of up to 100,000 tons capacity to berth themselves.

These are immediate programmes, but ultimately the port will be developed to have three iron ore berths capable of handling 200,000 tons of iron ore or more. There will be 19 cargo berths, one oil jetty, two docks for repairs and an extra berth for naval vessels. This programme of development is impressive, but there is more in this project than just a port. Paradip is also linked with the massive iron ore mining plans in this State — the Kiriburu and Balaidilla schemes. The Japanese who will be drawing their iron ore supplies from these mines are naturally interested in Paradip port, and one of their expert teams submitted a report late last year how the development of this port can be linked with some of the major schemes of economic development of Orissa. The National Council of Applied Economic Research, which conducted a techno-economic survey of Orissa a few years ago, also suggested ways in which the development of the port can be interlinked with economic development projects like the mining, transport and export of iron ore, transport of Talcher coal to points of consumption in southern and western India and the building up of communications in the hinterland which extends to most of the Orissa State and its growing industrial centres.

**

While tea production in India declined to 757.7 million lbs. in 1963 from 761.4 million lbs. in 1962, the prospects for the current year's crop are said to be good. For example,

THE CALCUTTA ELECTRIC SUPPLY CORPORATION LIMITED

(Incorporated in England)

5% RUPEE DEBENTURE STOCK, 1970
INTEREST FOR THE HALF-YEAR ENDING
30TH JUNE, 1964

Notice is hereby given that interest at the rate of Rs. 25/- (less Indian Income Tax) per Rs. 1,000/- of Stock will be paid on 1st July, 1964 to Debenture Stockholders registered in the books of the Company on 22nd June, 1964. Applications for transfers received at the Company's Office at Victoria House, Post Box 304, Chowringhee Sq., Calcutta, up to 22nd June, 1964 will, if otherwise satisfactory, be registered at that date for the purpose of participation in the above interest.

Debenture Stock Transfer Books will be closed from 23rd June, 1964 to 30th June, 1964 both days inclusive.

By Order of the Board,
D. P. M. KANGA
AGENT

Victoria House,
Calcutta, 18th May, 1964.

output during April last was appreciably higher than in the same month of last year, and weather conditions have so far continued to be favourable. But if 1964 is going to produce a bigger crop, this country should be in a position to market it. Trade opinion in India is sharply divided on whether a bigger crop will be good or bad for the country. One school appears to hold that world production of tea is moving ahead of consumption while the other is of the opinion that with further growth in population and continuously rising standards of living, the market for the world's cheapest beverage is continuously widening. The Food and Agriculture Organisation belongs to the former school and it sees the possibilities of overproduction in tea if the major producing countries do not control their crops in the meanwhile. But whichever of the two schools is right, there can be little doubt about the fact that the world will require more and more quality tea at competitive prices. Because apart from the drive of all producing countries to maximise their exports, other beverages, especially coffee, are now strongly competing with tea for the consumer's favour. India did well last year in the export front — she exported 496 million lbs. as against 458.8 million lbs. in 1962, 451.6 million lbs. in 1961 and 429 million lbs. in 1960, and a particularly encouraging fact is that her exports to the United Kingdom, the single largest market for Indian tea, recorded an appreciable increase, while the USSR and the UAR took larger quantities. But this happened in a year of expanding world consumption. Along with India, Ceylon too raised her exports from 450.7 million lbs. to 454 million lbs., while East Africa achieved quite a jump from 80 million lbs. to 102.6 million lbs.

Water for the Thirsty

From Our Correspondent

MADRAS:

THE PROBLEM of urban water supply has again assumed importance with the inauguration of the Cauvery water scheme for Bangalore City a few days back by Mr. Lal Bahadur Shastri. This scheme had been under discussion for a long time and it was wondered whether as much as Rs. 26 crores could be spent on the provision of adequate supply for a growing city. There were also some technical aspects of the scheme which gave cause for worry in the earlier stages and the expert team from the World Bank, which studied this project, had to be satisfied about the feasibility on the technical side. Apart from the advisability of tapping large quantities of water from Cauvery river, the question of pumping these quantities over a gradient of 1,210 ft. from the river end to the city end, the pumps had to be obtained from foreign sources and fairly heavy expenditure was involved for this purpose. Besides, large tanks had to be constructed at intermediate stages and it had also to be examined whether the economics of the scheme would be such as it would pay for itself. These problems have not been satisfactorily tackled and the Mysore Government has decided to implement this project on its own, getting the required assistance from the Centre and the World Bank.

The unfiltered water would be carried from the Sivasamudram Anicut through huge concrete pipes which would be later pumped in four stages to Bangalore City after being purified. It has been estimated that the water supply would be required to the extent of 90 million gallons daily by 1971 against the present availability from the existing sources of 30 million gallons. In the first stage of Cauvery water scheme, there will be an additional supply by 60 million gallons and construction work is expected to be completed before 1971. There could be an increase to 120 million gallons daily if the need arose at a later stage.

At present, 30 million gallons are being used by a population of 1.4 million and numerous industrial units. The scarcity has been acutely felt in some parts of the city and in view of the likelihood of the position getting worse in the next two or three years, the Mysore Government thought it advisable to act promptly. While it is to be congratulated on its bold decision, there is a feeling that the Madras Government has not been sufficiently serious in regard to an identical problem facing Madras City. While it is apprehended that there will be serious trouble later in the year if sufficient rains do not replenish depleted supplies in the lakes feeding the City, total availability is only 35 million gallons daily for a population of 1.8 million. This figure relates only to the area covered by the Madras Corporation and the suburbs beyond 8 miles from the heart of the city have been left to secure their needs of water supply from their own sources. Great hardship is naturally felt in the summer months which have been rather severe this year.

It has, therefore, been urged that immediate steps should be taken to augment water supply as the population has been growing fast and numerous industrial units are springing up every month. No doubt attempts have been made to tap underground water resources and in the northern part of the city particularly fairly large supplies are available. But it is felt that it would be no use merely tinkering with the problem as the health of the population will be badly affected and there will also be a serious deterioration in sanitary conditions. Even the development of new industries might be retarded if the requisite water supplies cannot be had. There was expectation for a time that the Andhra Pradesh Government would proceed expeditiously with the proposal to supply 5,000 million cft. from the Krishna river in pursuance of the recommendation made by the Gulhati Commission. But on closer analysis, it has been found that water from Krishna river cannot be had for a number of years as the nature of the project has still to be decided upon while it has been indicated that no supplies can be had until the Srisailam project has been completed.

As it will be several years before Krishna water can be brought to Madras City and in the meantime, the problem would have assumed alarming proportions, the new Mayor of the Corporation suggested sometime back that the surplus water from Neyveli should be brought to Madras. The Neyveli Lignite Corporation has been pumping out 60 million gallons daily from the artesian aquifers in pursuance of its mining operations. When lignite is being dug out, the under-water pressure has to be kept under control in order to prevent flooding of the mines. Mining operations have been going on round the clock for a number of months now and the surplus water of about 45 million gallons is now being used mainly for agricultural operations. The thermal station no doubt requires large quantities of water for cooling purposes and raising steam. But the net demand including the township is not for more than 50 million gallons. Even if the other projects come into being, it is estimated that there will be a surplus of 30 million gallons which could be made available to other consumers. There was a proposal sometime back to make use of this surplus water for industrial purposes. But the Neyveli Lignite Corporation is unwilling to commit itself to a definite supply of large quantities of water to outside consumers, as there is a feeling that the availability of under-water resources should be more carefully assessed for some time. Besides, there has been a complaint that the pumping operations have resulted in a reduction in the pressure in some nearby artesian wells and agricultural operations have been handicapped to some extent. There is no doubt an offsetting effect in the nature of the surplus water being available for irrigation purposes and there might be protest from agriculturists if there is large-scale diversion for industrial purposes or for supplying water to the urban centres. This is the reason why there has been hesitation on the part of the Neyveli Lignite Corporation authorities to agree to the proposal of the Mayor of Madras for bringing the surplus water to the City to get over its immediate difficulties.

Whatever might be the ultimate outcome of this proposal and the results of the scheme to fetch Krishna water to the City, it is emphasised that the Cauvery water scheme should be taken up without delay and that an expenditure of Rs. 25 crores in this connection should not be considered forbidding in any sense. The urgency of the problem is such that the Madras Government should take upon itself this task without delay.

**

Mysore State has another reason to be happy over recent favourable developments. After considerable controversy and opposition, Mangalore is to have a first class all-weather port in a new area. The work in this connection was inaugurated by Mr. K. Kamaraj while Mr. Lal Bahadur Shastri cut the first sod for digging the inner channel. The cost of the project is estimated at over Rs. 15 crores and the whole work is expected to be completed in the next three or four years. Until it was realised that iron ore exports would assume huge proportions in the coming years and there was need for dispersing the traffic between a number of ports and eliminating congestion on the railway system, it was argued that here was really no case for having an all-weather port in Mangalore especially as Marmagao was available with its first class facilities after its merger with the Indian Union sometime back. It has, however, been found that even if Marmagao's captcity were raised to handle 10 million tons of iron ore, there would be scope for exporting 3 or 4 million tons of iron ore from Mangalore, the ore deposits in South Mysore being exploited for this purpose. Besides, Marmagao is proposed to be fed by deposits from the Bellary-Hospet region at a later date as there is a proposal to construct a broad-gauge line from Hospet to Goa. The Mangalore Port will be connected to the hinterland by a new railway link with Hassan. The port is already handling about 8.5 lakh tons of iron ore annually besides large quantities of coffee and cashewnuts. A decision about whether the Mangalore-Hassan link should be metre gauge or broad gauge is expected to be taken in the next few weeks. It is, therefore, comforting to note that the economy of enlarged Mysore State is getting fast industrialised. It has been suggested that two steel plants should be located in Goa and in the Bellary-Hospet region in order to utilise effectively available mineral resources. While Mysore has been pressing its claim for a medium-sized steel plant, the advantages of erecting a big unit in the Goa region have been lattery canvassed. What exactly will be the ultimate decision is difficult to say at this stage.

THE
UNITED COMMERCIAL BANK LTD
Head Office : 2, India Exchange Place, Calcutta

FOREIGN EXCHANGE FOR TRAVEL ABROAD

AS A result of a recent policy review by the Union Government the Reserve Bank of India has announced the following concessions in respect of release of foreign exchange for travel abroad and changes in policy in regard to approval of passage applications :

(i) In order to meet the increased cost of living in most foreign countries, the daily allowances granted by the Reserve Bank for certain types of foreign travel have been raised.

(ii) A limited amount of foreign exchange for incidental expenses will be released where passage applications are approved against invitations with full offer of hospitality received from foreign Governments, trade union organisations, international chambers of commerce or other international organisations, well-known educational, cultural and health foundations.

(iii) Passages of directors of foreign companies to attend board meetings abroad and of directors/executives of Indian branches of foreign companies or of Indian companies which are wholly-owned subsidiaries of foreign companies, if invited with full hospitality by the foreign company concerned, will also be approved.

(iv) A person proceeding abroad for taking up definitely secured employment will normally be granted passage clearance for three months only in the first instance, the period of stay being subsequently extended by the Indian Embassy missions abroad after verification if the person was in continued employment.

(v) Passage clearance will not be granted in respect of private hospitality except for meeting parents, sons and daughters. In special cases, eminent Indian scientists, educationists and professional persons will be allowed to proceed abroad on invitation by individuals at the discretion of the Bank; special facilities of a limited character will also be given to staff of airlines who, under their terms of service, are entitled to free passages.

(vi) Students, who secure scholarships from universities or recognised international institutions for full maintenance and fees irrespective of the courses of study, will also be granted passage clearance.

(vii) Exchange facilities will not be granted to Indian nationals (including persons domiciled in India) wishing to emigrate except in special circumstances and to a limited extent.

NEW U.S.A.I.D. DIRECTOR

Mr. C. Tyler Wood, Minister for Economic Affairs and Director of the United States Agency for International Development in India (USAID), will be returning to the United States in September 1964. Mr. Wood came to India in November 1959 as the head of the economic affairs and assistance programme of the American Embassy. Since then he has worked closely with the Indian Government, Planning Commission and the Ministries concerned with economic planning and development. He devised and supervised the execution of a number of major assistance projects of the American Aid Programme which, since 1951, has contributed more than five billion dollars (Rs. 2,500 crores) to the strengthening of the Indian economy.

Dr. John Prior Lewis, a member of President Lyndon Johnson's three-man Council of Economic Advisers and former Chairman of the Department of Business Economics and Public Policy at Indiana University, will succeed Mr. Wood as Director of AID in India. Dr. Lewis was previously on the staff of the Economics Division of the Brookings Institution in Washington and in this capacity he spent much of 1959 and 1960 in India studying the nation's economic development and wrote a book entitled "Quiet Crisis in India".

MERGER OF AIRCRAFT UNITS

On June 1, 1964, the Aircraft Manufacturing Depot, Kanpur, will be merged with the Aeronautics India Ltd. as a first step towards the final amalgamation of all the three aircraft manufacturing units in the country -- including the Hindustan Aircraft Ltd., Bangalore — under a single public corporation. The Aeronautics India Ltd. was registered as an autonomous undertaking in the public sector in August, 1963 for manufacturing a modified single-engine fighter aircraft, MIG-21, complete with engine, air-to-air missile equipment and other aircraft components, in collaboration with Russia. The Aircraft Manufacturing Depot, Kanpur, was formally opened in January, 1960 and produced, in the record time of 22 months, the first India - made twin - engine, turbo - prop transport plane Avro-748. The first Avro-748, series I, was handed over to the Indian Air Force in February, 1964. Besides the Indian Airlines Corporation, several foreign countries have also evinced interest in the purchase of this aircraft.

NEW YORK WORLD'S FAIR

As a result of India's participation in the New York World's Fair a business firm from Los Angeles (California) has become "actively interested" in taking up an agency for the import of American-model cycles manufactured by an Indian concern. A businessman from Sweden has expressed a desire to import jute goods from India. Yet another visiting trader from Tel Aviv has shown interest in importing Indian coffee, cashewnuts and pepper. The liaison officer at the fair notes down their queries and puts across a quick "telex" message to the Ministry of International Trade at New Delhi, which on its part passes the enquiries on to the concerned industrial houses without any loss of time; and thus the intending exporters in India and the importers in foreign countries are brought in direct touch with one another.

EARTH MOVING EQUIPMENT

A new State-owned undertaking, called Bharat Earth Movers Limited, has been registered as a company with headquarters in Bangalore. It will be entrusted with the task of setting up a factory for the indigenous manufacture of various types of heavy earth moving equipment in technical collaboration with Messrs. Le Tourneau-Westinghouse Co. of the USA. The project is estimated to cost Rs. 10.50 crores. The factory will be located in the Kolar Gold Field area. When the factory goes into full production, it will turn out 150 motorised scrapers, an equal number of 'haulpaks' and 125 rear dump trucks per year. It will also supply some essential equipment for use by the Border Road Organisation.

OBRA THERMAL PROJECT

On May 20, 1964, a 136 million rupee agreement for the supply of equipment for the Obra Thermal Power Station was signed in New Delhi between the Uttar Pradesh State Electricity Board and the Technopromexport of the USSR. The deliveries of thermal equipment will be financed out of the 'rouble' credit extended to India under the Indo-Soviet Agreement of September 1959. The Obra thermal power station in Uttar Pradesh, which is a third Plan scheme, consists of five units of 50 MW each. The erection of the power station is to be done by Indian personnel with the technical collaboration of Soviet specialists. Besides the supply of five 50 MW units, the present agreement provides, among other things, for Soviet technical assistance in the erection and commissioning of the power station as also for the training of Indian personnel. The delivery of the equipment for the power station under the present agreement is to start immediately and is to be completed within the first quarter of 1966.

According to the present programme, the first 50 MW unit is expected to be commissioned by the end of 1965.

An indication of Soviet help for India's power development is given by the fact that according to the arrangements made so far, about 2.5 million KW of equipment for nine power stations in this country will be supplied by the USSR. The cost of these power plants (which includes the cost of the construction equipment in the case of some of the projects) amounts to about Rs. 95 crores.

WORKING OF COLLIERIES

According to official statistics released by the Chief Inspector of Mines, 808 collieries were working during the month of January, 1964 with an average daily employment of 422,508 workers, the corresponding figures for the previous month being 806 and 426,539 respectively.

Output of coal per "man-shift" for January, 1964 was estimated at 1.35 tonnes for miners and loaders, 0.72 tonne for all workers below-ground and in open-cast workings and 0.52 tonne for all persons employed including above-ground workers as compared to 1.34, 0.72 and 0.52 respectively for December, 1963. The percentage of absenteeism in January was of the order of 12.08 as against 11.73 in the preceding month. The average all-India cash earnings per worker per week were Rs. 26.63, the corresponding figures for Jharia and Raniganj fields being Rs. 26.22 and Rs. 26.77 respectively.

IMPROVED TELEPHONE EQUIPMENT

On May 21, 1964 agreements were signed in New Delhi between the Government of India and the Indian Telephone Industries Ltd., and the International Standard Electric Corporation and the Bell Telephone Manufacturing Company of Belgium, for the manufacture of crossbar telephone equipment at the ITI factory in Bangalore. Orders are also being placed at the same time by the P & T Department for the import of crossbar equipment from the Bell Telephone Manufacturing Company to expand the telephone systems of Bombay, Delhi and Madras and for the installation of automatic trunk exchanges at these places and Kanpur. It is expected that by the end of 1964, the Indian Telephone Industries, Bangalore will begin assembling the crossbar equipment. Full production of the order of 1,00,000 lines of crossbar equipment per annum, on single shift basis, valued at about Rs. 5 crores, is expected to be reached within 3 years. A high indigenous content is planned from the very beginning. The capital outlay of the project is estimated to be about Rs. 1.8 crores. The foreign exchange component of capital outlay of about Rs. 80 lakhs will be financed by credits from Belgium.

The agreements mark a major step in the development of the country's tele-communication network on modern lines for handling the growing volume of traffic, for meeting the country's demand for telephones which is increasing rapidly with the advancing economy and for the introduction of such facilities as subscriber-to-subscriber trunk dialling. As early as in 1959, the technical experts of the Posts & Telegraphs Department had unanimously recommended the use of the crossbar system of telephone equipment in the country. Experts had suggested that the manufacture of this modern equipment should be undertaken in the country and that the manufacture and use of the earlier type of equipment — "Strowger step-by-step type" — should be progressively reduced. The recommendations in favour of the crossbar system were based on the following favourable points:

(i) Crossbar switches are easy to manufacture quickly and in large quantities.

(ii) Crossbar switches require less maintenance. Experience in other countries shows that the number of faults on crossbar systems are considerably lower as compared with the type at present in use in India.

(iii) The equipment now in use has limitations for extensive subscriber trunk dialling.

(iv) In the case of crossbar system, the planning of the telephone network is more flexible and expansion of exchanges can be done quicker and at lower costs.

In the major cities, the introduction of the new system will help to integrate the telephone exchanges in the outlying areas with the main telephone system. The biggest advantage of the new system is that it will hasten the process of setting up nation-wide subscriber trunk dialling on an easy and flexible basis. Expansion in the rural areas and connecting these areas to the neighbouring towns and cities will also become simpler.

SUGAR EXPORTS TO JAPAN

The Indian sugar delegation to Japan, which was led by the Union Government's Food Secretary, Mr. V. Shankar, has returned with the impression that there is a distinct possibility of increasing our sugar exports to that country. Japan imports about 1.3 million tons of raw sugar every year. In 1962-63 India exported about 93,000 tons of sugar to Japan. According to the findings of the delegation, there is a need for specialization in the manufacture of sugar in order to cater to the peculiar needs of different countries. The requirements of refineries in various foreign countries are so diverse that a scheme of specialisation would have to be given top priority in India's plans to step up exports of sugar. In view of the limited storage facilities of the foreign refineries, the delegation has stressed the need for ensuring prompt shipment.

INTERNATIONAL TRADE CENTRE

The General Agreement on Tariffs and Trade (GATT) has announced the coming into operation of its new centre for trade information and trade promotion advisory service, with the primary objective of assisting the less developed countries in their efforts to expand their export trade. During the initial stages, the activities of the centre will include:

(a) the establishment of a "documents centre" and the operation of a "clearing house for trade information" — "trade information" being understood in its broadest sense, relating not only to information on commercial policy matters (such as tariffs, quantitative restrictions, trade regulations, etc.) but also to market intelligence and market research. The centre will be of assistance to exporters in making the necessary contacts with trade organizations and importers in the importing countries;

(b) the provision of a "correspondence answering service". This service will be useful in enabling exporters in less developed countries to direct their enquiries to one central agency and obtain answers with the minimum of delay;

(c) the publication of a "Register of Sources of Trade Information";

(d) the publication of a bi-monthly, and later monthly, trade news bulletin. The bulletin will serve as a means of acquainting importing countries with the products which the less developed countries are now, and will in the future be, in a position to supply, and will also inform exporters in less developed countries of market openings for their products in foreign markets;

(e) the provision of training facilities in export promotion.

The centre will also conduct studies aimed at assessing the export potential of and exploring the market prospects for the less developed countries. This programme will include:

(i) a general survey of the over-all economic situation and an examination of international trends in development.

(ii) the carrying out, over a period of approximately two years, of detailed studies of development plans and trade and aid relationships in respect of some 20 less developed countries.

(iii) assessment of trends in trade and development, affecting products of special export interest to the less developed countries.

Company Affairs

HINDUSTAN POLYMERS

HINDUSTAN POLYMERS Ltd. entered the capital market on May 26 with a public issue of Rs. 127.40 lakhs in 127,400 equity shares of Rs. 100 each. The subscription list will close on June 4 or earlier at the discretion of the directors, but not before May 28. It has an authorised capital of Rs. 5 crores —300,000 equity shares of Rs. 100 each and 200,000 unclassified shares of Rs. 100 each. Issued capital is Rs. 3 crores in 300,000 equity shares and paid-up capital is Rs. 15.31 lakhs. Out of the issued capital, 30,000 equity shares of Rs. 100 each have been subscribed by Shree Ram Mills Ltd., Bombay, the promoters of the company, 51,990 equity shares have been subscribed by promoters, subscribers to the memorandum of the association, directors and their relatives etc., 20,000 equity shares have been reserved for subscription by the Industrial Credit and Investment Corporation of India, 20,000 equity shares by Commonwealth Development Finance Company Ltd., London and 20,000 equity shares by Bakelite Xylonite Limited, London. Of the total issued capital of Rs. 3 crores, capital worth Rs. 30.61 lakhs has been subscribed, capital worth Rs. 141.99 lakhs has been reserved for subscription and the remaining worth Rs. 127.40 lakhs has been offered for public subscription. The issue offered to the public has been underwritten by Andhra Pradesh Industrial Development Corporation Ltd. (Rs. 25 lakhs), Life Insurance Corporation of India (Rs. 20 lakhs), Industrial Finance Corporation of India (Rs. 20 lakhs), ICICI (Rs. 10 lakhs), The Bank of Baroda Ltd. (Rs. 10 lakhs), The Bank of India Ltd. (Rs. 10 lakhs), The United Commercial Bank Ltd. (Rs. 10 lakhs), Canara Bank Ltd. (Rs. 8 lakhs), The New India Assurance Co. Ltd. (Rs. 2 lakhs), South India Insurance Co. Ltd. (Rs. 3 lakhs), The New Great Insurance Co. of India Ltd. (Rs. 3 lakhs), Rajnikant Chinubhai Sheth (Rs. 3 lakhs), Narottom B. Javeri (Rs. 1.40 lakhs), M. Nanjappaiah Jahgirdar (Rs. one lakh) and M/s. Lallubhai Ranchhoddas (Rs. one lakh).

The company was incorporated for the manufacture and sale of power alcohol, styrene monomer, polystyrene and its copolymers and materials and by-products derived from alcohol, styrene monomer and polystyrene and its copolymers. The company has been licensed to produce 7,500 tons of polystyrene and its copolymers per annum and the factory will be located at Visaknapatnam. The licensed capacity of styrene monomer is 10,000 tons per annum and that of Power Alcohol nearly 1.5 million gallons per annum. It has obtained the technical collaboration of M/s. Universal Oil Products Co. Inc. of Des Plaines, Illinois, USA, who are one of the leading firms carrying on research in petroleum refining and petro-chemical industries. The other collaborators are M/s. BX Plastics Ltd., of Manningtree, England, who have agreed to supply technical know-how for the manufacture of polystyrene and its copolymers. Besides these foreign collaborations, the Power Gas Corporation Ltd. of England will supply the plant and machinery for styrene monomer and polystyrene to the company and will procure, fabricate and supervise the erection of the plant. M/s. Kusum Products Ltd. of Calcutta will design, engineer, supply and supervise the erection of distillery for the manufacture of power alcohol. Molasses and benzene will be the basic raw materials and the company expects to obtain sufficient molasses on reasonable rates from sugar factories in Andhra Pradesh. The Government of India have agreed to render all assistance to the company for procuring 10,000 tons of Benzene per year. The Hindustan Steel Ltd has agreed to supply it from its steel plants.

The project is expected to cost nearly Rs. 6.35 crores and this amount is proposed to be raised through equity share capital to the extent of Rs. 3 crores; foreign exchange loans of Rs. 2.16 crores, and bank borrowings, unsecured loans etc. of Rs. 1.19 crores. The Commonwealth Development Finance Co. has agreed to provide a sterling loan of Rs. 66.67 lakhs. ICICI has agreed to a loan of Rs. 75 lakhs in dollars. IFC has agreed to grant loans worth Rs. 54.33 lakhs in French francs and the Mercantile Bank Ltd. has agreed to provide a loan of Rs. 20 lakhs in sterling. The company expects to be able to manufacture power alcohol by the third quarter of 1965 and styrene monomer, polystyrene and its copolymers by the second half of 1966.

STRESS ON MANAGEMENT

Hindustan Lever Ltd. is one of those companies where efficiency is nourished and valued to the maximum extent. Having himself maintained the traditions of highly competent management, Mr. P. L. Tandan, Chairman, chose the occasion of the annual general meeting to provide a full picture of the pattern of management development in the company. He indicated that it has always been a professionally managed company with a tradition of development and promotion of men and women for good jobs. Over 20 years ago the company started its Management Trainee selection scheme which over the years has, with attention and assimilation of new techniques, improved considerably. The Chairman defined the three basic elements of management development: in the first instance the requirements over the next five to 10 years are anticipated, then men and women to fill these requirements are recruited and finally these individuals are trained to develop attitudes which help them to meet their responsibilities at the desirable standards. He explained that the first element dictated the company to prepare every year the Management Review for the next five years. This instrument of forcasting took into account the needs of the business expansion by way of new projects, new products and organisational changes. This requirement was then equated with internal resources. In analysing the needs it was made sure that it was not Parkinsonian expansion of administrative machinery, but a very precise assessment of when and how the needs would arise. The management review forcasting also assured a full consideration of the promotion potential within the company.

To be sure of a regular stream of management personnel the company formulated an annual plan of recruitment. Mr. Tandon stressed the facts that the individuals who were capable of being made the managers within the framework of the company were given the first preference. The process of selecting staff with a good original record, observation, training and grooming ensured a regular flow from within which provided opportunities for capable individual working for the company at lower levels. The company also recruited trainees fresh from the universities. It was in search of good minds with ability to develop the set of attitudes that were considered important for the company. Mr. Tandon outlined certain interesting features of the selection procedure followed by the company. It laid immense stress on the selection of the best individuals, who were then supposed to go through a period of training. After a short period of familiarisation the trainees were put to work so that, when, at the end of a year and a half of training, they got the first managerial responsibility, they thoroughly understood the working of the department. All through the training the seniors devoted a good deal of time and attention to the progress of each trainee after which a recommendation was put up for his confirmation in the covenanted grade.

Mr. Tandon further stressed that the training of the management staff never stopped and they could get promotions and more responsible posts along with training facili-

ties at various institutions associated with the company. Management development for Hindustan Lever, therefore, remains an integrated operation which has provided best opportunities to the best individuals.

BANK OF RAJASTHAN

The Bank of Rajasthan Ltd. recorded an increase in deposits during 1963 to the extent of Rs. 91 lakhs so that by the end of the year, the figure was around Rs. 7.18 crores. The number of deposit accounts also increased from 42,153 to 47,780. The advances by the bank also increased by Rs 73 lakhs to Rs. 4.23 crores. The Chairman indicated recently that with the industrial development of the State of Rajasthan, the share of industrial advances increased from Rs. 72 lakhs at the end of 1962 to Rs. 105 lakhs by the end of 1963. The advances to small-scale industry and co-operative institutions also increased. The gross income of the Bank increased by Rs. 6.60 lakhs to Rs. 48.68 lakhs, so that the net profit for the year was Rs. 4.04 lakhs as against Rs. 2 34 lakhs last year. During the year under review, four new branches were opened at Jaipur (Adarshnagar), Bharatpur, Kota (Industrial Es.ate) and Manasa in Madhya Pradesh, raising the total number of branches to 45. The bank proposes to continue this expansion by opening five more branches during the current year. The Chairman argued that the demand for the nationalisation of banking industry was quite baseless because the protagonists of nationalisation had advanced certain reasons which were not proved by facts.

HINDUSTAN ALUMINIUM

The Hindustan Aluminium Corporation Ltd., will be raising the production capacity of primary aluminium from 20,000 tonnes a year to 60,000 tonnes, and have obtained the necessary industrial licence from the Government for that. The corporation has approached the Export-Import Bank for financing the foreign exchange requirements and the first purchases of the expansion programme. Although the Corporation has received sanction for further issue of capital the directors do not propose to proceed with the issue for the time being. With regard to fabrication facilities major equipments namely the rolling mills and the extrusion press with their ancillary equipment are yet to arrive and efforts are being made to expedite the deliveries. The directors hope that most of these should be installed and put into operation before the end of 1964. A separate company, a wholly owned subsidiary, is being formed for setting up a thermal plant to meet the additional requirements of power. The proposed company, Renusagar Power Company Ltd., will have an authorised capital of Rs. 5 crores.

COMINCO BINANI ZINC

Set up to produce about 20,000 tons of electrolitic zinc and two by-products, namely 45,000 tons of sulphuric acid and 30,000 to 40,000 tons of cadminum annually Cominco Binani Zinc Ltd., will enter, the capital market on May 27 to offer for public subscription, 839,993 Equity Shares of Rs. 10 each. The subscription list will close on June 6 or earlier but not before May 29. The authorised capital of the company is Rs. 3 crores devided into 3,000,000 Equity Shares of Rs. 10 each. The Metal Distributors Ltd, have agreed to take up 420,000 shares, The Consolidated Mining and Smelting Co. of Canada 840,000 shares and 839,993 shares are offered for public subscription. Of the public issue, 80,000 shares will be reserved for the shareholders of the Metal Distributors Ltd., for preferential allotment.

The company will set up a factory near Alwaye in Kerala. It will raise loans from the Industrial Finance Corporation of India, The Kerala Industrial Development Corporation and The Export Credits Insurance Corporation of Canada. M/s. Consolidated Mining and Smelting Co. Ltd., Canada, the collaborators in the present company, have been the pioneers in the development of the electrolytic refining of zinc and have taken up 40 per cent of the issued capital of the company for cash.

ANDHRA FOUNDRY ISSUE

The Andhra Foundry and Machine Co. Ltd., which is presently fabricating chemical plant and equipment and structurals, has decided to put a spun pipe plant at an estimated cost of Rs. 102 lakhs, with a capacity of 24,000 tons of cast iron spun pipes per year on a double-shift basis. This is one of the three companies under construction, the other two being Kesoram's of Calcutta and Shakti's of Madras. The Company has entered into a technical collaboration agreement with Messrs. Rheinstanl Industrie-Planung GMBH., Essen, of West Germany, who are Western Europe's largest spun pipe manufacturers. The plant is expected to be completed by the second quarter of the next year. When the plant goes into commission, Padmasri N. B. Prasad, the Company's Technical Director and a well-known metallurgist, indicated recently, they would be turning out spun pipes (ranging from 3" to 16" in diameter) at around Rs. 550 per ton, which would be half the price obtaining in Europe. By reason of this decided price advantage, the company's spun pipes could easily be exported to the Middle East, where these pipes are in great demand, it is felt. Further, spun pipes, mainly used in water supply, are in short supply, in the country even at present, and more of these would be needed in the fourth Plan period, when Government are likely to take up a number of water supply schemes, as also drainage and sewage schemes in a big way. It has also plans for diversification to include manufacture of malleable castings. The installation of hot-blast metallurgical cupola in the place of cold blast cupola, it is stated, would permit the utilisation of steel scrap (of which there is no dearth in the country) for spun pipe manufacture, besides pig iron. The use of scrap is believed greatly to reduce the cost of production. The directors anticipate a profit of 25 per cent., taking into consideration the experience of other fabrication works of the company, and, if all goes according to schedule, they propose to declare a dividend by 1966.

It is in the context of the proposed plant that it has decided to come to the capital market with a public issue of Rs. 45 lakhs, divided into 30,000 equity shares of Rs. 10 each and 15,000, 9.3 per cent cumulative redeemable preference shares of Rs. 100 each. The subscription list will open on June 4 and close on June 15 or earlier, but not before June 8. The entire issue to the public has been underwritten. The Company has an authorised capital of Rs. one crore divided into 30,000 preference shares and seven lakh equity shares. The issued capital is Rs. 65 lakhs, while the subscribed and paid-up capital is Rs. 10 lakhs. The Company, which was incorporated in 1961, is situated in Hyderabad.

DHARMSI MORARJI

The contact sulphuric acid plant with a capacity of 200 tons per day of the Dharasmi Morarji Chemical Co. Ltd., will have gone into production before the annual general meeting is held in the first part of June. During 1963, the company made actual withdrawals of Rs. 25 lakhs from the rupee loans of Rs. 30 lakhs granted by the ICICI and Rs. 17.96 lakhs from the foreign currency loan of Rs. 19.20 lakhs by Sulphur Export Corporation, New York, to finance this project. It has made necessary arrangements with the Dena Bank for an additional over-draft facilities of Rs. 20 lakhs to finance the working capital required for this project. The recent rights issue of

Rs. 13.79 lakhs will also meet a part of the finance required for the project.

Regarding the 100-ton alumina sulphate project at Ambernath, the company had completed installation of equipment for a production of 70 ton per day, but due to paucity of sulphuric acid and steam, production has had to be restricted to 50 tons a day. Construction work for the additional equipment required to achieve the normal capacity, is in progress. The installation of equipment for the 50 ton per day alumina sulphate project at Kumhari has been completed. The production of this factory had to be curtailed for the shortage of sulphuric acid. Necessary quantities of sulphuric acid and steam will be available when the 300-ton sulphuric acid plant goes into production. The company has been licensed to expand its capacity of chlorosulphonic acid plant from 1010 tonnes to 6,600 tonnes per annum. No progress has been made during the year in the implementation of industrial explosive project.

GOOD YEAR INDIA

Mr. R. E. O. Carey, Managing Director, Good Year India Ltd., has revealed that the sales of the company during the first four months of 1964 have reached Rs. 3.35 crores against Rs. 2.69 crores in the corresponding period of last year. The net profit for this period is approximately Rs. 2 lakhs against a loss of about Rs. 17 lakhs for the corresponding period of 1963. Mr. Carey was hopeful that this trend would continue. The Government of India has extended the time limit for the issue of rights shares till the end of 1964. The issue of further capital and the implementation of the expansion programme is under consideration of the directors. Mr. Carey indicated that the set-back during 1963 has been due to the power failure and fluctuating water supply as a result of which production had to be lower in order to maintain the quality. He, however, pointed out that the company was steadily going ahead with its programme of marketing new products manufactured under Good Year quality standards. The beneficial results of the quality compaign implemented in Ballabgarh factory, are being felt. The new 3-T Nylon earth moving tyres have been well received.

DUNLOP RUBBER

The Dunlop Rubber Co. (India) Ltd. recorded sales of the order of Rs. 40.74 crores during the year ended December 31, 1963, nearly Rs. 3.61 crores more than last year. The net profit before taxation was Rs. 327.69 lakhs. A sum of Rs. 10.25 lakhs was provided for development rebate reserves and Rs. 107.01 lakhs for general reserve. The directors felt that it would be prudent to merge the surplus as at December 31, 1962 and the small provision previously made in respect of retirement gratuities with the general reserve. The dividend for the year on the guaranteed cumulative preference shares amounting to Rs. 2.40 lakhs has been paid and the dividend on the second cumulative preference shares for the year under review amounts to Rs. 2.20 lakhs. The directors have recommended dividend on the ordinary share capital of 17½ per cent subject to income tax. This compares favourably with 15 per cent in respcet of the previous year and will absorb Rs. 78.75 lakhs.

CAPITAL ISSUES

Nine companies, it is learnt, have been allowed by the Controller of Capital Issues to raise capital. These include both equity and preference shares. The consent in all the cases is valid for 12 months.

The Hindustan Electric Company Ltd., Maharashtra, Bombay, engaged in the manufacture of machines operated by the use of electricity, steam etc., and having a paid-up capital of Rs. 140 lakhs, has been accorded consent to the issue of further capital of Rs. 140 lakhs divided into 1,20,000 equity shares of Rs. 100 each to the existing shareholders on rights basis in the ratio of 1 : 1 and 20,000 irredeemable cumulative preference shares of Rs. 100 each carrying dividend of 8.57 per cent (gross) to Brown Boveni and Company Limited, Baden, Switzerland, for cash at par. The proceeds of the issue will be utilised for financing the expansion programme of the company.

Voltas Ltd., Bombay, has been granted consent to issue further capital of Rs. 102 lakhs divided into 1,02,000 equity shares of Rs. 100 each for cash at a premium of Rs. 25 per share. The shares will be offered to the existing share holders of the company in the proportion of two for five shares held. The proceeds of the issue will be utilised on the company's expansion schemes in the manufacture of power factor capacitators, electric hoists etc.

Hada Textile Industries Ltd, Calcutta, a new company, has been granted consent to issue capital of Rs. 36 lakhs for cash at par consisting of Rs. 24 lakhs divided into 2,40,000 equity shares of Rs. 10 each and Rs. 12 lakhs divided into 12,000 9.5 per cent, cumulative redeemable preference shares of Rs. 100 each. The proceeds of the issue will be utilised for the setting up of a cotton spinning mill.

Mayarkshi Cotton Mills Limited, Calcutta, has been granted consent to issue capital of Rs. 60 lakhs for cash at par consisting of Rs. 45 lakhs divided into 450,000 equity shares of Rs. 10 each and Rs. 15,00,000 divided into 15,000 cumulative redeemable preference shares of Rs. 100 each carrying a dividend of 9.5 per cent. The proceeds of the issue would be utilised for the setting up of a spinning mill in the district of Birbhum with 12,000 spindles.

Wheels India Ltd., Madras, has been accorded consent to issue further capital of Rs. 13 lakhs in equity shares of Rs. 100 each, to be issued privately at par, partly for cash and partly other than cash. Of these, shares of a value of not exceeding Rs. 5.85 lakhs will be issued to Dunlop Rubber Company Ltd. (U.K.) at par against supply of plant and equipment. The proceeds will be utilised on the manufacture of wheels and top rollers for tanks.

Kerala Spinners Ltd., Allepey, a public company incorporated in Kerala, has been accorded consent to issue capital of Rs. 40 lakhs (including Rs. 10 lakhs raised already) divided into 40,000 equity shares of Rs. 100 each, for cash at par. The proceeds of the issue will be utilised for setting up a spinning mill with a capacity of 12,000 spindles.

The Plantations Corporation of Kerala Ltd., a Government company, has been given consent to the issue of capital of Rs. 80 lakhs, divided into 8,000 equity shares of Rs. 1,000 each for cash at par. The proceeds will be utilised for rubber plantation.

Indian Drugs and Pharmaceuticals Ltd., Delhi, a Central Government undertaking, has been given consent to the issue of further capital of Rs. 2 crores divided into 20,000 equity shares of Rs. 1,000 each for cash at par. The proceeds will be utilised for financing the drugs and surgical instruments plants.

Gujarat State Fertiliser Company Ltd, Ahmedabad, has been given consent to issue of further capital of Rs. 12,99,54,700 divided into 9,99,547 equity shares of Rs. 100 each and 3,00,000 9.3 per cent redeemable cumulative preference shares of Rs. 100 each to be issued for cash at par. Of this, equity shares of the value of Rs. 5,11,54,700 and preference shares of the value of Rs. 1,53,00,000 would be offered to the public by prospectus and shares of the value of Rs. 5.35 crores (Rs. 3.88 lakhs in equity and the balance in preference shares) would be subscribed by the Government of Gujarat. The proceeds will be utilised for the manufacture of chemical fertilisers and allied chemicals.

LICENCES ISSUED

The following licences have been issued under the Industries (Development and Regulation) Act, 1951 — during the week ending 9th May, 1964. The list contains the names and addresses of the licensees, the articles of manufacture and annual installed capacity.

STEEL CASTINGS

Prakash Engineering Co. and Rolling Mills, Freeganj Street, Agra. (Uttar Pradesh) — Grey-Iron Castings — 500 tons.

NON-FERROUS CASTINGS

Rashtriya Metal Industries Ltd, Kurla Road, P.O. J.B. Nagar, Bombay-59 AS P.O. J.B. Nagar, Bombay, (Maharashtra) — Non-ferrous castings — 73 metric tons.

ELECTRICAL MOTORS

Kilburn & Co. Ltd., 2, Fairlie Place, Calcutta. (West Bengal) — Air break drum controller and resistances for A.C. & D.C. Motors — 240 initially and 696 Nos. per annum finally (5th year).

DRY CELLS

Saxby & Farmer (India) Pvt. Ltd., 17, Convent Road, Entally, Calcutta-14. (West Bengal) — Air Deplorised Wet cells — 72,000 nos.

ORGANIC HEAVY CHEMICALS

Andhra Sugars Ltd., Venkatarayapuram, P.B. No. 2, Tanuku — (West Godavari) (Andhra Pradesh) — Sodium Acetate — 12,688 tons.

MISCELLANEOUS CHEMICALS

Foods, Fats & Fertilizers, (Private) Ltd., 67, Godown Street, Madras-1. (Andhra Pradesh) — Distilled Fatty Acids — 3,000 tons. Glycerine — 3,36 tons.

COTTON TEXTILES

Shri Ratnappa Bharamappa Kumbhar, Chief Promoter, Kolhapur Zilha Shetkari Vinakari Sahakari Soot Girni Ltd., Ichalkaranji, District Kolhapur, **Proposed name:** Kolhapur Zilha Shetkari Vinakari Sahakari Soot Girni Ltd. (Ichalkaranji, Taluka Hatkangale, Distt. Kolhapur, Maharashtra) — Cotton yarn — 25,000 spindles. The General Industrial Society Ltd, 15, India Exchange Place, Calcutta-1. (Madnapur Distt. West Bengal) — Cotton yarn — 12,500 spindles.

VEGETABLE OILS

Laxmi Industries, 10, Bruce Street, 2nd Floor, Fort, Bombay (Amravati, Maharashtra) — Cotton seed oil — 16,000 tons of cotton seed.

ASBESTOS CEMENT

Hyderabad Asbestos Cement Products Ltd., Sanatnagar, Hyderabad-18. (Vallabgarh, Gurgaon, Distt. Punjab) — Asbestos Cement Sheets — 36,000 tonnes. Pressure pipes and Accessories — 6,000 tonnes.

CHANGE IN NAMES (Owners or Undertakings)

(During the week ending 9th May, 1964)

(Pertaining to particular licences only)

From (1) Government Ceramic Concerns, Kundara, and (2) Kerala Government Ceramics, Kundara to M/s. The Kerala Ceramics Limited, Kundara. From M/s. Jay Shree Textiles Ltd., P.O. Rishra, Distt. Hooghly to M/s. Jay Shree Textiles and Industries Ltd., P.O. Rishra, Distt. Hooghly. From M/s. Development Corporation (Private) Ltd., Ernakulam to M/s. Bharat Tyre and Rubber Co. Ltd., Ernakulam. From M/s. Gandhi Electric Industries Private Ltd., Bombay to M/s. Emco Electricals Private Ltd., Bombay.

LICENCES REVOKED OR SURRENDERED

(During the week ending 9th May, 1964)

(Pertaining to particular licences only)

Shri H. N. Choksi, Bombay — Oxygen and Dissolved Acetyelene. M/s. Champaka Sugar Plantations Limited, Mannargudi — Sugar. M/s. The Basti Sugar Mills Co. Ltd., P.O. Watterganj — Sugar. M/s. Narhari and Choudhary Company, Guntur — Cigarettes.

TEXTILE MACHINERY CORPORATION LIMITED

NOTICE

NOTICE is hereby given that the Twenty-fourth Annual General Meeting of TEXTILE MACHINERY CORPORATION LIMITED will be held on Thursday, the 25th June, 1964, at 4 p.m. at the Registered Office of the Company at Belgharia, 24 Parganas, West Bengal to transact the following business :—

1. To receive and consider the Report of the Directors, and to adopt the Audited Accounts of the Company for the year ended 31st December, 1963.
2. To declare dividend on Preference and Equity Shares.
3. To appoint Directors in place of Shri D. N. Kapur and Shri G. R. Podar, who retire by rotation and are eligible for re-election.
4. To appoint Auditors and fix their remuneration.
5. AS SPECIAL BUSINESS :
   To consider and, if thought fit, to pass with or without modification, the following resolutions :
   As Ordinary Resolutions :

   ORDINARY RESOLUTION No. 1.

   "Resolved that the appointment of Textileen Agencies, Ahmedabad, as Sole Selling Agents for the sale of certain products of the Company in the State of Gujarat on the terms and conditions as contained in the Agreement dated 31st March, 1964, be and is hereby approved."

   ORDINARY RESOLUTION No. 2.

   "Resolved that sanction be and is hereby given to the Company for purchasing with the approval of the Company Law Board 50,000 Equity Shares of Rs. 10/- each in Shree Export House Limited, Calcutta."

The Register of Members and the Share Transfer Registers of the Company will remain closed from 17th June, 1964 to 25th June, 1964, both days inclusive.

By Order of the Board,
R. C. MAHESHWARI
FINANCE OFFICER

BELGHARIA,
15th May, 1964.

N.B. (1) A MEMBER ENTITLED TO ATTEND AND VOTE IS ENTITLED TO APPOINT A PROXY TO ATTEND AND VOTE INSTEAD OF HIMSELF AND THE PROXY NEED NOT BE A MEMBER.

(2) Dividends, when declared, will be paid to the registered shareholders whose names would appear on the Company's Register on the 25th June, 1964 or to their order or to their bankers on/or after 20th July, 1964.

(3) The explanatory statement pursuant to section 173 of the Companies Act, 1956 is being sent to the shareholders individually along with this notice.

BOOKS BRIEFLY

Controllers of Credit

Eight European Central Banks: A Descriptive Study; Published under the auspices of the Bank for International Settlements, Basle; Allen and Unwin, London, 1963; Pp. 336; Price 45 sh.

Reviewed by D. KRISHNASWAMI RAO

IT IS a sign of the revival of interest in the working of monetary weapons that there has been in the past five years a considerable output of literature on the subject. This book, an official BIS study of the organization and functioning of eight central banks in western Europe, is, however, the first of its kind.

Each central bank gets a chapter, written by an expert who is or has been connected with it in an official capacity. The purpose of the book being to facilitate comparative study, the chapters follow a common pattern. Each deals with the origins of the central bank concerned, its legal framework, its functions and objectives, administrative organization, powers and fields of activity. In all this the contributors to the book draw heavily on the statutory basis of the central banks they write about. Lastly, they discuss monetary policy, with of course the neutrality of approach that the official sponsorship of the book and their own official standing entail.

To our students of central banking who take for their models of central banks in developed money markets only the Bank of England and the Federal Reserve System, this study, ponderous though it is with provisions of statutes and regulations, should be instructive. For here are money markets, old and functioning with considerable vigour but not all of one standard pattern that can be marked out as "developed". Among the central banks dealt with are some ancients — the Swedish Riksbank being 26 years older than the Bank of England — but they all adapt their techniques of control to the particular institutional environment in which they operate, a situation far removed from the simplified text-book descriptions that treat of 'credit control in developed money markets' as though it were one standardised entity fashioned by the Old Lady of Threadneedle Street.

Moral Suasion

Thus we read in the opening chapter, on the National Bank of Belgium, that the Bank does not intervene, contrary to everyday practice in England, as a buyer or seller, in order to regulate the market for 'short-term' government securities. Further, in Belgium the reserve ratios that are fixed for the banks are to be gradually extended to cover other financial institutions, an extension of control that England's Radcliffe Committee considered but hesitated to recommend. It is also interesting to note that although the statutory regulations are not helpful to it in this regard, the National Bank has been building up the power of moral suasion in its dealings with the banks.

Considerable interest will attach to the description of the operations and policy of the Deutsche Bundesbank — the central bank of the Federal Republic of Germany — for it is the controller of the credit system of an economy that is of great and growing significance for the world. One is disappointed that this chapter only mentions but does not discuss the conflicting pulls on the Bank's monetary policy exerted in recent years by the untypical juxtaposition of a strongly buoyant internal economy and heavy balance of payments 'surpluses'.

The most readable account in the book is that of the Bank of England, partly for the reason that this the most technically competent central bank in the world is one the least buffered by statutes. In fact it is in the absence of detailed formal powers coupled with the exercise of very great informal influence that there lies the difference between central banking in England and on the other side of the Channel and the North Sea, a difference to which practically every page in this book bears witness. To the reader who wants to get a good short description of the Bank of England's work —in essence as the Radcliffe Committee found it — the relevant chapter in this book is to be strongly commended.

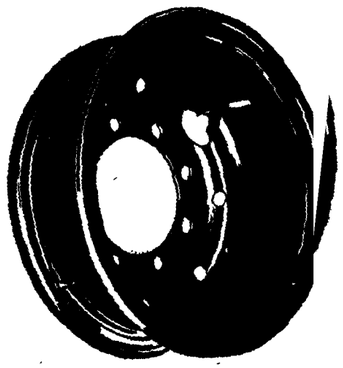
The study of the Banque de France brings out clearly the dictates of the situation that faced the Bank at the end of the last War; an economy in a highly liquid state, with business activity at a low level and a vast reconstruction effort to be undertaken with extensive recourse to credit. In order therefore to direct credit to the uses that were considered most important the central bank's traditional armoury had to be buttressed by new quantitative controls and also by a wide range of selective restraints on credit.

In France as well as in Italy there is a system of inspection of the banks as elaborate as that which exists in India; in Italy after the War the system was extended to cover all financial institutions that accept deposits and make loans. Not surprisingly, the Bank of Italy does not use the instrument of open-market operations, a lack made up by the power of prescribing compulsory reserve requirements for the banks, a common instrument of credit control on the Continent.

In the Netherlands the central bank is statutorily charged with the supervision of credit institutions for the two-fold purpose of ensuring their solvency and liquidity and of assisting the Bank to carry out its monetary policy. Use is also made in that country of the method of variable cash reserve ratios for the banks, though mainly with an eye on the balance of payments position — a point that this book does well to emphasise, because otherwise it would seem paradoxical that in the Netherlands this ratio has been increased during recessions and reduced during times of credit expansion. The central bank's use of moral suasion, where possible, in preference to formal instructions to credit institutions, is also stressed.

The last two chapters in the book are on the central banks of Switzerland and Sweden (the latter the world's oldest) in whose case however we do not notice the proliferation of credit control powers that is found elsewhere on the Continent — the Swiss National Bank does not have even the power of prescribing compulsory reserves. "Recommendations" made to credit institutions regarding their lending and investment patterns therefore play an important part in the functioning of these two central banks, particularly the Swiss.

The book has two conspicuous lacunae: it has no introductory chapter outlining the broad features of central banking in the countries covered, without which it must be hard on the uninitiated reader, and secondly, it lacks an index.



ELIMINATING WASTAGE

Admars: Fourth Annual Number and Directory, 1964; Published by Admars Company, Bombay; Pp. 274; Price Rs. 10.

ADVERTISING CALLS for a systematic approach for eliminating wastage. A guide for producers and consumers is, therefore, timely. The Editorial Board of *Admars* deserves appreciation for the latest Annual which exhibits a marked improvement in the volume, contents and get-up over its previous Numbers. This sumptuous Number is divided into eight sections each dealing in an expert manner with the subject taken up. Particular mention needs to be made of Section II which is studded with illuminating articles on various topics of public interest such as population, sales, advertising, planning, technology, marketing research, etc. The other sections provide the reader with a fund of valuable information about various advertisers, advertising media and personalities in publicity field. All those engaged in the field of advertising and publicity will certainly find this annual extremely useful.

3,00,000 TRUCK WHEELS ON THE HIGHWAYS

WL wheels are known for their sustained performance, built-in safety and capacity to withstand any road condition—qualities really hard to match. Even under the greatest strain WL wheels keep on running absolutely trouble-free.

OBJECTS

The Company was incorporated on 7th October, 1961 and has set up a workshop in Hyderabad where orders are being executed for fabrication of structurals and chemical plant equipment.

The Company now proposes to establish a plant for the manufacture of Cast Iron Spun Pipes and has entered into a collaboration agreement for technical know-how with the well known firms, **M/s Rheinstahl Industrie Planning, G m b H., M/s Rheinstahl Huttenwerke A G.,** in West Germany, for this purpose. The plant will produce 24,000 tons of pipes per year on double shift These pipes are mainly required for water supply schemes and for drainage and sewage schemes. The factory is located at Maula Ali (Hyderabad) The Company is assured of supply of raw materials, power and water The foreign exchange cost of the plant and machinery is being met out of a loan Rs. 37 00 lakhs in foreign exchange sanctioned to the Company by the Industrial Credit & Investment Corporation of India and the balance cost of the project will be met out of this public issue

The subscription list will open at 10 00 A M. on 4th June 1964 and will close at 5 00 P.M on 15th June 1964 or earlier at the discretion of the Directors but not earlier than the close of business on 8th June 1964

Copies of prospectus and application forms can be obtained from Bankers, Underwriters and Brokers to the issue and from the Registered Office of the Company.

RECORDS AND STATISTICS

Dhebar Committee Report

AT THE 68th session of the Indian National Congress, held on January 9 and 10, 1964 at Bhubaneswar, a resolution on "Democracy and Socialism" was adopted. The Congress President appointed a Sub-committee in the last week of March to prepare a draft report on the implementation of the resolution. The Sub-committee consisted of Mr. U. N. Dhebar, Mr. C Subramaniam, Mr. Sadiq Ali, Mr. S. N. Mishra and Mr. Bali Ram Bhagat. The report of the Sub-committee was submitted to the Congress President on May 7, 1964. The Working Committee of the party accepted the report of the Sub-committee and placed it before the All-India Congress Committee Session which was held on the 15th, 16th and 17th May, 1964 at Bombay. Full text of this report is reproduced below:

The Bhubaneswar Resolution on Democracy and Socialism has outlined the essential characteristics of the social and economic order that the Nation is determined to build for itself as speedily as possible. The Resolution has in particular stressed the importance of ensuring —

(a) that the essential requirements in respect of food, clothing, housing, education and health of every man, woman and child in the country are satisfied;

(b) that, as a means to the above end as well as because of the intrinsic value that should be attached to social justice in a viable democracy, large disparities that exist in the economic and social status of different sections of the community should be narrowed down;

(c) that necessary fundamental changes in the ways of thinking and in the ways of living of the people be brought about democratically so as to facilitate the full growth of human personality which alone would make it possible for the full utilisation of the enormous human resources which the country is endowed with; and

(d) that the Nation should set before itself the task of realising these objectives substantially by the end of the fifth Plan.

Basic Strategy

The basic strategy that has to be adopted for realising these objectives is adumbrated in the successive five-year Plans. While it is in all conscience a difficult strategy requiring people to practise austerity and undertake sacrifices in the present for the sake of the future, it should be realised that there is no easier course to sustain freedom and to ensure prosperity consistently with the laws of human justice. While we are convinced of the validity of this approach, we feel it necessary to emphasise that the Organisation and the administration have as well to bear in mind the strains and stresses inherent in the situation. They (the Organisation and the administration) carry a moral obligation to ensure that the results bear reasonable relationship to the effort on the part of the people and not only the burdens and sacrifices but also the fruits thereof are equitably distributed.

In concrete terms this requires that national effort be directed towards (a) the attainment of more rapid progress in all sectors of the economic activity so that the targets for the third five-year Plan are realised and the Nation is prepared for the achievement of further acceleration in the fourth and the subsequent Plans; and (b) those in charge of planning and execution direct their efforts towards strengthening the base of the country's economy as also towards widening it so as to reduce the gap between the bottom and the top layers of our society. Given the necessary will and determination, progress in the next few years can be of a nature and character which will yield something of the order of 7 per cent per annum increase in the total national output. This alone, in our opinion, can ensure realisation of the aforesaid objectives.

Shortfall in Implementation

If the results in the past few years have not been commensurate with the country's anticipations, the failure, by and large, is not that of strategy but of implementation. It is to this urgent matter that the country, Government and the Congress organisation have to devote their particular attention at this stage of the country's development effort.

Nowhere has the gulf between promise and fulfilment been of more serious consequences to the material well-being of the common people than in the rural sector, especially agriculture. And nowhere has this failure been so clearly a result of organisational weaknesses and inadequacies. With all possible progress in other areas of economic activity, it still remains indisputable that, for the foreseeable future, the agricultural sector will be the main provider of employment and consumption articles to the mass of the people, and only a sufficiently high level of agricultural production will ensure a higher rate of growth for the economy.

The Committee therefore considers it absolutely necessary that advance in this sector has to be assured in the immediate present as much as over a period and the Planning Commission should set before the country and the Government realisable but firm targets for the remaining two years of the third Plan as also for the ten-year period thereafter. The Committee feels that the target of annual rise of five per cent accepted for the third Plan period is not an over-optimistic target. The sustained annual increase of 5 per cent must be our objective in the fourth and fifth Plan period. In any event agricultural production will have to reach up to 92 to 94 million tons by the end of 1965-66. This would mean an annual increase of 7 per cent to 8 per cent during the next two years. Remedying the human failures that come in the way of ensuring a fast and steady growth in this sector becomes, therefore, a matter of utmost urgency.

The methods to achieve agricultural progress have been indicated in the third five-year Plan. But these themselves will bear little fruit unless a proper atmosphere as well as an adequate organisation and machinery is built up to ensure the most effective application of these aids to larger production. It is principally in this area that we would like to make specific suggestions for action in the following two years. We would like to emphasise once again that what we achieve in the next two years is most crucial.

It is only the effort and enthusiasm of the peasant-cultivator that can transform the rural scene. It would be illogical to expect the peasant-cultivator to put forth his best efforts

if the economic and social order continues to be one in which he is denied his right to security and full enjoyment of the fruits of his labour. The ensuring of this has to be the first concern of the Government and the Congress Organisation.

The essential prerequisite for realizing this objective is the early implementation of the Land Reforms programme. Within the next two years, a determined effort should be made to secure effective implementation of the measures for redistribution of the rights in land — including the abolition of intermediaries, enforcement of ceilings on land ownership, assurance of security of tenures, determination of fair rents, and preparation of proper cadastres and records of right. Necessary steps will have to be taken to enable the tenants to acquire rights of occupancy by payment of compensation.

There is a general feeling in the country that the actual benefit derived by the small cultivators, tenants and agricultural labourers is inadequate taking into account the legislative measures indicated. Many a time we have fixed the dates by which the programme of Land Reforms was to be completed, but in practice those have not been complied with. The time has come for a decisive commitment so that no quarter is given to further procrastination or further frustration.

We, therefore, urge that the AICC should call upon the Government of India and all the State Governments to implement the programme of Land Reforms before the end of the third Plan period. At the political level the Congress Organisation will have to play an active role in seeing that this is done. We suggest that the AICC should forthwith establish its own machinery for assisting and watching the implementation of this programme. This wing of the Organisation should be placed in charge of a very senior leader of the Party who should be assisted by four or five senior members of the Party one from each zone.

Removal of Deficiencies

For each State a Committee of Congress Legislature Party should also be formed to help and assist the Chief Minister as well as the machinery set up at the AICC level for this task. The function of this Wing or Committee of the AICC should include review of the progress made in the implementation of the Land Reforms in each State, making recommendations to the Chief Ministers to remove deficiencies if any in the legislation, making arrangements for educating the peasantry about their legal rights and issuing instructions to the PCCs and through the PCCs to the subordinate Congress Committees about the steps to be taken to assist the State Government and the peasantry.

The target of implementing the Land Reforms within the coming two years is realistic. There are, however, we believe, built-in deficiencies in some of the land legislations which are being exploited by the vested interests to defeat the purpose of Land Reforms. The proposed Committee of the AICC will have to be vested with adequate powers to cope with this aspect of the problem also. We feel convinced that only a very high level political machinery would make for speedy implementation of Land Reforms in the States and clear away at the political level the hurdles in the way.

The above Committee should submit six-monthly reports to the Congress President on the progress of implementation. Similar reports should be invited from the PCCs. Based on these, a comprehensive report should be presented to the AICC every year beginning from May next.

The completion of Land Reforms will mark the end of a chapter in re-organisation of the rural economy. We shall then have provided a sound and stable base to the rural economy, for the peasant will then be sure of getting the fruits of his labour and investment.

Agricultural Development

Simultaneously, in the next two years we should ensure the fulfilment of a target of production of 92 to 94 million tons of foodgrains. With that end in view, the Committee feels that attention should be concentrated on 'Package Programme Areas' in the country. There are now nearly 250 IADP areas in the country. In these Intensive Agricultural Development Areas, adequate facilities in men and material have already been made available. Detailed plans have been drawn up. These areas have been selected in consultation with the States concerned and the targets also have been fixed in consultation with them. There is no reason, therefore, why there should be any failure in achieving the targets unless of course there is total failure of monsoon.

In the same way, in the non-IADP areas, the administration should carry out the tasks that may be fixed in consultation with the Planning Commission and the Government of India in the remaining years of the third five-year Plan.

The implementation of programmes of agricultural reforms and development has in the past been unsatisfactory partly because of a lack of clarity in assignment of the responsibility to carry out defined tasks. It is of the greatest importance to take firm steps to remedy this weakness on the administrative side. We, therefore, suggest that in case of failure to achieve the targets set for the next two years, the Chief Minister and the Minister-in-charge should be held accountable to the Congress Parliamentary Board, and if the Congress Parliamentary Board is not satisfied with the performance, the necessary consequences of failure to discharge the responsibility should follow.

This concept of accountability of the Chief Minister and the Minister concerned for the performance of the Plan target should be considered hereafter to be a normal feature of ministerial responsibility in our Organisation. The holding of office will carry with it the obligation to show the necessary competence which will be reflected in the results achieved. This will also ensure vigilance and alertness as well as allocation of responsibility at all levels.

Other Suggestions

We have a few other suggestions to make, in relation to agriculture, required to be performed by the end of the third Plan:

(i) It was intended to cover the entire country with Service Cooperatives by the year 1962-63. This target must be fulfilled at least by the end of the third Plan. In areas where because of backwardness it is difficult to generate popular initiative, it should be the responsibility of the State Governments to make necessary arrangements to build up co-operative institutions within this period. The Government should locate responsibility on some authority specifically for the due discharge of this responsibility. Timely supply of seeds and credit as well as timely sales of their agricultural products will be difficult unless this net-work of co-operative organisation is completed.

(ii) Common Services programme will also have to be organised in order to help farmers with uneconomic holdings throughout the country to undertake economic cultivation of their land and to make available at moderate cost the services of science and technology. In the initial stages, incentives may have to be given to induce the farmers with uneconomic holdings to undertake Common Services programmes. This should lead ultimately to common planning on the basis of sizable economic units.

(iii) Soil testing equipment should be made available at least in one central place in every Block by the end of the third Plan. This will mark the beginning of scientific agriculture.

(iv) The next two years should also be utilised to organise the manufacture and supply of agricultural implements — the objective being that by the end of the fourth Plan there will be no farmer who cares for improved tools, to go without them.

Regulation of Trade & Prices

The third major task that has to be undertaken in the sphere of agricultural development is that of ensuring a remunerative price to the producers of agricultural commodities viz. the farmers. This is a task which is as complex as it is important, since agricultural products constitute articles of mass consumption and any undue increase in their price affects the poorer sections of the community most severely. A variety of measures to benefit the producer without placing an undue burden on the consumers have been introduced by the Governments in the past few years. But these have not been implemented purposefully, with the result that the prices paid by consumers have tended to be much higher than is warranted by the level of producers' prices.

It is generally appreciated that there can be no equitable sharing of the burden of development if the prices of essential food articles and of textiles are allowed to rise from period to period as has been happening in the past. If the socialist pattern of society that we envisage is to be made a reality, firm measures have to be taken within the next two years for effective regulation of the prices of food articles, particularly foodgrains, and of other articles of common consumption such as textiles. To this end, the Government should acquire before the end of the third Plan a commanding position in trade in foodgrains. Without this, it will be impossible to assure proper prices to the farmers on the one side or the consumers, particularly the more needy sections of a consuming public, on the other. The steps which, in our opinion, should be taken are the following:

(a) Government should fix and publicise widely the minimum support prices which would ensure fair return to the farmer for the principal foodgrains; the Central and State Governments should set up purchasing agencies in all primary markets for unlimited buying of supplies at those prices. This will help to eliminate distress sale.

(b) The Central Government should, after a proper enquiry, fix up a margin to be charged from the producers' point to the consumers' point in the case of each commodity. Such margin should include expenses for processing as well as other charges.

(c) Wholesale traders in foodgrains should be permitted to operate only under a licence; this policy has already been accepted and State Governments should see to it that the policy is effectively implemented.

(d) In the interim period, the maximum prices at which licensed wholesale traders in foodgrains could sell their stock should be specified; at that price all stocks with the traders should be made subject to sale only on government authorisation;

(e) Processing facilities such as rice mills should be brought under close government supervision until they are taken over as a means of regulating processing charges as well as for purposes of facilitating greater control on trading operations. In particular, rice mills in principal rice-growing States should be brought under government control and prohibited from engaging in trading activities.

(f) Simultaneously with the acquisition of a commanding position in the processing and wholesale trade operations, State Governments and the other government agencies should enlarge the number of fair price shops and consumers co-operative stores at which foodgrains would be sold at fixed and reasonable prices to the final consumer; in the establishment of consumer co-operative stores and in the ensuring of a proper code of conduct by authorised fair-price shops, the Congress organisation should assume more substantive responsibilities than in the past.

(g) The Congress organisation should create a machinery of its own to assist the State Governments in the prevention of hoarding and profiteering in foodgrains by private traders as well as in wiping out corruption and inefficiency in State Directorates or State-sponsored agencies at all stages of distribution;

(h) Within the course of the next two years, the Government should see to it that every person dealing with foodgrains displays the prices of foodgrains at which he has purchased it and at which he is selling it to the consumer. Such display should also state the quantity purchased and quantity available for sale.

We believe that these measures, if taken with determination and a concern for the well-being of the poorer sections of the community, will evoke response and co-operation from the general public and make for effective and easier implementation of the other policies suggested for agricultural development.

Animal Husbandry

As in agriculture, specific task for the next two years must be set by each State Government, in consultation with the Government of India and the Planning Commission, for the development of animal husbandry, poultry farming, dairies, fisheries etc. Systematic effort has not so far been made to exploit the vast resources of animal wealth in this country. There is still very scarce realisation of the potential in terms of increases in production and speedy production in this sector. The investment-output ratios in other fields will be far exceeded by the results in this sector, if only close attention is paid to its development. Again, as development proceeds, the demands for the supplementary foods and other raw materials provided by this important sector will rapidly grow. If close attention is given to the scientific development of the natural resources available in this field, the supply of alternative and nutritious foods can be augmented quite rapidly at a minimum investment to the Nation. Above all, it will help the vast population of cattle breeders in the country which numbers millions — a good portion of them nomads who are at the end of their tethers, economically and socially.

Two facets of development of this sector deserve special attention. The first of these is an improvement in the quality

of the animals that are bred, through adoption of scientific methods of selective breeding and of production of fodder and food materials. The second is that of providing adequate marketing facilities for the products of animal husbandry. Both these facets are inter-dependent and have to be harmonised. In the absence of this facility, there will be no incentive to the rural population to develop this wealth of the Nation. We, therefore, attach the highest importance to the formulation and implementation of an adequate policy in this regard.

In order to improve the quality of the animal stock in the country — of which the cattle stock is the most important —we suggest that in the next two years the following tasks should be completed:

(a) assessment of the potential for development of animal husbandry in each Community Development Block;

(b) implementation of the programme of sterilization of cattle of poor quality;

(c) provision for stud-cattle of requisite quality and the necessary breeding facilities, for a group of C. D. Blocks if not in each Block;

(d) speedy conversion of fallow and cultivable waste lands into pastures, and provision for scientific preparation of fodder and feedstuffs;

(e) linking the existing marketing facilities with development work;

(f) settling the breeding policy leading to scientific development and resulting in economising on effort as also the resources of feeds and fodder;

(g) settling the price policy for the products of animal husbandry and saving the people engaged therein from exploitation;

(h) revising the credit policy so as to bring the facilities of cheap credit to the animal husbandry men; and

(i) developing on scientific lines the utilisation of the postmortem remains of the animal.

On the marketing side it is of importance that immediate attention be given to the creation of Government sponsored co-operative agencies for collecting and marketing of products of animal husbandry as well as to the enlargement of cold-storage, canning and other facilities. Transport facilities also need to be augmented. In regard to cold-storage, processing and transport facilities for these products, the general policy should be such that they are prevented from becoming instruments of exploitation of farmers by private capitalistic organisations. Particularly in respect of cold-storage and transport facilities, the State should draw up a programme of expansion of State-sponsored agencies for early implementation.

Agro-Industrial Expansion

Rural industrialisation has now been accepted as one of the major economic and social objectives of the plan of the economic development of the country. As Dr. Gadgil has put it, objective of rural industrialisation implies industrialisation of the country as widely dispersed and as at small a scale with as high an economic potential as is compatible with efficient techniques and the requirements of the process of development. This should mean the utilisation of manpower, agricultural and other raw material resources available in the villages and the deliberate development of processing and consumer goods industries and ancillary industries in the rural areas to the maximum extent possible.

While in theory it is easy to conceive of the widest possible extension of the programme of rural industries, we come up against several fundamental difficulties in actual implementation. Except for village industries that come under the Khadi and Village Industries Commission, there is no organisation that can take charge of this problem. The entrepreneurial class interested in this type of work is relatively insignificant. There is complete chaos in the field of raw material supplies, except perhaps in the field of cotton supplies where there is some organisation. Law and rules relating to credit do not make for any easy or smooth expansion. Marketing organisations do not exist. Any attempt at large scale expansion is out of question unless these hurdles are simultaneously removed.

Programme Outlined

Bearing in mind these difficulties, as in the case of agriculture and animal husbandry, we would like to suggest that the following steps should be taken in earnest in order to place the programme of rural industrialisation on a proper footing as an integral part of the programmes of industrial development of the country:-

(i) It should be realised that in the consumer goods industry sector, there is, at any rate, in a few industries already substantial unutilised capacity. Nevertheless, expansion is proceeding. Such expansion would automatically mean commitment on the part of the Government to the supply of raw materials and other resources to the new units. This will, forever, leave a limited field for rural industrialisation. With heavier investments in the fourth Plan, the position that now obtains may become even more critical. It has to be realised in the context of conditions obtaining in the country that decentralised industry on small and cottage scale will continue to occupy an important place in the economy of the country. There should be no doubt that in the process of social transformation, next to agriculture and animal husbandry, rural industrialisation occupies a high enough place of importance. This is an inescapable conclusion if we are thinking in terms of broadening the base of our economy. A high level policy decision is called for in this regard.

(ii) Secondly, while rural industrialisation is not being conceived in the narrow limited sense of continuing the present techniques of production, it should, however be realised that the rural industrialisation will require in the initial stages the strongest possible support of the Government and the society if it is to hold its own against the organised large scale sector which besides the advantage of higher and superior techniques have other advantages that established concerns generally possess and the competitive economy generally affords. This means the responsibility for sponsoring the scheme of rural industrialisation will have, in the initial stages, to be undertaken by the Government.

(iii) In the next two years, the Government should evolve a suitable pattern of organisation and bring that into position if the problem of unemployment and underemployment and guaranteeing minimum living standards is to be tackled effectively, by the end of the fifth Plan. We are of the opinion that a sponsoring body should be immediately set up. It should be an autonomous body under the Industries Ministry of the Government of India. It will concentrate on the implementation of the programmes of rural industries. As its work develops State bodies and even regional bodies can be set up according to the needs of the situation.

(iv) The rural industries programme should be worked through co-operatives of the artisans or their registered institutions. The artisans will by and large be self-employed people and care will have to be taken that the State's support does not lead to the creation of an exploitative class in between the State and the artisan.

(v) In the matter of finance, electric power and distribution of raw materials and of transport, a relatively high priority will have to be given, if the rural industrialisation programmes have to take the roots without loss of much time. Costing norms especially in relation to supply of electric power will have to be reviewed if the rural industries product have to be economic. Once these are provided for, it should be the responsibility of the sponsoring organisation to draw up plans for the supply of raw materials, credit, improved tools and the technical know-how. Organising research and training programmes as well as manufacture of tools and dissemination of improved tools shall also be the responsibility of the sponsoring organisation.

(iv) and (v) above may mean a review of some of the policies thus far followed in the matter of supply of social and economic overheads on the part of the Government.

We feel that this calls for a bold and imaginative effort in the next two years. The inculcation of scientific practices and new techniques will have a direct effect upon the techniques of production in the agricultural and animal husbandry sector also. It is so very necessary to break through the deep veil of tradition that holds back progress in the rural areas. Expansion of rural industries sector will also help the process of breaking through the veil of tradition that holds back India's progress. Acceptance by the vast rural masses of the need for approaching their problems of production from new angles will emerge. Neither agriculture nor industries in the rural areas will then remain in the stagnant condition in which we find them today.

Industrial Development

Prominence given to agriculture, animal husbandry and rural industries does not detract from the need for rapid industrialisation for achieving the national objectives of raising the level of living of our people, securing continued development and ensuring economic independence. With the menace of external aggression that the country has now to face, this aspect of the strategy for development becomes more important than ever. There is a mistaken view that larger effort in the development of infrastructure and basic industries may make the realization of the objectives of agricultural development, enlargement of employment opportunities and cultural development, and improvement in consumption standards more difficult. In actuality there is no such basic conflict between these two vital sectors of the economy. Indeed, it is the industrial sector that provides fertilizers, better implements, cement, iron and steel, electric power, pumps, motors and so forth to the agricultural sector; without these material aids, agricultural productivity cannot be stepped up at the rate that the country requires. Similarly, an expansion of the industrial sector is essential for adding to the employment opportunities outside of agriculture, and for a widening of the market for both food articles and raw materials. If these inter-relationships between agriculture and industry are not explicitly recognised in developmental policy, the achievement of the national objectives of economic well-being and social justice will be made more difficult than it need be.

The programme for industrial development should, therefore, be such that the country will reach, within the next decade or so, a stage where a high rate of growth and investment can be maintained with minimum reliance on external assistance. This will call for a more rapid change in the structure of the industrial product in the coming years. In particular, it will be necessary to seek speedy expansion in the output of industrial products needed for agricultural development and of oil, metals and machinery needed for reducing the dependence on imports. Once these are secured, the basis will be firmly established for continued growth of a great variety of industries processing agricultural and industrial raw materials — many of which will be potent instruments for decentralisation of economic activity and power. Given these considerations, it follows that for several years to come, a substantial part of annual investment in the economy should be devoted to the building up of intermediate and capital goods industries; and in order that there may be rapid progress towards a socialist society, the major decisions in respect of such investment should rest with the public sector.

Division of Responsibility

The division of responsibility for industrial development between the public and private sectors should be geared to the socialist objective of increasing the proportion of means of production under socialist control. The broad allocation of spheres between the two sectors defined in the Industrial Policy Resolution of the Government is in this context entirely appropriate. In future, however, special attention should be paid to widening the scope of machine-building industries in the public sector. The fulfilment of targets that may be set for these industries is of the utmost importance for economic development; furthermore, an efficient and large machine-building industrial complex operating under public control will facilitate the regulation of other industries to be equipped by them.

Since the enlargement of the public industrial sector is essential for both economic development and social control of the means of production, it is imperative that Government should undertake in full or in a very large measure the responsibility for establishment and efficient operation of all the important intermediate and capital goods industries. In implementing the Industrial Policy Resolution, the paramount consideration should be that of phased fulfilment of targets; adjustments in the relative roles of the public and private sectors should be marginal and relate directly to the avoidance of delay in achieving production targets. In the past, Government has on this consideration allowed the private sector to enter into fields reserved for the public sector with a view to realising the third Plan targets. What is equally necessary is that in the fields allotted to the private sector, Government should be ready to enter when the private sector fails to take steps to implement the projects assigned to it. Furthermore, additional capacities in industries of mass consumption like cloth should be in the co-operative or state sector on a decentralised basis. Production in these units should be regulated to a few items of mass consumption. The existing units may be helped to produce more for exports.

In the sector of consumer goods industries it is very necessary to reorient our ideas. The production should be oriented to the needs of the common man. But we fear that it is getting more and more oriented to the needs of the higher income groups. What is, therefore, necessary is to create a powerful check on multiplicity and sophistication of varieties and to lay emphasis on producing things of mass consumption.

This will reduce cost and divert the resources of nation to the essential channels of production. We think it is high time we accept this as a part of our Industrial Policy.

As the public sector takes more and more responsibility in industrial enterprises, the delays in plan implementation as well as the costs of technical and managerial advices will cumulate unless suitable organisational changes are made within the public sector. These costs are particularly large in industries involving heavy capital investments and long gestation periods; to ensure that these costs are minimised, Government should set up specialised planning and design organisations for major industries like steel, fertilizers and chemicals and so forth, immediately. Such organisations should be able not only to provide expert opinion and advice on matters referred to them but also be made responsible for the detailed planning of the industries placed under their charge. These organisations should also be utilised for judging the suitability of related projects envisaged for development in the private sector.

Control on Private Sector

The objectives of social justice cannot be achieved unless simultaneously with the expansion of the public industrial sector, effective control is exercised on the pace and manner of expansion of the private sector. Measures have to be taken to ensure that projects in the priority industries assigned to the private sector are in fact implemented. While there is no doubt that for this purpose the licensing system will have to continue, it has to be modified in several respects if it is to be a really effective instrument for ensuring adequate performance and deconcentration of economic activity and power. In respect of larger and more important projects, licences should be issued only in cases in which full information is provided on technical as well as economic aspects. At the time the regular licences are issued, the successive steps to be taken by the licensee and the time schedule for these should be clearly defined. And when, despite any assistance that may be provided by Government, there is undue delay in the execution of the project, Government should revoke the licence and the project taken into the public sector for implementation. The policy of revoking licences will work only when the Government has built up the technical and managerial organisations mentioned earlier; revocation of the licence will then mean not an elimination of important planned project but their effective implementation by the public sector.

The tightening of the licensing system should be accompanied by greater insistence on the selection of locations, size of units which are economically viable and conducive to a progressive reduction in costs of production In this context, it is important that the issue of licences to units of an economic size should not result in their being concentrated in large business houses on the grounds that entrepreneurial ability or rupee resources are scarce. This will necessitate a decision on the part of Government not to issue any licences for new projects to existing large industrial concentrations. The relatively smaller business houses should be encouraged to acquire the necessary experience and technical expertise and specialised financial institutions set up under Government auspices should be directed to give preference to such business units. In particular Government should encourage through financial and other assistance enlightened technical and managerial personnel in the private sector to come forward and set up industries on their own. This will not by itself solve the problem of concentration of economic power but it is necessary for preventing the very large business houses from getting even bigger. For a real curtailment of concentration of economic power in private hands, it will be necessary for the Government to intervene more extensively than at present in both financial and distributive activities.

Finally, the tightening of the licensing system in the manner indicated above will necessarily increase the stresses on the administrative machinery connected with operating it. Unless steps are taken to reduce this strain on the agencies administering industrial development policies, the danger of corruption will greatly increase. In general, the approach to controls of this nature should be to specify clearly the high priority sectors or uses and restrict the operation of the quota or the licensing system only to them. Once the needs of such priority industries or uses are met, the others in the private sector should be left to obtain their requirements through competitive bidding for residual supplies. This will reduce the scope for black-marketing operations on the one hand and larger revenues for the Government on the other through the use of appropriate fiscal devices. This type of an arrangement need not necessarily imply that the ultimate consumers will have to pay prices higher than those which they are now being forced to pay to profiteers and black-marketeers.

In the present state of economic development, we have necessarily to seek and obtain assistance from foreign countries to industrialise our economy. Foreign assistance comes as Government to Government credit, private credit and as equity. The Government of India and the Congress have always welcomed the participation of foreign equity capital in selected industries where we lack technical know-how and need large amounts of capital. Foreign exchange that becomes available as equity has to be selectively used in industries where we cannot on our own make headway. We should continue this policy of selective and discriminating encouragement of foreign capital.

Direction of Credit

In order that credit and investible resources are canalised along the lines of national priorities and social purposes, the Reserve Bank should direct the Commercial Banks to go into the question of the end-use of the money they lend and see that borrowers use the money for the purposes for which they borrow it. For this purpose the Reserve Bank should have a proper machinery for detecting cases of abuse and taking suitable action. Further, by means of suitable regulations and use of its powers the Reserve Bank should ensure that the priorities which the Commercial Banks work upon in the matter of lending are in accordance with the accepted national or social priorities in planning. In other words, basic and small industries, new entrepreneurs and agricultural operations which merit financial assistance before others get proper priority in the lending policies of the banks.

In addition to the powers already vested in it, the Reserve Bank of India should have power **suo moto** or after conducting an inspection (a) to order a special audit, (b) to appoint auditors whenever inspection discloses some irregularity; and (c) in suitable cases to replace auditors elected by shareholders.

It should also be a statutory obligation for the Reserve Bank to conduct an annual inspection of the working of Scheduled Banks with paid-up capital and reserve of Rs. 50 lakhs and above.

The Reserve Bank should similarly have full authority and be always prepared to exercise it, to direct that Commercial Banks which enter into undesirable practices of the kinds mentioned below, are either reconstituted with new Boards of Directors or amalgamated with public sector banks or other approved Scheduled Banks or run in any other suitable manner under its overall guidance:

a) if serious irregularities are disclosed at the Reserve Bank's inspection or at the special audit or annual audit conducted by auditors appointed by the Reserve Bank;

b) if the licence of a bank is withdrawn or cancelled;

c) if the registration of a bank under the Deposit Insurance scheme is cancelled or withdrawn;

d) if the directives of the Reserve Bank of India in respect of selective credit control for different types of advances are violated;

e) if the advances against one type of security for one type of business or to one industry exceed half the aggregate of advances.

f) if the advances to undertaking in which directors are concerned except as ordinary shareholders, exceed 1/th of the aggregate of advances;

g) if the bank continues to have on its Board of Directors a person who has been fined or otherwise punished for breach of income-tax, Estate Duty, Sales Tax or Customs or Foreign Exchange Regulations or a default in respect of the payment of dues by way of income-tax, Estate Duty, Sales tax or custom duties;

h) if the bank has on its Board of Directors two or more persons belonging to the same joint families or same group of managing agents;

i) if the banks carry on business with or in a foreign country in violation of directive issued by the Reserve Bank;

j) if the banks continue to lend money without ascertaining the end-use of the money from the borrower and verifying that the declared end-use is in practice adhered to;

k) if the banks carry on activities of any kind which are clearly against the national interest.

Unaccounted Money

Unaccounted money comes into unscrupulous hands in a variety of ways and is used in many different manners for unsocial or anti-social purposes. Among examples may be cited the practice of sale or transfer of import licences etc., rebate in the general insurance trade, the sale, purchase and renting of real property — specially in large cities — smuggling, under-invoicing and over-invoicing of exports and imports and so on.

In dealing with unaccounted money we have to consider two aspects — (i) how to deal with the existing unaccounted money in the community and (ii) to prevent accumulation of unaccounted money in the future.

So far as the first aspect is concerned no argument is needed to emphasize evils and dangers of unaccounted money in the community today. No step in this context can be considered too drastic. These problems, therefore, have to be considered seriously.

For the purpose of preventing the future accumulation of unaccounted money, we have to take into account in what circumstances and environment unaccounted money is generated. The accumulation and unscrupulous use of unaccounted money get a fillip in an inflationary economy. Greater the stability of prices the less scope will there be for accumulating and using unaccounted money. An all-out attempt to eliminate graft and corruption from the Government's machinery of controls, the general insurance field and transfer of real property in cities, will be of help. Better supervision and control by the Reserve Bank of India of the circulation and use of large money through non-banking channels should make for an improvement. The machinery for collection and enforcement of direct and indirect taxes should be under continual scrutiny to see in what respects they can be improved and made effective.

Unless along with measures taken to root out existing unaccounted money steps are taken to prevent accumulation of unaccounted money in the future, we may have to resort to drastic steps every time, disturbing the whole economy Therefore, it is necessary to deal with this problem in all its aspects as a whole.

We have approached the problem thus far from the point of view of increasing incomes at all levels specifically at the lower levels. But the experience of the last 10 years asserts itself that with the increase in the speed of development new types of disparities grow. This process has to be counteracted. The third five-year Plan has accepted the broad objective of progressively reducing the gap between the highest and lowest level incomes to 1:30 times over the next 2 or 3 plan-periods. To this end more purposive fiscal measures should be adopted. However, steps should be taken for incentives for workers with specialised ability, responsibility and risk. Problem of unearned incomes and of disparities between the rural and non-rural incomes have also to be tackled.

Labour Policy

As a factor of production labour has no less importance than capital. A high rate of economic growth requires carefully considered labour policy and its proper implementation. Increased production and increased productivity can be achieved only if labour takes keen interest in the problems of economic growth. In a socialist society, this has to be achieved by associating labour increasingly with management.

These aims have to be viewed against the present restive state of labour relations, particularly in the key industrial units of the public sector. Trade unions belonging to different political persuasions have carried to the shop floor political conflicts and internal and interunion rivalries. In this discipline has been the first casualty leading to loss of production in vital and important sectors. In the bid for popularity, each political faction in trade unions has tried to outbid the other. Each faction has put forward demands some of which are becoming more and more unreasonable. This competitive struggle between the labour unions has spread strife in many places. A radical reconsideration of the attitude of political parties to the problems of trade unions is necessary if industrial progress is to be secure and stable.

All political parties in the country have been responsible for the idea of trade unions growing up attached themselves. The time has come for us to decide the future of this link between trade unions and political parties which has had unfortunate repercussions from the point of view of economic growth. The country has to evolve a new policy towards labour which alone would enable a disciplined use of our working force, without at the same time doing violence to the freedom of association of labour. One line of development which the country should consider is to elect by secret ballot in each industrial unit a representative body of labour which will be the only authorised body to negotiate and represent the labour force in the factory. This will go a long way to restore discipline in our factories at the same time ensuring adequate and responsible representation. Such an approach will also enable participation by labour increasingly in management.

This problem calls for an immediate study and methods should be evolved to improve the situation in industrial re-

lations leading to association of labour more and more in management of industries.

While the Committee has emphasised in the preceding paragraphs the basic development programmes which alone can make possible the early fulfilment of the pledge given in the Bhubaneswar Resolution, it would like to be more definite about aspects of minimum needs and social security. They have special significance of their own. They require to be specifically mentioned.

Drinking Water

We suggest that a phased programme should be worked out to provide to the people of the country in cities, towns and villages potable drinking water all the year round, in all seasons. It is necessary to underline the need for potable water as also for its supply the year round in all seasons, as it is sometimes not realised that the arrangements usually fail in summer and draught. There must be assured water supply.

The resources for water supply must come from the Central Government, State Governments and Local Bodies. It may also be possible to invite donations for this noble purpose. It may be possible to receive popular help in kind or in the form of labour. There are so many agencies which deal with the problem of water. For instance, the Irrigation Department has its own schemes for agricultural purposes. Power Boards have their own schemes for Hydraulic power. Even Mining Deptt. and mining concerns have to deal with the problems of surplus water. In the oil and gas projects, in the initial stages, this question of disposal of surplus water sometimes becomes a problem. There was at one time a proposal mooted before the Government of India to form a Water Board. We think the idea is sound and it should be revived. A machinery with the necessary powers for co-ordination and execution should be immediately set up both at the Centre and in the States. We also feel that the fulfilment of this phased programme, like the fulfilment of the targets of agricultural development, should be given the highest importance and the Chief Minister and the Minister in-charge held accountable in case of default.

It is very necessary to realise that the problem of providing water is not as easy as it appears. There are still big cities, modern in every sense — cities like Bombay, Madras, Calcutta — where the outlying areas are still not provided with adequate facilities for water supply. The programme will require heavy investment. It will require, when water is to be led through pipelines, large quantities of iron, steel and cement. In many places water will have to be raised to higher levels by electricity. Due provision for all these should be made in evolving the phased programme. Fulfilment of this programme will, no doubt, take some time but the very fact that earnest endeavours are being made for a systematic implementation of the programme will convince the people that this is not a hollow promise.

Housing and House Sites

This is another difficult item. Both in the rural and urban areas there is much of congestion. Rural areas have this difficulty too. There is no lack of non-arable land but the house sites for the expanding population in the villages have to be generally provided in close vicinity of the village and the non-arable areas may be far away. The cultivable lands near the village sites may be very costly. In such cases, the question of establishing new villages may also arise. In the towns, the mounting pressure of new entrants is resulting in shooting up of rents as also the price of land. There is so much of abuse on the part of landlords as well as the tenants that all kinds of tensions mount up. Moreover, it is difficult to get housing material; the timber is getting more and more costly; even the domestically produced bricks and mortar are getting costlier.

We feel that the spirit of socialism should be reflected in the attitude of the Government and the Local Bodies in providing necessary facilities to the lower income groups and the weaker sections in meeting their minimum housing needs. For this purpose, the following steps appear to be immediately called for:

(1) A survey should be undertaken to ascertain the number of families without a homestead. A phased programme to provide house sites to these families before the end of the fourth Plan should be finalised within a year. The agency of Community Development Blocks should be utilised for this purpose.

(2) The life insurance schemes should be linked with services and housing programmes. The people will not mind compulsory life insurance if it is once accepted that the funds available with the Life Insurance Corporation would be utilised for health and housing by and large.

(3) A phased programme should be worked out for providing house sites and housing material to those who are in bad need of housing accommodation. A family with less than 2-room accommodation if it falls within the category of low-income groups or belongs to the Scheduled Tribes and Scheduled Castes should come in that category. Loans should be made available to them, repayable in easy instalments and at concessional rates of interest.

(4) The Government should assist the Local Bodies, the industrial units — both public and private — and the Panchayat Samitis in undertaking housing programmes for their staff and workers.

(5) Easy procedures should be laid down for utilization of Government fallow land for the purpose of manufacturing bricks and for the purpose of house sites and house construction.

(6) Owners of vacant plots of land in towns, cities and rural areas should be called upon to undertake construction within a reasonable time. In default, the land should be forfeited to the State, Municipality or the Panchayat as the case may be. This will go a great way in reducing pressure on accommodation, bringing down rents and even to a certain extent the land prices. It is also necessary in the thickly populated townships and cities to fix up not only the maximum limit for construction but the minimum limit for it also so that land may be as economically used as possible and housing in these areas may make rapid progress.

(7) Genuine Housing Co-operative Societies for low-income groups, labour, peasants, Harijans and Tribals should receive suitable priority in the matter of financial assistance and housing material as also in the matter of allocation of house sites.

Health and Education

Children should be the first concern of the nation so far as health and education are concerned. Equality of opportunity should begin with the birth of the child. Its nutrition, its healthy growth, its education, are, in one sense, a social insurance against the possible deterioration of the nation. Children of the under-privileged in this context, should require special help to bring them somewhere nearer those of the privileged.

By the end of the fifth Plan primary education should be free and compulsory for all; the secondary education should be free for all the children whose parents earn less than the national average family incomes and the higher education should be free for all promising children. Free education should include free books, mid-day meals as well as clothing for the children of the Scheduled Tribes and Scheduled Castes, especially for girls. In the higher category, free education should include free books and hostel charges. The benefit of free education should be extended to the children who go for Certificate or Diploma Courses in technical lines, in case of their parents earning less than the average national family incomes.

Agricultural Labour

In our scheme of increasing agricultural output we have never given attention to the quality of labour. It is usually forgotten that the quality of labour determines in a big way the output from land. The training and equipment of the agricultural labour thus becomes important from the point of view of developing agriculture and introduction of new scientific practices. It is also necessary to reduce the pressure on land. From this point of view also the agricultural labour has to be trained for new techniques in the fields of village industries of both processing and consumer goods type as well as ancillary.

We suggest, therefore, a two-pronged attack upon this problem:

1. Re-settlement of agricultural labour on agricultural wastes and its training for improved techniques in agricultural production, and

2. Training and recruitment of agricultural labour for rural industrialisation.

Both these approaches will have to be simultaneously adopted if this problem is to be satisfactorily solved. In the coming two years we suggest that a basis should be laid for this approach. Settlement of agricultural labour together with the training, as mentioned above, will help fulfilment of the agricultural targets and training and equipment of the labour for rural industrialisation will go to reduce pressure on land.

While this is attempted the Minimum Wages Act should be enforced so as to improve even in the intervening period the condition of the agricultural labour.

Organisation

A number of drawbacks and deficiencies have crept into the organisation. The historically inevitable entry of the Congress into office has tended to take the senior leadership away from the rank and file; electoral processes have thrown up many persons who while they may be good in their own ways, have little or no emotional regard for the goals and objectives for which the party stands; and there has been a constant narrowing of the organisational base so far as the mass of the people are concerned.

It is high time the party applied its mind to this question. We would suggest:

(i) Revival of its mass base by drawing a good bulk of its cadres from the peasant and the working classes. The Organisation should become the real representative of the actual tillers of the soil, of the agricultural labour, the factory labour and the like. Members of the Intelligentsia who are engaged in dealing with their problems have no doubt a vital role to play and should be encouraged to participate increasingly in the Organisation. The character of the Organisation must undergo a revolutionary change if the Congress is to reflect the mass urges and to mobilise mass effort. A worker who has roots in the masses should have preference in the matter of selection for representative institutions including legislatures. The test of selection should be work among masses.

(ii) Genuine democracy should prevail in the Party. It should be the general rule that all decisions involving formulation of policies and all important programmes should be discussed within the Party and the members should be given fullest opportunity to have their say. Once the decision is taken it must be accepted and implemented. This is possible only if discussions of policies and programmes are made absolutely indispensable and free. This will assist in the clarification of issues and make for better understanding and cohesive functioning.

(iii) Finally, no party, more so a progressive party, can escape public criticism. Sometimes such criticism is prompted by ignorance of facts or issues. More often it is prompted by vested interests who stand to lose because of the progressive policies. All this is a part of the game. But compromise on fundamentals with an eye on elections cannot be excused. On certain fundamental issues such as land reforms, concentration of economic power, communal harmony and programmes and policies affecting the underprivileged classes there could be no possible compromise. The Congress must be prepared to stand or fall on these issues. This will give a character to the Organisation and determine its composition and strength.

Training of Cadres

This is a long felt need. We would suggest the following minimum steps to be taken in the next two years:

(i) AICC should set up a centre for organising research and for training and education of workers.

(ii) To begin with we should have small handbooks written and printed on select subjects of importance. They may be priced. Every active member should be required to read these handbooks. There should be lecture-cum-discussions organised.

(iii) We should have at least one person in each Commissioner's Division to explain the Party's policies and programmes to the workers, to answer questions arising out of them and to provide to them talking points. We may select such persons from the MPs and MLAs. This should be easy if at the time of the selection of candidates such persons who have special aptitude for the kind of work are given a special preference.

The most important aspect of Congress activity in the next decade would be mobilisation of resources in the villages for the development of agriculture, animal husbandry and rural industries, including cottage and village industries.

Tasks should be assigned to every Active Member to render his contribution in the development of these. This must be the test of his eligibility and his loyalty for recognition to the organisation.

Both at the AICC and the State level there should be permanent Committees concerned with the implementation of the Plan and the fulfilment of the promises in the Election Manifesto. They will submit their reports annually to the AICC and PCC as the case may be. These reports will be fully discussed in these bodies.

Greater attention needs to be paid to the departments of youth, women, labour, peasant and weaker sections at the AICC level with a view to activising them. It will be necessary to pay special attention to the programmes affecting them so as to generate their interest in the Organisation.

The Committee feels strongly that there should be a Parliamentary Committee composed of the members of Parliament to watch the progress of the Plans. There should be similar committees at the State level to watch progress of the State Plans. These Committees should be analogous in status to the Public Accounts Committees.

The Congress has a role to play in fighting corruption. The Government of India is evolving programmes for it. It has to be helped in the task. Admission of failure on its part will greatly affect the structure of this organisaion. A mass drive must be undertaken for eradication of corruption.

It is only a clean administration that will be able to exercise with confidence and strength the regulatory powers so very much needed for successful implementation of the Plans. The people will also trust only such an administration with wide powers. Fighting corruption thus is one of the key tasks.

Conclusion

The acid test of Indian politics is its capacity to awaken people to their new responsibilities as much as to their opportunities and to harness them in the national endeavour. It will not be possible to evolve a new social order unless the people consciously accept it and make it their own responsibility. Absence of this consciousness on the part of the people has in more ways than one hindered our progress. The democratic attitude with its emphasis on the dignity and freedom of man, the socialist approach with its stress on equality of opportunity and the scientific temper of the present age of technological revolution — all these have to permeate the Indian political consciousness That these and the message of non-violence and purity of means which Mahatmaji gave us should be a part of the nation's way of thinking, its attitude and its way of life is dependent upon many factors including the way our planning and our educational programmes work. But above all, the Party is primarily responsible to give lead to the people and show them the way. This and this alone is the surest way to success.

Income Tax Payable at Selected Income Levels

IN THE light of the changes in the Finance Bill recently passed by Parliament, the Finance Ministry has issued a number of statements showing the amount of tax payable at selected levels of income by individuals in different circumstances (unmarried, married but with no child, with one child and with more than one child) on earned income and on unearned income. These statements show the tax liability without allowing any rebate of tax admissible in respect of contributions to provident funds, payments of life insurance premiums, charitable donations etc.

The Best Prime Minister We Have

AS MUCH IN the peak hours of his political power and glory as in the waning phase of his failing health, Jawaharlal Nehru had kept the world confronted with two interrogatives of Delphic complexity: "After Nehru, Who?" and "After Nehru, What?". Of those questions, if the second was much the more important, the first was clearly the more urgent. The credit for finding for the country a solution for the problem of "who?" must be shared equally by the Congress President, Mr. Kamaraj, and Mr. Morarji Desai, the man on whom fell, more than on anyone else, the agonizing responsibility for deciding whether the succession was to be publicly contested on the party platform or not.

The role which the Congress President has played with such amazing fairness and finesse in the five days following Jawaharlal Nehru's death has deservedly won national admiration. It had, of course, been clear for some time now that the Congress President and some of his close colleagues and associates in the party had more or less definite ideas on who was to succeed Jawaharlal Nehru as Prime Minister when the need arose. It was no secret either that this powerful grouping within the Congress organisation had picked up Mr. Lal Bahadur and would work for his acceptance and nomination as the leader of the Congress Parliamentary Party when that post fell vacant. In the circumstances it had again always been clear that any rival contender for the succession would have to reckon with the authority and resources of the Congress presidency being thrown into the battle against him. Mr. Morarji Desai, no doubt, was aware of this and yet it was never in doubt — and it became increasingly evident as the hours of those fateful five days went by — that he could and did command considerable strength and support within the party and, let it be added, from directions that cut into some very surprising sources. If in the end, Mr. Desai decided not to press his candidature to voting point, it could not have been so much because he was disappointed with the extent of support that he or those who worked for him were able to mobilize as because, as he himself put it, he chose to act as a disciplined soldier of the Congress and accepted the verdict of the party when the Congress President, acting on the authority of the Working Committee, ascertained and declared the consensus in the Congress organisation to be in favour of Mr. Lal Bahadur. As a result, Mr. Lal Bahadur has been elected as the leader of the Congress Parliamentary Party without a contest. But it cannot certainly be claimed that the party has unanimously chosen him. In fact, it would have been surprising if it had done so, for Mr. Lal Bahadur certainly does not have that positive personality which could compel unanimity in his behalf. As a matter of fact, if the general view of the party has been found to support him, it is essentially because, in the opinion of majority of Congressmen, there is more to be said against other candidates, actual or potential, than to be said for Mr. Lal Bahadur. In this sense, the country has now been placed in the philosophic position of contemplating Mr. Lal Bahadur as, to borrow a historic phrase, "the best Prime Minister we have".

It is possible that nobody realizes this more clearly than Mr. Lal Bahadur himself. It is, of course, easy enough to mark and put down his major limitations and inadequacies for the role of Prime Minister, and in fairness to him and the country, it is necessary that this should be done. For a man who, by the nature of his office, must wield the most effective political authority in the country, Mr. Lal Bahadur is lacking in the will to power. This is not to say that he has not been nursing political ambitions, but this is certainly to suggest that by himself he

would never have found the drive and the determination to pursue those ambitions effectively. There is, secondly, the fact that Mr. Lal Bahadur has never enjoyed the prestigious status of a national leader, even to the extent to which the late Mr. Gobind Vallabh Pant managed to do in his late years. In fact, he cannot claim even the secondary, but nevertheless substantial, standing of being the most powerful or even the most influential leader in his home State. On the contrary, among the major weaknesses in his candidature for Prime Ministership has been that in the Congress politics of Uttar Pradesh, Mr. Lal Bahadur has at best been one among warring equals.

It is true, however, that he has had a certain amount of political training in one of the most politically conscious of the States in the country, and it is also true that he has had considerable administrative experience. But it remains to be seen whether either of this has been enough to sow in him the seeds of capacity for leadership at higher levels. Jawaharlal Nehru, of course, seemed always to find him useful and reliable. But if that made him more of a confidant, it certainly rendered him less of a colleague. Whether Mr. Lal Bahadur has any positive ideas on domestic economic policies or whether he has any ideas at all on international affairs only his actual tenure as Prime Minister will reveal. For the present it is not unfair to suggest that he is probably not sufficiently educated in either of these important fields. In economic affairs, at any rate, his spell as Minister for Commerce and Industry (from March, 1958 to April, 1961) was not particularly distinguished either for imaginativeness or for executive competence.

There is no need to stretch out this catalogue, since enough has been said to suggest that the country cannot be expected to be widely enthusiastic over Mr Lal Bahadur as Prime Minister. But the country has certainly cause for comfort. This is because many more points, although naturally different ones, could be made against any of the possible alternatives to Mr. Lal Bahadur. It is, however, unnecessary to list the limitations of those who have after all failed in the bid (or even to make a bid) for Prime Ministership. It would be more to the point to indicate whether Mr. Lal Bahadur, despite his lack of pretensions to outstanding excellence in any particular respect, would still, in the circumstances in which he will be Prime Minister, be of benefit to the nation. In our view, what is nationally the most important thing to be said in his favour is that he, more than any other possible successor to Nehru, seems suited by training and temperament to the vital task of carrying the bulk of Congress opinion with him in the difficult days ahead. This is no mean political qualification for, even as many Opposition spokesmen have been found to confess in the wake of Jawaharlal Nehru's death, it is important that the Congress party should continue to function for some years to come as an effective national organization if political stability and national unity are to be maintained in the post-Nehru phase.

But when we suggest that Mr. Lal Bahadur is most likely to be able to preserve unity in Congress ranks, we have in mind not so much his ideological position which has been described as being neither to the Right nor to the far Left as to the more practical consideration that it has so happened that among the candidates, declared or undeclared, for Prime Ministership, he seems to be the one to command the confidence and support of the most coherent and purposive grouping of leadership within the Congress organisation. If the candidature of Mr. Lal Bahadur has succeeded as smoothly as it has done it is largely because there has come to be enlisted in his favour group action of the most clear-headed and skilful kind. While there is no need to challenge the Congress President's finding that the consensus in the party was clearly in favour of Mr. Lal Bahadur as Prime Minister, it is certainly proper and pertinent to point out that this consensus was created, organized and put to political purpose by the determined action of a group of leadership within the party. As a

Eastern Economist 20 Years Ago

JUNE 2, 1944

FEW RETIRED British officials have had better understanding of or deeper insight into Indian political and economic problems than Sir George Schuster, lately Finance Member of the Government of India. His comments on the Bombay Plan, published by the 'Indian Express', are therefore worth much more than all the criticisms of the British journals and publicists which suffer mostly from ignorance or prejudice. Sir George has firstly, driven the nail on the stupid idea as he calls it of regarding India's problems as economic rather than political. Emphasizing the dangers and absurdity of this attempt at side-tracking the issue, he says: "Man is a political animal, as Aristotle has said. Political problems come first; unless they can be solved, there is no solution for economic problems." This is the answer to all those of the Government of India who fondly hope that through economic lines of attack the essentially political problems can be solved or that economic questions so called can be satisfactorily handled except through political settlement. His view that the target of the Bombay Plan is not fixed too high and that it is "really quite a modest plan" is in consonance with the prevailing public opinion in India and will, we hope, dispel the doubts and fears injected into the Government of India by their experts. He has no doubt himself that to aim at doubling the national income in a period of about 20 years (allowing 5 years for preparation) is not unreasonable. Underlining what Mr. G. D. Birla had pointed out in his address to the Federation of Indian Chambers in March, Sir George points out that the problem is essentially human and political and that for the success of the plan we want great numbers of engineers, managers and skilled foremen. "We must think of the problem not in terms of financial obstacles but in terms of organizing human effort."

consequence, Mr. Lal Bahadur will have the invaluable backing and support of the dominant influences within the Congress party in discharging his responsibilities as Prime Minister. This development could have immense significance of a beneficial quality to India's evolving democracy. Hitherto Jawaharlal Nehru's unique personality was largely sufficient in itself in mobilizing the people or public opinion behind the policies and decisions of the Government. This was the fact which gave to India in the crucial years after Independence the twin blessings of political stability and continuity of administration. This was how India hitherto was made and kept safe for democracy. Now that Jawaharlal Nehru is no more, the Congress party must take over and fulfil this responsibility for an effective partnership between the rulers and the ruled. In Mr. Lal Bahadur the Congress party may well hope to find the best Prime Minister we have for assisting [illegible] further success of this distinctively Indian experiment in democracy.

Consortium's Candid Co-operation

AT THE TENTH meeting in Washington of the Consortium of Governments and institutions interested in assistance to India held under the auspices of the World Bank, a decision was taken on May 26, 1964 to pledge for the year 1964-65 — the fourth year of the third Plan — aid to the extent of $1,028 million as against a request for $1,110 million. As the table at the end of the article shows, the total volume of assistance to this country added up, for the first four years of the Plan, to $4,445 million, though there has been a slow decline in aid from $1,295 million in 1961-62 to $1,028 million in 1964-65. Since the total requirements of external assistance from all sources, including non-Consortium countries, and private foreign investments have been estimated at $5,460 million, the demands of this country for aid to finance the development projects have, by and large, been met; a relatively smaller volume of aid will be needed for 1965-66.

An outstanding feature of the aid promised this year is that nearly half of it will be untied. India had requested that the ratio of the non-project aid should be raised from 40 per cent to 50 per cent. This request has been acceded to, in view of the slow manner in which aid already authorised has been recently utilised. A special committee under the chairmanship of Dr. V. K. R. V. Rao had recently indicated that the ratio of disbursements to the volume of sanctioned aid fluctuated between 55 and 59 per cent during the last 12 years. The committee also listed the causes for the lag in the utilisation of this assistance, highlighting the fact that the non-project loans could be utilised speedier than aid tied to specific projects. Again, it is necessary to continue to feed the present industries with the requisite materials so as to make full use of the available installed capacity. This could be achieved only if a large percentage of the pledged aid was not tied to projects.

While this country is grateful to the Consortium for support in meeting our broad needs of external assistance, it needs to be emphasised that the loans in future should be in terms of longer periods and lower rates of interest. This is essential as the burden of repayments is likely to gather momentum in the coming years. It is estimated that even during the third Plan period the total repayments will amount to about $[illegible] million. [illegible] capacity of the economy to shoulder [illegible] has not increased sufficiently, especially in terms of foreign exchange. A gesture of goodwill in this regard is of vital significance at the present moment. On its own, this country has already realised that the climate will have to be created to encourage a free flow of private foreign capital since government-to-government assistance may not meet all its requirements. Mr. T. T. Krishnamachari, the Union Finance Minister, has taken measures in the latest budget to improve the climate for private foreign capital and has reduced the tax burden on foreign companies and has provided certain other incentives to foreign companies and has also provided incentives to foreign personnel working in India. Recently, he has also brought about some modifications in the terms of collaboration with foreign firms. He has, for example, permitted majority participation of foreign capital under certain conditions. Broadly, if a project comes under the category of the highest priority in the Plan and no alternative sources of foreign exchange are available to meet the cost of the import content, the collaborator would be allowed to hold the majority share. This liberal outlook is expected to enlarge the volume of private capital entering this country.

There is no doubt that continued political stability and economic prosperity coupled with a fair rate of return are the necessary conditions for relatively free availability of private foreign capital. The death of India's first Prime Minister, it was feared, would create conditions of instability for some time. But happily, wise counsels have prevailed with the leaders of the Congress party who have elected, without contest or much controversy, the person most likely to be able to keep the party together, viz., Mr. Lal Bahadur, as Mr. Nehru's successor. This will certainly create great confidence at home and abroad and will help discount the forecasts of the prophets of doom.

The climate for government-to-government aid has not been very favourable in recent years despite the satisfactory state of affairs in regard to the aid promised

to India by the Aid-India Club. There has been a cut in the US aid appropriations which is only an indicator of the shape of things to come. India will have to fall back upon its own capacity to earn additional foreign exchange by increasing exports. It is to be conceded that in the short period there are limitations to the increasing of exports, though some hope has been raised by the performance of India's exports in 1963-64 which very nearly touched the all-time peak of Rs. 800 crores. Unfortunately, most of this increase has been brought about in trade with the rupee payment countries, notably the Soviet Union and other East European countries. We have not been able to cut much ice with the Western countries. Unless the current Geneva Conference shows ways and means of expanding India's exports, the possibility of raising our foreign exchange earnings in the future may not be very bright. In the Ministry of International Trade, efforts are being made to explore new possibilities in both the traditional and the new markets. New techniques are being tried and an Institute of Foreign Trade has just been established, while market surveys are being conducted abroad, commodity-wise and country-wise, to locate the weak spots in our export strategy. All these factors will, it is hoped, produce some tangible results.

The fourth five-year Plan is being drafted on an ambitious scale with the result that the demand for external assistance will be much larger than that of the third Plan. As against the estimate of Rs. 2,600 crores of external assistance for the third Plan, it is computed that the corresponding figure in the fourth Plan may be around Rs. 5,000 crores. Will the Aid-India Club be willing or able to step up its efforts correspondingly? It is feared that the volume of aid in the next Plan may not be much larger than provided in the third Plan. Whatever the gap, it will have to be filled by providing greater incentives to private capital, by expanding India's foreign trade by all possible means, by restraining the use of foreign exchange to the minimum possible and by encouraging import substitution wherever feasible. While the Consortium has co-operated in a splendid manner in the current year, the generosity of the members should not be taken for granted for all time to come.

freedom is in peril, defend it with all your might —Jawaharlal Nehru

DEFENCE OF THE COUNTRY NEEDS CONTINUOUS EFFORT

The external danger that faces us is not of today only. It may last for a considerable time. So the nation will always have to be on its guard. There can be no complacency, no slackening of effort to strengthen defence in every way.

WORK RESOLUTELY

Highlights of the Week

POLICYHOLDER NEGLECTED

WHEN IT comes to the question of utilising the funds of the Life Insurance Corporation, so much seems to be taken for granted, especially by public sector interests and institutions like Industrial Finance Corporations, that it has become necessary for those in charge of the LIC to speak out their mind on the subject. Mr. B. K. Kaul, Chairman of the Life Insurance Corporation, has been at once clear and courageous in the stand he has taken in a special communication on the question which he has sent to the Planning Commission.

Anyone who is reasonably conversant with the working of the LIC will readily endorse the point made by Mr. Kaul that nothing should be done that would adversely affect the profitable functioning of the Corporation, whilst also fulfilling its primary responsibilities to policy-holders and playing its legitimate role in national development. This is certainly a more positive and practical approach than the one urged by some misguided enthusiasts of the public sector who demand that more funds of the LIC should be placed at the disposal of the public sector and State financial bodies. It is amazing that these are unable to appreciate that, even with the existing percentage of funds earmarked for investment in Government securities, the public sector stands to benefit more when the Corporation is dynamic and growing than with a higher percentage of such funds when it is static and its business starts shrinking. This is as simple a thesis as the statement that 50 per cent of Rs. 1,000 crores is less than 55 per cent of Rs. 900 crores. In other words, when the Corporation is making good progress, even with the earmarking of 50 per cent of the LIC funds, the public sector stands to benefit more than with a relatively higher percentage when the LIC ceases to make progress and its business begins to decline. The funds of institutional investors, especially a life insurance undertaking, must be invested in a precise and pre-planned manner, bearing in mind certain obligations. For instance, the LIC owes it to its policy-holders to ensure that a certain average rate of interest is obtainable on its investments.

There is point, again, in the contention of the LIC's Chairman that it is high time that the notion that "the LIC is a purveyor of cheap credit and a pre-emptive source of aid" is dispelled. Institutions like the Industrial Finance Corporation, State Finance Corporations, State Electricity Boards and State Housing Boards, it is said, feel that whatever the rate of interest they may charge to their clients — the LIC must provide them with funds at no higher than 4¾ per cent. And if the LIC does not oblige them, they charge it with coming in the way of the fulfilment of the objectives of the Plan! While not necessarily wanting the monetary authorities to regulate their policy to suit the Corporation's convenience, it is noteworthy, Mr. Kaul has not been sparing in his criticism of the manner in which some of these financial institutions have been raising funds through medium-term loans and demoralising the medium-term loan market in the process. He is perfectly justified in making this criticism in view of the resultant adverse effect on Government loans which constitute the single largest portfolio of the LIC's investments. In adopting this attitude, Mr. Kaul cannot be said to be unmindful of the requirements of these institutional investors. Only he is intent — and rightly so — on bringing about a change in the 'modus operandi' of raising their requirements by resort to medium-term loans. For one thing, he wants these institutions to raise medium-term loans only to the extent of their bare or genuine needs. For the rest, he says, they could approach the LIC and obtain their requirements by private negotiations, that is in a business-like way by offering satisfactory terms. It is unfair on the part of these financial bodies, to say the least, to expect the LIC to provide them funds at low rates of interest even when they can very well afford to pay relatively higher rates of interest and they themselves have no qualms in lending at very much higher rates — as much as 7 to 7½ per cent — to their customers.

The LIC Chairman has also ably countered the argument about the Corporation's investments in shares of companies in the private sector. He has made it clear that it is not the LIC's business to support, nor is it interested in supporting,

> **"I have received so much love and affection from the Indian people that nothing that I can do can repay even a small fraction of it, and indeed there can be no repayment of so precious a thing as affection. Many have been admired, some have been revered, but the affection of all classes of the Indian people has come to me in such abundant measure that I have been overwhelmed by it. I can only express the hope that in the remaining years I may live, I shall not be unworthy of my people and their affection."**
>
> —From the Will and Testament of Jawaharlal Nehru.

stock exchanges or speculators in shares. The investment policy of the LIC is designed to ensure the best possible yield over a given period. It is this consideration which makes it imperative for the LIC to be extremely selective in the purchase of shares. If the LIC is obliged to invest only in new companies, as has been suggested, it has to forget about yields on at least a part of its investments for quite some years and, what is worse, risk a sharp fall in the total return on its investments in shares. Needless to say, this would upset all actuarial calculations of yield.

No one can take exception to the contention of Mr. Kaul that the interests of policy-holders are, and must remain, supreme. Nor can anyone question the soundness of his preference that, if the Corporation takes good care of the interests of policy-holders, it will be able to command ample resources to the benefit not only of other institutional investors but also of national development generally.

SMALL BANKS

IN THE MIDST of cries of nationalisation, on the one hand, and pleas for more mergers of banks, on the other, one would be quite justified in asking whether there is going to be a place at all for small banks in the future. Yet things do not seem to be so hopeless for the small banks. Otherwise, it is difficult to appreciate all the care and trouble that the Reserve Bank of India has been taking to arrange periodical seminars of chief executives of small and medium-sized banks in the country. Last year alone, three such seminars were held. All these seminars were held in Madras, although Mr. P. C. Bhattacharyya, Governor of the Reserve Bank, stated, when he inaugurated the first seminar in Madras, that it was the Reserve Bank's intention "to have similar seminars in the other areas in due course." The preponderance of small-sized banks in Madras was given as the explanation for holding the first seminar there. Evidently, conditions in other areas

as, for instance, West Bengal, where subsequent seminars might have been held, have been far from normal. But it should not have been difficult for the Reserve Bank to fix some other venue. The idea of rotating the venue is to lend a touch of novelty, if not variety, which is eminently sensible.

Correct Approach

But the venue is the least important aspect of these seminars. What is really important is the discussions that take place at these meetings. It is from these discussions that one comes to form some idea of the peculiar problems facing the small banker in his place. Obviously, it is not the big banker in cities only that has to face problems like advances to directors and loans against shares. What is noteworthy is that the seminar discussions on these issues proceeded purely on a practical plane, which is the correct approach of a banker, and not on ideological lines. Take, for instance, this gist of the discussion on advances to directors: "A director by his association with the bank is expected to give it prestige and thus assist in attracting good business. There can be no general objection to such business as is brought by a director, including business from companies and concerns in which he is interested. In accepting business in which a director is interested, it is, however, necessary to ensure that the business is acceptable on the basis of standards normally adhered to by the bank and that there could be no reason to think that the director had used his influence in securing any special terms which would not have been granted to other parties." This is absolutely unexceptionable.

Take, again, the position of small banks, following the promulgation of the Gold Control Order. It is well known that, in the case of most of these small banks, advances against gold ornaments constituted the main line of business. According to Mr. Bhattacharyya himself, personal loans generally against the security of gold ornaments formed about two-fifths of the total advances of non-scheduled banks. With this avenue barred, these banks have naturally to look out for other avenues to employ their surplus funds, but then there are genuine difficulties in the way. Either the opportunities for making advances against usual commercial banking securities are restricted in their areas of operation, or the banks do not have the staff with the requisite special knowledge and experience to venture into other fields. And there are also differences as between the older small banks and the younger ones, the former tending to view the present conditions only as a passing phase and the latter not quite subscribing to it. This probably also explains the approach of the two schools to the question of amalgamation or merger. But it is gratifying to note that the consensus of opinion among all is that a well-conducted, small-sized bank with growth potential does not present any problem. And it is to ensure this precisely that these seminars were conceived and are being held. "We in this country", as Prof. Karve has observed, "have refused to be drawn into the ideological controversy between branch banking and unit banking. A bank which satisfies the requirements of sound and progressive banking has a right to exist. Again, to recall Prof. Karve's words, at the present stage of development in the country, it is extremely important to offer to as many bankers, especially those in charge of small and medium-sized banks, as possible, opportunities to keep their banking knowledge, of law and procedure, quite up-to-date and to learn lessons of other peoples' experience. The Reserve Bank is to be congratulated on having thought of and arranging these seminars, largely at its own expense, we understand.

Gloom in Parliament

By Our Parliamentary Correspondent

NEW DELHI:

WHEN EARLY this month, the President ordered that the two Houses of Parliament should meet in special session on May 27 to legislate the Constitution (Nineteenth Amendment) Bill, no one could imagine that one of the first tasks that the Parliamentarians would have to perform would be to mourn the demise of India's first Prime Minister, Mr. Jawaharlal Nehru. The two Houses had hardly assembled on that fateful morning when they were given the sad tidings of Mr. Nehru having been taken seriously ill and that his condition was causing anxiety. This was enough to make the two Houses deserted places, even though business for the day was carried on for some time in fond hope that, as in the past, the Prime Minister would pull through. But Providence wilt otherwise. Shortly after 2 p.m. on that fateful day, the news was broken to the stunned and dazed Lok Sabha that Mr. Nehru was no more. The following day's sittings of the Parliament were washed out by the tears of the nation. The two Houses met again on May 29 for a short while to pay homage to the departed leader. Inevitably a vacuum was felt as everyone turned to the Prime Minister's seat which had been adorned by Mr. Nehru for the past 17 years. Paying of tributes by the leaders of various parties and groups in the Parliament was no easy task; words failed to reflect the mental agony each of them was feeling. In the Lok Sabha, Mr. G. L. Nanda, who had been catapult to Prime Ministership after the death of Mr. Nehru, confessed that he found it "difficult to speak on this occasion". Mr. Hiren Mukerjee described Mr. Nehru as a gem of a man who never stooped to pettiness —a lover of children, animals, life and laughter, a gentle colossus who no longer strode the Indian scene. The Speaker, Mr. Hukam Singh, spoke of Mr. Nehru as a parliamentarian and democrat. In the Rajya Sabha, the Education Minister, Mr. M. C. Chagla observed: "Who are we to pay tribute to Jawaharlal Nehru? He bestrode the world like a colossus and we petty men can only remember his greatness and give him our tears from stricken hearts. The 17 years of Mr. Nehru's stewardship of the country will be known as the 'Nehru Age.' India and the world will never be the same without Nehru." The Chairman, Dr. Zakir Hussain, spoke of Mr. Nehru as the guiding genius of our young democracy. The two Houses resolved to strive for the ideals of world peace and progress, and national unity, solidarity and prosperity to which Mr. Nehru had dedicated himself throughout his life.

Land Reforms Act

The regular business was taken up in the two Houses on June 1. The Lok Sabha debated the controversial Constitution (Nineteenth Amendment) Bill and adopted it by 389 to 30 votes after accepting an official amendment to style the measure as the Constitution (Seventeenth Amendment) Bill. The Bill seeks to provide protection to various State land reform Acts from being challenged in the courts of law and enlarges the definition of "estate" in Section 31-A of the Constitution. An identical Bill — the original Constitution (Seventeenth Amendment) Bill — had fallen through during the budget session of the Lok Sabha for want of simple majority of the total membership of the House, although it fulfilled the other constitutional requirement of securing two-thirds majority of the members voting. This time the Treasury Benches could muster the requisite strength.

Despite the fact that this constitutional amendment had been deliberated upon at length during the budget session, the debate during the current session continued to be acrimonious with the Swatantra Party never relenting in its opposition to the move. The independent member, Mr. J. B. Kripalani, even questioned the wisdom of proceeding with this legislation in the face of a new Government being formed soon. The Swatantra Party spokesmen characterised the Bill as an expropriative measure and alleged that the motive behind it was to deprive the small land-owners of their holdings and to drive them into co-operative, collective farming. The Jan Sangh members also opposed the move on similar grounds. Their leader, Mr. U. M. Trivedi, thought that the Government should have studied the land and agrarian reforms in other countries before coming up with this bill. He, however, considered the abolition of zamindari and jagirdari system as a step in the right direction. The Bill was also opposed by many an independent member. Mr. Kripalani objected to it on the score that it was not proper to rush with amendments to the Constitution as soon as the judiciary expressed itself against any enactment. Frequent changes in the law of the land, he opined, would not solve the food problem. Dr. L. M. Singhvi wished that the Government drew up its land policy on scientific lines. He deplored that no methodical survey of the land resources of the country had been undertaken by the Government so far. What was needed, he said, was practical steps to improve agriculture. The Government thinking on land reforms, he felt, was embedded in economic orthodoxy. Dr. M. S. Aney also opposed the measure and objected to Parliament revalidating the State enactments after they had been held ultra vires by the courts.

Technical Obstructions

Replying to the general debate on the Bill, the Union Law Minister, Mr. Asoke Sen, stated that the Government was determined to remove all technical obstructions in the way of agrarian reforms which aimed at providing minimum acreage of land to the tiller; excess land possessed by some had to be taken away from them. The Bill, he added simply sought to facilitate and expedite this process. He denied that by bringing forth this measure, the Government meant any disrespect to the judiciary; no affront was involved, he argued, if the enactments struck down by courts were put on the statute book after suitable amendments. Mr. Sen did not agree with the Swatantra Party's view that compensation at full market rates should be paid for the excess land taken away from the big land-owners.

The Rajya Sabha discussed the revised rules of procedure and conduct of business in that House as recommended by a Committee appointed in 1962. It approved the new rules aimed at removing divergence between the rules of procedure

of the two Houses of Parliament. The revised rules provide for Question Hour in the Rajya Sabha also on every Friday and half an hour discussion on any day of the sitting of this House as in the Lok Sabha.

Question Hour

Cane Prices: The Minister of State for Food, Mr. A. M. Thomas, told the Lok Sabha on June 2, that no change was contemplated in the price structure of sugarcane for the next crushing season. The Governments of U.P. and Bihar had requested the Central Government to fix cane price for 1964-65 at a flat rate of Rs. 2 per maund, instead of linking it with the sucrose content. But the Union Government adhered to the view that the price already announced was appropriate and no change was called for in it. The Union Food and Agriculture Minister, Mr. Swaran Singh, added that there was no opposition from any State to the recovery-based formula for fixing cane prices; this formula had worked well. He opposed the move to raise the minimum price of cane to Rs. 2 per maund on the ground that it would have wide implications and might push up sugar price further. Mr. Swaran Singh indicated that if the weather conditions did not play havoc, there was every possibility of an improvement in the sugar supply position next year. Mr. Thomas agreed that the machinery for distribution of sugar had not functioned satisfactorily, but refuted the allegation that black marketing in this commodity was rampant. Mr. Swaran Singh opined that in view of the urgent need to earn foreign exchange, it was not desirable to stop sugar exports altogether. Exports during the current year, he added, would, however, be not more than 250,000 tonnes, as against 500,000 tonnes last year.

Cochin Shipyard: The Minister for Transport, Mr. Raj Bahadur, told the Lok Sabha on June 2 that an official delegation would be leaving for Tokyo shortly for discussions with the Mitsubishi group of industries to finalize the agreement for setting up the second shipyard at Cochin. He indicated that total cost of this project would be around Rs. 8.87 crores. Of this, a sum of Rs. 2.7 crores would have to be spent in foreign exchange.

Tourist Corporation: Mr. Raj Bahadur revealed in the Rajya Sabha on June 1 that the proposed Tourist Corporation, in the public sector, was expected to be set up within the next three months. The Corporation was intended to handle certain commercial activities connected with tourism, such as provision of hotel and road transport facilities. Regarding the development of the hotel industry, Mr. Raj Bahadur stated that the Government policy was to encourage foreign participation in this industry mainly with a view to attracting foreign tourists. The ownership and control of hotels in India was proposed to be retained in Indian hands. This, however, was not a rigid policy. Each case of foreign participation would be decided on merits. The Minister indicated that India had to build by the end of 1968, hotel accommodation to the tune of at least 5,500 rooms. This was expected to cost Rs. 25 crores.

Shortfall in Locos: The Deputy Minister for Railways, Mr. Shah Nawaz Khan, told the Rajya Sabha on June 1 that the indigenous production of locomotives during third Plan period was expected to fall short of expectations by about 565 diesel and 1221 electric locomotives

Bonus Commission's Report: The Deputy Minister for Labour and Employment, Mr. R. K. Malaviya told the Lok Sabha on June 1 that the recommendations made by the Bonus Commission were still being considered. The Union Government was consulting the State Governments and the employing Ministries at the Centre on the implications of the report. Some States had already sent their comments. The remaining ones were expected to do so shortly. Decisions on the Commission's report would be taken as expeditiously as possible.

Textile Mills: The Minister for Industries, Mr. Nityanand Kanungo, told the Rajya Sabha on June 2 that the Union Government had rejected the demand of the Indian National Textile Workers' Federation for setting up a corporation to take over mismanaged and uneconomic textile units. The Government, he added, was of the view that it was neither necessary nor desirable to set up such a corporation. The existing arrangements for taking over mills which had closed down or had become uneconomic were considered to be adequate.

Tea Exports: The Minister for International Trade, Mr. Manubhai Shah, stated in the Lok Sabha on June 1 that tea exports from India during 1963-64 declined by 11.5 million kgs. The decline was witnessed in exports to the United Kingdom, Ireland, Iran, Turkey, Sudan, the USA and Australia. The closure for 10 to 12 days of tea auctions and exports during January, 1964, due to civil disturbances, Mr. Shah added, had cost the country about 10/12 crores. The production of tea last year was also lower due to adverse weather conditions. This reduced the availability of this beverage.

Alloy Steel Plant: The Minister for Steel, Mines and Heavy Engineering, Mr. C. Subramaniam, revealed in the Lok Sabha on June 1 that a private party of Kanpur had been licensed to set up an alloy and special steels plant. The licensee had entered into technical collaboration with a French firm. The capital goods requirements of this venture were covered by the French Credit. No financial or technical help was being given for the project by the Central Government.

IAC: The Deputy Minister for Transport, Mr. Ahmed Mohiuddin, told the Lok Sabha on June 2 that the Central Government had approved the purchase of the fourth Caravelle jet aircraft by the Indian Airlines Corporation on credit. The terms of purchase were being negotiated.

Family Planning: The Minister for Health, Dr. Sushila Nayar, revealed in the Rajya Sabha on June 2 that the proposal to regularise abortions by amending the present Act, made by the Family Planning Research Centre, Bombay, would be considered by the Central Family Planning Board at its next meeting. Personally, she said, she did not favour legislation of abortions entirely. Abortions in India, she added, have been allowed so far only on medical grounds.

Khadakvasla Dam: The Minister for Irrigation and Power, Dr. K. L. Rao, told the Rajya Sabha on June 2 that the Union Government had advised the Maharashtra Government to reconstruct the existing Khadakvasla Dam near Poona with the provision of suitable earth backing. This recommendation, he added, had been made in preference to the State Government's proposal for constructing a new masonry dam about 200 feet downstream of the existing dam. The cost of the new dam proposed by the Maharashtra Government was estimated at Rs. 4.1 crores and its completion would take about five years. The cost of the scheme recommended by the Union Government, however, would be only Rs. 1.5 crores and this scheme could be completed within two years.

Resettlement of DPs: The Minister for Rehabilitation, Mr. Mahavir Tyagi, told the Rajya Sabha on June 2 that the Madhya Pradesh Government's scheme for reclaiming about 45,000 acres of ravine land in Bhind and Morena districts for initially providing work to the displaced persons from East Pakistan and ultimately resettling about five to six thousand refugee families there, was being considered.

The Weakness of the Indian Rupee

B. R. SHENOY

A STOCK exchange scrip or a commodity is deemed to be "strong" when its price is firm and moves upward. When the price sags, it is deemed to be "weak". This concept of strength and weakness applies to currencies as well. A currency is strong or weak according as its exchange rate rises or declines. But unlike the case of scrips or commodities, the exchange value of a currency cannot rise or fall unlimitedly. Under a gold standard, a currency cannot rise above the gold import point. When it touches this point gold will flow into the country and the currency reserves will grow. The gold inflow will arrest any further rise in the exchange value of the currency. In place of the rising exchange rate, the country will take gold. Conversely, a weak currency cannot fall below the gold export point. When it touches this point gold will flow out of the country and the currency reserves will decline. The gold outflow will arrest any further decline in the exchange value of the currency. In place of the falling exchange rate, the country will lose gold.

The rise in the price of a stock exchange scrip or of a commodity is the consequence of an increase in the demand for it. The same applies to the rise in the exchange value of a currency. It is the consequence of an increase in the demand for the currency. And the increase in the demand for the currency is the reflex of an increase in the exports of the country. The one is a counterpart of the other. The larger exports cause a corresponding increase in the demand for the currency to pay for the exports.

Basic Strength

The basic index of the strength of a currency, then, is the strength of the exports of the country. If exports are high and rising the currency will be strong as well—unless non-economic factors vitiate the situation by undue capital exports. In the foreign exchange market, this strength will be manifested in a firm or rising exchange rate; under a gold standard, the exchange rate — seasonal or other temporary variations apart — is apt to be above par and the currency reserves may grow. Rising exports may cause rising imports or, alternatively, rising capital exports; and the currency reserves may rise less than exports, or may not rise at all. The reserves will reflect the balance of payments position. Whether it is the exchange rate, reserves, imports or capital exports that keep rising and in what measure of each is a matter of the collective effects of the relative decisions of individuals; of the decisions of the monetary authority; and of the trade and fiscal policy of the government. These are but the several alternative ways of using the benefits of strong exports. The essential point is that the strength of the currency depends on the export position and the latter provides the basic index of the strength of the currency.

This takes us to the question, what is the criterion of the strength of a country's exports? If exports are deemed to be strong, they cannot lag behind the overall tempo of the economic life of the community. And perhaps the best index of this overall tempo is the rate of increase of the national product. It follows that for the export position of a country to be deemed strong, the expansion of its exports must at least keep pace with the expansion of the national product. The ratio of exports to the national product may remain steady or rise. Since a strong export position will be attended by a healthy balance of payments position it follows, too, that the expansion of exports will generally keep pace with the expansion of imports. The ratio of exports to imports may remain steady or rise.

In periods of heavy capital imports, imports may jump up correspondingly. In such situations, due adjustments must be made for the rise in imports from foreign aid or other capital imports, before comparing the expansion of exports to the expansion of imports. When, however, the export position of a country is strong though in the early stages of development it may import capital as the economy develops, it is apt to repay more than borrow afresh and eventually become a capital exporter.

By the same reasoning, for the export position of a country to be deemed strong in the world context, the expansion of its exports must at least keep pace with the expansion of world exports. The ratio of the exports of the country to world exports must remain steady or rise.

Conversely, the basic index of the weakness of a currency is the weakness of the exports of the country. The world's demand for the currency to pay for the exports of the country will be less than the supply of the currency placed on the world markets, representing the country's imports and the possible flight of capital from it. The ratio of exports to the national product, to the imports of the country and to the world exports will decline. In the foreign exchange market, the weakness of the currency will be manifested in a falling exchange rate. Under a gold standard, the exchange rate — seasonal or other temporary variations apart — is apt to be below par and the currency reserves may decline.

Judged by these tests, the Indian rupee would seem to be among the weakest currencies in the world. As a ratio of national income, Indian exports fluctuated downward from 6.30 per cent in 1950-51, the immediate pre-plan year, to 4.53 per cent in 1961-62; as a ratio of world exports they fluctuated downward from 2.03 per cent in 1950-51 to 1.06 per cent in 1962-63 and as a ratio of imports they fluctuated downward from 92.5 per cent in 1950-51 to 64.3 per cent in 1962-63.

Overvalued Rupee

The decline in our exports as a ratio of world exports may be even larger than indicated by the relative percentages quoted above. The rupee being over-valued, the US dollar equivalent of Indian exports gets exaggerated by the extent of the over-valuation; and the ratio of Indian exports to world exports, both stated in US dollars, gets correspondingly overstated, too.

The ratio of Indian exports to Indian imports are vitiated by two factors. On the one hand, imports are kept at an unduly low level by rigorous licensing and exchange controls; in the absence of these restrictions imports would be larger. The ratio of exports to imports in the context of import controls might be, therefore, larger than what the ratio might be in the absence of these controls. On the other hand, some of the imports represent inflows of capital, as foreign aid or equity capital; this calls for an adjustment in these ratios in the opposite direction. It is not possible to say to what extent these opposite adjustments would cancel one another.

The evidence of the weakness of the rupee provided by the declining percentage of Indian exports to the Indian national income is free from any of these obvious limitations. Though Indian national income rose by 47 per cent from 1950-51 to 1961-62, Indian exports stagnated, being at Rs. 647 crores in 1950-51 and at Rs. 668 crores in 1961-62 so that expressed as a ratio of the national income exports declined significantly. In the case of countries with convertible currencies — Article VIII countries under the IMF classification

— whose convertibility seems secure, as may be seen from the table below, the export position, as indexed by the ratio of exports to national income, has been strong.

RATIO (PERCENTAGE) OF EXPORTS TO NATIONAL INCOME

	1953	1962
Austria	20.5	23.1
Belgium	33.8	42.2
Canada	22.5	20.9
France	11.6	15.4
Germany	16.6	20.3
India	5.1	4.5
Ireland	26.7	31.5
Italy	10.0	15.1
Mexico	10.8	7.9
Netherlands	42.5	42.3
Peru	20.2	28.3
Sweden	21.0	22.6
U.K.	19.6	17.4
U.S.A.	4.0	4.4

It will be seen that as between 1953 and 1962 with the exception of Canada, Mexico and the United Kingdom, the ratio of exports to national income has remained steady (Netherlands) or has gone up.

And why are India's exports so low? The answer is threefold. First, the Indian exchange rate has remained unchanged in terms of the US dollar since September 1949, when it was devalued by 31 per cent to 21 US cents per Re. 1; and in terms of sterling since before 1927, when we adopted statutorily the exchange rate of Re. 1 = 1s. 6d. An inflationary rise in prices in the context of a rigid exchange rate meant a corresponding rise in the prices of Indian exports in terms of foreign currencies to the buyers of Indian exports abroad. The latter, as a consequence, switched over to rival producers whose currencies were not over-valued; or to substitute goods. This acted as a hurdle to the expansion of Indian exports; and the latter lagged behind in a background of continued uptrend of world output and world exports. This contributed to a fall in the ratio of exports to the national product.

Secondly, the exchange barrier in the way of exports which prevented exports from expanding, was accompanied by complementary changes in the domestic market. On the one hand, import restrictions denuded it of the much needed import goods. On the other, the aggregate domestic demand, being fed by inflation, increased. In particular, inflation and corrupt incomes (born of controls) produced a bulge of demand for goods consumed by the upper-income groups. In ordinary times this demand bulge would be met by larger imports. Severe import restrictions rendered this impossible. Potential export producers hit by the retarded demand for exports were, therefore, easily able to switch over to production for the home market to fill the vacuum caused by the import cuts and to meet the surging demand for fancy goods. Every rise in domestic prices reduced the profits from exports and added to the relative attractiveness of the home market, especially, since the comparative control of inflation in the great trading countries of the world. The rise in the costs incidental to the new and unfamiliar lines of manufacture did not deter this switch-over of production; the scarcity of supplies caused by import restrictions and inflation drove prices up perhaps more than sufficiently to cover the higher costs. Trade and industry had little to worry from the retarding exports. This merely meant a shift of production from exports to the home market. The national product continued to move up, though perhaps at a slower pace because of the wastage of resources involved; only exports lagged behind.

Thirdly, the enormous sums invested under planning in heavy industries, on power projects, on irrigation and on consumer goods industries created a correspondingly enormous demand for goods of all kinds to meet the needs of these development projects. Imports being severely limited, this offered opportunities of manufacture on a scale undreamt of before. Plan investments rose from Rs. 3,760 crores in the first plan to Rs. 12,350 crores in the third. This made possible almost indiscriminate fabrication at home of all varieties of goods wellnigh regardless of costs or quality. If production in a given line was technologically feasible, entrepreneurs could go full steam ahead. The administration was ever ready to provide the requisite market for the output through adjusting the amount of the import licences for the corresponding items of imports from abroad. Such production was hailed and welcomed as yielding a "saving" on foreign exchange, while at the same time contributing to economic development. Resource wastages were deemed of secondary consideration even if this aspect of the matter received any attention.

Deleterious Effect

The outcome of this misguided policy has been the production at home of goods — stray exceptions here and there apart — which are mostly unsalable abroad because of the high cost and poor quality. To cite some illustrations, the cost of production in India as against the cost of imports is over three times in the case of sugar, over ten times in the case of penicillin, over three times in the case of refrigerators, over twice to four times in the case of automobiles and over 1½ times in the case of oil engines. This category of Indian manufactures can have little chance in the world markets unless their prices are drastically reduced in terms of foreign currencies through an appropriate devaluation of the rupee.

This raises the question, what is the appropriate measure of the devaluation? The purchasing power parity theory can provide no answer. A comparison of the trends of prices and inflation at home and abroad suggest the incorrect inference that the rupee is not very much over-valued, after all. The purchasing power parity is powerless to explain the low level of Indian exports — the root cause of the weakness of the rupee — since this is not due to relative inflation and relative price trends alone. The weakness of the exports and the weakness of the rupee are due also to non-monetary factors — the policies of production in defiance of the doctrine of comparative costs.

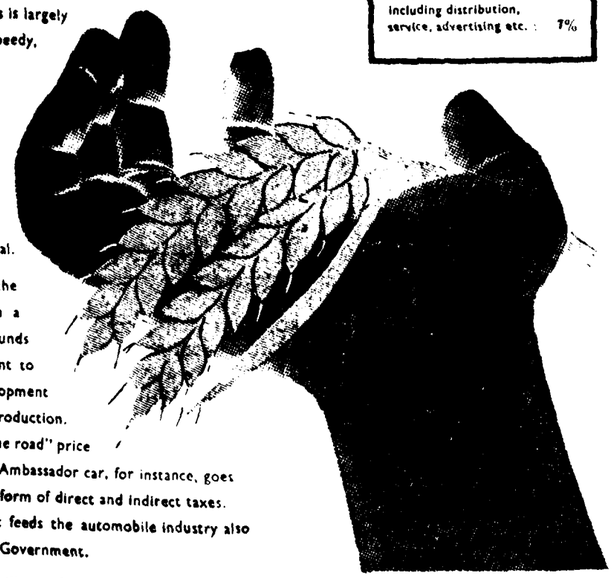
Nor do the free market quotations for the rupee provide a dependable measure of its over-valuation. The free market quotations are vitiated by a complex of factors and are, therefore, misleading. An examination of these issues and the question of a reliable guide to the extent of the over-valuation of the rupee must be deferred to a later article.

(To be concluded)

THE AUTOMOBILE INDUSTRY . . . .

lends a hand to food grain production

In order to achieve self-sufficiency in foodgrains and to attain the present target of 100 million tons or a per capita consumption of 17.5 oz. a day, we need expand our irrigation system, conserve soil, produce improved agricultural implements, introduce modern techniques of farming, manufacture more fertilisers, build warehouses and storage godowns, provide facilities for marketing and distribution operations.



Every one of these operations is largely dependent on the efficient, speedy, economic form of transport provided by the motor vehicle. In the construction of dams and canals or the building of factories and warehouses, road transport helps the quick movement of men and material.

Each vehicle produced by the industry also contributes in a large measure towards the funds required by the Government to meet the cost of the development programme of agricultural production. Fully one third of the "on the road" price in Calcutta of a Hindusthan Ambassador car, for instance, goes to the Government in the form of direct and indirect taxes. Every ancillary industry that feeds the automobile industry also contributes its share to the Government.

Thus the automobile and ancillary industries help meet one of the country's prime needs—food production.

CAR PRICE STRUCTURE:

Government taxes, direct and indirect :	33%
Raw materials, manufacturing and overhead expenses, salaries and wages, depreciation, profit etc. :	25%
Indigenous ancillary components :	24%
Imported components :	11%
Dealer's commission including distribution, service, advertising etc. :	7%

THE AUTOMOBILE INDUSTRY IS A KEY INDUSTRY

WINDOW ON THE WORLD

Lessons of the Moselle Canal

From our Special Correspondent

LUXEMBURG :

THERE WAS no representative of the European Communities at the inauguration this week of the Moselle canal, one of the biggest hydro projects ever completed in Europe and certainly the biggest technical project undertaken here by several nations. Yet President de Gaulle made the journey, his first since a recent operation, to join with President Lubke of Germany and the Grand Duchess Charlotte in opening this "liquid staircase" 170 miles long. For the successful completion of this century-old project illustrates Gaullist ideas about European unification. A great international project, whose benefits are not equally shared among participants but favour one more than the other, has been carried through without any concession to supranationalism, by traditional negotiations between sovereign states. More than that, a supranational community was at hand and should have been interested (the Coal and Steel Community, CECA) but was unable to contribute to the task exactly because it lacked the attributes of sovereignty.

The late Robert Schuman used to say that the canalisation of the Moselle would be a "test" for European unity. After 17 years of arduous negotiations, it has passed the test but not by the means recommended by the supranationalists. One understands why the Gaullists, who made no special contribution to the job, wish to take the Moselle as a test-case for the methods of European unification. But first one must recall the economic significance of the new waterway.

Ruhr Vs Lorrain

Germany's iron and steel industry arose along the Rhine River, and on the tributary called the Ruhr, and thus always enjoyed direct, cheap connections with the North Sea (Rotterdam, the world's biggest port, is on the delta of the Rhine). The heart of France's industry, in contrast, was in Lorrain near the iron ore deposits, on the banks of a southern tributary of the Rhine, the Moselle River. It happens that the Moselle was not navigable between Coblence, where it enters the Rhine, and Lorrain. It flows in a deep gorge that marks the frontier between Luxembourg and Germany, and drops 300 feet between Thionville in France and Coblence in Germany. The result was that the French industry was isolated from the Rhine, hence from the North Sea, and had to rely on the railways for its supplies and despatches. The railways in question were largely foreign, the German system, and had no particular interest in helping Lorrain compete with Ruhr, so freight rates were as high as the traffic would bear. The idea of canalising the Moselle between Lorrain and the Rhine was, therefore, put forward soon after the industry arose.

Most of the work required to make the river navigable would have to be done on the German side of the border, and yet the only gainer would be the French steel industry. The gorges on the German side are too narrow to allow of industrial installations and will probably always remain given over to the vine, as now. Gaining nothing, the Germans would lose on two scores: loss of traffic for their railways, and loss of a competitive advantage for the Ruhr. So even when Lorrain was part of Germany (between 1871 and 1918, and again between 1940 and 1944), the Germans let the Moselle-canal file gather dust. More than that, when the Coal and Steel Community was formed, the Ruhr's opposition sufficed to prevent that international organisation taking any interest in the project. This was curious, because the major (at first, the only) traffic on the canalised Moselle would obviously be ore, coal and steel, and the transport of those commodities is CECA's concern. It was clear that a conflict of interests between two powerful industries could not be arbitrated by supranational bureaucrats, but required an agreement between states.

The agreement was obtained by traditional diplomacy, in its worst sense, that is by horse-trading between nation-states. France had occupied the Saar at the end of the last war but obviously could not stay there forever, a referendum having shown that a majority of the population wanted the territory to return to Germany. It is the task of diplomats to extract rewards even for inevitable sacrifices, and the French sought compensation for evacuating the Saar. They got it in the shape of certain economic rights in that territory, to continue after its return to Germany, plus German agreement to the canalisation of the Moselle. That West Europe's biggest international project since the war has this origin is perhaps regretted by the apostles of supranationalism, who imagine that an infant super-state would be able to over-ride vested interests. It is simple realism, however, to see that the centres of effective power remain (and will for many years) the historical states and nothing can be achieved without them, even less against them. The Gaullist doctrine of the "Europe des patries" says nothing else.

The present illustration is especially interesting because the opposition that had to be overcome was not only private industry, the Ruhr, but also governmental enterprises, the railways — and in France as well as in Germany. The railways in both countries fought tooth and nail against the Moselle project. Apart from noting that the influence of the railways is today generally retrograde (witness their successful throttling of road transport and of such projects as the Channel Bridge from England to France), one sees that only an agreement between governments could overcome the opposition of such substantial government departments as the railways; one cannot envisage a super-state issuing orders to the national rail corporations.

Encouraging Experience

The building of the canal was itself an instructive experiment in international co-operation, and an encouraging one in that it showed how much could be achieved by two nations without surrender of sovereignty in a third organisation. The International Moselle Company was registered in Germany, its capital was 49 per cent German, 49 per cent French and 2 per cent Luxemburger, it had a German manager and a French manager, with a board representing the three nations. Of the funds needed to execute its large task, two-thirds were provided by France (who, as we saw, stood to gain most) and one-third by Germany. Incidentally, as with most immense projects, the actual costs far exceeded the estimates: there were 400 million francs, but in the end the work absorb-

ed 975 millions. National, not to say nationalist, susceptibilities were respected throughout the construction work; all plans were approved three times over, by the national administrations and then by the International Company, and there were always technicians from both countries on the site. Now that its work is done, the International Company will be wound up. The national river-navigation services will administer their respective sections of the canal. Navigation across the frontier is free but within national borders domestic carriers have a monopoly.

The economic consequences of the linking of eastern France to the sea will be considerable, given the saving in transport costs of bulk materials. Even before transferring their custom from the railways to the barges, the French steel mills have been offered freight reductions of 20 to 40 per cent by the German railways, whose stranglehold is broken. The Lorrain thus finds itself with transport charges equal to those of the Ruhr and the Belgian regions of Liege and Charleroi. The further industrialisation of the region will be powerfully promoted, and this applies as much to the nearby parts of Luxemburg and the Saar as to Lorrain. Needless to say the 13 barrages and locks built along the Moselle to permit river traffic take advantage of the potential energy of the 300-foot descent to generate electricity: ten stations will obtain 850 million kWh yearly from these installations. Thus the region's power of attraction is enhanced, and a major steel mill is the first new project to exemplify this.

Perhaps the thing that most deserves Indian attention is that two of the world's most industrialised nations should choose, in this day of modern transportation, to spend almost Rs. 100 crores in order to open the way into the heart of Europe to lumbering barges of 1500 tons. Despite the spectacular progress of the railways on the Continent, with electrification and dieselisation, and the extension of road transportation, the slow, quaint old barges hold their own as the most economical form of carriage, not only for bulk commodities but also for automobiles and many other manufactures. Indeed, the Moselle canal is just the first (though probably the most difficult, both technically and potentially) step in a more grandiose project: a canal from the North Sea to the Mediterranean, which will exist once the Rhine is linked to the Rhone. The section opened this week by the three heads of state stops at Thionville in France, but by next year the French will extend the channel (40 yards wide, nine feet deep) upstream as far as Metz, and then start work on the section to Nancy. By that point, which should be attained before 1970, the whole of north Europe will be covered by a network of big canals, and the junction with the Rhone, opening the way to the Mediterranean, will be in sight. Colossal sums are being invested in this prosaic and old-fashioned means of transport, and the tolls (where tolls are collected) will not amortise them, for they never exceed one naya paise per ton-kilometer. That the Common Market should choose this unromantic field for its first major venture contains a lesson for countries that neglect the possibilities of river transport.

Taxation Without Tears

JOSSLEYN HENNESSY

LONDON:

"IF A MAN earns, he has to pay a heavy income tax. If he spends, he has to pay expenditure tax. If he gives money away, there is a high gift tax. If he dies leaving any savings, he has to pay a heavy estate duty". Thus was Mr. K. K. Birla recently reported in "Eastern Economist" to have told the Indian Chamber of Commerce.

Although the U.K. has not yet attained the heights of taxation reached in India, public expenditure rises spectacularly all the time — particularly on education, health, hospitals, roads, publicly supported housing and, not least, defence — and both political parties — the Conservatives regretfully, the Socialists blandly — declare that the prospects for tax reductions are nil: the problem is which taxes should be raised.

Narrowing Scope

Although no party leader has admitted it in public, there is a growing feeling in informed economic circles, which influence opinion, that the scope for increasing direct taxation is narrowing. Apart from economic arguments, one political reason is that, as incomes rise, more voters are becoming income-tax conscious.

On the other hand, until recently, the orthodox view has prevailed that to increase indirect taxes — sales taxes, excise duties, etc. — is "regressive", i.e., it puts a proportionately higher burden on the mass of lower incomes, and does not hit the "rich" so hard, and that this is "socially unjust". But what to do? New universities and new roads cannot be had for nothing.

In these circumstances, British economists have been looking around to see what lessons, if any, can be learned from the experience of other countries, notably Germany.

German Government investment constitutes 30 per cent of total gross investment, 32 per cent of GNP goes in taxation, and social security benefits absorb 40 per cent of those taxes. But the basic difference between the "dirigisme" of a social market economy and state intervention in a planned economy is that the planner takes the initiative in injecting funds into investments of the government's choice, whereas the dirigist seeks to encourage investment leaving the choice as far as possible to private enterprise — a method which ensures expansion without a significant increase of government debt.

In 1948, Erhard rejected the British diagnosis that Germany's economic paralysis was an "under consumption" depression, of the interwar type, to be cured by Keynesian credit creation. He pointed out that what was lacking was not buying power, of which there was an inflationary surplus, but goods to buy, and that this, together with war's devastations, rendered the production of sufficient goods impossible. In other words, Germany was suffering from "under investment". Investment would not come from further creation of credit. It could only come by, first restoring real values and the price mechanism by a currency reform, and thereafter clamping down on consumption to divert resources to investment. This could be done by providing innumerable encouragements to plough back profits and by maintaining high rates of interests to promote the efficient use of resources. The abolition of price controls and the pent up demand for goods, in fact, enable high profits to be made. Aided by high taxes and low expenditure (notably for defence), the government used the budget surpluses thus obtained to invest in housing, public utilities, and the nationalised industries. It is, however, important to note that (1) this investment came not from deficit financing but from savings out of current revenue, and (2) Germany's government enterprises are expected to make profits, so that Germany does not suffer from the misallocation of resources experienced in countries where the nationalised industries are governed by social (sic) aims.

Erhard's policy of boosting public investment by budget surpluses, and private investment by inducements to plough profits back, got Germany prosperously onto its feet. Nevertheless, as time went on, certain disadvantages emerged. Government investment originally went primarily into roads, schools, hospitals, and other social overheads, but it then began to compete with the free market and the steady growth of the public sector alarmed public opinion (including the Socialists) as undesirable concentration of economic power. In the private sector, also, ploughing back was similarly leading to ever greater concentrations. Erhard therefore inaugurated a second phase, with a new "share the wealth" policy (also approved by the Socialists), the aim of which was not so much to redistribute income as to spread the ownership of capital. How? By (a) leaving as much of a man's earnings in his pocket as possible and (b) encouraging him to save rather than to spend. Erhard achieved (a) by reducing income tax from a maximum of 95 per cent to 55 per cent, and (b) by raising his revenues more and more from transaction, sales, and consumption taxes, so that whereas in the 1960's income tax provides over half of budget revenue in the U.K., it stays around one-third in Germany.

Whereas the U.K. government mulcts the taxpayer for schools, hospitals, roads etc. and what is left is, as it were, his pocket money, the German government leaves him with a comfortable cash balance and encourages the feeling that how it is spent is his decision and not that of some bureaucrat. A wide battery of permissible tax deductions to encourage saving includes: insurance premia (in toto), savings banked for five years or over; sums invested out of income in securities, shares, investment trusts, and building societies; bonuses for inventions and for suggestions for improvements; and many others.

Germany, in effect, abondoned progression in income tax and increasingly went over to taxes on expenditure. The tax structure bears lightly on the creation of income (income taxes) and the possession of wealth (property taxes) and weighs heavily on the use of income (business transaction, sales, consumption taxes). Note that German tax authorities object to a capital gains tax, because it slows down changes in investments, whereas the object of a capital market is to be immediately sensitive to opportunities for the more profitable re-allocation of savings.

All this explains why Germany consumes 72 per cent of GNP, compared with 82.3 per cent in the U.K.

But while Germany thus goes all out to favour investment and decrease consumption, the all embracing social security system counteracts the regressiveness of taxation. Already in 1957 benefit expenditure was £3,200 million, or 21 per cent of total consumption expenditure, compared with £2,155 million, or 11.2 per cent in the U.K.

The American Miracle

PAUL BAREAU

THE TERM "economic miracle" has tended in the recent past to be applied to the expansion that has been achieved in a number of countries on the Continent of Europe. Germany, France and Italy have each had the honour of having that title bestowed upon them and one commentator with less than the appropriate measure of sympathy to France and Italy, said recently, "the German miracle was the result of hard work, efficiency and discipline; the other two were genuine miracles". The other two are certainly looking somewhat tarnished today, given the symptoms of inflation that have begun to appear in each of those countries.

It is, however, time that this somewhat abused expression were applied to the United States. In that country there has been a genuine miracle in that a boom which has persisted for close on three years has been accompanied by virtual stability in the purchasing power of the currency. The theme of "expansion without inflation" has often been intoned on this side of the Atlantic as the expression of an ideal that must always be out of reach of a free Parliamentary democracy. This is because in these days every government has put full employment and the maximisation of expansion at the head of its list of priorities and cannot withstand the electorate's pressure in favour of spending and economic growth. And yet the United States have over the past three years provided a solid and sustained illustration of the way in which these highly desirable objectives can be reconciled. Moreover they have done so without a planning commission or an openly declared incomes policy.

One might claim that Keynesian revolution has found a more adept follower in the United States than in any other country. And yet the name of the late Lord Keynes is not one to conjure with in every sphere of political and economic opinion in the United States. It would nonetheless be fair to say that in the purposive intervention of the State in an attempt to create an appropriate economic climate while leaving the operation of commerce and industry to private enterprise, the United States have applied the Keynesian principles to better purpose than any other country. It may have been done involuntarily; but what is important is that the objective has been achieved. Moreover, it is still being put into active operation if one may judge from the substantial reductions in taxation which have recently been put into effect, not by reason of immediate budgetary considerations but as a means of influencing the general economic situation.

Beneficial Consequences

This achievement has tremendous consequences for the rest of the world. The fact that the United States are now economically the most powerful nation in the world, the largest importers of raw materials and manufactured goods and the largest exporters of capital, gives them a dominant influence over the world economy. It used to be said "when America sneezes, Europe catches pneumonia"; the reverse also applies. When America booms, as it is now doing, there is likely to be an infection of happy buoyancy in the whole world economy.

There can be no doubt as to the boom. President Johnson in a recent press conference pointed out that the gross national product had reached a rate of over $608,000 million, an expansion of nearly 6 per cent on the figure for the year previously; corporation profits declared this year show an increase of nearly 10 per cent over the comparable figure for 1963 (no apologies were offered for this); price stability had been maintained. Since the end of 1961 the cost of living in the United States has risen by only 3½ per cent, wages by 7 per cent, while on balance there has been no change at all in the level of dollar wholesale prices. This absence of price increases in the United States over a period when there have been sharp rises in Western Europe has played an all-im-

portant part in the improvement that has occurred in the United States balance of payments.

This improvement in the US balance of payments derives in part from the ability which that country has shown in controlling wages, costs and prices at a time when others have been less successful. It is also a result of the measures that have been applied to discourage the export of capital from the United States to all but developing countries. Although the levies applied on foreign issues in the New York market and on purchases of foreign securities by US citizens have only recently been enacted, they were made retrospective and, therefore, the required deterrent effect became apparent from the moment the new legislation was tabled in mid-1963.

Whatever the causes of the improvement in the US balance of payments, it has undoubtedly taken the pressure off the dollar and has removed one major cloud that had persisted for so long on the economic horizon of the United States.

At the same time this phenomenon has raised some serious problems for the rest of the world. It awakens unpleasant echoes of the dollar shortage of the immediate post-war years. The balance of payments deficit in the United States has over the past twelve years done a great deal of good to the world at large by providing the additional volume of international reserves required to underpin the expansion of world trade. They have fed the dollar balances held in the reserves of foreign central banks. If this flow is to be diminished, or even reversed, the problem of world liquidity, which is now being considered by several international committees in anticipation of the International Monetary Fund meeting in Tokyo next September, will acquire an entirely new and somewhat more menacing aspect. As far as the United States is concerned, there is no doubt that for the near future the improvement in the balance of payments is a favourable point and one which promises a happy continuation of the existing boom, since no domestic corrective measures will be required for external reasons.

There is, however, one darker stain on this picture. It lies in the fact that during these three years of "economic miracle" unemployment in the United States has varied between 5½ and 6 per cent. This is a high rate, judged by West European standards. The cynics will argue that this relatively high level of unemployment must in part at least be responsible for the stability of wages, costs and prices over this period. On the other hand it could be contended that the rate of economic expansion in the United States would have been more impressive still had the available manpower been more fully used.

Unemployment in the United States is in large part a technological phenomenon: the result of automation and of the consequent reduction in the demand for unskilled labour. The American authorities are aware of the problem and are taking steps to deal with it. The recently announced tax cuts are part of a programme to stimulate the economy to still greater efforts of production. The campaign against poverty which President Johnson has launched is another facet of this attempt to achieve the full realisation of the Keynesian revolution: expansion without inflation but also with full employment.

Private Investment Aids Exports

GUY SIMS FITCH

WASHINGTON:

NUMEROUS AND well-documented *case studies* attest to the contributions that private investment can make to a nation's economic growth and development. Not so well-known, perhaps, is the extent to which these investments, through their promotion of industrial progress, help build up a developing land's export potential, and thus enhance its capacity to earn its way in the world. A particular case in point is Puerto Rico, autonomous and self-governing island commonwealth freely associated with the United States. Under the auspices of its economic development administration—popularly known as FOMENTO — Puerto Rico has undertaken a vast and highly successful self-help industrialization programme, one that has attracted many new industries from the United States and other countries.

Improved Standard

Since world war II, roughly a thousand new factories have been built in Puerto Rico, providing some 135,000 jobs with a total payroll of $250 million. This has paid off handsomely in improved living levels for the people, despite the island's population growth. In the past decade alone, Puerto Rico's per capita output of goods and services has doubled, and its per capita income has climbed from $401 to $740 a year. In the process, Puerto Rico in the post-war period has been transformed from a generally poor and predominantly agricultural society to a bustling community with an industrially dynamic economy.

There has been no let-up in the Puerto Rican effort to bring in more new industry and investment. But recently, with the industrial base established and growing, the island's Government has started the development campaign into a new phase. This has involved increased local participation in industrial development, and a research for new and larger export markets for the products of the island's expanding industries. Particular attention is being paid to export markets for local manufactures. This export campaign, which is being promoted by a FOMENTO subsidiary called Markets Development Corporation is bringing a number of Puerto Rican firms into the export business for the first time. It is opening new export markets not only in the United States, which is the island's principal buyer as well as supplier of goods, but throughout all of Latin America. Plans also are under way to explore export opportunities in Europe, Africa and other parts of the world. Already a new unit of Puerto Rico's Department of Commerce has begun to survey and analyse foreign markets with an eye to expanding the island's exports.

The many new products made in Puerto Rico today, which reflect the substantial growth of the island's own domestic markets, offer promising opportunities for export expansion. Among them, for instance, are leather goods, plastics, electrical products, chinaware and pharmaceuticals. These are in addition, of course, to such traditional Puerto Rican products as cigars and agricultural items. The importance of export expansion to Puerto Rico derives from the ever-present need to earn more foreign exchange to help sustain the remarkable economic progress, and from the fact that Puerto Rico's island economy is heavily dependent on trade and must import many of the industrial and consumer products it uses.

While Puerto Rico's exports have been growing, they reached a total of $845 million last year. Helping to offset the deficit has been Puerto Rico's rise as a major tourist centre. All in all, Puerto Rico offers an exciting example of a developing land which has made substantial economic strides through a combination of enlightened government programmes and a vigorous private sector.

The Tasks Before Mr. Shastri

By Our Special Correspondent

NEW DELHI:

THE ADROIT handling by the Congress President, Mr. K. Kamaraj, of the succession issue has dispelled the fears entertained in some quarters that Mr. Nehru's failure to name his successor might lead to political instability and a fierce battle of succession in India. No doubt, the battle of succession did rage and there was hectic activity last week-end for canvassing support for the two main contenders to Mr. Nehru's mantle — Mr. Lal Bahadur Shastri and Mr. Morarji Desai. But the situation changed suddenly when the Congress Working Committee on Sunday authorised Mr. Kamaraj to name the new leader after having a consensus on who among the possible candidates in the Congress top brass commanded a majority in the Parliamentary Party. The consensus threw up Mr. Lal Bahadur Shastri as the new leader. It goes to the credit of Mr. Morarji Desai and his supporters that they did not create any fuss after the result of the consensus was known. At the Parliamentary Party's meeting on Tuesday, Mr. Shastri's name was proposed by Mr. Gulzari Lal Nanda, who temporarily succeeded Mr. Nehru. Mr. Desai supported the proposal. With no other candidate in the field, Mr. Shastri was elected as the new leader of the Congress Parliamentary Party unanimously. The choice of this liberal politician raises hopes that democracy will steadily get firmly rooted in this country. Mr. Shastri is expected to be sworn in as the new Prime Minister on June 9. When he hopes to finalise his Cabinet.

Addressing the Congress legislators after his election, Mr. Shastri reiterated his faith in non-alignment and socialism and declared that he woud carry the country forward on the path carved out by Mr. Nehru.

In an informal meeting with the Press in the evening on that day, Mr. Shastri expressed the view that the task before his Government was: (1) building up expeditiously the defences of the country; (2) holding the price line; (3) the development of the economy and eradication of poverty; and (4) furtherance of national integration. The economic issues, Mr. Shastri stated, were as vital as the safeguarding of independence; eradication of poverty was no less important than strengthening of the country's defences.

Holding the Price Line

Mr. Shastri announced that he proposed to have consultations soon with the Ministers of Food and Finance and the Planning Commission on what practical measures could be taken to contain the price spiral which had been hitting particularly hard the poorer and the middle classes.

While talking of national integration, Mr. Shastri said that national interests would have to take precedence over regional, caste or community considerations. He emphasised that the interests of minorities had to be fully preserved so that the country could remain united. The language question, which came in the way of national integration, Mr. Shastri added, would also have to be tackled effectively.

Mr. Shastri welcomed the latest statement of the Pakistan President, Mr. Ayub Khan, and stressed that India wanted to develop the friendliest ties with all countries — of course, without involving herself in power blocs. The policy of non-alignment, initiated by the late Prime Minister, Mr. Shastri stated, was beneficial for the country.

Mr. Shastri also dwelt at some length on the situation in Laos and expressed the view that this problem could not be solved satisfactorily unless another conference of the 14 nations charged with the task of bringing about peace to this strife-torn South-East Asian country was held. India, he added, had agreed to the British proposal for an informal meeting of ambassadors in Vientiane. The suggestions of the USSR Government for resolving this tangle, he continued, were also receiving the considerations of the Government of India. Since the situation in Laos was taking a serious turn, this problem, he opined, had to be dealt with immediately. India would try to carry with her the United Kingdom, the United States and the Soviet Union and strive for maintenance of the 'status quo' till conditions were restored in which things could move smoothly and without creating any kind of irritation or conflict.

In a message to the nation, Mr. Shastri said that the country must stand as one people and tackle its problems as effectively and as quickly as possible. "Those who are in power", Mr. Shastri emphasied, "have to realise fully the great responsibilities we have been charged with after the departure of Mr. Nehru. We must work hard and try to co-operate with each other".

★★

In its paper on the fourth and the fifth Plans, the Perspective Planning Division has estimated that the demand for petroleum products in India will go up to 14.84 million tonnes by 1965-66, 26.74 million tonnes by 1970-71 and 41.98 million tonnes by 1975-76. It has, accordingly, suggested that refining capacity of the order of 30 million tonnes should be established during the fourth Plan period.

The production from the existing refineries and from those being set up currently is expected to reach 14 million tonnes by 1965-66. Its broad break-up will be: (in '000 tonnes): Gasoline 2,314; Kerosene (including ATF) 2,513; High Speed Diesel 2,801; Light Speed Diesel 755; Furnace Oil 3,505; Lubricants 55; Bitumen 663; miscellaneous products 494. The demand for these products in 1965-66 (in '000 tonnes) is estimated at: Gasoline 1,665; Kerosene (including ATF) 3,200; High Speed Diesel 3,000; light diesel 760; furnace oil 4,700; lubricants 485; bitumen 580; miscellaneous products 450. The domestic production will, thus, fall short of the requirements in the case of kerosene (687,000 tonnes), high speed diesel (199,000 tonnes), light diesel (5,000 tonnes), furnace oil (1,195 tonnes) and lubricants (430,000 tonnes). It will on the other hand, exceed the demand for gasoline (649,000 tonnes), bitumen (83,000 tonnes) and miscellaneous products (44,000 tonnes).

The 1970-71 and 1975-76 demand estimates for the various petroleum products are as follows

('000 tonnes)

Product	1970-71 Demand	1975-76 Demand
Gasoline	4,185	7,000
Kerosene	5,285	8,400
High Speed Diesel	6,195	10,250
Light Speed Diesel	1,040	1,200
Furnace Oil	7,535	11,600
Lubricants	800	1,280
Bitumen	1,000	1,300
Miscellaneous	700	950

The production pattern anticipated on the basis of a 30

million tonnes and 45 million tonnes refinery capacity being stablished by 1970-71 and 1975-76, respectively, is as follows:

('000 tonnes)

Product	1970-71 Production	1975-76 Production
Gasoline	4,780	7,300
Kerosene	5,575	8,725
High Speed Diesel	6,405	10,345
Light Speed Diesel	810	1,010
Furnace Oil	7,410	11,600
Lubricants	806	1,266
Bitumen	1,100	1,300
Miscellaneous	609	754

For establishing 30 million tonnes refining capacity by 1970-71, the Perspective Planning Division favours expansion of all the existing refineries, except the Digboi Refinery, and setting up of the three projected refineries at Madras (2.5 million tonnes), Haldia (2.5 million tonnes) and somewhere in North-West India (3.5 million tonnes). The existing refineries, it has been suggested, should be expanded to the following capacities:

Private Sector Refineries: Burmah-Shell (Trombay) 4.75 million tonnes; Esso (Trombay) 3.5 million tonnes; Caltex (Visakhapatnam) 1.55 million tonnes.

Public Sector Refineries: Barauni 3 million tonnes; Koyali 3 million tonnes; Nunmati 1 million tonnes. The expansion proposed for the Cochin Refinery is to a capacity of 3.5 million tonnes.

★★

The Perspective Planning Division has suggested that if India's economic development has to be made less and less dependent on foreign assistance, the country must develop in future machine-building industries at a much faster rate than had been the case hitherto. Particular emphasis has been placed by the Perspective Planning Division on the development of the capacity to manufacture cotton textile machinery, sugar machinery, cement machinery, paper and printing machinery, equipment for chemical industries, heavy plates and vessels, metallurgical equipment, power boilers, industrial boilers, air compressors, machine tools, road-construction equipment, etc., during the fourth Plan period. The following capacity and production targets have been suggested for 1970-71 and 1975-76. The figures in brackets indicate the capacity and production likely to be achieved by 1965-66.

Industry	Capacity 1970-71	Capacity 1975-76	Production 1970-71	Production 1975-76
Machinery				
1. Coal & other mining machinery ('000 tonnes)	75 (45)	100	65 (15)	90
2. Cotton textile machinery (Rs. million)	500 (200)	600	400 (200)	500
3. Jute textile machinery (Rs. million)	35 (35)	45	35 (27)	40
4. Sugar machinery (Rs. million)	250 (120)	300	200 (120)	250
5. Cement machinery (Rs. million)	160 (80)	300	150 (45)	250

★★

The Union Government has banned, with effect from June 1, 1964, forward trading in (1) groundnuts, (2) groundnut oil, (3) mustardseeds, including taramiraseeds, (4) rapeseeds or toria, (5) groundnut oilcake, (6) mustard oilcake, including taramira oilcake, (7) methi, (8) coriianderseeds, (9) cottonseed oilcake, (10 sesamum oilcake, (11) rapeseed oilcake, (12) aniseeds, (13) arhar chuni, (14) mung chuni. All the outstanding forward contracts in these commodities, it has been directed, should be closed and settled at the rates prevailing at the close of business on June 1, 1964.

The step has been taken in view of the recent increase in the prices of these essential commodities and owing to the fact that the measures taken by the Forward Markets Commission for preventing speculative activity in them had proved of little avail.

Millions Mourn Nehru in Bombay

From Our Correspondent

BOMBAY:

BOMBAY WAS plunged in grief, with the rest of India, over the irreparable loss sustained by the nation, in the passing away of the guiding genius and spirit of India, Mr. Jawaharlal Nehru. It has been a week of homage and tribute to the great departed leader. Practically all the company meetings and important social functions have been postponed.

★★

Gujarat's plan of development over the 10-year period envisages a total investment of over Rs. 1,792 crores. The projections indicate an increase in the State's income from Rs. 674 crores in 1960-61 to Rs. 923 crores at the end of third Plan, Rs. 1,265 crores at the end of the fourth Plan and Rs. 1,733 crores at the end of 1975-76. The per capita income is expected to increase from Rs. 327 in 1960-61 to Rs. 401 in 1965-66, Rs. 490 in 1970-71 and Rs. 612 in 1975-76.

This is revealed by the working paper of the State's planners. The figures of outlay indicate the amount of Central assistance available on certain assumptions at Rs. 947 crores. The private sector investment in the fourth Plan would be higher by 30 per cent over the period of the third Plan and by about 40 per cent in the fifth Plan over the fourth Plan level. At this rate, the total investment in the private sector over the period of 15 years would be of the order of Rs. 648 crores. The working paper has suggested certain changes in the Plan strategy and the pattern of priorities for the fourth and fifth Plan periods. While agriculture would claim a larger allocation of 52 per cent in the fourth Plan outlay against 47 per cent in the current Plan, the amount would go down to 33 per cent in the fifth Plan. It has pointed out the inherent limitations of an agricultural economy and has suggested that self-sufficiency in food should not become a dogma in Gujarat. While every effort should be made to reduce the quantum of food imported into Gujarat to meet the deficit, the future of the State depends in laying a strong basis for large-scale and small-scale industrialisation. In terms of the physical targets in the agricultural sector, the paper envisages a substantial increase in the production of food, from 2.9 million tons at the end of the third Plan to 4.8 million tons at the end of fifth Plan. Cotton production would be of the order of 2.3 million bales and that of groundnut would be 2.8 million tons. The irrigated area would increase to over 6 million acres.

In the industrial sector, the investment is proposed to be increased from over Rs. 7 crores in the third Plan to over Rs. 20 crores in the fourth Plan, and over Rs. 60 crores in the fifth Plan. Similarly, the outlay on power and transport would be stepped up from over Rs. 68 crores in the third Plan to Rs. 120 crores in the fourth Plan and Rs. 297 crores in the fifth Plan. As regards social services, the expenditure is proposed to be kept at 18 per cent of the total outlay. The projections for the growth of population place the increase of population at a reduced rate of 2 per cent in the fifth Plan period from 2.68 per cent per annum for the decade 1951-61.

The planners have felt that a bold attempt will have to be made for providing an increased volume of gainful employment. It is estimated that 37 per cent of the additional population that will come into existence in March, 1968, will be about 800,000. The total labour force that would need to be absorbed during 1961-66 will be 11,82,000, while the employment likely to be created during the same period will be of the order of 800,000, leaving a backlog of 382,000 as unemployed. During the fifth Plan period, the size of the labour force that would have to be absorbed would be of the order of Rs. 14,32,000, including the backlog of 382,000. It is hoped that the entire labour force will be gainfully employed and the unemployment problem will have been nearly liquidated by the end of the fifth Plan. Nevertheless, it is probable that unemployment of 3 to 4 per cent of the educated labour force may emerge at the end of the fifth Plan.

★★

Mr. S. G. Barve, State Minister for Industries and Power, in Maharashtra inaugurated the third branch of the Maharashtra Financial Corporation, at Miraj. Mr. Purushottam Banjibhai, chairman of the Corporation said that, during the nine years since the inception of the Corporation, as many as 842 applications for loans, totalling Rs. 12 crores, had been received. Loans to the tune of Rs. 7 crores had been sanctioned. Sangli, Kolhapur and Satara districts had been granted loan amounting to nearly Rs. 35 lakhs during the period. The main purpose of the Corporation was to provide funds for small-scale and medium-scale industries and expressed the hope that industrialists of the area would avail of the facilities provided by the branch of the Corporation.

★★

An elaborate study of the economics of raw sugar production — a comparatively new field being tapped by sugar factories for export markets — undertaken by technologists of the Shriram Sahakari Sakhar Karkhana Sangh, Phaltan, (Satara), has revealed great advantages for the industry. The study has reported the following advantages as compared to white sugar production operation: Increase in factory capacity by 15 to 20 per cent; saving in power and labour; increase in the duration of every run from one week to three weeks, saving chemicals for cleaning: saving in chemicals; reduction in consumption; increase in recovery from cane of 0.4 to 0.5 per cent; saving in steam consumption

and of 4,000 tons of bagasse in 80 days; savings in interest on the usually locked up capital as a result of quick clearance for exports. On the debit side were two disadvantages, viz. extra good conditioning of godowns and increased work load for hamals.

★★

Gujarat is making a massive effort to develop the chemical and fertiliser industrial complex of the State. The Rs. 33-crore Gujarat Fertiliser and Chemical Project, which is being set up six miles from Baroda has been planned to scale down substantially the investment cost, the cost of production and the retail cost of fertilizers. The authorities have integrated the project for utilising various intermediates and by-products for the production of methanol and formaldehyde at a later stage, production of technical grade urea for the manufacture of urea formaldehyde and the excess annual capacity of 21,000 to 25,000 tons of ammonia for the manufacture of various amides, amines caprolactum and nitrites. They are also planning for the disposal of the by-product calcium carbonate and gypsum. They will also provide utility and other services such as common supply of gas, feed stock and fuel, water and drainage. The Gujarat project will produce: (1) Ammonia, 150,000 tons per year (largest plant in India); (2) Urea, 1,00,000 tons per year; (3) Technical Grade Urea, 3,200 tons per year; (4) Sulphuric Acid, 470 tons per day (largest in India; (5) Phosphoric Acid, 165 tons per day; (6) Ammonium Sulphate, 475 tons per day; (7) Diamonium Phosphate, 341 tons per day.

Facilities have been provided also for granulating into chemical compound the diamonium phosphate and ammonium sulphate and annually produce 256,000 of ammonium sulphate phosphate (19.5 : 19.5). The project will have a capacity to produce 1,20,000 tons of nitrogen, with 96,000 tons of nitrogen as fertilizers and the rest as technical grade urea and ammonia and 50,000 tons of P2O5. The investment in this project for an output of 96,000 tons of nitrogen as fertilizers and 24,000 tons of nitrogen as technical grade urea and ammonia should work out to Rs. 34.35 crores. For the production of 50,000 tons of P2O5, the total investment will be Rs. 9 crores. Thus, the total cost of the project under the conventional methods of planning will be Rs. 43.44 crores. The authorised capital of the company is Rs. 15 crores — Rs. 12 crores equity and Rs 3 crores preference. The project requires a further amount of Rs. 17.5 crores of which Rs. 14 crores will be provided by the Aid India Club from Japan and France. The balance of Rs. 3.5 crores is to be raised by 1966 from indigenous loans. The company has, therefore kept the equity borrowings ratio around 1:2 which has been approved by the Government of India. The capacity production is expected to be reached within 20 months after the project is complete although the project authorities have scheduled to reach only 60 per cent of production capacity during the first six months.

Soaring Prices of Wheat

From Our Correspondent

LUCKNOW :

THE HOPE that the food prices would show signs of relaxation after the harvesting period has been belied. The Food and Civil Supplies Minister, Mr. Jagmohan Negi, complained recently of the "persistent trend" of wheat prices to run high in the State. According to him, compared to the corresponding period last year, the price of wheat was higher by 2 to 3 rupees, averaging at Rs. 22 per maund. The Minister attributed this tendency to the poor arrivals of wheat in the 'mandis'. Again, a part of the pressure was caused by the lack of a ban on the movement of gram outside the State and the higher price of gram as compared to wheat. As a result of this, both the traders and the producers devoted more attention to gram than to wheat. The Minister, however, seemed to miss the basic cause, that is, the relatively poor crops this year because of the adverse weather conditions in many parts of the State. The Minister went on to point out that the high level of prices, due to poor arrivals in the 'mandis', created an adverse psychological effect. A silver streak in the otherwise cloudy picture is the increased offtake of imported wheat and flour from the fair price shops, which stands at three times the quantity cleared at the corresponding, period last year.

★★

Recently, the Chief Minister, Mrs. Sucheta Kripalani stated that Uttar Pradesh stands in need of an industrial structure, broadly based on rural industries, to provide job opportunities to the masses. To make a beginning in this direction, she announced that the U.P. Government proposed to set up small factories involving an investment of Rs. 2 to 3 lakhs at the block level directly under the charge of the block development committees in the rural areas of the State. She said that these industries would not involve the use of imported raw materials and would be selected out of the list approved by the Directorate of Industries. In this connection, she stressed the need for evolving a new administrative and supervisory machinery for giving an accelerated tempo to the development of agro-industrial complex in the State.

Presiding over the meeting of the State-level Co-ordination Committee on agro-industrial projects, she exhorted the officials to cut down procedural delays and entrust the work of ago-industrial projects to those endowed with initiative and aptitude. It was because of the absence of such qualities at the executive level that the blame for the slow implementation of these programmes was laid at their door. She, however, noted with satisfaction that the pilot agro-industrial projects, being run for the last two years at many a place by the Planning Research and Action Institute, had made a dent in rural unempoyment situation. The third five-year Plan of the State had expected that nearly 4,000,000 people would be without jobs in 1965-66 despite the fact that as many as 2,300,000 new job opportunities would be created in the State during the current Plan period. This brings out the enormity of the rural employment problem in the State.

Referring to the marketing problem of the cottage industrial units, she suggested that the rules regarding government purchases, particularly at the district level, should immediately be relaxed to provide impetus to cottage industries.

In this bleak picture of the employment situation, particularly in the rural areas, there is one redeeming feature. This is in connection with the training programme of skilled craftsmen in the State. According to a press release of the State Government, it has achieved almost two years ahead of the scheme the target of 200 per cent increase in the outturn of skilled craftsmen which it had set before itself. As many as 9536 persons have already been admitted for training in 26 engineering and 12 non-engineering trades in different institutions. As against the target of 10,632 additional skilled workers during the Plan period, the State would now be turning out 16,000 skilled craftsmen every 18 months. The target is also accomplished with regard to bringing the number of industrial training institutes in the State to 44 during the third Plan. Buildings have already been constructed for 15 institutes while building construction is going on for 12 more institutions. The institutes are more or less fully equipped. Skilled workers are in great demand everywhere and are readily absorbed both in the public and the private sectors.

Calcutta Stunned by Nehru's Death

From Our Correspondent

CALCUTTA :

LIFE IN Calcutta stood still for practically three days due to the shocking news from Delhi. The grief over the Prime Minister's death was spontaneous and it immediately expressed itself in the people of this huge city withdrawing into their homes and ponder over the tragedy which has befallen this country. Among the institutions which took the lead in suspending their activities as a mark of respect for the departed great was Calcutta Stock Exchange, which closed its operations for the rest of the week. Homage apart, operators feel deeply disturbed by the sudden removal of what the President in his broadcast called the all-pervasive leadership which during the past 17 years had ensured the stability of India's democratic institutions and the parliamentary form of Government. Mr. Nehru believed in socialism, but he also believed in the rule of law, fairplay and justice. Mr. G. L. Nanda has assured that the late Prime Minister's policies in all their aspects would be continued, but the operators apparently prefer to wait and watch.

Mr. Nehru's death came at a time when stock market investors were already beginning to feel worried about the declining profit margins in industry. Most industries have been reporting higher gross sales, but the profit margin in most cases has been squeezed by higher production costs. The stock markets have been sluggish because of the cautious investor attitude, although companies like Braithwaite have declared bigger dividends in the meanwhile.

★★

Rice gets scarcer in Calcutta and its neighbourhood as the West Bengal Government takes one measure after another in its attempt to defeat the "nefarious game of profiteers and hoarders". The latest of the measures under the Government's contemplation is to send any consumer to jail who pays more for his rice than the rates fixed for him by the Government. But rice has disappeared from many of Calcutta's retail markets and the consumer does not know where to get his rice from. Under the modified rationing scheme only a part of the people of Calcutta used to get rice from fair price shops. The Government has doubled the supply to these shops to cover 2 million people. That leaves 4 million still of the total population of the Greater Calcutta area who have to get their supplies from the open market.

It looks as if the Government has invited trouble by over-estimating West Bengal's rice crop during the current year. According to official statistics, West Bengal has produced 5.2 million tons of rice — a much better crop than during the previous year and only about 1 million tons short of the State's total food requirements. Since a greater number of Bengalees are now taking to wheat in place of rice, the Government has felt that with 1 million tons of wheat from the Centre, there should be no cause for anxiety on account of the food situation at any time until the next harvest. Consequently, it confidently fixed prices for different grades of rice early this year, at which wholesalers and retailers have to sell the cereal throughout the year. But as prices have spurted much above the officially prescribed rates, the Government feels clueless as to where the root of the problem lies.

A committee appointed by the Government some time ago under the chairmanship of Dr. Bhabatosh Dutta, a well known economist who has now been appointed a member of the Fourth Finance Commission, enquired into the various causes of the unchecked price rise in this State. Appointed about a year ago, the committee has now submitted its report. It points out with great emphasis that rice holds the key to the problem. No startingly novel conclusion this, but some of the recommendations which the committee makes to tackle the problem are rather startling. For example, it recommends the Government to control the rice trade at all stages — including the take-over of the rice mills and acquisition of the entire marketable surplus. Discussing the administrative measures to implement such a policy, the Committee has suggested that the Government should license producers, importers, wholesalers and retailers in all areas; markets should be regulated mainly at the wholesale stage; there should be buffer stocks and price advisory committees; and finally, all surplus areas should be cordoned off and statutory rationing introduced in all industrial areas.

From the press reports which have appeared, it is not clear what the committee means by the licensing of producers. Is it visualised that each farmer must take out a licence before he sows seeds in his fields? Even if this is ordered, what useful purpose will it serve? Secondly, how will the Government determine the marketable surplus? How much will it take from each producer and who will determine the quantity to be taken? The Government cannot do that equitably without making it compulsory that no person or agency should trade in rice other than a Government organisation. Is the State Government in a position to set up an agency which can handle millions of tons of rice? The sheer enormity of the problem of procuring paddy from millions of farmers from all parts of the State, storing and transporting it to the mills mostly located in Calcutta and other urban centres and the huge amount of finance involved, would make a government much better equipped and more resourceful than West Bengal's think many times before it dares to embark on such a venture.

Govt. Failures

Without going the whole hog, the Government of the State has already been trying to implement the committee's recommendations on a limited scale. In fact, just now its officials are busy procuring paddy from the farmers in the surplus districts. But the operation is by no means proving outstanding success. If the Government is not succeeding, it is because the procurement is still called voluntary and the procurement officials are finding it difficult to determine rich farmers' surpluses. The best thing for the Government would be to build an adequate buffer stock, and it must persuade the Centre to provide a substantial quantity of wheat and rice for that purpose. It can then ensure regular and sufficient supplies for the urban population through its modified ration shops in times of stress such as the one being experienced at present. Once the rich farmers or wholesalers know this, they will not hoard or withhold supplies from the market. At present, it is the rich farmers who are mainly responsible for the rice crisis. They have been refusing to part with their produce at prices fixed by the Government; the mills have no option but to suspend their operations. Even if the mills were nationalised, what could managements do if the farmers sold them no paddy? If the rice mills are to be taken over, then State trading in foodgrains on an exclusive basis will have to be introduced. It has already been pointed out that the West Bengal Government has no such resources at its disposal. It needs to be pointed out here that whatever good it may or may not do to the consuming public and to the price structure, it will at once take away from millions of self-employed people their only means of livelihood.

★★

The Union Government's decision to decontrol the distribution of soft coke for domestic consumption and grades II and III non-coking coal from July 1 this year is calculated to increase the consumption of these coals, and hence a step in the right direction. It has been known for some time that

the output of the lower grades of the fuel is currently in excess of consumption requirements and that a large stock has accumulated at the pitheads. If something is not immediately done to stimulate consumption, then the producers will feel obliged to curtail output, and in fact, some are reported to have already been doing this. (The production of grade II coal was 9.64 million tonnes in 1960-61, it declined to 8.26 million tonnes in the following year and recovered sharply back to 11.01 million tonnes in 1962-63. Likewise, the production of grade III was 5.47 million tonnes in 1960-61, it remained more or less at the same level in 1961-62 and rose to 7.29 million tonnes in the following year). Conflicting opinions have been expressed about the nature of the coal surplus and on the assessment of the demand for the commodity. But there can be no doubt that the Government itself did not know what the actual demand was likely to be at various stages of the third Plan. It rather misled the industry by a frequent revision of the demand targets and the current over-production in the lower grades of coal can be partly attributed to this. However, the decontrol decision has been welcomed by consumers, but whether it will benefit the collieries concerned remains to be seen. But then it is hard to think of any other solution for the problem at the moment.

**

Importers of chemicals are now passing through hard days, mainly because of the Government's policy to canalise more and more imports through the State Trading Corporation. Even established importers are getting squeezed out. Voicing the difficulties of this trade, Mr. Atma Ram Kajaria, President of the Indian Chemical Merchants' Association, said at the body's annual general meeting in Calcutta last week that because of the STC's growing incursions, chemical merchants are now in a sad plight. The STC is not only participating in the import and export trade of chemicals, but it is now handling a fair part of internal distribution as well. In the circumstances, a large body of self-employed people are threatened with the loss of their livelihood. His suggestion for a compromise was that the STC might import chemicals in those cases where the reason for it was obvious, but the internal distribution after the import should be left to esatblished trade channels. This would hurt the trade much less. If the Government was anxious to ensure that the distribution and prices in the domestic market should be according to the norms prescribed by it, the trade would always co-operate with any arrangement that might be devised for the purpose. Mr. Kajaria also felt that the sales policy of domestic manufacturers of chemicals needed to be broad-based so that the distributive trade could benefit to some extent. As the industrialisation of the economy progresses, the demand for chemicals keeps rising, but if the consumer is to derive sufficient benefit from rising internal production, the distributive trade must be helped to play its proper part.

Nehru Was the Symbol of Unity

From Our Correspondent

MADRAS :

PRIME MINISTER NEHRU'S death on Wednesday last week shocked the nation and for nearly three days life was at a standstill in every part of the country. It had been assumed that Mr. Nehru would be at the helm of affairs for at least another five years which are regarded as crucial from the political as well as the economic angle. It took nearly two days to get over the initial shock. Later, the thought slowly dawned that the nation had to get on and that the work of integrated development of the country, and achieving emotional integration also at the highest level, should be carried on with the same vigour as before. The ideals laid down by the late Prime Minister have to be scrupulously followed while the task of economic planning should be implemented with zeal and without interruption There is naturally anxiety that the new leadership should be able to evolve policies which will have general acceptance and which will allay particularly the fears of the people in the southern States. There are now fears that Hindi imperialism will assert itself and that not much attention may be paid to the development of the industrial potential of the southern States. There may not be really any warrant for these fears as the senior leaders can be expected to be responsible enough and act wisely. The fears now prevailing, however, provide an indication of how new problems will arise in the absence of towering leadership like that made available by the late Prime Minister. There is still faith that the Indian people are essentially constructive in their outlook. The economic development of the country has been so striking in recent years that the self-generating stage is not far off. If in the next five years the planning of new schemes and their implementation can be effective, the take-off stage could be reached by the end of the fourth Plan. There will necessarily have to be greater concentration on economic planning, in the next few years and a stable administration both at the Centre and in the States is necessary for the purpose. And talking of regional planning, in order to eliminate the backwardness of some areas and bring about a dispersal of industrial capacity with a view to securing the maximum results, it has been emphasised that the southern States can play a vital part in the further development of the steel industry. Andhra Pradesh can house a large-sized steel plant at Visakhapatnam. Iron ore in large quantities can be obtained from the Baladillah region which is now being developed for stepping up exports of this mineral to Japan. Coal can be brought from areas in West Bengal or Bihar by the sea or rail route. In the Goa area also a large plant can be erected as ore from the Bellary-Hospet region can be used while the required quantities can be imported, if necessary, as a large number of bulk carriers will be calling at the port of Marmagao for transporting huge quantities of iron ore. The Salem Steel Project, of course, will have to be accorded the highest priority as there will be no problem of iron ore or fuel supplies. It is expected that the project report will be submitted by the consultants shortly and the question now relates to whether the project should start initially as a pig iron unit or whether alloy steel should be manufactured even from the beginning. As the Bhadravathi unit is being developed in a big way for the manufacture of alloy and special steels, it may have to be decided that pig iron will be produced in the early stages at least to the extent of five lakh metric tons annually. As there is such an acute shortage of this basic product and concurrently with an increase in the consumption of steel there will also be increase in the consumption of pig iron an early decision should be taken regarding the implementation of this project so that pig iron in large quantities can be made available from this source. There will be no serious problem of transport either in handling raw materials or the finished product as lignite and iron ore are available from nearby areas. The marketing of pig iron will be easy as the needs of consumers in this part of the country can be taken care of, to a great extent, by this unit.

As regards the Bhadravathi Steel Project, it has been indicated by the Mysore State's Industries Minister, Mr. Mallappa, that the draft of the agreement for purchasing plant and machinery from West Germany, on the basis of credit

provided by a bank in that country, has been got ready and is now with the Central Government for their scrutiny and approval. Demag of West Germany will be collaborating with the Bhadravathi Steel Works in the expansion scheme for manufacturing special and alloy steels and it is estimated that this project will cost Rs. 12 crores out of the total expenditure of Rs. 17 crores. It may be recalled that it was at the instance of Mr. C. Subramaniam, Union Minister for Steel and Heavy Industries, that it was decided to convert the project for producing additional quantities of steel and pig iron into a scheme for producing special and alloy steels. Apart from considerably improving the economics of the proposition, it was felt that badly needed supplies of alloy steel could be made available at an early date with the implementation of this scheme. It is stated that the value of the ouput after the completion of this scheme will be Rs. 50 crores annually. Mr. Mallappa has also stated that there is a proposal to erect a third pig iron plant having a capacity of 400 tons daily at a cost of Rs. 1.5 crores.

With the prospect of large quantities of power being available in the near future, when the various units in the Sharavathy project are commissioned, there is anxiety to undertake industrialisation of the Mysore State in a big way. Efforts are being made to start a plant for producing Silicon Carbide and Corundam with Czechoslovakian assistance. That country has agreed to provide the necessary technical assistance and finance. It is also being examined whether for manufacturing chip boards a unit can be started with the help of a West German firm.

**

As there will be large movement of raw materials and finished products with the development of the steel and engineering industries and it is also the policy to connect major ports with broad gauge railway systems, it is proposed to convert some metre gauge lines into broad gauge lines. It may ultimately be decided to construct the Mangalore-Hassan railway line as a broad gauge line while the proposal of the Madras Government regarding a broad gauge track between Tiruchirapalli and Tuticorin port is being seriously considered and may even be included in the fourth Plan. Mr. S. V. Ramaswami has actually stated that the cost of construction of the broad gauge line between these two centres will be less than that of the Mangalore - Hassan line and that the hinterland of the Tuticorin port would be well served thereby. The railway line connecting Virudhunagar, and Manamadurai has also been completed and opened for traffic. This metre gauge track also will be useful in developing a backward area besides helping the Tuticorin port. At the same time the Deputy Railway Minister has stated that the Salem-Bangalore link will be ready by the end of next year. It is also felt that the Guntkal-Renigunta link should be converted into broad gauge instead of the proposal to double the railway track, in order to handle the increasing volume of iron ore traffic. The cost of conversion will be much cheaper than the doubling scheme and diesel locomotives can be expected to handle the growing volume of traffic. The position is expected to become difficult after the mechanical handling equipment is installed at Madras. It is then expected that iron ore exports through the Madras port can be increased to over three million tons annually.

**

The automobile and ancillary industries in the Madras State have been doing better latterly though it has been complained that the producer of cars has had to contend against serious difficulties. With control over selling prices and the rising cost of components and parts, it has been difficult to maintain profitability. It has actually been complained that even under the new dispensation, difficulty is being experienced in importing vital components and that the rate of production might be affected in the coming months by delayed shipments. It is, however, hoped that there will be a distinct improvement in working conditions once the press under construction begins operating. There is also a programme for manufacturing one-ton trucks. The company has been granted a licence to produce 1,500 units annually. As it has been stipulated in the industrial licence that there should be an indigenous content of 70 per cent right from the start elaborate tooling arrangements are being completed It is expected that the actual production of trucks and delivery vans will start towards the end of the year and full rated output achieved by the middle of next year. When the pressing of bodies is undertaken in the factory premises and the truck programme also gets under way, it is hoped that the margin of profit on sales will improve considerably. In 1963, there was a decline in sales to Rs. 3.52 crores from Rs. 3.66 crores in the previous year on account of a lower output of cars. But a decline in earnings before depreciation was averted because there were larger sales of spare parts and job work also was undertaken on behalf of outside parties. It was possible, therefore, to provide a larger sum towards depreciation and development rebate. The dividend on ordinary shares has, however, been maintained at six per cent though with a transfer of Rs. 1.3 lakhs from dividend equalisation reserve.

Encouraging Performance

Enfield India Limited, however, has presented an encouraging balance-sheet for 1963. Apart from the fact that the company has started deriving full benefit out of the large development expenditure incurred in recent years, the company has been selling nearly the whole of its output of heavy-duty motor cycles to the Defence Services. Until recently there were practically no sales of this type of motor cycle to the civilian market. Indeed, the output of the light-weight model had to be suspended while the manufacture of scooters could not be undertaken on a large scale. It is expected that during the current year a new light-weight will be introduced while the output of scooters will be stepped up. The manufacture of Villiers engines in larger numbers, with the help of the components and parts provided by the units functioning in the Sundaram Industrial Estate, is expected to be helpful. There are 20 units in this Estate and it is hoped that they will be working up to rated capacity in the next few months. As a result of the larger output of industrial engines, motor cycles and scooters, it is estimated that there will be an increase in sales during the current year by a further 25 per cent. The company's products have already an indigenous content of 82 per cent and this is expected to go up to 90 per cent when the manufacture of another vital component, which is not normally taken up by the main producer, will be produced by Enfield India. The remaining are proprietary parts which are also expected to be available from indigenous sources before long.

In 1963, there was a big increase in sales to Rs. 222 39 lakhs from Rs. 140.50 lakhs in the previous year. There has been a consistent increase in sales in the past few years and therefore, a new record has been set every time. It is expected that in 1964 sales would amount to Rs. 2.70 crores and in the next year the Rs. 3-crore mark will be comfortably exceeded. Indeed, it is claimed that the proposal to double the capacity in the fourth Plan period can be achieved without any large capital expenditure and the outlook for the company in the coming years is exceedingly satisfactory. The net profit for 1963, before taxation and depreciation, amounted to Rs. 26.25 lakhs against Rs. 15.60 lakhs in 1962. It was naturally necessary to set aside the larger sum of Rs. 13 85 lakhs towards depreciation against Rs 8 57 lakhs on the earlier occasion besides writing off deferred revenue expenditure to the extent of Rs. 44,832. The development rebate reserve gets Rs. 2 44 lakhs against Rs. 1.16 lakhs while the provision for taxation is Rs. 4.97 lakhs against Rs. 2.93 lakhs. The dividend has been nearly doubled to 7½ per cent, taxable, from 4 per cent, taxable.

The moving finger writes

I MUST confess that I did not share the excitement of many of my colleagues in the press over Mr. Kamaraj's quest for a "consensus" during the days between May 27 and June 2. Somehow I had always expected Mr. Lal Bahadur to succeed Nehru and I had been saying so even when Pandit Pant was alive. Had Pandit Pant outlived Mr. Nehru, he would certainly have been promptly chosen as the successor. But very few would (or could) have thought it at all likely that Nehru would pre-decease Pandit Pant who, besides being two years older, was certainly not in anything like a comparable physical condition. There had certainly been speculation of greater or less respectability all along about the prospects of, say, Mr. Krishna Menon or Mrs. Indira Gandhi. But I for one had always regarded Mr. Menon as the last person to be a democratically chosen Prime Minister of India and as for suggestions that a coup, military or other, might put him into power, I had too much faith in Mr. Krishna Menon's ability not to get on with anybody to imagine that there could ever be a group of people who would really choose to go to all that trouble merely for his benefit.

Possibilities regarding Mrs. Indira Gandhi were, of course, much more serious. But there too, I could never really believe that Nehru would bring himself to exerting his authority or prestige in the cause of keeping the Prime Ministership within the family. For this reason, I was always inclined to rule out the likelihood of Mrs. Indira Gandhi succeeding her father during the latter's lifetime. There was, however, always a faint possibility that once Mr. Nehru had passed away, his daughter might have been carried into the Prime Minister's office on a tide of popular or party sentiment. But I was, nevertheless, cynical enough to recognise that there would be enough hardened politicians in the higher echelons of the Congress hierarchy to ensure that a political rather than an emotional decision was taken on the issue of succession.

Mr. Jagjivan Ram's pretensions I never could take seriously, and as for Mr. Nanda, his brief tenure of Prime Ministership is just one of those silly little jokes which Cleo occasionally likes to permit herself. Mr Morarji Desai, however, is a different kettle of fish. It was always apparent that his would be a very considerable challenge. If, nevertheless, I had still made up my own mind long years back that after Nehru it would most likely be Lal Bahadur, it was for the reason that I was inclined to suspect that, among the top Congress leaders who would, in effect, settle the succession, there would be a strong disposition to keep away from controversial figures. In other words, I was convinced from the beginning that Nehru's successor would be chosen by a process of elimination; and the possibilities of that process pointed most definitely towards Mr. Lal Bahadur. To me, consequentially, if there was at all a problem of succession, it was only whether Mr. Lal Bahadur would win the nomination without a contest or as a result of one.

**

The impromptu press conference on the lawns of the residence of the Prime Minister-designate on the evening of the very day on which the Congress Parliamentary Party had elected him as its leader, was undoubtedly and wholly worthwhile. Mr. Lal Bahadur, as he told us, had merely agreed to meet journalists informally — and for a few minutes — just to exchange a "hello". If, however, he permitted a regular flow of questions and answers to develop, it was surely as much because of his politician's instinct as because of his obliging nature. Mr. Lal Bahadur was quick to sense the feelings of curiosity and expectancy that were in the air and the desire of pressmen to get to know him and the workings of his mind better at the earliest possible moment; and the shrewd public man that he was, he seemed to have decided then and there that there was nothing to be lost and perhaps a great deal to be gained by permitting the questions to come along while choosing to answer only those he wanted to. That, at his first confrontation with the press as Nehru's successor, he indeed did exceedingly well is a happy thought and one which could be expressed without any suggestion of condescension. While it is true that he often took his own time in formulating his ideas or finding the words in which to convey them, he succeeded to a surprising degree, in creating an impression of spontaneity and the image of a man who was prepared to trust and be trusted.

**

Among the news that emerged from the meeting between the Prime Minister-designate and the press was the information that Mr. Lal Bahadur had decided to attend the forthcoming Conference of Commonwealth Prime Ministers in London. This is certainly a wise decision. Enough excuses could certainly have been found for Mr. Lal Bahadur staying away. That he did not succumb to the temptation is a point in his favour. His appearance at an important international gathering early after his assumption of the Prime Ministership will surely do more than anything else to reassure the world that India, after Nehru, is once again settling down to the routine and regular processes of governmental and public activity. For Mr. Lal Bahadur himself, his London visit should be a major exercise in political education. Meanwhile, it was rather amusing to hear Mr. Lal Bahadur call for a "bold" policy on the part of the Government of India with regard to Laos while his further statement that this country hoped to have the co-operation of the United States, Britain and the Soviet Union in solving the problem of Laos was certainly most intriguing. Even granted that India has a special status or responsibility in Laos by virtue of its Chairmanship of the International Commission, the Government of India ought surely to be careful not to bite off more than it can chew. It is possible, however, that the Prime Minister-designate was only reacting to speculations abroad that, with the passing away of Mr. Nehru, India's capacity to influence the so-called "third world" might diminish or disappear.

**

It was an interesting aspect of the Prime Minister-designate's first press conference that he seemed anxious to impress on the public his personal interest in economic affairs. Mr. Lal Bahadur spoke of the high importance of steps being taken immediately and effectively to arrest the tendency of prices to go up and up. He also swore by a new social order in which wealth would not be with the few but would be available for all. I have no quarrel with him for having said what he did, but I do have a quarrel with him for not adding something more which would have been so very relevant to all that he did say. I am referring here to the elementary proposition that prices are not going to be kept down, nor can the welfare of the mass of the people be increased, unless there is more production. I wish the Prime Minister-designate had indicated that he understood this.

V. B.

Trade Winds

RANIPUR HEAVY ELECTRICALS

ON MAY 23, 1964, contracts ior Rs. 23.5 crores were signed in New Delhi between the Heavy Electricals (India) Ltd., a Government of India Undertaking, and V/O "Prommash-export", Moscow, for the delivery of equipment, materials and the working drawings for the Heavy Electricals Equipment Plant at Ranipur (Hardwar). The contracts also provide for technical assistance by Soviet specialists during construction, erection of equipment and commissioning of the project. This will be the biggest heavy electrical equipment unit in South-East Asia and one of the largest in the world. It has been designed for the manufacture of units up to 300,000 kW for thermal power stations, up to 100,000 kW units for hydro power stations, and 'electric drives' up to 10,000 kW for use in Heavy Machine Building Plant, Ranchi, Coal Mining Machinery Plant, Durgapur, steel plants, etc. The total manufacturing capacity for steam and hydro turbo-units will be 2.7 million kWs and of electric machines 515,000 kWs annually. The yearly output at full production is estimated at Rs. 40 crores. Its importance to the national economy is evident from the fact that while a total of 7 million kW of generating capacity will be installed during the third five-year Plan period, this plant alone will provide a potential of 2.7 million kWs of power generating units annually.

The total supply of equipment for the project from indigenous sources, including 25,000 tons of structural steel, will be worth about Rs. 13 crores. Over 30 per cent of the equipment and practically all the construction materials will be secured locally. Over 7,000 workmen including about 1,400 engineers and technicians will be employed at the plant, which has already been equipped with a training school and workshop for building up the requisite force of technicians and artisans for production.

RISE IN GROUNDNUT PRODUCTION

The All-India final estimate of groundnut for 1963-64, released by the Directorate of Economics and Statistics of the Ministry of Food and Agriculture, puts the area under groundnut for the year at 16,814,000 acres. As compared with the partially revised estimates of 16,962,000 acres and 4,821,200 tonnes of nuts for 1962-63, the estimates for 1963-64 show a decline of 148,000 acres or 0.9 per cent in area and an increase of 469,400 tonnes or 9.7 per cent in production. The yield per acre during 1963-64 works out to 694 lbs., an increase of 10 7 per cent over the yield of 627 lbs. per acre in 1962-63. The increase in production was recorded in almost all the producing States except Rajasthan where the rainfall was deficient and erratic. The decline in area during 1963-64 occurred mainly in Gujarat, Andhra Pradesh and Madhya Pradesh where the rainfall was late and insufficient. This decline was, however, off-set by increases in areas in Madras, Punjab, Uttar Pradesh and Maharashtra where climatic conditions were favourable at the time of sowing. Expansion of the area under the Integrated Oilseeds Development Scheme in Madras was another reason for increase in the area under groundnut in that State.

PRICE SUPPORT FOR LEMONGRASS OIL

During the last two years the world prices of lemongrass oil have been declining heavily because of the synthetic production of citral and severe competition from cheaper lemongrass oil from Guatemala and other countries. With a view to give price support to the numerous small producers of lemongrass oil in the State of Kerala, large-scale purchase and price support operations were undertaken by the State Trading Corporation last year at the instance of the Union Government. The State Trading Corporation had to purchase the bulk of the lemongrass oil (nearly 1,000 tons out of the total annual production of about 1,300 tons in the Kerala State) but it was able to export a large portion thereof. As the production of cheap synthetic citral is continuing to reduce the prices, the Government has decided that for the new crop the State Trading Corporation should give the price support and purchase lemongrass oil in the coming season from the first week of June and onwards at prices of Rs. 11 per kg. for lemongrass oil containing not less than 78 per cent of citral and Rs. 12 per kg. of lemongrass oil containing not less than 82 per cent of citral. The prices have been fixed in consultation with Kerala Government. With a view to earning the maximum of foreign exchange the exports of lemongrass oil will be canalised through the State Trading Corporation. The floor prices for exports announced last year are being withdrawn and Rs. 12 per kg. of lemongrass oil containing not less than 82 per cent of citral. The prices have been fixed in consultation with the Kerala Government. With a view to earning the maxition will open depots at various places, viz., Cochin, Alwaye, Calicut, Tellicherry, Muvattupuzha, Kuruppumpady, Manatvady, Meenagadi, Taliparamba, Adimali, Kothamangalam and Piravam, where the producers can bring their oil up to certain limits fixed for each of the depots during a month. The Corporation will purchase in the coming 5 to 6 months lemongrass oil up to a quantity of 750 tons.

TIN PLATE

The first electrolytic tinning line on the continent of Asia is to be erected in the Rourkela Iron and Steelworks, India. DEMAG was awarded the supply contract for the first expansion stage last year, and is now to supply the machines for the second expansion stage together with the main order. On commissioning, the plant will have an annual capacity of 150,000 tons of tin plate, which makes it one of the largest in the world. India will then be able to produce and process more tin plate. This plant, which is designed for a maximum strip width of 1,040 mm, strip gauges of 0.15 to 0.31 mm and coil weights of max. 15 tons, belongs to the "Processing Line" sector.

EXPORTS OF SPICES

Exports of spices during the financial year 1963-64 totalled 51,179 tonnes valued at Rs. 15 3 crores compared to 48,340 tonnes valued at Rs. 13.3 crores in 1962-63. The increase was notable in respect of chillies, the export of which amounted to over 12,000 tonnes valued at Rs. 2.8 crores in 1963-64 against 4,876 tonnes valued at Rs. 0.9 crores in 1962-63. The significant decline, both in quantity and value, occurred in the case of black pepper. Against 20,868 tonnes of pepper valued at Rs. 6.5 crores exported in 1962-63, exports during 1963-64 totalled only 18,935 tonnes valued at Rs. 5.8 crores. The decline in pepper exports is attributed, by the Spices Export Promotion Council, to the general fall in international prices while the substantial increase in the export of chillies is ascribed to the impact of the visit of the Spices Trade Delegation to Ceylon and the quality control standards introduced by the Council.

"ONE PER CENT" PLAN

The UN World Trade Conference in Geneva has approved, by an overwhelming majority, the "one per cent" plan under which the industrialised nations are to set aside one per cent of their gross national income for the developing countries. While all the 71 developing nations represented at the Geneva meeting and most of the Western industrialised nations voted in favour of the idea the West German delegation abstained. The German attitude was received with astonishment and misgivings by both the developing countries and the Western countries. However, it is not clear yet whether West Germany will retain this reserve in the final voting at the end of the conference.

JUTE MILL MACHINERY

Addressing the inaugural function of the Jute Machinery Manufacturers Association on May 21, 1964 in Calcutta, Mr. S. C. Kela pointed out that 70 per cent of the requirements of jute mill machinery are now being met by indigenous production. The following table shows the actual production of jute machinery industry since the year 1956-57:

Year	Production in Rupees Lakhs
1956-57 ..	37.83
1957-58 ..	70 81
1958-59 ..	90.21
1959-60 ..	178.43
1960-61 ..	174.04
1961-62 ..	211.54
1962-63 ..	308.70
1963-64 ..	375.00

The anticipated availability of jute mill machinery vis-a-vis the demand during the fourth Plan period has been estimated as follows:

Nomenclature of Machinery	Estimated Annual demand during the Fourth Plan Period (by Nos.)	Anticipated Annual availability during the Fourth Plan Period (by Nos.)
Carding Machine	302	310
Drawing Frame	357	648
Spinning Frame	631	1044
Roll/Cone Winder	40	108
Cop Winder	151	160
Prebeamer	24	72
Dressing	20	22
Carpet Backing Loom	86	156
Modern Automatic Loom	367	400
	Value Rs. 918 lakhs	Rs. 1380 lakhs

BRNO FAIR

The Government of India has decided to participate in the International Trade Fair scheduled to be held at Brno (Czechoslovakia) from September 6 to 20, 1964. India's recently concluded long-term trade arrangement with Czechoslovakia holds prospects for large-scale purchases of engineering items from India by the foreign trade enterprises of that country. The Government of India is arranging to give suitable publicity to India's traditional items of trade with Czechoslovakia through display of samples in a well-equipped Samples Library, and through the dissemination of commercial information at an information stand at the Fair. The intending participants may send the lists of their exhibits by June 22, 1964 to the Director of Exhibitions, Ministry of International Trade, New Delhi. Because of the excellent opportunity offered by the Fair for negotiations and transaction of on-the-spot business, the Government of India will consider requests for release of foreign exchange for the visit of representatives of participants at their own cost.

NAPHTHA CRACKER

The expansion programme of the chemicals and plastics plant of the Union Carbide India Ltd., at Trombay includes the manufacture of heavy organic chemicals by the installation, for the first time in India, of a Naphtha Cracker. This equipment will bring about a revolution in the heavy organic chemicals industry. The production of various salable chemicals will increase to 9 million kgs. per annum and that of salable polyethylene alone to 9 million kgs. per annum. Increasing the supply of these materials will satisfy to an extent the ever increasing demand for these materials by various industries. The expansion will also result in an increase of invested capital in this project from Rs. 4 5 crores to Rs. 13.00 crores. Originally the plant was designed to produce about 6.8 million kgs. of chemicals and plastics worth Rs. 2.5 crores annually and provide a steady market for industrial alcohol, a by-product of Maharashtra's growing sugar industry. Union Carbide Corporation, USA, besides making available the capital and equipment, provided technical know-how.

CEMENT MACHINERY

Four additional parties have been licensed for the manufacture of cement machinery in collaboration with Danish, Japanese, Czech and American firms. The firms are: Utkal Machinery, Rourkela (with F. L. Smidth, Denmark) with an annual capacity of one plant; the Indian Sugar and General Engineering Corporation, Ambala (with Kawasaki Dockyard, Japan) two plants; Walchandnagar Industries, Poona (with Perov Engineering Works, Czechoslovakia) one plant; and Mcnally Bird, Bihar (with Kennedy Van Saun, USA) two plants. The capacity already approved is expected to meet the fourth Plan requirements also. The three firms now manufacturing cement machinery are: Associated Cement Companies at Shahabad in Mysore, ACC-Vickers-Babcock at Durgapur and KCP at Thiruvottiyur in Madras. The Shahabad unit is to be expanded and a new foundry as well as a new shop are to be set up. The capacities of the AVB and ACC shops are complementary. Their combined capacity is about three standard plants a year, each with an annual capacity of 2,00,000 tonnes. This is likely to increase to four standard plants by the end of the current Plan. Machinery worth Rs. one crore has already been installed at the Thiruvottiyur shop of KCP, which is collaborating with Fives-ILLE Cail of France for the manufacture of both cement and sugar machinery. All the firms, including the additional parties that have been licensed, are well equipped to book orders. Their total annual capacity of 12 plants, valued at Rs. 17 crores, is stated to be adequate to meet the internal demand.

CENTRAL REVENUE COLLECTIONS

The revenue realised from items on which duties were levied and collected by the Central Government in the financial year 1963-64 amounted to Rs. 1571.28 crores. Of this, Rs. 247.13 crores were collected during March, 1964. The corresponding figures for the financial year 1962-63 and for the month of March, 1963 were Rs. 1233.42 and Rs. 173.65 crores respectively. The following table gives details of the revenue realised under various heads:

(In lakhs of Rupees)

Revenue Heads	March		April to March	
	1964	1963	1963-64	1962-63
Customs	3667	2232	32379	23899
Union Excise Duties (excluding cesses on salt, coal and iron ore)	6334	5017	70626	58158
Corporation Tax	7556	5120	28827	21987
Income Tax	6404	4442	23295	17473
Estate Duty	130	99	482	398
Taxes on Wealth	549	391	1049	957
Expenditure Tax	3	10	12	21
Gift Tax	31	28	111	96
Opium	39	26	347	353
TOTAL	24713	17365	157128	123342

Company Affairs

MUKAND IRON

MUKAND IRON and Steel Works Ltd. has completed twenty five years of its eventful existence. Incorporated in 1938 with a paid up capital of Rs. 13.71 lakhs, its progress was interrupted by the partition of the country in 1947 which resulted in the total loss of its Lahore unit. In compensation it received a small machine tool factory at Batala -- Batala Engineering Co. Ltd. During the last few years its plant at Kurla has increased in size so that it employed 2,838 persons in 1963 as against 1064 in 1951. During the decade its sales also increased from Rs. 33.44 lakhs to nearly Rs. 6.46 crores in 1962-63.

With this experience Mukand Iron is going ahead with various expansion schemes. It is installing at Kalwe near Thana a 20-tonne arc furnace which will be among the largest in the country and also a modern rolling mill. The project is expected to go into operation in 1965, when it will be rolling mainly wire rods at the annual rate of about 100,000 tonnes. Its furnace will melt scrap and supply about half its requirements of billets which will be cast by the new continuous casting process. The total cost of the project will be approximately Rs. 4.5 crores, including the working capital. The company covered the foreign exchange requirements of about Rs. 1.60 crores by loans from CDFC and the ICICI Orders for plant and machinery worth more than Rs. one crore, have been placed. This subsidiary, the Batala Engineering Co. Ltd., has recently entered into technical collaboration arrangements with Italian firms for the manufacture of open side planing machines and lathes. A new machine tool factory will be put up at Ballabhgarh near Delhi, in addition to the expanding activities at other places.

INDIAN PAPER

The Indian Paper Pulp Co. Ltd., has applied to the Controller of Capital Issues for sanction to capitalise Rs. 35.28 lakhs standing to the credit of the share premium account and issue 352,800 bonus shares to the existing shareholders in the ratio of two bonus shares for every five held. The new shares will not participate in any final dividend which may be declared in respect of the year ended March 31, 1964.

INDIAN COPPER

Indian Copper Corporation Ltd., has released its preliminary results on 1963 which show a profit of £1 38 million against £1.35 million last year. A sum of £170,000 is provided for depreciation, £821,855 for taxation, £26,597 for development rebate reserve and £98,000 for general reserve which leaves a net profit of £246,729. It compares favourably with last year's figure of £175,094. The directors have proposed a taxable dividend of 12 per cent on the capital increased by the issue of bonus shares as against a taxable dividend of 18 per cent on the original capital. As the bonus issue was at the rate of one for two, the dividend works out to be the same.

TATA MILLS RIGHTS

The directors of the Tata Mills Ltd., have decided to issue out of the unissued ordinary shares new ordinary right shares of Rs. 25 each "at par" in the proportion of one new share for every three held to the existing shareholders. The directors have decided to cut the dividend for 1963 from 20 per cent to 18 per cent due to a setback in their earnings. The net profit, before tax, has declined to Rs. 18 24 lakhs as against Rs. 24.80 lakhs last year. A sum of Rs. one lakh has been provided for taxation and Rs. 4 50 lakhs for development rebate reserve. Provisions for gratuity and dividend reserve absorbed Rs. 30,000 and Rs. 12.40 lakhs respectively against Rs. 60,000 and Rs 13 50 lakhs respectively last year. The turnover has risen from Rs 490 lakhs to Rs. 522 lakhs and the proposed dividend is to be paid out of d vidend reserve.

AHMEDABAD ADVANCE

The directors of the Ahmedabad Advance Mills Ltd., have decided to increase the authorised capital of the company from Rs. 60 lakhs divided into 50,000 ordinary shares of Rs. 100 each and 10,000 preference shares of Rs. 100 each to Rs. 110 lakhs by the creation of 50,000 new ordinary shares of Rs. 100 each. In other words the company will be doubling its equity capital from Rs. 50 lakhs to Rs. one crore.

The directors have further decided to issue bonus shares to the existing shareholders by utilising Rs. 10 lakhs from the share premium account. The bonus will be in the ratio of one share for every five held. This issue of 10,000 new ordinary shares of Rs. 100 each will be subject to the consent of Controller of Capital Issues. The directors have also proposed to issue 15,000 new ordinary shares of Rs. 100 each at par to the existing shareholders in the ratio of one share for every four held. In the meanwhile the working of the company during 1963 has resulted in a short setback with the net profit before tax and development rebate declining to Rs. 6.63 lakhs from Rs. 14.38 lakhs, though the turnover has improved marginally from Rs. 298 lakhs to Rs. 311 lakhs. The directors have, therefore, been obliged to prune the dividend from Rs. 11 a share to Rs. 10 a share less tax. In fact they have been obliged to draw from general reserve to the tune of Rs. 3 lakhs to make up for the distribution which amounts to nearly Rs. 5 lakhs.

BRAITHWAITE & CO.

The Braithwaite & Co. (India) Ltd., has reported a net profit, after providing for depreciation and taxation of Rs. 60.30 lakhs for 1963 as against Rs. 35 88 lakhs last year. The rise was essentially due to an increase in 'contracts invoiced'. Depreciation has been raised to Rs. 14.19 lakhs against Rs. 9.96 lakhs but taxation is lower at Rs. 62.21 lakhs against Rs. 75.18 lakhs. A sum of Rs. 17 lakhs has been provided for surtax reserve and Rs. 21.70 lakhs for general reserve. The dividend has been raised from Rs. 1.85 to Rs. 2 a share, less tax.

With regard to Clive works the directors stated that the output reached 28,569 tonnes and was slightly below the target of 30,000 tonnes because of the slowing down of production thrice during the year. Even this output has been the highest so far achieved and the directors are confident that with improved raw materials position the performance during the current year will be still better. The Angus works have progressed satisfactorily and turnover was nearly double that of 1962.

TELANGANA MILLS

Talangana Spinning and Weaving Mills Ltd., will enter the capital market shortly with a public issue of Rs. 20 lakhs comprising 80,000 cumulative preference shares (9 5 per cent) of Rs. 10 each and 120,000 equity shares of Rs. 10 each. The company has an authorised capital of Rs. 50 lakhs — Rs. 15 lakhs in preference shares and Rs. 35 lakhs in equity shares. The issued capital is Rs. 30 lakhs of which a capital of Rs. 10 lakhs has already been subscribed and the balance will be offered to the public. The entire public issue has been underwritten. The company proposes to set up a spinning mill with an installed capacity of 12,096 spindles. The capital outlay

DUNLOP RUBBASEAL

THE COMPLETE UNDERBODY PROTECTION FOR YOUR CAR

Unseen by you, dangerous enemies are at work on the underbody of your car. Flying flints, mud, corrosion and rust play havoc with the unprotected underbody. You can prevent this needless damage with an application of Rubbaseal—the complete protection for vehicle underbodies. Rubbaseal also reduces drumming noises and enhances the resale value of your car

DUNLOP RUBBASEAL

The complete underbody protection

is estimated at Rs. 70.75 lakhs which will be met by share capital (Rs. 30 lakhs), loan from Andhra Pradesh State Financial Corporation (Rs. 20 lakhs), deferred payments (Rs. 15.57 lakhs) and bank borrowings (Rs. 5.18 lakhs).

DALMIA CEMENT

Mr. V. H. Dalmia, Chairman, Dalmia Cement (Bharat) Ltd., revealed the fact that the installed capacity of cement production in India reached 10.12 million tonnes in 1963 which meant an increase of nearly 4 per cent over the last year. At this rate the installed capacity by the end of the third Plan would be around 14.2 million tonnes with a production of 11.6 million tonnes as against the original target of 15.24 million tonnes of installed capacity and 13.2 million tonnes of actual output. This, in fact, was likely to be the demand for the year 1965-66. There was going to be, therefore, a gap of nearly of two million tonnes every year.

He referred to the establishment of the Cement Corporation of India, which the Government has formed to increase the cement manufacturing capacity, in the public sector. One of its principal tasks would be limestone prospecting and the Chairman was hopeful that his company would be allowed to benefit from these efforts of the Corporation. Apart from the establishment of Cement Corporation which was expected to increase the output of the industry as a whole, the manufacture of blast furnace slag cement was likely to register expansion. Such steps adopted firmly would tend to eliminate present scarcity.

The Chairman was of the opinion that better supply of coal and improved rail transport facilities had resulted in improved utilisation of capacity in the cement industry so that it was nearly 92.5 per cent in 1963, which was the highest figure for the last decade. The Government did provide certain incentive to the industry which resulted in improved production but its policy was not without various drawbacks. For instance, the Chairman indicated that the formula adopted by the Government of India for computing the quarterly packing charges resulted in a loss of nearly Rs. 3.27 lakhs to the company in 1963. Although the ratio of second hand to new bags was revised from 1:1 to 1:2, the loss still persists because the formula assumed the price of the second hand bags at 65 per cent of that of the new bags while actually in the market it was 85 per cent. Thus there was a considerable scope for the Government to reshape its policy of cement production if it wanted the output to improve within a reasonable period.

The Chairman referred to the increased competition that iron ore faced in the international markets as a result of which the Minerals and Metals Trading Corporation of India Ltd., conceded some reduction in the price of the basic grade iron ore to be supplied to Japan. The Chairman, however, was much pleased over the prospects of the development of Cuddalore port through which this company's ore was to be imported. The company was further planning to reduce the transport cost for its iron ore by laying a ropeway from the mines to the rail-head and by introducing a substantial degree of mechanisation in mining.

PERRY CONFECTIONERY

The directors of Perry confectionery Ltd., propose to pay a second interim dividend on the ordinary share capital in September, 1964. This will be on top of the interim dividend of 8 per cent paid in April. The final dividend, subject to the profits continuing to be satisfactory, will be recommended at the annual general meeting to be held in December, 1964. The decision to pay a second interim dividend follows the change in company's financial year. It has been closing its account on March 31, every year but the directors felt that the closing of the accounts on this date gave rise to many direct difficulties. It is felt more convenient to close the accounts on September 30 every year, when there is less pressure of work. The next accounts will, accordingly, be made up for the period of 18 months from April 1, 1963 to September 30, 1963 and annual meeting will be held in December. It is in order to avoid hardship to the shareholders by reason of the change in the accounting year that the directors proposed to pay a second interim dividend.

FINLAY MILLS

The Finlay Mills Ltd., during the year ended December 31, 1963, recorded a profit of Rs. 15.33 lakhs after making provisions for depreciation (Rs. 13.26 lakhs), development rebate reserves (Rs. 3.93 lakhs) and taxation (Rs. 14.86 lakhs). The directors have recommended a dividend of Rs. 23 per share which will absorb Rs. 11.50 lakhs. A sum of Rs. 3 lakhs has been transferred to general reserve. The directors have pointed out that the company has decided to take advantage of the opportunity provided by the official notification permitting the mills to expand their installed capacity to the extent of 7½ per cent of their spindleage and 10 per cent of their looms which is under implementation. Ten new ring frames were received and installed during the year and delivery of other 36 ring frames is expected to commence early in 1965. The company has also placed order for 48 automatic looms and some more equipment. A new mercerising machine has been received and is under installation. The directors also point out that their quota of imported long staple cotton yarn was once again severely cut on account of tight foreign exchange position while voluntary price control on cloth continued to be in force throughout the year. The company, however, is doing well in its retail shops which are being opened at many places.

LARSEN AND TOUBRO

Larsen and Toubro Ltd. recorded a successful year on March 31, 1964 when their sales exceeded Rs. eight crores to show a 40 per cent rise over the corresponding sales in the previous year which stood around Rs. 5.8 crores. Income from other sources is also expected to show an increase over the previous year's figures. It is indicated that an encouraging feature of the rise in sale during the year was that the value of output in the company's workshop, at Powai, Bombay, registered a 60 per cent increase over the corresponding figure in the preceding year.

HINDUSTAN LEVER

Mr. P. L. Tandon, Chairman, Hindustan Lever Limited, who was a member of the Board of Governors of the Indian Institute of Management, Ahmedabad, has been nominated the Chairman of the Institute. Mr. Tandon succeeds Mr. Jivraj Mehta, who resigned his chairmanship on his appointment as High Commissioner for India in the United Kingdom. The Institute of Management, Ahmedabad, was sponsored by the Government of India and assisted by the State Government of Gujarat, the Indian business community and the Ford Foundation.

MADRAS ADVERTISING

After the death of Mr. S. Anantharamakrishnan, Chairman, the Madras Advertising Co. Pt. Ltd., Mr. M. V. Venkatraman, who was the finance director, has now been elected as its Chairman. He has also been elected as the Chairman of Amalgamations Private Ltd. and its subsidiary companies.

KIRLOSKAR ELECTRIC

Kirloskar Electric Co. Ltd., will issue shortly 25,000 cumulative redeemable preference shares (9.3 per cent) of Rs. 100 each. These shares will be offered in the first instance to the existing equity shareholders. Subsequently, if there is any balance left it will be offered to the public for subscription. The company is also likely to issue fresh equity shares at a later date.

COMPANY NOTICE

THE GANESH FLOUR MILLS COMPANY LIMITED

DELHI

Registered Office: SUBZIMANDI, DELHI

NOTICE

NOTICE is hereby given that the 72nd Annual General Meeting of the Shareholders of The Ganesh Flour Mills Co. Ltd., Delhi will be held at the Company's premises at 64-65, Najafgarh Road (Industrial Area) New Delhi on Monday the 29th day of June, 1964 at 10 A.M. to transact the following business:

1. To receive, consider and adopt the Directors Report and the Audited Balance Sheet and Profit and Loss Account of the Company for the year ending 30th September, 1963;

2. To declare dividends;

3. a) To appoint a Director in place of Shri Satya Narain Gupta who retires by rotation under the Articles of Association of the Company and being eligible for re-appointment, offers himself for re-appointment as a Director of the Company.

   b) To appoint a Director in place of Shri Om Parkash who retires by rotation under the Articles of Association of the Company and being eligible for re-appointment offers himself for re-appointment as a Director of the Company.

4. To appoint Auditors for the Financial Year 1963-64 and fix their remuneration. Messrs. A. F. Ferguson & Co., Chartered Accountant, the retiring Auditors being eligible for re-oppointment, offer themselves for re-appointment as Auditors of the Company for the year 1963-64.

SPECIAL BUSINESS

5 To consider and if thought fit to pass the following with or without modification as an ordinary resolution.

"Resolved that the Company hereby approves of the appointments and consents to the continuance, as the case may be, of the Sole-Distributors/Distributors/Dealers of the Company for a period not exceeding five years commencing from the dates of such appointments and for the products and the area respectively mentioned, subject to any variation that may be made in the terms of their appointments including changes in area and products and subject also to the condition that the arrangements may be terminated earlier by one month's notice on either side".

(List of Sole Distributors/Distributors/Dealers and the explanatory statement regarding special business as required under section 173(2) of the Companies Act, will be included in the notice of the Annual General Meeting to be sent to the Share Holders alongwith the Balance Sheet).

By Order of the Board of Directors

For The Ganesh Flour Mills Co. Ltd.,

KIRPA NARAIN

Secretary & General Manager.

Delhi,
Dated 30th May, 1964.

N.B.: (a) Share Transfer Books of the Company will remain closed from 17th June to 29th June, 1964 (both days inclusive).

(b) Members unable to attend are requested to send their Proxy Form, sent alongwith the notice, duly stamped, signed and completed in favour of a person attending the meeting. Forms not properly signed and/or completed or received less than forty-eight hours before the meeting will be treated as invalid.

(c) A member entitled to vote is entitled to appoint a Proxy to attend and vote instead of himself and that a proxy need not be a member of the Company.

(d) The terms of appointment of Sole Distributors/ Distributors/Dealers as mentioned in item No. 5 above will be open for inspection of the members at the Registered Office of the Company from 17-6-64 to 29-6-64 during working hours.

(e) All Shareholders of the Company are requested to send their present addresses to the Company before the date of the meeting so that dividend warrants for the year ending 30-9-63 may reach them at their correct address.

COMPANY MEETING

DALMIA CEMENT (BHARAT) LIMITED

Summary of the Speech of the Chairman, Shri V. H. Dalmia, delivered at the Twelfth Annual General Meeting of the Company held at Dalmiapuram (Madras State) on 1st June, 1964.

Gentlemen:

I extend to you a very cordial welcome on the occasion of the Twelfth Annual General Meeting of your Company.

2. We are meeting today under the shadow cast over the length and breadth of our land by the sad and sudden passing away of our great leader, Pandit Jawaharlal Nehru, who, as the first Prime Minister of India, has guided and shaped the destinies of our country since Independence. Not only was he the architect of modern India, but he was an acclaimed and accepted leader in the international sphere and particularly in the resurgence that has emerged in Asia and Africa. Above all else, he was a man of peace, who had dedicated his life to the ideal of the brotherhood of man and to the principle that all differences between men and nations be resolved by peaceful means. His loss will be mourned not only in the country of his birth but throughout the world where men of peace and goodwill meet. His passing away leaves a vacuum in our country which may, perhaps, never quite be filled. There could be no better tribute to his memory than our resolution to move together steadfastly forward in furtherance of his dream of a peaceful, prosperous and united India.

3. The Annual Accounts and the Directors' Report for 1963 have already been circulated and I am sure you must have noted that the excellent results obtained in the previous year have been maintained. Though the gross profit is slightly lower at Rs. 134.05 lakhs compared to Rs. 146.62 lakhs in the previous year, on account of reduced provision for taxation, the net profit available for appropriation is higher at Rs. 57.65 lakhs compared to Rs. 55.53 lakhs in the last year. Rs. 26.50 lakhs have been appropriated to the General Reserve and a dividend of 12 per cent subject to tax has been recommended on the Ordinary shares. Some shareholders have represented that the distribution of the net profit by way of dividend should have been increased and that it was unnecessary to make any large allocation to General Reserve. It would have been easy for your Directors to give in to the temptation of increasing the dividend, but on a long-term view, they came to the conclusion that it was desirable to maintain a steady dividend and to build up the reserve position of the Company by adequate appropriations whenever the profits made that possible. More reserves would reduce Surtax liability in future years, whereas higher dividend would have meant more dividend tax and thus further drain on the Company's coffers.

4. Cement continues to be in very short supply throughout the country due to the slower rate of growth of the industry and partly to the more rapidly increasing demand. In 1963, the installed capacity reached 10.12 million tonnes against 9.72 million tonnes in the previous year, an increase of only 4 per cent. Despite all efforts, it is likely that at the end of 1965-66, the installed capacity will be about 14.2 million tonnes with a production of 11.6 million tonnes as against the original Third Plan target of 15.24 million tonnes and 13.2 million tonnes, respectively. The demand for 1965-66 at a growth rate of 10-12 per cent per annum was estimated at 13.2 million tonnes. Later trends have, however, indicated a faster rate of increase in demand. It is conceivable, therefore, that the end of the Third Plan, the gap between demand and supply may be about two million tonnes per annum. The industry has read with much interest Press report about Government having under consideration a proposal to remove or relax the control on ex-Works cement prices allowed to the producers. Details of this proposal are not yet known but it is hoped that Government will see fit to accord this much needed relief to the industry which would then be better placed to find resources for its future expansions. The industry will watch with interest the progress of the Cement Corporation of India which the Government of India have decided to establish for increasing cement manufacturing capacity in the public sector. The industry hopes it will be allowed to benefit from the limestone prospecting efforts of the Corporation, which as reported, will be one of its principal tasks. Manufacture of blast furnace slag cement has registered some expansion, but, so far, manufacture of blended cements by admixture of fly ash and other pozzolanas has not made much headway. I hope the Government will take more energetic steps in regard to the latter to mitigate the present scarcity.

5. Mainly due to better supply of coal and better rail transport facilities, the capacity utilisation of the cement industry in 1963 at 92.5 per cent was the highest during the past decade. The incentive given by Government to the industry last year to increase production, contributed to this to some extent. If the incentive is continued, it would be desirable that the incentive formula for higher production of cement from year to year should be linked with the average of the last three years' production and not, as was done last year, to the highest production achieved by a factory during any one year of the preceding three years.

6. The formula adopted by the Government of India for computing the quarterly packing charges resulted in 1963 in a loss of Rs. 3.27 lakhs to your Company. Despite belated revision of the ratio of second-hand to new bags from 1:1 to 1:2, the loss still persists as the price of new and second-hand bags in Government's formula for fixing packing charges are not in line with the actual procurement prices. Whereas the formula assumes that the price of second-hand bags is 65 per cent of that of the new bags, the actual ratio may be 85 per cent. It is hoped that the Government, while computing packing charges in future, would take a more realistic view and give due regard to the factual position as represented by the industry.

7. Since last year, the position of the raising and distribution of coal has improved further, and, by and large, the cement industry is happily placed in regard to the procurement of its coal requirements. The Government have, therefore, decided that further conversion from coal firing to oil firing in cement factories situated at long distances from the Bengal-Bihar coalfields was not necessary, and your Company's proposal to resort to oil firing has been dropped. Movement of Bengal-Bihar coal by the rail-cum-sea route to certain industrial consumers in Western India has been discontinued. The bottleneck of transport from the Bengal-Bihar Collieries via Waltair to the South, however, persists and your Company and certain other consumers of Bengal-Bihar coal are still compelled to obtain their supplies by the rail-cum-sea route. Though the coal subsidy is intended to equate, approximately, the cost of sea-borne coal with coal carried by the all-rail route, the subsidy actually paid leaves a substantial shortfall which has not been remedied so far despite your Company and others representing about this shortfall to the Government of India ever since the announcement of the subsidy formula in August, 1961. In your Company's case, for the coal received via Cuddalore Port, the short-fall ranged from Rs. 7.45 to Rs. 12.17 per tonne. The present shortfall is Rs. 9.54 per tonne which works out to about Rs. 6 lakhs per annum.

8. Among the important items contributing to the shortfall in the coal subsidy are inadequate allowance for railway freight and handling charges. In the case of your Company, the element of railway freight from collieries to Calcutta Docks allowed in the formula left a shortfall of Rs. 0.70 per tonne in 1961, which has now risen to Rs. 3.50 per tonne. Similarly, the shortfall of Rs. 0.84 in 1961 in the element for freight from the port of unloading to the consuming centre rose to Rs. 2.41 in April, 1964. As against the provision of only Re. 0.20 per tonne for shipping and handling charges at Calcutta Port, actual expenses vary from Rs. 2 to Rs 5 per tonne. While representations have been made to Government for full compensation for the railway freight and other charges in the subsidy formula, it is regrettable that no increase has so far been granted even to cover the increases in the railway freight structure effected by Government itself. Presently your Company loses about 5 per cent in unloading and handling at Cuddalore Port which aggregates to about 3,000 tonnes per annum and is equivalent to about Rs. 2.40 lakhs. As this loss is due to the compulsion under which your Company has to take supplies by the rail-cum-sea route, Government has been requested to compensate adequately for it. There is no provision in the ex-Works retention price allowed to the cement producers for the substantial shortfall in the coal subsidy as the cost of production was computed by the Tariff Commission on the assumption that under the subsidy scheme, coal moved by the sea-cum-rail route would be made available to the consumers more or less at the same rate as if it had moved by the all rail route. I hope the Government will make good this serious inadequacy in the subsidy, retrospectively, which discriminates unfavourably against those consumers, such as your Company, who are compelled to take Bengal-Bihar coal by the sea-cum-rail route.

9. There are indications of recovery from world-wide recession in the steel industry, referred to by me last year. Certain experts estimate the steel production to rise to 1200 million tons in 1991 against 400 million tons in 1961, for which the 1961 iron ore production of 500 million tons will have to be trebled during the same period of 30 years. On this basis, it is being planned to raise India's annual iron ore exports to 30 million tons by 1970 from 16 million tons targetted for the end of the Third Plan. There is, however, severe competition for iron ore in the International Markets, as a result of which in 1963, the Minerals & Metals Trading Corporation of India Ltd. had to concede reduction of Sh. 7 in the price of the basic grade iron ores to be supplied to Japan. This competition is likely to continue for some time and it is heartening to note that Minerals & Metals Trading Corporation of India Ltd. is actively seized with the need of reducing

the end-costs of Indian ores to their foreign buyers. Among the measures planned are more mechanisation of mines, rationalisation of transport and development of Indian ports. I am happy to say that the Government of India has recently approved a Scheme costing about Rs. 1.5 crores for developing Cuddalore Port through which your Company's ore is being exported. I request the authorities to plan and execute this development speedily and in such a manner as would enable progressively higher loading rates being achieved without having to wait for the completion of the work.

10. Your Company realises the need of reducing mining and transport costs for its Iron Ore and is now finalising plans for laying a ropeway from the mines to the rail-head and for introducing a substantial degree of mechanisation in the mining. We hope, in this manner to further in some small degree the Minerals & Metals Trading Corporaiotn of India Ltd.'s efforts to reduce their procurement cost of high grade Iron ore. We also hope that we will have their sustained support, which is so necessary, in the formulation and implementation of these plans.

11. Since last year, there has been a further recession in the dead-burnt magnesite industry, which is reflected in the results of Messrs. Dalmia Magnesite Corporation, in which your Company is a partner. This is due to steel production having fallen short of the Third Five-Year Plan target while the dead-burnt magnesite industry increased its capacity in anticipation of the steel target being achieved. This difficult position is likely to continue until 1967-68 when the Third Five-Year Plan target of 10 million tons of steel production may be achieved. Even, if the target under consideration of 18 million tons of steel production for 1970-71 is reached, the increase in consumption of dead-burnt magnesite by the steel industry may be comparatively negligible as improvements in the quality of indigenous refractories and steel making techniques are reducing considerably consumption of refractories per tonne of steel production and as in new steel making processes, such as the LD process which will mainly be adopted for further expansions of India's steel industry, use of conventional refractories including basic will be replaced to a great extent by tarred Dolomite. Moreover, as the Dead-burnt Magnesite Industry can increase its capacity within about 1/3rd of the time required by the steel industry, I would earnestly urge the Government to defer for the time being any proposals for expansion in Dead-burnt Magnesite Industry, including the reported setting up of a Dead-burnt Magnesite plant in the public sector based on the Almora deposits of raw magnesite, until future consumption trends of Dead-burnt magnesite justify such expansion.

12. Efforts to export dead-burnt magnesite from India have not met with much success due to severe competition, both in terms of price and quality, from foreign manufacturers and particularly the producers of sea-water magnesite, and to very unfavourable freight rates applied to cargoes from Indian ports. We hope Government will be able to reduce the discriminatory freight rates and extend special export incentives to the industry to increase foreign exchange earnings and to enable the industry to utilise its idle capacity. Dalmia Magnesite Corporation, nevertheless, continue to make strenuous efforts to export.

13. The Scheme for conversion of the Deferred shares of the Company into Ordinary shares has been sanctioned by the Madras High Court and will take effect from the date to be fixed by your Board for this purpose. The implementation of the Scheme had been kept in abeyance on account of the apprehension that Capital Gains Tax might be attracted in the hands of the shareholders since the Central Board of Revenue had taken the view that the conversion amounted to a transfer and thus attracted the incidence of the said tax. I understand that there has been some rethinking on the part of the Government of India on this question and that it has now been decided that no tax should be levied at the time of conversion of shares of one class into another. As a result, Capital Gains Tax would be levied only when the converted shares are disposed of. As soon as this position is confirmed by the Government, the Scheme would be implemented and I expect that this would be done in the course of this year.

14. I am happy to report that the relations between the management and the employees of the Company continue to be cordial. I would like also to congratulate Shri M. Palaniandi, President of the Dalmia Cement National Workers' Union, Dalmiapuram, on his selection by the National Productivity Council for training in Industrial Relations in the United States of America. In the end, I wish to express our appreciation of the sincere and devoted services rendered to the Company by all the executives, staff and workers.

JAI HIND

N.B. : This does not purport to be a report of the proceedings of the General Meeting.

VISADEX
THE DASHBOARD OF BUSINESS

Work the VISADEX way to get the best out of your men, machines and materials.

VISADEX can tell you what you need to know at a glance. VISADEX offers you a fluent indexing system by which records are kept on cards, while colour signals spotlight what things are in stock or needed, whether production is ahead of or behind schedule, sales are increasing or decreasing, where to intensify advertising, which department requires more personnel, who owes you and how much . . . VISADEX, in short, affords greater control at less cost, besides keeping records secure.

Our VISADEX Representative will be happy to show you, without obligation, how simple VISADEX is to operate—either with Card Pockets or Brass Card-holders—and how easily it can meet your specific requirements.

RECORDS AND STATISTICS

A Chronology of Nehru's Life

1889	Born in Allahabad (November 14).
1905	Left for England to join Harrow (May).
1907	Entered Trinity College Cambridge.
1909	Visited Germany and France.
1910	Took his degree with Honours in the Natural Sciences Tripos (Chemistry, Geology and Botany).
1912	Barrister-at-law, Inner Temple. Returned to India. Started practice at Allahabad High Court. Attended the Bankipore session of the Congress as a delegate.
1913	Joined the United Provinces' Congress organisation.
1915	Delivered first public speech in Allahabad at a protest meeting against a new Act muzzling the press.
1916	Married Kamla Kaul (February). First meeting with Gandhiji at the Lucknow Congress.
1917	Joined the Home Rule movement. Daughter Indira was born (November 19)..
1918	Became member of the All India Congress Committee.
1919	Assisted C. R. Das in the inquiry into the Punjab disturbances.
1921	Imprisoned for the first time for distributing notices of hartal in connection with the visit of Prince of Wales (December 6).
1922	Released from jail (March 3). Imprisoned again for 'Intimidating' dealers of foreign cloth (May 11).
1923	Released (January 31). Imprisoned in Nabha jail for defying Resident's order asking him to leave the State (September 22). Released (October 4). Elected Chairman of the Allahabad Municipal Committee. Appointed General Secretary of the Indian National Congress at Cocoanada Session (again in 1924-1925; 1927-1929).
1925	Resigned from the Chairmanship of Allahabad Municipality. Kamla fell seriously ill.
1926	Took Kamla to Switzerland for treatment (March). Visited Italy, France, Germany Belgium and Russia.
1927	Attended the Congress of Oppressed Nationalities in Brussels as official delegate of the Indian National Congress (February). Returned from Europe and was instrumental in committing the Indian National Congress for the goal of independence at the Madras session (October).
1928	Was lathi-charged while leading a procession against the Simon Commission in Lucknow (November 29). Founded Independence for India League, which advocated complete severance of the British connection, and was its General Secretary.
1929	Got the All-India Congress Committee to accept the D.P.C.C.'s Socialist programme. Presided over Lahore session of the Congress where Congress goal was changed to complete independence. Presided over a Nagpur session of the All-India Trade Union Congress. Raised funds for defending the prisoners of Meerut Conspiracy Case. Published **Letters from a Father to His Daughter.** Arrested and sentenced to six months' imprisonment for participation in the Salt Satyagraha (April 14). Released from Naini Central Prison (October 11). Re-arrested for participating in a peasant conference at Allahabad and sentenced to two years' rigorous imprisonment (October 29).
1931	Released from jail (January 26). Father Motilal Nehru died (February 6). Arrested for defying order prohibiting him from leaving Allahabad; sentenced to two years' rigorous imprisonment (December 26).
1933	Discharged from jail on account of mother's illness (August 30).
1934	Toured earthquake-stricken Bihar and organised relief for sufferers (January). Arrested at Allahabad for his 'seditious' speech at Calcutta and sentenced to two years' imprisonment (February 16). Released to visit Kamala Nehru who had taken seriously ill (August 11) but re-arrested ten days later for making anti-Government speeches. Published **Glimpses of World History.**
1935	Completed his **Autobiography** in Almora District Jail (Febraury 14). Released because of Kamla Nehru's critical condition (September 4) and flew to Europe to be with her.
1936	Kamla Nehru expired (February 28). Visited London and Rome also. Presided over the 49th session of the Congress held at Lucknow (April 23). Agreed to the Congress contesting the elections under the Government of India Act 1935 but opposed acceptance of office. Formed and drafted provisional constitution of the Indian Civil Liberties Union and took active interest in its work (June 2). Toured the country extensively on an election campaign. Presided over the Indian National Congress session at Faizpur (December 26).
1938	Mother Swarup Rani died. Became Chairman of the National Planning Committee. Visited Spain during the Civil War.
1939	Visited China.
1940	Arrested during the individual Satyagraha Movement (October 31) and sentenced to four years' rigorous imprisonment.
1941	Released from jail (December).
1942	Discussions with Chiang Kai-shek in India. Participated in the negotiations started by Stafford Cripps for settlement with India. Moved the famous 'Quit India' resolution at the AICC. Arrested along with Gandhiji and Members of the Congress Working Committee, and taken to Ahmednagar Fort (August 8).

1944 Started writing 'Discovery of India' (April 13).

1945 Released from jail (January 15). Participated in the Simla talks for settlement with the British Government (June 25). Organised legal defence for officers and men of the INA.

1946 Published **'Discovery of India'** (March). Toured South-East Asia. Elected Congress President for the fourth time (May 9). Accepted Viceroy's invitation to form an Interim Government (August 17), sworn in as Vice-President and Member in-charge of External Affairs (September 2). Visited NWFP (October). Visited London to discuss with the British Government certain interpretations of the Cabinet Mission Plan (December). Moved the Objective Resolution in the Constituent Assembly (Dec. 30).

1947 Presided over the Indian Science Congress at Delhi (January 3) Inaugurated the Asian Relations Conference in New Delhi (March 23). Became Independent India's first Prime Minister (August 15). Visited riot affected areas in the Punjab with Liaqat Ali Khan and Sardar Patel (August 31).

1948 Propounded in the Constituent Assembly India's new foreign policy based on non-alignment, freedom to judge all issues on merit (February 17). Laid the foundation stone of the Hirakud Dam (April 12). Inaugurated the third session of the United Nations Economic Commission of Asia and the Far East at Ootacamund (June 2). Addressed the first meeting of the Atomic Energy Commission (August 20). Inaugurated the first meeting of the Regional Committee of the WHO for South-East Asia (October 4). Attended the Commonwealth Prime Ministers' Conference in London, which led to the continued membership of the Republican India in the Commonwealth (October 6). Addressed the special session of the General Assembly at the United Nations in Paris (November 3). Inaugurated the Asian Regional Conference of the International Meteorological Organisation at New Delhi (November 10). Inaugurated the Silver Jubilee session of the Indian Historical Records Commission in New Delhi (December 23).

1949 Inaugurated the 19-Nation Asian Conference to condemn the Dutch aggression on Indonesia (January 20). Attended the Commonwealth Prime Ministers' Conference (April 19). Called on Pakistan to join India in a "No War" declaration (September 24). Left India on an official visit to the USA (October 7), addressed the US Congress, also addressed the Trusteeship Committee of the U.N. General Assembly (October 19). Visited Canada and addressed both Houses of the Parliament at Ottawa (October 24). Awarded American Spirgarn Medal for services in the Negro cause (Nov. 6).

1950 Addressed the annual convocation of the University of Ceylon, Colombo (January 12). Laid the foundation stone of the National Stadium, New Delhi (January 19). Inaugurated the Supreme Court of India (January 28). Planning Commission, with Nehru as its Chairman, set up (March). Received the Prime Minister of Pakistan and signed the Nehru-Liaqat Ali Agreement on minorities. Inaugurated the Indian Council for Cultural Relations in New Delhi (April 9). Visited Karachi at the invitation of Pakistan Government (April 26). Issued an Appeal to the Big Three calling for a speedy end to the Korean war (July 14). Laid the foundation stone of the Sapru House, New Delhi (October 20).

1951 Visited Cairo, Geneva, London and Paris. Official visit to Nepal (June 11). Elected President of All India Congress (September 9) and presided over the 57th session of Congress at Delhi (October 18).

1951 Addressed International Statistical Conference at New Delhi (December 5). Performed opening ceremony of Salar Jung Museum, Hyderabad (December 16)

1952 Signed Indo-Syrian Treaty (February 25). Inaugurated the Silver Jubilee Session of the Federation of the Indian Chambers of Commerce and Industry at New Delhi (March 29). Participated in the International Buddhist Conference held at Sanchi.

1953 Participated in the World Gandhian Seminar held in New Delhi (January 9). Presided over the Hyderabad Session of the Indian National Congress (January 17-18). Attended Coronation of Queen Elizabeth II (May 28). Visited Karachi at the invitation of Government of Pakistan (July 25). Inaugurated Nationalised Air Corporation (August 1). Opened the deliberations of the Consultative Committee of the Colombo Plan at New Delhi (October 13).

1954 Received Sir John Kotelawala, Prime Minister of Ceylon (January 15). Inaugurated the Institute of Public Administration in New Delhi (March 29). Paid a week's visit to Ceylon (April 27-May 3). Received Chinese Premier, Mr. Chou En-lai (June 25). Issued a joint statement embodying the Five Principles of Co-existence, Panchsheel (June 25). Visited China (October). Received President Tito of Yugoslavia (December 17). Visited Burma, Thailand, Indonesia and Malaya.

1955 Received in New Delhi the U.N. Secretary-General, Dag Hammarskjoeld (January 3). Attended the Commonwealth Prime Ministers' Conference and called on Queen Elizabeth (January-February). Received Prince Norodom Sihanouk and Mr. Leng Ngeth, Prime Minister of Cambodia (March 17). Welcomed to India Mr. U Nu, Burmese Prime Minister (March 25). Met Egyptian Premier Nasser and his party (April 13). Attended Afro-Asian Conference at Bandung (April 15-25). Received Emir Faisal, Prime Minister of Saudi Arabia in New Delhi (May 2). Laid foundation stone of National Museum in New Delhi (May 12). Held talks with Pakistan Prime Minister, Mohammed Ali and Interior Minister, Major General Iskander Mirza (May 13-18). Left on a tour of the Soviet Union, Yugoslavia, Poland, Czechoslovakia, Austria, Italy and Egypt (June 5) and conferred with Premier Nasser of Egypt at Cairo. 'Bharat Ratna' conferred (July 15). Met President Sukarno (July 19). Signed joint statement with the Crown Prince and the Prime Minister of Laos emphasising the need for implementation of the Geneva Agreement on Laos (Sep 21). Inaugurated Hindusthan Machine Tools Factory at Bangalore (October 6). Welcomed to India

the Russian Prime Minister, Marshal Bulganin and the then First Secretary of the Russian Communist Party, N. Khrushchev (November 18). Welcomed King Saud of Saudi Arabia to India (November 28). Laid foundation stone of Nagarjunasagar Project (December 10).

1956 Had meetings with Selwyn Lloyd, the British Foreign Secretary, John Foster Dulles, the U.S. Secretary of State, the French Foreign Minister, Christian Pineau, and First Deputy Prime Minister of Soviet Russia, Mr. Mikoyan (March). Signed an agreement with Canada for the establishment of atomic reactor in Bombay (April 28). Attended the Commonwealth Premiers' conference in London (June 27-July 6) and later visited Ireland, West Germany, France, Yugoslavia, Greece, Egypt, Syria and the Lebanon. Held discussions with President Nasser and President Tito in Brioni (July 18-20). Temporarily took over the Finance portfolio (July 23). Sounded a warning against the use of force in solving the Suez Canal question (July 23) and sent a message to U.N. Secretary-General urging swift U.N. action against Anglo-French Israeli aggression against Egypt (October 31). Involved in a jeep accident near Anjar (Saurashtra) (August 18). Addressed the delegates to the Ninth UNESCO conference in Delhi (Nov. 5). Participated in the Colombo powers Prime Ministers' conference in New Delhi on Egyptian situation (November 12-14). Discussed in New Delhi with Chinese Premier Chou En-lai the border dispute between the two Governments and Chou En-lai accepted the formalisation of McMahon Line (November 28). Visited U.S.A., Canada and Europe (December). Addressed an informal meeting of the members of the U.N. General Assembly (December 20). Held talks with Chou En-lai during the latter's visit (December 30, '56 — January 2, '57).

1957 Visited Nalanda with Dalai Lama and Panchen Lama for final ceremonies of the 2500th anniversary of the Buddha's Mahaparinirvana (Jan. 12). Inaugurated Hirakud Project in Orissa (Jan. 13). Opened Asia's first reactor in Trombay (Jan. 28). Held talks with Syrian President, Shukri Al-Kuwatli (January 17-19). Received Marshal Zhukov, Soviet Defence Minister (January 25). Temporarily took over Defence Portfolio (Jan. 30). New Central Cabinet headed by Nehru sworn in (April 17). Left on goodwill visit to Syria, Denmark, Finland, Norway and Sweden (June). Attended Commonwealth Prime Ministers' Conference (June 6 to July 5). Visited Holland, Egypt and Sudan (July). Attended Bhoodan Conference on September 20-21 at Yelwal. Visited Japan (October 4-13). Addressed Commonwealth Parliamentary Conference in New Delhi (December 2).

1958 Held talks with Prime Minister of Czechoslovakia Mr. William Siroky (January 3-5). Held discussions with President Soekarno of Indonesia (January 7-8), and with Harold Macmillan, the British Prime Minister (January 8-10). Issued joint statement with King Zahir Shah of Afghanistan for a high level meeting to relax international tension (February 13) and later similar statement with Prime Minister of Rumania Mr. Chivu Stoica (March 10). Expressed desire to retire from Prime Ministership but bowed to unanimous desire of members of party to continue (May 3). Visited Bhutan (Sep. 16 to Oct. 2). Opened "India 1958" exhibition (October 8). Inaugurated joint meeting of the World Bank, the International Monetary Fund and the International Finance Corporation (October).

1959 Received Prime Minister of Ghana Mr. K. Nkrumah. Inaugurated International Congress of Jurists (Jan. 5). Commended socialist way to progress at Nagpur Session of Congress and reaffirmed India's faith in the Panchsheel (Jan. 9). Held discussion with East German Prime Minister, Otto Grotewohl and President Tito of Yugoslavia (January 12-15). Addressed Golden Jubilee Session of the Institute of Science at Bangalore (February 4). Held talks with Sardar Mohd. Daud Khan, Prime Minister of Afghanistan (February 5). Laid foundation of Indian Institute of Technology (March 10). Met Dalai Lama at Mussoorie (April 24). Visited Nepal (July 11-15). Inaugurated Truck Manufacturing Unit of Gun Carriage Factory, Jubbalpur (July 21). Held discussions with President Ayub Khan of Pakistan on Indo-Pakistan relations. Visited Afghanistan (September). Discussed with Burmese Premier Ne Win relations of India and Burma with China.

1960 Met Mr. Chou En-lai in New Delhi and decided to get the respective view points examined at official level, making every effort to avoid friction (April). Attended the Commonwealth Prime Ministers' Conference in London and visited Paris, Egypt, Turkey and Lebanon (May). Signed the Indus Water Treaty with Pakistan (September 19). Attended the U.N. 'Summit' General Assembly Session as leader of Indian delegation (September-October) and urged renewal of contacts between USA and USSR. Inaugurated Kundah Hydro-Electric Project, Madras State. Inaugurated States of Maharashtra and Gujarat. Visited Paris. Condemned Sharpeville and Langa massacres in South Africa. Visited Egypt, Turkey, Lebanon, Syria and West Pakistan. Held talks with Field Marshal Ayub Khan. Addressed U.N. General Assembly stressing the need for world peace.

1961 Inaugurated formally the Canada-Indian nuclear reactor at Bombay (January 16). Said at a news conference in New Delhi that India was definite that China had committed aggression on India's northern borders, and it was wrong on the part of Pakistan to agree to discuss with China the question of demarcating Kashmir border (January 18). Inaugurated WHO Session in New Delhi (February 7). Held talks with Maharaja of Bhutan (February 8-13). Attended the Commonwealth Prime Ministers' Conference (March). Attended the summit meeting of the non-aligned nations at Belgrade (September). Inaugurated the first Asian History Congress in New Delhi (December 9). Inaugurated Bhakra Power House in Punjab (December 10). Met the Paramount Ruler of Malaya (December 8) and President Brezhnev of Russia (December 13).

1962 Inaugurated Noonmati Oil Refinery in Assam (January 1). Inaugurated the 49th Session of the Indian Science Congress (January 3). Met Burmese Premier U Nu (January 11). Inaugurated Commonwealth Education Conference

(January 11). Pressed into service the first India made Nissan Patrol Vehicle (January 24). Met President Kampmann of Denmark (January 18) and Vice-President Amer of UAR (January 24). Invited to form new Government after the Third General Elections and the new Cabinet sworn in (April 10). Met King Mahendra of Nepal (April 18). Presided over the National Integration Council meeting (June 2 and 3). Visited Paris and Cairo after attending Commonwealth Prime Ministers' Conference (September). Addressed UNESCO in Paris (September 21). Received President of the Council of the State of the Rumanian People's Republic (October 17). Gave a call to the nation to meet Chinese aggression unitedly (October 22). Wrote to Chinese Premier that India could not agree when actual and new aggression was taking place and called upon China to restore status quo as it was prior to September 8, 1962 (October 27). Sent messages to various Heads of Governments on the situation created by renewed armed aggression of Chinese forces on Indian territory launched on September 8 (Oct. 26-27). Received Tengku Abdul Rahman, the Malayan Prime Minister (October 27). Received President of Cyprus, Archbishop Makarios (October 31). Took over Defence portfolio temporarily (November 1). Issued joint statement with President Ayub Khan of Pakistan reaffirming determination to resolve their differences (Nov. 30).

1963 Had talks with Ceylonese Premier Mrs. Bandaranaike, Mr. Ali Sabry of UAR and Mr. Asante Ofori-Atta of Ghana on Colombo proposals on Sino-Indian dispute (Jan. 10-13). Moved resolution in Lok Sabha for acceptance of Colombo proposals (Jan. 23). Inaugurated Village Volunteer Force (Jan. 26). Received Lebanese Premier Mr. Rashid Karame (Jan. 15) and Prince Sihanouk of Cambodia (Jan. 28). Opened Ladakh Vihara near Delhi (Feb.). Commissioned 'Lokmanya', first electric loco (Feb.). UN accepted Nehru's proposal to make 1965 as Year of Co-operation (Oct.). Dedicated Bhakra Dam to the nation (Oct.) Inaugurated Pinjore Plant (Oct.) Met Laotian Premier in Delhi (Nov.) Inaugurated Conference of envoys to African countries (Nov.) Commissioned first AC Electric Loco at Chittranjan (Nov.). King Hussain of Jordan met Nehru (Dec.)

1964 Laid foundation-stone of Orissa's Tikkarpara Dam project (Jan.) Taken ill during the Bhubaneswar Session of the Congress (Jan.) General Ne Win, Chairman of the Burmese Revolutionary Council, met Nehru (Feb.) Prime Minister of Singapore, Mr. Lee Kuan Yew met Nehru (Feb.). Met King Mahendra of Nepal on the occasion of foundation-stone laying ceremony of the Kosi and Gandak projects (May). Met Sudanese President Farik Ibrahim Abboud (May). Visited Dehra Dun for rest (May 23-26). Light went out (May 27).

The Task Ahead

BROADCASTING TO the nation last Thursday, the Prime Minister made pleas as well as promises. He exhorted his countrymen to rededicate themselves along with him to the aims and ideals of Jawaharlal Nehru and take a pledge to build a socialist democracy at home with freedom for all and maintain world peace and friendship with all nations abroad. Pointing out that the real source of strength for the Government was the willing co-operation of the people, he appealed for unity and solidarity and pleaded that sectional sentiments or interests should be subordinated to the need for differences being resolved within the unalterable framework of one nation and one country. The Prime Minister then went on to promise on behalf of the Government that it would carry forward the work of national integration started with the conference of 1961. Striking a personal note, he took a pledge to discharge the responsibilities of his office through reliance on methods of persuasion and mutual accommodation and constant search for areas of agreement as basis for action. Spelling out the priorities that his administration would have to deal with, he said that of all the problems facing the country, none was more distressing than that of the dire poverty in which tens of millions of our countrymen continued to live.

The Prime Minister spoke movingly, in particular, of the centuries of neglect which had been the portion of the most backward sections of the community, such as the scheduled castes and scheduled tribes. He pointed out that the establishment of a more just social order was thus an imperative. At the same time, the country had been compelled to bear the burden of building up its defences. The defence effort had to go on but Mr. Lal Bahadur said that, at the same time, his Government was determined to ensure that the development of the economy did not fall in arrears. Next, the Prime Minister asked himself the question how the quality and vigour of the development effort could be improved upon. In his view, the prime consideration here would be the efficiency and integration of the administration. He undertook to have systematic attention paid to the problem of administrative reform in its various aspects. Here the Prime Minister stressed that the objective of administrative reorganization should be recognized to be a two-fold one. There was the need, undoubtedly to modernize administrative methods and processes so that they become an effective instrument of economic change. But that alone would not be enough. It was essential in a democracy for the public services not only to function competently but also in a spirit of service, sympathy and humanity.

Turning to foreign affairs, Mr. Lal Bahadur reiterated that Indian policy would continue to be the development of friendly relations with all countries irrespective of differences in ideologies or political systems. Non-alignment, he emphasized, would remain the fundamental basis of our approach to world problems and in our relations to foreign countries. The Prime Minister promised that his Government would address itself particularly to the building up of co-operative relations with neighbouring countries. Permitting himself an understatement, he said that "we have problems with some of them", and suggested that those problems ought to be settled peacefully on an honourable basis. Then came some wise references to the unfortunate state of relations between Pakistan and this country. Striking an optimistic note, the Prime Minister welcomed the recent broadcast of President Ayub Khan as timely and helpful and said with robust faith that, with patient striving on both sides, the tide of ill-feeling and antagonism between the two countries could be

reversed. Mr. Lal Bahadur's remarks on China also showed a similar desire for a peaceful settlement of disputes, but there was a difference in nuances in that he did not mince words and once again placed on record this country's deep resentment over the premeditated aggression committed against it.

Fanning into a wider world, the Prime Minister's subsequent observations on foreign policy reaffirmed support for the United Nations as "the only hope of the world for bringing peace and freedom to humanity". Stressing the obligations of the United Nations for the promotion of the freedom of dependent nations, Mr. Lal Bahadur recalled the record of this country's activities in this cause. He said with pride that Jawaharlal Nehru was one of the founders of the Afro-Asian movement, the aim of which was to work for the freedom of the peoples of Asia and Africa and assist them in securing economic growth and higher living standards. India, he said, would continue to participate in this Afro-Asian effort and he appealed for the solidarity of Afro-Asian nations assuring them that India sought no leadership of the group but was only concerned to be a collaborator with the sister nations of Africa and Asia in this still unfinished struggle for the eradication of colonialism from those parts of the world where large sections of peoples are still being denied freedom or fundamental rights. Finally, recalling President Johnson's words that a world without war would be a most fitting memorial to Jawaharlal Nehru, the Prime Minister said that his Government would work in the United Nations and elsewhere for the achievement of disarmament and world peace.

It may be a fair criticism of the Prime Minister's broadcast that it had nothing new in it, but it will not be a relevant criticism considering that the object of Mr. Lal Bahadur apparently has been to make it clear as Prime Minister what he had been saying earlier as Prime Minister-designate that the policies of the new Government, whether at home or abroad, would be the policies of Jawaharlal Nehru and that his own endeavour would only extend to ensuring that those policies were implemented faster and more effectively. It cannot be denied that this theme of "business as usual" has been stated with candour and conviction in the Prime Minister's broadcast to the nation. It follows that it would be more useful to examine anew whether the policies by which the new Prime Minister has sworn are really good enough for our present purposes and future needs than to protest that those policies are not new.

Thus, Mr. Lal Bahadur has, for instance, pointed to the urgent problem of poverty. This problem had been recognized at least 17 years ago and three five-year Plans have been appealed to in the hope that they would make some difference to the vicious vastness of Indian poverty. That some difference has, in fact, been effected is not to be denied, but it has to be admitted too that the improvement has been all too small. The question is whether the doctrine of "business as usual" would be of much use in a situation of this kind. It is not enough to feel deeply about poverty. Poverty clearly cannot be talked out or sighed away. The only way to deal with poverty is to try to diminish it, if not destroy it. It is clearly Mr. Lal Bahadur's next obligation to the country to spell out in what ways he proposes to make our planning against poverty more effective than it has been so far.

The Prime Minister spoke of a new social order and of the right that is of every citizen to share in the wealth of the nation. These are admirable sentiments. But we wish the Prime Minister had not stopped there. The poverty of the Indian people is essentially the poverty of the Indian economy. This poverty can be dealt with only through increased production and increased investment. The Prime Minister has been expressing distress over poverty, unemployment and high prices. But this expression of dissatisfaction cannot lead to positive and constructive action unless it is understood very clearly that the misfortunes which Mr. Lal Bahadur laments are but the symptoms of the basic disease of low production and low investment. In the last 15 years or so, the Government had been following certain policies and adopting certain approaches for increasing production or stepping up investment. This effort, as we have said, has had some success but not sufficient success. It is, therefore, not enough for the Prime Minister to deplore poverty or unemployment. He must proceed from there to ask himself how and in what ways the old assumptions would have to be altered or old policies improved so that better results could be achieved in the future. The central fact in the national economic situation today is that not enough investment has been permitted in the private sector while not enough production has been secured in the public sector. Unless, therefore, the new Government has the sense and the strength to opt for a new economic policy, the poverty which the Prime Minister deplores will merely continue to be the emotive theme of many more broadcasts to come. In this matter, it is certainly not enough to say that Jawaharlal Nehru had charted the course and that we, in duty bound, must stick to it. That would be betraying the Man while making a fetish of his memory. True loyalty would demand that the aim should be won, not that the means should be worshipped.

Mr. Lal Bahadur has displayed an admirable enthusiasm for reform in the administration. We are glad to note that here he has moved away from the somewhat sterile conception of the Home Minister to whom the negative aspect of punishing corruption seems to have come to mean more than the positive aspect of raising the quality or speeding up the pace of administrative processes. Mr. Lal Bahadur is right, again, in laying the stress on systematic effort being made to mend or modernize administrative procedures and processes. It might be tempting to imagine that some magic formula could be invented to do away with the inertia or inaptitude of the bureaucratic machinery. The sober truth, however, is that it is only through continuous attention to the particulars as well as to the principles that the tone and temper of the administration can be improved. It is, therefore, easy to agree with Mr. Lal Bahadur on the need for a systematic approach and possible to feel reassured by his promise to address himself to the major problems of administrative reform.

There is, however, still a need to indicate the limitations of the Prime Minister's approach as well. Mr. Lal Bahadur has said that administration should be increasingly competent and considerate. We are afraid, however, that this would be asking for too much so long as the government continues to be incapable of setting a limit to the variety of demands it chooses to make on the public services. Mr. Nanda has failed to realize that corruption is largely a consequence of the government machinery being continuously asked to do more and more and permitted simultaneously to do it more and more arbitrarily. This is unfortunate, but it would be a tragedy if the Prime Minister on his part were to fail to sense that, in these circumstances, it would be equally unrealistic to expect the administration to be competent or considerate either. Administrative reform is, no doubt, useful in its place, but as the fate of the interim recommendations of the Swaminathan Committee has shown, sound advice may be given to the Government and accepted by it and yet that advice could and does get lost in the inherent complexities of an over-burdened and over-stretched administration. Mr. Nanda condemns government servants as sinners, actual or potential; Mr. Lal Bahadur apparently assumes that all government servants are saints, actual or potential. It is possible that both may be wrong. Government employees, like everybody else, are ordinary human beings, apt to tire of work which is too much or too complicated, rebel against responsibilities which strain their temper or character and be cynical about authority too easily given and capable of being too lightly wielded.

The Prime Minister, in other words, ought to realize that the problems of administrative reform are not simply problems of routing or re-routing of files. It is essentially an exercise in determining how much, in a given milieu, the machinery of Government may be expected to do and how well. It is above all a matter of judgment, of refraining from asking the administration to carry out functions which it cannot carry out or cannot carry out well enough, while seeing to it that it does the things which it alone can do or which it can do better than other agencies. Despite the worst tyrannies in history of the totalitarian concept of society, the community has always been larger than the government and no administration can really maintain its integrity as Mr. Nanda expects it to or display competence and humanity as Mr. Lal Bahadur wants it to, once it becomes the policy of the State to displace progressively non-government agencies from the economic and other activities of the community. The Prime Minister ought first to make up his mind what he wants the administration to do, and how much before he could hope that it would do it well.

The Prime Minister's declaration of intentions to seek improved relations with some of our "problem neighbours" may be unreservedly welcome. In the matter of Indo-Chinese relations, however, it is Peking which is in the position of calling the tune. The Prime Minister has thrown out a hint that if China is keen on an improvement of relations with this country the least it might do would be to stop promptly its anti-Indian propaganda among the Afro-Asian countries. It should be interesting to know how Mr. Chou En-lai who has been sending friendly, if formal, messages to this country on recent occasions would react to this suggestion. As for India and Pakistan, 17 years are too long a period for two countries which are not actu-

Eastern Economist 20 Years Ago

JUNE 16, 1944

Tired of politicians who demand self-government or Pakistan, Delhi is paying more attention to industrial leaders, particularly the authors of the 15-year plan. There is a tendency, indeed, to associate the name of one or the other among the authors with some big appointment. Sir Purshotamdas Thakurdas is being mentioned as the next member for the combined portfolio of Food and Agriculture. It is said that he has been offered the post.

The veteran leader of industrial and commercial opinion will doubtless make an excellent leader of a drive to produce more food and distribute it equitably and efficiently. But many independent observers doubt whether Sir Purshotamdas will care to be in such a role in the present regime. Even though he is no young, he has enough reserves of energy to serve the country, under a National Government. It will be a surprise if he accepts the proposed portfolio. Some quarters suggest that if the Finance portfolio were handed over to one of the authors of the non-official plan, then alone will the offer to Sir Purshotamdas make sense. For the present, the reshuffle of portfolios suggested last week holds the field.

There is no doubt, however, that in the absence of Congress leadership and because of Mr. Jinnah's pre-occupation with bitter domestic disputes in the Muslim League Party, the task of voicing Indian opinion has fallen to industrial leaders. Delhi studied, as it had never done before, the working of the resolution passed last week by the Executive Committee of the Federation of Indian Chambers of Commerce and Industry. Since the meeting took place after Sir Purshotamdas Thakurdas, Mr. G. D. Birla and Mr. J. R. D. Tata had visited Gandhiji, the Committee's resolution is interpreted as the industrial leaders' solution of the political deadlock in the light of their discussion with the Mahatma.

ally at war, to go on quarrelling and being hostile to each other. Sooner or later, the initiative has to be taken on this side of the border or on the other to find a way out of a mutually disagreeable and potentially dangerous situation. That initiative is yet to come. But there is at least now a desire cutting across the frontiers that its coming should not be delayed.

The Prime Minister has claimed that "with most of our neighbours we have friendly and co-operative relations". This may not be an accurate description when applied to the state of affairs with Burma or even Ceylon. There is no point in glossing over the fact that India must reconcile itself to receiving and absorbing in due course a considerable number of refugees or repatriates from Burma or Ceylon. It is difficult to pretend that these prospects would contribute to the promotion of harmony and goodwill between India and those countries. It may, nevertheless, be necessary for this country, by virtue of its history and size, to take a long view of the future of South-East Asia, despite current impositions or provocations, and endeavour to counter distrust with patience and aggressiveness with tolerance. At more than one place in his broadcast, the Prime Minister spoke movingly of the legacy of Jawaharlal Nehru, of this country's dedication to the cause of world peace. Referring to its and its Government's role in the Afro-Asian group, Mr. Lal Bahadur said that the aim would be to cultivate widening areas of peace and understanding. The place to practise this husbandry most sedulously is, obviously, our immediate neighbourhood.

Flogging a Dead Horse

MOVING THE Lok Sabha for a reference of the Gold Control Bill to a joint committee of the two Houses of Parliament, the Minister of State in the Ministry of Finance claimed that the scheme of control was realistic and workable. If the Government could believe this, it could believe anything. This Journal had been one of the first to welcome, in principle, the gold control regulations when they were first introduced. It was pointed out then that the weaning of the people from their traditional habit of putting their savings into gold and gold ornaments was, undoubtedly, a desirable socio-economic objective. That point still remains valid, but at the same time we, as intelligent and responsible men, cannot be blind to the fact that, in political as well as administrative terms, the Government's attempt to control gold has been a complete failure. More important still, there is little likelihood of the implementation of the gold control policy at all becoming more effective in the foreseeable future. In the circumstances it has become the particular obligation of those, such as ourselves, who had welcomed the intentions of gold control to stand up and say candidly and courageously that those intentions have failed to be realized and that they are unlikely to be realized in the foreseeable future.

This is the only honest assessment that is possible of gold control as it has been attempted or is proposed to be continued. If there is any honesty in Government, it too can now come to no other conclusion. It has been pleaded from the beginning that the success of gold control would be determined by the extent to which it is effective in releasing for the use of the economy such of the yellow metal as may be held, in its various forms, as hoards. Here, despite the gold bond scheme, reinforced as it has been by the police measures of the gold control scheme, the amount of non-ornament gold which has been declared has been disappointingly small.

It has been argued that, by discouraging and diminishing transactions in gold and thereby effecting a reduction in the market price of the metal, the gold control scheme would succeed in knocking the profitability out of smuggling and thereby check the leakage of foreign exchange occasioned by the smuggling trade. This hope too has been dashed to the ground. The tempo of smuggling does not seem to have abated significantly. On the contrary, since the market price of gold has not only not gone down, but has, in clandestine dealings, risen very considerably, the scope for and gains of the smuggling trade have actually become even more abundant now than they were before gold control. The third main argument in favour of gold control, again, has fared no better than the other two. There are precious few signs that the people's love of gold has dimmed. On the contrary, the gold control regulations only seem to have whetted the appetite of the public for the yellow metal. It is an open secret that the concession given to self-employed goldsmiths for legally converting old gold ornaments into new ornaments of equal purity is being abused extensively.

There is, therefore, little wisdom at this stage in the Government refusing to concede that its gold control policy has failed and withdraw or abolish the scheme altogether. It is perhaps the argument of the Government that the Gold Control Bill cannot be judged prematurely or in a hurry since the impact and the effects of measures of this kind take time to make themselves felt. It could be contended that the deep-rooted sentiments and prejudices or the ingrained customs or habits of a still largely traditional society cannot be changed overnight. But the complaint is not that there has been no rapid advance in the right direction but that there has actually been a good deal of retreat in the wrong direction. The restrictions on the making of gold ornaments of higher purities seem to have strengthened rather than weakened the desire of people at large for gold ornaments. Rather predictably, the public is being exploited in the circumstances. Deprived of access in a legitimate manner to manufacturers or merchants of repute, people are obliged to resort to self-employed goldsmiths, many of whom are operating on a hand-to-mouth basis in backyards and blind alleys. In doing business with them the public has to make do without any safeguards as to weight or quality and is placed in the unfortunate position of not being able to question the price charged for the gold or the fee charged for making the ornaments. The retort that those who deliberately violate the law cannot expect the law to protect them would be easy enough, but it would be neither fair nor proper. Where an impracticable and feeble law is made to curb a deep-rooted human institution or habit or attitude of mind, the responsibility for the distress or hardship which that law causes cannot be evaded by the law-makers.

It is possible that the Government really believes that the failure attending on the gold control scheme is of a temporary nature and that over a period an adequate administration could be built to secure effective enforcement. We question this easy optimism. The people's (and the Government's) experience of prohibition is there to show that socio-economic reforms which do not have the active support of public opinion or which are undertaken in undue anticipation of changes in mental habits or social values do not improve with age. On the contrary they tend to degenerate and decay as the authorities become cynical and the community contemptuous. We have little doubt that this is the unhappy destiny which is in store for the gold control scheme should the Government stubbornly persist in it. Even in the most favourable circumstances, it would have been difficult to change people's notions of the worth of gold as ornament or as a store of value. With inflation having gathered momentum, it has become virtually impossible to discourage the people from seeking to put their savings into the yellow metal. It must be borne in mind that gold is less of a rich man's plaything than is widely assumed. On the contrary, it clearly functions as one of the most democratic means of owning property. The crux of the gold problem is that gold is scattered in small quantities over millions of people many of whom are really not well-to-do. These small possessions are being added to marginally from time to time by the individual's preference for gold. The gold control scheme has not succeeded in destroying this preference. Nor is it likely that success will come to it in the foreseeable future. Millions of people, not particularly rich, will continue to stick to their small possessions of gold and whatever the obstructions created by law, will continue to endeavour to add to their possessions. In seeking to proceed with the Gold Control Bill the Government consequentially is only flogging a dead horse.

SOCIALIST COMPETITION

Highlights of the Week

UNITY—SOCIALIST STYLE

IN THE political vocabulary of India the phrase "socialist unity" has suddenly acquired the magic of an "open sesame". That it would certainly open the doors of government office to many erstwhile wanderers in the wilderness of Leftist opposition is, of course, true. But it cannot, however, be said that it is the prospects of political employment alone which have led the Asoka Mehta group in the now defunct Praja Socialist Party to resolve at its Lucknow convention last week to join the Congress. The more basic explanation is that, as a separate political party, the PSP has simply failed to click. Once the Congress, at its famous Avadi session, had accepted as its goal a socialist pattern of society, the PSP leaders promptly got reduced from being men with a mission to being boys carrying messages. It did not really require the Bhubaneswar resolution of the Congress on democratic socialism to put the PSP finally out of business. Mr. Asoka Mehta had made up his mind much earlier.

In organizational terms or in terms of political appeal or strength, the accession of the Mehta group to the Congress is unlikely to bring the latter any very considerable gains. Whether it has conspicuously promoted socialist unity is also doubtful despite the enthusiasm of the Congress President. It is significant that Mr. K. D. Malaviya has been as vociferous as Mr. G. L. Nanda in extending a welcome to Mr. Mehta and his men. The Congress, no doubt, has been apt to be a house with many mansions. This, in the main, has been its strength but it has also often been its weakness. On the present occasion, the entry of the Mehta group may well end in making the confusion within the Congress camp worse confounded. Although Mr. Asoka Mehta himself has been lately speaking on economic issues with a certain amount of pragmatic liberalism, it is possible that the exigencies of political in-fighting among Congressmen might result in his influence weighing in favour of Leftist loud talk. While it is unlikely for the Mehta and the Menon-Malaviya groups to function together, it is not only possible but probable that there might be a general eruption of "keep Leftism" within the Congress—a development which other trends of thinking within the Party will not be able indefinitely to avoid challenging. Meanwhile, in this matter of socialist unity, there is, currently, at the highest levels of orthodox leadership a naivete which is truly amazing. We note that the Congress President has been suggesting that the good work started by Mr. Mehta should be completed by Mr. Dange. Mr. Kamaraj's appeal to the Communists too to join the Congress would indicate that criminal convictions have finally become a substitute for intellectual convictions in the fluid kaleidoscope of post-Nehru political India.

Incidentally, there is irony in the fact that while the decision of Mr. Asoka Mehta and his group to walk out of the PSP into the Congress camp has been hailed in some quarters as a contribution to socialist unity, it has also served to isolate, more definitely than ever before, a hard core of those who claim that they and only they are the true gospellers. Thus such of the PSP members as have not chosen to find their socialist salvation in the bosom of the Congress Party have followed Mr. S. M. Joshi into an embrace with Socialist Party of Dr. Ram Manohar Lohia. The love-child of this urgent union is the Samyukta Socialist Party, but at its birth there have been many bad fairies. At the moment, there is considerable speculation in the political world about the probable plans and programmes of this 'enfant terrible'. It is amusing to note that the more dismal prophets have lost no time in foreseeing the SSP playing into the hands of other opposition parties, such as the Swatantra or Jan Sangh on the one hand or the Communists on the other, and thus weakening the Congress-concocted structure of socialist unity. That the existence of a militant socialist opposition outside the Congress might cramp the style of the "keep-Leftists" within the Congress, however, does seem possible.

ONE LESS THAN FIFTY-TWO

THE PRIME Minister, Mr. Lal Bahadur, appointed last week no less than 20 Deputy Ministers, thus taking the total of his Council of Ministers to 51 (inclusive of the Prime Minister). As reported earlier ('Eastern Economist' dated June 12, 1964, page 1349) he had appointed 15 members of the Cabinet and 15 Ministers of State. Only two Deputy Ministers in Mr. Nehru's Cabinet — Mrs. Tarakeshwari Sinha and Mr. P. S. Naskar — were dropped while all the remaining Deputy Ministers were retained. Mrs. Sinha's exclusion was anticipated as she had requested the Prime Minister not to include her name till she was cleared of the allegations against her. The list of Deputy Ministers, given below, shows that in a number of cases the portfolios have changed hands; the corresponding portfolios of Deputy Ministers in Mr. Nehru's team are given in brackets.

Dr. Mono Mohan Das	Deputy Minister in the Ministry of Rehabilitation (Education).
Mr. Shah Nawaz Khan	Deputy Minister in the Ministry of Food & Agriculture (Railways).
Mr. S. V. Ramaswamy	Deputy Minister in the Ministry of Commerce (Railways).
Mr. Ahmed Mohiuddin	Deputy Minister in the Ministry of Transport (Transport).
Mr. B. S. Murthy	Deputy Minister in the Ministry of Community Development and Co-operation (Community Development and Co-operation).
Mr. Lalit Narayan Mishra	Deputy Minister in the Ministry of Home Affairs (Home Affairs).
Mrs. Soundaram Ramachandran	Deputy Minister in the Ministry of Education (Education).
Mr. D. R. Chavan	Deputy Minister in the Ministry of Food and Agriculture (Defence).
Mr. C. R. Pattabhi Raman	Deputy Minister in the Ministry of Information & Broadcasting (Labour).
Mrs. Maragatham Chandrasekhar	Deputy Minister in the Department of Social Security (Home Affairs).
Mr. Jagnath Rao	Deputy Minister in the Ministry of Law (Supply).
Mr. Sham Nath	Deputy Minister in the Ministry Railways (Information & Broadcasting).
Dr. D. S. Raju	Deputy Minister in the Ministry of Defence (Health).
Mr. Dinesh Singh	Deputy Minister in the Ministry of External Affairs (External Affairs).
Mr. Bibudhendra Misra	Deputy Minister in the Ministry of Industry (Law).
Mr. B. C. Bhagavati	Deputy Minister in the Department of Communications (Communications).
Mr. Shyam Dhar Misra	Deputy Minister in the Ministry of Irrigation and Power (Community Development and Co-operation).
Mr. Prakash Chandra Sethi	Deputy Minister in the Ministry of Steel and Mines (Steel and Mines).
Mr. Ratanlal Kishorilal Malviya	Deputy Minister in the Ministry of Labour & Employment (Labour & Employment)
Mr. Bhakt Darshan	Deputy Minister in the Ministry of Education (Education).

In view of the sharp criticism relating to the re-organisation of the various Ministries — a criticism which emanated both from within the Council of Ministers and without — Mr. Lal Bahadur announced some changes in the portfolios of some of the Cabinet Ministers and the Ministers of State. Mr. Satya Narayan Sinha was given Communications instead of Civil Aviation; he retained charge of the Ministry of Parliamentary Affairs. Mr. Asoke Kumar Sen was appointed Minister of Law and Social Security in place of Law and Communications. Mr. Nityanand Kanungo took charge of the Ministry of Civil Aviation (which was earlier allocated to a Cabinet Minister, Mr. Satya Narayan Sinha) and relinquished the Ministry of Cultural Affairs which has now been allocated to Mr. R. M. Hajarnavis. The Ministry of Cultural Affairs has once again been attached to the Ministry of Education. Dr. Ram Subhag Singh has been appointed a Minister of State in the Ministry of Railways while Mr. A. M. Thomas will be a Minister for Defence Production in the Ministry of Defence. Mr. K. Raghu Ramaiah, Minister for Defence Production in the Nehru Cabinet and Minister of State for Labour in the Cabinet sworn in on June 9 has now become Minister of Supply in the Ministry of Industry. All changes in the portfolios of the Cabinet Ministers and the Ministers of State are given below:

CABINET MINISTERS

Mr. Asoke Kumar Sen	Minister of Law and Social Security.
Mr. Satya Narayan Sinha	Minister of Communications and Parliamentary Affairs.

MINISTERS OF STATE

Mr. Nityanand Kanungo	Minister of Civil Aviation.
Mr. K. Raghu Ramaiah	Minister of Supply in the Ministry of Industry.
Dr. Ram Subhag Singh	Minister of State in the Ministry of Railways.
Mr. R. M. Hajarnavis	Minister of Cultural Affairs in the Ministry of Education.
Mr. A. M. Thomas	Minister of Defence Production in the Ministry of Defence.

A new department of Social Security has also been created. The subjects included under the control of this Department are: co-ordination and development of village industries including Khadi and handicrafts and Ambar Charkha which was formerly under the Ministry of Industry. Different subjects relating to Social Security which were formerly under the Ministries of Education, Health, Home Affairs and Labour and Employment have been placed under this new Department. All matter relating to scheduled castes, scheduled tribes and backward classes which were formerly under the control of the Ministry of Home Affairs have also been allocated to the new Department.

The Ministry of International Trade has been re-named as the Ministry of Commerce. It will have under its control all those subjects under the former Ministry of International Trade including the new additions of textiles, handloom industry, jute and sericulture.

The Ministry of Industry has also been re-christened as the Ministry of Industry and Supply. Now it has three departments. They are: (1) the Department of Heavy Engineering which was formerly under the Ministry of Steel, Mines and Heavy Engineering, (2) the Department of Industry which includes all the subjects that were formerly under the Ministry of Industry except the subjects transferred to the Ministry of Commerce and the Department of Social Security, (3) the Department of Supply and Technical Development which combines all the subjects which were formerly under the separate Department of Supply and of Technical Development. Also, with the transfer of the Department of Heavy Engineering to the Ministry of Industry and Supply, the Ministry of Steel, Mines and Heavy Engineering has been re-named as the Ministry of Steel and Mines with two Departments under it, namely, the Department of Iron and Steel and the Department of Mines and Metals.

UNIT TRUST

THE SALE of units by the Unit Trust of India, established only last February, is to start from July 1, 1964. The units will be in ten or multiples of ten, with no upper limit on the total amount invested. A notable attraction for investors in these units is that dividends received by them up to Rs. 1000 are exempt from both income-tax and super tax (the latter only in the case of a unit holder who would not have been liable for super tax but for the inclusion of the dividend on his units). Those who go in for these units during the first month will get them at par, but thereafter unit prices will be fixed by the Trust based on the prices of securities included in the portfolio of the Trust's investments quoted on the stock exchanges. These prices will be determined and announced daily (in the USA, this is done twice daily). Unit holders will receive their distribution of the Trust's net income (90 per cent of which will be distributed) every year after the making up of the annual accounts as on June 30. This is expected to work out roughly to six per cent per annum. The return would be higher, if capital gains also were distributed, as in the UK and the USA, but this is not proposed to be done by Unit Trust of India. The Trust will buy back the units from November 1, 1964 onwards. Both sales and purchases of units are being managed through the State Bank of India and its network of over 3,500 offices, the commercial banks which have contributed to the initial capital of the Trust and shareholders on the recognised stock exchanges.

Announcing these details, Mr. R. S. Bhatt, Chairman of the Board of Trustees, recalled that the basic objective of the Trust is "to afford the small investor a means of acquiring a share in the widening prosperity, based on steady industrial growth of the country which combines the advantages of a minimum risk and a reasonable return." The words "widening prosperity based on steady industrial growth" are very important indeed, for it is on the eventuation or otherwise of this premise that the Trust can mobilise, as it hopes to, adequate resources and then channel such resources into suitable investments. In other words, the success of the Trust would depend considerably on whether or not the Government's policy is conducive to industrial growth.

Mr. Bhatt also announced the composition of the Board of Trustees, which is representative of those contributing to the initial capital and which may be regarded, more or less, as the advisory board. The day-to-day work of the Trust will be carried on by an Executive Committee working under the direction of the Board. The Board, we are told, is required to act on business principles with due regard to the interest of the unit holder, which is as it should be, but, in matters of policy involving public interest, it would appear, the Trust

would be guided by the directions of the Reserve Bank. Normally there should be no conflict between what is in the interest of the unit holder and matters of public interest broadly, but situations may arise when there is some conflict, depending on the interpretation that those who ultimately decide may choose to place on the words "matters of public interest". The chances of such conflict arising have, however, been minimised by clearly spelling out the Trust's investment policy which, as in the case of similar institutions everywhere, pays due attention to security of capital and reasonable return, including capital appreciation. Certain guidelines, such as limits on investment in any one company (not more than 5 per cent of the value of the total investible funds of the Trust or 10 per cent of the value of the securities issued and outstanding of such a company, whichever is lower) and on investing in the initial issues of new industrial undertakings (not more than 5 per cent of the investible funds) have also been provided, so that the Trust has perforce to function within certain narrow and defined limits. All these features, however, go to strengthen the appeal of a holding in the Trust, especially to people with meagre means to whom security is as important as, if not more important than, return

Modest Beginning

As the Trust is constituted today, it can only begin in a modest way, but after gaining sufficient experience, it can extend the scope of its activities and offer more sophisticated forms of investment, such as plans of investments with payment of dividends in cash or in the form of further investment in units or cumulative investment programmes and so on. Although unit trusts are primarily for the benefit of people with low income, people with larger incomes also would be attracted to this form of investment when such additional features are introduced.

There are a few characteristics about the units of unit trusts which would-be-holders should be told straightaway. For instance, inasmuch as the shares of the Unit Trust will represent investment in common stocks, unit holders should be told that the price of the Trust's shares will go up or down with changes in the market value of the stocks held by the Unit Trust. Similarly, they must be made to understand that, as dividends on securities held by the Trust also will increase or decrease, the distribution of net income too will tend to go up or down. Again, they must be told that there are going to be no annual meetings of unit-holders as of shareholders in the case of a company. The only thing that unit-holders and shareholders have in common is that both have an opportunity to share in the country's economic progress. In the case of the Trust, the holders are assured of experienced, professional investment management.

How important the management of one's capital or investment is will be evident when one is aware of the full time attention that this task receives not from one person but from a number of specialists in the case of investment management of trusts in other countries. Responsible people, qualified by specialised training and intimate knowledge of business and finance, attend to this work and supervise investment. It is axiomatic that sound investment can be made only on the basis of sound information. For this purpose, therefore, unit trusts in other countries have their own specialists whose business it is to study all industries at first hand by discussions and interviews with business executives. The Massachusetts Investors' Trust, for instance, has reported that its Trustees and Industry Specialists had interviews and discussions with over 3000 corporate executives and other informed persons during 1962 and that, including travel abroad, when necessary, they spent over 500 days on field trips covering approximately 300,000 units! To reach this stage, it will, of course, take years for Unit Trust of India, but it must have its sights set right from now if it is to make an impact.

IMMORTAL MESSAGE OF TRUTH AND LOVE

After he had attained 'enlightenment', the Buddha, centuries ago, gave a stirring message of truth and love that inspired millions of people all over the world. Poets and writers, artists and craftsmen, down the ages, have faithfully recorded the teachings of the Buddha on tree-leaves, on stones and temple walls.

And now it is through the powerful medium-paper-that the Buddha's immortal message is conveyed to mankind.

ORIENT's writing and printing papers are there to meet the country's needs.

Relative Prices and Weakness of the Indian Rupee

B. R. SHENOY

N THE article on the "The Weakness of the Indian Rupee" 'Eastern Economist' dated June 5, 1964, page 1307), we saw hat the index of the strength or weakness of a currency is n the strength or weakness of the export position of the ountry concerned; and that the criterion of the strength or /eakness of the export position of a country was in the rend of the ratio of exports to the national income, of the atio of exports to world exports and of the ratio of exports o the imports of the country. Judged by this triple test we aw, too, that the Indian rupee was probably among the weak- st currencies in the world today. All the three ratios are on he decline and have been at a low level for long.

In this article we shall examine the question whether elative inflation as reflected in the relative rise in prices at ome and abroad — the purchasing power parity theory — rovides a dependable index of the extent of the devaluat on f the rupee to restore equilibrium in the balance of payments f the country.

The purchasing power parity theory, whatever may be s merits in other situations, does not provide a satisfactory as.s of explanation of the weakness of Indian exports and, herefore, of the weakness of the Indian rupee; it would not rov.de, too, a measure of the extent of the devaluation which s necessary to restore equilibrium in our balance of payments. his is so for the simple reason that this theory, apart from the imitations inherent to pr.ce index numbers, is capable of measuring only the relative changes in inflation and prices at ome and abroad. But, as we shall presently see, the /eakness of the Indian rupee is not due to the adverse rela- ive price changes alone. It is due, perhaps in a much larger easure, to the working of non-monetary factors as well — he policies of planning which, among other things, force or nduce the fabrication at home of goods in defiance of the aw of comparative costs. The purchasing power parity heory is incapable of grasping in its net the contribution of hese factors to the weakness of Indian exports and hence f the Indian rupee.

Degree of Overvaluation

The purchasing power parity, in fact, might mislead us nto thinking — as has happened in the case of many super- c'al observers — that the Indian rupee is not after all very uch over-valued. This is well brought out by the table elow. We find from the table that, though Indian rices rose faster than prices in the countries with onvertible currencies cited in the table — Article VIII

GENERAL PRICES INDEX

countries of the IMF classification — they were not, except in respect to Belgium, the Netherlands and the USA, far ahead of the rest. France was close to India, Austria and Mexico were not far behind, and the remaining countries followed India at some distance. While the picture is doubtless one of comparative over-valuation of the rupee, the degree of this over-valuation, which the price indexes suggest, does not seem very considerable. On the other hand, the semi-stagnation of Indian exports in the context of the expanding national product and the expanding world production is weighty evidence against any hypothesis that the over-valuation of the rupee is no more than marginal.

The weakness of the Indian rupee — the low level of Indian exports — is explained by inflation only partially. To the extent inflation in India was balanced by inflation abroad, inflation in India may not be a barrier to Indian exports, as the higher domestic cost of production, resulting from it, would be, then, correspondingly balanced by the higher costs abroad. Inflation would be an export barrier only to the extent that it outpaced inflation in the countries competing with us in the world market.

Inflationery Push to Costs

But costs in India are higher than costs abroad due to non-monetary factors much more than inflation. Under Plan policies, production in the industrial sector, in particular, in the so-called "basic" industries and certain favoured consumer goods industries is pushed far beyond the margin of production, if the latter may be defined as the limit of profitable production under normal competitive conditions with an equilibrium exchange rate, any physical restraints on international trade and payments being absent. The forced expansion of industries is being pursued regardless of the costs and the quality of the output. We saw in the earlier article how inordinately high the relative costs of manufactures in India were; to cite some strong instances, sugar and refrigerators were about thrice as costly, motor cars twice to four times, penicillin ten times and oil engines 1½ times. There is little hope of exports moving up and of the rupee gaining in strength under policies which produce such comparative cost patterns.

In agriculture and cotton textiles production costs are kept unduly high by the direct and indirect disabilities in the way of the expansion of output to the margin of production. In the case of cotton textiles, which account for about a third of industrial production, physical restraints stand in the way. There are severe limitations on the increase in the number of spindles and looms in the mills; the production by them of certain varieties of cloth is subject to ceilings; the production of dyed saris is banned; the borders of white saris have to satisfy certain restrictive regulations; the counts of the yarn in the wrap and the weft and the quantities in the "reed" and the "pick" must conform to the prescribed patterns; mill yarn is subject to distribution control; any effort to reduce costs through the extension of rationalisation and of the modernisation of the machinery and equipment needs tripartite — the industry, the trade unions and the government — approval before implementation; and so on. These and similar rigidities, through stiffening the cost structure, have gone far to cripple the industry in the world markets, where we have been continually yielding ground to rival producers, who are much more free to arrange the pattern and costs of their output to the changing needs of competition.

Agricultural production is prevented from growing to its

full measure, even under the limited and the rather primitive know-how of the bulk of the farmers, by three handicaps. First, the low ceilings on interest rates have rendered the business of farm credit unremunerative in the extreme. The ceiling interest rates may be more than fair if all loans were good loans; but the proportion of the bad and doubtful debt being so large, the average returns may be often well below costs.

Secondly, the restrictions on the transfer of land have, on the one hand, reduced the credit-worthiness of the farmers through immobilising almost the only mortgageable asset they have for raising credit with; and, on the other, have added enormously to the risks of farm loans to the creditors. The difficulty in which the farmer finds himself has been further worsened by the Gold Control Rules which have rendered gold trinkets unacceptable to the banks as security against loans. The indigenous rural bankers have, as a result, migrated with their capital to the urban areas to finance the expanding industries; or have changed over to other forms of business. Their role as an essential link between the commercial banks and the farmers has diminished in significance and the flow of credit into farm loans from the money market has shrunk dangerously.

Thirdly, since the commencement of planning, the state has been appropriating the lion's share of the total investment resources, the proportion currently being of the order of 70 per cent of the sum of domestic savings, past and present, and foreign aid. The private sector has somehow to make do with the remaining 30 per cent. While the "organised" part of this sector has been able to obtain its credit needs on more or less reasonable terms, about the worst sufferer has been the farmer, who, already the weakest link in the chain, has been further debilitated as a borrower by the "reforms" referred to above.

The acute shortage of credit available to the farmers is reflected in the fantastic interest rates which they have to pay, the Rural Credit Survey, 1954, (p. 174), placing them at as high as 88 per cent on secured loans. This has constricted agricultural production generally to well within the possible margin it may reach in the absence of these artificial credit barriers. Agricultural production costs thus remaining unduly high, exports of agricultural output get correspondingly retarded.

High Production Costs

The role which these factors play in retarding exports being independent of the influence on exports of inflation and a rigid exchange rate, even with inflation under control and a devaluation of the rupee to correct past inflation, exports may remain low and the rupee may continue to be weak, any response of exports to the devaluation being less than sufficient to cover the balance of payments gap. Control of inflation and the devaluation will have removed only one of the two obstacles — the lesser one — in the way of exports. The other millstone round the neck of exports will be still there, holding back its progress.

Production costs at home will remain higher than comparative costs abroad, and exports may not respond sufficiently so long as, through plan policies, production in India was either forced well beyond the competitive margin, as in some sectors, or was prevented from reaching this margin, as in some others. The high comparative costs, stemming from these production policies, may not show up at all in the general index of prices, as the latter would reflect only the changing ratios of the volume of money incomes to the volume of output. These ratios would not encompass the high cost effects of production policies. Being independent of monetary policies, the latter will continue to hinder exports and keep the rupee weak even after the control of inflation. Exports being but about 5 per cent each of the national income, changes in the costs and prices of exports may not make much of an impression on the general index of prices, however large these changes may be on an average of the export items.

It is easy to see, however, that the high comparative costs, whether they were due to inflation and the rigid exchange rate or to the production policies, would be reflected in the prices of the import licences. The market prices of the import licences of a commodity would measure the gap between its landed costs and the market prices. When the domestic market is competitive, the market prices would correspond to the domestic production costs. Since the landed costs of the import goods are determined by their production costs abroad — the landed costs would be equal to the external prices multiplied by the rate of exchange plus customs duties and incidental expenses — it follows that the prices of the import licences indicate the magnitude of the difference between production costs at home and production costs abroad. The enormous magnitude of the cost disparties is evidenced by the fact that the prices of the import licences vary from 30 per cent to 500 per cent or more of the landed costs, depending upon the commodity concerned.

Uneconomic Enterprises

Obviously, the whole range of these cost disparities cannot be corrected by currency devaluation. The extent of the devaluation which this will call for will be self-defeating and disastrous. The control of inflation and devaluation to remedy the over-valuation ensuing from past inflation will not therefore, eliminate the phenomenon of the gaps between the landed costs and the market prices of import goods. Only those price gaps will cease to be as were equal to, or less than, the extent of the devaluation The price gaps in the rest of the commodities will remain. This will necessitate the continuation of import controls and exchange restrictions, even after the control of inflation and devaluation.

There is no remedy to this situation other than to supplement the monetary reforms — the control of inflation and devaluation — by appropriate reforms in production policies designed, on the one hand, to wind up uneconomic enterprises and, on the other, to expand production in sectors with comparative cost advantages. This double reform is the crux of India's balance of payments problem. Without both prongs of it operating simultaneously, it is not possible to restore equilibrium, and freedom of transactions, in the foreign exchange market.

Theoretically, it might seem possible to restore this equilibrium and freedom of operations, if, simultaneously with the monetary reforms, tariff walls are erected to protect the uneconomic industries. But, apart from the very complicated operational problem of determining the appropriate measure of tariff protection, this would be a highly costly remedy to the national economy. It would be much more wise to wind up uneconomic undertakings than to perpetuate a drain on the national resources for maintaining them by keeping them alive, though this may mean an immediate deterioration in the unemployment position. But this deterioration would be transitory, as the labour and other resources released from the uneconomic undertakings should get absorbed by the economically stable ones, the expansion of which will be fostered by the two-pronged reforms.

The adoption of these reforms is already long overdue. Any further deferment of them will add to the complexities and costs of the readjustment. The stability and progress of the Indian economy are being continually undermined in the name of planned economic development. If the ill effects of our policies are not showing up in their full ugliness, this is in large measure due to these effects being covered up by foreign aid.

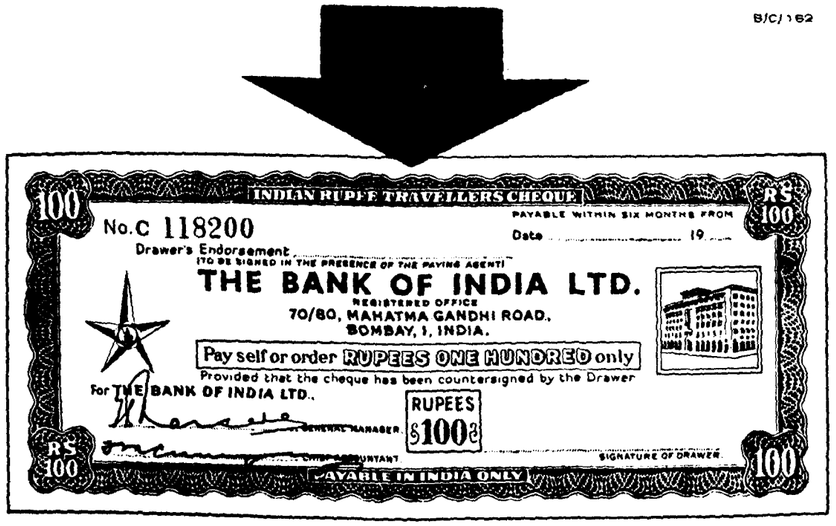
THE AUTOMOBILE INDUSTRY . . . .

saves India Rs. 700 million in foreign exchange

CAR PRICE STRUCTURE

Government taxes, direct and indirect :	33%
Raw materials, manufacturing and overhead expenses, salaries and wages, depreciation, profit etc. :	25%
Indigenous ancillary components :	24%
Imported components :	11%
Dealer's commission including distribution, service, advertising etc. :	7%

THE AUTOMOBILE INDUSTRY IS A KEY INDUSTRY



The sixty thousand motor vehicles produced yearly in India today represent a considerable saving in foreign exchange, as otherwise they would have to be imported for the equivalent of some 700 million rupees. In addition, the spare parts for the maintenance of these vehicles would also have to be imported for a further large amount of foreign exchange.

Today as much as 80% of the components and material of a vehicle are of Indian origin and in the case of a car such as the Hindusthan Ambassador the cost of imported components, exclusive of import duty, only amounts to about 1685 rupees per vehicle. As more ancillary industries develop in India, the indigenous content will further increase and the foreign exchange content will correspondingly decrease.

Such savings in foreign exchange for the benefit of the country's economy necessarily entail some sacrifices on the part of the purchasers of automobiles, both price-wise and quality-wise; price-wise because local materials and indigenous ancillary components are more costly than their imported counterparts; quality-wise because the Indian automobile industry—and more particularly the ancillary industries—are still young and have not yet reached the high standard of quality attained by more advanced foreign manufacturers through decades of experience, automation and other mass production methods.

WINDOW ON THE WORLD

Common Market Calendar

From Our Special Correspondent

PARIS:

MR. ROBERT MARJOLIN, vice-president of the ECM Commission, said here the other day that "the reasons that incited the United States, 20 years ago, to support European unification unreservedly, have lost none of their force". The Americans, it is evident, sometimes doubt this and Mr. Marjolin was trying to convince them that first thoughts are best. To the period of enthusiasm for European unity, there succeeded in the USA a phase in which the costs of that unity to American interests began to be tallied up carefully, though the project was still generally approved. To that in turn succeeded anxiety tinged with hostility, a mood that found its scapegoat in General de Gaulle. In this phase (which still lasts), the Americans have not turned against European unity but they incline to wishing that it would slow down progress more cautiously and take no decisive, irrevocable steps until more suitable times — i.e. until France has found more accommodating leadership. The same temporising policy is followed of course by Britain, whose main aim since her failure to gain admission to the association has been to paralyse it, as far as lies in her power.

There are reasons to believe that this attitude is a mistake on the part of outsiders, that it runs counter to their own interests. If the Americans had lost faith in the Common Market and could undo it at their will, it might make sense to oppose further progress toward European unity while awaiting the moment to reverse it. But since what has been achieved cannot be undone, one might ask whether the present half-baked state of the European union is not more awkward for outsiders than would be a completed economic unit on the Continent. There would be nothing immutable in such an economic union, except its very existence; all its external policies would be capable of revision, and would be as responsive to outside influences as are the trade policies of other responsible Western nations. Specifically, if outsiders are concerned about the level of the common external tariff, then it would be reasonable of them to want to see that united tariff brought into force as soon as may be, whereupon its incidence on outsiders could be discussed otherwise than theoretically, as now. Or if it is the prospect of a common agricultural policy in Europe that awakens anxiety, one could well ask the Six to make haste fixing on and implementing a single policy, so that bargaining with outsiders could begin.

Outside Intervention

On either count, perpetuation of the present phase of indecision is contrary to outsiders' interests, and much more so would be a deepening of confusion caused by deliberate outside intervention to paralyse progress toward European economic unity. The point has been illustrated this month by the failure of the Six to agree on future unified prices for foodgrains — which immediately threatens the Kennedy Round of tariff negotiations on which the Americans set so much store. The ECM Commission warned the six governments after their adjournment of a decision on grain prices that "this postponement puts the Kennedy Round in jeopardy. The absence of a common price for cereals among the Six will lead the GATT negotiations in Geneva into a dead end, on the agricultural side. Because of the inter-dependence of industrial and agricultural questions, we must expect a general stalemate in the negotiations, if not rupture. The ECM will be held responsible for such a development". Indeed the Six would be to blame for wrecking the Kennedy Round under such conditions, but their fault would lie in not achieving economic unity on a crucial point.

There is no suggestion that in this particular case outside intervention is responsible for the Six's inability to make progress. The reason is an electoral calculation, of a fairly vulgar order, on the part of Dr. Erhard, whose doctrinaire liberalism is, like every liberalism in office, infinitely elastic in the direction of downright protectionism once it is a question of vote-catching. To be precise, Dr. Erhard does not want a unified wheat price in Europe because West Germany's, by far the highest, would have to come down, and that might irritate voters on the farms. The Common Market Commission apparently feels that suitable American pressure would influence Bonn's obstinacy, for it has appealed to Washington to point out to Dr. Erhard that he is endangering the Kennedy Round by betraying all his free-trade principles. It is instructive to note that no such pressure is coming from France. Though in favour of unified grain prices, which are the basis of a common farm policy, the French are content to enjoy Dr. Erhard's embarrassment. Firstly, if Dr. Erhard does wreck the Kennedy Round that would not be tragic, as seen from Paris. Secondly, it is no time to raise French wheat prices (the region's lowest) when the Government is trying manfully to stabilise living costs. And thirdly, it is Gaullist doctrine that sovereign nationalism cannot be overruled by supranational objectives, and that goes for Germany as much as for France herself.

Common Farm Policy

The upshot is that this is an instance where delay in European unification is not causing dismay inside the Community but is grounds for anxiety on the part of outsiders — of all outsiders, to the extent that the Kennedy Round is in danger. It is very likely that the Americans will abandon their go-slow attitude on European unity and positively press the West Germans to agree to a unified cereals price and hence to a common farm policy. If that is done, and if the Kennedy Round is carried to a successful conclusion, outsiders will have new reasons to hope that the Six hasten the process of unification. For the new tariffs that will be negotiated at Geneva cannot become reality until the Six have in actual practice a common external tariff. A 50 per cent reduction in the Community's tariff on machines remains quite theoretical as long as the old national tariffs are in force. According to the Rome Treaty, the full customs union will exist from 1970 but, to the extent that the Kennedy Round leads to concessions of interest to outsiders, they will want to see this date advanced.

The ECM Commission had already suggested that it be brought forward to Jan. 1, 1967, while in the report that it has just published it does not exclude an even earlier date. Apparently it has in mind 1966 for the complete dismantling of tariff inside the region and hence (what goes with that automatically) installation of the common external tariff. This new plan for acceleration of the Common Market is explicitly presented by the Commission as "not only important for the accomplishment of the customs union but liable to facilitate the Community's external relations". In general, outsiders will find it easier to deal with a complete union than with six nations half-way to unity. They have

nothing to gain by seeking to prolong current indecision and confusion.

To which some British politicians would reply perhaps that since the Common Market is "protectionist and inward-looking" (to use the phrase consecrated by the polemics of recent years), outsiders have no interest in hastening its perfection and every right to use the present British strategy of a-spoke-in-the-wheel wherever possible. The assertion that the ECM is protectionist and inward-looking (the Macmillan Cabinet has the credit for this invention) has resisted so well against mere facts that one cannot hope to overthrow it now with a few more mere facts, but one is bound to bring the argument up to date by taking note of the 1963 figures. They show that last year the ECM's imports increased by 11 per cent to $34,600 million (while the USA's increased by 5 per cent to $17,000 million). Thus the Six's imports have increased 40 per cent since their venture got going on its "protectionist and inward-looking" course, whereas the free-trading and outward-looking Americans and British in that time increased their imports by 27 and 20 per cent, respectively.

The Community's exports increased too, but much less, so its trade balance has deteriorated further. There was a negligible deficit in 1958, but one of $3,000 million last year; the trade gap had been multiplied by 12 in five years. The Community's balance of payments stayed positive longer, but there was already a small deficit last year and for the current year the Commission foresees a payments gap of several million dollars.

In the five years to 1963 the Six's imports from the USA grew by 80 per cent, whereas the Americans managed to sell only 34 per cent more to Britain and 41 per cent more to the Free Trade Association. The ECM's imports from Britain in the same five years increased by 105 per cent, while its exports to that country rose 50 per cent. The contrast between these two figures, incidentally, raises the question of whether British accuations about protectionism in the ECM are not made in deliberate bad faith. The Six's imports from Latin America meantime rose 35 per cent, and from developing countries in general by 19 per cent, while exports to those regions rose by little or nothing.

In view of these proofs of the ECM's trade liberalism, it would be natural for outsiders to ask for more haste in European economic integration, rather than to practise a policy of obstruction. To be sure, the Six cannot go on importing more in this way and they must soon take steps to correct their unbalanced trade. There again, a completed customs union could act more effectively and with more respect for outsiders than the present half-formed association.

U.K.'s Export Problems

JOSSLEYN HENNESSY

LONDON:

ALTHOUGH THE U.K. export performance is currently better than ever, it continues to worry the authorities. In absolute figures, the U.K.'s postwar record has been good. In real terms, the value of exports has risen over 40 per cent, but this, of course, is not enough to meet the U.K.'s ambitions to raise her standard of living ever higher and to export capital. Where does the trouble lie?

Exhortations to export are useless. They irritate those already exporting and leave cold those who are not. What is needed is more serious study of how export performance could be improved and propaganda to show the advantages that the exporting firm has over the non-exporter. This is what the British Institute of Export (14 Hallam St., London. W.1.) exists to do, and many (though by no means all) of the facts and arguments that I am about to cite are taken from a report that the Institute is to publish later this year.

Last year the total of U.K. exports was £4,800 m., yet the startling fact was that the ten biggest companies were responsible for 18 per cent of overseas sales and the forty biggest for as much as 30 per cent. Small firms, with less than 500 employees, account for over half of the U.K.'s manufacturing employment, but supply less than a quarter of the exports. There are 15,000 to 20,000 firms which do not export at all. Why?

Not only does it cost more to sell goods abroad but competition in international markets usually forces prices below those in protected home markets (except for luxuries, or for goods of obvious technological superiority). This explains why the majority of manufacturers—the smaller firms—listen coyly to exhortations to export. This, however, is a superficial reaction and closer examination of the facts would open encouraging horizons.

For if exporting could not be made to pay—and to pay handsomely—no firm would export at all. Exporters do not export out of philanthropy, but because they realise that if they were not to export their market would be limited to the U.K.'s 52 million inhabitants, whereas overseas they have awaiting them at least the 500 million customers inhabiting the industrialised countries. And limitless new markets are, of course, gradually opening all over the world. These firms find that, despite narrow margins, exports yield high profits on a volume of sales infinitely greater than the home market could provide.

In the 15,000 to 20,000 firms which, at present, do not export at all, the U.K. has an enormous reservoir of potential exporters. Moreover, if an appreciable number of them were to launch out in export markets, a virtuous circle would be initiated, since the faster national growth rate that a rising flow of exports would create would help to lower unit production costs and, in turn, lower home and export prices. It has been calculated that if every manufacturer exported 7 per cent of his 1964 turnover the N.E.D.C. export growth target of 5.7 per cent per annum could be attained this year.

Promotes Efficiency

Other advantages of exporting are that it multiplies the number of "baskets for eggs," so that if one market is depressed others can take up the slack by fuller exploitation. Greater production, and a steadier flow, lower costs and spread overheads. Foreign markets widen "know-how" and contacts; they stimulate new ideas for design, new uses for existing products, new products, and better methods of production. The act of exporting helps to promote efficiency, because the sale of goods overseas requires greater exactitude than the sale of the same goods at home. A firm that does a high proportion of exporting tends to be more efficient, abroad and at home than one which is content to jog along in its home markets.

The existence of export merchants, whose entire livelihood depends on selling abroad, has always disproved the oft-repeated myth that export is only possible, or profitable, when conducted from "a soundly based home trade." Since World War II, those U.K. manufacturers who have been persuaded to paddle in the export shallows have been agreeably surprised to find that, if they were prepared to learn to swim properly, the deepest waters held no terrors. The Institute of Export observes that when a firm regards the world as its oyster, and the home market as but one small part of it, it is set on the road to expansion and prosperity. But the inescapable requirement is that the job must be done properly: not even the best product will survive ham-fisted exporting.

There is no reason why the smaller firm should not regard the world as its oyster and take an order from Nicaragua as much in its stride as one from Nottingham—for two reasons: First, because if it wishes to investigate the possibilities of doing its own exporting, there are so many authorities—such as the Board of Trade (with Trade Commissioners all over the world), the Federation of British Industries, the National Union of Manufacturers, Chambers of Commerce, etc.—ready to give not merely general guidance but detailed information about specific products and countries—that it is impossible to list them. Secondly, the smaller firm is not compelled to set up its own export department, because there are so many organisations — such as general export merchants, merchant banks, joint venture schemes for firms not in competition with each other, "foster firm" schemes, whereby a larger firm, already established abroad, undertakes to introduce a smaller firm's complementary products — that it is, again, impossible to list all of them.

The basic problem, as I see it, is twofold. On the one hand, high tariffs provide too many U.K. manufacturers with cosily protected markets. If profits were difficult to make at home, they would be compelled to explore overseas markets. On the other hand, we are up against the Socialist view (expounded here on May 22) that profits must be "reasonable." Unfortunately, the prospect of a 5 per cent dividend has never inspired a successful export drive in any country.

Decline in Unemployment

GUY SIMS FITCH

WASHINGTON:

RECENT QUICKENING of the production and sales pace points to a further acceleration of economic activity in the United States, and indicates that the income tax reduction enacted in March is having its expected, if impatiently awaited, effect. Now there has come what may well be the single most significant development on this score, in the form of the government's report on employment for the month of May. It shows that the number of Americans holding jobs rose by no less than 1.2 million to an all-time high of 71.1 million, while the number out of work declined by 300,000 to a total of 3.6 million. In evaluating these figures, one must examine the seasonal implications. The improvement far exceeded normal expectations for this time of the year, on both the employment and unemployment sides. As a result, the seasonally adjusted unemployment rate fell from April's 5.4 per cent to May's 5.1 per cent of the labour force, the lowest in more than four years.

Notable Improvement

One month's results are not necessarily definite of course, and the heavy influx into the labour force of high school and college students seeking summer vacation jobs could push the jobless rate higher again in June. But given the coincident improvement in other aspects of US economic activity, government economists are highly pleased with the May employment trends, particularly when these are subjected to closer analysis. All work force categories showed notable improvements in May, save one. This was the teenage group, which continued to show a 16 per cent unemployment rate. But these youngsters, with their generally scanty skills, make up a very small part of the nation's labour force. Most of them, moreover, live at home, and except in relatively rare instances are hardly to be considered principal family supports.

Far more significant is the employment gain among adult males, particularly among married men — the family "breadwinners" by and large, and the backbone of the labour force. The jobless rate for all adult men fell to 3.6 per cent in May, the lowest since August 1957, while for married men the rate was down to 2.6 per cent, the lowest since July 1957.

Year-to-year comparisons offer additional cause for comfort. Total employment is up more than two million from May 1963. For the major non-agricultural sector, which accounts for well over 90 per cent of the nation's work force, the rise is an even more imposing at 2.2 million — the largest year-to-year gain since the spring of 1959, and more than making up for the continuing long-term decline in the agriculture work force.

Underlying Buoyancy

Unemployment, meanwhile, is down by some 400,000 since May 1963, and half of this improvement is in the important area of long-term joblessness, which means people out of work for 15 weeks or more. As a matter of fact, the number of long-term unemployed — often a key indicator in assessing the magnitude and nature of the unemployment situation — is now little more than a million, and on a seasonally adjusted basis is closer to 900,000.

Evidence of the underlying buoyancy of the American economy is the fact that the employment gains have taken place against the backdrop of a 1.6 million year-to-year increase in the size of the total labour force. In fact, the average labour force increase for the first five months of this year has been somewhat higher than had been expected on the basis of long-term trends — another indication that job opportunities are becoming more plentiful and are drawing more people out of the home and into gainful employment. An especially optimistic omen is the labour department's latest report of substantial declines in both new and continuing claims for unemployment compensation, to which jobless workers are entitled under government programmes. It is significant that these declines reflected developments in the weeks ending May 23 and May 30, which follow the mid-month period in which the monthly employment data are gathered. Hence, they probably are indicative of further improvements in employment over and above those already set forth in the May report.

Search for Key to Curb Food Prices

By Our Special Correspondent

NEW DELHI:

DESPITE HIGH-LEVEL confabulations throughout last week, the Union Government's thinking on the measures to contain food prices has not yet crystallized. A conference of State Chief Ministers is being called some time next week to consider the issue. It is only after this conference that concrete steps will be taken to tackle the food prices problem.

The new Union Food and Agriculture Minister, Mr C. Subramaniam, for the present has set before himself the task of checking further rise in foodgrain prices. The question of bringing them down from the present high levels will be considered after the immediate task is accomplished.

Opinion continues to be divided on whether resort should be taken to State trading in foodgrains or not. The Prices Committee of the Union Government, consisting of senior secretaries, is understood to have expressed itself against this step at the present juncture in view of the fact that this year's rabi harvest is already over and the next kharif crop is yet far away. With adequate administrative machinery for the purpose not there at present, it thinks, no useful purpose can be served by going in for State trading in foodgrains immediately. The Prices Sub-committee of the Congress Parliamentary Party has also lent only lukewarm support to State trading at the present stage. It has advised that the Government should enter the trade in foodgrains at the wholesale level and that too in some selected commodities and in selected areas. There is, however, another quite vocal section of opinion which favours State's entry into the foodgrains trade immediately for bringing out the stocks hoarded by the traders and the big producers. As a long-term measure, both the official and Congress Parliamentary circles, of course, by and large, favour procurement of the staple foodstuffs only by the State or its nominees.

Strict Enforcement

For the immediate future, the Government's Prices Committee has recommended statutory fixation of maximum wholesale prices for various foodgrains and stricter enforcement of the Wholesale Trade Licensing Order. The enforcement machinery, it has been suggested, should be strengthened. The Union Finance Ministry is stated to be prepared to meet 25 per cent of the cost of maintaining the existing enforcement machinery in the States and 50 per cent of the cost of building up additional such machinery for the future. After fixing the maximum wholesale prices, the Committee has recommended, maximum retail prices should be notified for the information of the public. For retail distribution of foodgrains, the Committee favours expansion of fair-price shops network, instead of rationing.

The Prices Sub-Committee of the Congress Parliamentary Party, on the other hand, has asked for drastic measures against hoarders and profiteers in foodgrains and seizure of stocks, wherever necessary, under the Defence of India Rules. To induce the farmers to disgorge their surplus foodgrains, the Sub-committee has recommended provision of price incentive and other inducements such as supply of essential commodities like cement, steel, kerosene, cloth and sugar, at fair prices and in adequate quantities. The banking procedures, it further suggests, should be simplified to provide channels for the agriculturists to save and to invest their savings. The Sub-committee also feels that unaccounted money operating in the foodgrains trade is creating difficulties. The Government should examine what steps are needed to check this evil. It has further urged the Government to explore the possibilities of importing more rice in the near future. The other important suggestions made by this Sub-committee include devising the monetary and fiscal measures to mop up surplus purchasing power and avoidance of all unproductive expenditure.

Whether ultimately the Government decides to immediately go in for State trading in foodgrains or not, stricter control on wholesale trade is not ruled out. There is also likelihood of fixation of maximum wholesale prices to prevent hoarding of grains and to curb the role of unaccounted money in this business.

**

In September last year, the Union Government set up a special Committee—popularly known as the Swaminathan Committee — to suggest ways and means for reducing delays in the establishment of industries. The Committee worked feverishly and produced its interim report in January this year. Because all its recommendations were designed to speed up the licensing procedures in the country, the Government lost no time in accepting all of them. The Committee has now submitted its final report (see the Records and Statistics section of this issue on page 1432). This report also breathes the same spirit as the interim one. It has extended the list of the "key" industries to eight additional industries which are either export-oriented or import-saving. The Committee has suggested that these industries should also enjoy the special procedures as recommended for the key industries. The Committee has also urged that the Government should accord the same privileged position to other industries which are instrumental in earning foreign exchange.

Regarding the non-key industries as well, the Committee has made some useful suggestions. It has recommended, for example, that wherever the limiting factor is not foreign exchange, the Government should, after the issue of a "letter of intent", provide all subsequent clearances, such as import of capital goods, approval of foreign collaboration terms, and issue of capital, within three months of the receipt of application.

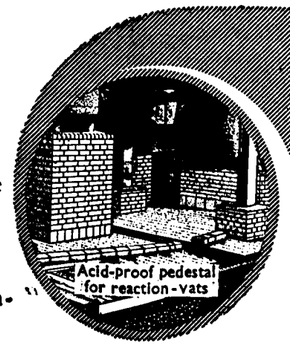
The Government has accepted the Committee's suggestion to issue import licences for raw materials and spare parts within a period of three months from the commencement of each licensing period. In cases of delay, the Government has devised a simpler alternative than the one suggested by the Committee. No ad hoc licences, as recommended by the Committee, are to be issued. In the case of industries where licensing is done on an annual basis and where raw materials cannot be had from indigenous sources, annual licences of the value of the previous year's licences will be issued subject, however, to the condition that during the first half of the licensing period, only 50 per cent of the value of an annual licence can be utilised. At the same time, authorisation will be provided for the utilisation of an additional 25 per cent from the commencement of the second half of the licensing period. At the time of announcement of the final import policy, the values of the licences would be suitably adjusted. In all other cases, the licences for the industry's requirements for the first half-year will be issued for a value not exceeding the value licensed for the first half of the previous licensing period. In the case of the established importers, however, the traditional author-

The label 'SANFORIZED' is helping to carry Indian cottons round the world

For centuries Indian textiles held sway in world markets. Millmade cottons are still a leading item of export. In 1963, over 500 million yards went abroad and earned the country Rs. 41.2 crores in foreign exchange.

New markets need to be tapped, however, to build bigger, even more profitable exports. The label 'SANFORIZED' is proving of great assistance in introducing our fabrics to fresh markets, for it has world-wide recognition. The name is known and trusted in 49 countries and inspires confidence in millions of consumers.

Today, leading Indian mills are using the trademark 'SANFORIZED' aggressively as a valuable aid in the sale of cottons in highly competitive world markets. In 1963 the exports of cloth labelled 'SANFORIZED' increased more than 31 per cent over 1962...and more than 85 per cent over 1961.



Issued by Cluett, Peabody & Co., Inc. (Incorporated in the U.S.A. with limited liability) proprietors of the registered trademark 'SANFORIZED'. The trademark proprietors use the trademark 'SANFORIZED', or permit its use by authorised registered users, only in respect of tested fabric which meets the trademark proprietors' strict requirements as to residual shrinkage.

ACCOCID
(ACID-RESISTING CEMENT)
Containing silicates of high purity, ACCOCID is proof against all strengths of inorganic and organic acids. ACCOCID is recommended for setting acid-resisting bricks for acid storage and pickling-tanks, acid towers and fume-stacks, reaction-vats and tanks, laboratory bench-tops etc.

ACCOSET-50
(MONOLITHIC REFRACTORY CEMENT)
Composed of finely ground plastic clays, high alumina burnt refractory materials and specia chemicals, ACCOSET-50 gives good bonding strength and high heat resistance. Once it is dried and burnt ACCOSET-50 becomes *one with the bricks*. Recommended for jointing, bonding, monolithic and rammed linings etc.

FIREBRICKS
With medium, high and super alumina content, firebricks are made to the required shape, size and quality. They resist spalling, abrasion and the various stresses induced by heat.

isation of 25 per cent of the value of the annual licence for the second half of a licensing period will not be made.

Currently, only one application is demanded for the issuance of an industrial licence. The Committee has suggested that two applications, instead of one, should be asked for. The first one should be submitted to the Government along with the preliminary application and the treasury challan to enable the issue of a "letter of intent", while the other application should be submitted at a later stage at the time of the issuance of the industrial licence. At the time of the initial application, the entrepreneur does not possess a clear picture of all the details sought in the application form. A revision of the application becomes essential when the entrepreneur holds discussions with the collaborators and the consultants.

The recommendation of the Committee that it may be reconstituted after a year to study the results of the working of the procedures desired by it and make suitable suggestions to Government, merits consideration. It is necessary that procedures should be constantly reviewed so as to improve them. It must be stated that no high principles of finance or administration were involved in the terms of reference of the Committee. It had to acquaint itself with the ways in which applications of the industrialists got bogged down in the labyrinthic proceedings of the various committees in the Secretariat. If after giving these proposals year's trial, it is found that certain other changes are necessary, they should be at once made operative in the larger interests of the industry

★★

With a view to expediting search for oil in the off-shore areas of the country, the State-owned Oil and Natural Gas Commission has signed this week two contracts with the Soviet trading organisation, Technoexport of Moscow. Under the first, contract, the Soviet organisation will send a specially equipped ship, "Akademik Arkhangelskiy", initially for a period of 16 months, for conducting seismic and radiogeodetic surveys in the coastal waters of India. The ship will be manned by Soviet experts. Some Indian technicians, however, will be associated with these surveys. The second contract provides for lending by the USSR services of 15 high-level experts in exploration and production of oil and natural gas. The tenure of these experts will range from one to two years.

The ONGC has already undertaken a certain amount of offshore survey in the Gulf of Cambay in a converted Indian vessel. The possibilities of discovering large reserves of oil and natural gas in some of the coastal areas of India, particularly in the Gulf of Cambay, Rann of Cutch and the Coromandal coast are rated high.

★★

The foreign oil companies operating in India are reported to have agreed to the Union Government's proposal to amend the definition of "indigenous crude" to include not only the crude oil discovered and produced within the Indian territory, but also such crude as may be found in West Asia or elsewhere (excluding, of course, the Communist countries) with the efforts of the Oil and Natural Gas Commission. The ONGC is expected to shortly bid for off-shore oil concessions in Iran in collaboration with two foreign companies, namely, ENI of Italy and Phillips Petroleum of the United States, which had qualified as bidders for these concessions last year. It is also likely to enter exploration business in Kuwait. Talks in this regard have been going on with the Kuwait Government for some time.

The ONGC's entering into partnership with the ENI and Phillips Petroleum for oil exploration in Iran appears to have brightened the prospects of their collaboration in setting up the proposed Madras and Haldia refineries. The other two main contenders for collaboration in these two refineries are stated to be the BOC-Shell International and ESSO Standard Eastern. The BOC-Shell International is understood to have quoted the lowest price for crude supplies to the Madras refinery — $1.56 per barrel f.o.b. Persian Gulf ports.

★★

The Union Government's move to abolish the Income-tax Appellate Tribunal and to refer all appeals on points of both law and fact to High Courts has been viewed with grave concern by the Federation of Indian Chambers of Commerce and Industry and the Institute of Chartered Accountants. In their representations to the Union Finance Minister, Mr. T. T. Krishnamachari, the two bodies have styled the move as "uncalled for" and have pleaded that not only the Tribunal should be retained and continued, but its working should be improved further.

The Federation is of the view that the IT Appellate Tribunal is an indispensable link in the tax appeal structure in the country. Citing the views of the Law Commission and the Direct Taxes Administrative Inquiry Committee, FICCI says that the wholesale transfer of cases before the Tribunal to High Courts would involve submission of certified copies of documents, translating them, producing of expert witnesses for cross examination, etc. This would cause inordinate delays in the disposal of cases.

To improve the working of the Tribunal, FICCI suggests that the first appeal before the Appellate Assistant Commissioner should be made an effective first appeal instead of being dealt with as a mere administrative review as at present. This, it opines, can be achieved if the Appellate Assistant Commissioner is independently placed under the Ministry of Law.

Cutting Tax Procedures

Two suggestions have been offered by FICCI to cut short the tax procedures. One is that where both the parties agree on the facts of a case and only a question of law is involved, the case may directly be taken to the High Court. The second suggestion is that where, on the question of law involved in an appeal before the Tribunal, varying judgments have been given by different High Courts, the President of the Tribunal may, on a request made to him, be entitled to refer the question directly to the Supreme Court for a decision. FICCI further says that the second Appellate Tribunal may take the form of a court of revenue appeals or a high tribunal for revenue appeals at the High Court level. It may set up five benches at Delhi, Bombay, Madras, Calcutta and Allahabad. Each bench may consist of three judges — two High Court judges and one accountant judge. Appeals from the orders of the Income-Tax Appellate Tribunal will then lie to the court of revenue appeals on both the questions of fact and law. The court of appeals will be under the direct control of the Supreme Court and appeals from its orders on question of law will be dealt with at the highest level. This, in FICCI's view, will secure appreciation of facts at the highest level.

FICCI has also suggested that the standard of recruitment and status of members of the Tribunal should be raised.

★★

The Union Department of Steel is understood to have finalised its plan to import 100,000 tonnes of low manganese-high silicon quality pig iron from the Soviet Union. The landed cost is likely to be around Rs. 325 per tonne. Shipments are expected to start shortly.

About 32,000 tonnes of these pig iron imports are proposed to be allocated to foundries under the State list. It is hoped that this will alleviate the present acute shortage of this industrial raw material in the country to a great extent. If

necessary, another 50,000 tonnes of pig iron may be imported from the Soviet Union towards the close of the current year.

★★

India intends to expand her sugar exports during the coming years, particularly to such profitable markets as the United States. The Union Food Secretary, Mr. V. Shankar, left New Delhi last week-end for London where he would be participating in the deliberations of the International Sugar Council, at its seventeenth session, on the report of the preparatory committee set up by it to initiate a study of the basis and the framework of a new international sugar agreement proposed to be brought into force from January next year. Mr. Shankar's effort will be to ensure that under the new agreement, the interests of the developing countries receive special consideration so that they are enabled to increase their sugar exports and to obtain reasonable price for them. Mr. Shankar will as well hold talks in Washington on the new Sugar Bill currently before the US Congress. He will plead there for a favourable consideration of India's case for inclusion in the list of the regular suppliers of sugar to the US.

Mr. Shankar will also have discussions with the US Department of Agriculture on foodgrain imports by India under the US Public Law 480. The current PL 480 agreement between India and the United States expires on June 30, 1964. It is expected that on that date more than 2 million tonnes of wheat, out of the 16 million tonnes promised under the agreement, will be outstanding for shipment to India. The US Government has been requested that the pact should be extended for some months so that India could import the outstanding balance. In view of the shortage of food in India at present, a new PL 480 agreement has also been suggested by the Union Government under which foodgrains supplies by the US Government to this country may be continued during the early years of the fourth Plan. The quantity asked for, of course, has not yet been divulged.

★★

The Heavy Electricals (I) Ltd., has signed an agreement with Messrs. Technoexport, of Czechoslovakia, providing for technical co-operation and consultancy services by the latter for producing (i) high pressure boilers ranging from 125 to 450 tonnes steam per hour capacity, (ii) package boiler units with output 8 tonnes per hour above 22 atm. pressure-temp. 380 C, and (iii) high pressure valves and fittings for these boilers at the Heavy Electricals High Pressure Boiler Plant being set up at Tiruverumbur, Tiruchirapalli. The agreement envisages a total payment to Messrs. Technoexport of a sum for Rs. 2 crores for its services.

The Tiruchi project is being financed out of the first Rs. 23.1 crores credit made available by Czechoslovakia in November, 1959.

★★

An official delegation, led by the Union Minister for Transport, Mr. Raj Bahadur, left for Tokyo last week for the final round of talks with the Mitsubishi Group and the Japanese Government in regard to securing Mitsubishi Group's collaboration in building the second shipyard at Cochin.

The Cochin shipyard will have a capacity of about 63,000 GRT and is estimated to cost nearly Rs. 10 crores. The Mitsubishi Group has been approached to provide the entire foreign exchange component of this cost. It is also expected to participate in this venture on a minority basis.

Construction work on this project is likely to be started by the end of current year. It is hoped to complete the shipyard in about four years' time. Production may, however, start in the third year of construction itself.

★★

Last week in this column we published the details of India's liability up to 1975-76, on account of repayment of principal and payment of interest on the credits received by her up to the end of 1963 from the World Bank, the International Development Association, the United States, the United Kingdom, Canada, West Germany and the USSR. The following are the details of the burden to be discharged by India [in million dollars, on account of principal repayment (P) and interest charges I)] in the case of the loans made available to her by Italy, France, Belgium, Japan, Austria and the Netherlands.

Italy: 1964-65 — P 1.1, I 0.5; 1965-66 — P. 1.7, I 1.0; 1966-67 — P. 3.3, I 1.9; 1967-68 — P. 3.3, I 1.8; 1968-69 — P. 3.5, I 1.6; 1969-70 — P. 3.3, I 1.5; 1970-71 — P. 3.3, I 1.4; 1971-72 — P. 3.3, I 1.2; 1972-73 — P. 3.3, I 1.1; 1973-74 — P. 3.3, I 0.9; 1974-75 — P. 1.8, I nil; 1975-76 — P. 0.8, I nil.

France: 1964-65 — P. 0.7, I 0.4; 1965-66 — P. 1.7, I 0.9; 1966-67 — P 2.8, I 1.7; 1967-68 — P 3.6, I 2.2; 1968-69 — P 3.6, I 2.2; 1969-70 — P 3.6, I 2.2; 1970-71 — P 3.6, I 2.2; 1971-72 — P 3.6, I 2.2; 1972-73 — P 3.6, I 2.2; 1973-74 — P 3.6, I 2.2; 1974-75 — P 2.9, I 1.8; 1975-76 — P 2.0, I 0.9.

Belgium: 1964-65 — P 0.2, I nil; 1965-66 — P 0.2, I 0.1; 1966-67 — P 0.3, I 0.1; 1967-68 — P 0.3, I 0.1; 1968-69 — P 0.3, I 0.1; 1969-70 — P 0.3, I 0.1; 1970-71 — P 0.3, I nil; 1971-72 — P 0.3, I nil; 1972-73 — P 0.3, I nil; 1973-74 — P 0.2, I nil.

Japan: 1964-65 — P 7.9, I 7.0; 1965-66 — P 12.6, I 8.9; 1966-67 — P16.0, I 9.0; 1967-68 — P 20..2, I 7.8; 1968-69 — P 20.2, I 6.6; 1969-70 — P 20.1, I 5.5 1970-71—P 16.9, I 4.3; 1971-72— — P 13.2, I 3.3; 1972-73 — P 10.8, I 2.5; 1973-74 — P 10.3, I 1.7; 1974-75 — P 10.3, I 1.2; 1975-76 — P 10.2, I 0.7.

Austria: 1964-65 — P nil, I 0.4; 1965-66 — P 0.3, I 0.5; 1966-67 — P 0.9, I 0.5; 1967-68 — P 0.9, I 0.4; 1968-69 — P 0.9, I 0.4; 1969-70—P 0.9, I 0.3; 1970-71—P 0.9, I 0.3; 1971-72— P 0.9, I 0.2; 1972-73 — 0.9, I 0.2; 1973-74 — P 0.9, I 0.1; 1974-75 — P 0.9, I 0.1; 1975-76 — P 0.6, I nil.

Netherlands: 1964-65 — P nil, I 0.4; 1965-66 — P 0.2, I 0.7; 1966-67 — P 0.2, I 1.1; 1967-68 — P 0.2, I 1.0; 1968-69 — P 0.2, I 1.0; 1969-70 — P 0.2, I 1.0; 1970-71 — P 0.2, I 1.0; 1971-72 — P 1.1, I 1.0; 1972-73 — P 1.1, I 1.0; 1973-74 — P 1.1, I 0.9; 1974-75 — P 1.1, I 0.8; 1975-76 — P 1.0, I 0.7.

Distress Signal for Food

From Our Correspondent

BOMBAY:

THE FOOD situation in Maharashtra has reached a critical stage. The production of wheat is likely to be lower by 26 per cent in the State, the market arrivals are lower by 6 per cent and the current trade stocks have declined by 43 per cent. The State Government has appealed to the Centre and Madhya Pradesh to rush rice and wheat. The Chief Minister, Mr. V. P. Naik, is in contact with Mr. C. Subramaniam, Union Minister for Food and Agriculture, and Mr. D. P. Mishra, Chief Minister of Madhya Pradesh, over supplies of rice and wheat to the State. Mr. Naik, listed some of the factors that contributed to the present food situation in the State. First, arrangements made for rice and wheat imports from Madhya Pradesh had not fructified because the State Government could not compel the traders in that State to supply foodgrains to the nominees of the Government. About prices for Madhya Pradesh rice and wheat, he said that they were fixed in consultation with both the Centre and the Madhya Pradesh Government. Unfortunately, neither the Madhya Pradesh Government nor New Delhi had taken any decisive step to see that the arrangements agreed to were put through. Mr. Naik also observed that no supplies of wheat could come from the Punjab because of the creation of the wheat zones. Besides, imported American foodgrains were held up in Bombay docks because of the recent strike of 'Matadi' workers. There was some hoarding both by traders and producers in anticipation of higher prices. The Chief Minister said that he had appealed to the trade to release their stocks at prices which were reasonable. The stocks with the trade were purchased not at the prevailing high prices but at cheaper levels obtaining some months ago. It was not fair on the part of the trade in the present difficult situation to insist on realising exorbitant prices when their supplies had been obtained at cheaper rates.

★★

The working of the Gujarat State Financial Corporation for the year 1963-64 shows that an interest has been created in the entrepreneurs of the State, in the useful role of this Institution, in the promotion of medium and small industries. Of the 81 units which have received assistance, 44 are small units. The Corporation which has also been working on agency arrangement to assist small-scale units, has disbursed loans totalling over Rs. 26 lakhs. There has been a decline in the receipt of applications from this sector. Reviewing the position recently, it felt that the limit on loans that could be sanctioned under this scheme at Rs. 25,000, was too low to be of much assistance to small units as the cost of capital goods has substantially increased. The Corporation has, therefore, requested the Government to restore the old agency arrangement under which the Corporation was authorised to sanction and disburse loans from over Rs. 10,000 to Rs. 75,000 and in exceptional cases, up to Rs. 1 lakh which was likely to attract more small industrial concerns for assistance under the "State Aid to Industries Rules." The textile industry has claimed a major share in the loans sanctioned as well as disbursed; Rs. 56.82 lakhs were sanctioned while Rs. 35 59 lakhs were disbursed. The solvent extraction units claimed loans of Rs. 27.72 lakhs (sanctioned) and Rs. 21.50 lakhs (disbursed).

A number of units manufacturing machinery and machine parts has been sanctioned over Rs. 20.82 lakhs as loans. Manufacturers of paper and paper boards have been sanctioned over Rs. 21 lakhs. Besides, new units in the manufacture of industrial gases, clinical apparatus and hard gelatine capsules have also received substantial assistance from the Corporation. The rate of disbursements and the amount of industrial loans sanctioned has progressively increased during the three years of the Corporation's existence. The total disbursement made during 1963-64 amounted to over Rs. 52.26 lakhs against Rs. 37.34 lakhs in the previous year. Similarly, the total amount of loans sanctioned during the year was also the highest at Rs. 75.25 lakhs against Rs. 49.06 lakhs made in the previous year. The Corporation in 1963-64 showed an increased income of over Rs. 9.33 lakhs against Rs. 7.92 lakhs in the previous year. The profits went up to over Rs. 5.78 lakhs against Rs. 5 lakhs in the previous year. The resources position has improved substantially after the successful flotation of bonds over Rs. 60 lakhs during the year. The Corporation also obtained sanction from the Refinance Corporation, for refinance for Rs. 46.93 lakhs out of which Rs. 16.51 lakhs have been availed of already. The liquid resources at the end of March have been placed at over Rs. 84.36 lakhs against the commitments of Rs. 52.95 lakhs.

★★

It is understood that the Government of Maharashtra is considering a proposal to enforce the 'Land Use Act' to regulate the use of land in urban areas, especially to ensure better town planning and facilitate quicker execution of such planning. At present, Government has only indirect means of regulating land use, such as by refusing to license commercial establishments in a residential area if they are considered uncongenial to the surroundings. The Gokhale Institute at Poona has drawn attention to the haphazard developments in the region of Poona, in the wake of growing industrialisation and the hectic movement of labour from the heart of the city to the remote work sites, in the absence of suitable industrial housing schemes, or other amenities. The State Minister for Urban Development has suggested the setting up of a metropolitan or development authority to co-ordinate town planning authorities in every major area. A skeleton governmental metropolitan staff has already been set up at Poona for preliminary surveys. Besides the severe shortage of qualified town planners, to the extent of 50 per cent of the needs as stated by the Minister, the old Bombay Town Planning Act of 1954, still in force, suffers from severe handicaps. Having been legislated prior to the re-organisation of States in 1956, the Act is ineffective in those areas of Vidharbha and Marathwada, formerly parts of Madhya Pradesh and Andhra. Also, under its limited provisions, town planning schemes are not statutory in those parts of urban areas which fall outside the municipal limits.

★★

Mr. Balwantrai Mehta, Chief Minister of Gujarat at the first meeting of the Gujarat State Mineral Advisory Board disclosed that the Government of Gujarat is considering the employment of foreign experts or any national or international agency to prepare project reports on lignite deposits on the lines of the report prepared by the Neyveli Lignite Corporation. The Government wants quick results in exploiting the mineral resources. The survey work of lignite in Broach and Kutch districts was already in progress and it was expected to be over by the end of the third Plan period. The Union Government had been approached to assist the State Government in completing the survey work speedily. Mr. Mehta suggested the preparation of pamphlets giving details of minerals, their grades etc., so as to enable the industrialists to be conversant with facts. On financial assistance to the new industries it was revealed that the Government was considering a scheme to provide loans, allot lands etc. and assist the establishment of a considerable number of useful industries in the State in the fourth Plan period. It was disclosed that fluorite deposits near Amba Dungar in the Baroda district would probably be of the order of 1.3 million tonnes and would be the largest known deposits in the country. At the meeting, several other issues, like survey and estimation of lignite in Kutch and Broach districts, survey of bauxite deposits in Kutch and Jamnagar, survey of china clay deposits in Saurashtra, Broach, Amreli and Kutch; survey of fluorite in Baroda district and of other minerals in various districts, royalty, unification of rules, elimination of delay in disposal of applications, etc., were also discussed.

★★

Mr. G. L. Mehta, Chairman of the Industrial Credit and Investment Corporation of India, inaugurating the summer school for Chartered Accountants at Bombay suggested that it was more economic to 'buy' than to 'make'—particularly in industries subject to economies of scale. A peculiar tendency in India among manufacturers to make everything needed under one's roof had resulted in the existence of a larger number of small-sized uneconomic captive manufacturing operations. Many rigidities and shortages prevalent in our economy encouraged this tendency, but sound costing practices showed that in many cases, it was more economic to buy than to make. This could also lead to an adoption of more sound policies on scale of units to be set up by plan authorities. Mr. Mehta observed that India was now at a stage in industrial and corporate development which the wes-

born countries had reached more than a 100 years ago There-fore she was still drawing large funds from outside individual investors unlike modern companies in the West which depend-ed to a larger extent on ploughed back profits. Also, both the levels of literacy and investor attitudes in India today were akin to those prevailing in the West about a century ago, and the need to assure them about their investment correspond-ingly larger. He said that in a mixed economy like ours, where decisions tended to be taken on grounds of expedi ency, there was a great need for independent professionals, like Chartered Accountants as their viewpoint would help to cor-rect excesses.

Resources for the Tea Industry

From Our Correspondent

CALCUTTA:

LIKE HOUSING and food supplies in Calcutta, the problem of public transport has now become intractable. At any time during working hours of the day, trams and buses ply much more overcrowded than they did only a few years ago. Any one not familiar with the conditions in the city would wonder why the number of vehicles is not being increased. The answer is that the haphazard way in which this huge, sprawling city has grown up sets a sharp limit to expansion in surface trans-port. Most roads in the city are narrow, so narrow in fact that it is difficult for two public buses to pass without brush-ing against each other Apart from being narrow, the streets are also very congested, full of slow-moving vehicles like rickshaws and push-carts and, worse, jay-walk.ng pedestrians absolutely with no road sense. That makes it difficult for automobiles to move fast; even so, street accidents are fre-quent, w.th local people often meting out rough justice to offending drivers.

The maintenance standards of the State transport author-ities are not what they should be A few months ago, there used to be unusual number of breakdowns on the road. Main-tenance appears to have improved of late, but a lot remains to be desired. Drivers still complain about the inadequacy of the organisation's repair and maintenance service. Such allegations cannot be verified easily, but the appearance of the buses would lend belief to such complaints. The trans-port authorities of course have their own answers. They have been called upon to carry an ever increasing numbe: of people as the lure of the city (specially because of expanded economic opportunities flowing from industrial expansion in the city and its neighbourhood) draws more and more from the stag-nant countryside. They have to keep in service as many vehicles of their fleet as possible, and often beyond what the normal maintenance requirements would justify.

Financial Worry

This necessity apart, the State transport undertaking has a lot to worry about its finances. The fare structure which it has been allowed to adopt is not an economic one. It does not allow it to build sufficient reserves to finance im-provement and expansion of its fleet. Raising the fare for public transport usually provokes political agitations. When the State Transport authorities raised the fare by one paisa a few months ago, leftist parties gave a boycott call, but the travelling public fortunately, ignored it. That is no guarantee, however, that all future increases will go unprotested. The chairman of the Calcutta State Transport Corporation, Mr. A. B. Ganguli, in the course of a recent address to the Indian Council of Economic Affairs, Calcutta, has urged the need for a ra-tional fare structure with the pricing of the service being scientifically related to the length of distance travelled. This is what the structure at present is not, and the Corporation, in spite of the one paisa increase, will not be in a position to earn a reasonable profit after meeting all operational expenses. But even if the people of Calcutta can be persuaded to pay more for the sake of better and more efficient public transport, there will still be no prospect of their getting an adequate transport service. Some 224 State buses will be added to the existing fleet over the next 14 months, but as Mr. Ganguli himself pointed out, the addition would not pro-vide much relief, and even this addition would require con-siderable planning and regulation of traffic. It is obvious that in addition to the existing two means of transport — trams and buses — a third one, either underground or overhead, will have to be found. This is what the Government has been considering for a long time, and of the two feasible alternatives — and underground tube railway or an overhead aerorail — the latter is considered the better proposition, taking all things into account, the cost in particular. But when and how soon this can be done, no one (including the Government), seems to know.

**

Mustard seed is among the 14 commodities, futures trad-ing in wh.ch has just been banned by the Forward Markets Commission, but that has yet to produce any perceptible effect on the supply situation in West Bengal, particularly in Cal-cutta. Mills which produce mustard oil, an essential cooking medium in Bengali homes, have just given notice of their intention to close unless something is done in the meanwhile to ensure mustard seed supplies to them in regular quantities and at reasonable rates. Owing to the failure of this year's crop, there has been considerable speculation in this commo-dity leading to an abnormal rise in the price of the seed. The millers say that there are plenty of old stocks with the traders in West Bengal to meet the mills' requirements for at least a few more months, but the merchants have not only enhanced their rates; they are also not selling from their stocks freely. The mills' move is obviously designed to put pressure on the Government to compel the traders to release their stocks at rates prevailing before the current speculative rise, since the Govern-ment has fixed a ceiling for mustard oil price. The Govern-ment apparently is finding itself in the same helpless position as it does in regard to rice supplies. What makes the Go-vernment's position more difficult s the fact that while West Bengal produces the major part of its own rice requirements, it depends on outside sources to meet the major part of its mustard seed requirements. It can at best fix prices for mustard seed, but will that help?

**

The Eastern Regional Council of the Institute of Cost and Works Accountants of India has done well by holding a seminar on cost control and cost reduction, which Dr. V. K. R. V. Rao, Member, Planning Commission, opened last week. Cost control is of fundamental importance to India's industrial and general economic progress. It will help industry to run itself on more efficient lines and thus bring benefit to producers and consumers alike; and under the present conditions of critical foreign exchange shortage, it will enable industry to achieve better results on the export front. In the course of his address, Dr. Rao emphasised the latter aspect. Cost reduction was necessary, Dr. Rao said, because the country was short of foreign exchange in industrial, agricultural and educational fields. Foreign exchange could be only obtained either by exporting commodities or services or through foreign aid. Foreign aid can only be of temporary value, so it is very important that the country concentrate on exports. Commo-dities can be exported only when their quality is good and

prices are competitive. The subsidy approach to exports pro-vides no permanent solution. Besides, it invites retaliation, from the affected countries. Discussing the various strands of a cost reduction programme, Dr. Rao said that the signi-ficant factors were a functional classification of costs and a favourable input-output ratio. Towards this end, every pro-gressive management must follow an intelligent inventory control policy. Organisations like the Institute must also help industries to achieve a better control over costs. The presi-dent of the ICWAI, Mr. J. N. Bose, emphasised another aspect of the problem — that of fighting inflation. If more pro-duction is to be got out of each unit of capital invested, in-dustries must rigidly control costs. An aspect of industrial costs, which apparently received less attention than it de-served, is the Government's indirect taxation policy which adds to production costs at several points in the same process.

**

The Deputy Chairman of the Tea Board, Mr. A. K. Ray's speech at the recent annual meeting of the Assam branch of the Tea Association of India in Jorhat, was interesting for the infor-mation it provided on the Tea Board's drive to promote the sales of Indian tea abroad. Apart from advertising tea in all major consuming centres of the world, India will be parti-cipating in a number of international exhibitions. Indian tea will also be served at Tokyo Olympics. "We are making an all-out effort to project vigorously the image of Indian tea in all possible markets. But the key to more exports is in-creased production." It is on the latter point that the views of the Government and the industry differ. The industry does not think that increased production will automatically lead to higher exports, especially if sufficient attention is not paid to the production of quality grades. The Government's fiscal and labour policies do not show that it is firmly seized of this matter. The fiscal policy gives no special encourage-ment to the production of quality teas through new plantation or replantation of old areas. The labour policy has so increased the industry's welfare burdens that much of its resources is used up in providing amenities for labour. In addition to existing obligations, two fresh burdens are on the cards; building of labour quarters according to the specifications of an official body, and secondly, the pending award of the Wage Board. The Assam Govern-ment has again increased its sales tax and agricultural income tax rates as applied to the tea industry. In the circumstances, the industry can take positive measures to produce more tea, more quality tea, only when it can find the necessary finance for it. The finance available under the Tea Board's loan scheme is costly, and the industry simply has not enough internal resources to meet the expenditure in full. As a major foreign exchange earner, the industry deserves special help from the Government, and Mr. S. R. Daga, president of the Tea Asso-ciation of India, suggested in the course of the speech the ways in which the Government should help the industry for the solution of its short-and long-term problems.

**

Bihar is deficit in food despite the potential for enough additional production to achieve self-sufficiency in this field. That the deficit should persist in spite of efforts spread over 13 years of planning, does not speak highly of the efforts, but has always been the State Government's defence that it is han-dicapped by funds and the Centre has not been giving enough for the purpose. When Sardar Swaran Singh visited Bihar a few weeks ago in his capacity as the Union Food Minister, he tried to ascertain as to what actually the causes were. In the course of the discussions which he had with the Chief Minister and his colleagues, several deficiencies came to light. First of all, Bihar's irrigation programme has been a near failure. As against a target of 2.5 million acres, a potential of only 1.6 million acres is likely to be achieved by the end of the third Plan. The actual result would cover all major, medium and minor projects. Most of the medium and minor projects on which much depends in the short run have been accomplish-ed only in the statistical sense, for it is reported that many of the irrigation channels constructed for the flow of tubewell water are in a state of complete disrepair. The progress in the field of major irrigation is not more reassuring. Major projects like the Kosi and the Gandak will take much longer than expected to yield the planned benefits. This poor pro-gress of irrigation schemes keeps the crops hopelessly depen-dent on the monsoon, and how can the State hope to achieve the additional 20.27 million tons of food production as the target for the third Plan requires? The Bihar Government is quite candid in its admission that its agricultural plan for the current quinquennium will be a half success, half-failure that is. At the first meeting of the State Planning Board, the Chief Minister, Mr. K. B. Sahay, admitted that the State would be able to produce only an additional 14.02 million tons, as against the target of 20.07 million tons during the third Plan period (the base at the end of the second Plan was 60 million tons). He also admitted that this was due primarily to insufficient progress in irrigation. The State has now made out a case for increased Central assistance; the amount asked for is some Rs. 11.4 crores. But the Centre can provide funds only when it is convinced that the money will be put to the most efficient use and not wasted through official incompetence or extravagance. Meanwhile, the State Government is likely to set up, as suggested by Mr. Singh, a high-powered body to co-ordinate agricultural activities. The Chief Minister will head this body, which will also consist of the Minister of Agri-culture and other Ministers of allied departments.

Changing Food Habits Reduce Urban Supplies

From Our Correspondent

MADRAS:

JUST AT a time when the Central Government has expressed great concern over the price situation some new developments have taken place in the foodgrains and cloth trades which have caused considerable worry to the consumers in different parts of the country. In the Southern Zone particularly the situation in regard to the availability of rice and sugar is getting more and more difficult as the months pass by. In the urban centres the hardship is not so keenly felt as in the rural areas as sales through the fair price shops have been helpful. Even here, the State Governments have been finding it impossible to meet the demand from consumers, albeit on a rationed basis, as the gap between the prices charged by the appointed dealers and those prevailing is so wide that, in the context of rising cost of living, there is anxiety to effect saving in expenditure wherever possible by making purchases from the fair price shops. In the past fortnight arrivals from Andhra Pradesh into Madras City have been very restricted while there is a large demand from dealers in Kerala. The competition for purchasing available supplies is so keen that the lower grades of rice from Andhra Pradesh and the Southern districts in Madras State are being exported to Kerala. The spurt in prices for inferior grades has naturally had its effect on the values for the finer varieties.

The curious phenomenon is the absorption of available supplies even at fantastic rates. In the Kuttalam rice market, which is the main centre for trade in this commodity in the granary of Madras State, new records have been established

and large sales have been reported in the past few weeks at rising prices, there being a heavy offtake on account of Kerala dealers. It has also been suggested that, on account of fears of some sort of control over the trade being imposed at all levels, there has been cornering of available supplies. These purchases, however, could have only exaggerated the upward trend. Even though the damage to the rice crop was not so heavy as expected earlier in both Andhra Pradesh and Madras States, the impression has gained ground that the surplus available in Andhra Pradesh is not as large as in earlier years as the local population has been changing over from coarse to fine cereals. In Kerala too consumption has been increasing at a fast rate on account of the larger employment available to the able bodied through recruitment to the Defence Services and through rapid industrialisation of the State. In Madras State also the general intake has tended to increase because of changing food habits and better living conditions in the rural areas. Left to itself the Madras State Government would be able to meet the requirements of its population as the yield of rice crop has increased appreciably in the past few years and the cultivators have shown a keen sense of awareness and are ready to take to new methods of agriculture which will result in the raising of larger crops from the same acreage. Sales of fertilisers have been fairly heavy and with the completion of the Parambikulam Project and many other medium-sized irrigation schemes, the target for production for the third Plan may easily be reached. If Andhra Pradesh too can step up its output the needs of Mysore and Kerala can be met without serious difficulty. But a more vigorous handling of the production and marketing problems is necessary as the changing food habits of the lower income group might upset all calculations.

In respect of sugar the same story is being repeated. Even though availability during the current season will not be less than 24,00,000 tonnes for the whole country and the factories in the Southern States have done extremely well, sales through co-operatives and fair price shops have been on a restricted scale and the quantum available for every family has been considerably reduced.

The move of the cotton mills in Bombay and Madras States, which account for a sizable proportion of the country's output, has also had an upsetting effect on consumers. It is agreed that the cotton textile industry has a valid case for increasing its selling prices for cloth and yarn as there has not been any major change since 1960. The voluntary price control scheme was scrupulously respected by the leading producers in the industry though the consistent rise in prices for cotton and an increase in the wage bill have upset all calculations. Even with a large increase in the turn-over a reasonable level of profits could not be maintained especially as with heavy expenditure on modernisation and renovation, depreciation charges were very much higher. There was naturally resentment that retail prices were unduly raised by heavier excise duties and sales taxes and that the producers were not even allowed to adjust their prices to some extent. It has been contended that as compared to 1961 costs on account of cotton and labour have risen by over 15 per cent and that even the rise in selling price by 10 per cent will not compensate fully the rise in working expenses especially in the case of mills producing coarse and medium varieties. The Government could have agreed to an increase in selling prices with some reductions in the excise duties as any loss of revenue would be offset by higher output in the coming months and next year. In any case, it is apprehended that the cumulative effect of increases in prices for essential commodities will be reflected in a lowering of the standards of living of the fixed income groups and the spread of discontent. The authorities should, therefore, adopt measures which will boost production in several directions. Mere controls over prices and distribution cannot yield the desired results.

★★

The power cut in Madras State has become inevitable. The earlier hopes regarding the ability of the State Electricity Board averting a cut in supply during this summer have been belied as the South-west Monsoon has again refused to oblige. The Madras Electricity Board has 14 power houses and 7 hydel projects having an aggregate capacity of 630 mW. But only about 70 mW of this capacity is thermal in character. The water storage at Kundah and Pykarah particularly is being utilised to the maximum extent but the net outflow has been continuous over several weeks and it is now felt that the demand cannot be freely met without a replenishment of the storages in different parts of the State. Luckily, Neyveli has been coming to the rescue of the State Electricity Board and in the past two weeks the daily supply has been between 4.5 and 5.0 million units out of the total consumption of around 11.0 million units daily. Thus, 48 per cent of the present demand is being met by the huge thermal station at Neyveli. There will be a further improvement in supply from this source when the sixth set is commissioned early next year. But for the help from this source, the cut would have been imposed a long time back. It is still hoped that the 50 per cent of cut on consumption in the case of high tension consumers in the hydel areas and 40 per cent cut in the thermal areas would be ony for a short period. The continuous process industries will not be affected. However, as indicated last week, it has been clearly emphasised that there should be a better balance between thermal and hydel capacity and that if the cuts which have been a recurrent feature of the past few years are to be avoided, the capacity of the Neyveli thermal station will have to be increased in an ambitious manner while the Madras State Electricity Board should be permitted to construct a huge thermal station, suitable for coal or gas firing, near Madras. It is anticipated that by the end of third Plan aggregate demand will be of the order of 15 million kW. The task of creating additional thermal capacity should, therefore, be taken up immediately.

★★

The stock markets have been in the doldrums and business passing has been extremely restricted. Besides the discouraging results of many cotton mills, it is now apprehended that the output of yarn and cloth will be affected by the power cut even though some of the units have got arrangements for generating their own power in a period of emergency. It was hoped that the interruption to production witnessed last year would be averted this summer. As the yield of the tea crop also has been adversely affected, general sentiment is inclined to be pessimistic. With the higher prices for cotton cloth and the hopes that the loss in output for the tea estates can yet be made good if rains in the coming weeks proved to be satisfactory, prices for popular shares need not have been marked down. However, in the absence of encouraging advices from Bombay and with the general disposition to await further development, trading in the local stock markets has been extremely restricted. It is agreed that the tax burden on the corporate sector especially in the case of selected industries is much lower than in the past year though investors have not regained confidence in the immediate outlook. The sudden demise of Mr. Nehru has also had complicating effect. It is not yet clear what the Shastri Government will be able to achieve and whether it will pursue radical policies which will create new difficulties for industries. So long as there is no large buying on account of individual investors there cannot be any significant recovery in prices. And investors in this part of the country are so cautious that only if there is ressurance about the policies of the new Government will there be a disposition to come out of the hiding.

The moving finger writes

MAIDEN performances may normally expect sympathetic audiences and I am, therefore, not surprised that Mr. Lal Bahadur's first broadcast as Prime Minister was widely well received. Indeed, it was even eulogized in the press and elsewhere. The main appeal of the broadcast perhaps was that it was reassuring, even soothing to national nerves, until recently drawn taut by the question "After Nehru, Who?" and still nagged by the other question "After Nehru, What?". In the circumstances, Mr. Lal Bahadur's prescription of the status quo in the matter of policies or programmes was apt to come as a relief. Consequently, the weakness of the broadcast — that he really had nothing new to say — was, in a way, its strength.

But public opinion will certainly be more discriminating and even demanding on future occasions. It will certainly not remain satisfied with being merely told at appropriate intervals that the heirs and disciples would remain loyal to their late Master's principles or beliefs. The world does not stand still; and in a more specific context, to the extent that the Government in this country had not always been able in the past to deal with problems satisfactorily, it would obviously be compelled to think anew or act differently in the future in order to clear accumulated arrears in policy-making or performance. And so, when next Mr. Lal Bahadur goes on the air, more attention will certainly be paid to the point whether what he has to say gives evidence of topically relevant and purposeful cerebration on the part of the Government.

★★

Again, it will not only be the substance that matters. The style will also count. Jawaharlal Nehru could do magic with words. Even on the occasions when his thinking was not clear or his ideas were apt to be vague, he could still manage to find words to express himself in an appealing or arresting manner. He had a feel for the nuances of words and phrases and he had a passion for speaking or writing them beautifully. Mr. Lal Bahadur's gifts do not lie in that direction. However, in the special circumstances of his early days as Prime Minister, the aura of sincerity and simplicity which surrounds him and informs his manner of talking or doing things has been some compensation and has served him well with a public, a large part of which still does not seem to have got over the wonder that there could have been a Prime Minister at all in succession to Jawaharlal Nehru. It may, however, be pointed out that honeymoons do not last for ever. The Prime Minister, therefore, cannot afford not to cultivate his public relations carefully. His predecessor was one of the most articulate persons in the world of politics and to him mass communication was not an effort but an element of his very being. Mr. Lal Bahadur must now set out to acquire deliberately what nature has obviously not too lavishly endowed him with.

I suggest that the Prime Minister should provide himself with a good team of speech-writers. This would be particularly desirable since it is not very likely that Mr. Lal Bahadur will exactly be erupting with new ideas every other day. When so much of what one has to say is something which has been said before, it becomes all the more important that it should be said well. I do not think that the Press Information Bureau, in the usual course, could provide him with the kind of talent I have in mind. I am sceptical also that the common or garden variety of the IAS Private Secretary would be the answer. I, therefore, suggest that the Prime Minister would be well advised to ask his talent scouts to look widely and deeply both within the Government and outside for a few men with the gift for the apt word or the magic phrase. I do often wonder whether it was not because the late President Kennedy had wisely equipped himself well in this matter of speech-writers that the New Frontier had almost managed to become a living reality even without quite succeeding in passing from phrase to programme.

★★

Incidentally, at the risk of being misunderstood, I would suggest that the Prime Minister should now lay off this 'humility business". Mr. Lal Bahadur is so transparently sincere that the risk of his sounding like a Uriah Heep is, no doubt, remote. Even so, the essence of modesty is that it should remain modest in all circumstances — modest, that is, even in proclaiming itself. Neither the world nor the country needs to be told again and again that Jawaharlal Nehru was an exceptional person. Jawaharlal Nehru's greatness is something which is of the experience of us all. There is no danger of any of us assuming that Mr. Lal Bahadur considers himself, or will ever consider himself, as a second Jawaharlal Nehru. There is, therefore, no need at all for Mr. Lal Bahadur speaking frequently of his awareness of his limitations for a job with as illustrious an antecedent as is the Prime Ministership of India. In fact, it is not seemly that the Prime Minister of this country should be publicly disparaging himself too often. Whether one likes it or not, the Indian mind is traditionally used to worshipping gods — and propitiating devils. It desires and demands that its leaders should be larger than life. If a Prime Minister of India chooses to ignore this sentiment unduly, he may well end up by being taken at his word.

★★

A woman who cannot say "no" is a danger to herself. A man who cannot say "no" could be a danger to others. I hope Mr. Lal Bahadur will awaken in time to the danger of his going down in modern Indian history as the Prime Minister who could not say "no". That he has decided to continue all the 20 out of the 22 Deputy Ministers on the public payroll may do credit to his heart, but it certainly cannot contribute to the improvement of morale in the Congress parliamentary party or standards of competence in the Government. The Prime Minister has been praised in some quarters for having shifted to new assignments those Deputy Ministers who had previously been for years at their particular posts. Mr. Lal Bahadur would have been deserving of even greater credit had he applied a simple, but excellent, rule that all those Deputy Ministers who had been at their jobs for, say, three years, without any great distinction, should gracefully make way for other hopefuls in the party. After all, the only justification which the institution of Deputy Minister can have is that it provides a safe means of testing the raw material in the ruling party. If this purpose is to be served, it is obvious that the turn-round of Deputy Ministers should be fairly rapid so that there is some chance for the processes of selection to work themselves out. We are now around the mid-term of the present Parliament and this is the proper time for some weeding out to be done among the Deputy Ministers so that openings and opportunities could be found for others — preferably promising young men (or women) —in the party.

V. B.

Trade Winds

COTTON PRICES FOR 1964-65

THE GOVERNMENT of India has announced that the floor and ceiling prices of cotton for 1964-65 season will be maintained at the same level as in the current season of 1963-64. Marginal increases have, however, been made in the floor and ceiling prices of some of the varieties keeping in view the improvement in their quality. An increase of Rs. 8 per quintal (Rs. 28 per candy) in the floor and ceiling prices of Digvijay 'A' has been made. The varieties AK-235 and AK-277 have been included for the first time in the price schedule and have been given the same floor and ceiling prices as for 'Gaorani' 6 and 12. The price schedule for 1964-65 also provides premium for "sawginning" in respect of all varieties, excepting Bengal Deshi, at a uniform rate of Rs. 14.10 per quintal (Rs. 50 per candy) at the floor level and Rs. 21.10 per quintal (Rs. 70 per candy) at the ceiling level. In the case of Bengal Deshi, the premium will continue at the existing level of Rs. 9 per quintal (Rs. 30 per candy).

The floor and ceiling prices (per candy) of various varieties under the new schedule will be: Moglai Jarilla Rs. 702 and Rs. 947; Vidarbha MP 197/3, Rs. 752 and Rs. 1014; Khandesh Virnar 197/3 Rs. 787 and Rs. 1095; Digvijay A Rs. 897 and Rs. 1195; Digvijay B Rs. 772 and Rs. 1051; Surti Rs. 896 and Rs. 1210; Punjab American 320 F Rs. 823 and Rs. 1075; Punjab American H 14, Rs. 850 and Rs. 1170; Westerns Rs. 741 and Rs. 1018; Karuganni Rs. 840 and Rs. 1120; Dholleras Rs. 961 and Rs. 935; Pratap Rs. 680 and Rs. 905; Bengal Deshi Rs. 609 and Rs. 819; Oomras Rs. 650 and Rs. 345; Mathia and Kungari Rs. 623 and Rs. 826; Buri American Rs. 91 and Rs. 1164; L147 Rs. 972 and Rs. 1264; Gaorani 6 and 12 Rs. 840 and Rs. 1122; AK 235 and 277 Rs. 840 and Rs. 1122; Kalyan Rs. 718 and Rs. 997; Jayadhar Rs. 843 and Rs. 1132; Laxmi Rs. 930 and Rs. 1219; Cambodia A Rs. 1165 and Rs. 1479; Cambodia B Rs. 1011 and Rs. 1325 and Cambodia C Rs. 948 and Rs. 1236.

The cotton grown in the districts of Ahmednagar, Poona and Sholapur of Maharashtra State, Bijapur district of Mysore State and the summer 'Cambodia Uganda' crop grown in Madras State which move in the months of July and August will be treated as new crop. The prices specified in the schedule will be reduced for cotton which appear to have been deliberately mixed or deliberately watered. In such cases the minimum and maximum prices will be reduced by an appropriate amount to be determined by the Price Control Committee after examining the samples submitted by the buyer or the seller. The Price Control Committee will comprise Mr R. G. Saraiya, Mr Jehangir P. Patel, Mr Contractor, Mr Pratap Singh Mathuradas, Mr Hansraj Jivandas, Mr Tricumdas Chhabildas, Mr Manubhai N. Amersey, Mr R. D. Shah, cotton adviser, Mr Dayabjibhai G. Patel and Mr K. M. Patel.

WORLD'S RUBBER POSITION

At its seventh meeting held recently in Tokyo, the International Rubber Study Group arrived at the conclusion that a major factor in the present world supply and demand position for all rubbers was the existence of substantial surplus production capacity for synthetic rubber. This had led to intense competition among the various synthetic rubbers, which in turn resulted in depressing the price of natural rubber. In the coming years there was every prospect of increasing competition between natural and synthetic rubbers on the one hand and among various types of synthetic rubbers on the other. Consequently there would be a decline in the price of both natural and synthetic rubbers. The impact of this decline in price would be of particular concern to those countries where the natural rubber industry was a major source of foreign exchange earnings and government revenue besides being the major source of employment and income to a large percentage of the population.

Assessing the demand and supply position of natural and synthetic rubber in 1964 the study group estimated that the world might consume some 2,255,000 long tons of natural rubber, and 2,545,000 long tons of synthetic rubber. As regards production, it was estimated that the world output of natural rubber in 1964 would be 2,135,000 long tons and of synthetic rubber 2,690,000 long tons. In addition to this, about 95,000 long tons of natural rubber would be available from government stockpiles during the year. These estimates do not include China and non-member countries of Eastern Europe. The country-wise estimates of production and consumption of natural and synthetic rubbers in 1964 are given in the tables below:

TABLE I.

ESTIMATED CONSUMPTION OF NATURAL AND SYNTHETIC RUBBER IN 1964.

(in 1,000 long tons)

Territory	Natural	Synthetic	Total
United States of America	435	1,355	1,790
Japan	207	138	345

Over 100 Years of Banking in India

NATIONAL AND GRINDLAYS BANK LIMITED

(Amalgamating National Bank of India Limited, Grindlays Bank Limited and the Eastern Branches of Lloyds Bank Limited)

Registered in London under the Companies Act of 1862 on the 23rd March, 1866. The Liability of Members is Limited.

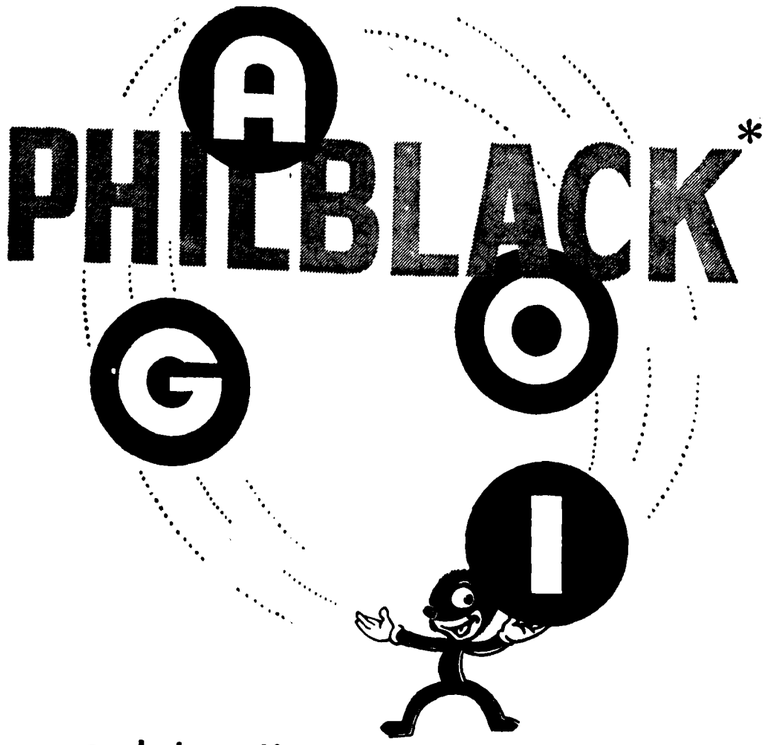
Bankers to the Government in Aden, Kenya, Uganda and Zanzibar.

AUTHORISED CAPITAL ... ... £ 9,000,000
ISSUED AND PAID-UP CAPITAL ... £ 5,703,000
RESERVE FUND ... ... £ 5,400,000

HEAD OFFICE: 26, BISHOPSGATE, LONDON, E.C.2.

London Branch:

13, ST. JAMES'S SQUARE, S.W.I.



Branches throughout Aden, Ceylon, India, Kenya, Pakistan, Northern and Southern Rhodesia, Somalia, Tanganyika, Uganda, and Zanzibar.

The Bank conducts all classes of Banking and Exchange Business throughout the world.

Delhi Branches:

Chandni Chowk; Chandni Chowk, (Lloyds Branch); Bhichha Mal Building, Grand Trunk Road, Kamla Nagar; Delhi Cloth Mills Premises, Bara Hindu Rao; 10, Parliament Street, (Lloyds Branch); H Block Connaught Circus; 10-E Block, Connaught Place; 1689, Arya Samaj Road, Karol Bagh; Jeevan Vikas Building, Asaf Ali Road.

outstanding performance

For more tread miles at moderate cost...for high reinforcing properties...for overcoming tough obstacles ...for excellent mould flow...for smooth and easy extrusion...versatile PHILBLACK. Developed to cover diverse rubber processing needs and famous all over the world for outstanding performance, four types of PHILBLACK are now available to you from India's first Carbon Black Plant at Durgapur.

Let any or all the types of PHILBLACK *work for you.*

PHILBLACK G, General Purpose Furnace Black

PHILBLACK A, Fast Extrusion Furnace Black

PHILBLACK O, High Abrasion Furnace Black

PHILBLACK I, Intermediate Super Abrasion Furnace Black

PHILLIPS CARBON BLACK LTD.

CANADIAN CREDIT FOR ZINC SMELTER

Under an agreement signed recently, Canadian capital equipment and engineering services for the construction of a zinc smelter and an associated sulphuric acid plant near Cochin in Kerala State, will be available to M/s. Cominco Binani Zinc Limited, Calcutta, which is a joint venture set up by the Consolidated Mining and Smelting Company of Canada Limited. Montreal, and its associate, Metal Distributors Limited, Calcutta. The Export Credits Insurance Corporation, Ottawa, has agreed to lend $1.6 million to cover part of the foreign exchange costs of the $12 million project. Repayment of the loan (at 6 per cent interest) will be made over a period of ten years following a 5-year period of grace. The ECIC loan is being made out of the special credits committed by Canada under its contribution to the World Bank's Aid India Consortium. This is the first occasion when the ECIC has agreed to give a loan direct to an Indian company rather than to the Government of India. The Consolidated Mining and Smelting Company of Canada will make a direct investment in the venture to the tune of $2 million, part of which will be used to cover Canadian and other foreign purchases. The rest of the financing will be shared by Metal Distributors Limited, the Industrial Finance Corporation, the Government of Kerala and the Indian public. On-site work on the project has already commenced and is expected to be completed by the middle of 1966. The plant will have a capacity for the production of 20,000 tons of zinc a year and 125 tons of sulphuric acid a day. The present demand for zinc in India exceeds 60,000 tons a year and it is likely to go up to 100,000 tons by the time the Cominco Binani goes into production.

SODA ASH INDUSTRY

Recently, while opening the public inquiry into the continuance of protection to the Soda ash industry beyond December 31, 1964, the Chairman of the Tariff Commission, Mr K. R. P. Aiyangar disclosed that the production capacity of the industry as reported by the units was 279,700 tonnes. The actual production increased from 148,216 tonnes in 1961 to 183,433 tonnes in 1962 and 234,533 tonnes in 1963. Production during the first quarter of the current year was 64,353 tonnes. The share of heavy soda ash in the total production had also been increasing. It was 132 tonnes in 1961, 13,940 tonnes in 1962, 28,230 tonnes in 1963 and 7,772 tonnes during the first quarter of the current year. About 3,300 workers were employed in the industry. He further disclosed that two of the existing four units had plans to expand their capacities over the next three years. According to the Directorate General of Technical Development the aggregate capacity of the four units would then rise to 352,000 tonnes in 1965, 402,000 tonnes in 1966 and 422,000 tonnes in 1967.

In 1961 the Tariff Commission estimated the domestic demand for soda ash (light and heavy) at 260 000 tonnes per annum and expected that it would increase steadily to 425,000 tonnes by 1964. The consumption of soda ash (comprising sales of domestic product, in the country, self-consumption by the manufacturers and the imports) stood at 228,326 tonnes in 1961, 286.737 tonnes in 1962 and 301,562 tonnes in 1963. The estimates of demand for the current year as well as for the next three years, as made separately by the Alkali Manufacturers' Association of India and the Directorate General of Technical Development, are given in the table below :—

DEMAND FOR SODA ASH BY THE CONSUMING INDUSTRIES

(In '000 tonnes)

Name of the consuming industry	1964		1965		1966		1967	
	Assn.	DGTD	Assn.	DGTD	Assn.	DGTD	Assn.	DGTD
Glass industry excluding bangles	75	90	82.5	100	90	114	105	130

JUTE DEVELOPMENT COMMITTEE

With a view to increasing jute yields in the country and improving the quality of the jute fibre the Government of India has decided to set up a central committee for jute development. The new committee will report annually to the 30-year old Indian Central Jute Committee which will continue to be in charge of jute research. The Special Secretary to the Union Ministry of Food and Agriculture will preside over both the committees. The central committee will in fact be set up in place of a jute development board that was suggested by the Srivastava Committee which was appointed in 1962 to suggest measures to modernise and expand the jute industry.

FABRICS FOR FAIR

The Government of India is arranging to participate in a big way in the international fair due to be held in Wellington, New Zealand, from August 20 to September 3, 1964. The Indian pavilion at the fair will display the country's choicest fabrics and handicrafts. Mrs. Paddy Walker, one of New Zealand's top experts on fashion exhibitions, and Miss Barbara Penberthy, a well-known fashion designer, are in Delhi at the invitation of the Government of India to select articles to be displayed at the fair.

RISING EXPORTS

Mr. Manubhai Shah, Minister of International Trade (now Minister of Commerce), disclosed recently in the Rajya Sabha that India's exports at Rs. 69.1 crores in April, 1964 had recorded an increase of Rs. 10.1 crores over exports in April last year when the figure stood at Rs. 59 crores.

Company Affairs

BRITISH INDIA CORPORATION

THE BRITISH India Corporation Ltd., made significant advances in its various activities during 1963. Mr. Satish Chandra, Chairman of the Company, revealed at the annual general meeting held recently that turnover increased by nearly 39 per cent during the year so that profit was also considerably higher. In view of its improved profitability, a dividend of 15 per cent on equity capital has been proposed to be paid. Substantial care has, however, been taken to consolidate the finances of the company, and a sum of Rs. 45.61 lakhs has been ploughed back by way of depreciation, development rebate and general reserves.

Mr. Satish Chandra outlined the progress recorded by several units owned or managed by the Corporation. The output of Cooper Allen and North West Tannery branches, for instance, revealed enhanced activity in the footwear and other leather products. Partly this increase was to meet the demand of the defence forces. He indicated, however, that results could have been still better if prompt supplies of imported factory spares could be obtained. The woollen mills — Lal Imli and Dhariwal — achieved record output and worked on a three shift basis for most of the time. The Government selected advisers to help the woollen mills by meeting their immediate demands that enabled industry to produce woollens according to specifications for the defence forces. The Minister for Supplies paid compliments to the woollen industry in recognition of its high standard of industrial performance.

The three cotton textile mills owned by the Corporation's subsidiaries — the Elgin Mills and Cawnpore Textiles — also worked at full capacity during 1963. The Chairman has mentioned the fact that the company retained only marginal profits for the defence supplies. Elgin Mills, which celebrated its centenary in March, 1964, has continued its expansion schemes. In addition to a licence granted in 1962 for the installation of 12,000 spindles, a further licence for 12,500 spindles each was granted in 1963 to the Elgin Mills and Cawnpore Textiles. The Chairman informed the shareholders that 12,000 spindles would be commissioned by the end of September, 1964 and the additional 12,500 spindles would be commissioned by June 1965. In case of Cawnpore Textiles, 12,500 spindles would be commissioned towards the end of 1965 Out of 240 automatic looms ordered by the Elgin Mills, 112 have already been received and would be put into commission in November, 1964 and the remaining ones are expected by the end of 1964. During the year Elgin Mills spent nearly Rs. 44 lakhs and Cawnpore Textiles nearly 12 lakhs on their rehabilitation and modernisation programme. During the current financial year too Elgin and Cawnpore would spend Rs. 40 lakhs and Rs. 2 lakhs respectively.

The Chairman indicated that it was rather a difficult year for sugar mills. Apart from the well known factor of availability of quality sugarcane, various other causes contributed to the adverse impact on profitability. These factors include unremunerative controlled prices and the old and outmoded equipments in the mills. The company has, however, made substantial efforts to modernise its sugar units and nearly Rs. 40 lakhs have been spent on this programme and even further investments were proposed. The business of its other units like Brushware and Saran Engineering was also considered satisfactory.

HINDUSTAN ALUMINIUM

Hindustan Aluminium Corporation Ltd., has recorded excellent results during the current year and it is likely to wipe out all arrears of preference dividend in 1966 and pay maiden dividend on equity capital in the subsequent year. Mr. M. P. Birla, director of the company, presiding over the annual general meeting in the absence of the Chairman, Mr. G. D. Birla, stated that production was now running at the rate of 2,000 tonnes per month and the sales for the current year might be around Rs. 8 crores to Rs. 8.5 crores. The company produced 22,138 tonnes of aluminium last year against the rated capacity of 20,000 tons.

Explaining the reasons for the delay in the payment of a maiden dividend, Mr. Birla indicated that the aluminium industry was highly capital-intensive which required large provisions for depreciation and development rebate reserve. He estimated that nearly Rs. four crores would be required to be provided for depreciation and development rebate reserve for 1964. Another reason for this delay in the payment of a maiden dividend was the expansion programme taken up by the company. He indicated that the installed capacity of the company has been decided to be increased to 60,000 tonnes per annum in line with the third Plan target, which has been raised from 85,000 tonnes to 120,000 tonnes per year. This expansion has already been sanctioned and Mr. G. D. Birla has been in Washington to negotiate for an Export-Import Bank loan.

Mr. M. P. Birla revealed that the first phase of the expansion programme, intended to raise the capacity from 20,000 tonnes to 48,000 tonnes per annum, was likely to be completed by the end of 1965. This would require an outlay of Rs. 12 to 13 crores. The management, he added, would try its utmost to avoid raising fresh capital to finance this expansion programme. A sum of Rs. 5.5 crores was proposed to be obtained by way of a loan from the Export-Import Bank and the balance from the company's own resources and PL 480 funds. Further expansion of the capacity from 48,000 tons to 60,000 tons per annum would be taken up at a subsequent stage.

Referring to the company's plan to set up its own power plant, he stated that a new company named Renusagar Power Co. Ltd., has been already formed and registered and was negotiating to secure foreign exchange as well as rupee loans. Hindustan Aluminium would also subscribe to the capital of this wholly-owned subsidiary. There was, however, no intention to offer the shares of the subsidiary to the shareholders of Hindustan Aluminium.

Mr. Birla informed the shareholders that the company would bring into operation its entire fabricating capacity by the beginning of the next year and by then it would be in a position to convert aluminium ingots into rods, sheets, circles, and strips so that the profitability of the company would increase further. Last year it sent 4,000 to 5,000 tonnes of aluminium abroad for conversion and this was no more necessary as there was enough demand for metal in the internal market. The shareholders were informed that the Life Insurance Corporation was now holding 74,400 equity and 35,000 preference shares directly and 23,500 equity and 5,500 preference shares through Indian General Guarantee, its subsidiary company. The ICICI held 102,950 equity and 46,359 preference shares.

DUNCAN BROTHERS

The financial results of Duncan Brothers & Co. Ltd. for 1963 show an advance over the previous year in terms of output, sales and profit. The sale proceeds were around Rs. 4.87 crores as against Rs. 3.41 crores last year and profit, after providing for depreciation, was around Rs. 43.16 lakhs against Rs. 35.59 lakhs. Provision for taxation, including surtax of Rs. 5.52 lakhs, was Rs. 26.15 lakhs against Rs 16.75 lakhs. The Directors have proposed to transfer Rs. 1.50 lakhs towards capital redemption reserve. A dividend on ordinary shares is proposed to be paid at the rate of Rs. 12 per share which will absorb Rs. 12.96 lakhs.

It appears that the good performance of the company has been entirely nullified by the incidence of the new corporate surtax and dividend tax. The directors of the company indicate that the surtax, like last year's super profits tax, has the effect of penalising especially those companies, like this one, which are investing heavily in the development of new projects. Moreover its substantial investment in shares of companies with properties in Pakistan have not received any return during the last few years although all possible steps have been taken to obtain the sanction of the Pakistan Government for the remittance of profits of these companies.

The directors have pointed out that the year was less satisfactory for the tea industry but in spite of that, the majority of its interests were maintained on a modest profit-earning basis during 1963. Its jute mills worked at maximum capacity but the trade margins were comparatively small. The company, however, increased its exports during the year. Its woolcombing unit, Isaac Holdens (India) Ltd., showed considerable improvement and a rights issue made at the end of the year was well received and fully subscribed. The working of the dye plant, however, suffered because of the shortage of dyestuffs. Following the acquisition by Woolcombers Ltd., Bradford, of the business of the company's technical consultants, Isaac Holdens & Sons Ltd., it was agreed that the name of the woolcombing company in India should be changed to "Woolcombers of India Ltd.", subject to the approval of the Central Government.

Its newly established units, that would produce carbon black, valves and beadwire were also progressing satisfactorily. The progress at the new oil refinery, in which this company has substantial shares was also expected to start functioning towards the end of the next year.

ANDHRA CEMENT

During the year ended December 31, 1963, the Andhra Cement Co. Ltd., recorded a net profit of Rs. 11.87 lakhs after charging depreciation of Rs. 8.82 lakhs. After making adjustments, the directors have proposed the payment of a sum of Rs. 5.15 lakhs towards taxation, and Rs. 1.53 lakhs towards rehabilitation fund for 1963. Dividend at the rate of 9 per cent on equity shares, subject to tax, will absorb Rs. 6.39 lakhs. It is indicated that production during the year did not improve substantially in spite of satisfactory supply of raw materials, including coal. To some extent, the short supply of transport posed a serious bottleneck with the result that there was an accumulation of stocks of clinker. The company was, however, able to carry out certain major repairs following unprecedented rains during the year. The output of cement and clinker was 160.114 tonnes and 163,219 tonnes respectively. The Government did allow an increase in the price by Rs. 2.75 per tonne (with a reduction of Rs. 0.25 per tonne in the Selling Agency Commission) with effect from June 1, 1963, but this increase was off-set by the increased costs.

ORISSA CEMENT

The working results of Orissa Cement Limited, during 1963, reveal a gross profit of Rs. 100.89 lakhs against Rs. 142.00 lakhs last year. A sum of Rs. 35.39 lakhs has been provided for depreciation and another sum of Rs. 36.05 lakhs has been provided for electricity charges relating to earlier year. The directors indicated that the profits for the year were adversely affected by the short-fall in despatches of cement, silica and basic refractories as well as general increase in costs on account of lower utilisation of production capacity in respect of clinker and certain types of refractories. Even then, the directors proposed the payment of dividend at the rate of Re. 1 per ordinary share of Rs. 10. This amount will be paid out of the dividend reserve to which Rs. 28.56 lakhs have been transferred from the general reserve, besides Rs. 10.66 lakhs appropriated out of the profit of the year under review. The company has continued with its programme of expansion. The second stage of the expansion of the basic refractories plant was completed with the installation of an additional heavy duty hydraulic press and by lighting of the second basic tunnel kiln early in 1964.

GODFREY PHILLIPS

Godfrey Phillips, India, Ltd. recorded a net profit of Rs. 12.34 lakhs, after providing for taxation, depreciation, etc., during the year ended December 31 1963. The directors have decided to transfer to general reserves a sum of Rs. 8 lakhs and to the development rebate reserve Rs. 22,000. An interim dividend of Re. one per equity share, absorbing Rs. 4 lakhs, was declared in December, 1963 and now the directors have recommended the payment of a final dividend of Re. one per share which will absorb another Rs. 4 lakhs. The sales of the company increased from Rs. 5.51 crores to Rs. 6.03 crores. The Chairman, however, indicated, that this did not represent an increase in volume, but merely reflected the increased prices. In fact, the sales in terms of volume were slightly lower than in 1962. Moreover, a larger proportion of the volume was of cheaper cigarettes with lower profit margins. In a way, the company was adversely affected by the recent increases in the various duties levied on tobacco and cigarettes. The company, however, was trying to instal latest types of machinery in order to improve its products and to increase its efficiency.

INDIAN STANDARD WAGON

The directors of the Indian Standard Wagon Company Ltd. report that during the year ended March 31, 1964, there was a profit of Rs. 17.38 lakhs which was nearly the same as last year. Although there was an increase in its turnover —sales at around Rs. 8.75 crores as against Rs. 8.05 crores last year — there was a smaller margin of profits. Provision for taxation absorbed Rs. 125.25 lakhs and depreciation Rs. 6.77 lakhs. The directors have recommended the payment of dividend at the rate of 15 per cent together with a cash bonus of 5 per cent on ordinary shares subject to the deduction of tax. A sum of Rs. 12.75 lakhs has been provided towards general reserve, Rs. 19.04 lakhs towards general development reserve, and Rs. five lakhs towards dividend adjustment reserve.

The company maintained its output of springs, forgings and wagons in spite of serious handicaps in respect of materials. The directors indicate that this uncertainty in respect of supplies is extremely unsatisfactory and precludes an accurate forecast of results for the current year. They, however, are hopeful of further expansion.

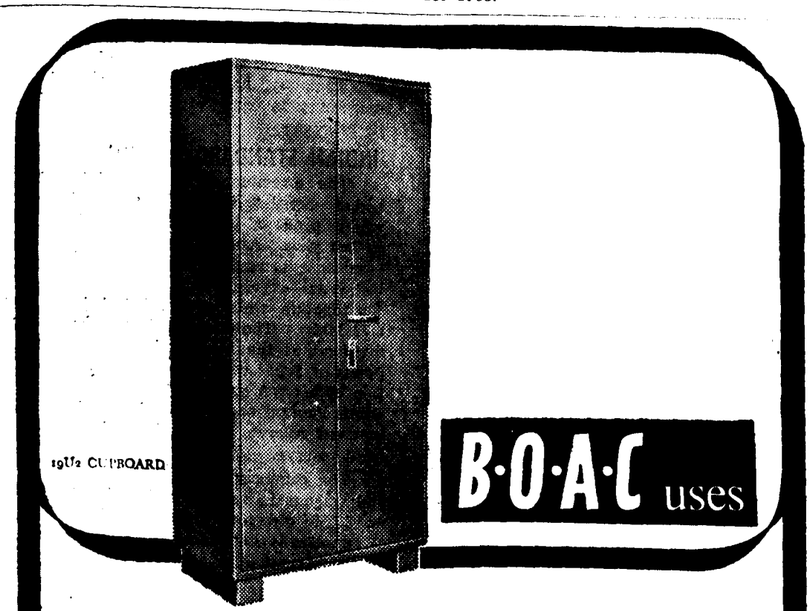
STRAW PRODUCTS

Straw Products Ltd. have recorded satisfactory working results during the year ended December 31, 1963. The gross turnover has reached a new high at Rs. 4.53 crores against Rs. 1.49 crores in the previous year. Commensurate with turnover, the gross profit has risen to Rs. 61.70 lakhs as against Rs. 16.97 lakhs last year. Amongst the allocations, depreciation absorbed Rs. 42.45 lakhs against Rs. 6.14 lakhs while a sum of Rs. 13.00 lakhs has been transferred to general reserves as against Rs. 11.00 lakhs in the previous year. A sum of Rs. 3.06 lakhs has been set aside for payment of arrears of dividend on preference shares for the year ended December 31, 1960. J.K. Paper Mills commissioned in October, 1962 made good progress during the year. After overcoming the teething troubles the mills achieved a good level of production and its total production from the Paper Mills reached 15,737 tonnes during the year under review and the sales amounted to over Rs. 3 crores.

SIMPLEX MILLS

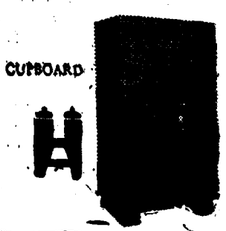
The Simplex Mills Co. Ltd. has announced its working results for the year ended 31st March, 1964. Its sales and gross profits are the highest since the post-War period. Sales profit has sharply increased from Rs 41.53 lakhs to Rs. 55.81 lakhs in spite of rise in the cost of production specially in the

items like cotton, dyes, chemicals, electricity etc. A sum of Rs. 56.34 lakhs has been made available for appreciation after writing back the excess provision of Rs. 0.28 lakhs and balance of profit brought forward Rs. 0.25 lakhs. The directors have proposed the payment of bonus for the years 1957 and 1959 to 1962 of Rs. 10.90 lakhs and provision for depreciation of Rs. 22.94 lakhs, development rebate reserve of Rs. 0.90 lakhs, taxation of Rs 10.45 lakhs, debenture issue expenses of Rs. 0.16 lakhs, dividend reserve of Rs 10.89 lakhs. They have recommended a dividend of Rs. 9 per fully-paid and consolidated share of Rs. 50, subject to deduction of tax, i.e. 18 per cent (against 16 per cent in previous year). The company is not to be subjected to surtax.



SOUTHERN BRICK

The inauguration of the mechanised brick and tile making plant of Southern Brick Works Limited, was recently performed by Mr. M. Baktavatsalam, Chief Minister of Madras. The factory was put up at Orakkad, a suburb of Madras city, at a cost of Rs. 35 lakhs, with the Czechoslovak machinery and technical assistance. The plant is capable of manufacturing one lakh bricks and 25,000 tiles per day.



Mr. K. T. Kosalram, Director, referred to fixing the price of wire cut bricks at Rs. 65 per 1000 as low when such wire cut bricks are sold at Rs. 230 per 1000 today. The use of these bricks will result in the saving of cement mortar, labour and time while giving immense strength.

RUBY GENERAL INSURANCE ISSUE

The directors of Ruby General Insurance Co. Ltd. have decided to capitalise Rs. 6.40 lakhs out of the premium on shares for fully-paid bonus shares of Rs. 8 each in the ratio of one bonus share for every five existing shares. Meanwhile, they have proposed a dividend of Rs. 1.25 a share, less tax, for 1963.

MASSIVE TYRES

FOR MASSIVE WORK

The scraper and the dumper. Two powerful modern beasts of burden, indispensable for moving with continuous operation thousands of tons of earth at project sites. Tremendously heavy and strenuous work, requiring the toughest pneumatic tyres. Dunlop Power Grip and EM. 7 Earthmover tyres are proving themselves superbly in service ... at Koyna, Nagarjunasagar, Kosi, Sharavathi, Beas ... In the iron ore mines of Bihar, Madhya Pradesh, Goa...in the farflung coalfields of the National Coal Development Corporation and at many other project sites all over India.

The tread pattern and especially tough casings of these Dunlop tyres were developed after prolonged field trials in different kinds of terrain in many parts of the world.

BOOKS BRIEFLY

Pyramids of Income

Thompson Consumer Index of Markets: Incorporating a Gazetteer of towns having population of 20,000 and above; Published by Edward J. Fielden for J. Walter Thompson Company Private Ltd., Bombay; Pp. 363; Price not mentioned.

THE ECONOMIC development of this country since independence has increased the total supply of goods and services, though the increment is not distributed uniformly area-wise. The sales departments of companies dealing with consumer goods particularly have to face the problem of organising their sales in such a manner that they may be able to take the maximum advantage of this increase in income. It is not that a company selling, say, radios or refrigerators can raise its sales in the same old areas in direct proportion to its output. It has to make an effort to locate the places where new pyramids of purchasing power are coming up.

The research work done by the market research department of J. Walter Thompson Company Private Ltd., has thrown up useful information regarding the key market factors in 684 cities. Index numbers have been computed which will assist the manufacturers and distributors in broadly establishing sales and advertising targets for their products. No less than 21 different statistical series have been used in the computation of the index numbers; they relate to population, number of literates, number of households, increase in population, employment, number of telephones, number of domestic radio-sets, number of private cars, revenue collected from sales tax, revenue collected from entertainment tax, scheduled banks; electricity consumption etc. Wherever official figures were not available, the researchers made use of unofficial series based on indirect evidence.

Greater Calcutta city emerged at the top of the list when all these factors were taken into consideration. The base, therefore, related to Greater Calcutta with the consumer index number fixed at 100.00. All the other towns were evaluated with Greater Calcutta as the base. The findings of the researchers revealed that the corresponding index numbers for Greater Bombay, Delhi and Madras were 83.93, 44.70 and 32.91 respectively. The number of cities for which the rating was more than one-tenth of the base i.e. Greater Calcutta was not more than 10. Twenty-five towns of the top class represented nearly 41 per cent of the urban market. In other words, if a manufacturer concentrated his sales efforts on the first 25 cities listed in this publication he would cover more than two-fifths of the urban market. At the other end of the scale, there were 592 cities which commanded only 40.5 per cent of the urban market.

The publication has not indicated anywhere as to how the 21 heterogeneous factors were compounded into a single index and what weightage was assigned to each factor in the index. There is no common denominator between electricity consumption and employment or between the ownership of private cars and deposits of scheduled banks. Broadly the first 10 markets have followed the population trend indicating that even though the number of market factors included in the index was no less than 21, population played the dominant role. There was only a slight variation between Poona and Kanpur; whereas Poona's population at 7,78,328 was lower than that of Kanpur at 9,71,062, the index ranking of Poona was higher at 13.13 in comparison with Kanpur at 11.90. Similarly Bangalore, with a population of 12,06,961 had a small superiority over Hyderabad in the index number while its population w fractionally lower than that of Hyderabad (12,51,119).

In the absence of consumer expenditure data for the towns, the Thompson Index is, perhaps, the best possible indicator that could be computed in order to provide some bro guidance to the advertisers as well as the manufacturers. T index does not take into account the qualitative factors, nam ly, the propensity to consume which may be higher in certa areas than in others. The index can be used only as a gener guide and not as a specific indicator for particular produc The consumers of different products are different. The d mand for refrigerators will emerge from a different secti of society as compared to the demand for washing soap. Th index under review does try to take care of this factor b including certain relevant market factors, but the preponde ance of the weightage of population tends to wipe out th impact. The index is a good first attempt; the gazetteer whi gives a number of details about the towns is a useful com pendium of information.

A RISK WORTH TAKING

Report On Prospects For Private Investment in India (wit particular reference to Joint Collaboration Ventures): B Anila Graham; Published by Economic and Developme Research Ltd.; 116, Seymour Place, London, W.I.; Pp. 4 Price not mentioned.

THIS MIMEOGRAPHED document purports to undertake "first hand" examination of the climate for foreig private investment in India in the light of the currer politico-economic situation. The Report goes into the divers factors affecting the prospective investors. The approac adopted here is, first, to highlight the difficulties and deterrant coming in the way of new investment ventures contemplate by foregn investors. Then the author goes on to examine th truth and substance contained in such complaints. In thi process, the debit side of the picture is neatly summed up which is countered by listing the positive aspects of India' economic landscape, making investment in India a profitabl proposition. The central fact standing in the midst of thes several considerations is that foreign private investment i not guided more by any other consideration than by that o secure, competitive profits. Profit-earnings is evidently risky enterprise, where it is never roses, roses all the way The author points out the risks involved and asserts that they are all calculable.

Before embarking on the task of enunciating these factors Anila Graham undertakes to establish the need for foreign capital in India, particularly from private sources. In a country like India, attempting to achieve self-sustained economic development, external capital is needed both for financial and technological reasons. Failing to meet these requirements of external finance from their own sources, owing to the sluggishness of exports, a resort to other sources of finance becomes inevitable. Though inter-Government loans and advances from multilateral international institutions are the most important sources available at present to bridge the foreign exchange gap, they fall short of the total requirements. Hence there is the necessity of tapping the residual source of foreign private capital — a most promising fountain head of foreign capital which does not threaten to dry up at the will of legislators or changing alignments of international

politics. This is a source which promises to be perennial provided adequate inducemens are proffered for this purpose.

After establishing the necessity of continued flow of foreign private capital, the author discusses the policy of the Government of India which welcomes foreign private capital in the country within the broad framework of the Plan, particularly in the priority industries. To put an end to any misgiving entertained by prospective investors in this respect, she quotes Mr. Eugene Black, ex-chief of the World Bank, as saying that "the Government of India's bark is much worse than its bite". She acknowledges the special efforts made in the 1964-65 budget of the Government of India towards "opening the doors even wider to private foreign investment" as being effective. She also takes this opportunity to make it clear that in India mixed economy, public sector and planning have come to stay — though the approach is not doctrinaire. They spring from purely operational considerations. Moreover these policies do not in any way come in the way of the continued flow of private foreign capital into this country. She elaborates this point by quoting the statistics of the growth of private sector during the last decade.

Candid Talk

Coming to the discussion in this report of the snags obstructing the flow of foreign private capital, we find a mixture of candid talk and adroit analysis. It is admitted that taxation is high in India. However, there is not much in it as Dr. Scheel, West German Minister for Economic Co-operation, is quoted as saying that "taxes are high all over the world". Really important are many other factors affecting the rate of profits. Many a tax concession is granted by the Government to the technical personnel. Procedural delays and red-tape, despite a number of committees, continue to cause headache to prospective investors. Fears of expropriation in the Indian context are rather ethereal and the investors can depend on the pragmatic policy of the Government. Moreover, agreements with foreign governments are also concluded which provide certain guarantees; in case of nationalisation, the investors are promised fair and reasonable compensation.

A number of positive aspects are brought to the notice of the prospecive investor which make investing in India sufficently attractive. The first one is the indisputable fact that India is a large and growing market which a dynamic entrepreneur can ill afford to lose. Imports being heavily restricted, the surest method of entering this market is to get under the tariff walls. It is as objective fact that the profits of the foreign controlled rupee companies (about 13 per cent of invested capital) have been higher than those of the branches of foreign companies (over 7 per cent invested capital). Hence to take advantage of one of the biggest potential markets of the world which is also a good centre to serve the Afro-Asian World, foreign producers must invest in India. Here the foreign investor gets the maximum possible facilities with regard to repatriation of capital and the remittance of profits. He is given here equality of treatment with domestic capital and enjoys many fiscal incentives. Profits on foreign private investment in India are also very attractive. Profits in India of British and American companies are higher than in most other parts of the world, including Western Europe.

On the basis of this analysis, the author comes to the conclusion that investing in India is a "calculated risk worth-taking". Neither facts are concealed nor white-washing is attempted. Neither the risks are minimised nor the bright points exaggerated. The clients of this agency at whose behest the Report is prepared would undoubtedly be enlightened by it in making their decision about investments in India. The Report by Anila Graham should prove to be of help to prospective investors in reducing the errors of calculation and judgment. One might at times wish, while going through the Report, that there were less of platitudes. But this, to a certain extent, becomes unavoidable in a generalised study of this type. On the whole, it is a commendable effort which should win recognition for itself.

Protection of your valuables no more a problem.

Your home is perhaps a vulnerable place for keeping costly jewellery and important documents. Why run the risk of losing your valuables by theft, fire and other hazards ?
The local head offices and branches of the State Bank of India afford facilities for the safe custody of your personal effects at moderate charges.
Facilities are also available at local head offices and at a number of important branches for hiring lockers of various sizes.
By depositing your valuables in the State Bank, you will save yourself the worry about their safety.
Please contact the nearest Branch Agent for further particulars.

COMPANY MEETING

BRITISH INDIA CORPORATION LIMITED

Extracts from the Address of Shri Satish Chandra, Chairman, The British India Corporation, Ltd., at the 44th Annual General Meeting of Shareholders held in Kanpur on 6th June, 1964.

Friends,

At the time of issuing the notice for this 44th Annual General Meeting of the Corporation, none of us could ever have imagined that we would be assembling today under the shadow of a great national tragedy and an overwhelming sense of personal grief. On May 27, 1964, our beloved Leader and Prime Minister, Jawaharlal Nehru, passed away and with him ended a glorious chapter in Indians history. With his nobility of character, humane approach to all problems, dedication to high ideals and the spirit of service and sacrifice, he moulded the lives, thoughts and deeds of our countrymen. The best homage that we can pay to this valiant fighter of our freedom struggle and the architect of modern India is to dedicate ourselves to his great ideals of national unity, secular democracy, social justice, universal brotherhood and world peace for which he worked, lived and died. Although it is not possible to fill the void created by his passing away, the work of the nation must be continued with perseverance and high endeavour on the foundation laid by him.

May I request you to stand silently in honour of his memory before I proceed with the normal business for which we are gathered today.

The period under review covers the first complete year of Management of your Company's affairs by the new Board of Directors elected by shareholders in the Autumn of 1962. You will recall the circumstances under which a General Meeting was specially convened, and an election held after several years. I am glad to report that the trading results for the year have been highly encouraging and show a substantial improvement over those of previous years. As you will see from the accounts, our turnover has increased from Rs. 928 lakhs in 1962 to Rs. 1,288 lakhs, i.e. by 38.8 per cent. Surplus for the year amounts to Rs. 236.07 lakhs as compared with Rs. 142.10 lakhs, reflecting an increase of 66 per cent over the previous year. A provision of Rs. 133 lakhs has been made for payment of direct taxes this year as against Rs. 77.54 lakhs last year.

In view of the satisfactory profitability of your Company, the Board after careful consideration have deemed it proper to recommend payment of a dividend of 15 per cent on the Equity Capital i.e., 75 nP. per share as compared with 45 nP. paid last year. It will be appropriate for me at this stage to draw your attention to the fact that out of the year's earnings a total sum of Rs. 45.61 lakhs has been ploughed back in the form of Depreciation, Development Rebate, and General Reserves in order to strengthen the resources of the Corporation.

Leather Branches: The trading results of our Cooper Allen and North-West Tannery Branches have shown reasonable improvement. As against recurring losses suffered in past years by these important branches of the Corporation, it has been possible to return a moderate figure of profit this year. There was increased activity in the footwear, chrome and bark leather departments. Footwear supplies to Defence Forces and the National Cadet Corps were substantial.

Woollen Branches: During the year under review, ou Lal-Imli and Dhariwal Woollen Branches have shown ver good results. A record output was achieved by both th factories, which ran on a three-shift basis for most of th year. In view of a complete change in the normal patter of production to meet the urgent needs of our Defence Force four Wool Advisers including the Superintendent of our Wool len Branches, Mr. V. Calloway, were selected by the Govern ment of India to plan production, negotiate prices, and arrang for raw materials. The team of Wool Advisers visited Aus tralia, New Zealand and the UK to purchase suitable cross bred wools. This co-ordinated effort on the part of Govern ment and representatives of the woollen industry enable supplies of materials for defence production to be made strictly according to specifications and delivery schedules.

The plant rehabilitation and modernisation scheme is making fairly good progress. Seventy-two semi-automatic looms imported from Poland at a cost of approximately Rs. 1 lakhs are now in process of installation. Most of the gilling, drawing and twisting machinery costing about Rs. 13 lakhs imported under rupee payment arrangements has already been received at the mills. An import licence for machinery worth about Rs. 25 lakhs for which an Essentiality Certificate has already been granted is, however, pending disposal. Import of this machinery is essential to enable us to derive the maximum benefit from the machines already purchased. Applications have also been submitted for the grant of import licences for carding, spinning, and winding machinery as well as automatic looms at a cost of approximately Rs. 60 lakhs.

The basic needs of our woollen factories for imported raw materials cannot by any means be met by the Government's present Export Promotion Incentive Schemes. I sincerely hope that allocations of import quotas will be made on the basis of a realistic assessment of the installed capacities as well as the magnitude of trading obligations of each unit. Full advantage continues to be taken by us of raw wool produced and synthetic fibres available in the country within the limits of their usefulness. If we are to remain in effective production, it is essential that the requisite quantity of imported raw material should be made available. I must point out in this context that the value of basic licences last year was reduced by Rs. 32 lakhs and this year there has been a further reduction by Rs. 21 lakhs.

Cotton Textiles: The three cotton textile mills owned by the Corporation's subsidiaries. The Elgin Mills Co. Ltd. and Cawnpore Textiles Ltd., worked at full capacity during 1963 except for the period when production was adversely affected for a few days during October 1963, due to a serious power breakdown in the city of Kanpur. Despite a larger turnover, the profits in both the companies were lower than the previous year, due to enhanced labour costs and a general rise in the prices of raw cotton and all stores and spares. Since 1960, the overall cost of production has increased by more than 16 per cent, but no corresponding increase in the prices of finished goods could be made due to the voluntary price control agreement between Government and Cotton Textile manufacturers. The rapid advance in basic costs, which has caused

profit margins to decline at a rate inconsistent with improved turnover, has now become a matter of concern to the Industry.

In addition to a licence granted to Elgin Mills in 1962 for the installation of 12,000 spindles, further licences for 12,500 spindles each were granted last year to the Elgin Mills and to Cawnpore Textiles.

The rehabilitation and modernisation programme of the cotton units is proceeding according to schedule. A sum of Rs. 44 lakhs was spent by Elgin Mills and Rs. 12 lakhs by Cawnpore Textiles during the financial year 1963. Further sums of Rs. 40 lakhs and Rs. 2 lakhs respectively have been spent by the two companies during the current financial year.

Elgin Centenary — Shastriji's Visit: The celebration of the Elgin Mills Centenary during the month of March 1964 was an outstanding event. On this momentous occasion which was indeed a landmark in the history of the Company, we had the privilege and honour of having Shri Lal Bahadur Shastri, now the Prime Minister-designate of India, as our chief guest. In his earlier capacity as the Union Minister of Commerce and Industry, he had taken a great deal of interest in the welfare of the B.I.C. Group of Industries. We are happy that he has now been chosen to guide the nation along the path shown by Gandhiji and Pandit Jawaharlal Nehru We have no doubt that under his stewardship, the nation will continue to march forward with determination and unity towards economic progress and social emancipation.

Sugar: The four sugar factories of Cawnpore Sugar Works Ltd. and two factories of Champarun Sugar Co. Ltd. experience another difficult year.

Apart from such factors as availability and quality of cane several other causes contributed to the adverse impact on profitability such as distress sales during surplus conditions and unremunerative controlled price during the subsequent shortage, the old and out-moded equipment in the units and their uneconomic capacities. About 40 lakhs rupees have been spent for rehabilitation and modernisation in these sugar units and further investment is being made.

The sugar companies are fortunate in having secured the services of Sri S. N. Gundu Rao, formerly Director of the National Sugar Institute as their Technical Adviser. Under his guidance the working efficiency of the six sugar factories in the group has already improved.

Brushware :

Saran Engineering:

Beta Picker: There was an improvement in the volume of business done by our subsidiary, Brushware Ltd. which maintained its reputation for quality products. The development programme in the Saran Engineering Co. Ltd. is in process of gradual implementation. The Corporation continues to serve as Secretaries and Treasurers for both these companies, and as Secretaries for the Beta Picker Co. Ltd.

Labour Relations: The labour relations during the year were, by and large, harmonious. I cannot, however, avoid reference to a very regrettable set-back in Elgin Mill No. 1 during the month of March 1964, only a few days after the Centenary celebrations. An infructuous and wholly unreasonable workers' strike was instigated over the issue of bonus voluntarily declared by the Company. Although in a year of decreased returns, bonus at a special rate amounting to Rs. 16.09 lakhs was sanctioned by the Management as against Rs 10.64 lakhs in the previous year with the sole object of letting the employees of the Company experience in the Centenary year a sense of joy over the progress of their unit, some trouble makers chose to launch a perverse campaign of indiscipline and agitation which led to a completely unwarranted and unlawful stoppage of work for 20 days. The workers realised only after considerable suffering that their leaders had misguided them along a wrong path to the detriment of their own interests. They subsequently admitted that they had violated the Industrial Truce Resolution and the Code of Discipline. Let us hope that such unfortunate incidents will not be repeated. In addition to loss of wages by the workers during the strike period, the loss in the mills' productivity will have its impact on profits during the current trading year and consequently on the quantum of bonus which the Company may be in a position to pay next year.

General : I think, the shareholders will agree that the affairs of the Corporation have been fairly consolidated so as to show tangible results. Although the Corporation has during the year under review shown excellent results, there are many important tasks ahead of us. The future will certainly throw up new problems in the spheres of finance, management, industrial relations, productivity, cost control, and sales. With the sound inherent strength of your Corporation, however, I am confident that we shall be able to evolve rational solutions leading to greater stability and progress

I regret to report the resignation from the Board of one of our Directors, Shri S. B. Bose, for reasons of ill-health. I am, however, pleased to welcome to the Board two new Directors, Shri B. P. Ray, the partner in a distinguished firm of Solicitors at Calcutta, and Mr. K. M. Wilcox. It is hardly necessary for me to introduce Mr. Wilcox, who has rendered long and meritorious services to the Corporation. Your Directors have thought it fit to invite him to join the Board and to appoint him as Deputy Managing Director subject to the approval of the Government.

To my colleagues on the Board I am deeply indebted for their valuable advice and guidance. Their mature judgment has been of tremendous help in finding solutions to many problems which have engaged the attention of the Management. I would particularly like to mention Shri B. P. Bajoria, the Vice-Chairman and Managing Director, whose perseverance and hard work have contributed a great deal towards the successful results of the Corporation during the year. I wish to express my thanks to all ranks of our employees for their loyalty, co-operation and steadfast devotion to duty.

Before I close, I wish to pay tribute to the gallant soldiers who either gave up their lives or suffered untold hardships on the battlefield in the defence of our motherland during the early days of the Chinese invasion. I am sure you would all like to associate with me in the expression of this humble sentiment.

CHAIRMAN'S STATEMENT

GUEST, KEEN, WILLIAMS, LIMITED

STATEMENT BY THE CHAIRMAN, SIR RAGHAVAN PILLAI, KCIE, CBE, ON THE OCCASION OF THE THIRTY-FOURTH ANNUAL GENERAL MEETING HELD IN CALCUTTA ON 12TH JUNE, 1964.

I have great pleasure in welcoming you to this, the thirty-fourth Annual General Meeting of your Company. The Directors' Report and the Statement of Accounts have been circulated and been in your possession for some time, and I propose with your permission that they be taken as read.

We are meeting in the shadow of a supreme tragedy. The man who made India what she is today is with us no more. Few men, in any country, or in any age, have given of their all in the service of their country, of their people and of humanity at large, as has Jawaharlal Nehru, in our country, and in our day. In him Nature wrought a rare synthesis of knowledge and understanding of the ancient and modern, of east and west, of science and the humanities, and of materialism and spirituality, and we as nation should be profoundly and eternally thankful that so unique a man should have been here to lead us in the hour of our greatest need. I count it the choicest among the blessings of my life that I had the privilege of working for him for close on eleven years first as Secretary of the Cabinet and later as Secretary General in the Ministry of External Affairs. I think of him as I knew him then — a man, before whom the dross in us seemed to melt away, and the magic of whose mind illumined and inspired our own. He is gone, and for us that remain I can think of no better wish than that we will, with renewed vigour and with his unseen guidance, go about our daily tasks, cheerfully as he would have wished, each resolved to help to fashion a new India fit in every way to take her place in this changing world, and yet not forsaking the traditional values of this ancient land.

RETROSPECT

In the lives of organisations, as of men, there comes a turning point when the past, however distinguished, seems but a preparation for what is yet to come That turning point has now come for your Company. Nineteen sixty-three has been an eventful year of outstanding significance in the history of your Company, and marks the beginning of a new period of increasing challenge as well as opportunity. The year has witnessed the consolidation of the gains from an earlier period of development; the merger of your Company and of its subsidiary, Sankey Electrical Stampings Ltd., making possible the more effective and efficient utilisation of the combined resources of the two companies; and a significant advance, beyond the stage of study and preparation, in the implementation of our further programmes of development. At a time when more than one business establishment in the country has celebrated its centenary, we must, I am afraid, count ourselves among the youthful, and for us the age of reminiscence still lies many decades away. Yet, though youthful, we can claim the advantage of vigorous growth, and it seems appropriate for us at this juncture to cast a backward glance at our own past, the better to assess our prospects for the future.

Our story opens with the formation in 1922 of Henry Williams (India) Ltd., which, in a small workshop at Shalimar, within the boundaries of the present Calcutta Works, started the manufacture of railway track and signal materials. The intention was to develop the Indian interests of Henry Williams Ltd., Darlington, U.K., which was well established as a manufacturer and exporter of these materials to the Indian railways.

In 1931 a new company was formed, under the name Henry Williams India (1931) Ltd. for the purpose, inter alia, of acquiring the former company and expanding its activities. One of the earliest major developments had been the establishment of a Bolt Works in 1926, and in consequence rolling mills were installed in 1932 mainly with the object of securing a source of the special raw material required for the manufacture of bolts and nuts.

In 1934 Guest, Keen & Nettlefolds Ltd. acquired a major holding in the company, which was then given its present name, Guest Keen, Williams, Ltd. Twenty two years later, in 1956, the Company became a public limited Company, and Indian investors now have a vital stake in the fortunes of the Company.

During the years 1939 to 1945 the Company made a valuable contribution to defence production, and at the end of the war resumed the manufacture of similar products to the pre-war range. After a period of consolidation the Company embarked on a long-term Plan of expansion which still continues and indeed has been progressively accelerated.

The first significant step was the installation of a steel melting furnace in 1952. This was followed by a second furnace in 1958.

A new unit was built at Bhandup near Bombay for the manufacture of woodscrews, and production started in 1953. Since that time the Bhandup Works has been substantially enlarged and numbers of other fasteners have been added to its range of manufacture.

At the same time much of the Calcutta Works was modernised, in particular the bolt works. A well equipped, modern toolroom was built in 1957. The manufacture of pressed steel car and trailer type wheels was introduced in 1960, and in 1961 the commissioning of extensive new rolling mills was completed, a project costing over Rs. 3 crores. In the same year the manufacture of bright steel bars was started. Fabricating and service departments have been generally improved and expanded in recent years, and the extent of overall development is clearly illustrated by the fact that the gross value of fixed assets in the Company's balance sheet has risen from Rs. 2.47 crores to Rs. 10.12 crores in the last ten years.

In December 1960 your Company acquired a controlling interest in Sankey Electrical Stampings Private Ltd This company was formed in Calcutta in 1943, primarily at the instance of the Government of India, in order to establish an indigenous supply of electrical stampings for defence purposes and at a time of acute shortage of imports.

The first works was set up at Worli in Bombay and was later moved to its present site at Bhandup in 1946. The increasing demand for stampings in Eastern India prompted the company to establish a second works in Calcutta in 1950 and a third unit came into being in Bangalore in 1959.

Apart from pioneering the manufacture of electrical stamp-

ings in India, the company, by virtue of its association with Messrs. Joseph Sankey & Sons Ltd., U.K., was in the fortunate position of being able to influence the negotiation of a technical collaboration agreement between that company and the Tata Iron & Steel Co. Ltd. in 1946 covering the manufacture of electrical steel sheets in India. That agreement with Tatas was an important milestone in the development of the electrical engineering industry in this country.

In recent years Sankey Electrical Stampings Ltd. has responded to the need for the diversification of its range of products by embarking on the manufacture of precision pressed components for various industries and several new ventures have been planned for the near future.

Finally we reach 1963, a year which has brought several important developments that have broadened the base of your Company's structure. Sankey Electrical Stampings Ltd. became a wholly owned subsidiary on the exchange of shares with Tatas, and on 10th December you approved a scheme of amalgamation whereby that subsidiary was to be merged with and operate as a division of your Company. I am glad to report that the consent of the Calcutta High Court has since been received and the amalgamation is effective retrospectively from the start of this year.

On 24th December, 1963, you approved the Directors' recommendation of a bonus share issue in the ratio of one for two. The bonus share issue and the exchange of shares with Tatas constituted a substantial increase in the issued capital which in turn necessitated raising the authorised capital of the Company, and you will recall that an increase from Rs. 6 crores to Rs. 10 crores was approved at the shareholders' meeting on 24th December, 1963.

To assist in financing expansion it was decided during 1963 to issue debentures amounting to Rs. 1.5 crores and as you may know that issue was fully subscribed in February this year. Another significant event during the year under review was your company's investment of Rs. 38.2 lacs, in the form of plant and cash, in Sankey Wheels Ltd., a newly formed company which is to make passenger and commercial vehicle wheels.

Thus, from its modest beginnings in the years between the World Wars, your Company has progressed steadily to a place of importance in our country's industry.

BOARD OF DIRECTORS

I am pleased to inform you that Mr. K. C. Maitra was appointed a Managing Director of your Company with effect from 29th December, 1963. Mr. Maitra has been the Managing Director of Sankey Electrical Stampings Ltd. for the past 14 years, and, as already mentioned, that company has now been amalgamated with your own Company

It is the intention also to appoint four additional Directors to strengthen the Board of your Company and the proposed election of Mr. N. R. Banerjee, Mr. A. H. Sethna, Mr. R. B. Ritchie and Mr. J. M. Leighton will be the subject of resolutions later at today's meeting. Mr. Banerjee and Mr. Sethna were Directors of Sankey Electrical Stampings Ltd. for a number of years, and Mr. Ritchie and Mr. Leighton are at present senior executives of the Company.

PRODUCTION

A rise in the level of output and sales of all major products was achieved in 1963, but raw material supplies were again the limiting factor which governed the extent of the advance. In particular, supplies of steel billets, which constitute the raw material for the majority of the Company's manufactures were unsatisfactory both in quantity and in surface condition, and it was only by virtue of comparatively large billet stocks at the start of the year that it was possible to maintain an adequate level of production.

At the end of the year stocks of good quality billets were critically low and output of various products has been adversely affected.

The output of the rolling mills rose again in 1963 in spite of irregular billet supplies, and in particular, production of spring steel bars for the transport services was increased satisfactorily.

Production of bright steel bars was twice the previous year's level of output but full use of the potential capacity of the plant could not be made owing to the continued shortage of free cutting steel in India.

In the forge production was affected by plant breakdowns, and steps are being taken to replace some of the older stamps. Whilst competition and raw material difficulties limited the output of certain railway track material, the production of major items, including crossing sleepers and points and crossings, was substantially increased.

A small increase in the output of fasteners in the Bolt Works was achieved, but the manufacture of special and high tensile products was hampered by the lack of quality raw material.

At the Bhandup Works, in spite of unstable conditions in the market for woodscrews and various other small fasteners, a substantial rise in turnover was achieved.

OPERATING RESULTS AND DIVIDENDS

The Accounts for the period under review have been with you for some time and you will no doubt have noted with satisfaction the improvements that have been achieved in the Company's operating results.

Turnover improved to Rs. 16,37,49,450 from Rs. 13,06,09,872 in 1962 representing an increas of 25.4 %. The increased income from sales helped by vigilant efforts to exercise economies has earned for the Company a total surplus before taxation of Rs. 217,43,217 compared with Rs. 1,27,55,590 for 1962. The available profit for disposal has not however, risen proportionately owing to a much higher charge for taxation which for 1963 amounts to Rs. 1,36,59,114 compared with Rs. 55,60,000 for the previous year.

The increased charge for taxation arises mainly from the issue of bonus shares in December last year for which an additional tax of Rs. 26,34,114 is payable calculated at the rate of 12½% on the face value of the shares issued. Furthermore a provision of Rs. 4,29,656 had to be made in respect of the new levy of 7½% on equity dividends introduced by the Finance Act, 1964. It is unfortunate that the welcome exemption from the payment of additional tax in respect of bonus shares, when issued out of share premium account, came just too late for your Company to benefit as its bonus issue was made prior to 1st April, 1964. As a silver lining to this disappointment, shareholders will have no doubt noted with some measure of relief that under the provisions of the Finance Act, 1964, as finally passed, this bonus issue will not attract capital gains tax in their hands.

In my statement to you last year I had occasion to mention that the Company would have no liability to Super Profits Tax in respect of its profits for 1962 but that a provision of Rs. 1,20,000 on this account had already been made, based on the original proposals in the Super Profits Tax Bill. As you know, the Super Profits Tax has now been replaced by a Surtax, but it is estimated that no Surtax will be payable on the Company's profits for 1963. Accordingly, the provision of Rs. 1,20,000 made in 1962 has been written back in the 1963 Accounts.

After all required transfers and appropriations the profit available for disposal is Rs. 66,86,070. An interim dividend of 60 paise per share has already been paid and your Directors have recommended a final dividend also of 60 paise per share, making a total distribution of Rs. 1.20 paise per share for the

52 weeks ended 28th December, 1963. The balance of Rs. 3,64,196 has been taken to General Reserve. Members of the the Company will, I am sure, appreciate that the reduction of 20 paise per share in the total distribution for 1963 compared with that for 1962 was inevitable in view of the additional tax payable on account of the bonus shares issued and the levy of 7½% tax on equity dividends, which amounts would otherwise have been available for disposal.

Whilst on the subject of the accounts. I should like to mention again some of the important features of the Balance Sheet.

The authorized capital of the Company was increased to Rs. 10,00,00,000 in December last year primarily to enable the bonus share issue to be made. The paid-up capital of the Company was also increased from Rs. 4,00,00,000 to Rs. 6,32,18,740 by the issue of 2,14,583 shares of Rs. 10 each to the Tata Iron and Steel Co., Ltd. in exchange for their holding in Sankey Electrical Stampings Ltd., and by the allotment of 21,07,291 bonus shares of Rs. 10 each out of the Company's share premium account.

Opportunity was taken last year of the Company's Debentures being offered at or below par to purchase and cancel Debentures worth Rs. 10,25,000 by utilizing the amount standing to the credit of the Debenture Sinking Fund. The outstanding liability for debenture loan at the end of 1963 has therefore been reduced to that extent. The effect of this operation is fully reflected in the movement in the Debenture Sinking Fund Account.

On the other side of the Balance Sheet you will find an investment of Rs. 38,20,000 in equity shares of a new Company, Sankey Wheels Ltd. This is in accordance with a Resolution approved at your Annual General Meeting last year.

SANKEY ELECTRICAL STAMPINGS LTD.

For our subsidiary Sankey Electrical Stampings Ltd., the year 1963 was an abnormal one. At its major works at Bhandup, as a result of inter-Union rivalry, a large number of workmen resorted to 'go-slow' tactics which culminated in an unjustified strike. Weeks of tension followed, but, thanks to the unequivocal stand taken by the company, with the support of the findings of the State Evaluation Committee and of its own commendable record of labour relations, and thanks, also to the understanding of the company's stand shown by those with authority and competence to judge, the strike was called off unconditionally after 108 days. I had intended to share with you today some thoughts evoked by this deplorable strike, but the recent constitution of a Court of Inquiry by the Government of Maharashtra to inquire into certain issues connected with the strike makes it inopportune for me to do so. Before leaving this topic, however, I should like to commend the devotion and loyalty displayed by all members of the management, the supervisory staff and those workmen who, during the period of the strike, worked under great stress, and at considerable personal risk, to ensure that essential supplies, in particular to the Defence services, were not interrupted. I should like at the same time to say a special word of gratitude to the company's wide circle of customers, both big and small, who, by their patience and forbearance, though being put to serious inconvenience and worse themselves, gave strength and support to the company during those trying days.

Apart from this unfortunate labour trouble, the Company was hard put to it to obtain sufficient supplies of transformer grade steel which have all to be imported. In spite of these major handicaps, the Company was able not only to maintain but actually to increase its turnover to a small extent. The programme for diversification of the range of manufacture continues to make good progress, and in fact, the increase in turnover is due entirely to these new products. There is now in hand another important project, the manufacture of brake components for the automobile industry, which in due course will further augment turnover.

FUTURE DEVELOPMENT

Construction of the new steel melting shop is making good progress and the Stage I plant will be in production next year. A year ago I mentioned the proposed reorganisation of the rolling mills, and I am now glad to inform you that this project has since been approved by the Government of India. The reorganisation includes the installation of a new merchant bar mill in new buildings and will permit the running down of some of the old mills which have been in service since 1932.

Much of the old plant in the Calcutta bolt works is being replaced by specialised, modern equipment and this is expected to lead to improved quality and some diversification in the range of sophisticated fasteners manufactured.

Work started towards the end of the year on the extension of the bright steel bar shop. The new plant has since been commissioned and will contribute to earnings in 1964.

At the Bhandup Works certain outmoded machines were replaced during the year by modern, high production plant and a new material storage bay and pickling plant were constructed and commissioned. The expansion of woodscrew capacity was largely completed and the plant is now being worked up to the required level of efficiency. The Government of India granted approval for the expansion of self tapping screw capacity and it is hoped that the plant will be installed next year.

Many other projected schemes for expansion and modernisation are on the drawing board, and, whilst newly installed plant is being carefully nursed into a state of optimum efficiency, planning for your Company's future continues.

To enable you to obtain a clearer idea of the scale of our development programmes, I should like to add that capital expenditure during the three years 1964-66 on planned expansion and rehabilitation projects is expected to be Rs. 7½ crores, of which a sum of Rs. 2½ crores represents foreign exchange. Expansion will naturally continue beyond this period, but as plans are under continuous revision in the light of changing demands and shifts in priority, it would not be realistic to give an estimate of the cost of such future expansion. By far the greater part of the foreign exchange required will be in sterling, and for this we shall be dependent on the liberal aid which, with a vast and invaluable fund of technical advice, we have been receiving from Guest, Keen & Nettlefolds Ltd.

Never since independence have the preservation of our national unity and the achievement of rapid and accelerated growth, in industry and possibly even more in agriculture, been as urgent and crucial as now. Yet, it is to be doubted whether we are continuing to hold our own with other large and developing countries with whose standards of performance our own will necessarily be compared. More than ever before, the pursuit of our national purpose must therefore today form the prime motive behind the efforts of us all. It is in this realization that your Company will continue, within its capacity and its resources, to play its part in helping to build the industrial strength of our country and promote the well being of our people.

Finally, I should like to express on your behalf, and on my own, our thanks to the staff and all employees who have worked keenly in the Company's interest during the year. Rapid growth and reorganization bring many frustrations in their wake, and the success of the Company's operations is a tribute to the loyalty and enthusiasm displayed by its personnel.

NOTE: This does not purport to be a record of the proceedings of the Annual General Meeting.

a new dimension to investment

The Unit Trust of India—established by an Act of Parliament—offers you a unique form of investment which is safe, brings a steady return and is liquid enough to realise when you are in need of funds. This is : Units under the Unit Scheme, 1964.

The object of the Unit Trust is to pool the savings of the community by sale of units and to invest them in well chosen securities of diverse types. The investment policy of the Trust is to build up a balanced portfolio of investments, yielding an average return of over six per cent per annum.

Barring expenses limited by statute to a maximum of five per cent of the income, the Trust will distribute the balance to the unit holders as dividend.

Income from dividend up to Rs. 1,000 is free of income-tax in the hands of unit holders.

The management of the Unit Trust is vested in the Board of Trustees consisting of representatives of the Reserve Bank of India, State Bank of India, Life Insurance Corporation, commercial banks and business and financial institutions.

Each unit will be of the face value of Rs. 10. You can buy ten or a multiple of ten units. There is no upper limit to investment in units.

The Trust offers the initial sale of units at par from July 1 to July 31.

By investing in units, you get these advantages :

Safety of Capital
Assured Income
Promise of Capital Growth
Spread of Investment
Tax Concessions
A Share in the Nation's Growing Industrial Prosperity

Details of the unit scheme and application forms will be available at over 3,500 offices of the following banks from July 1 :

State Bank of India, Bank of India Ltd., Central Bank of India, Punjab National Bank Ltd., United Commercial Bank Ltd., Allahabad Bank Ltd., Bank of Baroda Ltd., State Bank of Bikaner & Jaipur, State Bank of Hyderabad, State Bank of Indore, Bank of Maharashtra Ltd., State Bank of Mysore, State Bank of Patiala, Bank of Rajasthan Ltd., State Bank of Saurashtra, State Bank of Travancore, Indian Bank Ltd., Devkaran Nanjee Banking Co., Krishnaram Baldeo Bank Ltd., New Bank of India Ltd., Syndicate Bank Ltd., Tanjore Permanent Bank Ltd., United Bank of India, Union Bank of India Ltd., British Bank of the Middle East Ltd., Chartered Bank, First National City Bank, Hongkong and Shanghai Bank Ltd., National & Grindlays Bank Ltd., Netherlands Trading Society Ltd., Mercantile Bank Ltd., Oriental Bank of Commerce Ltd. and Indian Overseas Bank Ltd.

Unit Trust of India

RESERVE BANK OF INDIA

Applications are invited for the following posts in the Reserve Bank of India :—

(A) **POSTS AND SCALES OF PAY :**

(i) **Deputy Chief Officers, Department of Banking Operations :** Rs. 1275-75-1575.
(ii) **Banking Officers:** Rs. 430-430-55-815 EB 55-925-60-1045.

Note: Candidates possessing exceptionally good qualifications and experience of value to the Bank may be given a higher starting pay in the prescribed scales.

In addition to pay, the selected candidates in both the categories mentioned above will be eligible to draw local pay (at centres where it is admissible) and house allowance at rates prescribed from time to time. Dearness Allowance is also admissible to Category (ii) at rates prescribed from time to time.

(B) **QUALIFICATIONS :**

(i) **Deputy Chief Officers:** Applicants should have a minimum of 15 years' commercial banking experience out of which not less than five years should be in a responsible position. Preference will be given to applicants with high academic qualifications who have made a special study of Economics, Banking, Commerce or Accountancy.

(ii) **Banking Officers:** Applicants should (a) have a minimum of five years' commercial banking experience out of which not less than three years should be in a responsible position. Preference will be given to applicants with high academic qualifications who have made a special study of Economics, Banking, Commerce or Accountancy or (b) be Chartered Accountants with a minimum standing of five years.

Candidates who have applied for these posts in response to previous advertisements issued during the last three years need not apply again.

THE SELECTION BOARD WILL INSIST ON A VERY HIGH STANDARD OF SUITABILITY IN MAKING SELECTONS FOR THE ABOVE POSTS AND ONLY THOSE CANDIDATES WHO POSSESS HIGH ACADEMIC QUALIFICATIONS AND/OR ADEQUATE EXPERIENCE OF THE TYPE SPECIFIED ARE ADVISED TO APPLY.

(C) **AGE LIMITS AS ON 1ST JULY, 1964:**

(i) **Deputy Chief Officers:** Candidates should not be over 45 years of age.

(ii) **Banking Officers:** Candidates should not ordinarily be over 35 years of age but the age limit may be slightly relaxed in the case of candidates with exceptionally good qualifications and/or experience of value to the Bank.

2. Candidates who wish to apply for more than one category of posts must submit **separate** applications accompanied by **separate** application fees and should clearly indicate the post for which they have applied.

3. Applicants for the above posts must remit with their applications a fee of Rs. 7.50 for each post by cheque or Bank draft on a **Scheduled Bank** payable at Bombay or by Postal Order. **The application fee is in no case refundable.** In the case of candidates belonging to Scheduled Castes/Tribes, the fee will be reduced to one-fourth.

4. Applications in the candidate's own handwriting in the prescribed forms obtainable from the Reserve Bank's offices at Bombay, Calcutta, Kanpur, New Delhi, Nagpur, Madras, Bangalore, Hyderabad, Trivandrum, Lucknow, Patna and Jaipur accompanied by copies (originals should not be sent) of certificates regarding age and educational qualifications, statements of marks secured in the Graduate and post-graduate degree examinations and two testimonials should be forwarded to the Secretary, Central Recruitment Board, Reserve Bank of India, Central Office, Post Box No. 406, Bombay No. 1 so as to reach him on or before the 25th July, 1964.

5. Candidates already in service will be required to produce a proper discharge certificate from their employers in the event of their being selected at the time of their appointment in the Bank's service.

6. Candidates belonging to Scheduled Castes/Scheduled Tribes should mention this fact prominently in their applications and also enclose a copy of a certificate to that effect from a competent authority.

7. Candidates must be prepared to serve in any office of the Bank in India, and to undertake tours when required.

8. Selected candidates will have to appear for interview/s before the Selection Board at any of the Bank's Offices.

9. Appointments will be subject to candidates being found medically fit for service in the Bank by the Bank's Medical Officer.

10. If any candidate desires to have his application acknowledged, he should send it by "Registered Post —Acknowledgement Due". Apart from those who may be specially called, interviews will not be granted to candidates nor will the Bank enter into correspondence with them.

11. Canvassing in any form will be regarded as disqualification.

RECORDS AND STATISTICS

Swaminathan Committee Report

THE GOVERNMENT of India in the Ministry of Industry constituted a Committee, (which has come to be known as the Industries Development Procedures Committee) by their Resolution dated September 24, 1963. The terms of reference of the Committe were to review the procedures relating to the operation of the controls applicable to the establishment of additional Industrial capacity under the Industries (Development and Regulation) Act, 1951, the import of capital goods, the issue of capital, and foreign investment and collaboration and to suggest such modifications as would reduce delays in decision. In a subsequent letter dated October 11, 1963, from the Secretary to the Government of India, in the Ministry of Industry to the Chairman of the Committee, it was clarified that the procedures governing the licensing of raw materials for industry could also be deemed to be included in the terms of reference of the Committee. The Committee submitted an interim report on December 17, 1963, which appeared in the Records and Statistics section, on page 115 in 'Eastern Economist' dated January 17, 1964. In this final report, the Committee has considered procedures and matters other than those covered by the recommedations in the Interim Report.

Forms of application for industrial licences and licences for the import of capital goods. The Committee has given detailed consideration to the form of application prescribed for industrial licences (form D prescribed under the Registration and Licensing of Industrial Undertakings Rules, 1952) and also the application prescribed for import of Capital Goods, and wishes to suggest some modifications to these forms, mainly with a view to ensuring simplification in some ways and provision of all information necessary for a quick and satisfactory decision. Another consideration that has been taken into account is the extent of detailed information likely to be available to the applicant at the time of his application. The forms have been revised (not reproduced here).

Tax Machinery Tightened

Item (2) in the form of application for the import of Capital Goods relates to Income-tax Verification Certificates. The machinery of tax collection has been progressively tightened up since these certificates were originally asked for. And, in any case the certificate relates to a past period and does not necessarily ensure that in the immediate period preceding an application for a licence, the applicant has not either evaded or defaulted on tax payment. This item appears to the Committee to be of doubtful value. While the Committee does not specifically suggest the deletion of this item from the form, it has requested the Chairman to discuss with Government the need for the continued retention of this item in the form. The obtaining of the certificate often entails delay which is avoidable.

The Committee has recommended the submission of two applications for industrial licence, one, a preliminary application to enable the issue of a 'letter of intent' speedily, and the other a final application at a later stage at the time of the issue of a formal industrial licence. The Treasury Challan, as prescribed, need accompany only the preliminary application. The consideration which has guided the Committee in suggesting two applications instead of one application as hitherto is that at the time of initial application, the entrepreneur does not have a detailed, clear picture of all the items prescribed in the application form. It is not unlikely that in respect of many of the items on which information has been furnished by the applicant in the preliminary application the position may change substantially after consultations and negotiations with foreign collaborators and machinery suppliers, both indigenous and foreign. The preliminary application would enable the speedy issue of a 'letter of intent,' after a broad and not too meticulous examination of the essential features of the proposal to establish an industrial unit. As the Licensing Sub-Committee's final decision on the conversion of a 'letter of intent' into an industrial licence would depend on a correct final appraisal of all material factors, a final application is being proposed. In the case of 'key' industries, this final application should be considered along with the simultaneous consideration of the subsequent clearances relating to capital goods imports, foreign collaboration terms, issue of capital etc. In the case of the remaining industries, the form of final application should be submitted either along with the capital goods import application or at some other suitable point of time, when all the relevant final details are available to the applicant. This application should be considered by the administrative Ministry concerned with the industry before conversion of the 'letter of intent' into an industrial licence. Where there is a substantial departure in the final application from the details given in the initial application in material particulars, the administrative Ministry concerned should, where necessary, place the case again before the Licensing Sub-Committee, before the 'letter of intent' is converted into a licence.

Requisite Amendments

The Committee recommends that appropriate amendments, where necessary, should be made in the Registration and Licensing of Industrial Undertakings Rules to give effect to the above recommendations. Meanwhile the Committee recommends the immediate adoption of the revised procedures suggested.

Form of 'Letter of Intent.' The speedy issue of a 'letter of intent' has been recommended by the Committee so that it may be possible for the entrepreneurs to carry on negotiations with foreign collaborators and/or manufacturers of machinery. In order that the 'letter of intent' may fully serve this end, it is necessary that this document should contain a positive assurance regarding the eventual issue of an industrial licence, subject to conditions to be specified being fulfilled. Accordingly, the Committee has given some thought to the form in which the 'letter of intent' should be couched. A new form has been recommended by the Committee (not reproduced here).

Priority treatment for certain industries other than 'key' industries which are import saving or substantially export oriented. The Committee has noted that substantial imports are at present taking place in certain industries listed below. It recommends that, though these have not been included in the list of 'key' industries, the accelerated procedures recommended in the Interim Report should, as far as practicable, be made applicable to them also, so as to ensure that adequate manufacturing capacities are speedily established.

Key Industries

Industrial chains, Transformer Oil, Insulating Paper, High Tensile Galvanised Steel Wires, Laboratory Glassware, Detonators and Detonating fuse, Synthetic Fibres, Caprolactum.

The Committee recommends similarly that accelerated procedures may also be adopted in the case of any industries which Government consider to be of a special importance from the point of view of earning substantial amounts of foreign exchange through exports.

Residual action in cases where letters of intent/licences have already been issued for 'key' industries. As a sequel to the recommendation in the Interim Report regarding the procedures for 'key' industries the Committee further recommends that cases of applications in which letters of intent or licences have already been issued for 'key' industries should be examined with a view to fixing time limits for the completion of formalities and obtaining of clearances for capital goods imports, foreign collaboration, capital issue i.e., (six to twelve months from the date of the grant of the letter of intent or licence, as the case may require). The accelerated procedure of simultaneous clearance by the Licensing Sub-Committee should be applied when the holders of these letters of intent/licences come up for other clearances.

Procedure for industries other than 'key' Industries. The Committee has considered whether in the case of industries other than 'key' industries the procedure for simultoneous consideration of all subsequent clearances after the initial issue of the 'letter of intent' could be adopted. For various practical reasons, including the foreign exchange shortages which make difficult the prompt clearance in all cases of import of capital goods, it has not been found practicable to follow the procedure recommended for 'key' industries.

3-Month Limit

In the case of these industries, the Committee, however, recommends that, wherever the availability of foreign exchange is not the main limiting factor, after the issue of a 'letter of intent,' all subsequent clearances such as applications for the import of capital goods, approval of foreign collaboration terms and the issue of capital, should be given within three months from the date of receipt of the respective applications. In order to keep a watch on the disposal of these applications, and to ensure that the prescribed time schedules are followed, as far as practicable, it is recommended that a list of cases which have not been disposed of within three months from the date of receipt of the applications should be put up for consideration at each meeting of the C.G. and Foreign Agreements Committees. Cases where applications for the issue of capital have not been disposed of within three month should be brought to the notice of the Licensing Sub-Committee at each of its meetings.

Procedure relating to licensing of raw materials/components. The Committee has examined the existing procedures for licensing of imported raw materials/components required by industry. It has been represented to the Committee that there are considerable delays in the issue of licences which are often issued only at the end of each licensing period. This delay is usually caused by the delay in the allocation of foreign exchange, owing to uncertainties connected with the availability of foreign exchange. As delay in the issue of licences for raw materials affect industrial production, the Committee recommends that ways and means should be found of issuing the licence within three months of the commencement of each licensing period. If, for any reason, this procedure is not found practicable, in the interests of ensuring continuous production, the Committee recommends that ad hoc licences equal to 50% of the value of the licences for the first half of the previous licensing year should be issued. The Committee realises that this would entail additional work, but in the interest of uninterrupted industrial production, this procedure is recommended.

According to the current procedure, only 50% of the value of the licence can be utilised during the first half of the licensing period. For the second half, a further announcement of policy by Government has to be awaited. The Committee recommends that by a general notification all licensees should be authorised to utilise at least 50 per cent of the value of the licence for the second half, pending the final announcement of policy for the second half of the licensing period. This would enable a minimum quantity of raw materials (or components) being ordered in time to maintain uninterrupted production. In many cases raw materials (or components) take a few months after order to be delivered.

Value-Wise Restriction

The Committee further recommends that while issuing licences, the limitation should normally be value-wise and not quantitative, so that the licensee has the direction to import any of the permissible items listed in the licence in such proportions as may be necessary. If it is seen that the adoption of the practice leads to misuse of the concession, appropriate remedial action in the case of the individual units concerned could be taken. In any case, "banned" items may not be imported.

Import Licence for spare parts either received short or in damaged condition and replacement of which is made free of cost either by the supplier or on payment by Insurance Company. Representations have been made to the Committee about delays in the issue of import licences for spare parts which are either received short or in a damaged condition and replacement of which is made free of cost either by the supplier or on payment by the Insurance Company. Delay in receipt of such spare parts often holds up production. The Committee recommends that where the cost of replacement is being paid by the Insurance Company, a licence should be issued automatically. Where the cost of replacement is met by the supplier, the Committee recommends that special efforts should be made by the Licensing authorities to issue the licences expeditiously.

Procedure followed by the Industrial Credit and Investment Corporation of India and Industrial Finance Corporation for the grant of loans—special procedure for 'key' industries. The Chairman of the Committee has had discussions with the Chairmen of the Industrial Credit and Investment Corporation of India (ICICI) and of the Industrial Finance Corporation (IFC) regarding the procedures followed by them. It has been agreed by the Chairmen of both the Corporations that if the parties concerned could approach the I.C.I.C.I./I.F.C. immediately after the issue of the 'letter of intent,' in the case of 'key' industries, the Corporations would take up consideration of their cases without waiting for clearances by the Capital Goods Committee. Final clearance of the application by the Corporation would, of course, be subject to clearance by the Capital Goods Committee. This procedure would result in a substantial saving of time and the Committee recommends the adoption of this procedure.

Reconstitution of the Committee after a year: Government has already implemented the main recommendations in the Interim Report. The Committee hopes that Government will soon take a decision on the recommendations in this Report. The Committee considers it important that the actual working of the revised procedures should be studied over a period of time. Accordingly, the Committee recommends that this Committee, with the same composition as far as may be, be reconstituted after a year to study the results of the working of the revised procedures and asked to make a report and suitable recommendations to Government. The co-ordinating Section in the Ministry of Industry should maintain statistics showing particularly the pace of disposal of applications under the revised procedures and other details so that the Committee, if and when reconstituted, may have the necessary

factual information for an appraisal readily available. At that point of time the feasibility of adopting the accelerated procedures in the case of industries other than 'key' industries could also be studied.

Govt. Decision

Government accept in principle the above recommendations of the Committee. As regards the Committee's recommendations regarding the licensing of raw materials/components, Government believe that it should be possible to issue licences within a period of three months from the commencement of each licensing period; every endeavour will be made to ensure this. Should there, however, be delay, Government have devised a simpler alternative procedure to secure the object which the Committee had in view. Instead of issuing ad hoc licences, it is proposed to take action as under:

(i) In the case of industries where annual licensing is done and where the raw material requirements are not likely to be met from newly developed indigenous sources, annual licences of the same value as for the previous year would be issued subject to the condition that during the first half of the licensing period only 50% of the value of the annual licence can be utilised. There would be simultaneous authorisation for the utilisation of an additional 25 per cent from the commencement of the second half of the licensing period. The value of these licences would be suitably adjusted when the final policy for the period is announced.

(ii) In other cases, licences for the industry's requirements for the first half year will be issued of a value not exceeding the value licensed for the first half of the previous licensing period.

The additional authorisation of 25% of the value of the annual licence for the second half of the licensing period will not, however, be made in the case of established importers.

Appropriate steps are being taken to implement the recommendations of the Committee.

The Truth About Prices

THE NEW Minister for Food and Agriculture faces a situation where the problem of prices is changing not simply quantitatively but also qualitatively. That the cost of living has been slowly and steadily rising is indeed no new phenomenon. Thus between 1960 and 1963, the all-India cost of living index had gone up from an annual average of 123.6 to 134. But lately a significant new trend seems to be emerging. Until some time ago the increase in the cost of living was noticed mostly in the second half of the year which, given our agricultural cycle, is relatively the leaner part of the year. In the current year, however, the average of the all-India cost of living index for the first three months of 1964 was 142 as against the average of 137 in the second half of the previous year and 131 for the first half. Now the significance of this altered trend in the behaviour of the cost of living evidently is that the economy has been driven deeply into a phase of price inflation. A chronic malady has now become an acute one as well.

This assessment has a special meaning for the problem of prices. It is, no doubt, true that the spurt in the cost of living in the earlier months of 1964 and over the closing months of 1963 was provoked considerably by a reduction in the size of the kharif crop. But that alone cannot account for the fact that, in the case of a wide range of essential commodities, supplies are becoming increasingly hard to get at prices which were prevailing only a short time ago. It should be tempting to attribute higher prices simply to lower outputs or to consumption growing more rapidly than production. That this explanation has a great deal of substance in it will not, however, help to make it completely true. It is a fact of current and common experience that many things are scarce only in a relative sense, that is, they are scarce at yesterday's prices, but they promptly become more accessible once the consumer is prepared to pay somewhat more. To this extent it is certainly true that hoarding in the sense of producers or the trade holding on to their stock in expectation of rising market is prevalent to some extent and is not a factor which could be ignored in discussing the price line. But it must be noted too that sellers' resistance is motivated by and subsequently borne out by the rising market.

The basic problem, therefore, is why there is this rising market. Is it because people are becoming steadily more and more prosperous and are able to afford to buy and consume more and more? If that were the entire explanation, rising prices will cease largely to be the serious social problem it is, although it would still be, in some ways, an economic problem. But this is surely not the situation now. While over the last 17 years, the economy has developed to some extent and the benefits of that development have percolated to the people, the improvement in the capacity of the mass of the people for increased consumption has certainly not been very large. In any case, there has been no particular gain in the dimensions of this improvement in the last two or three years. If, therefore, there is still this problem of rising prices associated with a disequilibrium between demand and supply, it must be regarded not so much as a reflection of prosperity but as an aggravation of poverty. The problem of prices essentially is a problem of dealing in a comprehensive manner with inflationary forces of the economy which have now gathered dangerous momentum.

Viewed in this manner, the question of food prices also becomes, in its essence, an economic problem of very wide dimensions. It is necessary

to see this clearly. Otherwise, there is a danger that hand-to-mouth measures of limited value or utility will be resorted to in enthusiasm but will end up in disappointment and frustration. This is why we would say that some of the remedies which are currently fashionable and which the Central Government will be discussing with Chief Ministers of States this week are irrelevant or at least unhelpful beyond a point. The Finance Minister some time ago spoke about state trading in foodgrains. His logic, no doubt, is perfect. In theory, given the basic inflationary situation, if the food price line is to be held, it is impossible to deny the inevitability of a very strict system of food controls. The Finance Minister's view seems to be that this system should be exercised primarily at the wholesale stage. This has the merit of avoiding the known defects of Government monopoly procurement from farmers at the one end and total rationing of consumers at the other. But it is significant that discussions among officials have tended to conclude that even this pattern of control

ALL-INDIA COST OF LIVING INDEX

might place excessively heavy burdens on the administrative machinery. Hence much of the current talk about the so-called strategic controls without anyone really seeming to know what these strategic controls are to be.

Fortunately, while the Government might permit itself the luxury of theoretical exercises, when business comes to be talked at the Chief Ministers' conference, more pragmatic considerations are bound to come into play. We would, of course, readily concede that, in the present circumstances, private trading in foodgrains is not functioning satisfactorily. But we would also say that there is no reason at all to suppose that any extensive government intervention with the channels of distribution at this stage will be a help to the consumer. Whether we like it or not, between now and the next kharif harvest there lies a period during which the food price line will continue to be distressingly undisciplined. This may be a disagreeable fact but it is, nevertheless, one which will have to be honestly faced. This is, of course, not to say that the Government need not or cannot take short-term relief measures to ease the position. That may and should, of course, be done. The new Food Minister has started well in this respect by readily accepting the demands of Maharashtra and Gujarat for supplies of foodgrains needed to tide over difficult conditions in those States. In the same manner the requirements of West Bengal too will now have to be provided for. But the Government's capacity to go to the rescue of strained or stranded States is not unlimited and is entirely dependent on how soon more grain will be reaching this

country under PL 480. The country, in other words, will have to live from ship to mouth in the coming months.

The more basic problem, therefore, is what we are going to do with the underlying economic situation which, more than the changing sizes of the harvests, seems to dominate and direct the trend in food prices and indeed in the general price line. Part of the answer —and this will be a large part — is that production should be increased as rapidly as possible and over as wide a range as possible. Again, while agricultural production has to be stepped up particularly, even the problem of food prices cannot be adequately coped with unless there is a general increase in the production of all consumer goods. It is rightly said, of course, that food prices call the tune for all other prices in the economy. But it is not less true that, under inflationary conditions, the pressure of demand on food prices could and ought to be dispersed by diverting it to other consumer goods the producion of which must, therefore, be increased as well. In fact, one of the reasons why the general price situation has been deteriorating is that in recent years the expansion of production of consumer goods has not been receiving the attention that is its due. Whereas in 1963 the output of producer goods recorded a rise of about 13.9 per cent over 1962, the corresponding increase in the output of consumer goods was only 5.2 per cent. In 1962 itself the rate of rise in the output of producer goods (at 14 per cent) was seven times the increase in the output of consumer goods which was only two per cent in that year. Unless an entirely new attitude is introduced in the Government's planning regarding the relative importance which is to be given to investment in and production of consumer goods industries, an attempt to deal with food prices on a limited basis cannot be made effectively nor can it give much satisfaction to the community.

Equally important is the need for the Government to attend to the general economic aspect of inflation.

cent in national income in 1963-64 over 1955-56, the increase in money supply was of the order of 69.1 per cent. If the velocity of circulation of money is assumed static in the period under study, wholesale prices should

Eastern Economist 20 Years Ago

JUNE 23, 1944

THE INDO-BURMA Immigration Agreement of 1941, which was concluded only for three years, has lapsed. The possibility of a new agreement between the Government of India and the Burma Government at Simla in the near future has set afoot negotiation. It is apprehended in some quarters that the weakness of the Commonwealth Relations Department whenever Indian interests are involved within the Commonwealth, will result in discriminatory provisions being adopted against Indian migration and investments similar to those in Ceylon or Kenya. The agreement of 1941 had failed to satisfy Indian interests, not only because it sacrificed certain special safeguards under the Act of 1935 for them, but also because it conceded wide limits within which the Burmese Government could effectively discriminate against them. There is evidence to show that the Burma Government lost no opportunity to take unfair advantage of those liberal concessions, and some of its acts went a long way to violate the spirit of the agreement. It is pleaded, on behalf of the Indian interests similar to those for British interests in future Burma, that domicile should be the recognised principle of citizenship and no other consideration should be admitted. In view of the fact that the enemy occupation would have destroyed many records, liberal treatment should be accorded in conferring citizenship rights to Indians after the war. It is further pointed out that Indo-Burmese relations stand on a plane different from the normal international relations. Every eleventh Burman is of Indian origin or domicile having migrated there when the two countries were one. The country is being liberated from a foreign yoke by an army predominantly composed of Indian soldiers. It is the natural outlet of population pressure in India. Its economy is complementary to that of India and it lies within the sphere of India's security. There is no doubt some element of truth in all these points, but it ill befits a country fighting for its own emancipation from the grip of alien economic interests to view her relations with other peoples from such a narrow angle.

have, theoratically speaking, remained unchanged if money supply with the public was increased by 30.2 per cent only. The excess rise of money supply by 38.9 per cent increased prices by 38.4 per cent which, however, is not a true reflection of the rise; the wholesale price index is so constructed that it under-estimates the magnitude of the inflationary spiral.

It is unfortunate that every time the suggestion is made that the Government should not be an agent of inflation through its policies of expenditure, it is protested that planning and development are being assailed. There is, of course, no truth in this defence. There are at least two broad ways in which Government expenditure could be curtailed without development being delayed or diminished. There is, first, the tremendous leakage of the tax-payer's money through corruption and inefficiency in the execution of projects which may in themselves be worthwhile. No honest Minister or administrator can really deny this very considerable element of unproductive expenditure in Government spending. It is useless to try to put a figure to this waste of resources. But we have little doubt in our mind that if the position in this regard is improved adequately, a very large saving in expenditure, amounting to some hundreds of crores of rupees annually, could be effected, thereby lightening the pressure of inflation on the economy. Secondly, there is the no less serious waste of public money in the form of projects which are obviously unproductive or worthless. Here again, neither the existence of this wastage nor its vastness can really be a matter of debate. It is true that official spokesmen have frequently stood up in Parliament and elsewhere to claim that most of the government spending is necessary or productive. But their words have never been taken at their face value; nor is it likely that they themselves really believe what they are saying. Now that the harm which unproductive and wasteful government expenditure does to the economy has become so serious, academic debating becomes an imperti-

nent exercise in cheating the public. Let the Government face the fact that prices are rising in the case of food or other commodities because an inflationary situation has been created, largely by government spending and that a good part of the spending does not contribute to the country's strength or its economic progress, and could, therefore, be eliminated here and now. This matter of food prices in other words is not a matter for ideological witch-hunting or administrative legerdemain. It is a matter to be dealt with primarily through honest policies of government spending and a reform of this spending is a necessary corollary of any short-term schemes of relief which may be recommended and accepted at the Centre's conference with Chief Ministers.

Justice for the Tax-Payer

I.A.T. is the accepted abbreviation of Income-tax Tribunal, but, it seems, it might as well stand for "Invariably A Target" For, off and on, over the score and odd years during which I.A.T. has been there, agitations and attempts have been made — although unsuccessfully so far — to abolish it. Periodically, arguments have been advanced both for and against abolition but, eventually, I.A.T. has always come out unscathed. Assuredly this is not because it has any charmed life. Tested utility obviously has been its *talisman*. More is required than the personal likes or dislikes of even the most powerful in the land, therefore, to give the short shrift to I.A.T. The final say in this matter belongs to the tax-payer and he has said in no uncertain terms that I.A.T. has come to stay and must stay.

Before such an agency as I.A.T., which, according to a fairly large section of tax-payers, has been serving a useful purpose, is abolished, it is necessary to go into the reasons for its establishment and find out whether those reasons have ceased to hold good today. Equally, it is important to make sure that the change proposed is a distinct improvement on the existing position. Now, the *raison d' etre* for the constitution of I.A.T. as an independent agency was the incessant complaint that the Appellate Assistant Commissioners of Income-tax invariably tended to lean more towards the Department. Human nature being what it is, officials in any department, especially of Government, would be averse to going against or reversing a decision of another official, even of a junior, in the same department. It is a sort

of unwritten convention. Moreover, in an income-tax appeal, tax issues are not merely confined to law but also involve technicalities of accounting and commercial practice, not to speak of administration and functioning of industries. So it was that the Government wisely decided, about 24 years ago, to have an independent agency on which there should not only be a judicial member to interpret the income-tax law but an accountant member as well to provide the accounting expertise. This happy blending (of legal acumen with accounting expertise) has served to ensure justice to the tax-payer on all complicated tax issues. Those considerations that prompted the constitution of I.A.T. are as relevant today, more perhaps than at the time of its establishment. Not only are there more tax payers but also more taxes and a bewildering variety of them to boot.

What is to take the place of I.A.T., if it is decided to abolish it as proposed? Tax courts or Revenue courts or recruitment of Appellate Assistant Commissioners from among the more senior officers have been mentioned. None of these, however, can be expected to achieve the same satisfactory results as I.A.T. has been providing. Tax courts or Revenue courts in the present set-up do not appear to command the same measure of confidence as I.A.T. Furthermore, in such courts, it is possible that the fine balance now obtaining as between the judicial and the accountancy elements may not continue to prevail, especially if, as has been suggested by some, the proposed bench should contain two judicial members and one accountant member. As for appointing senior officers of the department, the same arguments as are raised in regard to existing Appellate Assistant Commissioners would apply. So long as the officers belong to the same department, whatever their seniority, the informal convention cannot and will not be broken. If complete independence in deciding tax cases is the desideratum, Appellate Assistant Commissioners should belong to a different department, say the Ministry of Law, as the tax-payers have been urging. In matters of taxation, particularly appeal matters, even more than in respect of other matters, it is very necessary that justice should not only be done but also appear to be done.

All these apart, what will happen to our High Courts if I.A.T. is abolished and all appeals from the orders of the Appellate Assistant Commissioners are sent up to the High Court? The resulting colossal accumulation of work has only to be conjured up to abandon the proposal unceremoniously. How many more benches and how many more judges must we recruit to keep pace with such accumulation? As it is, many of our High Courts are reportedly suffering from an oversurfeit of cases which they are not able to dispose of as expeditiously as many who believe in the axiom that justice delayed is justice denied would wish. The tagging on to them of thousands of tax case appeals would only throw the entire appellate machinery out of gear and create avoidable confusion.

It may be argued that expert bodies like the Law Commission and eminent jurists have advocated the abolition of I.A.T. To this, those who are opposed to the abolition of the I.A.T. retort by pointing to a few of the arresting observations of the Direct Taxes Administration Enquiry Committee. In the unequivocal opinion of this Committee, there is clear need for such an organisation as I.A.T. According to it, similar independent appellate agencies exist in the USA and the UK. It also declared — and this is very important — that the judiciary of the land could not be expected to go into the minute technical and accounting aspects involved in tax appeals and that the High Courts, as presently constituted, would not be able to devote sufficient time to dispose of the large number of cases which are now being dealt with by I.A.T. and which would have to go to them if the suggestion to abolish I.A.T. were accepted. The High Courts and those connected with them may disagree with this view, but the tax-paying public has no illusions on the subject and, in the ultimate analysis, it is but fair that the voice of the tax-paying public must prevail.

PUNJAB COLD STORAGE

Highlights of the Week

SONS AND SINNERS

THE REPORT of the Das Commission, upholding grave charges of corrupt practices against Mr. Pratap Singh Kairon in his capacity as Chief Minister of Punjab, which was released in summary form by the Government of India on June 21, is a profoundly disturbing document. The gravity of its findings spills over a much wider area of public interest than the misdeeds of a Chief Minister who connived at the amassing of wealth by his sons and relatives through improper means and through the exploitation of his position in the State Government, or of some of his colleagues in his Ministry as well as quite a few senior officials in the administration who thought nothing of flouting law or ethics in their scramble to please the Chief Minister by serving the ends of his sons and relatives.

The gravamen of the indictment made by the ex-Chief Justice, Mr. S. R. Das, lies elsewhere. Said the Santhanam Committee only recently: "There is a large consensus of opinion that a new tradition of integrity can be established if the example is set by those who have the ultimate responsibility for the governance of India, viz., the Ministers of the Central and State Governments. The problem is too difficult and delicate. Ministers are necessarily the leaders of the political party which succeeds in obtaining a majority in elections on adult suffrage. There is a widespread impression that failure of integrity is not uncommon among Ministers and that some Ministers who have held office during the last 16 years have enriched themselves illegitimately, obtained good jobs for their sons and relations through nepotism and have reaped other advantages inconsistent with any notion of purity in public life. The general belief about failure of integrity amongst Ministers is as damaging as actual failure. That these Ministers have held office in the name of the Indian National Congress which had evolved the highest notions of personal integrity and service under the inspiration of Mahatma Gandhi has given rise to an exaggerated view of their failure to maintain high standards of integrity. It is a pity that neither the Congress authorities nor the great leaders who took over the Government of India realise the importance of evolving a suitable machinery and procedure for preventing or dealing with such corruption. We are convinced that ensuring absolute integrity on the part of Ministers at the Centre and at the States is an indispensable condition for the establishment of a tradition of purity in public services".

And Loving Fathers

This was, no doubt, a bold statement for a Committee presided over by a professing Congressman to have made, but it would be doing no injustice to Mr. Santhanam or his colleagues on that Committee to point out that their utterances on the subject of integrity among Ministers must sound unduly cautious in the context of the Das Commission's Report. What the Santhanam Committee hesitantly recorded as a widespread and possibly exaggerated impression of failure of integrity among Ministers has now been shown, in the particular case of a Chief Minister and three of his colleagues, to have been a clear and well-founded suspicion of deliberate and consistent abuse of the opportunities and advantages of high office. The question is: Was not the Santhanam Committee rather squeamish in facing the fact that the failure of integrity among Ministers is something more solid and substantial than a mere impression among the public? It may be tempting for the Congress party to yield to a view of Mr. Pratap Singh Kairon as an unusually affectionate or accommodating father, but the Home Minister who has been quick to claim — in our view, without adequate justification — the dethronement of Mr. Kairon as a triumph of the Nanda crusade against corruption, no doubt, has enough evidence in his Ministry to suggest that paternal — and, let us add, "fraternal" — feelings of the kind which had taken possession of the pliant heart and soul of the Chief Minister of Punjab are not by any means a rare sentiment among Congress Ministers. Actually it is within public knowledge that at least in two other States the presiding personalities in Government and party had just managed to evade their own Das Commissions by getting "Kamrajed" in time. Mr. Kairon, in other words, has simply been less fortunate than some other satraps of the nation's principal political party; but he has surely not been the most venal.

The leadership of the ruling party may hasten to claim credit for such actions as has been taken by it on the Das Report or such consequences as have followed almost automatically from that report, but it is necessary to point out here that the Das Commission having arrived at the sort of findings it had been driven to, it was just not possible for the Central Government or for the Congress High Command to let Mr. Kairon continue as Chief Minister of Punjab. As a matter of fact, within the limited area left to it for manoeuvre, the Congress leadership, both at the party level and at the level of the Central Government, had certainly dealt with Mr. Kairon less firmly or brusquely than was justified by the indictment in the Das Report. Thus, in spite of the fact that the Prime Minister, the Home Minister and the Congress President were fully aware all the time of the nature of strictures passed on Mr. Kairon, the latter was not only asked to continue as the head of the Caretaker Government after he had resigned and his resignation had been accepted by the Punjab Governor, but he had also been permitted to sponsor or veto candidates for the succession. In the circumstances, it is unlikely that the Kairon episode would succeed in serving as an effective sop to Cerberus. On the contrary, an aroused and now thoroughly apprehensive public opinion will certainly demand that the other Kairons in the Congress party who too may be having paternal, fraternal or other family or friendly instincts of the kind which were harboured in the Kairon bosom should be brought under judicial inquiry. The charge of corrupt use of government office or political power made against the ruling party cannot any longer be regarded merely as an election slogan of the Swatantra party.

THE GENEVA CONFERENCE

THE DIALOGUE between the developed and the developing countries of the world which was carried on for three months at Geneva on matters of trade and development came to a close on June 16, 1964, without yielding any spectacular results, though the joint declaration of the developing countries stated that the Conference had been a "significant step towards creating a new and just world economic order". On the credit side, the Geneva Conference may claim three broad gains. In the first place, the developed countries have accepted in principle, that they would contribute one per cent of their gross national product by way of resources for the development and aid of the developing countries. Secondly, a decision has been taken to form a continuing machinery — the Trade and Development Board — to implement the decisions of the Conference. Lastly, the Conference would be convened at intervals of not more than three years; the next meeting would, however, be in 1966.

What is the true significance of all these decisions? The resolution to contribute one per cent of the gross national product is not a new one. A similar declaration was made by the developed countries about four years ago. No attempt has, however, been made since then to take the volume of assistance for the developing countries to that level. There is no guarantee that this promise will take practical shape in the years to come. Again, the new Board consisting of 55 members elected by the Conference would be plagued by the special conciliation procedures, although each member has been given one vote and decisions on matters of substance will be taken by a two-third majority. According to the recommendation made for special conciliation procedures, a special committee will be appointed by the United Nations Secretary-General to prepare proposals designed to establish a process of conciliation to take place before voting. Since the next Conference will be held in 1966, the present nebulous state of affairs in international trade and aid will continue for another two years. The same jugglery may be repeated in 1966.

Other Recommendations

A number of other recommendations were approved by the Conference which were all of a general nature and did not grapple with specific problems. Regarding competition from synthetics and substitutes, the Conference recommended "special action of a national and international nature, with a view, among other things, to raising technical efficiency of production of primary commodities, improving quality and grading, intensifying market research, co-ordinating investment planning and policies in the field of natural and synthetic sectors". It was also recommended that developed countries should avoid giving special encouragement to the production of new competitive synthetics when such investment could be employed more effectively in other fields.

The following recommendation couched in vague terms, once again, is an eye-wash, the developed nations knowing fully well that they would lose nothing by lending support to it: "Developed countries are recommended to help the developing nations with technical and other assistance. The US should provide to the developing countries technical assistance to improve one another's markets and to help them overcome the practical difficulties which at present limit trade in primary commodities between developing countries". A few of the other recommendations — all lacking precision — adopted and incorporated in the final Act were:

(a) "The United Nations General Assembly at its 19th Session should take suitable action with a view to the establishment of a specialised agency for industrial development. Pending the establishment of such an agency the existing centre for industrial development of United Nations should, in addition to its present functions, fulfil the functions of the new body".

(b) "The Secretary-General of the United Nations should make appropriate arrangements for the establishment as soon as possible for a committee of governmental representatives drawn from both developed and developing countries to consider the matter with a view to working out the best method of implementing preferences on the basis of non-reciprocity from the development countries as well as to discuss further the differences of principle. The Committee should take into account the recommendations, documents and declarations considered by the Conference as well as the relevant work of other international institutions. The Committee should report to the Secretary-General of the United Nations within a time limit to be set by him. The report of the Committee should be circulated to the Governments participating in this Conference and to the continuing machinery established following the United Nations Conference on Trade and Development".

(c) "The developing countries should take into consideration and for subsequent action various measures relating to integration of exports of manufactures and semi-manufactures in development plans and policies; productive efficiency and cost reduction programmes; standardization and quality control; financial, monetary, fiscal and other aids and incentives; training and research facilities; technical assistance; and national market information and trade promotion centres".

(d) "Whenever international measures to stabilize prices of primary products in relation to the prices of manufactured goods are inadequate, arrangements should be made on an equitable and universal basis, and without prejudice to the general level of financial aid to developing countries, to correct and compensate the deterioration in terms of trade and short-term decline in the export earnings of countries exporting primary commodities with a view to facilitating the implementation of economic development plans and programmes".

Perhaps the only noteworthy success of the Conference was that it produced unity amongst the developing nations who collectively exerted pressure on the powerful, developed nations to yield some ground in extending aid and liberal terms of trade. In regard to aid, the participating countries got divided into two blocs of North and South as against the political division of East and West. The thaw in cold war brought about this new look for the first time, cutting across some of the political affiliations.

MIKOYAN'S VISIT

THE SOVIET First Deputy Premier, Mr. Mikoyan, was in New Delhi on a two-day visit on Sunday and Monday last. During his short stay, he is stated to have exchanged views with the new Prime Minister of India, Mr. Lal Bahadur, the Union Finance Minister, Mr. T. T. Krishnamachari, and the Union Defence Minister, Mr. Y. B. Chavan, on the pressing world problems and Indo-Soviet relations. Reports suggest that Mr. Mikoyan assured Mr. Lal Bahadur and the Union Finance Minister of substantial assistance from the Soviet Union for the fourth five-year Plan. But apart from Bokaro for which aid has already been promised by the USSR, the quantum of the other assistance likely to be available for the fourth Plan from this source may not be known exactly until Russia's own next Plan, beginning in 1966, gets under way.

The Union Government is understood to have impressed upon the Soviet First Deputy Premier the need to expedite the execution of the MIGs project for bolstering India's defences.

The world problems discussed, it is learnt, included the situation in Laos. Mr. Mikoyan, while appreciating the gravity of the Laos situation, is said to have counselled against any alarmist view. He reiterated the Soviet Union's stand on the Kashmir issue and appreciated that the Lal Bahadur Government was striving to follow Mr. Nehru's policy of non-alignment and co-existence.

Mr. Lal Bahadur was invited by Mr. Mikoyan to visit the Soviet Union. The invitation has been accepted, but no date has yet been fixed for Mr. Lal Bahadur's visit to the USSR. Mr. Mikoyan's visit at the present juncture when India is slowly overcoming the shock it suffered from Mr. Nehru's demise and Mr. Lal Bahadur's sojourn to Moscow in the near future should strengthen Indo-USSR relations further and pave the way for greater mutual understanding between the two Governments.

Shares for All

ASIMAVA CHANDA

A FEW weeks ago, giving the third lecture under the auspices of the Economic Research and Training Foundation (B. F. Madan Memorial Lecture Series), Mr. S. G. Barve, Maharashtra's Industries Minister, said among other things:

> "In fact, what we want is a widespread blossoming out of enterprise among the people at large rather than its monopolisation by a few; we also desire for industrial shares a far wider and more popular base of ownership especially including the working classes than is the case today."

Ever since the corporate sector has been on the move for expansion, the idea has gained ground that a wider share-ownership is imperative not only in the interest of society but all the more so for a matching contribution by the largest organised sector of trade and industry to step up the growth of our economy. But despite this widely shared idea and the pressing need for increasing domestic investments, there has been very little concerted effort, except the establishment of a Unit Trust, to broaden the shareholding community; and none so far in the direction suggested by Mr. Barve. The need for a popular base of share ownership has at least been conceded and voiced by many, but practically no serious thought has been given so far to embrace the working class in the share-owning community. Coming as it does from a Government spokesman, one may legitimately hope that Mr. Barve's idea will prove something more than mere wishful thinking and some early steps will be taken not only to attract the industrial workers to this end but also to make it possible for them to share in the ownership of corporate enterprises for the success of which their contribution is by no means mean. An attempt will be made here to develop this idea of share ownership by industrial workers and employees and also to suggest some steps whereby the idea may be put into effect.

Tapping Funds

It is said that in the USA anyone can buy a few shares over the counter while waiting for a train at the Grand Central Station. Now, India is indeed not America but the desirability to try to make the Indian workman as ready as his American counterpart to believe in the advantages to him, his company and his country of profit-making and of investment by him in Industry cannot be disputed however formidable the obstacles may prove initially. From the point of view of urgent development needs of Indian industry, it is clear that unless employees generally come forward to invest their spare cash in the industrial expansion, that expansion will be woefully limited in the future. For a faster growth of the economy to achieve the prosperity which scientific and technological progress potentially command, tapping the funds of the ordinary man and woman may well prove a sizable addition to our limited investment resources. From the social angle too, it is only right and becoming of a country wedded to democratic socialism, that no person should be deprived of sharing to the full, as far as he can, in the growth of Indian industrial and commercial progress. It would be wrong and even social injustice not to try to remove the obstacles which prevent a wage-earner to partake in the country's investment programme, however slender might be his contribution. From the national standpoint also, the ideal of a property-owning democracy would surely be brought nearer by more widespread dispersion of share ownership among those who work in the industries. And, if such ownership becomes really widespread, the identity of interest of all who work in our industry —of employees and their employers — would certainly become much more generally recognised than ever before.

Although such ideas have been discussed and generously advocated in the past followed by various industrial co-partnership schemes, nearly all such schemes have been too narrow in scope and aim to disperse the share ownership to the extent in view. For the schemes, restricted to ownership of shares only in the company for which the employees work, could not go far to stimulate investment in general. Experience of countries which applied co-partnership schemes, notably the UK among them, have shown that they have failed to make saving by investment general or to make it as easy for the wage-earner as for the man of means. Then again, these schemes have involved, by and large, such an element of subsidy to the employee as to fall short of true ownership.

Obstacles to Share-owning

There are indeed far too many obstacles in the way of workers entering into the domain of share-ownership. Apparently, a camel going through the eye of a needle seems easier than for a workman in India to break into investment in shares. The appalling ignorance of the working class coupled with its proverbial poverty possibly makes it an outrageous proposition. But there are unmistakable signs that the position of workmen is changing, however modestly, for the better not only in bigger pay packets (offset, to some extent, by the rising cost of living) but also in the direction of literacy and general consciousness. Even so, it would undoubtedly appear to many to be too premature to think of any scheme whereby workers could participate in investment programmes. But growing to manhood in the Planning age the workers, especially in a socio-democratic setup, must play their role as partners of the growing and expanding enterprises to which we have jointly set our hands. To give this partnership a minimum realistic basis, a beginning must be made sometime now and not in the remote future to open up opportunities for the workers to participate in the ownership of enterprises for which they work, even if it is an infinitesimal fraction of the total ownership, to start with.

In suggesting the steps with which to give a shape to the proposal of share ownership by workers, the writer is reminded of the UK plan announced by "Aims of Industry" in 1958. This plan, intended to remove the obstacles, legal and practical, in the way of investment by employees and to make it as easy for the working man to save some of his wages by taking a share in the British industry as it is for him to buy a packet of cigarettes is still considered much too sophisticated for the Indian conditions. The essence of this plan is that bearer share warrants will be available for purchase over the counter inside the factories so that they can be transferred from one owner to another without registration or filling-in of forms; they are transferable by delivery — literally from hand to hand, and as easily as a currency note. But the operative part of the plan is rather unsuitable for India at this stage For firstly, money has to be provided for purchase on the stock exchange of the initial stocks for sale i.e. the supply of share warrants on the counter. Companies adopting the plan are required to advance the initial amount of money on loan. The loans are made to a small "shop" company, formed by the sponsoring company taking the form of a private company, limited by guarantee, whose memorandum and articles of association ensure that the income and property of the company are applied solely to achieve the objects

of the company which, basically, are to provide facilities for saving through investment by wage earners. Much though the plan attempts to simplify the sale of warrants to the employee customers, it has necessarily to go through minimum formalities to avoid contravention of the Companies Act and connected legislations. However, since it is not intended to make a case for adoption of this plan in this country, a detailed discussion on it is neither necessary nor is likely to prove very useful. That the idea of share ownership by workers has been actively pursued in the UK in a systematic method and proved feasible no doubt provides us with an example whose salient features may well prove worth following. Besides, the 'core' of this plan, that is, provision of facilities whereby ownership of shares is easily available to workers who have possibly no more than Rs. 30 to Rs. 40 to invest in a year, remains much the same with what is suggested for India.

Thanks to the establishment of a Unit Trust in the public sector, a number of hurdles in the way of extending opportunities of investment in shares by workers have been obviated. For unlike the British plan, it would not be necessary either to create a chain of "shop" companies initially financed by loan from the sponsoring companies or to base the scheme on sale of bearer share warrants requiring a good number of companies to issue them. For one thing, share warrants are seldom issued in India and many companies, for reasons of their own, may not be willing to issue them. For another, the British plan is dependent on the willingness of the sponsoring companies to advance the initial fund. Such willingness is a more uncertain factor in the Indian conditions. Moreover, formation of 'shop' companies will naturally involve compliance with many financial and legal requirements. For instance, under the British plan, it is incumbent on sponsoring companies to be careful to make loans to the small 'shop' company they set up so that the latter is constituted a trustee for the purpose of buying shares in the former. And loans for this purpose should be separate from loans for acquisition of shares in other companies to circumvent such difficulties as purchase of its own shares by the sponsoring company.

Over the Counter

What is proposed, therefore, is the extension of the Unit Trust inside the factory — to set up a counter, preferably near the pay office or the canteen, to sell and buy the sub-units at convenient times and to deal with dividend coupons The pre-requisite to this is, of course, that a supply of sub-units shall be readily available to the intending customers. This will at once dispense with complicated legal precautions and what is more, the scheme will enjoy the robust confidence of state backing, inasmuch as the Unit Trust is in the public sector, right from the inception. In regard to the operation of the 'counter', the plan envisages that suitable publicity measures to explain its objectives and popularise the scheme among the worker-investors would be taken and factual information made available to them whenever required. Unfamiliarity with investment and its method may in the beginning make it difficult to sell the sub-units but once their interest is roused, which may indeed take some years, the workers are likely to prove themselves as steady investors as their resourceful counterparts in the investment market. Their readiness to buy the sub-units will, however, be stimulated when it is made clear to them that these are not only salable on mere delivery by the purchaser wherever he pleased, but would always be bought back at the 'counter' at their current market price. Moreover, receipt of returns on their investments twice yearly will undoubtedly be a sustained incentive to the worker-investor. For the provisions relating to the allocation and disposal of the Unit Trust's annual income and relief from taxation are likely to render the returns comparatively attractive and possibly steady. On the whole, under this scheme, the advantages to the worker of saving by investment over the counter are that first, the opportunity is there, in the works, today, when he has pay in his pocket; secondly, he not only benefits from the expert investment skill but also gets a wider spread for his investments; thirdly, he owns the sub-units without registration or filling-in of forms and is spared of the incidental charges which, compared to the size of his investment, may prove prohibitive; fourthly, he may convert the sub-units into cash whenever any pressing need compels him to do so; fifthly, the denomination of the sub-units being as small as Rs. 10, it enables him to venture in investment. This may be made easier if the scheme adopts the 'thrift plan' whereby regular or even irregular savings of even small amounts (as little as a rupee) may be paid over to the counter and when sufficient, used to buy one or more sub-units; alternatively, issue of sub-units of smaller denomination, say, of Rs. 5, may also be considered.

A Drawback

Admittedly, one drawback of the scheme is that sub-unit holders although owners of the underlying investments, would be on a different footing from the shareholders and, as such, deprived of the rights as to voting, attending meetings etc. But, as we all know, such rights are rarely, if at all, exercised by even enlightened small investors. The cost of providing attendance at the counter to sell and buy the sub-units at convenient times and to deal with dividend coupons together with the cost of publicity campaigns to popularise the scheme may be initially high but there is no doubt that as its operations expand, the costs would decline.

It will be noted that the scheme outlined is primarily meant for industrial employees and workers. Its success or failure will depend on how efficiently it is organised and managed. In any case, for proper functioning, it will require helpful and prompt service to the worker-investors who, besides being strangers to investment, have little or no education. For this reason, establishment of a separate unit trust, also in the public sector, which will exclusively serve the employees and workers of our industries, deserves active consideration. Public sector is suggested because, apart from the confidence it will enjoy from state backing, it would ensure both integrity and efficiency of management of the Trust which will ultimately contribute to its success. Besides, a unit trust in the private sector for this purpose would find it extremely difficult to raise initial capital for covering management costs and yield maximum return to unit holders on their invested capital. Moreover, at the present juncture, what is needed is to inspire confidence among the potential worker-investors in the institution of unit trust and once this has been created, more unit trusts may be allowed to be set up in the private sector.

The part which unit trusts, and only unit trusts, can play in broadening the ownership of industry and in providing an element of stability in the capital market is coming to be ever more clearly and widely appreciated; undoubtedly the influential quarters will begin to concern themselves in the national interest to encourage such a development.

'WINDOW ON THE WORLD

Italy's Prosperity Crisis

From Our Special Correspondent

PARIS:

THE ITALIAN ECONOMIC crisis is heading for a denouement that will probably take the form of a new and more serious round of austerity measures followed by a loan from the other Common Market countries. The other five have already agreed to make the loan (though it will be less than the $1,000 million asked for by Rome), conditional on the Italian Government first enforcing a fairly tough disinflationary policy: higher taxes, increased charges for public utilities, lower State spending and, as far as possible, a wage freeze. The alternative would be that the payment deficit would continue to mount, and before the year were out, Italy would be obliged to devalue the lira and isolate itself from the Common Market for a time. However, there is no reason to foresee that disaster. The measures that Rome is now preparing to take, with an extraordinary slowness, will no doubt be adequate to handle the situation, given the foreign assistance that is promised.

For the Italian crisis is rather less alarming than France's case was in 1958. It is in every sense a prosperity crisis, that could have been dealt with quite expeditiously by a strong and self-confident government. Unfortunately, that is just what Italy lacks today, the electors having returned an assembly that can be governed only by an uneasy coalition. However, before looking at the political complications, let us recall the basic economic malady, which constitutes a textbook case. The long economic boom led to a doubling of industrial output between 1953 and 1961, while national income increased by three-quarters in the same period. The boom seemed to gather pace in 1959-60, when folk started talking about the Italian "economic miracle". The quickening of the tempo of expansion was in reality a bad sign, due to the absence of a firm hand at the reins in Rome, and also to a sort of intoxication with material prosperity in a country that found itself rich for the first time in 2,000 years.

First Experience

Before taking too moralistic a tone about this giddy eagerness to consume which overtook the Italians about four years ago, one must note that the thing they were spending most of their extra money on was food. The conspicuous consumption of the class of insolent rich (more evident in Italy than elsewhere in Europe) and the automobile craze were actually less dangerous than the vast increase in just plain eating and drinking by lakhs of poor people who, in many cases, were having their first experience of regular employment. In the two years 1962-63 workers' wages (which make up two-thirds of the national income) rose by 43 per cent — and outlays on food jumped 28 per cent. It happens that the marketable produce of Italian farms rose by only 1 per cent in each of those years. Obviously, the extra food had to be imported: food purchases abroad soared by 54 per cent in the one year, 1963. Exports of manufactures could not compensate for this, so the trade deficit grew alarmingly.

In other words, there occurred a transfer of resources to a class whose propensity to save is minimal, whose propensity to consume is maximal, and whose consumption centred on a sector where the elasticity of supply is low, agriculture. For industry these same facts meant that in 1962 and 1963 the labour-cost per unit of output rose 27 per cent. Industry absorbed the shock in very creditable fashion; Italian industrial prices rose only 7 per cent in that period, and export sales were maintained (they have actually increased this year). But to do so, industry pared its profit margins and is unable to finance new investment; savings from outside are quite inadequate, for we have noted that income had been transferred to folk who do not save. When a credit squeeze was introduced as a first step toward controlling the situation, the last source of finance for industry, bank credit, dried up. Thus Italian enterprise is desperately short of cash, its expansion plans are on ice, its profits are diminished or wiped out, and of course its stock has plummeted in the share market.

For all that, its situation is fundamentally healthy; witness the alacrity with which the Americans are offering to supply sorely needed ready cash in return for a stake in Italian industry. Montecatini, the country's major chemicals producer, has been bailed out by Royal Dutch Shell, which has taken over half of Montecatini's petrochemicals subsidiary in exchange for the liquidities the Italian firm required. Minnesota Mining and Manufacturing took over Ferrania the photo and films company; Dow Chemical bought a substantial interest in a major Italian drugs firm Ledcga; and so on. Olivetti, similarly in a bad way for ready cash, avoided falling into General Electric's hands, but the Olivetti family had to hand over control to a group of banks and industrial companies who had more cash (Fiat, Pirelli).

Unstable Mixture

This painful shake-out need not have lasted more than a few months, and, given suitable Government action, it would soon have appared in retrospect to be a mere incident in Italian expansion — the sort of skid into which most rapidly developing economies have slipped at least once. The trouble is that suitable Government action was not forthcoming fast enough. Steps were taken in Rome at the start of this year, and they were far from ineffectual. The improvement in the situation (or the slower pace of deterioration) is very evident already, and encourages the belief that if Rome now takes a second and more determined bite at the cherry, the Italian economy will be back on an even keel in six to 12 months. The reason for delay and confusion is that the Government is a coalition of Social Democrats, the Left wing of the Christian Democrats and the Right wing of the Socialists. This unstable mixture is called the Centre-Left Government. It would be more effective if the whole Christian Democrat party and the whole Socialist party were committed to it, but in reality there is a hostile wing of each party that is opposed to working with the other, and keeps up a guerrila war against colleagues in the Cabinet. Thus ex-premier Fanfani is constantly taking pot-shots at fellow Christian Democrat Moro, who heads the coalition, while Signor Nenni, who led the Socialists into the coalition is under fire from pro-Communist Lombardi in the party's paper 'Avanti'. Naturally, under these conditions the Government finds it difficult to take the decisions, some of them unpleasant, that the situation cries out for.

One has seen, notably in India and France, motley coalitions of this sort handle quite dangerous economic crises thanks to a firm and courageous finance minister. But, because of distrust between the parties, Italy today is cursed with three finance ministers: a Christian Democrat "Treasury Minister", Colombo; a Socialist "Budget Minister", Giolitti; and a Social Democrat "Finance Minister", Tremelloni. Each has a say in the formation of economic policy, and at a moment when determined action is needful three cooks are quite enough to spoil the broth. These political details are required if one is

to understand why the Italian economic crisis has dragged on longer than seems reasonable, and why it appears graver than it is really.

However, the period of hesitation is at an end. There is strong pressure from Italy's partners in the Common Market to correct the situation, pressure which, as Signor Colombo said lately in a letter to the premier, "grows every day less cordial". Negotiations between the other five and Rome (kept secret at the Italian Government's request) have been going on for over a month and have culminated in a veritable ultimatum from Brussels: either Rome adopts the measures recommended by her partners or she devalues. In the former case, generous help will be forthcoming, principally from West Germany. The disinflationary procedures chosen will perhaps be known before this is in print, so there is no point speculating on them; they will be a tougher version of the stabilisation measures taken in France last September.

More important are the long-term lessons to be drawn from Italy's prosperity crisis. Some are saying that it proves that the Italian economic miracle was a "false miracle", that there was something radically unsound about the long and spectacular boom. I see no reason to accept that view; accidents are likely to happen when millions of poor people are catapulted into the Christmas-tree society. Consumption runs ahead of production, especially as regards farm produce; savings dry up; impatience knows no bounds and trade unions get to believe that wages can be raised indefinitely by strikes. As the governor of the Bank of Italy says in his latest report. "No economic system could have stood up unshaken before the shock of a redistribution of revenues and of the consequent displacement of demand, on the scale that such phenomena have assumed in Italy in the last two years". Still, there are precautions that could have been taken.

One is that the shift in demand consequent on the transfer of unemployed or under-employed masses into industrial work can be foreseen and should be anticipated: from the moment the Italian boom started, over a decade ago, increase in agricultural output should have been a first concern. If, despite that, demand for food outruns supply, there is no sense in gearing wages rigidly to the cost of living, i.e. essentially to food prices in these cases of developing economies. However "just" it may appear that workers' wages should rise in step with food prices, once we are all wage-earners then we are only chasing our own tails by boosting wages, hence food prices, hence wages again. To index wages on food costs is to build inflation into the system, to do nothing about increasing food supplies, and to price our exports out of world markets. A final lesson concerns the need to offer new forms of saving to redistributed income. Italy, for example, does not even have unit trusts (*mutual funds*). As from now, India is ahead of her on that score at least.

How Weak is Sterling?

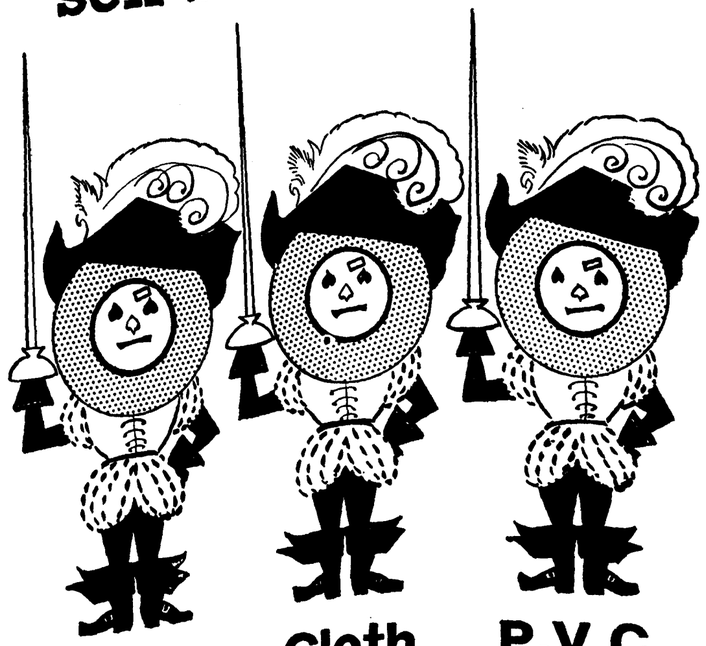
PAUL BAREAU

LONDON:

IN THE foreign exchange market sterling has recently fallen to its lowest level for three years in terms of US dollars, and is now at the lowest of its permissible margin of fluctuation in relation to the German mark and French and Swiss francs. These exchange movements have cast a cloud of gloom over the investment scene. The Stock Exchange has been in the doldrums, not so much because of the approach of a general election, which increasingly looks as though it will be the harbinger of a Labour Government but because the weakness of sterling brings with it hints of another balance of payments crisis and the promise of the all too familiar series of restraining measures designed to bring our present boom to an end.

Is this the beginning of a big slide in sterling: the combined effect of a balance of payments deficit due to overexpansion at home, together with the withdrawal of capital that could precede a general election in which the odds are clearly on a Labour victory? Events so far do not justify a firm positive answer to this question. The domestic economy has admittedly been expanding at a highly satisfactory rate, but apart from some serious bottlenecks in the labour situation, and a real shortage of skilled workers in the engineering industry, there is as yet no evidence of inflationary overstrain. Wages and prices are being held back far more successfully in Britain than on the Continent of Europe, including some countries whose currencies are for the time being seemingly much stronger than sterling.

The current balance of payments has, it is true, switched from appreciable surplus in 1963 to a modest deficit in the early months of 1964; but much of this is due to a vast piling up of inventories of imported industrial materials. This reflects not only the increasing pace of industrial expansion, but also anticipation of still higher commodity prices and, therefore, precautionary stocking up of the commodities in question. Even so, the balance of payments deficit is still marginal. Looking to the future, there is no cause for alarm. The export order book of British industry is well filled. In the matter of costs and prices British industry remain competitive.



How then does one account for the weakness of sterling? The first and at present most important factor which began to operate in the second half of May has been the sudden tightening of credit conditions in many countries of Europe. The anti-inflation measures taken in France, Italy, Holland and Denmark have led to real stringency of credit. In Holland and Denmark Bank rate has been increased. In Paris the scarcity of credit has been such that up to 6¼ per cent is now being paid for day to day money. In these circumstances a considerable amount of short term money has left London for these centres where it can earn at least 2 per cent more. This is unquestionably the influence which set in motion the decline in sterling that began towards the end of May and has persisted ever since.

Fear Complex

It was soon reinforced by commercial purchases of foreign currencies occasioned by fear that the movement might go further. Many importers in the sterling area countries, seeing sterling declining, rushed into the market and covered their requirements of dollars, marks and other foreign currencies in order to protect themselves against such possible eventuality as a devaluation. This is a typical illustration of the "leads and lags" in the exchange situation which, in a currency as widely used in international trade as sterling, can impose very serious strain on the reserve. It does not, however weaken the basic position, since these anticipatory purchases of dollars and other currencies merely mean that the purchases in the latter part of the year will be proportionately smaller.

The next point to note is that the authorities in London have seen fit not to intervene in the market to any appreciable extent. The dealers at the Bank of England are very well informed about what is going on in the market. The leads and lags can be left alone since in due course they will reverse themselves. As for the movement of short term

THE AUTOMOBILE INDUSTRY. . . .

Tens of thousands of scientific and technical personnel — engineers, metallurgists, technicians, skilled craftsmen—are needed to accelerate the country's industrial and economic development.

The Automobile Industry and the allied industries with their wide range of manufacture—from steel sheet to upholstery leather, from electrical components to intricate mechanical parts, from rubber and plastic articles to paints and textile fabrics—play an essential part in supplying this need.

These industries, with the multiplicity of techniques employed and the complexity of operations involved, afford excellent training ground for a variety of technical and scientific personnel. A number of these industrial firms—notably Hindustan Motors Ltd.—have organised training schemes for apprentices and for engineering graduates and are conducting special courses for mechanics (including sons of factory workers), workshop and service personnel.

The financial contribution made by the Automobile Industry to the Government in the form of taxes, duties and other levies also helps to develop various schemes under the Five Year Plans, such as public sector industries and technological institutes which again provide scope for training technical manpower. A Hindusthan Ambassador car, for instance, contributes as much as 5140 rupees or 33% of the "on the road" price of the car in Calcutta to the national exchequer.

The automobile and allied industries thus help to multiply the trained manpower in the country.

lends a hand to the training of manpower

capital, why should the authorities intervene and support the rate when by doing so they will merely give the "hot money" operators a more favourable rate at which to convert their sterling into French francs or other currencies? The fall in the rate of sterling has, therefore, been accompanied by little if any encroachment on the reserve of gold and convertible currencies.

This absence of intervention does not, however, suggest that either the means or the will to intervene are absent. They are both there — and in abundant measure. The gold reserve was further strengthened in May and now stands at just on £1,000 million. Under the "Basle arrangements" with Continental central banks the Bank of England could mobilise up to the equivalent of $1,000 million. By activating the standby credit with the International Monetary Fund (which will certainly be renewed next month) the Exchange Equalisation Account could lay its hands on a further $1,030 million. The swap arrangement between the Bank of England and the Federal Reserve Bank of New York puts another $500 million at the disposal of the Exchange Equalisation Account, if there is need for it. Finally, there are dollar securities held by the Treasury — the remnants of the dollar investments that were mobilised by the Government during the war — last valued at $800 million and available as collateral for raising further credit in the United States.

The ammunition available to defend sterling will not run short. The sense of co-operation between central banks and finance ministers, in the cause of maintaining exchange stability is greater today than it has ever been. There is a far wider recognition among them that the main currencies of the world hang together; that serious damage to one will inevitably react on the others. If, therefore, stering is subject to further pressure as a result of the withdrawal of short-term capital, or by reasons of speculative attacks in anticipation of the general election, the day will come when the authorities in London will hit back and do so with massive power.

This, however, is not to say that all is well and that the amplitude of available reserves ensures that sterling can and will hold its ground. It will only do so if the balance of payments remains somewhere near the point of equilibrium and if there is no evidence of a runaway inflationary movement in the British economy. Since there is no sign of that yet, since a certain amount of foreign capital continues to come in (note the Chrysler bid for a stake in the Rootes Motor Group) and since, above all a great many other countries appear to be inflating a little faster than Britain, sterling is by no means as weak as recent movements in the exchange market would appear to suggest.

Growth Without Inflation

GUY SIMS FITCH

WASHINGTON:

THE U.S. ECONOMY is in its 40th month of sustained and vigorous expansion, and the accumulating evidence points to a firm and continuing strength. As a matter of fact, Americans expect economic activity in the United States to remain high for some time to come, if historically reliable government surveys are given their usual credence. One study has found that manufacturers are looking ahead to further improvement in their sales, with gains of two per cent anticipated in both the second and third quarters of this year. While these advances would not quite equal the spectacular first quarter rise, they would surpass by a comfortable margin the quarterly average of the last two years. Another survey shows that business men now expect to spend a record $43,900 million on new plant and equipment this year, 12 per cent more than last year's high. More importantly, the survey reaffirms the steadily rising trend in investment planning that is characteristic of periods of sustained busines expansion. Only three months ago, business men were talking of a $43,200 million outlay on new plant and equipment in 1964.

Consumers, no less than business men, have been boosting their spending and raising their economic sights. Confirming earlier indications based on preliminary weekly data, retail sales in May did score a new monthly high of $21,700 million, seven per cent above that of May 1963. Recent surveys, moreover, show an escalation in consumer confidence and buying intentions that generally parallels the upward trend in business investment plans. As an example, the number of people planning to buy new cars and other consumer goods this year has continued to increase by a small but significant margin as the months have passed. Bearing out this promise, the already buoyant automobile market has continued to grow, with sales of new cars in April and May hitting new peaks for those months. The industry is becoming increasingly confident that 1964 will see another milestone reached with the sale of eight million new passenger cars. Deliveries of trucks, according to some analysts, also are proceeding at a record pace.

With production and demand high, and with new construction maintaining its record rate, the steel industry's prospects also are growing increasingly brighter. May output of steel was five per cent more than that of April, and major steel mills already are raising the estimates of June shipments they made only a few weeks ago. Present projections suggest that the usual seasonal let-down in steel operation this summer will amount to no more than 10 per cent from the spring peak. In 1955 and 1957, the industry's two biggest years up to now, summer declines of about 20 per cent occurred. Steel industry officials usually are a rather cautious group not given to extravagant predictions. But they, too, are growing more optimistic with each passing month. They look for a substantial seasonal upsurge in steel output this autumn, and are beginning to talk openly of a new annual production high that will surpass the record of 117 million short tons (one short ton equals 0.91 metric tons) set back in 1955.

Economy Looks Up

All of this brings one back to the recurring but basic theme. The state of the US economy clearly indicates that — so far at least — the recent tax cut is working about as its proponents claimed it would. It is providing an additional lift to both consumer and business activity, and it has not provoked any unsettling "boom" conditions. Those who assumed that the tax cut would bring no benefits to the economy are being proved wrong, as are those who warned of inflationary consequences. On this score, a staff study by the US Federal Reserve Board is highly informative. It finds that even with the rising production trend, there still is enough room in the buoyant US economy to expand output further in major industries — especially because of the prospect of a five per cent increase in plant capacity this year. The study also finds that while some skilled labour shortages could develop, the overall labour supply situation is not likely to impede further significant gains in output.

Thus, there is no imminent threat to the impressive record of stability in prices and in unit labour costs that has been maintained over the last several years. In other words, the present prospect for the United States is for continued buoyant economic growth without inflation.

LISTENING POSTS

Mixed Bag from Geneva

By Our Special Correspondent

NEW DELHI:

THE DECISIONS of the Geneva Conference on Trade and Development have been received here with a mixed feeling. While acceptance by the developed nations of the need for setting up a continuing machinery to implement the decisions of the Conference is considered a major victory for the developing countries, disappointment is being expressed at nothing concrete having emerged in regard to extension of the commodities agreements and provision of preferential treatment by the developed nations to the manufactures of the developing countries.

The outcome of the Geneva Conference has been hailed here as a good beginning for tackling the world trade problems from a new angle which would safeguard the interest of the less-developed countries. The decisions of the Conference are subject to the concurrance of the U.N. General Assembly which would be meeting for adopting them some time in November. The official sources here, of course, do not anticipate any difficulty in the major proposals of the Geneva Conference being approved by the General Assembly.

The Trade and Development Board recommended to be set up by the Geneva Conference, on present indications, is likely to have its headquarters at New York. Any other location, it is felt, would mean a higher budget for it and will make its co-ordination with ECOSOC and the UN Special Fund cumbersome. As decided at Geneva, the UN Secretary-General would set up a small expert committee to decide on alternate procedures for the functioning of the Board. This, it is gathered, was the concession made to the Western countries some of which sought special weightage for them in voting procedures.

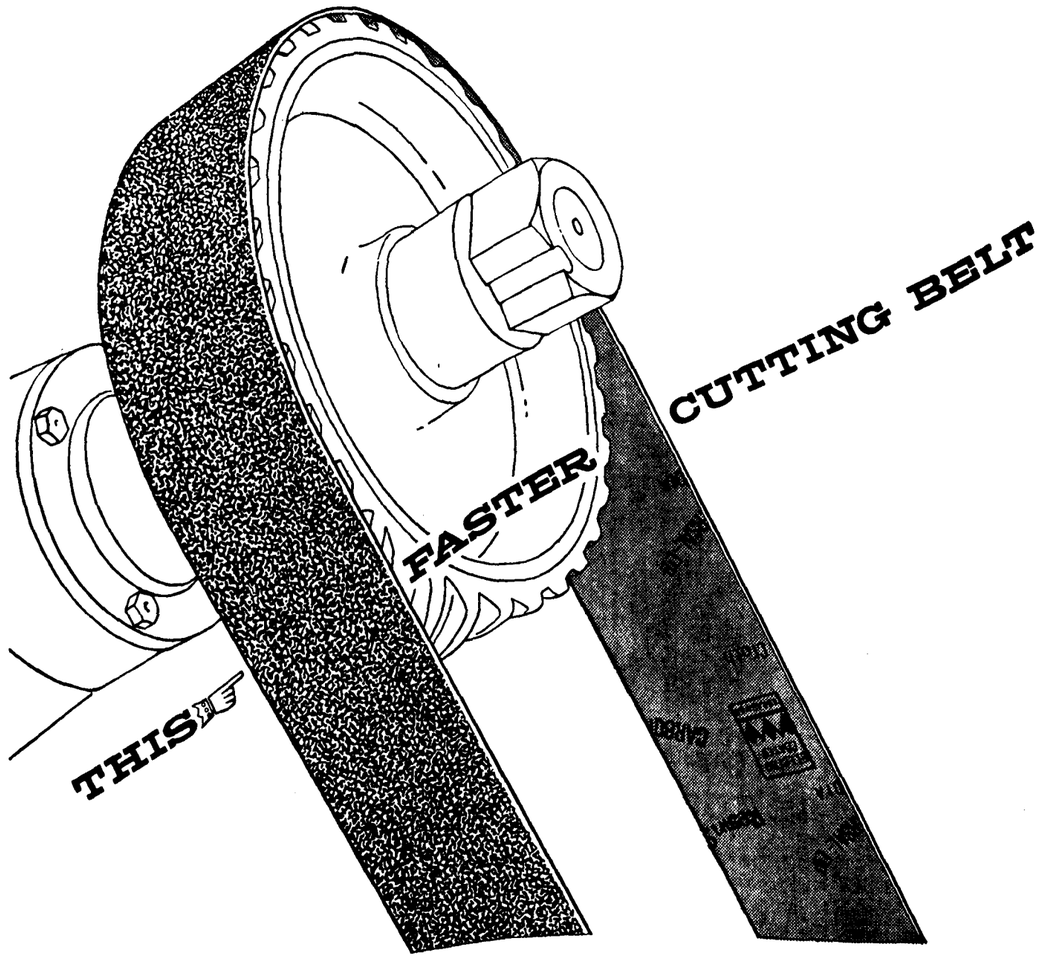
The other decisions of the Geneva Conference have been welcomed in New Delhi. One is the acceptance by the Conference of the principle that the developed countries should transfer one per cent of their national income for development of the less-developed countries. The second relates to the agreement on providing an international forum for discussing shipping matters. For the first time, arrangements are being made now to set up an international body which can keep a watch on shipping freights and also on the acquisition of merchant fleets by the world nations.

Although no concrete results have flowed from the Geneva Conference on commodity agreements, it is believed that in the next few years, 5 or 6 more commodity agreements might come into being on the basis of the discussions at Geneva.

**

The export trade in manganese ore is proposed to be thrown open to the private sector from next year. This was announced here on Friday last by Mr. Govind Narain, Chairmain of the State-owned Minerals and Metals Trading Corporation of India. The MMTC, Mr. Narain added, hoped to fulfil all its barter agreements in this commodity by the end of this year. No barter agreements for managenese ore exports are envisaged to be entered into for shipment after December 31, 1964.

From January 1, 1965, any person who wants to export manganese ore on his own will be allowed to do so. The services of the MMTC, however, will be avaliable for others who find it difficult to effect exports on their own. For the benefit of such mineowners and exporters, the MMTC will be entering into long-term arrangmeents with the foreign buyers so that they could be assured of a regular off-take and reasonable prices.



The decision to stop manganese ore exports on barter basis, it is understood, has been taken in view of the desire on the part of the foreign buyers to have direct trade links with the Indian exporters on a long-term basis.

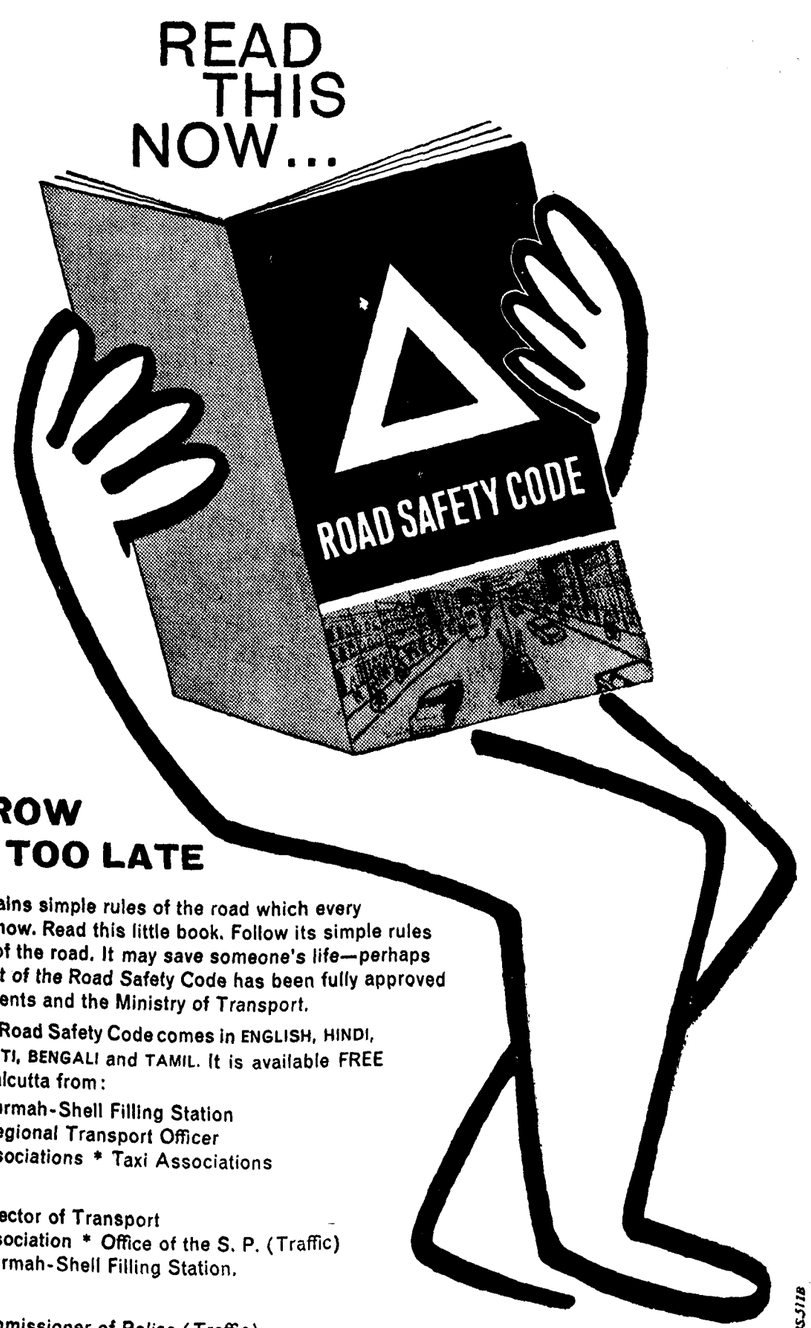
Mr. Govind Narain also expressed the opinion that if everything went well, India would not only be able to achieve the 25 million tonnes iron ore exports target set for 1970-71, but might even exceed it. He expected that the third Plan target of 16 million tonnes iron ore exports would be exceeded by about one million tonnes. At least 11 million tonnes of iron ore are expected to be exported during the current financial year — 6 million tonnes from Goa and 5 million tonnes from the rest of the country. In 1963-64, India exported nearly 9.5 million tonnes of iron ore — 5.3 million tonnes from Goa and the rest from the other areas.

**

In the last two issues, we published the details of India's liability up to 1975-76, on account of repayment of principal and payment of interest on the loans received by her up to the end of 1963 from the members of the Aid-India Consortium (including the World Bank and the International Development Association) and the USSR. The following are the details of the burden to be discharged by India [in million dollars, on account of principal repayment (P) and interest charges (I)] in the case of the credits made available by Kuwait, Switzerland, Poland, Czechoslovakia and Yugoslavia — the remaining five countries which have extended loans to India for her economic development:

Kuwait	1964-65 — P 6.7, I 2.6; 1965-66 — P. 6.7 I 2.2; 1966-67 — P 6.7, I 1.9; 1967-68 — P 6.7, I 1.6; 1968-69 — P 6.7, I 1.3; 1969-70 — P 6.7, I 1.0; 1970-71 — 6.7, I 0.7; 1971-72 — P 6.7, I 0.3; No liability thereafter.
Switzerland	1964-65 — P nil, I 0.3; 1965-66 — P 1.1 I 1.3; 1966-67 — P 1.1, I 1.5; 1967-68 — P 2.1, I 1.4; 1968-69 — P 3.6, I 1.3; 1969-70 — P 6.4, I 1.2; 1970-71 — P 7.6, I 1.1; 1971-72 — P 6.3, I 0.9; 1972-73 — P 2.2, I 0.8; 1973-74 — P 2.0, I 0.6; No liability thereafter
Poland	1964-66 & P nil, I 0.3; 1965-66 — P nil, I 0.5; 1966-67 — P nil, I 0.6; 1967-68 — P 3.3, I 0.7; 1968-69 — P 3.3, I 0.6; 1969-70 — P 3.4, I 0.5; 1970-71 — P 3.3, I 0.4; 1971-72 — P 3.4, I 0.3; 1972-73 — P 3.4, I 0.2; 1973-74 — P 3.4, 0.1; 1974-75 — P 3.3, I nil; 1975-76 — P nil, I nil.
Czechoslovakia	1964-65 — P nil, I 0.2; 1965-66 — P nil, I 0.5; 1966-67 — P 3.2, I 0.6; 1967-68 — P 3.2, I 0.6; 1968-69 — P 3.2, I 0.5; 1969-70 — P 3.2, I 0.4; 1970-71 — P 3.2, I 0.3; 1971-72 — P 3.2, I 0.2; 1972-73 — P 3.2, I 0.1; 1973-74 — P 3.2, I nil. No liability thereafter.
Yugoslavia	1964-65 — P nil, I nil; 1965-66 — P nil, I 0.2; 1966-67 — P nil, I 0.3; 1967-68 — P nil, I 0.4; 1968-69 — P 2.1, I 0.5; 1969-70 — P 2.1, I 0.4; 1970-71 — P 2.1; I 0.4; 1971-72 — P 2.1, I 0.3; 1972-73 — P 2.1,

CUTS COSTS... BOOSTS PRODUCTION!



You get more work from every Carborundum Universal **Resin Industrial Cloth Belt.** Your output goes up. Your costs come down. You turn out a better product... In shorter time!

Carborundum Universal give you electrocoated belts of greater strength and durability. The Resin bond withstands frictional heat, humidity, high speed and shock. And the sharp aluminium oxide grains on tough cloth backing give maximum and continuous cutting action!

TOMORROW MAY BE TOO LATE

This booklet contains simple rules of the road which every road-user must know. Read this little book. Follow its simple rules in your daily use of the road. It may save someone's life—perhaps your own. The text of the Road Safety Code has been fully approved by State Governments and the Ministry of Transport.

IT'S FREE! The Road Safety Code comes in ENGLISH, HINDI, MARATHI, GUJARATI, BENGALI and TAMIL. It is available FREE in Bombay and Calcutta from:

* Your nearest Burmah-Shell Filling Station
* Offices of the Regional Transport Officer
* Automobile Associations * Taxi Associations

In Delhi from:

* Office of the Director of Transport
* Automobile Association * Office of the S. P. (Traffic)
* Your nearest Burmah-Shell Filling Station.

In Madras from:

* The Deputy Commissioner of Police (Traffic)
* The Director of Transport
* Automobile Associations * Taxi Drivers' Associations

Road Safety is a matter of life...and death

Issued in the interest of Road Safety by Burmah-Shell.

The Governments of India and the United States concluded last week an agreement under which the US Administration will be providing, through the US Agency for International Development, a loan of $7.8 million (Rs. 3.7 crores) for the construction of India's first methanol plant at Trombay. The project will make India self-sufficient in methanol, a key chemical used in the manufacture of plastics, drugs, resins, synthetic fibres and dyestuffs.

The methanol plant will be put up by the Fertilizer Corporation of India adjacent to its Trombay fertiliser factory. It will have an annual capacity of 33,000 tonnes of methanol and is expected to go into production in the second half of 1965. It will utilise synthesis gases produced during the course of fertiliser manufacture.

The Trombay fertiliser factory, designed to produce 420,000 tonnes of chemical fertilisers annually, has also been financed by the United States to the tune of Rs. 27.7 crores. This loan had been made available partly in dollars to meet the foreign exchange cost and partly in rupees out of the PL 480 counterpart funds to meet the expenditure in Indian currency.

A portion of the loan for the methanol project will also be used for the installation of ancillary facilities, including a sulphuric plant and an argon gas recovery unit in connection with fertiliser production. The argon gas recovery plant will have an annual production capacity of 116,820 cubic metres and will be the second such production unit in India.

A contract has been entered into by the Fertiliser Corporation with the Girdler Corporation, Louisville, Kentucky, USA, for designing, fabrication and erection of the methanol plant. When in full production, this plant will save the country foreign exchange equivalent to nearly Rs. 4 crores a year.

★★

The first one-million-tonne unit of the State-owned Barauni refinery is expected to go on stream shortly. Trial runs have already been started at this venture with the crude oil supplied by Oil-India.

The Chairman of Oil-India, Mr. Khandubhai K. Desai, in his annual statement to the shareholders — Oil-India is a 50 : 50 partnership between the Government of India and the Burmah Oil Company — has assured that the company will be able to meet fully the requirements of the Digboi, Nunmati and Barauni refineries according to stipulated programme. Despite delay in the commissioning of the Barauni refinery, Oil-India has been able to show satisfactory working during 1963 and has declared a divided of Rs. 120 per share on the paid-up capital of the year. This amounts to a minimum dividend of 9 per cent, after payment of all taxes. Another notable achievement has been that despite the difficulties faced in acquiring land, Oil-India has been able to accomplish its drilling targets for 1963 and in spite of increased cost of material and labour and also heavy expenditure incurred on exploratory drilling in new concession areas, it could contain the drilling costs through improvement in operations.

Mr. Desai has also assured the Union Government and the Government of Assam that natural gas from the Nahorkatiya and Moran oilfields in excess of the present commitments to various Government projects, would be available for sale to other approved projects at a price which would be sufficient to enable the company to compress and store gas to the extent necessary to provide for uninterrupted supplies over the periods required by the consumers.

The Constitution (Seventeenth Amendment) Bill, 1964, to pass which special sessions of the two Houses of Parliament had to be summed on May 27, has received the assent of the President. The Act amends the definition of "estate" in Article 31A of the Constitution by including therein lands held under ryotwari settlements and also other lands in respect of which provisions are normally made in land reform enactments.

The Act also provides that, where any law makes a provision for the acquisition by the State of any estate and where any land comprised therein is held by a person under his personal cultivation, it shall not be lawful for the State to acquire any such land as is within the ceiling limit applicable to him under any law for the time being in force or any building or structure standing thereon or appurtenant thereto, unless the law relating to acquisition of such land, building or structure provides for payment of compensation at a rate not less than the market value. The Act, further, amends the Nineth Schedule to the Constitution by including therein 44 State enactments relating to land reform in order to remove any uncertainty or doubt that may arise in regard to their validity.

The Lockheed Aircraft Corporation is making a bid for entering the commercial market for cargo transport aircraft with its Hercules C-130E. This giant plane is currently on a round-the-world demonstration and goodwill flight. It showed its paces here at the Palam airport last week.

A preliminary certificate of airworthiness was granted to the demonsrtator aircraft by the US Government on May 15. It is expected that commercial certification will be made avail-

able by the end of the current year, both for passenger and cargo transport.

— Eight countries — Australia, Canada, Indonesia, Iran, New Zealand, Pakistan, South Africa and the US — are already using C-130Es for their military services. One of the series of the C-130 planes helped the Indian Air Force alsoo during the days of Chinese aggression.

The Lockheed Aircraft Corporation claims that Hercules C-130E provides for the lowest ton-mile operating cost for short and medium range services. It can land on unprepared landing strips. Its maximum payload is 45,000 lbs., which can be airlifted more than 22,000 nautical miles.

The Industrial Development Bank of India Act, 1964, came into force with effect from June 20, 1964.

Bihar's Fourth Five-Year Plan

From Our Correspondent

CALCUTTA:

IN LINE WITH the rest of the country, Bihar too has drawn up an ambitious plan for the next five-year period. The State's draft fourth five-year Plan is estimated to cost Rs. 675 crores, which is more than double the outlay for the third Plan. The Government is prepared to raise one-third of the proposed outlay for the next Plan out of its own resources, and it expects that the Centre would provide two-thirds. The distinctive (and sensible) feature of the Plan is that it places its main reliance on rural industries, leaving heavy industries to the Union Government. Agriculture too has been given a key place — in fact, most of the outlay is proposed to be spent on agriculture, community development and allied activities. It is planned to modernise agriculture as much as possible with the aid of machines and power in all practicable cases. It is rightly felt that as long as agriculture and rural industries remain as backward as they are, the real per capita income of the people of the State will never rise. Not that the State Government and its Planning Board do not realise the importance of large industries, but they realise their limitations and feel that there is not much in this field that is in their power to accomplish.

They, however, do plan for certain industries, based largely on the resources of the State. Only one project will require substantial outside help, and that is for a machine tool plant. The State Government has sought Hungarian collaboration for this purpose. The Hungarian response is said to be favourable, not only for the proposed machine tool plant, but for a number of small State-sponsored industries in the Patratu area where a Russian-aided large power house is being built. One of these latter is to make coloured polyestar sheets as a substitute for corrugated sheets, another is to manufacture wire braids and nettings and a third one is to make furniture and clothes. The schemes relating to north Bihar, the State's relatively less industrially developed region, are based on sugarcane and its by-products. The huge quantity of bagasse produced by the 28 sugar factories in Bihar are at present being wasted, being used mainly as a kind of domestic fuel. Bagasse is a raw material for industries making pulp boards, jointings, etc., and some industrial schemes are designed to put it to industrial use. There are other projects for using molasses to make industrial alcohol, which is in great demand, and Bihar is now wasting at least 50 per cent of its present output.

Mineral development and improvement of transport and communications have been allocated only Rs. 50 crores, but Rs. 77 crores are proposed to be spent on social services and education. In the Rs. 337-crore third Plan, these latter have got only Rs. 23.87 crores. The planners apparently feel that the past neglect of social services should be remedied in a big way. It is not known how the Planning Commission and the Union Government which is expected to provide the bulk of the funds react to the State's plan, but Bihar apparently has based its case on the need to achieve a balanced development of the country as a whole, on the ground that this is one of the fundamental objectives of planning.

★★

Civil work for the Bokaro plant, a Central Government project in Bihar, is about to start soon. The steel project authorities have been receiving maximum co-operation from the Government of Bihar. The West Bengal Government, which once opposed the construction of a dam at Tenughat, which will supply most of the water for the projected steel plant and township, has already given its consent to the building of the dam. Land acquisition is proceeding apace and some 7,000 acres have already been acquired. Eventually, 36,000 acres will have to be taken over, displacing some 7,000 families spread over 55 villages, but the Bihar Government is making prompt arrangements for the rehabilitation of the families affected. Progress of the construction of link railway lines is satisfactory, and the railway authorities have already surveyed the site for a marshalling yard. All this brisk preparation is on account of the time schedule which the Union Steel Ministry has drawn up for installing the plant in the fourth Plan. According to this time schedule, the first stage of the plant, for which Russian aid has been assured, will be completed by 1968 to yield an output of 1.5 million tons. Th second stage is to be completed by 1970, when the full design capacity of 4 million tons of steel ingots will be achieved. (By the latter date, the Bhilai steel plant, also a Russian-aided project, is to reach th capacity level of 4 million ingot tons, according to current expansion plans.)

Lower Estimates

The cost estimates prepared by the consultants, Messrs. Dastur and Co., are appreciably lower than those of the US technical team which studied the techno-economic feasibilities of the Bokaro project when India was seeking American aid. According to Dasturs' estimates, a sum of Rs. 450 crores will be required to complete the first stage of the project, and another Rs. 600 crores or so for the second stage. Of this, roughly 20 per cent will be in foreign exchange. The Steel Ministry is, however, exploring ways and means to economise the cost by adopting some of the features of Japan's steel technology. An expert team has just returned from Japan after studying that country's steel-making techniques, and it is reported that it has gathered ideas which can be usefully aplied in Bokaro. The Heavy Engineering Corporation's factories in Ranchi are also likely to contribute part of the plant and machinery, which will save some foreign exchange expenditure. It is, however, not the cost which is the main issue, but the speed with which the plant can be constructed and commissioned. Bokaro is designed to produce flat products. These are at the moment critically short in the economy, and many vital industries, particularly engineering, are suffering on account of this shortage. The Bokaro plant is also designed to produce a sizable quantity of foundry grade pig iron, which too is acutely short. The foundry industry is able to use barely 50 per cent of its installed capacity due to inadequate supplies of pig iron, its raw materials, and Bokaro was expected to supply more than one-fifth of the total quantity of salable pig iron during the third five-year Plan.

★★

The Union Rehabilitation Minister, Mr. Mahabir Tyagi's visit to Assam recently highlighted the serious refugee problem which this border State is now facing. It is estimated that some 125,000 people have so far come away, now living in 20 camps or so, but where it will not be possible to live much longer because of the monsoon. Mr. Tyagi discussed the plan for dispersing the refugees, and naturally, the Assam Government took advantage of his presence to press its case for more Central aid in the shape of funds as well as bigger allocation of foodgrains. Most of the refugees are tribals, simple and hardy folk, who could be turned into an asset by making them take to agriculture in the vast tracts of land in the State now lying waste. These lands can be reclaimed for the rehabilitation of the displaced persons. In the NEFA area too, land available for resettlement is said to be plenty. Even so, operation resettlement will require considerable funds and efficient organisation of the official machinery which is to be entrusted with the work.

The Assam Government's plan is to resettle as many of the refugees on land as possible, but some suitable new industries will be needed to take in those who cannot be so resettled. The State Government has, therefore, drawn up schemes to set up a jute and a spinning mill in Goalpara (in this sub-division the bulk of the refugees are now housed in transit camps), a ceramic factory in Gauhati, a paper mill in the Mikir Hills, a sugar mill in Cachar and addition of capacity to Charduar and Gauhati spinning mills. During his visit, Mr. Tyagi is reported to have agreed that these projects are necessary, and he is even reported to have assured that he would try his best to secure as much Central assistance for this purpose as possible. But a curious thing which the Union Rehabilitation Minister is reported to have stated at a Press conference, he held in the course of his visit to Assam, is that India has not yet reached the saturation point in the matter of absorbing refugees from East Pakistan. Although he later hastened to add that this country cannot possibly accommodate the entire minority community of Pakistan. He did not quite indicate where exactly the saturation point would lie. Already half a million or thereabouts have crossed the border, and the flow continues. West Bengal, in particular, finds it very difficult to absorb any more refugees than it has already done, and the problem becomes much more difficult due to the preference of the displaced persons to live in West Bengal.

★★

The West Bengal Financial Corporation wants to extend its lending activities, and with that end in view, a number of steps have been taken. A panel of technical advisers has been appointed for examining the technical soundness of the schemes for which the Corporation's loans are sought; a law officer has been appointed to avoid unnecssary delay in processing loan applications; and to stimulate the interest of entrepreneurs all over the State in the Corporation's loan schemes, it has been decided to hold meetings of the Board of Directors at different important centres. One such meeting has already been held in Assansol, where the board convened a conference of the industrialists of the area. The Corporation has, however, not been able to function as the agent of the State Government for routing the latter's funds to small-scale industries. The Accountant-General has raised certain issues which remain to be cleared. Meanwhile, the

FDS-UBI

Reserve Bank has taken up the matter with the State Government, and it is hoped the procedural or legal difficulties will be overcome.

In order to expand its lending activities, the Corporation must increase its rseources. The avenues which have been open to it so far are (a) borrowings from the Reserve Bank against 'ad hoc' bonds; and (b) borrowings from the Refinance Corporation for Industry by way of refinance. The Corporation is now authorised to accept deposits from the public. It proposes to take appropriate steps to attract deposits from them, but not much fund is expected to flow in this way. Another important avenue left with it is to raise funds by issuing bonds. In the past, the Corporation has raised Rs. 2 crores through such issues, and recently, it decided to raise a crore of rupees through bonds. It is reported that some scheduled banks have already agreed to subscribe to the issue and more are expected to follow.

In keeping with its objective of providing more and more assistance for the industrial development of the State and for increasing employment potential, the Corporation has steadily increased its financial assistance over the years within the limits of its means. During the year ended March 31, 1964, the Corporation sanctioned loans totalling Rs. 1.71 crores, while disbursements amounted to Rs. 1.29 crores. The percentage of disbursement to loan sanction was 76 as against 46 in the previous year, and is the highest proportion reached so far in the life of this body. Also for the first time, it underwrote shares and debentures to the extent of Rs. 25 lakhs. According to the report of the Board of Directors for the year ended 31st March, 1964, the commitments of the Corporation since its inception up to 31st March, 1964, are as follows: total loans sanctioned Rs. 7.84 crores; the total amount disbursed Rs. 4.93 crores; loans declined by the applicants or not made available for one reason or another Rs. 1.08 crores; amount yet to be disbursed Rs. 1 83 crores. The gap between the loans sanctioned and the amount actually disbursed is big, which requires to be reduced. Speedier processing of loan applications should help in reducing the gap.

Maharashtra's Mounting Needs for Finances

From Our Correspondent

BOMBAY:

WITH THE setting up of the Fourth Finance Commission, a careful review of the entire problem of State finances has assumed urgency, especially in the context of the fourth five-year Plan. It would be instructive to study how the finances of Maharashtra have been shaping in the period of the first four years of the third Plan. On the revenue side, tax revenue would increase from Rs. 103 crores in 1962-63 (Accounts) to Rs. 129 crores in 1964-65 (Estimated) i.e. by about Rs. 26 crores. Under taxes on income, the significant trend is a decline in yield from Agricultural Income-Tax, from Rs. 75 lakhs in 1963-64 (Budget) to Rs. 5 lakhs (Revised) for the same year and Rs. 15 lakhs (Estimated) for 1964-65. The taxes on property and capital transactions are practically at the same level, with marginal variations. The revenue from general sales tax has shown an upward trend from Rs. 36 crores in 1962-63, to Rs. 50 crores in 1964-65 (Budget). Under non-tax revenue, the striking trend is the increase in grants-in-aid and other contributions from Rs. 13 crores in 1962-63 to Rs. 22 crores in 1964-65 (Budget), the total non-tax revenue registering a rise from Rs. 146 crores to Rs. 184 crores during the period. The trends show that there is not much of buoyancy in the tax-system of the State.

Rural Bias

On the expenditure side, development expenditure would rise from Rs. 64 crores to Rs. 89 crores, in the period 1962-63 (Accounts) to 1964-65 (Budget). Education, Medical and Public Health, Agriculture, Veterinary and co-operation, Irrigation, and Rural and Community Development projects have significantly shared in the increase. On the whole, the developmental expenditure has decidedly a rural bias in Maharashtra. The non-development expenditure would rise from Rs. 78 crores to Rs. 95 crores in the period under reference. The notable increases are under the heads of collection of taxes, duties etc., debt services and civil administration. The civil expenditure has also risen up on account of the trend towards increased social security benefits to the Government servants. The total expenditure, on revenue account, would rise from Rs. 143 crores to Rs. 184 crores in the period.

On capital account, while the receipts would fall from Rs. 81 crores to Rs. 70 crores, the capital outlay would increase from Rs. 27 crores to Rs. 40 crores; including other items, the total disbursements would rise from Rs. 67 crores to Rs. 80 crores leaving a deficit of over Rs. 10 crores. Thus, due to the lack of buoyancy in tax-receipts and the growth of Central assistance at a faster pace, the State may not be free from facing the ways and means difficulties in the period of the balance of the third Plan and in the fourth Plan. While the State Government has spared the economy from additional taxation in the budget year, how far it can continue this policy is a matter for speculation.

**

At the quarterly meeting of the Scientific and Surgical Instrument Manufacturers' and Traders' Association, Bombay, it was disclosed that the glass industry is on the threshold of a revolution. Because of the astonishing progress made by chemical technology, processes are being developed which will help glass industry to give its products innumerable forms, shapes and sizes, thereby expanding the field of glass. It also assures a bright future for the industry. Besides the members of the Associations, 75 glass technologists from different States of the country attended the meeting. Emphasis was laid on close coordination among manufacturers, distributors and consumers. Complete automation in the industry was ruled out in view of the need for employing human labour in the present circumstances. It was agreed that the best possible use should be made of all the raw materials, machinery and products needed by the industry and available in the country with the object of reducing dependence on foreign suppliers. The vast possibilities of exporting specialised glass products to the Far East were also indicated

**

Mr. S. L. Khemka, Chairman of the Meter Manufacturers' Association of India, addressing the 30th Annual General Meeting of the Association observed that the meter industry is passing through a crisis. If the Government does not take proper steps soon, the industry will not survive. To put the industry back into shape, he suggested a cut in output and increase in export incentives and drawbacks, grant of subsidy, enough supply of raw materials, components and spares, and diversification. Above all, the industry should be united in its efforts to eliminate unhealthy practices of under-selling. The output cut should be on a graded basis, i.e. units with an annual capacity of 60,000 meters should cut their production by 10 per cent, those with a capacity of 120,000 meters by 15 per cent and those with a capacity of 200,000 meters by 20 per cent. Since the world price of a meter was Rs. 11 to Rs. 14 a piece f.o.b. port of shipment, and the Indian manufacturers were unable to quote so low a price, they should be permitted a higher export incentive of about 200 per cent against the present 75 per cent. The drawback should also be enhanced. He pointed out that a few producers were under-quoting the selling price of their meters around Rs. 28 a piece f.o.r. destination, against the normal prices charged by others around Rs. 40. In view of this, most units, which could not quote such low selling prices owing to their high cost of manufacture, suffered losses. To prevent these units from closing down, the Government should intervene, bring about a proper understanding on the industry's sales policy as a whole and give a subsidy of Rs. 5 a meter in the meantime. He asked for the grant of liberal import licences to meet the urgent needs of the industry in respect of raw materials like zinc, copper, stainless steel wire, condensor paper, precision tools like drills, taps, jigs, fixtures and numerous other necessary items. A thorough study of the industry's problems and a careful united action for their solution were called for.

In a review of the industry by the Association, it is stated that while output of meters has improved substantialy from 34,356 numbers in 1952 to 11,30,000 numbers in 1963 the offtake, which was expected to reach 20,00,000 meters a year by 1965, has actually been limited to only 10,00,000. So far, 33 units are licensed with a capacity of 27,50,000 meters a year. Of these, 10 are in production. Most of the existing units have begun completing their expansion also. The overall production will, therefore, be far more than at present. Due to high cost structure, the industry has found it difficult even to exploit the export markets, where it has to contend with severe competition from East European countries and Japan.

**

The Demographic Training and Research Centre, Bombay has completed its study on 'migrants in Greater Bombay' and the report will be published shortly. The study is concerned mainly with analysis of the demographic, social and economic characteristics of migrants, and the extent to which they differed in their characteristics from non-migrants living in the city and from the general population. An attempt was also made to analyse the tempo of migration to the city during the last 20 years. It is seen that the fall in the rate of growth of Greater Bombay's population from about 5 per cent per year during 1941-51 to 3.2 per cent per year during 1951-61 was wholly attributable to the fall in net migration. While in the former decade Greater Bombay experienced a net migration of approximately 950,000 persons, in the latter decade, the net migration was less than 600,000 persons. Propensities to migrate to Bombay City were found to be significantly greater for minority religious groups, for those who were not married, and for these who had high educational attainments. Migrants who came to the city before the marriageable age showed a definite tendency to adjust their marital pattern to the conditions in the city. The longer such migrants had been in the city, the closer their marital pattern and educational attainments resembled those of city-born persons. The analysis of economic characteristics by industry and occupation of the migrants revealed that they were well represented in all commodity-producing industries of Bombay, four out of every ten being engaged in manufacturing. However, migrants born in different States of India showed considerable differences in their industrial attachments.

**

Mr. Upendra Bhatt, Chief Engineer of the Gujarat Refinery of Koyali revealed that the Ankleshwar oil-field was expected to yield about 53 million tons of oil. Arrangements were being made to step up production of oil and its processings. He said that work on the Gujarat Refinery was progressing according to schedule, and the first stage to process one million tons of oil would be ready by the end of the current year. By June 1965, the capacity to process another million tons would have been installed and the three-million-ton capacity would be achieved by the end of 1965. The Soviet experts are currently negotiating with the project authorities in Koyali on the expansion of the refinery capacity to three million tons. When the refinery reaches its full capacity the country would save about Rs. 7 lakhs per day in foreign exchange.

**

The port charges, which vary widely, and have a differential incidence on commodities of export, are a factor to be examined in improving the competitive position of Indian exports. The Gujarat Government has under consideration, the welcome move to reduce port charges by about 20 per cent so that bauxite exported from Saurashtra ports could compete in foreign markets. This was revealed by the Director of Ports, Mr. B. C. Mehta; the latter also said that Gujarat ports would be equipped with new flotilla and machinery, with the grant of Rs. 35 lakhs as foreign exchange by the State for the purpose. Engines for nine tugs at Saurashtra ports were to be imported. He added that while the State's schemes for port development were proceeding according to schedule, except in the case of Porbandar, Government was reconsidering the proposal of having an oil mooring berth at Okha in view of the establishment of an oil refinery at Koyali.

**

The Bombay Region is an industrial centre of major importance and the efficacy of productivity methods and the training programmes sponsored by the National Productivity Council would be judged by the success they had in this area. Addressing the sixth annual meeting of the Bombay Productivity Council, Mr. S. G. Barve, Maharashtra Minister for Industries, emphasised that the adoption of productivity methods was a prime necessity in India, because many Indian goods were priced out of international markets because of their higher cost. The issue of productivity was particularly relevant in India because industries in this country were functioning in a relatively sheltered and protected market, without the urge to improve that came from keen competition. The public sector, moreover, had a virtual monopoly in certain lines of production. In such conditions, it was all the more necessary to study the various factors that influenced productivity. In this context, he felt that it is important to make industrialists productivity conscious,

Training Programme

Earlier, welcoming Mr. Barve, Mr. Y. A. Fazalbhoy, the President of the Council, referred to the progress the Council had made; he said its membership had passed the 1,000 mark, and included 274 institutional members, about 14 of which were from the public sector. Against 14 training programmes held by the Council in the previous year, it had held 16 during 1963-64. The number of participants had risen from 333 sent by 261 organisations to 435 from 308 organisations. It was the aim of the Council to devote more attention to training programmes for the lower echelons of management and men on the shop floor. It had accordingly conducted courses in Marathi, Hindi and Gujarati. The Council had also introduced a training course on methods improvement and cost reduction in small-scale industries. Realising the need for technique-oriented study groups, it had set up three study groups on Maintenance Practice, Materials Control and Purchase Procedures and Standardisation of Tools and Tools Control. It would shortly set up a fourth group on Fuel Utilisation Practices. Mr. Fazalbhoy stated that three factors influenced productivity; a man at work required economic and social security; the institution that employed workers also needed security and the laws and enactments of government had to assist in the development of an industrial society. He mentioned two services that had recently been introduced by the National Productivity Council. The first was the Fuel Efficiency Service to help industries to secure efficient and economical use of fuel, and the second was a Productivity Survey and Implementation Service for industries employing

100 to 300 workers to assist them to adopt techniques of improved management and operational efficiency.

**

At the Exporters' Chamber meeting, Mr. Asoka Mehta called upon traders not to be 'backward-looking', but to adjust themselves to changes in the process of economic development. He wanted them to be 'pioneers and not mere passengers' by going into new production lines, without looking only for opportunities to exploit scarcities. They ought to be in the vanguard of development and transform and dynamise the economy. Mr. Mehta cautioned that unless there was self-regulation, governmental regulation could not be avoided.

How Many Steel Plants for the South?

From Our Correspondent

MADRAS:

THE STATEMENT by the spokesman of Hindustan Steel to the effect that the World Bank does not favour the erection of a number of steel plants in the South, excepting a unit at Goa, has had a disturbing effect in this part of the country. It had been generally expected that the schemes for constructing three medium-sized steel plants at Visakhapatnam, Salem and Goa would be vigorously pursued and that these units would be established during the fourth Plan period. The arguments put forward in favour of the establishment of these three units were based on the broadening of the base of industry and dispersing steel making capacity besides providing the scope for further expansion in the coming years. It was also felt that a number of steel plants operating on an economic basis in different States would lead to the promotion of new engineering industries and eliminate the backward character of some regions.

The importance of three new units, besides Bokaro, will be realised if it is pointed out that the existing units in the public sector cannot profitably be expanded to have a capacity beyond 3 million tons each. The two big units in the private sector will also be expanding to the fullest extent so that, in the fifth Plan, only the Bokaro project will be capable of further expansion. Even allowing for the fact that the big units in the steel belt can grow further in size, the needs of other regions will have to be taken into consideration especially as abundant iron ore reserves are available in the three States of Andhra Pradesh, Madras and Mysore.

Imported Coal

It has been argued that a big unit in Visakhapatnam can be erected drawing its ore supplies from the newly developed Baladilla region while another plant can be erected at Goa, the ore reserves in the Bellary-Hospet area being utilised for this purpose. In both these cases, there will, of course, be need for importing coal by sea either from foreign countries or from the West Bengal region. The economics of this scheme will perhaps have to be more closely examined though it is contended with justification that, if Japan can build up an efficient industry based on imported ore as well as coal, the Southern States could develop the steel industry by importing metallurgical coal. The erection of these units cannot be delayed for long.

It is not clear how the spokesman of Hindustan Steel has stated that the World Bank will be agreeable to provide the foreign exchange required for a steel plant at Goa.. The World Bank has not so far financed the construction of any steel plant in the public sector though the two units in the private sector have been granted liberal loans and their present expansion plans will also be implemented with the help of this institution. This statement does not square with the observations made by Mr. C. Subramaniam sometime back, when he was Minister for Heavy Industries and Steel, that the offer of assistance from friendly countries will be availed for constructing medium-sized plants in the Southern States.

Whatever might be the argument put forward by the Hindustan Steel spokesman, it will be generally recognised that the Salem steel project is on an entirely different footing. There cannot be any objection to this project on the score that fuel resources are not available in the same locality. In fact, it is claimed that the Salem Steel Plant has all the advantages possessed by the steel units in North-East India. Thus, iron ore, lignite, limestone and other raw materials are available within a radius of 50 miles. In fact, limestone reserves are available in areas close to the iron ore deposits. There, was for a time, a controversy regarding the feasibility of lignite as a reducing agent. It has now been proved beyond doubt the lignite can be used for this purpose and for smelting processes electricity can be used in large quantities for producing steel. Arguments were also put forward by the opponents of the Salem steel project that lignite could be used to greater advantage for generating power and that there might even be a net loss on the production of pig iron based on Salem iron ore and lignite. These arguments were fallacious and tendentious as the value of output of pig iron will be very much more than the value of power generated with the same quantity of lignite. It might be said that the use of power by the consumer goods and engineering industries will result in a larger value of output. But this argument is equally true in the case of other steel plants. The cost of coal or lignite and power used in the manufacture of pig iron or steel will be higher expressed as a proportion of total costs than it would be in the case of other industries.

Adequate Resources

What is really relevant to the controversy is the availability of adequate quantities of lignite for power generation as well as steel making. It has been emphasised by the Madras State Government that adequate reserves exist in the Neyveli area and that there will not be at any time a clash between the power generating schemes and the Salem steel plant. The Neyveli thermal station is being expanded to have a capacity of 400 mW by the end of this Plan. There is also a programme to raise the capacity further to 600 mW in the fourth Plan period. Indeed, it has been emphasised by the Planning Commission that a second super station should be located in the same area so that the capacity can be raised ultimately to 1,000 mW. It is being examined whether a second mine-cut can be opened for this purpose and whether lignite available in deeper areas can be successfully exploited.

In any case, the Salem Steel Plant is not expected to have initially a capacity of more than 500,000 tons of ingots. The quantity required for this purpose will be 1.5 million tons of lignite. It has even been suggested that without waiting for the expansion of the mining operations, the briquettes produced at Neyveli can be used for reducing purposes and power use for other processes. There will, no doubt, be a denial of briquettes for use as fuel in households on account of the diversion for purposes of steel making. But the briquetting plant is capable of easy expansion and there are schemes for increasing the output of lignite from the existing minecut to 4.8 million tons annaully. Besides, it is also being examined whether dried lignite can be directly used as a reducing agent. There is confidence that this process will be commercially feasible and that further expansion of the steel plant to over one million tons can be undertaken in this manner. The position in regard to the availability of lignite will improve considerably if the efforts now being made to locate new reserves in Ramanathapuram district prove successful.

It has also been claimed that Salem iron ore is ideally suited for manufacturing alloy steel because of its low phosphorus content. Estimates regarding the cost of production of Salem Project compare favourably with the actual cost of Hindustan Steel while there is every likelihood of a premium being realised on pig iron or steel produced by the Salem project. The low phosphorus content will enable malleable castings to be produced in large quantities on an economic basis. There is no case, therefore, for shelving or even postponing the Salem Steel Project. If an adverse decision is taken by the Centre, public opinion will react violently and the impression will gain ground that the South is being denied legitimate opportunities for growing at a fast rate even though the requisite facilities exist.

**

The power cut in Madras State came into force on June 15, and it was at first announced that all industries, excepting those adopting the continuous processes, would have to reduce their consumption by 50 per cent in the hydel areas and by 40 per cent in the thermal areas. But the Madras State Electricity Board had to decide on the imposition of even more drastic restrictions because the expectations regarding adequate rainfall in the catchment areas did not prove correct. Actually, the demand for power was so great that even on the restricted basis, the Electricity Board found it difficult to keep the industries functioning. There was confusion in Coimbatore for a time and the mills could not operate even on the restricted basis as there were frequent interruptions and breakdowns. It was felt that a total cut would enable them to lay-off workers. The complete cut became effective from 18th June in the hydel areas while in the thermal areas the industrial consumers were allowed to operate at only 20 per cent of their capacity. The continuous process industries are, however, exempt from the cut. The fresh restrictions were necessitated by the precarious level of water storage in the various hydel reservoirs. For a few hours, one of the units in Neyveli thermal station also was out of commission on account of minor trouble. The authorities, therefore, got alarmed and decided to enforce drastic restrictions.

It is difficult to imagine what would have happened if the Neyveli thermal station had not been supplying large blocks of power. At the present moment with all the five units functioning, the power available from this source is 5 million units daily against the total consumption of 8 million units daily, with restrictions force. In the absence of rains, it may not be possible for the hydel stations to produce even 2 million units daily. It is hoped that Neyveli would continue to operate at maximum efficiency and that the difficult situation would be got over early in July. Heavy rains for even two days in the catchment areas would be sufficient to enable the Electricity Board to lift the restrictions. There is a large hydel capacity which can be used to advantage if only there is adequate water storage. The delayed monsoon has upset all calqulations. In the last year there was a similar cut in June-July and there have been cuts in 6 years in the past decade.

Production Loss

The textile mills in Coimbatore and elsewhere are at a standstill. The various industrial units are also unable to continue their operations and it is feared that the backlog of orders cannot be easily cleared. Some effort might be made to offset the loss of production by working multiple shifts in later months. This may, however, be found difficult in the case of units which are already operating on a multiple shift basis. The loss of cloth production would be keenly felt though there is no danger of the powerloom or handloom weavers being denied their requirement of yarn. Curiously enough, while there is a brisk demand for mill-made cloth, powerloom and handloom weavers have not been able to dispose of their current production without difficulty. There has actually been an increase in stocks and mills were complaining about accumulations of coarse and medium counts of yarn in their godowns. The suspension of production will enable the clearance of accumulated stocks. Serious difficulties will, however, be felt in other directions as there are shortages of many manufactured goods and any decline in output will have its undesirable effects. The value of production lost during the period of the power cut will amount to Rs. 8-10 crores.

The question is now being asked whether there will be a repetition of the happenings next year. It is difficult to give a straight answer, though it is expected that one more unit would have been added at Neyveli and that new hydel capacity would have been installed on a large scale. The Madras State Electricity Board, however, hopes that it would be possible to conserve available water resources by judicious operations of the different hydel stations. If the lakes get filled in all places, this procedure may prove successful.

Hastening Industrialisation in Punjab

From Our Correspondent

CHANDIGARH:

FRESH EFFORTS are being currently made to impart added tempo to the process of industrialisation in this dynamic State. An ambitious programme has been chalked out by the State to create an industrial belt along the entire Grand Trunk Road running from Delhi to Ambala. Recently the Chief Minister made public the scheme of the State Government in this respect. Significant inducements to the private enterprises have been offered by way of large concessions and facilities for this purpose. The Government proposes to set up an Industrial Estate at Ganaur, 10 miles from Sonepat. The decision of the State Government to set up a pig-iron plant at Hissar should give further impetus to the industrialisation of this area. This plant, with an annual production capacity of 150,000 tons of pig-iron, is expected to cost Rs. 4 crores. Moreover, the Department of Industries of the State Government has started preparing feasibility reports for various types of industries that can be successfully operated in this area. It is proposed to give greater attention to the development of those industries which hold out a hope of contributing sizably to the foreign exchange earnings of the country. Such industries as machine tools hosiery, iron-pipes, sewing machines, bicycles and dry colours fall under this category. With the already achieved developments in the field of industries, power, road transport and technical training, these programmes should be able to attract industrialists willing to go ahead with new ventures. However, some snags remain. Quite significant among these seems to be non-availability of imported equipment and basic raw materials. With assured Government support, this should not prove to be insurmountbale.

**

The programme with regard to rural electrification is acquiring a changed look. The Punjab State Electricity Board —the agency entrusted with the task of implementing rural electrification schemes—has recently revised its policy so as to give priority to the electrification of relatively backward areas. Accordingly, a quarter of the total allocation for rural electrification schemes will be reserved for the under-developed areas of the State. The selection of villages for inclusion in this programme is promised to be made purely on merit, though without sacrificing the financial interest of the Board. During the current year, a crore of rupees have been set aside for this purpose. The Board itself realises the inadequacy of the amount. It is making efforts to get loans from the State Government and the Life Insurance Corporation. The Board is also

contemplating a number of economy measures with respect to the machinery for selecting personnel, purchasing procedures and retrenchment of superficial staff, especially in the highest cadres.

★★

The third Plan programmes of agricultural development are proceeding satisfactorily. The wheat package programme aiming at increased per acre yield of this major crop of the State has been initiated in the major wheat-growing districts of the State, namely Hissar, Rohtak, Amritsar and Ferozepur. The programme has already covered Ludhiana district. A major part of the programme would be to extend the use of improved seeds over 10,00,000 acres of land under cultivation. It is also expected that the number of warehouses in the State would increase from 74 to 110 by the last year of current Plan. Some 13 warehouses were set up during 1963. Another 26 are to be set up in the year 1964. Of these 3 warehouses would be set up by the Central Warehousing Corporation in addition to 7 warehouses already set up by it.

★★

The State Government is devoting itself to the task of checking the rise in wheat prices. It has already banned the export of wheat and has prohibited the licensed foodgrains dealers in the State from building up inventories of wheat exceeding 250 quintals. This amounts to a ceiling of one wagon load of wheat stock for each licensee. Moreover, it has been decided to license only those dealers who in the past had been keeping stocks of wheat of one wagon or more. As a result of such measures, it is expected that prices would show signs of downward movement before long. As soon as the prices reach the minimum level, set by the Government, it would embark on building up buffer stocks of wheat. Meanwhile, everybody is watching with interest the talks about state trading in foodgrains emanating from New Delhi.

Cashed in a Minute!

And that is precisely what we mean. It takes no longer than a minute to cash your cheque at any PNB office with the Teller System.

The streamlined Teller System eliminates tokens, queues, all tedious and unnecessary waiting and delay.

PNB was the first bank to have introduced the Teller System as far back as 1954. Today, PNB has 60 branches operating this system and plans to introduce this on-the-spot service in 60 more branches throughout the country.

The moving finger writes

I DO NOT care greatly for the Congress High Command's manner of finding a new Chief Minister for Punjab. The proper course, of course, is to let the Congress Legislature party in Punjab to elect a successor to Mr. Pratap Singh Kairon. It is true that there was a possibility at one time that, in the event of the High Command refraining from giving a lead, that party might have been unduly influenced by Mr. Kairon or the Kairon group in the choice of its new leader. But that risk vanished the moment the Das Report was published. It is surely not possible now for Mr. Kairon or for those who have been closely associated with him in the administration of the party to play a decisive part in the shaping of Punjab politics for some time to come. It follows that it should have been possible for the Congress High Command to contemplate the desirability of the Congress Legislature party in Punjab choosing Mr. Kairon's successor without any interference or even advice from above.

It is therefore a pity that neither the Congress President nor the Prime Minister seems to have understood the wisdom of permitting the Congress Legislature party full and real freedom of choice of leadership. It is a commonplace of Congress history that imposed leadership is seldom successful either in consolidating the party strength or in providing a competent government to the State concerned. It is extremely undesirable that the big bosses of the Congress organisation should set out to nominate Chief Ministers or other Ministers on the least provocation. That way the post-Nehru era in Congress politics is unlikely to be less free from factionalism in the States or even at the Centre than the Nehru era was. I said advisedly "at the Centre", because once the High Command begins to indulge in power politics at the State level, the inevitable consequence would be for the top leaders themselves to get divided among warring cauc uses scrambling to build up positions of power or prestige. Even if the Congress Legislature party in a State were to make an unwise choice of leader, no great catastrophe would result. An error of that kind could always be corrected in due course. The only responsibility which the High Command should assume in the matter of the selection of a Chief Minister is that it should try to ensure that no undemocratic or otherwise improper methods are followed. The election, in other words, should be free and should be decently conducted.

★★

Mr. Swaran Singh has once again proved to be an extremely durable Central Minister. Some of my colleagues in the profession who are physically more active than I am, had been telling me in the past few days that the results of their news-hunting had convinced them that so far as Mr. Swaran Singh himself was concerned, he was not exactly unwilling to take up the challenging responsibility of succeeding Mr. Kairon. I, however, continued to have my doubts. Mr. Swaran Singh is a man of varied talents, but I would not count among them the qualities that would be needed to govern Punjab successfully in the wake of Mr. Pratap Singh Kairon. The Minister for Industry is a master of the art of the interminable talk which gives away nothing. This may be useful in certain fields of diplomacy, but it is unlikely to be helpful where to decide and to act would be more important than to talk and to please. By the same token, Mr. Swaran Singh may well be successful in the mission in which he has been sent to Chandigarh by Mr. Kamaraj and Mr. Lal Bahadur, that is, assuming that the Congress High Command has already made up its mind on who should be the next Chief Minister and is asking Mr. Swaran Singh simply to sell its man to the Congress Legislature party.

★★

I have said earlier that I doubted that Mr. Swaran Singh could be enthusiastic over trading his Central Ministership for the Chief Ministership of Punjab. I am, however, quite ready to agree that the Prime Minister, for his part, was equally far from being keen on releasing Mr. Swaran Singh from the Central Cabinet. Not that I had ever thought that Mr. Swaran Singh's achievements were outstanding or even completely satisfactory in any of the many portfolios which he has been holding from time to time. But there is this fact to reckon with that Mr. Lal Bahadur believes in playing safe, as is evident from, for instance, his Cabinet-making. And there is nobody who is "safer" than Mr. Swaran Singh. He is such a completely normal human being that his very presence at one's side must be reassuring. To one of Mr. Lal Bahadur's temperament it would certainly not appeal to let a man like Mr. Swaran Singh go. This apart, in more concrete terms, Mr. Swaran Singh's leaving the Central Government would have given rise to problems and complications of a kind which Mr. Lal Bahadur would most definitely be reluctant to face. Gossip in the Capital has it that, in the event of a vacancy in the Industry Ministry, Mr. S. K. Patil, for one, would have lost no time in pressing his claim for the post. Again, there is the question of a Sikh replacement. Whether Mr. Hukum Singh would finally have decided to give up the Speakership of the Lok Sabha for a Ministership at the Centre I do not profess to know. But my suspicion is that it might be easier to find a satisfactory successor to Mr. Kairon in the Punjab Government than to Mr. Swaran Singh in the Central Cabinet.

★★

These are days when politicians seem over-ready to become business men, while business men appear to be equally keen on turning politicians. It is, therefore, always a pleasure, as real as it is rare, to come across a business man who chooses to remain one even when he has to deal with politicians. That agreeable experience I had while listening a few days ago to the Chairman of the Indian Woollen Mills Federation, discussing the ways of the Government with the woollen industry. The points which Mr. R. K. Birla makes are simple enough. In the first place, an industry which has been officially rated as of high priority for defence purposes should surely be given adequate equipment and raw material to achieve full production. Secondly, an industry which, besides being important for defence, is also engaged in supplying essential articles of consumption to the public, should be assisted in its efforts to cut down costs by working its existing equipment fully and also by modernizing its machinery. Mr. R. K. Birla believes that in both these respects the Government's policies have been by and large unhelpful and illogical. It is true that there is a shortage of foreign exchange and so the woollen industry's requirements of imported wool or imported machinery should be carefully scrutinized. But, there is surely no sense in restricting the industry to obviously low rations of its essential imports unless, of course, the Government has decided as a matter of policy that the woollen industry should reconcile itself to partial production or aging machinery, no matter how important its output may be for defence and the economy.

V.B.

Trade Winds

STC IN ROTTERDAM

AS A part of the plan to expand and consolidate trade between India and West European countries the State Trading Corporation has opened a branch office at Rotterdam (in Holland) which is the biggest port of Europe with up-to-date port facilities. The new office, which is a depot-cum-trading centre, will endeavour to step up STC's activities in Western Europe generally and provide facilities for marketing, warehousing and exhibition of samples to Indian exporters. The office will function in three sections. The commission agency and marketing section will endeavour to supply to West European markets manufactured, processed and semi-processed goods of standard quality as well as Indian raw materials in demand in these markets, at competitive prices. For this purpose the section will undertake market surveys, study consumer preferences and contact prospective importers at personal level and assess their requirements. It will ensure proper performance of contracts and supply of goods in accordance with the delivery schedules and the prescribed quality standards. Wherever feasible, it will also arrange credit facilities.

The barter or link section will arrange and supervise barter or link deals between trading parties in India and Europe in relation to commodities and monetary ceilings approved from time to time. It will also sponsor visits of purchasing missions to India.

The third section will deal with collection and stocking of samples of a wide range of goods at Rotterdam, thus providing a show-window for Indian products. It will also arrange for bulk stocking of goods in bonded warehouses so that ex-stock deliveries will be possible whenever intending purchasers place orders after on-the-spot inspection of samples. Necessary facilities will be provided for reprocessing and repackaging of goods. The items which this section will handle to begin with, include superior varieties of cotton, silk, art silk and woollen textiles, knitwear, ready-made garments, carpets and other floor coverings, coffee, tea, spices, cashewnuts, leather and hides, handicrafts, and artware, coir and jute goods, frozen and tinned fruits, juices and marine products, oil cakes and tobacco. In order to bring its activities to the notice of the trading community in Western Europe the Rotterdam office will organise an intensive publicity drive through the media of 'participation in trade fairs and exhibitions', radio and television, local festivals, advertisements, cinema snippets, hoardings at important places, etc.

BLANKET TOLL INCREASE

The Chairman of the Suez Canal Authority, Mr. Mahmud Younes, has announced a blanket toll increase of one per cent on all shipping through the canal with effect from June 30, 1964 and an additional two per cent increase on all ships with a draught of more than 37 feet. The two per cent increase is evidently to be levied on vessels which benefit from President Nasser's plan to deepen and widen the canal with a view to permitting heavier ships to transit through it. The prices of certain good imported into India may go up as a result of the increase in tolls.

INDO-POLISH TRADE

The negotiations between the visiting Indian Trade Delegation and the Polish Government at Warsaw resulted in the signing of a mutual trade agreement on June 18, 1964 for trade between the two countries during 1965 and 1966. The agreement envisages the volume of trade between the two countries to be of the order of Rs. 38 crores both ways by 1966. It will also entail considerable diversification of goods to be exported by India and will include engineering goods and cotton textiles. There will also be expansion of trade in traditional goods such as iron ore, manganese ore, mica, jute goods and tobacco. Poland is also interested in imports of de-oiled linseed cakes from India. Among the items to be imported by India from Poland are: steel, machine tools, textile machinery and chemicals.

WORLD PRODUCTION OF FERTILISERS

The UN Food and Agriculture Organisation, in a recently brought out publication entitled "Fertilizers — An Annual Review of World Production, Consumption and Trade for 1962", has estimated the world production of all commercial fertilizers based on nitrogen, phosphorus and potash at 31,200,000 tons in 1961-62 — six per cent higher than in 1960-61. The world consumption has been estimated at 29,340,000 tons for 1961-62, an increase of about three per cent over 1960-61. The volume of world trade in fertilizers in 1961-62 has been estimated at 3,050,000 tons representing just over 27 per cent of the world consumption compared with 26 per cent in the previous year. The total world output of 31.2 million tons in 1961-62 comprised 11.5 million tons of fertilizers based on nitrogen, 9.3 million tons of those based on potash and 10.4 million tons of phosphate fertilizers. According to the FAO review the pattern of fertilizer consumption varies widely from continent to continent. In Europe, South America and the Soviet Union, for example, the three plant nutrients have come to be used in nearly equal quantities. In Asia there has been an emphasis on nitrogen-based fertilizers because of the large acreage of irrigated paddy land, though in recent years the need for greater use of phosphorous and potash based fertilizers has been recognised. Phosphate fertilizers have remained the most popular fertilizers in Australia, South Africa and in New Zealand.

Europe was the largest net exporter of fertilizers in 1961-62 with 1.7 million tons, followed by the Soviet Union with 464,000 tons and North and Central America with 29,000 tons. The other continents were net importers, Asia being the largest with 1.1 million tons, followed by Africa with 327,000 tons, Oceania with 148,000 tons and South America with 122,000 tons.

INSTANT TEA

Addressing a press conference at the end of his two-week tour of the United States and Canada, the Chairman of the Tea Board of India, Mr. A. S. Bam, said that instant tea was proving increasingly popular in North America and might also catch on in the continent. He disclosed that a big instant tea plant would soon go into production in India and would help to meet the new demand. The consumption of instant tea had, however, not caught on in Britain which was the biggest tea consuming nation in the world.

WORLD RICE PRODUCTION

According to the FAO's Consultative Sub-Committee on the Economic Aspects of Rice, the world production of rice reached record level in 1963-64 season and, on the whole, both the volume and value of international trade in 1964 should remain well above the average of recent years. The committee estimates that the production of paddy in 1963-64 (excluding the mainland of China) will reach a record level of 158 million tons — nine million tons more than in the 1962-63 season — despite lower output in some parts of the Far East, in Latin America and in southern Europe. Among the importing countries, there were good crops in India and Pakistan, and bad crops in Indonesia and Cuba. As for exporters, crops were heavier in the United States, the United Arab Republic, Thailand, Vietnam, Madagascar and Korea, while production fell in Burma, Taiwan, Brazil, Italy and Spain. As regards stocks, the committee reports that since the carry-over supplies in some countries have been offset by reduced production, "world supplies available for export this year are probably more or less the same" as last year.

TEXTILE MACHINERY IMPORTS

The Textile Commissioner has invited applications from units in the woollen textile industry for imports of permissible items of woollen textile machinery. Yugoslavia is in a position to supply semi-automatic and automatic woollen looms, drying chambers for wool, wool dying and wool washing machines, rag tearing machines and cross winding machines. The interested parties may submit their applications in the prescribed form, together with proforma invoices and giving full justification for the import, to the Joint Chief Controller of Imports and Exports, Bombay, (with a copy to the Textile Commissioner) so as to reach him on or before July 15, 1964.

INDO-SOVIET TRADE

According to Mr. V. F. Sinev, Deputy Trade Representative of the USSR in India, the annual turnover of trade between India and the Soviet Union is expected to exceed Rs. 200 crores by 1968. The trade turnover between the two countries in 1963 was over Rs. 100 crores compared with Rs. one crore in 1953. In 1964, the turnover is expected to be over Rs. 135 crores.

DISPOSAL OF DIAMONDS

According to the Japanese Finance Minister, Mr. Kukuei Tanaka, Japan may offer 160,000 carats of diamonds for sale abroad through international tenders next year in order to replenish its foreign exchange reserves. These diamonds were collected by the Government from the Japanese people during World War II. The number of the diamonds is estimated at 1.5 million pieces, valued at 7,200 million yen.

BILLIONAIRES CLUB

The U.S. Billionaires Club increased its membership to 62 in 1963. The club, restricted to companies with annual sales or revenues of at least $1 billion (listed on the New York Stock Exchange), opened its doors to four new members in 1963, while dropping two others from its rolls. The newcomers were Continental Oil, General Tire and Rubber, National Tea and Food Fair Stores. The dropped companies were Martin-Marietta and US Rubber. As usual, the General Motors rated first in 1963 with annual revenues of $16.5 billion, followed by — again, as usual — Standard Oil (N. J. with revenues of a little more than $11 billion. The relative ranks of the top ten were exactly the same in 1963 as in 196 with one exception — Sears Roebuck which took over th sixth position from General Electric which in turned dippe to the seventh place. The sales and revenues of the billion aires in 1963 totalled $159 million, showing an increase of 6 per cent over the previous year. The total net profits increased to $11.3 billion in 1963 from $9.9 billion in 1962.

FAIR PRICE CORPORATION

The Punjab Government has decided to set up a corporation in the public sector for the establishment of a chain of fair price shops in the State to keep down the prices of essential commodities. To begin with fair price shops will be opened in 40 to 50 important towns. In course of time such shops will be opened in villages also.

I.D.A. CREDIT FOR PAKISTAN

The International Development Association, an affiliate of the World Bank, has extended two credits totalling the equivalent of $39.5 million to assist in financing highway projects in Pakistan. One credit of $22.5 million, is for the construction of a 150-mile highway between Dacca and Chittagong in East Pakistan. The other credit, of $17 million, is for the construction of a 90-mile highway between Karachi and Hyderabad and of three bridges to the north in West Pakistan. The credits will also finance the services of consultants to advise and assist the highway departments in both the provinces and to undertake certain feasibility studies.

FOREIGN DEBT OF INDIA

As on January 31, 1964, India had signed foreign loan agreements for amounts totalling Rs. 3745.37 crores of which Rs. 2304.18 crores had actually been utilized. Against these loans the country had paid off (by January 31, 1964) Rs. 405.82 crores as principal and Rs. 243.27 crores as interest. Of the total amount of Rs. 3,745.37 crores, Rs. 2,135.83 crores are repayable directly in foreign currency, Rs. 455.76 crores through export of goods and Rs. 832.41 crores in rupees. The rest of the loans amounting to Rs. 321.37 crores were drawn from the

KNOW-HOW FROM JAPAN

According to the Japan Machinery Exporters' Association, the Japanese machine tool industry is willing to introduce its technical "know-how" for the manufacture of machine tools and metal working machinery in India and Pakistan. A committee comprising eight machine tool makers and seven trading firms of Japan has been formed to deal with offers from India and Pakistan. Three Japanese firms have already concluded contracts with Indian firms. The Hitachi Seiki Company is to supply technical know-how and manufacturing facilities for turret lathes worth about 200 million yen to the Industrial Plants Limited of India. The Indian firm will produce 100 to 120 sets of turret lathes annually. The O-M Limited and Okuma Machinery Works, both Japanese lathe makers, have granted technical "know-how" to the Pearl Mechanical Engineering & Foundry Works Limited and the Investment Mechanical and Engineering Limited of India respectively. Each of the two Indian firms will assemble turret lathes at the rate of 30 sets per month.

MITSUBISHI MERGER

Three major companies of the Mitsubishi group have been merged to form "Mitsubishi Heavy Industries" which will now be the largest manufacturing concern of Japan. The new company created by the amalgamation of Mitsubishi Nippon Heavy Industries, Shin Mitsubishi Heavy Industries and Mitsubishi Shipbuilding and Engineering has a capital of £79 million and anticipated sales in excess of £360 million. It will be bigger than Hitachi, hitherto Japan's largest manufacturing enterprise. The merger is aimed at streamlining the Mitsubishi group's heavy industrial activities to enable it to compete more effectively in the international sphere.

BANK OF ASIAN DEVELOPMENT

The Ministry of International Trade and Industry of Japan has drafted a plan for the establishment of an Asian development bank. The plan envisages the grant of loans to such industrial, transport and communication projects as would be of value to the economic and industrial progress of the Asian region. The membership of the proposed bank would also be open to countries not belonging to the UN Economic Commission for Asia and the Far East.

A.I.D. LOAN FOR SHARAVATHI

The Agency for International Development has agreed to grant a loan of $3.1 million for the purchase of the eighth unit for the Rs. 100 crore Sharavathi hydel project. The first generator with a capacity of 89,100 kW is under erection and is expected to be commissioned before the end of 1964. The project, when fully completed, will generate one million kW of power.

Company Affairs

CHALLENGE AND OPPORTUNITY

MR. RAGHAVAN PILLAI, Chairman, Guest, Keen, Williams Ltd, while addressing the annual general meeting, told the shareholders that the year 1963 marked a turning point in the history of the company and was one of outstanding significance. It marked the beginning of a period of increasing challenge as well as opportunity. This year, he said, witnessed the consolidation of the gains from an earlier period of development; the merger of the company with its subsidiary -- Sankey Electrical Stampings Ltd. -- making possible the more effective and efficient utilisation of the combined resources. The Chairman gave an interesting description of the manner in which this company grew during the last 42 years. During these years it established various units at Bombay, Calcutta and Bangalore to manufacture a large variety of engineering items.

This tempo of progress was maintained during 1963 too. It improved its turn-over by more than 25 per cent from Rs. 13.06 crores to Rs. 16.38 crores, in 1963. Sankey Electrical Stampings Ltd., became a wholly owned subsidiary on the exchange of shares with Tatas. Towards the end of 1963, the issue of bonus shares in the ratio of one for two was approved and along with the exchange of shares with Tatas it meant a substantial increase in the issued capital. The authorised capital of the company, therefore, increased from Rs. 6 crores to Rs. 10 crores. To meet the cost of expansion the directors decided during 1963 to issue debentures amounting to Rs. 1.5 crores and the issue was fully subscribed in February this year. The company also invested Rs. 38.2 lakhs, by way of plant and cash, in Sankey Wheels Ltd., a newly formed company, which prosposes to make passenger and commercial vehicle wheels. Thus from its modest beginnings during the inter-war years the company has progressed to its present impressive position.

The Chairman indicated that it was as a result of vigilant efforts to exercise economies that it increased its income. In spite of that, available profit for disposal did not rise proportionately due to much higher charge for taxation. This rise was mainly from the issue of bonus shares for which an additional tax of Rs. 26.34 lakhs was payable. Moreover a provision for Rs. 4 30 lakhs had to be made in respect of the newly imposed levy on equity dividend. It was indeed unfortunate that the welcome exemption from the payment of additional tax in respect of bonus shares, when issued out of share premium account came just too late for the company to benefit as its bonus issue was made prior to April 1, 1964. He added, however, that there was some relief in the sense that under the provisions of the Finance Act, 1964, this bonus issue would not attract capital gains tax in their hands.

The Chairman outlined the future plans which include the construction of the new steel melting shop which was making good progress. Its stage I plant would be in production next year. Moreover the company proposed to reorganise the rolling mills and this reorganisation included the installation of a new merchant bar mill in new buildings which would permit the running down of some of the old mills. Much of the old plant in the Calcutta belt works was being replaced by modern equipment which would lead to improved quality as well as better range of sophisticated items. At the Bhandup works certain outmoded machines were replaced by modern high production plant and the Government of India had granted approval for the expansion of self tapping screw capacity and that plant was hoped to be installed next year. The chairman indicated that many other projected schemes for expansion and modernisation were being studied and this process would continue to make this company increasingly more important in its field.

RE-INSURANCE CORPORATION

The experience of India Re-insurance Corporation Ltd., (I.R.C.) may be said broadly to reflect the position of general insurance business in India. Although, on the whole, general insurance business in 1963 was quite favourable, the Corporation's experience showed that profitability was actually lower than in previous years.

How risky — and how far from lucrative, as the champions of nationalisation aver — general insurance business is can be gauged from the results of working of the I.R.C. in 1963. The Corporation's total gross premium income last year amounted to over Rs. 6.99 crores, as against Rs. 5 87 crores in 1962, while the total net premium in 1963 and 1962 was Rs. 3.89 crores and Rs. 3.28 crores, respectively. According to the Directors' report, there was a moderate increase in fire and marine premiums and a substantial increase in premiums from the miscellaneous department. The claims cost of the Corporation rose from 51.1 per cent to 54.7 per cent, notwithstanding the decline in commission costs (from 33.7 per cent to 33.1 per cent) and in management expenses (from 2 per cent to 1.7 per cent). An amount of Rs. 10.70 lakhs was transferred to profit and loss account, as against Rs. 6 46 lakhs transferred in the previous year. From the profit and loss appropriation account, Rs. 3.5 lakhs were transferred to general reserve and Rs. 8.83 lakhs to dividend reserve. There was also a transfer of Rs. 25,148 to the reserve for depreciation on investments in order to meet the depreciation in market value of the Corporation's investments as compared to their book value.

The Chairman's statement to the members has dealt with the Corporation's experience in the different departments. It should be obvious from this account how fitful profits of general insurance could be, depending, as they must, on a variety of factors, both national and international. It remains to be seen how the general insurance market in India will fare this year with the entry (since 1-4-1964) of the Life Insurance Corporation which, by the way, has registered itself as Non-Tariff Insurer. It is not clear why the L.I.C. did not choose to be a Tariff Insurer when, it is believed, it is prepared to charge the same rates as laid down by Tariff. So long as L.I.C. continues to do so, that is, work in co-operation with Tariff Insurers, there is every scope that the Indian market will continue to grow in strength and stability. If, on the other hand, there is unfortunately any want of understanding and in consequence, a rate-war between Tariff Insurers and Non-Tariff Insurers, stormy days would be ahead for general insurance.

BOMBAY STEEL ROLLING

The subscription list of Bombay Steel Rolling Mills Ltd., opened on June 24 for the public issue of 120,540 ordinary shares of Rs. 10 each. The subscription list will close on July 4 or earlier, but not before June 27. The company has an authorised capital of Rs. 25 lakhs and issued, subscribed and paid-up capital of Rs. 12.55 lakhs The entire present issue offered for public subscription has been underwritten. The company holds a licence for the manufacture of steel bars and sections and is now putting up a modern plant of the capacity of 30,000 to 50,000 tons for re-rolling mild steel bars, light structurals, gate channels etc. at Kalyani in West

Bengal. It also proposes to manufacture box strappings and seals of various gauges and sizes of high quality in collaboration with Messrs. A. J. Gerrard & Co. of USA. It also proposes to manufacture high tensile bolts and nuts and link chains.

NATIONAL ORGANIC CHEMICAL

National Organic Chemical Industries Ltd., a new company engaged in the production of petro-chemicals, is progressing well in the establishment of its Rs. 30 crores project. Construction of the factory is expected to start after the monsoon, so that it can commence production in the third quarter of 1966. It will have an issued and paid-up capital of Rs. 10 crores and will enter the capital market at an opportune time. Shell International of the USA, the proposed foreign collaborators, will subscribe to one-third of the capital besides offering technical know-how. The promotors will make an equal contribution with the Standard Mills investing about Rs. 75 lakhs and the balance will be offered for public subscription. The shareholders of Standard Mills will be entitled to one share of the company for every two Standard shares. The foreign exchange component of the project is estimated at about Rs. 14 crores which will be secured by way of long-term foreign loans of Rs. 11 crores and the collaborators' contribution of nearly Rs. 3.33 crores.

Another new company, Polyodefins Industries Ltd., proposes to manufacture 20,000 tonnes of polyethylene in collaboration with the West German firm, Farbwerke Hoechst Ag. The capital outlay of the project is likely to be Rs. 8.5 crores, out of which the company's capital will be Rs. 3.60 crores with National Organic Chemical Industries Ltd. and the foreign firm each raising one-third. The balance will be offered for public subscription.

METAL BOX

The preliminary results of the Metal Box Company of India Ltd., for the year ended March 31, 1964 show an increase in the pre-tax profit, after providing for depreciation, from Rs. 123.60 lakhs to Rs. 154.10 lakhs. The tax provision absorbed Rs. 92.50 lakhs against Rs. 79 lakhs last year. The directors have recommended the payment of final dividend at the rate of 9 per cent against 10 per cent paid last year, but this year dividend is on an increased capital. The total distribution for the year comes to 18 per cent as against 19 per cent paid last year. The interim dividend for the year under review and the whole of the distribution for 1962-63 were on the old capital. The company offered in January this year, one rights issue for each share held at a premium of 25 per cent.

KIRLOSKAR PNEUMATIC

Kirloskar Pneumatic Co. Ltd. proposes to offer 15,090 equity shares of Rs. 100 each at par to the existing shareholders in the ratio of three new shares for every seven held. The new shares will rank pari passu with the existing shares and will be entitled to any dividend that may be declared in respect of the year ended March 31, 1965. The present capital of the company is Rs. 34.91 lakhs divided into 958 preference shares of Rs. 100 each, 24,910 equity shares of Rs. 100 and 9,042 equity shares converted from preference shares. The company proposes to diversify its activity by expanding the range of its production of compressed air equipment as also by taking up new articles for manufacture. The company is already making refrigeration compressors under licence from a Dutch firm and has also signed a licence agreement with Westinghouse International Co., USA for the manufacture of compressors and components of air conditioning units. It has also finalised a licence and technical assistance agreement with Westinghouse Brake and Signal Co. Ltd. of UK for the manufacture of air brake compressors suitable for railways.

MADRAS MOTOR INSURANCE

Madras Motor and General Insurance Co. Ltd., has made substantial progress during the last 14 years. On the basis of its results for 1962 the Indian Insurance Year Book shows that already it ranks fifth among the Indian insurers engaged in General Insurance business in terms of net profits. Even from the point of view of gross premiums net premiums and total assets it is among 12 largest Indian insurers. During 1963 the company further strengthened itself so that the gross premium underwritten has crossed Rs. one-crore limit. The year also witnessed the expansion of its capital base so that the paid-up capital of the company was raised from Rs. 30 lakhs to Rs. 40 lakhs. In addition to the Motor Insurance business it has also under-written miscellaneous business of all types and the directors feel that there is a vast potential in this field. It has made investments in a number of companies many of whom are having foreign collaboration and have good growth potential. It recorded a net profit of Rs. 11.46 lakhs during the year ended December 31, 1963 as against Rs. 10.95 lakhs last year. The directors have recommended dividend of 21 per cent, subject to tax, which will absorb Rs. 6.43 lakhs. The directors indicate that in common with other general insurance companies it has to meet the competition of the L.I.C. which is the biggest insurer with a large number of branches, country-wide organisation and enormous resources.

NATIONAL INSURANCE

National Insurance Co. Ltd., during the year ended December 31, 1963 recorded a gross premium of Rs. 96 21 lakhs as against Rs. 75.24 lakhs last year. In 1956 its gross premium stood around Rs. 28.00 lakhs which shows a steady progress during these years. The company suffered a loss to the extent of Rs. 3.44 lakhs due to the devaluation of the Indonesian Rupiahs from 9.52 to 66.64 per Indian rupee. The amount consists of devaluation of the amount due from the Life Insurance Corporation of India. As it has settled the account with the LIC, the loss in devaluation and the difference has been adjusted. Profit during the year was lower at Rs. 1.42 lakhs as against Rs. 3.06 lakhs this year. The dividend at the rate of 6 per cent has, however, been maintained.

CAPITAL ISSUES

Seven companies have been authorized to raise fresh capital aggregating Rs. 7.31 crores. Of these, one company is issuing its capital on rights basis, two are issuing equities and another two are offering equity shares plus preference

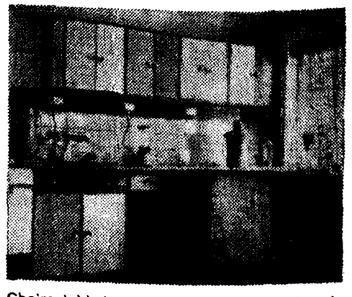
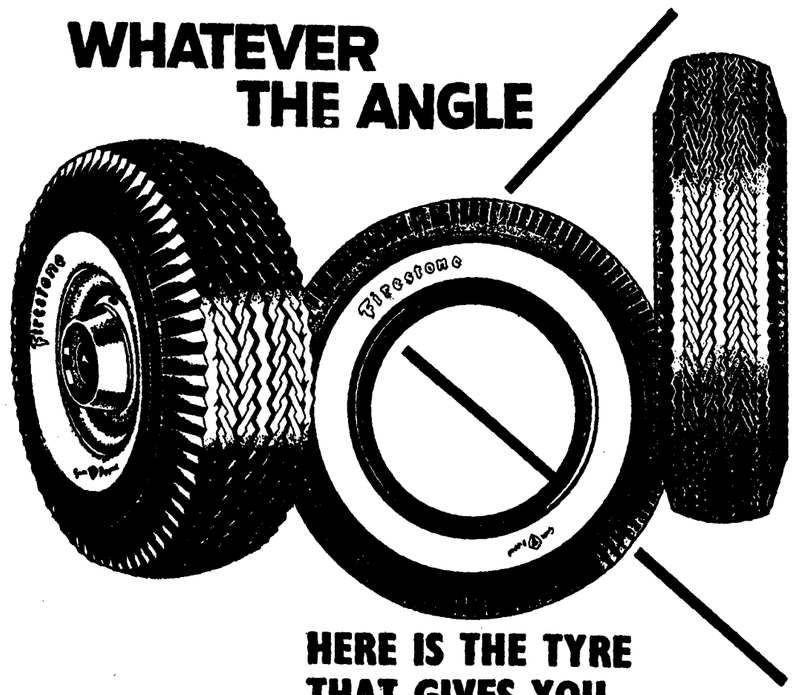
WESTERN INDIA PLYWOODS LIMITED
are the largest suppliers of marine plywoods in India

Different industries need different types of specialised plywoods. In ship-building, for instance, plywood processed to resist the rotting influence of moisture, salt water and destructive insects, is required. Western India Plywoods are the largest suppliers of such plywoods in India. ■ Western India Plywoods are, in fact, the largest manufacturers of processed woods in India. They make numerous varieties of plywoods to meet the industrial, architectural and defence needs of our country. They also manufacture 'WESTON' Hardboards, 'WIPEX' Paper laminates, Flushdoors and Block Boards.



• • •

Specially processed 'Westindply' marine plywoods are unusually tough, resist the rotting influence of salt water and fungi.



Special aircraft plywoods engineered to meet the demands of lightness and strength, go into the gliders and other aircrafts built in India.

Chairs, table tops, panels, shelves, cup-boards, flooring—infinite is the scope of 'Westindply', 'Weston' and 'Wipex'.

shares. Five of the companies are offering part of their capital for public subscription. Foreign collaboration is involved in the case of two companies.

Excepting one company, which has been given permission to float its issues until Nov. 10, 1964, the consent of the Controller of Capital Issues is valid for 12 months in all cases.

Mysore Acetate and Chemicals Company Limited, Mysore, is to issue capital of Rs. 2,25,00,000 in equity shares of Rs. 100 each, partly in cash and partly for consideration other than cash. The money will be used to manufacture cellulose acetate at Mandya.

Of this issue, Government of Mysore would subscribe for Rs. 50 lakhs in addition to Rs. 30 lakhs to be taken up by Mysore Sugar Co. Ltd., a wholly owned undertaking of the State Government. The foreign collaborators, von Kohorn Universal Corporation of the US and Chematurs of Sweden, will be offered shares of the value of Rs. 58.5 lakhs and Rs. 9.5 lakhs respectively. Of the balance, such number of the shares as would qualify the shares to be listed on the stock exchanges would be offered to the public.

Jayshree Chemicals Limited, Calcutta, was given consent in 1963 for the issue of Rs. 90 lakhs consisting of Rs. 70 lakhs in equity and Rs. 20 lakhs in preference for the manufacture of caustic soda, chlorine, bleaching powder, etc. at Ganjam, Orissa.

In supersession of an earlier consent of an issue of capital of Rs. 124.93 lakhs, **Madras Tube Company Limited,** Madras, has now been given permission to issue capital of Rs. 1,39,93,000 divided into 9,99,300 equity shares of Rs. 10 each and 40,000 preference shares of Rs. 100 each, for cash at par. Of the issue, suitable number of equity and preference shares which will enable the company's scrip to enlist with the recognised stock exchanges will be offered for public subscription.

The capital will be utilised for setting up a new undertaking at Madras for the manufacture of welded steel tubes.

The consent remains valid for 12 months from the date of its earlier issue, i.e. until November 10, 1964.

Larsen and Toubro Limited, Maharashtra, Bombay, engaged in the business of engineers, contractors, and manufacturers, will be issuing on rights basis further capital of Rs. 66 lakhs (nominal) divided into 6,60,000 equity shares of Rs. 10 each for cash at a premium of Rs. 2 a share.

The Mysore Chemicals and Fertilizers Limited, Mysore, is to issue further capital of Rs. 100 lakhs, for cash at par. Of the issue, shares of a value not exceeding Rs. 10 lakhs may be offered to the Government of Mysore and the remaining shares will be offered for public subscription. The capital will be expended on the installation of a new plant in the existing factory premises for manufacture of caustic soda/chlorine.

Hindustan Photo Films Manufacturing Company Limited, Ottacamund, a Central Government company, is to issue equity capital of Rs. 60 lakhs in 6,000 shares of Rs. 1,000 each for cash at par. The money will be utilised for manufacture of raw films for cinema industry etc.

Transformers and Electricals Kerala Limited, a new company incorporated in Kerala, will be issuing capital of Rs. 110 lakhs for the establishment of a factory with Japanese collaboration for the manufacture of power transformers. The issue will be made to the Kerala State Industrial Development Corporation Limited to the extent of Rs. 25 lakhs, the Kerala State Government Rs. 28.60 lakhs, Hitach Limited, of Tokyo Rs. 28.60 lakhs and Rs. 27.80 lakhs will be offered for public subscription.

Social Costs Of Business Enterprise: By K. William Kapp.; Asia Publishing House, Bombay, 1963; Pp. XV+311; Rs. 20.00.

Reviewed by D. KRISHNASWAMI RAO

THIS BOOK is a modified and expanded version of the author's "The Social Costs of Private Enterprise," published in 1950, and carries forward his study of the incidence on society of a part of the costs of business enterprise. This is a problem that has received the attention of some economic theorists since the time of Alfred Marshall but Professor Kapp has submitted it to empirical research with a view to "the elaboration of tentative and pragmatically tested objective welfare criteria."

The term "social costs" is used by the author to mean the harmful consequences which other persons or the community as a whole suffer as a result of private productive activities and for which the private entrepreneur is not made accountable. They may take the form of injury to health, deterioration of property values, premature exhaustion of natural resources, and waste and diseconomies of various kinds.

Professor Kapp first reviews briefly the background of classical economics to explain the latter's omission to consider social costs, and shows how even in present-day economic analysis the social costs of business enterprise are regarded as exceptions rather than the rule in a competitive economy. He regards this attitude as being responsible for the failure of economics to illuminate many of the practical problems of modern economies.

In his detailed consideration of the costs inflicted on the community by modern industrial activities, the author gives first place to the pollution of air and water by industrial processes, and the resulting injury to public health and adverse effects on plant and animal life. He then discusses the losses borne by society due to excessive depletion of renewable natural resources such as soil fertility, forests and fisheries, and of non-renewable resources (particularly coal and oil) by unregulated exploitation. Professor Kapp, though by training an economist, has studied these phenomena as a naturalist would and presents them with a degree of concreteness that is not common today among votaries of his own subject.

Impairment of the worker's capacity by industrial accidents and occupational diseases is considered next, but fortunately protective legislation in countries with an advanced social conscience is tending to make the prevention of this social cost a part of private entrepreneurial costs. The social costs in the form of extensive unemployment to which technological change and general business fluctuations give rise are similarly generally recognised as necessitating remedial fiscal and monetary policies. One might therefore wonder whether an entire chapter was needed to prove the obvious point that "the cost calculations of the individual firm fail to record the social costs resulting from enforced idleness".

Professor Kapp then turns to a discussion of the social loss involved in the over-expansion or duplication of capital investment which is a normal characteristic of certain industries such as transportation and distribution and of industrial research. It is paradoxical, as he points out, that in ordinary times we ignore the waste from the point of view of the overall efficiency of the economy of such duplication while in an emergency such as war, society is out to reduce the diseconomies arising from duplication and un-coordinated operation of installed capacity.

The social costs of cut-throat competition and of high-pressure sales publicity that are dealt with next have been admitted by economists in the last four decades. The author has, however, done well to highlight them, particularly in the case of Advertising which today ranks as an "industry" by itself in the Affluent Society. Sales promotion expenditure by manufacturers in the US, as he remarks, is almost double the expenditure incurred on primary and secondary education in that country! Under such conditions the much-vaunted sovereignty of the consumer becomes little more than a myth.

Professor Kapp's aim in writing this book was to show the inadequacy of equilibrium in modern economics wherein private entrepreneurial costs are balanced against private returns and the social costs of production are left out of account. Equilibrium economics with its belief in the market economy and the competitive calculus is to him "an obstructive nuisance" in the way of a proper understanding of economic reality. The suggestions that he makes in the last chapter of the book for building up "A New Science of Political Economy" are however not very distinctive.

This book will not revolutionise economic thought, but it is useful as a systematic treatment of an aspect of the working of the competitive economy to which orthodox economists pay little attention. It is written in non-technical language so that it might be read by people who have had no training in economics. To that end, however, a book half the size and price of this would have been the thing.

Readers' Roundtable

RISING PRICES

Sir,

As the Union Finance Minister has observed, the price situation is indeed "critical". Prices are expressed in terms of money. Therefore, in dealing with the problem of rising prices, it is essential to keep in view two basic characteristics of money: first, it represents the stream of goods and services produced; second, money is a settlement of debt, which implies a host of intricate relationships as regards savings, investment, production and consumption. Hence, in order to bring prices down, while on the one hand production should be encouraged, statist measures like controls, state trading etc. which hamper production and distort the characteristic of money as a settlement of debt should be avoided.

The first and most urgent step in bringing down prices is to reduce Government expenditure, particularly on the administration. The number of Government servants at all levels has steadily increased. For instance, between 1960 and 1963, it has gone up from about 69 to 81 lakhs. This bureaucracy is by and large unproductive and is a drag on the economy. The over-staffing in Government departments can be made out from the recent O and M Division report. A study of requirements of lower division clerks in the Central Secretariat found out that instead of 700 reported vacancies, there was a surplus of 1,000 hands, thus resulting in a total economy of 1,700 clerks and an annual recurring saving of Rs. 42 lakhs.

Apart from this huge burden which the country has to bear, the way Government spends the scarce resources of the community does not lead to increase in national wealth, thus accentuating the price problem.

Unless this situation arising from rapid and indiscriminate politico-bureaucratisation of the economy is corrected, the problem of rising prices will be aggravated in days to come. This is a dangerous situation because the patience of the people is running thin.

RECORDS AND STATISTICS

Middle Class Family Living Survey: 1958-59

VERY LITTLE information is available about the conditions and levels of living of the middle class population which occupies a strategic position in the Indian society. With a view to fulfilling this major gap, an enquiry into the living conditions of the middle class families was undertaken during 1958-59. The survey, the first of its kind on a national scale, was undertaken as a joint effort of the Central Statistical Organisation, the Indian Statistical Institute and the National Sample Survey. It was conducted on the advice of the Technical Advisory Committee on Cost Of Living Index Numbers set up by the Government of India with Professor P. C. Mahalanobis as Chairman.

The survey covers nearly 36,000 middle class families in 45 selected cities and towns. A "middle class family" is defined as one which derives 50 per cent or more of its income from the earnings of its members who are gainfully occupied as employees in non-manual work in the non-agricultural sector. The report has estimated the total number of such middle class families at about 2.5 million. Table I gives the cities and towns in the sample arranged in the descending order of the estimated number of middle class families to indicate their concentrations. The largest concentration of middle class families is in Bombay. Although Calcutta happens to be a much larger city than Delhi, the latter apparently contains more middle class families than the former which is more industrialized and has a large number of manual workers and self-employed non-manuals. Madras, Hyderabad and Bangalore follow in that order as could be expected from their population size. As between Lucknow and Kanpur, the former, though smaller contains a larger number of middle class families than the latter which is an industrial centre. Similar is the case with Poona and Ahmedabad.

The most comprehensive single indicator of the level of living of a community is the per capita expenditure. Although it does not present a complete picture of the level of living in all its aspects, its break-up into the various components does provide a broad indication of the amenities, comforts and luxuries enjoyed by the community. More important, however, from the point of view of a study of the family budgets is the per family expenditure.

Expenditure Grouping

The family expenditure has been grouped under four heads. It includes all normal domestic expenditure on:

(a) food, beverage, tobacco and intoxicants;
(b) fuel and light;
(c) housing, household requisites (furniture, appliances and utilities) and services;
(d) clothing, bedding, footwear and headwear; and
(e) miscellaneous expenditure (on medical care, transport and communication, personal care, personal effects, ceremonial expenditures subscriptions, gifts, expenditure on litigation, remittance to dependants and taxes including direct taxes).

It does not include expenditure on gold, silver and other precious ware, land and buildings, livestock, machines, tools and transport equipment. It does not also include investments, bank deposits, insurance premia and loans. Thus, while it excludes all capital expenditure, including certain marginal cases like machines and transport equipment of domestic use, it includes certain transfer payments such as gifts, charities, remittances and taxes.

Expenditure includes not only consumption from purchases but also consumption from home-grown or home-produced goods, gifts, loans and free collections. Value of goods not purchased has been evaluated at the retail market prices. The expenditure on each item includes all taxes and levies associated with the purchase such as sales tax, entertainment tax, etc. Values of durables and semi-durables purchased or otherwise acquired are included in the expenditure.

The per family and per capita expenditures and the average size of the middle class families at various centres are given in Table II. The highest family expenditure is recorded at Delhi-New Delhi, higher than even at Bombay and Calcutt, although in terms of income, Delhi occupies only the third place. Surprisingly, Ajmer also reports a high level of family expenditure, higher than even Calcutta and Madras. Middle class families at Simla spend more than at Madras but not as much as at Calcutta. The other towns which show a comparatively high level of expenditure are Jaipur, Chandigarh and Srinagar. The case of Srinagar deserves special attention as the average expenditure there is reported to be twice as much as at Jammu in the same State, which, incidentally records the lowest reported expenditure. Kurnool and Gulbarga also report comparatively low levels of expenditure. Average family expenditures at the other centres vary from Rs. 200 to Rs. 300 per month.

The per capita expenditures shown varies from about Rs. 36 at Jammu and Gulbarga to Rs. 87 at Delhi-New Delhi and Rs. 88 at Bombay and Simla. Calcutta and Madras show per capita expenditure of Rs. 71 per month. Gauhati discloses a higher figure of Rs. 81 per month.

The average size of the middle class families of various income groups at each of the 45 centres, varies from 3.2 at Gauhati to 6.4 at Srinagar. It is 4 or less at 5 centres, 4 to 4½ at 9 centres, 4½ to 5 at 18 centres and more than 5 at 13 centres.

Components of Expenditure

The average monthly expenditure of middle class families by item groups is given in table III. It will be seen that expenditure on food, beverages, tobacco and intoxicants varies from about Rs. 80 at Jammu to Rs. 158 at Delhi-New Delhi and constitutes the largest component of the family expenditure. Next to Delhi, the largest expenditure on food etc. is reported at Srinagar. The distribution of the centres according to the percentage of expenditure on food, etc., is given below:

DISTRIBUTION OF CENTRES BY PERCENTAGE OF EXPENDITURE ON FOOD, BEVERAGES, TOBACCO AND INTOXICANTS

Percentage of expenditure on food, etc.	Centres.
Below 40 per cent	: Gauhati, Trivandrum, Bombay, Indore, Jaipur, and Ajmer.
40 to 45 per cent	: Calcutta, Patna, Muzaffarpur, Vijayawada, Madras, Madurai, Kozhikode, Bangalore, Hubli-Dharwar, Poona, Nagpur, Ahmedabad, Rajkot, Gwalior, Jabalpur, Judhpur, Delhi, Lucknow, Chandigarh and Simla.
45 to 50 per cent	: Shillong, Kharagpur, Ranchi, Cuttack, Sambalpur, Hyderabad, Visakhapatnam, Kurnool, Tiruchirapalli, Mangalore, Gulbarga, Bhopal, Kanpur, Allahabad, Agra, Meerut, Amritsar and Srinagar.
Above 50 per cent	: Jammu.

This distribution marks a striking contrast to the consump-

tion behaviour of working class families which are known to spend more than 60 per cent of their total expenditure on food, beverages, tobacco and intoxicants.

While the expenditures on fuel and light are relatively small and vary from Rs. 9 to 19, expenditure on clothing, bedding, headwear and footwear ranges from Rs. 13 at Jammu to Rs. 57 at Delhi-New Delhi. Miscellaneous expenditures, the magnitude of which seems to vary the most, range from Rs. 27 at Jammu to Rs. 120 at Bombay.

To facilitate a more meaningful study of the inequalities in the levels of expenditure, average monthly expenditures have been estimated by interpolation in respect of the bottom 25 per cent, the mid-50 per cent, the top 25 per cent, the top 10 per cent and the top 5 per cent of families ranked according to family income. The results are given in tables IV and V. It will be seem that the monthly expenditures of the mid-50 per cent vary from Rs. 126 at Jammu to Rs. 323 at Bombay. The expenditures of the top 25 per cent vary from Rs. 263 at Jammu to Rs. 736 at Bombay while those of the bottom 25 per cent vary from Rs. 85 at Jammu to Rs. 199 at Simla. Expenditures of the top 25 per cent are thus about 3 to 4 times the expenditures of the bottom 25 per cent. Expenditures of the top 10 per cent vary from Rs. 379 at Jammu to Rs. 1088 at Bombay, while those of the top 5 per cent vary from Rs. 404 at Jammu to Rs. 1432 at Bombay. The top 10 per cent of families spend roughly 4 to 6 times and the top 5 per cent about 5 to 8 times as much as the bottom 25 per cent. A classification of centres according to the ratio of the average expenditures of the top 5 per cent to those of the bottom 25 per cent is given below:

DISTRIBUTION OF CENTRES BY EXPENDITURE DISPARITIES

Ratio of expenditure of top 5 per cent to bottom 25 per cent	Centres
Less than 5 times	: Visakhapatnam, Kurnool, Tiruchirapalli, Ahmedabad, Rajkot, Bhopal, Jabalpur and Amritsar.
5 to 6 times	: Shillong, Kharagpur, Ranchi, Muzaffarpur, Cuttack, Vijayawada, Kozhikode, Bangalore, Mangalore, Gulbarga, Poona, Nagpur, Gwalior, Indore, Lucknow, Agra, Meerut, Jodhpur, Simla, Srinagar and Jammu.
7 to 8 times	: Gauhati, Calcutta, Poona, Hyderabad, Trivandrum, Hubli-Dharwar, Bombay, Kanpur, Allahabad, Delhi, Jaipur, Ajmer and Chandigarh.
More than 8 times	: Sambalpur, Madras and Madurai.

Considering the fact that the higher income groups have families roughly twice or thrice as large as the lower income groups, it appears that inequalities in per capita expenditures are less sharp than the inequalities in family expenditure. The range of variation in the levels of expenditures as between centres is less marked in the lower income groups than in the higher income groups. Thus the maximum bears a ratio of 2.3 to the minimum in the case of the bottom 25 per cent, as against the corresponding ratio of 2.6 in the case of mid-50 per cent, 2.8 in the case of the top 25 per cent, 2.9 in the case of the top 10 per cent and 3.5 in the case of the top 5 per cent. The expenditure of the lowest 25 per cent is the highest at Simla, followed by Delhi, Ajmer and Bombay in that order.

The distribution of expenditure by quartile income group is given in tables VI and VII. Whereas the bottom 25 per cent of the families spend about half their expenditure on food etc., the top 25 per cent spend about two-fifths in most centres. On the other hand while the bottom 25 per cent spend only a fifth of their expenditure on miscellaneous items, the top 25 per cent spend about three-tenths.

The expenditure patterns of the top 10 per cent and the top 5 per cent show marked deviations from that of the bulk of the middle class families. The top 10 per cent spend nearly as much on miscellaneous items as on food, etc. while the top 5 per cent spend even more.

No Marked Variation

It is difficult to draw any inferences from the variations in consumption pattern as between centres from the available data. The centres can be grouped in two ways: regionwise and sizwise. Simple averages of the percentage expenditures on various item groups for the various regions are given in table VIII. It does not show much of a variation in the expenditure pattern as between the regions. The eastern region, however, spends relatively less on fuel and more on housing, while the western region spends slightly more on clothing and miscellaneous items and less on food.

Weighted average expenditures together with the corresponding percentages for various size groups of centres are given in Table IX. They show a significant variation in the average family expenditure as between the "major cities" on the one hand and "other cities and towns" on the other.

The main conclusions are:

(i) The average monthly expenditure of middle class families varies from Rs. 148 at Jammu to Rs. 388 at Delhi, the level of expenditure in the major cities exceeding by far the level of expenditure in the minor cities and towns;

(ii) The reported level of expenditures is generally in excess of the reported level of income except at the higher levels of income (say above Rs. 750 per month), it is to be noted however, that in family budget studies based on interview method, expenditures are generally exaggerated, while incomes are somewhat understated;

(iii) Expenditures of the top 25 per cent of middle class families are 3 to 4 times the expenditures of the bottom 25 per cent, the top 10 per cent spend 4 to 6 times, and the top 5 per cent 5 to 8 times as much;

(iv) Inter-centre differences in the level of expenditure are much higher in the case of the upper income groups than in the case of the lower income groups;

(v) About 44 per cent of the expenditure of middle class families is on food, beverages, tobacco and intoxicants, about 4 per cent on fuel and lighting, about 12 per cent on clothing, bedding, footwear and headwear, about 14 per cent on housing, household requisites and services and about 26 per cent on miscellaneous items;

(vi) In the major cities, middle class families spend relatively more on housing, household requisites, services and miscellaneous items and less on food, beverages, etc., and fuel and light;

(vii) A regional analysis reveals that in the eastern region middle class families spend relatively less on fuel and light and more on housing, household requisites, etc., whereas in the western region, they spend relatively more on clothing and miscellaneous items and less on food, beverages etc.

(viii) The most important sub-group of the food group from the point of view of expenditure is cereals, the next most important being milk and milk products; consumption of meat, fish and eggs shows large regional variation and occupies an important place in the food budget of the middle class families in Assam West Bengal and Orissa as also at a few other places such as Bombay, Mangalore and Srinagar.

(ix) Among the miscellaneous items of expenditure transport and communications account for the largest share in 19 of the 45 centres and education in 6; transport and education are both expensive at Bombay and Delhi; transport is expensive at Madras too and education at Calcutta.

TABLE I.

ESTIMATED NUMBER OF MIDDLE CLASS FAMILIES

	Centre	Number (in thousands)
1.	Bombay	169.9
2.	Delhi - New Delhi	92.1

TABLE VIII.

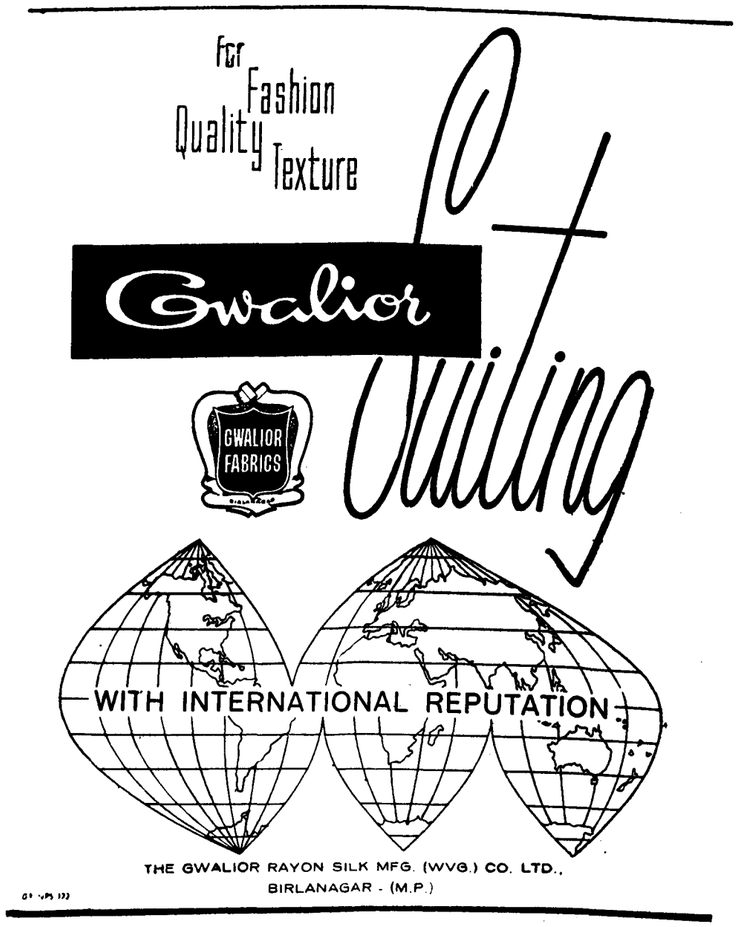
DISTRIBUTION OF EXPENDITURE BY REGIONS

(Percentages)

Region	Food, Beverages, etc.	Fuel, Light etc.	Cloth-ing etc.	Hous-ing etc.	Miscel-laneous	Total
East	44.8	3.8	10.4	15.5	25.5	100
South	44.9	4.6	11.9	13.7	24.9	100
West	42.4	4.5	13.9	12.2	27 0	100
North	45.1	4.6	13 0	12.4	24.9	100

TABLE IX.

DISTRIBUTION OF EXPENDITURE BY CLASS OF CITIES



Class of centres		Food, Bever-ages, etc.	Fuel, Light, etc.	Cloth-ing etc.	Hous-ing etc.	Miscel-laneous	Total
Major cities	Rs.	148.64	14.0	44 31	55.42	106.13	368 50
	%	(40.34)	(3.80)	(12.02)	(15.04)	(28 80)	(100 00)
Minor cities	Rs.	116.02	12.97	31 82	36.65	65.93	263.39
	%	(44.05)	(4.92)	(12.08)	(13 92)	(25.03)	(100.00)
Other towns	Rs.	116.92	11.53	34 34	34.30	75.53	267.62
	%	(43.69)	(4.31)	(12.83)	(12 82)	(26.35)	(100.00)

NOTE:

Major cities: Cities with population of more than 12 lakhs— Bombay, Calcutta, Madras and Delhi.

Minor cites: Cities with population of 5 to 12 lakhs — Hyderabad, Bangalore, Poona, Nagpur, Ahmedabad, Lucknow and Kanpur.

Other towns: Towns with a population of less than 5 lakhs.

MORE ALUMINIUM for the industry

PESHAC-1164

HINDALCO

The Rs. 200 million Birla-Kaiser Aluminium Project has, since December, 1962, attained the present target capacity of 20,000 tonnes of virgin aluminium per annum. HINDALCO products now include commercial grade ingots, electric conductor grade ingots, high purity ingots, wire-bars, billets and re-draw rods of a very high quality. Fabrication facilities to manufacture sheets, plates, circles, and extrusions are being undertaken, to keep the fast growing national industries on their march to progress and prosperity.

HINDUSTAN ALUMINIUM CORPORATION LTD.

Calcutta Sales Office: 5, Clive Row, Calcutta-1 (Phone: 22-8616/8617/8618 Gram: Hindalcorp)

Regd. & Bombay Sales Office: 159, Churchgate Reclamation, Bombay-1 (Phone: 24-5181 Gram: Hindulcor)

Works: P.O. Renukoot, Dt. Mirzapur, U.P. (Phone: Pipri, 79. Gram: Hindalco)
