After meeting all expenses and providing depreciation, the Company shows a profit of Rs 8.75 lakhs. After making some other provisions the Directors have recommended the dividend at 8 per cent subject to deduction of income-tax, on the paid-up capital of the Company as at December 31, 1959, to the shareholders whose names appear on the Register of Members on 1st September, 1960, irrespective of the dates of payment, but no dividend is proposed to be paid on new shares allotted and paid for in the year 1960.

ORISSA CEMENT

Mr J. Dalmia, Chairman of Orissa Cement Limited, observed at the annual general meeting of the Company held recently that there has been a significant expansion in the refractory industry during the last few years so that the output has increased from 4.44 lakh tons at the beginning of the Second Plan to over 8 lakh tons in April, 1960. This increase is not adequate because the requirements of India's expanding steel industry are much greater. He pointed out an anomaly that existed in the industry today. While the production of refractories is very short in the field of special steel plant refractories such as glass furnace bricks, ladle refractories, basic refractories, etc., there has been to some extent a surplus capacity created in the manufacture of ordinary fireclay types. He, however, expressed satisfaction that the Orissa Cement has been concentrating more on the production of specialized refractories including basic, blast furnace, ladle and silica bricks

The Chairman observed that the expansion of this vital industry is being severely hampered by lack of foreign exchange. He was of the opinion that in the present circumstances preference should be given to units already in production who would be able to balance their plants for increasing the range and quantum of production by a comparatively small expenditure of foreign exchange.

PATTERNS OF INDUSTRIAL GROWTH, 1938-1958

Dimensions and patterns of the material growth over 20 years in the industrial sector (mining, manufacturing, construction, electricity, gas) of countries of the world are measured and analysed in this publication for the first time. The distribution, according to areas of the world, stages of economic development and kinds of industry, of output and employment in 1938, 1948, 1953 and 1958 is also delineated and significant changes over these years in the structure of industrial activity and resources are traced.

Published September 1960 (New York)
Bilingual (Eng/Fr) 471 p. 9 x 11½" Cloth Rs. 44.62.

Latest issues of other important books—

STATISTICAL YEARBOOK, 1959

Comprehensive statistics for more than 250 countries covering a very wide range of economic, financial and social subjects. Current year compared with several recent years, and with pre-war years. Among the subjects: population, agriculture, production, mining, manufacturing, transport, trade, balance of payments, international economic aid, national income, public finance, education, culture.

Bilingual (Eng/Fr) 624 p. 8¼ x 11"
Cloth Rs. 52.50 Paper Rs. 42.00

YEARBOOK OF INTERNATIONAL TRADE STATISTICS, 1958

Detailed statistics on the trade of 122 countries. **Volume I:** value of merchandise imports and exports in national currency and US dollars; trade in gold; quantum and unit value indexes, terms of trade; trade in principal commodities (quantity and value); trade by countries of provenance and destination, **Volume II:** Value of trade for each year beginning 1953 by large commodity classes and by principal regions and countries of provenance and destination in US dollars.

Company Meetings

The South Madras Electric Supply Corporation Limited.

TIRUCHIRAPALLI

August 27, 1960

CHAIRMAN'S SPEECH

Ladies and Gentlemen,

I have great pleasure in welcoming you to this Twentieth Annual General Meeting of the Company.

I believe you have studied the Directors' Report and the Balance Sheet & Accounts which have been in your hands for some time. I shall take these documents as read, with your leave, and shall invite your comments on them later.

This year too we have suffered from paucity of finance. A capital expenditure of Rs. 10.35 lakhs was incurred and 19 new villages were electrified in the Trichy and Tanjore areas. I must admit that this is far below the expectations of the large numbers of power supply applicants and in spite of our anxiety we could do no better.

The share issue of Rs. 14 lakhs worth of equity shares made this year have been fully subscribed. Your Directors have sanctioned a comprehensive works programme; with due consideration to priority of applications and it is expected that we may be able to execute about Rs. 15 lakhs worth of capital works before 31st March, 1961.

We have also been informed by the Government of Madras that a sum of Rs. 25 lakhs has been placed by them with the Madras State Electricity Board for disbursements as loans to licensees. We have submitted schemes to the Electricity Board and we expect they may give us our share of this loan, may be about 14 to 15 lakhs, before the end of March, 1961. Expeditious steps will be taken to utilize these funds for extensions in the year 1961-62.

The back-log of works are heavy. Even about a crore of rupees will not suffice to completely satisfy the demands in our area of supply. And even if such a sum of money were made available, we will not be able to utilise the sum in an year for want of materials and adequate skilled man power. It is my hope that with our resources and loans from the Electricity Board we may execute every year between Rs. 15 & 20 lakhs of new works, thus satisfying the consumers to the extent possible.

Apart from our own difficulties it is a well-known fact that adequate power supply is not available from the Electricity Board's existing power houses and grid. I expect it will easily take another 2 or 3 years for the supply to catch up with the demand, if the Kundah and Neiveli Schemes get completed by then and the State Electricity Board is enabled to plan for the future in a broad based way by supplementing existing resources with thermal and nuclear stations.

The revenue earnings this year have been satisfactory and we have been able to maintain the usual 9% dividend on equity shares. I believe this will nearly represent the position in future years. With the existing ramifications of the Electricity Supply Act nothing better could be expected.

On preference dividends you are aware of the controversies created by the Finance Act. Your Directors have, under proper advice, decided the measure they have adopted as explained in their Report. It has also been indicated to you that in due course your approval will be sought to change the dividend structure, to give the preference shareholder a 7% dividend from which the shareholder's tax will be deducted. This step appears to me to be equitable, from the point of view of all classes of shareholders. This change involves a complicated procedure of class meetings and an extraordinary General Body Meeting. These will be convened in due course, unless legislation anticipates us and makes position easier for us.

Among your Directors, Sri M. V. Krishnamurthi Rao resigned this year, to seek election to the State Legislature. I would like to tender to him on behalf of all of you and myself, my sincere thanks for his contribution to the development of the Company. In accordance with the policy enunciated last year and to comply with the requirements of the Electricity Supply Act, it has been recommended to you that this vacancy need not be filled up and the strength of the Board reduced accordingly. The suggestion is that the strength of the Board be reduced to ten members (excluding ex-officio directors) by not filling vacancies as and when they arise.

I am glad to say that staff relations have been very cordial all through. The Works Committee is functioning usefully and responsibly much to the satisfaction of both the management and labour.

Last year I told you of the proposals put forward by the citizens of this City and the districts to have an Engineering College here in memory of the late V. Seshasayee. Considerable progress has been made in this direction and I am hopeful that Trichy will have its Engineering College in 1961. At the appropriate time I am sure we will have your support.

I now move that the Directors' Report and Audited Balance Sheet as on 31-3-1960 and the Profit & Loss Account for the year ended 31-3-1960 be approved and adopted.

(Sd.) K. A. P. VISWANATHAM,
Chairman.

Tiruchirapalli,
27-8-1960.

N.B. The above does not purport to be the report of the proceedings of the 20th Annual General Meeting of the Company held on 27th Aug., 1960.

THE ENFIELD INDIA LIMITED

Sharp Increase in Turnover

SRI K. R. SUNDARAM IYER'S REVIEW

Presiding over the Fourth Annual General Meeting of the Company held on Wednesday, the 31st August, 1960, at Tiruvottiyur, Sri K. R. Sundaram Iyer, Chairman, said :

Gentlemen:

I have great pleasure in extending to you a cordial welcome to this Fourth Annual General Meeting of the Company. The Directors' Report and the Statements of Account for the year ended 31st December, 1959, have been with you for sometime and with your permission, I shall take them as read.

Satisfactory progress was made during the year in all directions. The production of vehicles was higher by 20 per cent and sales turnover increased from Rs. 71 lakhs to Rs. 91 lakhs. The profits increased to nearly Rs. 7 lakhs from Rs. 5 lakhs for the previous year, before providing for depreciation. This has enabled your Directors to recommend, after writing off fully the balance of the preliminary expenses and brokerage on shares and after providing for Development Rebate Reserve and dividend on preference shares, a maiden dividend on the ordinary shares.

Further plant and machinery were acquired and put into operation. The gross block increased from Rs. 39.4 lakhs to Rs. 48 lakhs. Your Company continued to make rapid progress in increasing the indigenous content of the motor-cycles, in spite of the several difficulties that industries having phased programmes of import substitution have to face. I am now able to state with greater confidence than I was able to muster at the last Annual General Meeting that the phased programme will be substantially completed during the calendar year 1960, according to the original schedule. During 1961, we shall be importing only a negligible number of finished components and even these, mostly will comprise what are commonly known as proprietory or specialised components, such as electrical equipment, carburettor, etc. which are not in our manufacturing programme and which normally vehicle manufacturers obtain from specialists. There is greater reason than ever to expect that, as a result of the measures that are being taken by the Government, industries for the manufacture of such specialised components would soon be established in the country, so that imports of even these proprietory items can cease in the coming years. Those who are already engaged in the manufacture of proprietory items and components in India have to play a vital role towards a rapid and smooth progress of the industries who depend upon such manufacturers for their original equipment requirements. Already many well-established manufacturers have given the highest priority for original equipment requirements. In the present critical stage of our having to achieve self-sufficiency, regulated deliveries are of paramount importance. I should not have referred to this but for the fact that there have been occasions when the only source of supply of some original equipment was the open market at unconscionable prices.

NEED FOR ADDITIONAL CAPITAL

I must once again express our gratitude to the Government of India for their continued and active assistance and guidance in general and in particular for progressively increasing allocation of foreign exchange for imported raw materials. This, coupled with the increase in indigenous content and increase in productivity to which I shall refer later, will enable your Company to achieve a further increase during 1960 and a substantial increase in 1961, in production. With such a steady expansion of our production, the need for larger capital has become insistent. As it is, the imbalance between the paid-up capital and the capital employed in the conduct of our business is large. Your Directors have, therefore, decided to make a further issue of equity capital to the extent of Rs. 10 lakhs. This, will be offered in the first instance to equity shareholders on our register. You will get the Company's circular in this regard shortly.

Significant progress was made by your Selling Agent, The Madras Motors Private Limited, in sales promotion and rendering service-after-sales. Royal Enfield motor-cycles are sold and serviced all over India by a net-work of dealers and sub-dealers, whose number has reached a record of 145 as against 91 at the time of the last Meeting. More Zonal and Service Representatives have been stationed to assist and guide the dealers. A separate organisation has been sponsored for providing hire-purchase facilities for our products. Training courses for service personnel of the dealers are being conducted with more intensity and with great advantage to the users of our products. A representative was deputed to the various countries in West Asia to make contacts and explore the possibilities for export of our products. With these various sales, service and export promotion arrangements and with the increasing use of motor-cycles at home consequent on increased economic activity, your selling agents are well set to take care of the increasing output.

It is gratifying to note that an increased volume of orders was secured for and executed by the General Engineering Department. This has been a significant factor in reducing the overheads and the cost of production of motor-cycles.

VISIT OF FOREIGN COLLABORATORS

I would like to express my pleasure that Major Smith, Chairman of our U.K. Collaborators, The Enfield Cycle Co. Ltd., accompanied by Mrs. Smith and Major Mountford, Joint Managing Director, was able to visit your factory early this year. Major Smith is a leading personality in the motor-cycle industry in the United Kingdom with over 50 years' experience in the line. We are naturally gratified when he expressed his immense

satisfaction at the progress which your Company has made and the quality of its production

EXPANSION PLANS

I would now like to say a few words about the expansion plans of your Company. During the second half of 1961, we expect to commence the production of Scooters for which, as you have perhaps seen from Press Reports, the Government has granted us a licence under the Industries (Development & Regulation) Act. Your Company has been the pioneer in the manufacture of powered two-wheeler transport in India. After bringing to a successful completion the phased programme for manufacture of motor-cycles, it seems logical that your Company should take-up the manufacture of Scooters, which is another popular item of powered two-wheeler transport and for which demand in the country is growing fast. The Scooter Project will go a long way to further strengthen and consolidate the position of this Company. The manufacture of motor-cycles and scooters involve, by and large, similar plant and machinery, techniques and skills. Therefore, we are in a specially advantageous position to achieve this expansion by better utilization of our existing equipment and with suitable additions to them. An entirely new scooter-making plant would involve a substantially larger outlay of capital and this is where our existing set-up secures for the new programme considerable economy in capital cost. Simultaneously, your Company will be commencing the manufacture of the well-known Villiers Road Vehicle engines. A unique feature in this expansion programme is that the same model of the Villiers engine with small modifications will be used both on the scooter and the light-weight motor-cycle. This should facilitate economies in the production of both the motor-cycle and the scooter. Plans are also under finalisation for the manufacture of Villiers engine for industrial and agricultural uses. There is a fast growing demand in our country for such engines.

In March this year we had the pleasure of a visit by Mr. Farrer, Chairman of The Villiers Engineering Co. Ltd., U.K. and an authority on engines, accompanied by Mrs. Farrer and Mr. Thornton, Export Manager. I consider that the collaboration arrangement with Villiers as an event of great importance to your Company. Mr Farrer's visit at this preliminary stage and the first-hand impression he has gained of your Company have given a good start to this programme.

At the last Meeting, I referred to our intention to promote a number of small-scale ancillary units. A detailed scheme has been got ready for this including the formation of an Industrial Estate by the small entrepreneurs on a co-operative basis. Apart from the fact that your Company would be playing a wholesome role in helping small entrepreneurs to come-up, the scheme will be mutually beneficial

INCENTIVE BONUS SCHEME

I must refer to some major steps that your Company had initiated during the year under review for increasing the efficiency of the Company's operations and thereby achieving higher productivity. Increase in the Nation's standard of living is, to a considerable extent, dependent on higher productivity. Even in some of the advanced Western countries the productivity movement is of recent origin. We are grateful to the Government of India, and in particular, to the Minister for Industries, for the stimulus given to the productivity movement in our country. As is known, productivity aims at achieving with a given set of facilities higher production of better quality at lower cost. This requires both increase in management efficiency and enthusiastic co-operation from the employees. Obviously, the fruits of higher productivity should be shared not only by the consumers, the Company and its shareholders but also by the employees. Otherwise, there is no motivation for them to take part in this important task. With the assistance of Industrial Engineering Consultants, your Company commenced during the year under review, studies of various departments for taking measures to increase management efficiency and to evolve a suitable scheme of incentives for the employees. As a result, an incentive bonus scheme was introduced in June this year. The Madras Chief Minister inaugurated the scheme and the Industries Minister presided over the function. By the end of the year most of the sections would have come under the incentive scheme and I have every hope that this scheme will play an important role in increasing the prosperity of your Company and its employees in the years to come. I wish to remind the shareholders once again that your Company is still in the midst of the phased programme which is scheduled to be completed by the end of this year and which involves considerable advance planning. The benefits that accrue from the above measures will be apparent only from the coming calendar year.

An important event in the labour-management relations since the last Meeting has been the merger of the two Trade Unions. This has further strengthened the cordial relationship between the employees and the management and eliminated to a considerable extent unhealthy rivalries. A start has been made to implement the scheme of joint consultation to improve productivity and on matters of performance standard, job evaluation and employees' grievances. An agreement has been signed with the merged union on the incentive scheme and bonus for 1958.

I would like to take this opportunity to convey our gratitude to the Madras Government from whom we continue to receive assistance and guidance.

I wish to express our appreciation to our U.K. Collaborators, The Enfield Cycle Co. Ltd. who have continued to give unreservedly their co-operation.

I take pleasure in expressing the thanks of the Company to the Selling Agents, the dealers and sub-dealers, who have played an active part in the sales promotion and servicing of our products.

Last but not least, the workmen, staff and officers of your Company deserve appreciation for having contributed to the satisfactory results of 1959.

NOTE: ("This does not purport to be a record of the proceedings of the above Fourth Annual General Body Meeting of the Company.")

NEW DELHI: SEPTEMBER 16, 1960.

Export or Perish?

THE National Development Council's meeting on Monday and Tuesday this week made all the appropriate noises on exports and prices. The Prime Minister, in what was obviously a sincere speech, demanded a supreme effort on exports in order to reduce our dependence on foreign countries and to make our own development more secure. For this purpose he prescribed austerity within, even of "necessities". That the foreign exchange position is serious enough to need this exhortation is not open to doubt. The question which will arise in everyone's mind, however, is whether the Government of India and the country as a whole are prepared for the full consequences of the policy the Prime Minister has prescribed.

In the first place, if "necessities" are exported —sugar is one of those which springs immediately to the mind — and their internal prices rise as a consequence, is the Government of India prepared to face the political consequences? Secondly, if there is need for exporting, say, coal to Pakistan, will the Government of India see that output of India's coal is speeded up by a production drive which is not hindered by Mr. K. D. Malaviya's shibboleths in the Ministry of Fuel and Mines? More bluntly, is the Government of India prepared to withdraw its ban on the private mining of coal in "contiguous" areas so that both India and Pakistan will have enough coal for their current needs? Finally, there is the question of price of commodities in export trade. Take the problem of cement which Pakistan is willing to buy in a substantial quantity, and where obviously there is room for exporting since many of India's large cement consuming projects could be deferred in the current emergency. Are we prepared to make the adjustments in price, removing, for example, the State Trading Corporation's commission and reducing the price to a level at which Pakistan will recognise that India is the most "economical" country from which to import? These are issues of policy which are by no means underwritten by a mere exhortation to tighten our belts and to export in order to find foreign resources for the Plan. India's public policies have hindered export, both by restriction of production and reduction of private incentives.

It is perfectly true that all the fault is not with the public sector. In a Special Article elsewhere in this issue, where India's balance of trade area-wise from 1958 to 1960 is exhibited, it is shown that practically the whole of India's rise in exports in the first half of the current year from Rs. 266 to Rs. 301 crores is "accidental." Practically the whole improvement in exports is due to a rise in unit values or in terms of trade. In other words, India's additional business with the West promoted by Indian businessmen in the private sector must be negligible in terms of volume, although substantial in terms of value. In effect, therefore, the export effort, although apparently satisfactory, is based on an "accidental" windfall. It is, therefore, obvious that the export situation is not what value figures might imply. The country has, over the last six months, made no export effort worth the name, notwithstanding a minor rise in certain engineering goods.

It is obvious if the balance of trade is to come right through India's exports, we must plan for a rise of at least Rs. 50 crores in the next twelve months. Most people agree that this cannot be done without a determined effort to "compel" exports, and to accept the consequences thereof; a rise of prices on the items exported, conceivably sugar, coal, cement and some engineering goods. This is an inescapable rise in prices and should not affect the cost of living and should, therefore, not be treated as a retreat from a policy of "holding the price line." But the dilemma of holding the price line of some commodities and increasing foreign exchange earnings at the same time should be squarely faced. Unless production is increased in all these commodities—and for most purposes steel and coal are central—the bold plans for export will be of no avail. Thus, it comes about that the Prime Minister's exhortation is meaningless unless the Ministries concerned in the Government of India now lay down a policy for export based on a much more dynamic policy of internal production. This applies particularly to the Ministry of Steel and Fuel whose failure to work its production according to schedule in steel and coal has blackened the face of the public sector, and has raised a major crisis in production for the nation as a whole. If the Prime Minister addressed himself to the Ministry of Steel and Fuel with half the passion he imparted to the National Development Council as a whole, some major development on the export front might be possible. When will Mr. Swaran Singh and Mr. K. D. Malaviya be held responsible for their major failures in production of coal and steel?

Indo-Pakistan Relations: The Turn of the Tide?

THE visit of India's Prime Minister to Karachi next week has rightly been regarded as a momentous event in Indo-Pakistan relations. Is it a turning point? Undoubtedly, over a large portion of India, the feeling that our enmity against Pakistan has been overdone and that our security against China is not adequately safeguarded on that account, has grown in the last few months. President Ayub Khan has also shown a statesmanlike approach to a settlement of outstanding pro-

blems with India. The signing of the Canal Waters Agreement, with the personal intervention of India's Prime Minister to settle a last-minute hitch, has thus been naturally treated as a sign of good augury for the future.

The Treaty has been rightly described by the World Bank as a "unique and historical document." It marks the end of 12 years of continuous dispute between India and Pakistan and which has been not a little responsible for further embittering the relations already strained between the two countries. It is worth drawing attention to some of the factors that have contributed to the reaching of this final settlement. First of all, a deserving tribute should be paid to President Ayub Khan who, as contrasted with the heads of the previous Pakistan Governments, was able to face the issue objectively, and in the main conceded the point of India that the issue should be isolated from politics and should be dealt with more by engineers than politicians. Secondly, the detached and friendly role played by the World Bank which was seized of the problem since 1951 cannot be exaggerated. As a matter of fact, the agreement now reached generally follows the World Bank proposals made in 1954. Finally, since finance was the bedrock of the solution, not a little credit goes to the United States and many friendly Commonwealth countries who have offered to build up the required fund of about one billion dollars (Rs. 500 crores). Here the contribution of India is estimated to be of the order of Rs. 60 crores which will go to build the replacement works during the ten-year transition period when India would diminish her supply of water to Pakistan.

There can be no gainsaying that this agreement is of great significance from the point of view of opening of new opportunities of economic development between the two countries and it would be a tragedy if either India or Pakistan remains content with this single success. The time is, therefore, ripe for India on her part to show a new initiative in the matter of trade. Indo-Pakistan trade, which was of the order of Rs. 87.36 crores in 1949-50 has dwindled to Rs. 15.72 crores in 1959-60. This is, in part, the result of natural economic forces such as the growth of Indian jute and Indian cotton to make us nearly self-sufficient in two major elements of import ten years ago. But it is also a reflection of indifference on both sides. There must now be a determination to multiply trade on a new basis. Certainly, India can guarantee import of jute cuttings of the order of an additional two lakh bales every year. India can balance this trade with exports of cement and coal, both of which must be arranged through a reasonable incentive to production and, in the case of cement, by the removal of unnecessary costs of distribution as well as excise duties. Some imagination similar to that which has led to the Canal Waters Treaty is obviously necessary. The President of Pakistan and the Prime Minister of India might be relied upon to supply this next week.

Finally, there is the problem of Kashmir. The Indian people are slowly realising that some relaxation in tension on the Kashmir front is also necessary. Mr. M. R. Masani, on behalf of the Swatantra Party has suggested this week that troops should be withdrawn on both sides of the cease-fire line in Kashmir in order that they should be more suitably utilised where they might be more urgently required. This is a suggestion which deserves to be considered, even if an approach on joint defence is considered impossible since Pakistan's military commitments with other countries make her a party in the Cold War. All in all, there can be no doubt that the signs are good that the political climate, heavily sown with distrust, is taking a firm turn for better understanding.

Self-Sufficiency in Shipbuilding?

INDIA'S shipbuilding industry has a long and arduous way to go before it can expect to achieve self-sufficiency in a substantial degree. The production costs of ships built at Visakhapatnam Yard are high because of the cumulative effect of three factors relating to production capacity ranging below the optimum, low per capita productivity of labour and an excessive degree of import content of machinery, equipment and materials used in the manufacture of the ships. The substantial import component is easily the greatest single factor contributing to the high cost structure of India's shipbuilding industry. But its replacement by indigenous equipment is fraught with real impediments of a great magnitude.

It will be a revelation to most people that the import content of Indian-built ships is as high as 80 per cent in value which involves foreign currency expenditure of that order. This high percentage gives a fair idea of the nature of the task before the industry in attaining a stage of near self-sufficiency. The main engines, engine room and deck auxiliaries, electrical installations, ventilation piping, navigational precision instruments and refrigeration equipment account for a high proportion of the major imported equipment used in the construction of ships in this country. The first two types of equipment take as big a slice of imported materials as 25 per cent. The prospect of replacing imported main engines and auxiliaries by indigenous products seems quite remote at the present time and, although there has been a talk of setting up marine engine manufacture in the public sector, it is anybody's guess when this proposal may very likely take a concrete shape. But about its postponement until after the Third Plan, or possibly the fourth Plan, there can be no room for doubt.

An engine manufacturing plant cannot be viable in this country so long as it depends entirely on the limited requirements of shipbuilding. But the move for self-sufficiency will not have made any striking progress until the main engines and its auxiliaries are manufactured at home. Another major item of import is the special type of steel required for shipbuilding, but its manufacture could not be undertaken in the country because it would be uneconomic when set against the very restricted requirements of the industry. It accounts for 10 per cent of the import content value at the present time. Nevertheless, it is a great redeeming feature that the steel plant at Rourkela is scheduled to undertake the manufacture of this special type of steel possibly towards the end of the Third Plan. But here again one cannot be certain.

One outstanding feature of the shipbuilding industry is that it does not admit of vertical integration of the manufacture of equipment ranging from small items of equipment to the major engine

in one shipbuilding yard. In this respect shipbuilding takes its place alongside a host of other heavy industries like automobile manufacture. It is of the essence of the shipbuilding industry that it has to resort to horizontal integration by extending a purposeful patronage to ancillary units, producing items other than the main engine and the like.

The drive for self-sufficiency must necessarily be concentrated for a considerable time to come on the manufacture of a number of small items required as lesser components in ship construction. Mr. G. L. Mehta, who delivered the inaugural address at the Industries Exhibition, opened last week at the Hindustan Shipyard, directed attention mainly to accelerating the production of this equipment, which alone could be given first priority in the struggle for self-sufficiency. This exhibition is conceived on a novel pattern, focusing attention on the nature of the equipment needed to be manufactured to start with, and it will be a normal accompaniment to the yard until the last category of this equipment is taken up for production at home. How much of the 80 per cent imported component is accounted for by this category of minor equipment now on exhibition is not clear, but cumulatively it is appreciable enough to warrant the priority that has been given to it.

At the present time a technical committee is seized of the problem of the development of ancillary plants which could switch part of their capacity to the manufacture of these parts. The main issues posed are that this equipment ought to be undertaken in medium-sized units, a high degree of precision required in their manufacture must be exacted from them and they must be made to conform to the standards laid down in Lloyds' Register and also by the Mercantile Marine Department. Conformity to these standards is essential to make the parts suitable for assembling into whole equipment. But apart from it, the standards set in Lloyds' Register give a warranty of soundness which is a vital factor in accepting underwriting risks. The components may be termed as minor, but the questions raised in their manufacture are certainly by no means so.

Disparities in the Fruits of Planning

THREE weeks ago, the Prime Minister initiating the debate in the Lok Sobha on the Draft Outline of the Third Five-Year Plan observed: "I think it is desirable, and I am sure it will meet the pleasure of the House, that we should enquire more deeply as to where this (increased national income generated by the first two Plans) has gone and appoint some expert committee to enquire exactly how this additional income that has come to the country or *per capita* has spread." Some thought he was just thinking aloud on the problem. Happily he has been quite serious about it; on Tuesday this week he announced the appointment of a National Distribution Inquiry Committee to study how the benefits of planning in the last ten years have been shared by the society. The findings of this Committee will be eagerly awaited; they can be a good guide for the investment pattern in the future and should throw a flood of light on the sectors of the economy which ought to be better exploited for finding resources for future development.

An enquiry of this kind has obviously to address itself to three components of the problem. Firstly, it has to be directed towards finding out what changes have come about in the past few years in the structure of various income-groups in the country. The second component of the problem is the study of regional progress under the two Plans. In the third place comes the probe into distribution of this additional income between the rural and the urban population. From the Press reports it appears that the proposed Committee may be primarily concerned with the first aspect of the problem. If it is to be so, its contribution towards future planning of the country will only be limited.

An interesting study, just completed by the Economic Intelligence Unit of the Indian Institute of Public Opinion, which was drawn upon extensively by Mr. R. Venkataraman, Madras Industries Minister, in his address to the National Development Council early this week, reveals that a decade of planning has resulted in marked disparities in the growth of the economy in different parts of the Indian Union. According to this study, the Plans have tended to heighten the disparity in per capita income as well as total income between the States. This divergence in the standard of living, instead of levelling up, is likely to grow under the next Plan. In real terms, total income of the Indian Union over the fifteen-year period 1950-51 to 1965-66 is estimated to go up by 86.38 per cent. "The advance will be greatest in the Punjab at 138.56 per cent, Orissa at 114.86 per cent and Gujerat at 101.02 per cent. Bihar, Maharashtra, Rajasthan and West Bengal will nearly double their 1950-51 incomes. Comparatively slow movers will be Assam (69.12 per cent) Andhra Pradesh (70.22 per cent), Kerala (76.43 per cent) and Madras (69.95 per cent). In Uttar Pradesh the rate of rise in income generation will be in each Plan substantially less than the all-India average and, over the three Plans together, it will be only 60.32 per cent against an all-India figure of 86.38 per cent. Madhya Pradesh increases will also be of a relatively low order (total 79.81 per cent)". The percentage increases in per capita income over this period are estimated to be as follows: all-India 40.39; Andhra 28.86; Assam 14.75; Bihar 51.10; Gujerat 45.37; Kerala 21.58; Madhya Pradesh 42.94; Madras 26.79; Maharashtra 41.01; Mysore 30.82; Orissa 74.05; Punjab 72.19; Rajasthan 43.84; Uttar Pradesh 23.14; West Bengal 59.88; Delhi 51.24; Himachal Pradesh 52.17; Manipur 25.94; Tripura 15.79.

This throws in bold relief one of the greatest liabilities of Indian planning. Similar trends may be revealed by the proposed enquiry in respect of the other two aspects of the problem. If the situation is not remedied in time, it may lead to fissiparous tendencies in the Union. Priorities of planning may warrant unequal distribution of the new wealth between different States, between various income-groups and between rural and urban population to some extent, but when these inequalities tend to widen in a marked degree, the Planning Commission and the Government must pause and ponder. There is obviously need to foster the development of ancillary industries in areas where heavy industry cannot be set up due to paucity of raw materials. When and How? These are important questions, but an imperative is not killed by the undoubted difficulties that it presents.

A DELHI DIARY

ALL THE WORLD'S A STAGE

I WONDER whether William Shakespeare could, with his tremendous imagination, have been thinking of the United Nations when he wrote: "All the world's a stage, and all the men and women merely players." I doubt if there is any better description than this for the session of the United Nations which opens next week in New York. Soviet diplomacy has been more than successful in its catch of great fish in the troubled political waters of the world. As far as I could see, the greatest figure of the Afro-Asian world—I did not say fish—is likely also to be attracted to the world's stage. The Prime Minister announced this somewhat suddenly at the second day of the National Development Council meeting on Tuesday. Has there been a certain change in the approach of some of the Western Powers to the Khrushchev invitation? Rumour in Delhi has it that Mr. Macmillan has agreed to go, and it is presumed that the Prime Minister is going as part of a concerted effort really to bridge a gulf. But if the United States stands aloof, where is the gulf to be bridged? That is what in New York, no doubt, will be called a 64-dollar question.

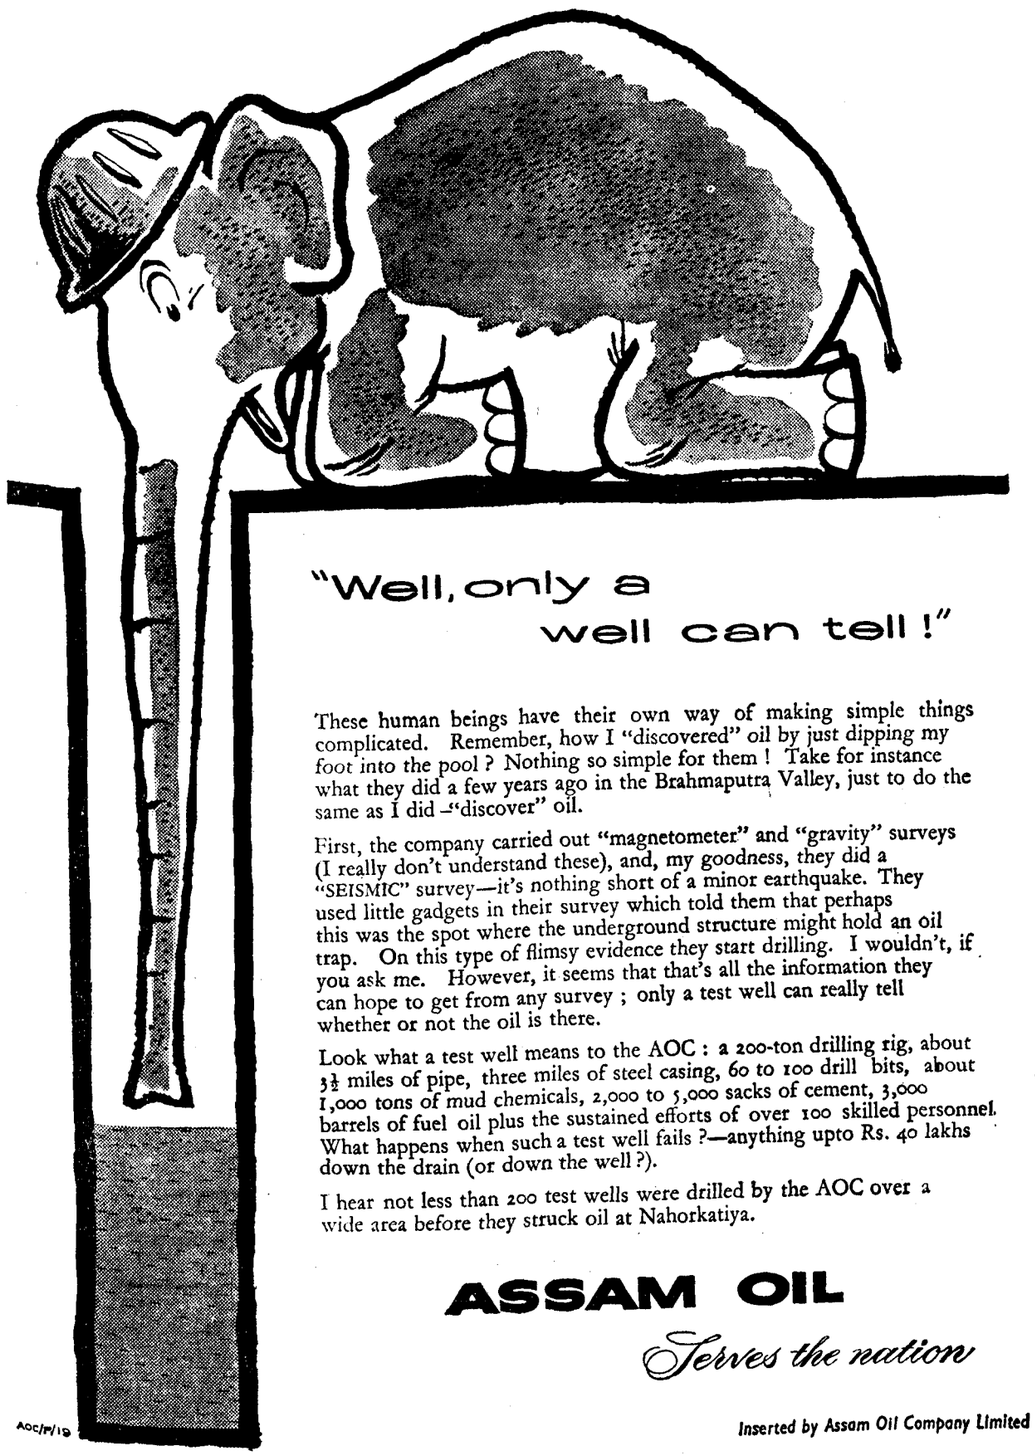
So far as the Indian Union is concerned, it is believed that the Russians are anxious to make some constructive new proposals on disarmament, and there is a widespread feeling that Russia is making these not in fear but from strength. It is believed that in missiles the Russians have a superiority over the Free World and most Indians think—perhaps we still live in the past—that, but for this, Cuba and even the threats of interference in the Congo would not have been taken as seriously as they have been. Whether or not they are right, I think I am correct in saying that most people recognise that the Prime Minister's presence in New York would be helpful to negotiations, if negotiations take place. The question is, if negotiations do not take place what will the Prime Minister be doing in New York? If we lean too heavily at this time, there is also the possibility that we may make the situation more difficult in regard to the underwriting of India's Plans during a critical political year. Everyone knows the risks that are being run, but most people feel that the Prime Minister being, what he is, a figure of world eminence, should be in the world's councils at this time. Only one hopes Hamlet is not being staged without the Prince. For the first time Hamlet, in this case, is not an Asian figure!

THE GRAND OLD MAN OF INDIA

Yesterday, September 15, there was celebrated throughout India the centenary of Sir M. Visvesvaraya, the grand old man of India. The occasion has been taken to strike a special stamp in his honour, and I have already seen queues at the Post Office collecting First Day covers. (If one does not strike a stamp, but only a coin, what does one do in respect of a stamp?) It would not be a bad thing for friends of Sir Visvesvaraya—and I am proud to count myself as one, although half his age—to strike a coin (the Mint and currency authorities permitting) for circulation amongst his large, but nevertheless limited, circle of friends. Those of us who have known Sir Visvesvaraya over the last twenty-five years have heard many stories—not all laudatory—of his achievements in Mysore. His passion for statistics, particularly in the Malnad, produced, from some slick amildars, figures which history has shown could bear no scrutiny. But, nevertheless, his approach was scientific in administration no less than in engineering. If the Mysore Steelworks incurred heavy losses for many years, and is still a unit of inadequate size, it is nevertheless making a contribution for which India can afford to pay. It has given both pride, and avenue of employment to Mysoreans who believe that they were forging out of their home materials—Kemangundi iron ore and charcoal from the Shimoga forest—a wonderful instrument of economic prosperity. We have seen Bhadravati at its worst and perhaps now at its best—not, indeed, a monument to an optimum distribution of the resources for steel making, but nevertheless a monument to a grand old man who will live for ever in the hearts of those who have seen him over the aging years.

I see the newspapers keeping talking about the manner in which Sir Visvesvaraya has reached his hundredth year. Apparently, his sovereign remedy is eight hours work, eight hours sleep, and eight hours 'leisure', including the inevitable daily walk. But less than forty years ago, the walk used to be a run round his official Bangalore residence, and Lake View in Mysore when he was there. The work, as I can bear witness, often included four or five drafts before a letter was issued! All in all, one might say that, quite apart from the great span of his life which takes us back to the period of the American Civil War in the turmoil of which he was born — only happily on the other side of the globe! — there has been a pattern of dedication which runs like a golden thread through both his successes and his failures. Today we celebrate not his successes (or his failures) but his courage and his capacity to live tenaciously with age and failing health, but always with a supreme sense of awareness of the country's welfare.

PLANNERS ALL!



Sir M. Visvesvaraya was India's first planner, and those of us who remember the first edition of 'A Planned Economy for India' will recognise that, so far as Indian planning is concerned, he is rightly its father. This week in the National Development Council, we have had planners of various other kinds, and I doubt if being a "planner" is itself a description of a philosophy or of capacity to conceive of economic development in any coherent way. Thus the planners this week were on both sides; some for State trading in foodgrains, and some against it. The final resolution at the Price Committee seemed to be both plus and minus, which means, in effect, that Mr. S. K. Patil, like Rafi Ahmed Kidwai, gets the best of both worlds. Nobody is disposed to question his capacity to get things done and perhaps it is the best test of planning that it permits flexibility in all directions.

THE ACHARYA AND ASOKA

But what am I to say of the contrast in planning of Acharya J. B. Kripalani, who is now resigning from the Praja Socialist Party, against that of Mr Asoka Mehta who is Chairman of the Party, and also a planner? A friend of mine has put it, not too charitably, by saying that Acharya Kripalani is a "Gandhian" planner and Mr. Asoka Mehta one of the Jawaharlal Nehru kind. Since Acharya Kripalani and Asoka Mehta do not seem to be able to meet, am I to conclude that at least in planning Jawaharlal Nehru is not the disciple of Gandhiji? This is a terrible heresy, and having emitted this redherring — nothing but the truth — I shall be burnt at the stake. What, if any, are my chances of survival?

ARGUS

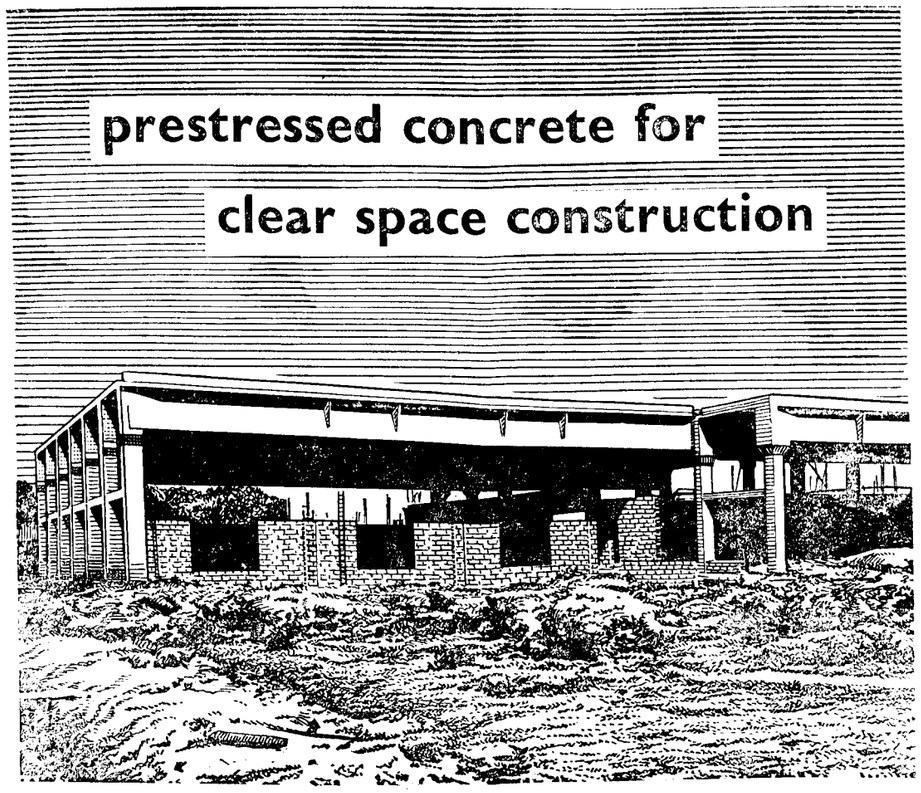
Memoirs of an Elephant—4

"Well, only a well can tell!"

These human beings have their own way of making simple things complicated. Remember, how I "discovered" oil by just dipping my foot into the pool? Nothing so simple for them! Take for instance what they did a few years ago in the Brahmaputra Valley, just to do the same as I did—"discover" oil.

First, the company carried out "magnetometer" and "gravity" surveys (I really don't understand these), and, my goodness, they did a "SEISMIC" survey—it's nothing short of a minor earthquake. They used little gadgets in their survey which told them that perhaps this was the spot where the underground structure might hold an oil trap. On this type of flimsy evidence they start drilling. I wouldn't, if you ask me. However, it seems that that's all the information they can hope to get from any survey; only a test well can really tell whether or not the oil is there.

Look what a test well means to the AOC: a 200-ton drilling rig, about 3½ miles of pipe, three miles of steel casing, 60 to 100 drill bits, about 1,000 tons of mud chemicals, 2,000 to 5,000 sacks of cement, 3,000 barrels of fuel oil plus the sustained efforts of over 100 skilled personnel. What happens when such a test well fails?—anything upto Rs. 40 lakhs down the drain (or down the well?).



I hear not less than 200 test wells were drilled by the AOC over a wide area before they struck oil at Nahorkatiya.

Uninterrupted Working Space at a Milk Factory, Calcutta

A roofing area of 24,000 sq. ft. was completed in about four months and no shuttering for roof slab was used. Seven 100 ft. long and eight 75 to 80 ft. long precast and prestressed concrete 'I' section girders spaced at 20 ft. apart were employed. On the top flanges and spanning between the girders, were placed 2½" thick x 14" wide precast prestressed concrete planks, over which 2" of in-situ concrete was laid, forming a composite flat roof slab of 4½" thickness. The roof was waterproofed with Stp "Tarfelt" treatment.

THE WEEK'S NOTES

Tibet

INDIA'S UNEASY CONSCIENCE

IT IS becoming a truism that public interest in any problem, however grave, cannot be indefinite. The rape of Hungary, when it occurred, no doubt stirred world conscience, but it has now passed into oblivion. It will be scarcely surprising if the case of Tibet also follows a similar fate. However, thanks to the Afro-Asian Convention, which met in New Delhi last April, attempts are being made to keep this issue alive. The Convention had established an Afro-Asian Council with Mr Jaya Prakash Narayan as its first president to take all necessary measures for mobilising public opinion and to give moral and political support to the unfortunate people of Tibet in their "desperate" struggle. The Convention had also resolved unanimously that the question of Tibet should be raised again at the U.N. Addressing a press conference last week, Mr Jaya Prakash Narayan expressed his appreciation of the action taken by Malaya and Thailand who had already taken the lead in this matter. He was, however, more concerned with the attitude that the Government of India should adopt on the Tibetan question.

It might be recalled here that when Tibet was brought up last before the United Nations by Ireland and Malaya, India had abstained from voting. But if the matter comes again before the United Nations, India cannot afford to maintain a non-possumus attitude. There are two aspects to be considered here. One is the question of human rights and the other how far Tibet can be allowed to remain a "domestic" affair of China. As regards the former, apart from the reports of the continuous stream of refugees from Tibet, there have been the findings of the Legal Enquiry Committee set up by the International Commission of Jurists. It has pointed out how acts of genocide had been committed in Tibet in an attempt to destroy the Tibetans as a religious group. The object of the Chinese, according to it, is not to permit adherence of the practice of Buddhism in Tibet and in pursuit of this aim, they had killed religious figures whose belief and practice was an encouragement and example to others. It is thus obvious that China has perpetrated and continues to perpetrate many crimes against the people of Tibet. On the plane of justice and humanity, this question of human rights cannot be treated as a domestic one and here India has a good precedent because she has never accepted the plea of South Africa that the treatment accorded to her citizens is her own concern. The fact, however, is as Mr Jaya Prakash Narayan pointed out, Tibet can never be considered a domestic issue of China. The Legal Enquiry Committee, which also went into the question of Tibet's status in international law has found that though Tibet surrendered its de facto independence by signing in 1951 the "Agreement on peaceful measures for the liberation of Tibet" with the Chinese Government, the repudiation of this agreement in Tibet in March 1959 restored the nation to its status of de facto independence. Tibet was justified in repudiating the agreement because the undertakings given by the Chinese under the agreement had been violated. It is also worth mentioning that from 1912 to 1950, Tibet was de facto an independent country and acted as such.

These are hard facts and when other countries come to the United Nations to demand the right of self-determination for the people of Tibet, India cannot afford to remain aloof. India's present policy seems to be guided by two factors. One is that since China is not a member of the U.N., there is no point in discussing this issue there. As Mr Jaya Prakash Narayan argued, if she does not happen to be there, there is no reason why the Chinese conduct should be considered to be beyond the purview of the U.N. particularly when it concerns international peace and justice. Secondly, it is often pleaded that no concrete results would follow by any U.N. discussion of Tibet. Here again, Mr Narayan asserted that where moral issues were concerned, it would be wrong to make such excuses for not taking a positive stand. The fact of the matter seems to be that there is a fear that India's advocacy of Tibet's case would complicate further her troubles with China. There may be some substance in this view; but for a country brought up in the Gandhian tradition, to take such an attitude would be totally unworthy, to put it very mildly.

Andhra

POWER TUSSLE

THE CONGRESS Parliamentary Board, which met this week, is reported to have decided against acceding to the request made by the Chief Minister of Andhra to permit him to reconstitute his Cabinet. It was Mr Sanjivayya's contention that three Ministers, who are members of what is called the "Unity Front" have formed a dissident group and hence he must have freedom to have a Cabinet of his own choice. Ever since Mr Sanjivayya was elected as Chief Minister in January this year, the Cabinet has not been having a smooth-sailing. It was only last June that a crisis was created by a member of the Cabinet, Mr A. C. Subba Reddi, who contrary to his understanding with the Chief Minister, contested for a seat in the Pradesh Congress Election Committee. The Chief Minister considered this as a breach of faith and demanded his resignation since he had lost his confidence. Here, he had the support of the Congress High Command, which decided that on constitutional principles, the Chief Minister must have his own way in the formation of his Cabinet. Since then, however, much has happened which has only added to the dissensions in the Congress Party. A "Unity Front" was formed by a powerful section of Congressmen as a protest against the alleged "autocratic" attitude of the official group and when elections were again held for the Pradesh Congress Election Committee, following its invalidation by the Congress President, the Unity Front won five out of the nine seats in the Committee and among those elected were Mr A. C. Subba Reddi himself. It is obvious that Mr Sanjivayya is faced with a difficult position and it is not possible for him to run a Cabinet when three Ministers are opposed to him and have formed a separate group. Apparently, based on party considerations, the Congress High Command has thought it necessary to follow a policy of masterly inactivity. But it cannot really go far in either preventing the growing dissensions or adding to the prestige of the Congress Party. Much the better course would be to give the Chief Minister freedom in reshuffling his Cabinet after seeking a vote of confidence. If he fails to muster a substantial majority, the choice is clear.

Britain

TUC AND DEFENCE

INTEREST IN last week's annual conference of the Trades Union Congress mainly centred on the question of nuclear defence. Though British trade unionism is faced with a number of other important problems connected with leadership and organisation, the debate as to whether Britain should or should not maintain her present defence policies based on NATO and the Atom and H-bombs eclipsed the others. The "official" Labour policy is committed to a defence programme favouring

the retention of American bomber and missile bases in Britain and Britain's continued reliance on the nuclear deterrent. But this is opposed by Mr Frank Cousins, Secretary of the Transport and General Workers' Union, which has already adopted a resolution supporting nuclear disarmament. It was thought that the Conference would decide one way or the other, either the official line or the Frank Cousins' motion renouncing the whole concept of a nuclear strategy though it was couched in studiously vague terms. But a very funny thing happened. The conference in fact voted both for the official resolution as also the Opposition motion. For the official resolution for retaining H-bomb, voting was 4,15,000 in favour and 3.46,000 against. On the opposition motion for unilateral renunciation voting was 4,356,000 in favour and 3.213,000 against. This egregious performance was made possible by the attitude adopted by the Amalgamated Engineering Union which cast its large vote on both sides. Apparently, the idea was that there should be no irrevocable commitment. In the process, the public has been, however, left in confusion, and this is not in the larger interest of the Labour movement. But the question is what is to happen at the Labour Party conference to be held in October at Scarborough, if a similar performance is repeated. This can perhaps avoid a split in the Labour Party, but this tactics cannot be continued for ever. If on the other hand, the Conference rejects the official policy in respect of defence, it would mean a resounding defeat for Mr Gaitskell. He has now to decide whether he should assert his independence and make the parliamentary party free from sectional pressures and face the issue squarely at the general election. All along, there has been criticism that Mr Gaitskell has been vacillating and has thus exposed himself to pressures from different sides. It is to be seen how far he would be able to give up the lukewarmness with which he has been advocating Labours' new defence policy and convince the country that the official policy is Britain's wisest course.

Rome Olympics

REVERSE IN HOCKEY

INDIA HAS lost the hockey crown which she had proudly worn for over thirty years since 1928 when hockey was first included in the Olympic games. In the final round at Rome, the better side won. Pakistan's Hamid and his men deserve felicitations for their this magnificent achievement; they at long last have been able to fulfil their country's cherished desire to beat India in this game. Opinions may differ whether India fielded the best team from amongst the talent available at hand in the Olympic Village—there have been reports that two players whose game had been considered below standard in the earlier rounds were allowed to take the field in the final—but there is no denying the fact that Pakistan with their superior forward line beat India convincingly, though by a solitary goal. Pakistanis, having secured the match-winner, may be accused of not having played the game towards the close of the fixture; they indulged in negative tactics in the last five minutes of the play. But that is scarcely surprising. India, perhaps, would have done the same in such circumstances.

It may be of some solace that the Olympic gold medal for hockey has not gone out of the sub-continent, but how long it will remain here is difficult to say. The record of Rome Olympics contains ample evidence of the fact that some of the other hockey-playing countries are coming up well. Among these the most important are Spain, Britain, Kenya, Germany, Holland and Australia. The former two gave a tough fight to Pakistan and India in the semi-finals round and proved beyond doubt that they can be better challengers at Tokyo four years hence. The same is expected of Kenya's young players who were unlucky this time in not reaching the semi-finals stage.

It is, however, not beyond India's capacity to regain the title at Tokyo, provided the house of the Indian Hockey Federation is put in order. As the l'affaire Balkishen Singh indicates, all does not appear to be well with the I.H.F. affairs. Will the Union Education Ministry institute an inquiry into this? Balkishen Singh was among the 21 players originally chosen by the I.H.F. to represent India at the Rome Olympics. Of these Keshav Dutt dropped out at the last minute. When the team left for Rome, Balkishen Singh, to the surprise of all, was left behind at the airport, his place having been filled by Haripal Kaushik whose name had not figured in the original list of 21. And then Balkishen Singh flew to Rome, reports suggest, of his own accord. But how was his name entered for an event—3000 metres steeplchase—for which he had shown no pretentions throughout his athletic career? And how was he accommodated in the Indian camp at the Olympic Village? An explanation is called for this from the Chef-de-Mission of the Indian Olympic contingent.

The moment fell flat

This was her moment of triumph. But as she reached high to display her handiwork to proud parents, they heard the rip of fabric. This fabric was recently sewn into a pretty dress. So new was the dress that it had only been washed once! But look how it has shrunk!

If only someone had told this child's dismayed mother to look for the label 'Sanforized' on every yard of cotton fabric, this dress would not have shrunk out of fit.

Look for 'SANFORIZED' REGD TD MK *on the label*

and your clothes will never shrink out of fit!

Issued by Cluett, Peabody & Co. Inc., (Incorporated in the U.S.A. with limited liability) proprietors of the Registered Trade Mark 'Sanforized'. The use of the trade mark 'Sanforized' is permitted only on fabrics that meet this Company's rigid anti-shrinkage requirements.

For information: 'Sanforized' Service, 95, Marine Drive, Bombay-2

A Window on the World

I'D RATHER KEEP A COBRA

By

ODYSSEUS

WHY DO I work a 7 day, 56 hour week?

There are several answers. One is an urge to share with others, through the good offices of the "Eastern Economist" and other exceptionally perspicacious journals, ideas that I gather by a steady round of visits to business and industrial executives, Governnment officials, and other recondite authorities, and by a close perusal of four daily newspapers (these, for the benefit of those with ambitions to outdistance my attempts at self-education, are the "Hindustan Times," the "Times" of London, the "Guardian" of Manchester, and the "Financial Times" of London), five weeklies (the BBC's "Listener", the "Economist", the "Times Literary Supplement", "Time & Tide", "Sunday Times" and "Observer"—all of London), and six specialist publications (the Reviews published by Lloyds Bank, Barclays Bank, the Midland Bank, the First National City Bank of New York, the British National Institute of Economic and Social Research, and Political and Economic Planning). Many publishers are also good enough to send me books for review on economic and Indian subjects. Finally, I look in on my club to leaf through the galaxy of dailies, weeklies, and monthlies available there, and to exchange ideas with the men from varied walks of life who congregate there.

So to a sizable extent my burden is self-imposed and pleasurable. But I confess that I sometimes envy the British working man's five day week of 35 hours and an annual holiday of a month, instead of the fortnight, eked out by an occasional week-end that I allow myself. My basic sources of income are such that I ought to be able to afford that. What prevents me is: inflation.

A writer belongs to one of those professions whose productivity is limited. True, I have mechanised myself as far as possible. I have two typewriters, so that I can use one, while my secretary uses the other, which is a noiseless machine, so that she can rustle away without impinging on my intellectual work-flow. I have also provided her with a Lindicator—a contraption which passes one line to be copied at a time before her eyes, so that she skips nothing. Even my transport is streamlined: where others take taxis and arrive for appointments anything between ten and twenty minutes late, apologizing profusely for traffic delays, I arrive in good order and at leisure ten minutes early on my bicycle. But I cannot instal a piece of capital equipment which will enable me to keep pace with inflation by providing me with two or three brains or four or five pairs of hands and multiply my productivity.

There is a fortune awaiting the inventor of a computer which, in answer to questions, can put together an article or a book from the raw material stored inside the human brain, or of a machine enabling a writer to spray his thoughts on to paper as an industrial worker sprays paint on to the body of a car.

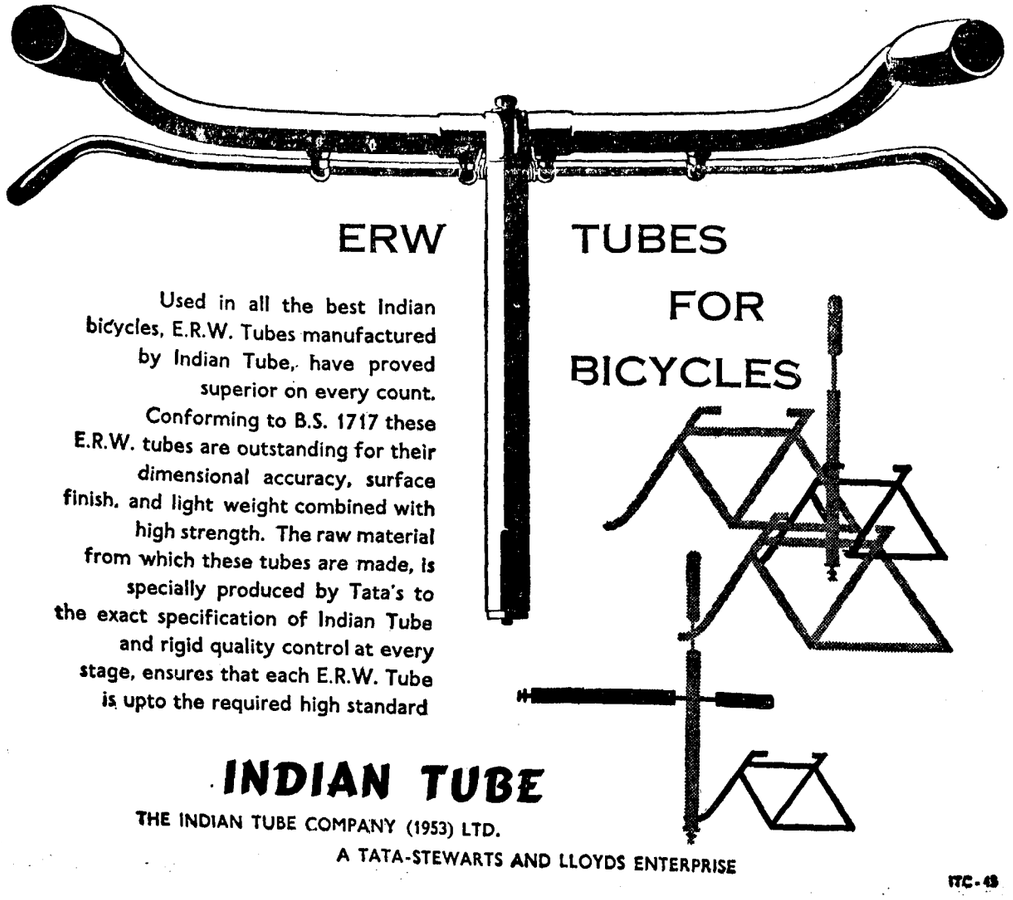
Idle fancies? When I look back on the fantastic progress that man has made in the control of nature in the last two centuries, I see no reason why some scholar of 2060 A.D. ferreting among the priceless store of wisdom laid up in the "Eastern Economist" should not be able to write an article pointing out that the wonders of science had long outdistanced my elementary imaginings.

But unless we halt inflation, I doubt that any scholar of 2060 A.D. will be in a position to write thus. Because inflation is today the greatest single barrier to the achievement of those affluent societies which all the world in general, and India in particular, are striving to attain.

DIRTY WORDS

Every country has its "dirty" words, whose dictionary meaning is smeared. Over wide areas the "profit motive" are dirty words; in the USA, "liberalism"; in the UK, "nationalization"; in Germany alone is "inflation" a dirty word. Other countries pay lip service to a stable currency, but in practice they give way to it at the slightest push. Some writers even suggest that "a little inflation" promotes progress.

But nobody would agree to "a little inflation" if they realised that even apparently a moderate increase in prices as 3 per cent a year means that the price level will double itself in 23½ years and that it will rise nearly four times over during the normal span of a man's working life (in the West). The danger that inflation will persist is not due to the minute minority who advocate it but to the difficulty of making the masses aware that its poison is far worse than that of a cobra, because whereas a cobra's ability to kill is limited to a handful of individuals, inflation can kill, and has killed, nations.



If the problem were one of spreading an understanding of an elementary point of economics, one could instruct all primary schools to teach Reading, Writing, and Inflation, and knowledge of it would keep pace with the rise in literacy. From the Indian Reference Annual, that admirable compilation issued by the Government of India's Publications Division, I see that India's literacy rate is 25 per cent among males. If one quarter of all men in India understood what in the long run it means to them that (1) the index of wholesale prices has risen from 104.6 in 1953 to 122.9 in 1960 (18.3 points, or 2.6 a year), (2) the working class consumers' index from 145 in 1952 to 168 in 1960 (23 points, or 2.8 a year), and (3) allowance is made for Rs. 550 crores of deficit financing in the Third Plan, the prospects for India's rate of economic growth would, foreign aid and other things being equal, be incalculably brighter.

TWO QUESTIONS FOR MORARJI DESAI

Will the editor of the Indian Reference Annual include in his next edition an elementary exposition of what inflation is and what it does? I doubt it because inflation is not an economic but a political problem and (doubtless being a dutiful father) he does not want to get himself the sack. Instead, he includes some question begging references to inflation in which he says that the "government continued their efforts during 1957-58 to achieve price stability which", he rightly adds, "is vital to the success of the Plan. Fiscal credit policies were further reinforced to restrain demand, particularly of a speculative character, from traders." But I suggest to the editor that (having first secured himself a job in some remote and inaccessible spot, such as Patagonia) he should look in on the Hon'ble Finance Minister and put him two questions: "Traders would not hoard goods—speculate that prices will rise—if they did not assume that prices will automatically rise. But don't prices only rise if the supply of money rises faster than the outturn of goods? Why don't you adjust the supply of money to the actual needs of trade?" After that he should take to his heels, having left himself enough time to catch the next plane out of India.

On May 6, "The Eastern Economist's" erudite leader writer, linking Mr. S. K. Patil's success in obtaining 17 million tons of food from the USA with other anti-inflationary measures concluded: "All in all one might, therefore, argue that while the Government has now in its hands ample anti-inflationary armour, a matter of fine judgment is required in regard to their actual use. Nevertheless, one can reach a conclusion that the instruments of the Government of India and the Reserve Bank have been well replenished and inflation inside the country has at last looked as though it were firmly under control." Well, since my colleague "Argus" periodically expresses his cordial disagreement with what is said in other parts of this paper, I see no reason why I should be deprived of my share of the fun, and express my distrust in our leader writer's faith in the ability of politicians to deny themselves inflation as an easy way out of their problems; he deserves an inflated reward in Hades for the tribulations that his words, endowed with all the authority of an "Eastern Economist" leader, are likely to encourage Government to impose on the rest of us during his (I hope) few remaining years on earth.

Next week, I will draw his attention to "Inflation and Society" (Allen & Unwin. July, 1960. Price 15sh.) by a leading British economist, Graham Hutton. It is written not for economists but for those capable of Reading, Writing, and Inflation. The "Times Literary Supplement" (in the only "rave notice that I have ever seen in that spectacularly unemotional journal) said on July 15: "Some public benefactor should arrange daily readings from it to Her Majesty's Ministers. No Member of Parliament should fail to study its 161 pages. A copy, suitably and respectfully inscribed, should be sent to Mr. Frank Cousins" (the secretary of the powerful British Transport and General Workers Union.) I would gladly fly to New Delhi to read it aloud daily to Mr. Nehru and Mr. Morarji Desai, but prevented by the inflated price of the air passage, I shall do the next best thing, and call their attention here to Mr. Hutton's demonstration that the basic reason why the UK's rate of economic growth has lagged behind those of the other European nations is inflation. While the real quantity of goods and services available for all purposes within the UK (after allowing for the need for additional exports) has increased by one-fifth, the amount of money in circulation has increased four times. The Macmillan government has at last faced this economic fact and has held prices since 1958. But the trouble in the UK, as in India, is that a halt to inflation automatically uncovers real values, prices, and costs—of materials, fuels, services and all kinds of labour. It unmasks economic and technical realities. This is all vital to progress and planning. But it provokes loud outcries from those now called upon to pay real prices (e.g., in rent, food, or railway travel) and from workers in occupations or firms revealed as obsolescent or inefficient by the genuine working of the laws of supply and demand, undistorted by artificially rising prices and price controls which act as additional barriers to production and to distribution. The air is rent by screams against profiteers and speculators. The resulting problems are not economic but political. They cannot be solved by politicians scrabbling after votes, but by statesmen looking to the future. In foreign affairs, Macmillan and Nehru have proved their statesmanship. They now have a chance to go down in history as statesmen in economic affairs. How you will benefit if they succeed, I will try to explain next week.

The European Scene

ATOMIC ENERGY PROGRAMMES IN THE WEST

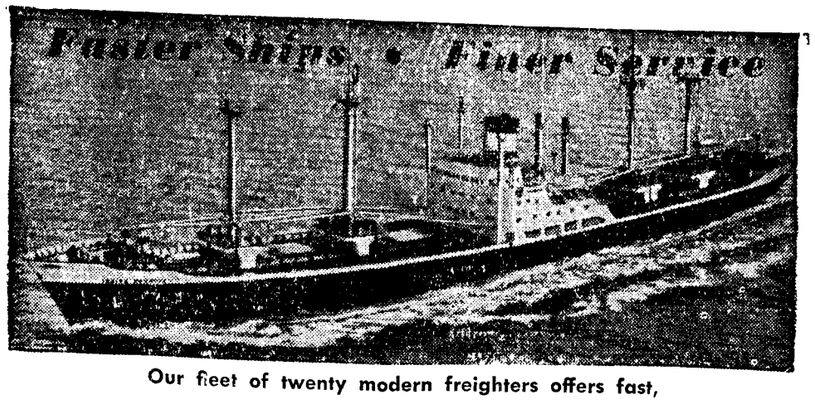
From Our Special West European Correspondent

PARIS, September 11.

THE Indian technologists whose advice is responsible for the decision lately announced by Mr. Nehru to build a series of nuclear power stations during the Trird Plan, apparently have opinions on this subject that are not shared by their colleagues anywhere in West Europe or the USA. That does not prove that they are in error. Research into the peaceful applications of atomic energy is indeed more advanced over here (especially in the USA, Britain and France where it is connected with vast military programmes), but, after all, the essence of this problem is the competitiveness of classic and nuclear sources of energy. Competitiveness depends on a host of economic factors and can vary widely from one country to another. It is theoretically possible that nuclear energy might be regarded as too expensive throughout the West but might be seen as an economic proposition in India, provided one makes very pessimistic estimates of the future evolution of marginal costs in the classic power-generating industries there. In that case, the discussion comes down to a comparison of classic power costs in India and the West, for the Indian technologists can scarcely claim to be able to produce nuclear power that is absolutely cheaper than that available abroad. Their curve for the probable evolution of nuclear power costs must be the same as that drawn in the West, and in fact it is almost certainly higher since all industrial costs are lower in this branch in the advanced economies. So the only justification they can give for the decision to which they have invited the Indian Government is that the rising curve of classic costs will, in the Indian case, intersect the falling curve of nuclear costs much earlier than elsewhere.

If that is so, they are drawing their arguments from a field in which, as atomic scientists, they are not especially competent: namely, the economics of classic power generation, and specifically the hazardous business of forecasting marginal costs in that industry over the next five or ten years. They are thus exposed to making errors at least as serious as those made by European atomic scientists five years ago, when they forecast the intersection of the classic cost curve and the nuclear cost curve for around 1965. That date has now been pushed back to 1970 at the earliest, and to 1990 by some experts—whereupon of course it is no longer a rational calculation but just a guess, because no one can pretend to foresee the evolution of costs in four or five competitive industries for so far ahead. The point to notice is that the West European scientists went wrong in the 1950's not so much because of mistakes about the development of nuclear energy generation (though they have had grave disappointments there) as because of errors in forecasting the economic behaviour of the classic industries with which it must compete. Naturally, they could not foresee the vast expansion in coal and oil supplies that has occurred in the past few years, the fall in oil prices caused by this excess and by Russian competition, the slump of shipping freights, the development of pipelines for the transport of oil, coal and natural gas, nor the slowing up of demand for power of all sorts caused by the mild recession. Those circumstances were sufficient to invalidate all forecasts about the date at which nuclear power would become competitive, but we cannot blame the atomic technologists for not predicting them. More serious, they failed to see the effects of technological improvement, keen competition and lower raw material costs on the price of electricity generated by classic means.

The nuclear power enthusiasts have assumed that, fortunate accidents apart, there is a chronic tendency for this price to rise. The facts have shown that, quite apart from the windfall of cheaper coal and oil, there is no such secular trend. The relative price of electricity has been held steady and now, with a long period of competition in oil production just beginning, it will probably remain so. Thus the date at which atomic energy becomes economic will not be set by the intersection of a rising and a falling curve, but by the moment at which the falling curve of nuclear power costs comes down to the level of stable classic cost. Since the atomic scientists have run into technical difficulties (quite apart from economic problems such as the cost of raising money for their capital-intensive projects), their curve is falling much more slowly than they had anticipated. Hence the wave of pessimism about the near-term future of nuclear energy described on this page on February 19.



Mr. Nehru's scientific advisers might brush all this aside as relating only to economic conditions in the West, whereas the Indian situation is so radically different that a firm and near date can be set for the appearance of economic nuclear energy. Granting that claim, however dubious, there remains the stark contrast between the nuclear energy programmes of India and the advanced Western countries: India contemplates the construction of a series of nuclear power stations of the same sort, whereas no Western country would today consider such a programme. All of them are building nuclear power stations, but never two of the same kind—for the simple reason that they have realised that nuclear power generation is still very much in the experimental stage and it is too early to put many eggs in the one basket. The British, who led the way in 1955-57 with an ambitious programme that has since been drastically curtailed, express this by saying that their plan is no longer quantitative but qualitative. Instead of building a string of stations along the same lines more or less simultaneously, they have decided to spread out their projects over time so that each successive venture benefits from the lessons, not only of the previous British undertaking, but of all the experiments now being made by Western countries in this field.

There has occurred a complex division of labour among all the entrants, with the British continuing to explore the possibilities of natural uranium, the Canadians concentrating on a heavy-water reactor, the Continentals united in Euratom following certain lines of their own, and the Americans spreading their ener-

gies over no less than eight different ten-year projects mostly based on the use of enriched uranium. All of the participants in this varied research programme are confident that sooner or later nuclear energy will be produced at prices competitive with classic electricity. But none of them are bold enough to make predictions about when that will happen, nor to pretend to know in advance which of the many different avenues being explored will lead to that goal. They regard their co-operative undertaking as a series of immense experiments, and you will find no Western Government ready to write into a national development plan or economic forecast the dogmatic assertion that such-and-such a quantity of power will be generated by such-and-such means in the year so-and-so.

If the statement that India will produce one million kilowatts of nuclear power by the end of the Third Plan is a firm economic target like the objectives set for other industries, then it is of a sort that no Western Government would accept in the present state of expert opinion. If, on the contrary, it is intended that the nuclear power station at Tarapore in Maharashtra should be India's contribution to the many-sided research effort now in progress, it would of course be welcomed by the European experts—who would naturally leave it to India to judge whether she can afford to make that contribution at this stage of her economic development. The Euratom scientists concur in the recent judgment of the US Atomic Energy Commission: nuclear power is for the future and meantime all projects must be purely "qualitative" or experimental. Toward the end of this decade, a selection will be made among the various lines now being explored, according to which have shown themselves to be more economic. Then and only then will it be time to pass on to "quantitative" development, i.e., to choose the most suitable form of nuclear power generation and expand it for economic purposes.

In the second half of the 1950's the British nuclear power programme was regarded as the model by the other West European Governments, and the six-nation Euratom hastened to write an ambitious plan along the same lines. But today, both the Euratom plan and its British model have been virtually scrapped, and the European nations see the course chosen by the Americans as ideal, though they cannot afford to imitate it. The Americans have allocated credits totalling $2,500 million (complemented by private investments) to a research plan that is spread over ten years and divided among eight quite different sorts of project, of which the most serious contestants are the Pressurised Water Reactor, the Boiling Water Reactor, the Organic Moderated Reactor and the Breeder. The cost of electricity generated in a conventional power station today is about 7 mills (i.e. seven thousandths of a dollar) per kwt-hour. If nuclear power stations were to be built now using these eight different types of reactor the cost of a kwt-hour would vary between 9.3 mills at the lowest (that is, 30 per cent dearer than conventional power) and 12.5 mills. The Atomic Energy Commission has, in effect, set the eight contestants on a race to see which can get down to the figure of 7 mills first. Unable to finance similar competition, the West European nations are entering their own starters in the same race, each concentrating on one or two projects or pooling their resources for a joint project. There is a considerable difference between this approach to the future of nuclear energy, and the assumption that large sums can now be committed to investments in a series of reactors of a given type, as part of a national development plan.

TOP MANAGEMENT

WILL WISH TO LISTEN TO THIS

All over the world, Insurance protection for employees while in service and satisfactory benefits on retirement have become accepted features of sound business management. Life Insurance and retirement incomes are indeed being regarded as a primary need as essential as food, clothing and shelter.

Progressive employers in our country are realising that the introduction of such employee benefits results in improved employer-employee relations, higher efficiency and increased production. An ever-increasing number of prudent employers are adopting the Group Insurance and Superannuation Schemes—employee Insurance and retirement schemes streamlined and perfected by the Life Insurance Corporation of India.

Today top management wants to know what exactly these Schemes can do for them, what the financial implications are likely to be and what precisely is the nature and scope of the benefits offered.

Broadly, the Schemes fall into two categories:

Group Insurance Scheme: offers low cost Life Insurance coverage on a Group basis to employees and gives real security to their dependants.

Superannuation Scheme: provides a source of steady and life-long pension to employees after their retirement (with or without Life Insurance cover).

Some features common to both Schemes are:

1 They can be instituted without any extra cost to the employer

2 Employers' contributions to such Schemes are allowed as normal business expenses for the purpose of income tax

3 Most of the administrative work with regard to these Schemes is done by the Life Insurance Corporation of India

Special features of Group Schemes:

1 For groups of prescribed size, attractive reduction in premium rate is allowed

2 All the members are covered under a single Master Policy

3 Flexibility—the benefits can increase from year to year.

The Group and Superannuation Schemes create a new atmosphere of employee loyalty and a sense of gratitude. They operate like a voluntarily organised Social Security Insurance in miniature.

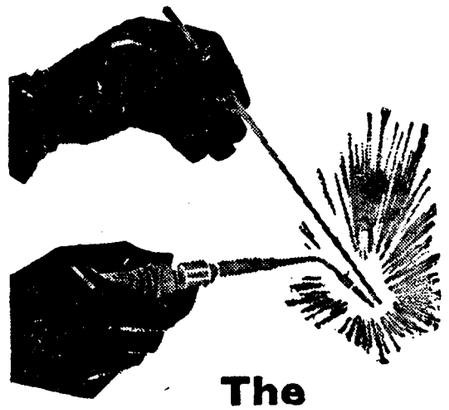
Please let our Group Representative come and explain the details to you without any obligation whatsoever.

There is no substitute for LIFE INSURANCE

Economic Report from the U.S.

FOREIGN AID

By GUY SIMS FITCH



WASHINGTON, Sept. 7.

IT has become the fashion to describe last August's special session of the U.S. Congress as a sort of fore-runner to the election campaign, and as largely unproductive of major legislation. To those interested primarily in domestic developments, this latter description may have a certain validity. From the point of view of foreign economic policy, however, the situation is very different. In this field, the record made during the special Congressional session has emerged as highly productive indeed. One need look only at the appropriation voted for the Mutual Security Programme, which embraces several key elements in U.S. assistance to other countries. When the Congress recessed its regular session last July, the House of Representatives had voted $3,500 million in foreign aid, a good $600 million less than President Eisenhower had requested. When Congress returned for the brief August Session, the two chambers brought the enactment of an appropriation measure calling for well over 700 million, one of the largest aid appropriations of recent years and a full $800 million more than had been appropriated the previous year.

Throughout the August deliberations, it was clear that foreign aid opponents in Congress had little chance of success in their efforts to cut the programme back to any significant degree. As a matter of fact, in a last-minue effort, aid supporters even managed to increase the original compromise by an additional few million dollars. This alone would have been sufficient to render Congressional handling of foreign aid specially gratifying this year. There were, however, other signal achievements, in the form of special aid authorizations urgently requested by President Eisenhower. One was the $100 million aid package to help the U.N. put the Congo back on its feet. The other was the very important Latin American aid programme, for which Congress authorized the full $500 million request, plus $100 million for earthquake reconstruction in Chile. Action on the large Latin American programme is particularly significant in the light of the economic conference that began in Bogota, Colombia, on September 5, under the auspices of the Organization of American States (OAS). With the Congressional authorization in hand, U.S. Under Secretary of State C Douglas Dillon and members of the U.S. delegation, were in a position to talk frankly and concretely about the projected new approaches through which the United States plans to assist the Latin American nations in their efforts to improve the lot of their peoples.

This new Latin American programmes goes beyond the usual development aid into such realms as housing, land reform and social as well as economic improvements. Exactly how it will be administered, and what parts will be played sufficiently by such agencies as the OAS. the U.S. Development Loan Fund (DLF), and the projected inter-American Development Bank, are details that still must be decided. But the $900 million authorization provides a sound basis on which discussions can be held and joint planning can start. This programme, of course, is visualized not as a substitute for, but rather as a complement to, the economic development projects financed by such U.S. agencies as the DLF and the Export-Import Bank. It thus represents another move in the far-flung and continuing U.S. effort to accelerate economic progress around the world, while recognizing the special ties which have marked U.S. relations with its Latin neighbours — witness the long standing and constructive activities of the OAS.

A breakdown reveals that $48,000 million, has gone into economic aid and $26,000 million into military aid while $5,000 million has taken the form of capital subscriptions to such United Nations bodies as the World Bank and the International Monetary Fund. Now, the appropriation of another $3,700 million for the fiscal year ending next June 30 guarantees that there will be no lessening of the aid programme. In fact, the United States has been urging other industrial nations, themselves the past recipients of U.S. economic aid, to step up their development assistance in line with their current capabilities. The creation of the new organization for Economic Co-operation and Development (O.E.C.D.) in which the United States and Canada are associated with the free nations of Western Europe, is one important step in this direction. It is no wonder that the United Nations, in a special report made a few weeks ago credited U.S. leadership for helping the world to understand the needs of developing nations, and for helping to expand the flow of public development capital. This flow, the report noted, has been "clearly a major element in the economic development."

The breath of industry

Oxygen—feeding the flame that knifes through steel, welding enormous broken castings and bubbling through molten metal to make pure steel—the flow of Oxygen in modern industry never ceases. From tiny workshops to the great steel plants and shipyards, wherever there is metal to be worked, Oxygen is on the job.

INDIAN OXYGEN LIMITED *Twentyfive Years' Service*

IOAX-778

WORLDGRAM

India

Exploring Oil in Rajasthan: It is now revealed that Standard Vacuum Oil Company has submitted proposals to the Government of India for exploration of oil in the Jaisalmer area of Rajasthan. This follows the official statement in the Lok Sabha recently that the Government of India was at present studying the proposals submitted by a foreign oil company for exploration in the Rajasthan area. The proposals were submitted in response to the Government of India's appeal to foreign oil concerns to engage in the research for oil in India.

*

Further Assistance to Nepal: Under agreements signed between the Government of India and Nepal, Nepal will receive a grant of Rs. 91.5 lakhs for its economic development. This amount will be available for utilisation up to March 31, 1966. The agreements were signed in Khatmandu on August 31, 1960. The fields in which the grant assistance will be utilised are: development of horiticulture, Rs. 25 lakhs; vetrinary services, Rs. 25 lakhs; forestry, Rs. 15 lakhs; Engineering school, Rs. 8.5 lakhs; and industrial estates, Rs. 18 lakhs. The present assistance is an addition to the aid of Rs. 10 crores (also a grant) already given to Nepal by the Government of India for use in various fields like construction of roads, Trisuli Hydro-electric Project, Irrigation and Water Supply Projects, Local Development Works, Establishment and Maintenance of Maternity and Child Welfare Centre and Community Projects etc.

*

Allahabad Agricultural Institute: The Allahabad Agricultural Institute has been a poineering institution in the field of agriculture. From a very humble beginning in 1910, the Institute has grown into an important centre of agricultural teaching, research and extension. It is commemorating 50 years of service this year. This includes a week of celebrations in October 1960 (23rd to 30th).

*

Electricity Output in May 1960: The total electricity produced by the public utility power stations in India in May 1960 was 1,380.7 million kwh. of which 1,119.4 million kwh. were sold to ultimate consumers. Corresponding figures for May, 1959 were 1,239.2 million kwh. and 999.4 million kwh. and for May 1951, these were 503.5 million kwh. and 404.9 million kwh. respectively. These figures indicate an annual increase of about 11 per cent in electricity production. The statistics for May, 1960 are based on 850 returns received from the public electricity supply undertakings.

*

Newspapers in India: About 7,650 newspapers and periodicals are being published in India in English and Indian languages. In 1959, there was an increase of 10 per cent in the number of newspapers and periodicals and 11.2 per cent in their circulation, as compared with the previous year. The largest number of newspapers, about 20 per cent, are published in English. About 19 per cent of the newspapers are published in Hindi, 9.2 per cent in Urdu, about 7 per cent in Gujerati, 6.6 per cent in Bengali, and 5.2 per cent in Marathi. Newspapers in other languages account for less than 5 per cent each. About 11 per cent of the newspapers are bi-lingual or multi-lingual. Hindi newspapers are published in all States except the Union Territories of Manipur, Tripura and Andamans. The number of dailies, published in different languages is 491. Their total circulation is about 47 lakhs. Nearly 2,080 monthlies with a total circulation of 56 lakhs, are also being published. In 1959, 42 newspapers had a circulation of over 50,000 each — 10 of them with a circulation of over 1 lakh. Among the latter are a Tamil daily, a Tamil tri-monthly and a Hindi monthly. There are 98 newspapers with a circulation ranging between 20,000 and 50,000 each. Per lakh of population, 2.1 newspapers are being published in India. Language-wise, the proportion is the highest in Gujerati — 3.2 newspapers per lakh of population. For every thousand persons in India, the number is the highest for Tamil, 82.2. Taking daily papers separately, for every thousand of population the distribution of their copies is 12.1. Comparable figures for some other countries are: United Kingdom 573; Sweden 462; Finland 420; Japan 409 and the United States 337. About 45 per cent of the newspapers are owned by individuals, 29 per cent by societies and associations, 7.7 per cent by Joint Stock Companies, and 8.2 per cent by firms and partnerships. The share of Government publications is 5.4. Three of the dailies are owned by co-operative societies. The first newspaper in India was published in Calcutta in 1780, called 'Bengal Gazette' or 'Calcutta General Advertiser.'

United Kingdom

Funds for Colonial Development: Britain provided the record sum of £25,500,000 in the last financial year for development and welfare schemes to benefit overseas territories. Provisional figures were announced the annual return of schemes made under the Colonial Development and Welfare Act by the Secretary of State for the Colonies. The return covers the period April 1, 1959 to March 31, 1960. Issues from funds for development projects in overseas territories made during the year by the United Kingdom Government reached the total of £24,115,000 with a further £1,470,000 for research. These figures bring the total sum issued since April 1946 to £200,604,770, of which £184,642,442 was for the development and welfare and £15,962,328 for research. Commitments undertaken during the year totalled £33,001,222 for development projects and £2,370,000 for research.

U.S.S.R.

Finland to Build Ocean Going Tankers for Soviet Union: A contract under which Finland will build 8 ocean-going tankers for the Soviet Union in 1964-65 was signed recently between the Soviet: "Sudoimport" Agency and the Finnish "Rauma Repola" joint stock company. The new order represents an extension of the contract concluded in May 1960 during the fourth Finnish Industrial Exhibition in Moscow. An understanding was reached then on the supply to the U.S.S.R. of 15 ocean-going tankers in 1961 and 1963. The contracts were concluded within the framework of the Third Five-Year Agreement signed in the autumn of 1959 in Helsinki.

*

Assistance to Syrian Region of U.A.R.: The Soviet Union will render technical assistance to the Syrian Region of the U.A.R. under the terms of a protocol signed recently. The protocol provides for technical assistance in the construction of a nearly 770-kilometre long Kamyshli-Aleppo-Latakia railway line through a pass, a nitrogen fertiliser plant with an annual output capacity of 1,10,000 tons of ammonium nitrate, a lubricacating oil plant with an annual output capacity of 25,000 tons and other projects essential to the economic development of the Syrian Region of U.A.R. The protocol also provides for an increased scope of geological prospecting for oil and other minerals.

Yugoslavia

Wheat Becoming Yugoslavia's Most Important Export: According to preliminary figures issued by the Federal Institute of Statistics, 4,27,000 wagonloads of wheat and rye have been produced in Yugoslavia this year. Out of this, 15,000 wagonloads will be available for export. According to the plan of long-term development, the production of wheat will be constantly rising in Yugoslavia, so that in the foreseeable future one of the largest passive items in Yugoslavia's balance of payments will become one of the most important figures in her foreign trade. Five years ago, wheat imported accounted for two-thirds of Yugoslavia's balance of payment deficits.

*

Work in Ship-building Industry to be Expedited: A Yugoslav scientist has constructed an instrument which makes it possible to work out the most important ship-building elements, such as displacement, stability at large inclinations, buoyancy, rolling etc. in a few hours. Experts think that the instrument will be of great significance in industry as it now takes 15 to 30 days to work out these elements. Both Yugoslavia and foreign ship-builders are greatly interested in the instrument which has been named "ship analyser." Its first prototype will be built at the Institute in co-operation with the mathematical department of the Institute for Nuclear Science.

Belgium

Belgian Locomoives for the Sudanese Republic: Following a tender in which the world's principal constructors competed, the "Societe Anonyme Cockerill-ougree" of Seraing was recently awarded a contract for the supply of 15 Diesel-electric main-line locomotives to the Sudanese railways. The locomotives under order are of the streamlined twin-cabin CC type, weighing 100 tons and developing 1,850 h.p. The electrical transmission parts are to be built by "Ateliers de Constructions Electriques de Charleroi" (A.C.E.C.). This large order is to be fulfilled within 13 months.

Malaya

New Battery Plant: Malaya's first factory for the production of batteries for radios and motor vehicles was opened on July 9, by the Minister of Commerce and Industry at Petaling Jaya, Kuala Lumpur. The new firm of Century Batteries (Malaya) Ltd. with $M1.5 million capital, is a subsidiary of the well-known Century Storage Batteries Company Ltd., of Australia, and will produce batteries of identical quality under the same trade mark as the parent company. Malayans have subscribed 45 per cent of the total and the Malayan Government has granted the company pioneer status, which gives them tax exemption for the first five years. The initial capacity of the factory is 50,000 batteries a year with a potential of 80,000, sufficient to meet the demands of Malaya, Singapore and neighbouring countries.

Israel

Exports in July: Israel's exports is July totalled $13.4 million, a rise of 25 per cent over the $10.7 million recorded during July of last year, the Central Bureau of Statistics and the Ministry of Commerce and Industry announced recently. The Ministry's spokesman added that the rise was mainly in industrial goods. In the January-July period exports totalled $134.6 million as against $113.6 million in the same period last year. Of this sum citrus fruit brought in $41.4 million compared to $40.6 million last year.

EEC

Main Agricultural Areas of the EEC: A special survey on agriculture in the Common Market countries has recently been undertaken by 2 international organizations: The Organization for European Economic Co-operation and European Economic Community. A detailed analysis is given of the agricultural areas such factors as natural conditions, density of agricultural population, farms structures, soil utilization, stockbreeding, yields, etc.

162514

I.F.C.

Investment in Mexico: The International Finance Corporation has announced a commitment to invest U.S. dollar 280,000 in Acero Solar, S.A. of Mexico for an expansion chiefly for the manufacture of high speed twist drills. Total cost of the project is estimated to the U.S. $640,000 equivalent. The IFC investment will be in unsecured dollar notes bearing 7% interest payable in dollars and maturing between 1964 and 1970. IFC will also receive a right to participate in profits. IFC's commitment is subject to completion of the necessary legal formalities.

FAO

Aid to Produce Vaccine to Fight Horse Sickness: An emergency allocation of $107,000 has been made by the Food and Agriculture Organization to combat the African horse sickness which is killing tens of thousands of work animals in the Near East and India. The use of contingency funds had been authorised by the United Nations Technical Assistance Board and this would enable the organization to help countries which wish to produce vaccines against the disease.

U.N.

World Industrial Output: The twenty-year period 1938-1958 was marked by profound changes in the distribution of world industrial output among the regions of the world, according to statistics compiled by the United Nations. As a consequence of World War II, Northern North America (the United States and Canada) replaced Europe as the prominent industrial region of the world, 'Patterns of Industrial Growth, 1938-58' shows. North America accounted for 39 per cent of world mining and manufacturing production in 1938, when Europe contributed 46 per cent of this output, the publication reveals. In 1958, however, Northern North America produced 47 per cent of world industrial goods while Europe produced 38 per cent of this total. The position in world industrial output of other regions—Latin America, Asia, Oceania—did not change materially during the 20-year period. Eacn of these regions accounted for a relatively small part of the world industrial product in both 1938 and 1958. The contribution of Asia to the volume of mining and manufacturing activity was about 7 per cent in 1938 and 1958. Corresponding figures for Latin America were about four per cent in 1938 and close to five per cent in 1958.

NEWS IN BRIEF

INDIAN

Accordig to information available from the State Governments a total number of 8,873 village were electrified up to March 31, 1959. The expenditure incurred in this regard was Rs. 5,012.67 lakhs.

*

In a written reply to a question, the Deputy Minister of Agriculture said in the Lok Sabha that no subsidy as such was being given by the Government of India to the State Governments in respect of foodgrains issued from Central stocks. The issue prices fixed for issue of foodgrains from Central reserve, however, included an element of subsidy.

*

The entire sugar produced during 1959-60 was likely to be sold and despatched by factories by February, 1961 and the finalisation of accounts would take a few months thereafter. The sugarcane growers would be entitled to get the additional cane price due to them after accounts for this season have been finalised.

*

The Minister of Industry, Mr. Manubhai Shah, revealed that Messrs. Technoexport of Czechoslovakia had submitted towards the end of March 1960 for the consideration of the Government of India a preliminary project study in respect of the Heavy Machine Tools Plant.

*

The steady progress in the number of Indians employed on salaries of Rs. 1,000 and above by the foreign-owned companies in India was reviewed recently. Detailed examination had shown that the share of the Indians in the salary group of Rs. 1,000 - 1,500 had risen from 55.7 per cent in 1954 to 88.7 per cent in 1959. In the salary group of Rs. 1,501 - 3,000, the rise had been from 23.6 per cent in 1954 to 55.4 per cent in 1959

*

The Minister for Safety in Mines, U.S.S.R. and the Soviet Embassy in New Delhi, have been requested to supply particulars about the new device called 'Geophone' capable of forecasting, at least six hours in advance, a blow-out of coal and gas in mines.

*

The proposal for enacting Legislation to constitute a Manganese Labour Welfare Fund has been deferred till the export of manganese ore increases and the price of ore stabilises.

*

The Government of India have accepted the Tariff Commission's recommendation that protection to the Engineers' Steel Files Industry should be continued for a further period of three years up to December 31, 1963, on a reduced rate of protection duty of 35 per cent ad valorem.

*

At present about 56,000 workers in Delhi are covered by the Employees State Insurance Scheme. Eighteen dispensaries, 12 whole-time and 6 part-time, have been opened under the scheme. The number of factories in Delhi, which have been exempted from the operation of the scheme, is 47.

*

As a measure of export promotion, the Government of India propose to grant drawback of duty on certain varieties of tin plate products at the rate of Rs. 276.50 nP. per ton of tin plate content and on petrol pumps and gas plants on brand basis.

FOREIGN

The Japanese Ministry of Trade announced recently that it had decided to liberalise the imports of 257 minor items, effective from October 1. They came under the categories of pig iron, machinery, chemicals, ceramics, rubber articles, construction materials, sundries, textiles, paper and minerals.

*

The export of Holden cars since January 1 totals 6,200 and the figure for the full year is expected to reach 12,000 earning Australia £A6 million in overseas exchange.

*

The Benelux countries and Japan will accord each other most-favoured nation treatment and observe the principle of non-discrimination on imports, under an agreement signed in Tokyo on July 16, details of which were released recently.

*

The Tanganyika Government intends to do everything it can to expand the industrial sector of the economy and to encourage foreign investment.

*

Imperial Chemical Industries has signed a patent licence agreement with Montecatini of Milan for the exclusive production in the U.K. of staple fibres, filament yarns and textile monofilaments from polypropylene.

*

According to data furnished by the Netherlands Central Bureau of Statistics, in 1959, 80 new industrial enterprises were started employing 2,108 persons on December 31, 1959.

*

A somewhat tenuous 6 per cent increase in coal production has been brought about by Canadian collieries so far this year, thereby reversing a 10-year trend.

*

A new oilfield — Israel's second — was discovered recently when the Johnson stem test at well Negba 3 revealed a seven-foot layer of exploitable oil-saturated sand at a depth of over 5,000 ft.

*

It is reported pressure has been revived in West Germany to cheapen imports by a revision of tax procedure. The Economic Ministry would like to waive, at least temporarily, the turnover compensation tax on finished goods.

*

More German companies have announced plans to establish subsidiary production plants in Austria in the near future, in addition to the 23 companies which have recently started operations.

*

Fifteen countries including Britain, the U.S. and the Soviet Union, will exhibit at the 19th International Fair in Bulgaria. Other exhibitors would be Communist China, Czechoslovakia, India, Poland, West Germany, France and Yugoslavia.

*

During the first five months of this year, Italian exports to the U.K. increased by 40 per cent to £40.2 million. Italian imports from Britain also increased, but less markedly, to £37.5 million.

Special Article

THE FOREIGN TRADE GAP: 1958-60

DURING the first half of 1960, India's exports (including re-exports) at Rs. 301 crores registered an improvement of Rs. 35 crores only over the corresponding period of the previous year. This has no doubt resulted in narrowing the trade gap to a certain extent, but the size of the gap in trade at Rs. 158 crores for 6 months has continued to be unduly large. It has naturally caused much concern in New Delhi during the last fortnight. A scrutiny of the export figures has revealed that there are two basic reasons for this slight improvement in exports. In the first place, there has been an increased volume of trade with the communist countries which has partly assisted in raising the level of export earnings. In the second place, the terms of trade have improved in India's favour and have increased the money value of exports without any substantial increase in the volume of exports.

Table I below shows the figures of imports, exports and balance of trade for the complete years 1958 and

TABLE I

* Includes Re-exports.

1959; it also sets out a comparison of the figures for the first half years of 1959 and 1960. The last column in this table indicates that except for the communist countries, the gap continues to be unfavourable to India in the case of almost all the major groups of countries. The gap with the Common Market countries at Rs. 69.1 crores was slightly lower than the gap at Rs. 82.1 crores registered in the corresponding period last year. In the case of the Little Free Trade Area, the adverse balance rose from Rs. 24.6 crores to Rs. 37.0 crores. This was also the case with the Commonwealth countries. It was only in the case of the communist countries that the balance of trade was favourable and increased from Rs. 2.8 crores to Rs. 13.7 crores. Amongst the communist countries which contributed significantly to the favourable trade gap were the U.S.S.R., Poland, China and East Germany. Amongst the Commonwealth countries, Canada, Australia, Aden and Ceylon also indicated favourable balances of trade, though the Commonwealth group of countries as a whole continued to exhibit an unfavourable balance of trade.

It may be stated that while the balance of trade continued to be unfavourable, the export earnings from the Little Free Trade Area showed improvement. This was also the case with the Common Market countries and the U.S.A. Here, the increased earnings were due, in the main, to the improved terms of trade. It means that India's exports to these countries were now fetching higher prices than a year ago. Confirmation of the improvement in India's terms of trade was obtained from 2 leading export commodities on India's export list. These two commodities were tea and hessian cloth. The average price of tea earned in the first 6 months of 1960 was Rs. 2.69 per lb. as against Rs. 2.51 per lb. in the same period last year, thus recording a rise of more than 7 per cent due to higher prices. Again in the case of hessian cloth, the gain was much higher. While the average yield per ton was Rs. 1,535 in 1959 January-June, it rose to Rs. 1,707 in 1960 (January-June) thus indicating an improvement by 11.2 per cent alone.

The overall terms of trade figures, released by the Department of Commercial Intelligence and Statistics, Calcutta, are not available till June 1960. However, the figures are available for the first quarter of the current year. Table II below compares the net terms of trade month by month for the first quarters of 1959 and 1960. In January 1960, the terms of trade showed an improvement of 11 per cent over January 1959. This advantage rose to 14 per cent in February but once again dropped to only 5 per cent in March. The average improvement in India's terms of trade over the quarter has thus worked out to be about 10 per cent per month.

It is obvious that whatever little improvement has taken place in India's foreign trade earnings has not been due to any export drive but partly because of the rupee account trade with the communist countries and partly due to the fortuitous turn of terms of trade in India's favour.

TABLE II

NET TERMS OF TRADE

Haste in Steel Expansion

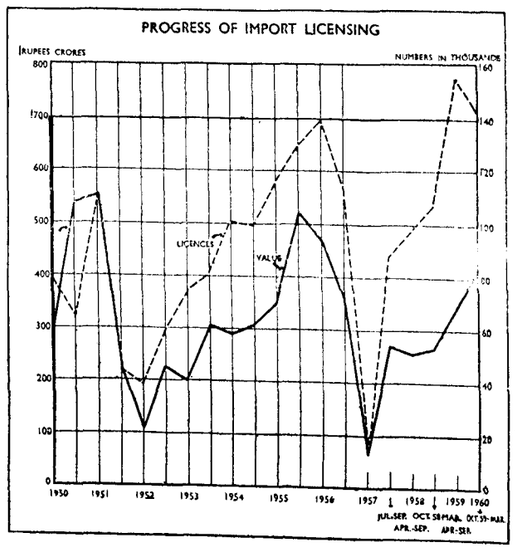
By CROESUS

WHEN people steeped with experience in steel for decades questioned the wisdom of fixing the target for steel production under the Third Five-Year Plan at 10 million tons, some time ago, the experts in the Planning Commission chose to differ, although, eventually, they did come down somewhat. What they seem to have failed to appreciate is that the expansion of steel capacity, which is inherently a slow business, will have to remain an essential feature of not one but several five-year plans and that the pace of expansion cannot be unduly hastened. Referring to the rapid and serious deterioration in the supply situation of coal and iron ore, Mr. J. R. D. Tata, Chairman of the Tata Iron and Steel Co. Ltd., in his statement to the shareholders released with the 53rd Annual Report of the Company (1959-60), has this to say: "....the difficulties which we must still overcome to get full production from expanded facilities...relate mainly to the deterioration in the quality of coal and of iron ore, to delays and irregularities in the transportation of raw material to Jamshedpur over a heavily strained railway system, as well as to the need for certain modifications and additions to the ore crushing and screening plant and to steel melting shop No. 3: Some of the remedies require action by us, others by Government."

Now this is a clear exposition of the position without any mental reservation. According to the Tisco Chairman, the difficulties are not only coal shortage and irregularities in transportation, but also deterioration in the quality of both coal and iron ore, besides the need for certain modifications and additions to the Company's plant. But the Union Minister of Steel, Mines and Fuel does not seem equally prepared even now to take the public fully into confidence. Material facts have been omitted from the statement which amounts to "suppressio veri." There is no mention whatsoever in the Minister's statement about the equality of coal, although the Railway Ministry has not been slow to refer to the inferior quality of coal, if only as a justification for its inability to provide all the 5,000 wagons needed to transport coal to the steel plants. Then, again, the Union Minister for Steel made no reference to the immediate prospects of a third blast furnace—the second blast furnace at Durgapur expected to be ready in October—also joining the two idle blast furnaces, one at Rourkela and another at Bhilai. What is significant is that, while the difficulty with regard to coal shortage was anticipated, no difficulty was anticipated with regard to iron ore. Yet the Union Minister for Steel stated that, in Bhilai, the production dropped in June and July because of the low stocks of the iron ore and poor receipts of coal. This shows that the powers-that-be manage to get into difficulties even where these are reasonably avoidable. Is it not fantastic that, even with our very large iron ore reserves, the first grade quality of which alone is estimated at about 21,000 million tons, we manage to become confronted with low stocks of ores in our steel plants?

There is another raw material, the difficulty in respect of which has yet to make itself felt. It is the shortage of good quality limestone particularly necessary for use in the open hearths, and all the public sector steel plants, excepting Rourkela which has also adopted the new L-D process, it be noted, have open hearth blast furnaces. In an address delivered to the students of the Defence College, Wellingdon, in June last, Sir Jehangir made a reference to this difficulty and said: "Supplies are by no means plentifully available in the vicinity of the steel plants, although the country as a whole has large reserves. At present, all the limestone for the steel plants is drawn from one area, the Sundergarh district of Orissa except for Bhilai, which obtains supply from a nearby quarry at Nandini. Reportedly, Durgapur is looking for alternative sources of supply in the Shahabad district of Bihar, but it will be some time before demand is actually diverted from Sundergarh. In the meantime, the scramble for good limestone is getting increasingly worse, because, although the ore could conceivably yield larger supplies, this depends on the availability of rail transportation from new quarries." In the context of this, it would not be surprising if, by the time the projected Ranchi and Rourkela railway line is commissioned, the steel plants were to experience difficulties in regard to supply of limestone as well. When warnings are uttered against going in for more steel plants, it is these and similar difficulties that provoke one to sound a note of caution.

After years of running their steel plant, the Tisco management, we are told, has now been confronted with the problem of improving the quality of iron ore despatched from its mines and of ensuring regular supplies of properly blended and sized ores to the plant. It has, however, lost no time in taking in hand a programme designed to provide a permanent solution of this problem, namely, by improving the performance of the ore crushing and screening plant, as a short-term measure, and by beneficiating the ore raised at the mines and storing and blending it before feeding it to the sinter plant and blast furnaces, as a long-term measure.



I would commend the latest annual report of the Tisco for the detailed scrutiny of Mr. Swaran Singh in order to be able to appreciate the difficulties involved in the proposed expansion of the steel plants in the public sector. By the time the expansion programmes are completed and the contemplated targets of production are achieved, there are bound to be a number of difficulties. While all would like the country's steel target to be achieved, we should bear in mind the wise words of Sir Jehangir that "the commissioning of a plant is not the same thing as bringing it to full rated production. This will take, as is borne out by the experience of steel plants all over the world, some two to three years. If everything goes well, we may expect the Second Plan target of 4.5 million tons to materialise in terms of production by the end of 1963. This is, of course, hoping for the best, but actually, it may take a year longer."

Business Notes

Foreign Trade

IMPORT LICENSING

THE FIGURES available in respect of import licensing during the Second half of 1959-60 reveal that, by and large, the object of import policy remained the same as for the first half of the fiscal year. An effort was, however, made by import control authority to adjust quotas of 93 items in a manner which would give relief and improve supplies in the case of commodities whose demand was more pressing. This was done by saving foreign exchange through the reduction of quotas of 40 items considered comparatively less essential or where indigenous production had increased. There were 53 items for which quotas were enhanced. These included asbestos packing, fractional horse power motors, garage tools, hydrosulphate of soda, gum arabic, cork manufactures, dyeing and tanning substances and bleaching powder, scientific and mathematical instruments and apparatus.

One significant feature in respect of licensing during the past two years is that the number of licenses is increasing in relation to value. This can partly be explained by the fact that the number of actual users, who account for comparatively lesser value, is on the increase. Then there are those who secure import licences against Export Promotion schemes. Apart from this, it seems that the issuing of supplementary licences too had increased. Overall, there appears to be more paper work in the licensing department than before, which does not contribute to economy in expenditure of foreign exchange. While, therefore, it is necessary that the interest of actual users and other importers are safeguarded, the department should, as far as possible, reduce complications and paper work so that delays are minimised.

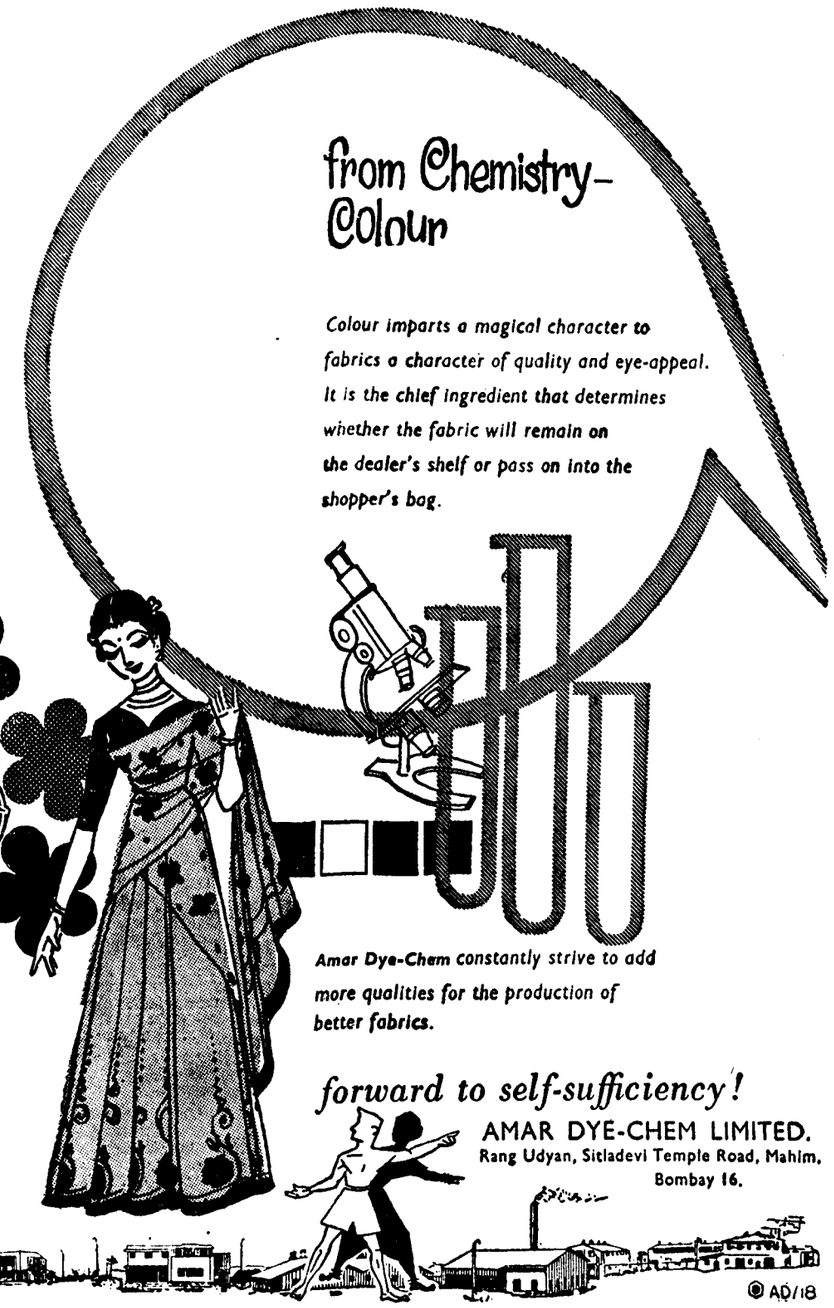
INDO-NEPAL AGREEMENT

THE INDO - NEPAL trade treaty signed the other day at Khatmandu is based, as usual, on the principle of reciprocal benefits, but Nepal has reason to be satisfied that the preponderance of benefits goes to her. The treaty will come into force on November 1. Its outstanding feature is that India will import Nepalese industrial products freely, while Nepal will be free to impose customs duties on Indian manufactures. In respect of trade with countries other than India, Nepal will be free to regulate it according to her own rules and regulations. Foreign exchange which was pooled so far with India, will now be separated and Nepal's account will be maintained in the National Rashtra Bank instead of in the Reserve Bank of India. Nepal has been accorded full transit facilities for her trade through India.

It would be interesting to note that main imports into India by land consist of wood and timber, jute manufactures, mustard and rapeseed, linseed, oilcakes, rice husked, rice unhusked, pulses other than gram and gram products etc. India's main exports to Nepal are cement, kerosene, salt, sugar, tobacco, cotton piecegoods, etc. In the twelve months ending April to March 1960, India exported to Nepal 2,43,325 maunds of cement 5,81,634 maunds of salt and 32,437 maunds of sugar refined and 27,099 maunds of manufactured tobacco. In 1958-59, cement, salt, sugar refined and manufactured tobacco exported was 199,563, 830,766, 69,029 and 38,311 maunds respectively. It will be observed that in 1959-60 while the share of cement in India's exports to Nepal went up, that of salt, sugar and tobacco declined.

This treaty serves to further underline the increasing economic co-operation between the two countries. For, in addition to the aid which India is giving of Rs. 23.8 crores, Nepal will derive considerable benefits from the Kosi and Gandak projects for her irrigation and power supply.

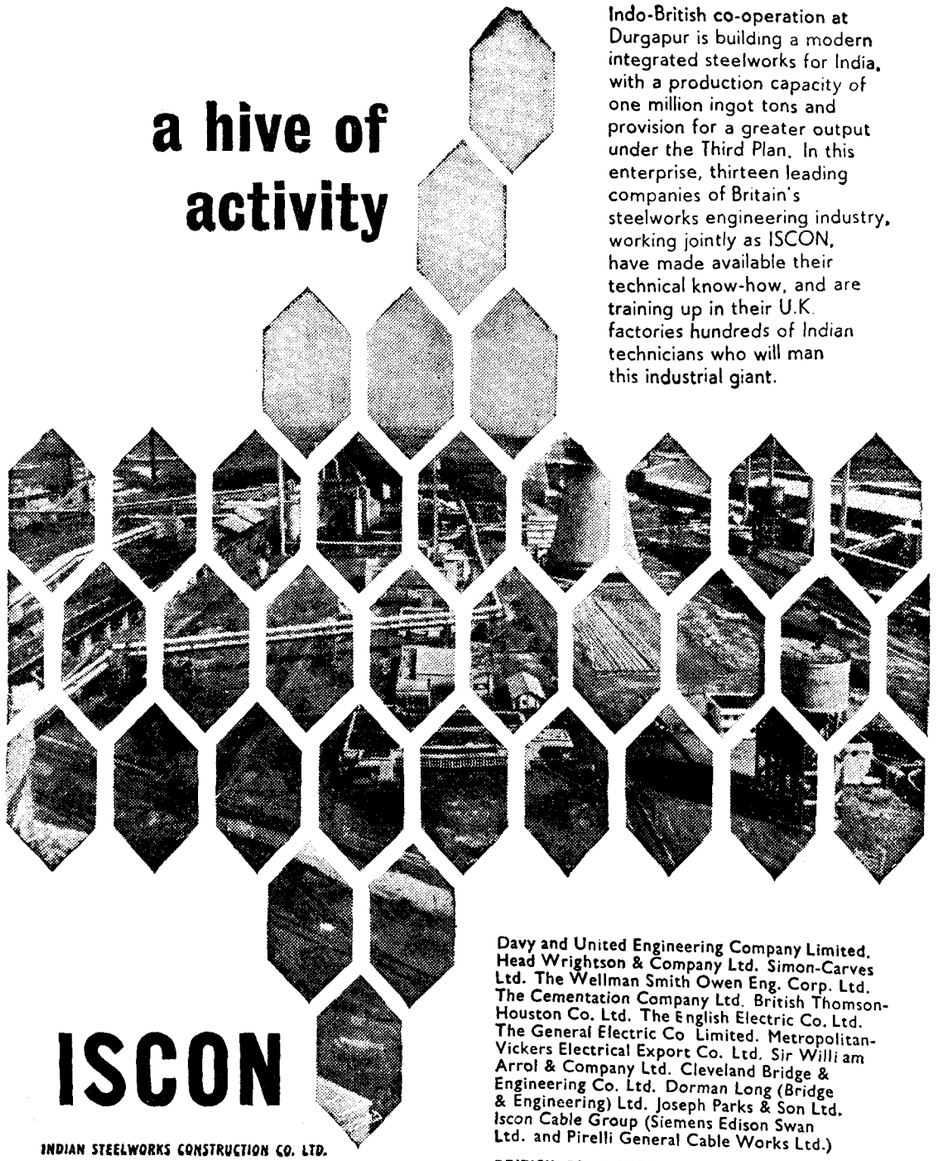
Fibres



MORE FACILITIES FOR RAYON

MR. C. C. DESAI, Chairman, Association of Man-made Fibre Industry in India, has advocated in a well reasoned plea the inclusion of Viscose Rayon and Celluiose Film within the perview of Sec. 56A of the Taxation Law (Amendment) Bill, 1960. He has suggested that the item "Man-made Fibres other than Viscose Rayon" in the proposed amendment to the above mentioned Bill be changed to "Man-made Fibre including Cellulose Film." This, he stressed, is necessary because viscose rayon retains the prime position among man-made fibres and the biggest use is for tyre-cord, the output of which saves considerable amount of foreign exchange. Viscose fibre also reduces the dependence on long staple cotton, which again has to be imported in large quantities involving a lot of foreign exchange. Viscose rayon is also cheaper as compared to non-cellulose fibre and can satisfy the demand of lower and middle income groups. Moreover, even as a source of revenue to the State it is an attractive proposition because quite recently the excise duty on rayon was raised by about 60 per cent. On these grounds, Mr. Desai has stressed that the output has to be raised which would be possible only through the expansion of present units or the establishment of new units. In either case the capital in most cases has to come through foreign institutional collaboration or participation. In that case, Mr. Desai adds, the facilities granted under Sec. 56A, if extended to Viscose Rayon and Cellulose Fibre, would greatly encourage the inflow of capital. It is to be trusted, therefore, that the Government of India will give close attention to this plea.

Re-insurance



IRC's CONFIDENT RECORD

RECENTLY THE Government decided to convert the Indian Guarantee and General Insurance Co. into a professional reinsurance body and, while announcing the

a hive of activity

Indo-British co-operation at Durgapur is building a modern integrated steelworks for India, with a production capacity of one million ingot tons and provision for a greater output under the Third Plan. In this enterprise, thirteen leading companies of Britain's steelworks engineering industry, working jointly as ISCON, have made available their technical know-how, and are training up in their U.K. factories hundreds of Indian technicians who will man this industrial giant.

PSIC 18

decision, the justification given was the need to strengthen the Indian re-insurance market. In fact, it was averred that the problem of strengthening the Indian market "was not satisfactorily solved by the establishment of the India Re-Insurance Corporation" and that it was the object of the "Indian Guarantee" to create a satisfactory re-insurance market. Those connected with the India Re-insurance Corporation, which was started only four years ago and which has made steady, if not spectacular, progress, could not very well let this charge go unchallenged. Indeed, it was expected that Mr. A. D. Shroff, Chairman of the India Re-insurance Corporation, would answer this charge. This he has effectively done in the Chairman's Statement for the year 1959 circulated last week, along with the annual report and accounts of the corporation for that year to the shareholders. In this statement, Mr. Shroff has said:

"The Corporation has made re-insurance facilities available to all companies in the Indian market on the same terms and advantages as obtained elsewhere, and a number of companies have started placing a portion of their re-insurances with the Corporation and the Corporation has also enlarged the re-insurance market by starting in its office the Re-insurance Exchange. The Corporation further made efforts to handle its portfolio of business in the most advantageous manner, and, in the short period since its formation, satisfactory progress has been made."

The latest results of working of the India Reinsurance Corporation fully bear out the claim of Mr. Shroff. Thus, in 1959, the Corporation wrote a total gross premium of Rs. 3.55 crores, as against Rs. 2.84 crores in the previous year. After taking into account the amount retroceded to members in fulfilment of its obligation, as also the premium otherwise retroceded, the total net premium income of the Corporation was Rs. 1.82 crores, as against Rs. 1.20 crores in 1958. The Corporation's net accounts show that the claims cost declined from 59.46 per cent in 1958 to 53.94 per cent; the commission cost also was lower at 33 per cent, as against 33.68 per cent in the previous year; so also management expenses which fell from 2.58 per cent in 1958 to 1.91 per cent.

FORWARD POLICY

In addition to an impressive performance, the Indian Reinsurance Corporation has increased its facultative business and placed on a firm basis its re-insurance exchange. Further, it has tackled the growing demand for guarantees in connection with hire purchase transactions in motor vehicles. The I.R.C. has also made available to its members sufficient re-insurance facilities for such guarantees, and this has been especially appreciated in view of the very limited overseas re-insurance market for this class of business. As Mr. Shroff has said, the I.R.C. has tried to save the re-insurance drain not only by improving its underwriting and by granting more re-insurance facilities to the companies in India, but also by making known in the foreign market the excellent features of the Indian re-insurance business, in particular our hull business.

The efforts of the representatives of the I.R.C. at international conferences have created a climate of understanding and brought about a better appreciation of the view-point of the Indian market in the London market. One of the immediate results that is expected to stem from this is the reduction in the rates of Indian hulls, a very large portion of which is re-insured abroad. In short, the Corporation is making all efforts to realise the objectives with which it was started, namely "to make all types of re-insurance facility available in India and to reduce re-insurance drain." Well was Mr. Shroff entitled to say, therefore, that he was unable to see how the I.R.C. has failed to strengthen the Indian market by creating a re-insurance market in the country, as alleged by official spokesmen. He also wondered how the creation of a second re-insurance company could improve the position. On the contrary, as he said, in the context of the present day trend in the insurance market, one re-insurance corporation supported by the whole industry would have served the purpose better than two corporations working separately. Yet, without even suggesting to the I.R.C. any measures that it thought fit for adoption by the I.R.C. and thereby strengthening the Indian market from the re-insurance angle, the Government has hastened to set up a second re-insurance corporation of its own. In the face of this, it was undoubtedly a significant gesture that Mr. Shroff made when he offered to the Government that the I.R.C. could always be used as a medium and went on to assure the Government the I.R.C.'s fullest co-operation.

Protection

BALL BEARINGS

THE IMPORTANCE of the ball bearing industry in the context of the rapid industrialisation of the country, is almost taken for granted. Yet Mr. K. R. P. Aiyangar, Chairman, Tariff Commission, did well to underline it while opening the public enquiry into the question of extension of protection to this industry for a further period beyond 31st December, 1960, last week. At the outset, Mr. Aiyangar traced the history of tariff protection for the industry since protection was first granted to it in 1952. According to the Tariff Commission Chief, there was only one large-scale unit in India in 1950 with an annual production capacity of 0.48 million ball bearings on a single-shift basis. Two new large units have been licensed—but the factories have yet to be established—since then, one in Poona and the other in Bombay, for an aggregated production capacity of 3.1 million ball bearings on a double-shift basis. But a small unit with a capacity of 25,000 thrust bearings per year has already been commissioned at Lonavla. In addition to this, we are told, there are 14 small-scale units producing ball bearings in the Punjab. While the figures in respect of installed capacity vary from source to source, the actual production of bearings was 1.6 million in 1957, 2.1 million in 1958, 1.7 million in 1959 and 1.3 million during the first half of 1960.

As may be expected, the demand for the products of the industry has been on the increase, but, as in respect of so many other industries, the estimates of demand vary from source to source. For instance, it was estimated at the time of the last enquiry by the Tariff Commission itself, that the demand for ball bearings up to 2" bore diameter would be 1.6 million in 1956 and that it would go up to 2.5 million in 1960-61. The Development Wing estimates, prepared on the basis of the target of the Third Five-Year Plan, on the other hand, show that the current demand itself is 4 million, while by 1965-66, the demand would shoot up to 11.68 million. Once again, therefore, the question of ascertaining the precise and the projected figure of demand faces the Tariff Commission.

The quality of the product with its vast consuming industries is said to be improving, but only slowly. Deliberate efforts are being made, such as the introduction of quality control at each stage of production, to eliminate the usual complaints of noise level in the bearings, tolerance of dimensions, shorter life of indigenous product, etc. The quality of the product may therefore be expected to improve in course of time and with the increased demand.

The same old story as in the case of many other industries is repeated with regard to the availability of sufficient raw materials for the ball bearings industry as well.

FROM THE CAPITAL'S CORRIDORS

"JANTA" CAR

THE Resolution of the Government of India on the manufacture of small (Janta) car has been gazetted. As anticipated, the Government has decided to produce this car in the public sector. An Expert Committee has been set up "to consider the feasibility of manufacturing a low-cost car within a price range of Rs. 6,500." The Government feels that the aim should really be to select, if possible, a car that will, on the one hand, be sturdy and give a really long period of trouble-free service, and, on the other hand, be available around Rs. 6,500, inclusive of transport charges, distributor's commission and taxes. This would mean that the ex-works price of the car should be around Rs. 5,000.

The Resolution further lays down that "with a view to economise in foreign exchange, an important consideration in selecting the car would be the extent to which the existing engineering facilities in the country, whether in the public sector or the private sector, could be utilized in its production."

The Ministry of Defence, which is likely to be entrusted with the manufacture of this car, has asserted that the small car which should be manufactured in this country should satisfy the following considerations:

(a) It should not cost more than about Rs. 5,000 ex-works.
(b) It should have enough room to seat 4 to 5 persons.
(c) The running cost in the shape of fuel, oil and maintenance, etc., should be low.
(d) The construction should be sturdy so that driving over bad roads and other dusty conditions does not impair the life of the car. Most small cars of today will not be able to stand out to Indian conditions of roads and usages.

It adds: "That the above conditions can be met, we have no doubt. However, it will mean very careful planning of layout and the production line as well as a high initial Indian content so as to minimise the incidence of customs duty. We feel that with the rapid extension of ancillary industries, it should be possible to commence production with an indigenous content of about 75 per cent. If the level of production is designed at 20,000 per annum, the cost can be kept down to about Rs. 5,000."

POTENTIAL MARKET

Regarding the potential market for this car, the Ministry says, "Many will question the wisdom of designing a production line of 20,000, but when one stops to think that most people are now willing to pay over Rs. 3,000 for a scooter with a delivery day of 12 months hence and that the national income is gradually increasing, there should be no room for pessimism." It has quite cleverly, coinciding with the publication of the Government Resolution, staged a demonstration of five prototypes of small cars, all following the main features mentioned above, but varying slightly in the H.P. and the available space for passengers and luggage. The object of exhibiting such a variety is to allow the potential cumtomers to make a choice between what they are prepared to pay and the comfort they desire. Two prototypes have been assembled by the Japanese firm, Nissan Motor Company, one by the Hindustan Aircraft Limited, Bangalore, another by the Technical Development Establishment, Ahmednagar, and the fifth one by Lloyd Motoren Works, West Germany. The Prime Minister who has inspected these prototypes has expressed his appreciation of one Japanese model named "Blue Bird."

COMMERCE AND INDUSTRY MINISTRY'S CONCERN

According to reports current here, the Ministry of Commerce and Industry is greatly perturbed over the queering of its pitch by its sister Ministry of Defence. It has re-invoked the blessings of the Prime Minister to own the small car manufacturing unit, promising all encouragement to the Defence Ministry to manufacture the components.

The newly set-up Expert Committee is being directed to visit Russia and Czechoslovakia with a view to examine the economies of cars manufactured in these two countries. It will not surprise New Delhi if the Union Ministry for Industry, as a counterblast to the Ministry of Defence, arranged a deal with either of these two countries. One big advantage of such a deal will be the saving in foreign exchange, any of the two countries accepting payment in Indian rupees, not only for capital equipment but also for components and technical know-how.

FORD PLANS

Meanwhile, reports from New York suggest that Ford Motors have for the first time confirmed publicly that at least part of their proposed four-seater small cars might be built abroad. Replying to the United Automobile Workers' Union, which had complained about this prospect, a spokesman of the company is reported to have said: "It (the company) has given serious study and consideration to the possibilities of using its U.S. facilities and employees for at least a substantial part of the work involved in building a competitor to the Volkswagen on the American market." This clearly indicates that the small car project of Ford Motors will probably involve some manufacture overseas.

Although the spokesman has hinted that no final decision has yet been taken on this project, a number of details of the company's plans are already known. The proposed small Ford car is tentatively named "Cardinal." Its four-cylinder engine would be in front and would drive the front wheels—the same mechanism as B.M.C. adopted for the Mini-Minor. To compete with the Volkswagen, this car would be sold in the region of $1,500 (about £570), or some $400 (£143) lower than any Ford currently on the market.

If Ford Motors go ahead with their plans to manufacture their small car in Europe, in part or completely, it would mean a major departure for the American car industry which has been hitherto content with relying on its overseas subsidiaries to supply small cars to meet the demand in U.S.A. The Ford Company has already placed some orders for parts with four U.K. companies, but the quantities are too small in relation to the company's total needs to warrant an interpretation that its proposed small car will be manufactured in Britain. The present plans are believed to involve its production in West Germany. The company's above-mentioned statement does not appear to preclude the introduction of the "Cardinal" at the rumoured time in next autumn.

"AID-INDIA CLUB" MEETING

New Delhi is anxiously waiting for the outcome of the current meeting in Paris of the "Aid-India Club."

The Union Finance Minister, Mr. Morarji Desai, had indicated in his last Budget speech that India still needed foreign exchange to the tune of Rs. 140 crores to successfully implement the "hard core" of the Second Five-Year Plan. The situation during the past three months has worsened thanks to heavier imports of raw materials like cotton and jute and increased defence expenditure. How far will the Paris meeting go in authorising credit to fill the yawning gap in India's balance of payments is the question being asked here.

As already indicated in this column, external assistance in the recent past, besides not being commensurate with the growing needs of the Indian economy, has been authorised somewhat late, necessitating financing of machinery, which was supposed to be paid for through loans or grants from friendly countries, from current export earnings. It is hoped here that steps will be taken at the Paris meeting to expedite credit authorisations in future.

Out of the 950 million dollars economic aid promised by U.S.A., Canada, U.K., West Germany, Japan and the World Bank at the first meeting of this consortium for the Second Plan period, India has been so far authorised to draw upon only 734 million dollars. The following is the break-up of this assistance in million dollars:

	Promised.	Allocated.
Canada	35	35
Japan	10	10
West Germany	123	123
United Kingdom	189	189
U.S.A.	291	165
World Bank	255	212
Total	903	734

TYAGI COMMITTEE'S RECOMMENDATIONS

More than 250 recommendations, out of a total of 367, of the Tyagi Committee on Direct Taxes have been accepted by the Government of India. This was revealed in a statement placed on the table of the Lok Sabha last week by the Union Finance Minister, Mr. Morarji Desai. The three major recommendations of the Committee which have been accepted are (1) simplification of the procedure for collection of tax from small assessees, (2) retention of the Income Tax Appellate Tribunal, and (3) withdrawal of exemption of income-tax from certain types of charitable trusts.

A number of suggestions of the Committee have not found favour with the Government. Among these the most important are (1) transference of control of the Appellate Officers in the Income Tax Department to the Law Ministry, (2) prohibiting the Income Tax Officers retiring prematurely from taking up private employment, and (3) withdrawal of the enhancement powers vested in Appellate Tribunal under other direct taxes Acts. The Committee's recommendation that the Appellate Tribunal should not be granted enhancement powers under the Income Tax Act has also not been accepted by the Government.

The Government has yet to take a decision on some of the recommendations of the Committee.

The recommendation of the Committee on simplification of the procedure for collection of tax from small assessees has been accepted by the Government in principle only. The actual procedure is yet to be finalized. The Committee had suggested that the income returned by small assessees should be generally accepted after preliminary scrutiny and that the assessment should be made under Section 23(1) of the Income Tax Act without calling the assessee to the tax office; detailed examination of the accounts and other scrutiny in these cases being made only once in four years. This new approach, the Committee opined, would have a psychological effect and improve the relations between the Income Tax Department and nearly 5 lakh assessees.

CHARITABLE TRUSTS

Regarding taxation of income of charitable trusts, the Government has decided to amend the Income Tax Act on the following lines:

(1) A charitable trust carrying on a business which is not in the course of carrying out the primary object of the trust itself should not be entitled to exemption under Section 4(3)(i) of the Income Tax Act and this should be made clear in the substantive part of the Section itself.

(2) Where a trust deed contains a clause that the funds of the trust should also be utilized for the relations and family members of the donor, or that in carrying out the charitable objects of the trust priority should be given to such relations or members, exemption should not be available under Section 4(3)(i) of the Act.

(3) As regards the other incomes of the trust, they will be exempt if the conditions under Section 4(3)(i) of the Act are fulfilled, but if more than 25 per cent of such income of a trust is set apart for being spent subsequently for charitable purposes, the amount set apart in excess of 25 per cent should be taxed in the year in which it is so set apart.

EVASION OF TAX

The Committee's proposal that the abetment of evasion of tax should be made punishable under the tax laws has been accepted, subject to the modification that for the present it is not necessary to provide for prosecution for this offence. The Government has also accepted in principle the various measures for arousing public conscience against tax evasion. These include steps to convince the tax-payers that the money collected through taxes is not spent wastefully, organising of a special drive against evasion through the co-operation of leaders in various walks of life, and the various chambers of commerce, professional bodies such as the Bar and Medical Associations and education of people about the real objects of collecting direct taxes through the press, radio and films.

Among the other recommendations of the Committee accepted by the Government are:

(a) The new scheme of taxation of companies and their shareholders, as laid down in the Finance Act, 1959, is sufficiently simple and easily workable. In order to avoid any difficulty to the shareholders, the Income Tax Department should issue exemption certificates.

(b) The Department should be provided with power to grant immunity from penal proceedings or prosecutions to those who, having abetted an offence, come forward to give evidence against an assessee.

(c) The Wealth Tax and Expenditure Tax Acts should be amended to provide both for a system of provisional assessment on the lines of Section 23B of the Income Tax Act and a system of self-assessment under which assessees would pay tax along with the returns as per their wealth or expenditure declared in them.

(d) On a question of law involved in an appeal before the Appellate Tribunal, if varying judgments had been given by different Courts, the President of the Tribunal may, on a request made to him, refer the question directly to the Supreme Court for a decision.

TAX ON GRATUITY

The position regarding taxation of gratuity has been clarified by Mrs. Tarkeshwari Sinha, Deputy Minister for Finance in the Central Government. She told the Lok Sabha last week that gratuity received by exployees in the private sector was taxable in their hands under the Indian Income Tax Act under the head "income from salaries." However, if the gratuity related to past services for a period of not less than five years, certain relief was granted to the assessee under the provisions of Section 60(2) of the Indian Income Tax Act, whereby the tax is charged at a concessional rate.

Payments of death-cum-retirement gratuity received after April 16, 1960, by exployees of the Central Government under the Revised Pension Rules and also gratuity received by employees of a State Government under a scheme similar to that of the Revised Pension Rules were "exempt" from tax under the proviso to explanation 2 to Section 7(1) of the Income Tax Act, she added.

The death-cum-retirement gratuity given by Government is part of an integrated Pension Scheme which is based on the assumption that that gratuity will not be taxable. The law has specifically been amended in order to secure this result.

METHYNOL PLANT

The question of setting up a methynol plant is to be examined again. This has been necessitated by the Messrs. BASF, of Germany, informing the Government of India that it would not be possible for them to make a turn-key offer in this regard. Early this year, this German firm had submitted a project report on production of methynol in this country, based on the assessment of demand for the commodity made by a Committee of Indian and Russian Technical Experts. While the report contained an estimate of the probable cost of the equipment required to install a complete methynol plant in India, it did not contain any quotation for the execution of the work as a turn-key job.

On the basis of the Technical Experts Committee's findings, it had been decided by the Government to set up one methynol plant in the country which could be operated for six months in a year.

HEAVY MACHINE TOOLS PLANT

The task of preparing a detailed project report for the Heavy Machine Tools Plant is proposed to be entrusted to Messrs. Technoexport, of Czechoslovakia, the organisation which had submitted to the Government of India a preliminary project study on the subject in March last, envisaging a production programme of five families of machines consisting of 17 individual items of such machines. This study has been considered by a Committee of Technical Experts of the Government of India, which, in consultation with the Czech experts, has agreed on a production programme envisaging seven categories of machines consisting of 22 individual items.

EXPORT OF SUGAR

Indian sugar is unlikely to be exported to the United States before April next year, according to knowledgeable circles here. The existing U.S. law regulating sugar imports expires on March 31, 1961. A quota for Indian sugar can be assigned only in the revised legislation which the U.S. Congress has still to consider. The chances of India getting a quota under the new law are, however, rated quite high.

There are two more technical difficulties which have to be surmounted before exports of sugar from India to the United States can be effected. Firstly, India has yet to become a member of the International Sugar Agreement. Secondly, U.S.A. generally imports brown sugar which is refined there and Indian sugar is for direct consumption. But this is not likely to stand in the way of exports being effected; Indian sugar can be further refined in the United States or it can be used as raw material in various industries.

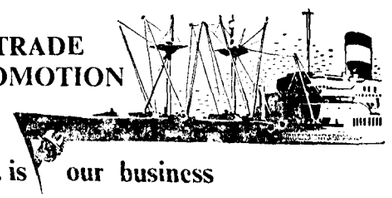
APPOINTMENT OF MANAGING AGENTS

Where the proposal for re-appointment of the managing agents has been rejected by the Company Law Administration or where the companies did not appoint their managing agents before August 15, 1960, as required under the Companies Act, the term of office of such managing agents would be deemed to have expired on August 15, 1960. This has been clarified in a statement issued by the Government last week. The statement adds that in such cases, the Boards of Directors of the companies concerned shall carry on the affairs of the company, till such time as the managing agents are either appointed again or other alternative form of management has been adopted. Where, however, it is proposed to appoint a director-in-charge, or managing or whole-time director or a director as manager or a committee of directors, the company will have to secure the approval of the Union Government to this effect.

MARINE DIESEL ENGINES PROJECT

The Marine Diesel Engines Project has been included under category (D) in the draft Third Five-Year Plan. This implies that no definite decision has yet been taken about the inclusion of this scheme in the priority list. Category (D) includes projects on which preparatory work is less advanced and for which no foreign credits have yet been arranged. These projects will be worked out in fuller detail and may, in due course, be considered for inclusion in the Plan in substitution of some other projects, or even otherwise if the necessary external and internal resources can be made available and other circumstances are favourable.

INVESTMENT CENTRE



The Indian Investment Centre, proposed to be set up in New Delhi in terms of an agreement signed between the Government of India and the United States Technical Co-operation Mission on June 20 last, will be registered as a society and will have on its governing body mainly non-officials connected with banking and industry.

JOINT STEAMER COMPANIES

It has been decided, in principal, to give a loan of Rs. 2 crores to the Joint Steamer Companies, subject to certain conditions, to enable them to rehabilitate their obsolete fleet for the maintenance of essential I.W.T. services on Calcutta-Assam route.

A CORRECTION

In this column last week we published a summary of the report of the World Bank Mission which visited India in April and May last. It was erroneously mentioned that this Mission was headed by Mr. Paul G. Hoffman. The leader of this Mission was Mr. Michael Hoffman. The error is regretted.

TRADE PROMOTION ...is our business

Australia, New Zealand, and Fiji offer opportunities to exporters and importers and the International Division of the Bank of New South Wales can help those interested.

The Bank's complete banking service includes such specialized facilities as trade and industrial enquiries, economic and trade information, and a complete travel service. The Bank, through more than 1,000 branches and agencies, is closely and constantly in touch with industry, business, and agriculture in the areas it serves.

Enquiries may be made through your own bankers or direct to

COMPANY AFFAIRS

TEXMACO'S STEADY PROGRESS

The Directors have reported that during the year to December 31, 1959, the Textile Machinery Corporations Ltd. maintained steady progress. The textile machinery division remained fully booked and the working showed an improvement. The recession which had started in the Cotton Textile Industry in 1957 was over and the cotton mills had embarked upon extensive modernisation and replacement of their plant and machinery. During the year the company booked a good number of orders for Ring Frames and Carding Engines. Development of Drawing Frames is proceeding well. These machines are being made to the specifications of the collaborators of the Company, Messrs. Howa Machinery Ltd., Nagoya, Japan. The efforts made at exports proved successful and some ring frames were exported during the year. This is the first time that textile machinery has been exported from India.

Progress of Sugar Mill Machinery and Water Tube Boiler Divisions was also maintained at a satisfactory level. The company has got sufficient orders for these products in hand. The erection work of the Radial Crest Gates at the Panchet Hill Dam and the orders from the Bhilai Steel Project were completed during the year under review. The company secured another important order for the manufacture and erection of such gates at Rihand Dam in U.P. Efforts are being made to diversify production in the Heavy Engineering Division of the company and the manufacture of Thermic Syphons for Locomotives was tried for the first time in India. The production in Steel Foundry Division of the company has improved. The major part of production in this Division was for wagons and Sugar Mill Machinery components required by the Heavy Engineering Division.

There was however a paucity of orders for jute spinning frames. The Jute Machinery Division of the company could not work satisfactorily during the year under review. The company is, however, switching over the machines to other items of production.

During the year the company had to face an acute shortage of raw materials which affected the production and the profits of the company adversely to some extent. The position, however, is improving now. The year's working shows a profit of Rs. 86.90 lakhs. After providing for depreciation, development reserve and taxation there is an amount of Rs. 32.90 lakhs for distribution. The Directors have recommended the payment of dividend at the rate of Rs. 2 per equity share of Rs. 10 each.

MUKAND IRON MAINTAINS PROGRESS

The progress made by Mukand Iron and Steel Works Limited in the past years has been well maintained during the year to 31st March, 1960. The sales have increased by Rs. 66 lakhs to Rs. 4.22 crores. This has been achieved on account of increased output of the rolling mills and higher valued production of the steel foundry. The net profit after making provision for depreciation, taxation and development rebate has risen by Rs. 2.80 lakhs. After making an appropriation of Rs. 8 lakhs for general reserve (same as last year), dividend of Rs. 1.2 for ordinary shares, and Rs. 16.86 for deferred shares has been recommended by the Directors. The dividend on preference shares has been recommended at Rs. 5 per share. Earning per ordinary share are higher at Rs. 2.34 from Rs. 2.18.

The Company has entered into technical collaboration agreements with the National Malleable and Steel Castings Co. U.S.A. and the English Steel Castings Corporations Ltd., U.K., for the manufacture of automatic centre buffer couplers. These are being made in our country for the first time. Orders for Rs. 84 lakhs for these couplers have been secured from the railways.

The implementation of expansion programme for increasing the steel melting capacity has been delayed because of the order of the State Government for acquisition of land at Kalwa near Thana being contested in the Courts. With the development of Iron and Steel Industry envisaged under the country's Second and Third Five-Year Plans, the company expects to make further progress in the years to come.

COMMODITY NEWS AND NOTES

IRON ORE PRODUCTION IN INDIA

The production of iron ore during June 1960, was estimated at 831,000 metric tons, according to the Indian Bureau of Mines. This brings the total output during the half year ending June 1960 to 5,300,000 metric tons which was higher by 39 per cent when compared to the output of 3,808,000 metric tons during the corresponding period of the preceding year. Orissa was the chief producing State with an output of 282,000 metric tons followed by Bihar with 239,000 metric tons. Mysore and Madhya Pradesh recorded an output of 152,000 metric tons and 103,000 metric tons while the output from Maharashtra was 14,000 metric tons. During the month despatches of iron ore for consumption in the iron and steel plants totalled 601,000 metric tons while the despatches to the export market were 142,000 metric tons.

TWO LAKH TONS OF SUGAR RELEASED

The Government of India has decided to release two lakh tons of sugar. There will be no release for free sale from the factories in Uttar Pradesh, Bihar and Punjab except a small quantity which will be released to each factory for sale to its employees. Allotments of sugar to Madhya Pradesh, Rajasthan, Uttar Pradesh, Bihar, West Bengal, Orrisa, Madras, Kerala, Maharashtra, Gujerat, Himachal Pradesh, Assam, Manipur and Tripura from factories in the controlled region will be made only to the nominees of the State Governments. In case of Punjab and Jammu and Kashmir allotments will be made direct to the State Governments or to their nominees. Allotments to Delhi will continue to be made on the existing basis. Allotments will be made at prices fixed under Notifications No. GSR 1188| Ess. Com.|Sugar dated October 25, 1959, and GSR 386| Ess. Com.|Sugar dated April 4, 1960. The controlled ex-factory price for U.P. and North Bihar factories is Rs. 37.85 per maund and for factories in Punjab and South Bihar Rs. 38.35 per maund for ISS D-29 grade with the prescribed price differentials for other grades. The fixed f.o.r. destination prices in respect of allotments made to Kanpur and Calcutta will be Rs. 38.60 and Rs. 39.85 per maund respectively for sugar of ISS D-29 grade.

IMPORT OF FOODGRAINS

Mr. M. V. Krishnappa, Deputy Minister of Agriculture, told the Lok Sabha recently that a total quantity of about 2 million tons of foodgrains had been imported into India during April 1 to July 31, 1960. So far as future imports against the current agreements such as the recent agreement with U.S.A. under P.L. 480 were concerned, they would be decided from time to time in the light of requirements, storage capacity and other factors. Replying to a question by Mr. S. M. Banerjee and others, the Minister said that at present there were agreements for the purchase of wheat and rice from the U.S.A., rice from Burma and rice from the U.A.R. Some rice might be imported from Thailand if the present negotiations with the Thai Government were successful.

SUGAR PRODUCTION AND DISTRIBUTION

In a written reply to a question Mr. M. V. Krishnappa, Deputy Minister of Agriculture, said in the Lok Sabha that the production and despatches of sugar from February 1, 1960 to May 31, 1960 totalled 12.59 and 6.58 lakh tons respectively. In a written answer to another question Mr. Krishnappa said that the selling price of sugar varied from place to place depending upon the quality of sugar and distance from factories. The retail selling price of sugar of medium grade was Rs. 1.02 per seer in Uttar Pradesh (Kanpur), Rs. 1.06 per seer in Assam (Gauhati), Rs. 1.05 in Punjab (throughout the State), and Rs. 1.09 per seer in Maharashtra (Bombay). He further said that two State Governments — Uttar Pradesh and Assam — were levying an adminisrative charge of 25 nP and 13 nP per maund of sugar respectively. The Punjab Government had a scheme for distribution of sugar at a uniform pooled price throughout the rural and urban areas of the State, including the far-flung hilly and inaccessible areas of Simla, Kangra, Kulu, Lahaul and Spiti. Under the scheme savings were adjusted against excesses at different places. The scheme had resulted in some saving to the State Government. The Government of Maharashtra was levying a charge of Re. 1 per bag of sugar distributed through co-operative societies in the districts and 20 nP per bag on sugar distributed through the co-operatives in Greater Bombay. The State Government advanced loans to the co-operative societies through the State Co-operative Bank for purchase of sugar from factories and the levy was to recover the cost on interest on the capital invested by the State Government. Only a small quantity of sugar — less than 1,000 tons per month — was being distributed under the scheme.

You owe it to yourself

Make it a habit to put away that *Extra Rupee* — regularly — and soon you will find a substantial amount at your credit. You can then confidently plan your future.

BIRDS cover a wide field

The Birds/Heilgers group do not produce steel. But they provide the vital raw materials that go into the making of steel—iron ore, coal, manganese ore, limestone, dolomite, refractories... They do not grow jute but their mills turn out jute goods for a variety of uses. Their interests cover a wide field from paper to engineering.. coal to electricity.

Their production units are today engaged in a programme of expansion to step up output to meet the increasing demands of India's industries. And their laboratories are constantly at work to improve their products... to explore new applications.

Through their service to the country for nearly 100 years, Birds have become a significant part of India's industrial scene.

BIRD & COMPANY (PRIVATE) LIMITED

Chartered Bank Buildings, Calcutta-1

TB 4382

It is said that it took 1,200 skilled workers almost twelve years to build the famous Konarak temple in the thirteenth century.

Judged by any standard, the building of such an edifice was a gigantic undertaking. It is easy to imagine that by expanding the demand for building materials and articles of daily requirements for an army of workers, it must have stimulated the growth of a large number of industries.

Today, even as in the past, the operations of a large undertaking encourages the growth of many existing industries and the birth of new ones, triggering continued expansion in the economic field. It has been the established policy of Standard-Vacuum to utilize local sources to the maximum extent possible, for the goods and services the organization needs for its operation. And in 1959, the value of such purchases in India amounted to Rs. 346 lakhs; of this, Rs. 289 lakhs represented the requirements of the Marketing Organization and Rs. 42 lakhs of the Refining Operations. The total requirements for all the three operations of Standard-Vacuum for the five years, from 1955 to 1959, was represented by Rs. 1,659 lakhs. Among the new lines of manufacture set up in India as a direct result of the demands generated by Stanvac's operation were drums and barrels for asphalt and other petroleum products; gasoline pumps and modern tank trucks and aircraft refuellers.

This is the hallmark of

QUALITY

This is the certification mark of the Indian Standards Institution. It is given to many consumer and industrial articles manufactured or processed according to relevant Indian standards.

The ISI mark has many advantages. To the manufacturer it means increased demand through customer satisfaction, and protection from unfair competition. To the consumer it offers an assurance of quality of goods and services purchased, and better value for the money spent. The granting of the licence to use the ISI mark is a trust placed with the manufacturer. ISI maintains a constant vigil to see that it is not misused in any way, for the interest of the consumer has to be safeguarded.

SEPTEMBER 23, 1960.

The Challenge of Calcutta

THE report of the World Bank Mission, headed by Mr. Michael Hoffman, which last week broke the portals of the Secretariat and emerged in print, has attracted wide attention for its fine perspective of India's problems of development. Particularly in regard to the need for a constructive approach to problems of raw materials, such as coal, and transport, the incisive character of the Mission's recommendations is likely to drive home defects which have been allowed too long to impose upon the country. But, curiously, the observations of the World Bank Mission which have attracted most interest are not related to the Plan, but to an item which is still, for reasons undisclosed, not a major element in any of India's plans. This is no other than a daring approach to all that is involved in the challenge that is Calcutta.

For the last fifteen years, and particularly in the last ten, when the refugee problem has been nearly insoluble, observers of the Calcutta scene have pointed out that the city's population and problems could not be borne by a single State or by the State plus disconnected activities of the Centre in the Rehabilitation Ministry. There was urgent need for a concrete plan for diversion of population from the city of Calcutta, and the building up of areas of employment in proximity to Calcutta, but significantly apart so that the refugees might have access to the heart of the area they have marked out for themselves without, at all stages, producing the unbearable disorder which still marks the Corporation's area of control. Over the last ten years, when the Central Government should have taken important steps to solve the problems of Calcutta, Dr B. C. Roy has been allowed to fight a lone hand, and perhaps, a losing battle against political discontent and economic destitution. What he has achieved is a remarkable tribute to one of India's greatest administrators. But it is not a solution of the problem of Calcutta. It is censure on the Central Government, even more than on West Bengal Government, that conditions in Calcutta have been allowed to deteriorate further.

The causes are simple. They are the absence of understanding in Delhi of the strategic place of Calcutta both in Indian politics and economics, and an absence of resources in the hands of the West Bengal Government to deploy in an imaginative way. The suggestions now made by the World Bank Mission that the problem of Calcutta should be approached on a new and adventurous pattern of development of industrial estates and subsidiary towns away from the current city as well as by development of the Port (and may be a subsidiary port) have not come too soon. The suggestion that the rupee expenditure might be financed by P.L. 480 funds has not been canvassed sufficiently strongly, but at least it can be stated that there is no reason to expect, with the World Bank Mission's positive support, that there should be any opposition in the United States to an allocation of funds for this purpose. India's Finance Minister does not seem to have appreciated that, notwithstanding the fact that this is not in the Third Five-Year Plan, the challenge of Calcutta must enjoy inevitably the highest priority. The year 1961 is likely to be a critical year both politically and economically, because of the elections in 1962 and because of the intolerable strain which the poorer classes in Calcutta are beginning to experience. The Prime Minister and all others associated with the Central Government must understand that there is a breaking point in Calcutta which will soon be reached, unless substantial new expenditure takes place and desperate overcrowding is removed.

For all these reasons, a new and daring approach to Calcutta's problems cannot be delayed. *The Eastern Economist* considers that the allocation of Rs. 200 crores, whether from P.L. 480 funds or any other, for this purpose will receive, once the strategic character of Calcutta is fully understood, the approval of the country. The Indian people must recognize that they owe to the people of Bengal a heavy debt on account of the sufferings caused by partition. It is already late to make amends; but not to make a beginning now will show us unworthy of the high place we seek for ourselves in history's scroll.

Coal Crisis Resolved?

IT IS now crystal clear that repeated public protests against the recent coal crisis have not gone unheeded. They were, indeed, so well-informed and the crisis cost the nation so dearly that at long last the Government awoke to the necessity of making a probe into it. The causes leading to the crisis were spread over time, statements were made in Parliament and still a plain official investigation into it was undertaken only belatedly. How else is the delay to be interpreted except as being indicative of a lack of a sense of full urgency? Anything resembling complacency about the immediate prospect would be harmful. Even now, the Ministry for Steel, Mines and Fuel is not prepared to give an indication as to when the idle blast furnaces at Rourkela and Bhilai would be commissioned into production and whether production would go on uninterrupted. Meantime, they will be joined in October by the second blast furnace at Durgapur whose erection will then be complete. The Ministry's reticence may mean caution against an attitude of confidence, but it may also mean a real feeling of diffidence, arising out of the factor of production of coking coal.

The official report into the crisis of supply of coking coal to the steel plants is reportedly under examination by the Cabinet. It would be idle to

speculate on the contents of this document. Whether or not the gist of the report will be obtained for public information by Parliament remains to be watched. But it would appear from available scraps of information that the Ministry of Steel, Mines and Fuel, on the one hand, and the Railway Ministry, on the other, have indulged in a bickering in an attempt to disown responsibility for the grievous failure of coal supplies to the plants. Inevitably, it has involved some amount of pointing the accusing finger at the other. This attempt is edifying to neither of the Ministries. It betrays a compartmentalized outlook on an issue of fundamental importance to the economy.

A little insight into this unseemly controversy has been rendered possible to those outside the official circles on the basis of some information that has appeared in the Press. This information has not been contradicted so far. A shortfall of 500 wagons for the loading of coal is said to have persisted for several weeks until August-end. The choice which this shortfall posed was to feed the steel plants in full at the cost of other industries elsewhere in the country or starve the steel plants partially. The Ministry of Steel is reported to have opted for keeping the third furnaces at Rourkela and Bhilai idle. The Railways, in effect, have attempted to score the point that they would have supplied the full quota of wagons required to feed the steel plants, as if denial of transport capacity to other industries was a matter of little consequence and for which they bore little responsibility.

The two Ministries have now evolved a formula whereby a repetition of keeping the capacity of the blast furnaces idle will be avoided. In fact, the formula aims at providing full transport to satisfy the entire requirements of the five steel plants in both the sectors. A daily flow of 1,400 wagons from the different coal fields to the five plants, on the basis of six days' loading per week, has been assured by the Railway Ministry. When the three public sector plants begin to work to full capacity, an additional daily supply of 250 wagons will be needed for the carriage of coking coal alone. This is exclusive of demands for the carriage of limestone, iron ore etc. The railways are said to be holding themselves in readiness for this task. Frequent recurrence of bottlenecks in railway transport makes it difficult to share this optimism. The railways are relying on the makeshift of keeping worn-out wagons on the track. An immediate strain that awaits them is the day-to-day arrivals of PL 480 shipments from America. Besides, there are other calls on rail capacity imminent in the wake of the Third Plan. The strain may be eased partially to the extent it would be possible to even out gross disparities of wagon flows in the busy and slack seasons by means of coal stock-piles at convenient centres in different regions. This solution, however, is not at all so easy as it appears on the face of it and in particular as the Railway Ministry makes it out to be.

Could it be assumed that the coking coal crisis will be completely resolved in the immediate future? It would be hasty to jump to such a conclusion, however tempting it may appear. The mounting demand is rapidly outpacing the supply. The pressure will intensify unceasingly. The public sector, which is making a debut in the production of coking coal, has made practically no preparations for its self-imposed task in the Third Plan. The coal washeries are far off as before. A great injury will be inflicted on the plans by making them do with coal having a high ash content. It is advisable that the Ministry of Steel should examine the feasibility of importing, for the time being, necessary quality coking coal from Poland on rupee payment. This is to be looked upon as an emergency solution, even as coal was carried in bulk to Newcastle in 1946-47, the old adage notwithstanding.

The Aid India Meeting

AT his Press Conference after the last week's meeting of the 'Aid-India Club' in Paris, Mr. B. K. Nehru, India's Commissioner-General for Economic Affairs, was only guardedly optimistic of its outcome. While declining to reveal the conclusions of the meeting, he made a cryptic remark, "There is a big gap between everything and nothing and the thermometer goes up and down." This is liable to any interpretation. The Paris meeting was concerned primarily with two things, one, to consider the need for further external assistance during the current year which is the last year of the Second Five-Year Plan and, two, to give preliminary consideration to the requirements of the Third Plan commencing in April next year.

So far as the first is concerned, the facts are that, following the foreign exchange crisis in 1958, the members of the 'Aid-India Club' agreed to contribute $930 million to enable this country to carry through the Second Plan. Mr. B. K. Nehru calculated that by March 1961, this quantum of aid may more or less be received, but the real difficulty is since some of the countries have laid down stipulations with regard to the utilisation of the money by tying it to specified projects or programmes, the Second Plan may still require about $260 million (or Rs. 130 crores) for its implementation. This is more or less the same which the Finance Minister himself estimated when he made his statement in the Lok Sabha last year after his return from the annual conference of the World Bank and the International Monetary Fund. He pointed that though a sum of Rs. 128 crores would be carried forward beyond March 31, 1961, the country will still need foreign assistance approximately of the order of Rs. 140 crores to finance the Second Plan, since assistance has been linked to specific projects in most cases and it cannot be diverted for financing any other projects. It would be too early to presume that the Paris meeting came to an agreement on prompt assistance to India especially when there are reports the other way round. Pending a formal announcement, it would serve little purpose to speculate either on the quantum of assistance that would be forthcoming or the manner in which the payments are to be made.

So far as the Third Plan is concerned, the meeting had the benefit of the appraisal of the Draft of the Plan made by the recent World Bank Mission which had reached highly encouraging conclusions on all major issues. There had been thus an 'international endorsement' at a very high level that what the country is trying to do is 'sensible and capable of being done'. It is expected that the Club would meet again in March next to discuss further India's aid requirements. Broadly, it would appear that the assistance required from the Club may have to be of the order of Rs. 1,800 to 2,000 crores. This is because out of the total estimated requirements of 3,200 crores of foreign aid, Rs. 300 crores have already been secured from the Soviet Union and other countries like Czechoslovakia and Poland and Rs. 600 crores have been negotiated under PL 480. Taking the spill-over from the Second Plan as estimated by the Finance Minister and the prospects of World Bank assistance at Rs. 200 crores (on the basis of performance during the Second Plan), the balance comes to about Rs. 2,000 crores. Even if the Soviet Union steps up her aid, it is apparent that the assistance this country should seek from the West would not be less than of the order of Rs. 1,800 crores.

Apart from the quantum of assistance given, what is equally vital is to ensure that it is of such a nature as is calculated to lessen the burden of repayments. In the light of this factor, it is only proper that fresh assistance should be in the shape of long-term loans extending possibly over 20 years. It is also necessary that consistently with the general pattern of the policy of the aid-giving countries, these loans should be "untied" to the maximum extent possible, so as to give room for flexibility in the purchases by the recipient country. It is now generally recognised in some of the influential quarters in the West that India cannot be treated as a normal borrower and her economic expansion must be underwritten on a more liberal basis than heretofore. The World Bank Mission is also categorical that aid to India should be provided on a "generous" scale.

The U.S.A. has been impressing upon the countries of West Europe for quite some time to take an increasing share in the aid to India's development plans now that they have entered upon the phase of rapid expansion. If Marshall Aid is the major explanation of this accelerated change in post-war Europe, there is all the more reason why developing countries should receive a similar helping hand. Enlightened self-interest demands that all countries should accept responsibility in proportion to their capacity for the achievement of a rapidly expanding world economy, for it is now becoming an axiom that no single country, rich or poor, can achieve maximum economic growth except in an expanding world economy.

The Selected Districts

IN about a fortnight's time, the package programme of intensive cultivation, launched in the Tanjore District of Madras State five months ago, will be extended to six more select districts in six different States, thus setting in motion a plan for agricultural development on which great reliance has been placed in the Third Five-Year Plan for achieving the target of 105 million tons of foodgrains output by 1965-66. The programme is envisaged to be launched in eight other districts during the next kharif season; this will result in its operation being extended to one district in each of the fifteen States of the Union. Ultimately, the whole of irrigated area in the country is proposed to be covered by it.

The programme, of course, contains little that can be construed as some new recipe for increasing farm yields; it only seeks to make available to the farmer simultaneously all the factors which contribute towards increase in production. What distinguishes it from the other schemes of agricultural development is the concentration of effort in some selected areas so as to get immediate gains in agricultural, particularly food, output. The programme envisages provision of adequate and timely supplies of seeds, fertilizers, implements, pesticides etc. To enable the farmers to purchase these production requisites in full, timely credit is proposed to be made available to them through co-operative societies, which will be strengthened with assistance from the Reserve Bank of India and the State Governments, to shoulder the responsibility of making 'clean' advances based on production plans of the borrowers. The agriculturist will be imparted training and intensive education in modern farming techniques. Transport arrangements are envisaged to be strengthened to ensure the mobility of staff and supplies. The number of godowns will be increased ten-fold to provide supplies and marketing facilities within bullock-cart distance. Marketing facilities will be made available through co-operatives so that farmers can get a fuller value for their surplus produce.

There can be little doubt that in areas where natural hazards are negligible and where irrigation facilities exist — these are the areas being brought under this programme — this intensive effort will yield wholesome results. If the scheme is executed properly, the current estimates of 40 to 60 per cent increase in production in these areas over a period of five years may turn out to be too conservative. With a less concerted effort and in the face of heavy odds like shortage of fertilizers, the Bombay Pilot Paddy Scheme — which forms the basis for this package programme — has succeeded in raising the yield by as much as 35 per cent over a period of three years. If the experience of four Japanese experts, who, working on a 3.5 acres piece of land, selected at random in a village near Saharanpur, have achieved an increase of 100 per cent in yield in one year alone, is any guide, the package programme can well be expected to raise output by 100 to 150 per cent in five years. That should be reasonable expectation, taking into consideration the investment involved; the implementation of the programme in the seven districts is estimated to cost Rs. 7.95 crores in five years, besides an amount of Rs. 29 crores which will be needed to finance loans to farmers.

It is heartening to note that arrangements have been made, with assistance from Ford Foundation, which is actively co-operating in the implementation of the scheme, to import sufficient quantities of fertilizers and pesticides over and above the normal imports of the country so that meeting of the full requirements of the farmers in these districts does not necessitate curtailing of supplies of these two production requisites elsewhere. The only snag in this otherwise imaginative programme appears to be that too much reliance has been placed on its implementation by State Governments, whose record in the vital field of agricultural development has not been encouraging. Since the State Governments have been associated with this programme right from the beginning and they have been given freedom to select the districts to be covered by it, their co-operation may be forthcoming in a greater degree. The supervision by the Central Government and Ford Foundation experts may also be of some help. But there is need to devise some sanctions against the erring States.

Some defects noticed in the working of the programme in the Tanjore district also need to be attended to. There are grievances about supplies of fertilizers being of the wrong type. Also in quite a few cases there is dissatisfaction with the attitude of officials incharge of the project. There is obviously need to rectify the attitude of officials and to ensure that they are there to serve, not to govern. Only that way can confidence be inspired among the agriculturists on whose intensive endeavour and genuine co-operation depends the success of the programme.

A DELHI DIARY

THE TAKE-OFF

THE Prime Minister has been away in Pakistan from Monday and our eyes have been following him there for every one of the five days of this historic mission. Knowing well how vital this visit (and that of President Ayub Khan to India which has just been announced) could be for the future of the sub-continent, I was disappointed to find the press so inadequately represented when the Prime Minister took off for Pakistan at 7-10 a.m. on Monday. I myself cannot claim any special virtue for having seen this departure. I was taking off for Bombay at 7 a.m. when a stentorian voice announced "owing to 'very' (sic) V.I.P. movement priority, the plane for Bombay will not leave at 7 a.m. but at 7-30 a.m." This was so compelling a direction from Providence that I hastily emerged to see what the "very V.I.P." priority might possibly be. There were many Ambassadors present, and I particularly noted Mr. Malcolm Macdonald (the Doyen of the Diplomatic Corps) and Mr. Ellsworth Bunker, Ambassador of the United States; both their countries have played a splendid part in the finalisation of the Canal Waters Treaty, and it was appropriate that they should feel that this last expression of goodwill should be an essential caping stone to a five-year diplomatic effort, one of the greatest pieces of international negotiations in recent history. Perhaps we in India have not seen it in proper perspective, but both American and British newspapers clearly went to town on the event. It was a happy thought for both the candidates in the American Presidential Election to send their congratulations to both countries in a full page advertisement as well as by cables individually to the President of Pakistan and the Prime Minister of India.

THE DISCOVERY OF INDUS

While we are slowly rediscovering our bonds with Pakistan and Pakistan her bonds with India, the world as a whole has been, it seems, setting out on a voyage of discovery, not of India, but of the Indus. The World Bank's imaginative approach to the dramatisation of the event—if I mistake not, under the brilliant direction of Harold Graves, who has done the Bank's public relations for years—has recorded in every country in the world. But who would have thought that we were so ignorant of our own geography? I knew all about the length of the Indus, about its tributaries and about the essential facts (as I thought) of the sharing of the waters. But I had never troubled to find out—foolish man that I am!—how much water there was to share. It is from the World Bank that I had to discover that (a) the Indus Basin System constitutes the longest irrigation network of any river system in the world; (b) it literally races ahead (and not like the 400 metre dash at the Olympics won by a short head) leaving all its opponents gasping for breath.

The annual flow of the Indus waters is stated to be more than twice that of the Nile and three times that of the Tigris and the Euphrates combined. More surprising than both these is the fact that it is nearly ten times that of the colorado river which, in my innocence, I believed was one of the greatest irrigation wonders of the world. We have now established that the subcontinent has two—and only two—firsts. One is, of course, the Olympic hockey championship which is won either by India or Pakistan. The other is—and this, perhaps, is more enduring after the new works to be undertaken—the Indus basin. It must be gratifying to know that there is no river system—not even the Aswan Dam Project on the Nile—which can bridge the gap between the Indus and any other river system. To those that have, apparently, to them shall it be given!

Let me continue, however, with some more geographical details. The Indus waters can cover France to the depth of a foot—that is, if some power could arrange the requisite transfer of irrigable resources, the flow of the new canals proposed to be built in this basin will be ten times the flow of the Thames at Teddington. Question: What is the flow of the Thames at Teddington? Answer: Don't know. Comment: Never mind! But I can say that the Indus basin irrigates (or is it capable of irrigating?) 30 million acres. This can be raised to 100 million acres—one and a half times the size of the United Kingdom.

CHAIN REACTION: WHEN?

So much for the Indus—for geography, for irrigation and national pride. How much will it contribute to our understanding of one another? Will the people of India and Pakistan, sharing this tremendous asset, begin to feel they need one another as well? I answer fervently yes? Of course, this is my wish which is father to my thought; therefore, wishful thinking, if you like. But it is also a legitimate conclusion from the fact that, at the top most level, there is such a desire for agreement as we have never previously felt. I am well content with what has been done in the last five days. The Prime Minister of India and the President of Pakistan have shown how great can be goodwill in the face of a major difference of opinion. When goodwill is so great, it does have an overflow into the differences themselves. Perhaps this was one aspect of what Mahatmaji called soul-force, meaning generous and tolerant conviction can give not merely courage; it provides the instruments of further goodwill. More biblically—one can dream of efforts such as these becoming the instruments of peace—we shall beat our swords into ploughshares and use them for the welfare of our people on both sides of our wholly artificial lines of division. When will the chain reaction start?

WATER FOR DELHI

I cannot resist the temptation of recording the discussion in the Standing Committee of the Delhi Corporation on a 'mighty' issue which took place on the very next day of the signing of the Canal Waters Agreement in Karachi. The Corporation seems to be labouring under a nightmare as the sole source of water supply to the city — the Jamuna — has already reached the saturation point, but the growth of population refuses to recognise this fact. It has urged the Central Government to make an approach to the Punjab Government to agree to the supply of at least 100 cusecs of water from the Bhakra source during the next three years at least. But this is not all. After arrangements are made to secure the first 100 cusecs of water from Bhakra, there will be a demand for an additional 100 cusecs, again from Bhakra, and for this demand the Corporation is quoting the high authority of the Master Plan. The Committee has further urged the Central Government to move the U.P. Government in order to ensure for Delhi 200 cusecs of water from the Ramganga Scheme. If the tangled negotiations on the canal waters dispute can after all be settled at an international level, why should there be so much difficulty in the matter of securing adequate water supply for Delhi? After all, can any one deny that the Capital City has a legitimate claim on all the States? Otherwise what is the virtue in a city being the Capital?

ARGUS.

THE WEEK'S NOTES

Cotton

A FEW FACTS

WHENEVER THE question of cotton textile production comes up a reference is made to the failure to provide adequate supplies of raw material for the industry. It is to be examined how far the statement is correct. The cotton supply position has, no doubt, been deteriorating during the last one year; thus as against the cotton crop in 1958-59 of 47 lakh bales, production in 1959-60 was only 38 lakhs, showing a decline of about 9 lakhs. But in spite of it, during the first half of this year production of cotton piecegoods was nearly of the order of 2,470.2 million yards as against 2,444.7 million yards during the corresponding period last year. Again, while exports during the first half of last year were 270.14 million yards, during the first half of this year, it has gone up to 314.4 million yards. (These exports only relate to Bombay Port from which, however, about 90 per cent of the textiles exports go). During the second half of last year, however, exports picked up and they were of the order of 448 million yards and it can be presumed that during the current half of this year also, a similar performance may be repeated. This is especially feasible because of the recent reduction in cotton prices when the domestic market may not provide so attractive a field. It is also worth mentioning that exports from the countries in the Communist bloc have been recently on the decline. Thus as compared to 780.55 million square yards exported in 1958, exports in 1959 declined sharply to 511.32 million square yards, almost the level reached in 1955.

It is, however, open to question whether the record of production as well as exports could not have been bettered this year with greater supply of cotton. Looking at the figures of raw cotton consumption during Jan.-May last year, one finds that the total is 2,10,400 bales consisting of 1,939,000 bales of Indian cotton and 174,000 bales of foreign cotton; during January-May this year, the corresponding figures were 2,081,000 bales, 1,814,000 bales and 267,000 bales. Though the consumption of foreign cotton has gone up from 174,000 bales to 267,000 bales, consumption of Indian cotton has gone down only slightly, from 1,930,000 to 1,814,000 bales. What is astonishing is that mill consumption of indigenous cotton should have continued more or less unabated even while the quantity licensed of foreign cotton has not been taken full advantage of. The import quotas announced during the cotton season aggregate to 1,220,000 bales. Of this the quantity licensed and actual arrivals upto mid-May 1960 amounted to 795,560 bales and 459,985 bales respectively. The details are shown below:

(Bales of 400 lbs. each)

Variety	Quantity Licensed	Actual arrival (including part quantity licensed during the previous season)
Egyptian	170,230	167,496
Sudan	80,967	63,149
East African	123,360	94,791
Peru, Pakistan and others	113,238	46,421
U.S.A.	307,765	88,128
	795,560	459,985

It would thus appear that actual arrivals are just 58 per cent of the quantity licensed. What is the reason for this state of affairs?

Banking

ENSURING EXPANSION

IN HIS recent lectures on "Monetary Discipline and Indian Banking" delivered in Calcutta, Mr. B. K. Dutt, covered a very wide ground that is full of interest to students of Indian banking. It is now readily granted that an organisational extension of the banking system is a 'sine qua non' for the economic development of any country and more so India, on the eve of launching her Third Plan. This is because only when the flow of money is organised and channelled, through the banking system can the various measures of monetary control operate effectively. However, the fact remains that today banking money represents only 30 per cent of the functional money supply and 8 per cent of the National Income whereas the corresponding figures in the United States are 80 per cent and 32 per cent respectively. The recent Palai Bank crash and the other rumblings in the banking world have caused misgivings among many that the expansion of the banking system may suffer a setback for at least sometime to come. It will be unfortunate if this feeling is allowed to gain ground which would only have the effect of retarding economic growth.

The quickness with which the Banking Companies Act was amended during the last session of the Lok Sabha to confer more powers on the Reserve Bank shows that the authorities have lost no time in benefiting from the lessons of the failure of the Palai Bank. But as Mr. Dutt pointed out, the essential base on which banking grows is the creation of a proper atmosphere and climate conducive to generating confidence and goodwill. Here, though banking control undoubtedly makes its own contribution, there are other measures that should be taken to remove any uncertainties in the public mind that might act as inhibiting factors in the growth of banking business. Here, he referred to two measures that will go far in inspiring public confidence. One is the insurance of bank deposits and the other, following from it, the rehabilitation of weaker banks.

It would now appear that the Reserve Bank is already examining the case for insurance of bank deposits. Though the bigger banks may not get much direct advantage out of such a scheme, there can be no doubt that they are also bound to benefit inasmuch as it would result in creating a suitable climate which will facilitate a general growth in banking, including the business of the larger banks. As Mr. Dutt showed, it is therefore only "enlightened self-interest" that the major banks should also press for the scheme for deposit insurance. Once the scheme for insurance of bank deposits gains ground, any step taken for the rehabilitation of the weaker banks is bound to be easier. The recent amendment to the Banking Companies Act has provided that as far as possible, bank failures should be prevented by rehabilitating in good time banks that are found wanting in some respect or the other. The suggestion for a Bank Rehabilitation Corporation made by Mr. Dutt deserves careful examination here.

Canal Waters

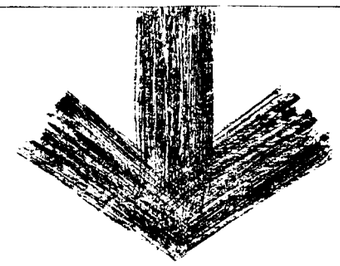
KARACHI AGREEMENT

THE SIGNING of the Indus Waters Treaty this week in Karachi has finally resolved the tangled problem of the allocation of the waters of the Indus system between India and Pakistan. Under the Treaty, India will be entitled to full use of the 20 per cent of the waters of this system flowing in the three eastern rivers—Sutlej, Beas and Ravi — except for a transition period extending to 10 years from April 1, 1960, when the Treaty comes into force, during which Pakistan will continue to receive waters from these rivers at a progressively diminishing scale. During this period Pakistan will have to build her works to replace these waters. India will contribute a sum of Rs. 83.33 crores towards the cost of these works, which will be scaled down by 5 per cent if the transition period is sought to be extended by Pakistan by one year, 10 per cent if the extension is required for two years and 16 per cent if it is proposed to be three years. The transition period will not be extended beyond 1973, except when unforeseen circumstances like a world war might affect supplies of raw materials required for these works from abroad.

Pakistan will be entitled to the full use of the three western rivers — Indus, Jhelum and Chenab — except for essential uses (irrigation, domestic water uses, hydro-electric development), present or future, in their own basins while they flow in India. The present irrigated areas in Jammu and Kashmir, Punjab (I) and Himachal Pradesh, approximately one million acres, will continue to receive irrigation waters from these rivers. Another 0.7 million acres can be brought under irrigation in these areas under provision for future uses. India will also be entitled to undertake measures for flood control and draining in these basins (as long as they do not adversely affect Pakistan) and use these waters for generating hydro-electric power. Further, India will be allowed to store for various purposes a total of 2.85 M.A.F. of water on the tributaries of these western rivers.

The U.S. Government and the World Bank have agreed to lend India Rs. 15.7 crores and Rs. 11 crores respectively to meet the foreign exchange cost of a dam on the Beas so that the longer transition period agreed to by India in order to accommodate Pakistan does not result in undue postponement of the perennial supplies to the Rajasthan Canal. Pakistan will get aid from U.S.A., U.K., Canada, West Germany, Australia, New Zealand and the World Bank to the tune of Rs. 333.3 crores for financing her development work on the western rivers. The Treaty also envisages the setting up of a permanent Commission, consisting of an Indian and a Pakistani Commissioner, which will iron out the differences between the two countries over its implementation. In case of a dispute remaining unsettled, a Court of Arbitration will be set up to look into the matter. A neutral expert will be called, if necessary, to whom differences of a technical nature would be submitted for decision. The Treaty contains a provision for future co-operation with regard to specific works, such as building of dams to control floods or drainage works which may be required to be built by one party in the territory of the other. These will be built, under separate bilateral agreements, at the request and cost of the party which benefits from them.

While the signing of the Treaty is welcome — it means one dispute less with Pakistan — the fact remain that Pakistan has struck a very hard bargain. It is difficult to understand how the contribution of India towards construction of the replacement works by Pakistan has been stepped up from about Rs. 60 crores, as suggested by the World Bank a couple of years ago, to Rs. 83.33 crores. It is also intriguing why India did not insist on this payment being set off against the Partition debt which Pakistan owes to her. Equally disconcerting is the fact that the Treaty envisages payment of this huge sum in foreign exchange when India is struggling hard to find external resources for her own development plans. Could we not have insisted that we should make our contribution towards building of Pakistan's replacement works by means of export of cement and steel which Pakistan will be importing for the purpose?



Ship-building

TECHNICAL PERSONNEL

IT IS not only in the sphere of manufacture of the main engine and components alone but also in the sphere of building cadres of technical personnel of various classes that the ship-building industry of India has a considerable leeway to make up. The difficulties in the manufacture of machinery and equipment are understandable, but it would appear amazing that the Visakh shipyard should still labour under a serious handicap of shortage of technical personnel for construction work. On the occasion of the launching of "Vishva Nidhi", Mr. G. L. Mehta, Chairman, Hindustan Shipyard, candidly stated that building of a nucleus of personnel for the designing of ships was one of the urgent and long-term tasks awaiting the yard. A good deal of preliminary work has to be gone through by way of collecting data on the classification of ships of different types before the nucleus of designers can come to grips with their regular assignment. About designing of ships, like designing of aeroplanes etc., delay in a country like India which has recently taken to the industry, is not unnatural.

But what is really a matter for surprise is the great difficulty which the yard is experiencing at the present time in obtaining the services of draughtsmen with requisite training and practical experience as also skilled tradesmen for steel fabrication and erection work which is a vital part of construction of ships. The Hindustan Shipyard has at long last started a scheme of practical training for draughtsmen, and in so far as skilled workmen are concerned, a separate training school has been set up in which a four-year apprenticeship course of theory and practice has been prescribed. The present limited requirements of the yard are expected to be satisfied in the next two years or so, as the Chairman of the Hindustan Shipyard has confidently stated. But in the meantime, expansion of output at the yard and the setting up of the second shipyard will make more demand on the supply of technical personnel.

The Indian Institute of Technology, Kharagpur, turns out graduates in naval architecture, but it will be news to many that all the training at this premier technological institute is not of adequate practical value. The graduates are not capable of being absorbed in the shipyard for the simple reason that they have no facility of intensive training in practical shipbuilding. One wonders how the practical part of higher training in naval achitecture was so grossly neglected in drawing up the curriculum for this degree course at Kharagpur. The real way out seems to be to make practical training at the shipyard for a specified period obligatory for these graduates before degrees are conferred on them. Unless some such arrangement is made in order to turn the graduates into full-fledged and readily employable technical executives, the gap in the naval architectural course at Kharagpur will not be removed.

How to get the most out of your Bank

Do not regard your bank merely as a convenience for depositing and withdrawing money. There are extra services available to you.

When you have a *current account* with State Bank, you can ask that commercial bills and pay or pension bills be collected and credited to your account; you can also instruct the Bank to pay periodically on your behalf house rent, school fees, club subscriptions, insurance premia, etc. and thus save yourself a lot of bother.

A *savings bank account* enables you to earn interest. It permits the facility of withdrawal once a week; at some offices the system of withdrawal by cheque is already in force.

For full particulars of these and many other facilities State Bank provides, please consult or write to the nearest office.

The State Bank with its background of years of sound banking traditions is waiting to solve your problems. Why not have them solved for you?

STATE BANK OF INDIA
INDIA'S LEADING BANK

SISTA'S-SB-16

Named after the ancient Chera Kings, Kerala dates back to a mythological past. This land of palm-fringed lagoons and lush vegetation has a close-knit cultural heritage which is best expressed in its theatrical art. Every year the Velakkali dancers stage the battle of Kurukshetra in commemoration of the martial past of the country— elaborate dress, make-up and dance-drama are fused in an epic grandeur of mood and movement.

Diversity is the keynote of your journey through India, from the emotional grandeur of Kathakali to the exquisite restraint of the Manipuri Ras dance.

And Wherever You Go, there is the full, rich flavour of Wills' GOLD FLAKE to enhance the pleasure of travel.

Wherever you go... they're good

A Window on the World

"IT COULDN'T HAPPEN HERE?"

By

ODYSSEUS

NOW, I WANT to discuss inflation, and in hopes of preserving an atmosphere of dispassionate enquiry, and avoiding treading on the sensitive toes of contemporary Finance Ministers, and Government officials, I will describe what it did to the Roman Empire. Why Rome fell is not an academic but a highly topical question. If we can find the answer, it will throw light on our own problems.

At its zenith, the Roman Empire covered an area corresponding to modern Britain, France, Germany, Spain, Austria, Czechoslovakia, Switzerland, Yugoslavia, Rumania, Bulgaria, Albania, Greece, North Africa, and the whole of the Middle East as far as Iran, totalling some 4,300,000 sq. miles. That is nearly four times the size of India. From 31 B.C. onwards for close on a quarter of a thousand years this vast area was a single economic unit, with an initially flourishing trade based on an (initially) stable currency. Free of the burdens of war, its peoples devoted themselves to industry and agriculture. Piracy was almost unknown. Roads sped travel and trade. The blossoming of economic and cultural life which followed the establishment of the Empire sprang from the multiplication of the middle classes, given free rein to their enterprise, and of cities providing concentrated markets. As in 19th century Britain, the emerging middle classes set the pace of progress. The Emperor Augustus (27 B.C. to 14 A.D.) inaugurated a broad policy of 'laissez faire'. Private enterprise created streams of new wealth. Mr F. W. Walbank, in his readable 90 page book, "The Decline of the Roman Empire in the West," (Cobbet Press. London. 1946) describes a world knit together, as never before, by the intensive exchange of all types of primary and manufactured commodities through a communications system of an efficiency never again attained until some twelve centuries after Rome's fall. Effective police forces on land and sea protected the trader from the North Sea to the Bay of Bengal. The postal service covered 40 miles a day. After the Greek seaman, Hippalus, discovered the monsoons, a merchant could leave Puteoli (on the west coast of Italy) in an Egyptian corn ship in May, and continuing by Nile-craft and caravan to the Red Sea, could sail direct to the Malabar coast, arriving (with good winds) sixteen weeks after leaving Italy. By using the North-East monsoon the following January, he could be home inside a year. The consolation of world trade promoted travel which broke down parochialism (forerunner of nationalism).

FLOURISHING INTERNATIONAL TRADE

This great world was strikingly similar to our own in its flourishing international trade and potentialities for progress towards a universally affluent society. (It had two advantages over us; freedom from fear of war and from national barriers to trade). What went wrong? What plunged these 4,300,000 sq. miles into such miseries that they have been known as the Dark Ages ever since?

From the several causes two stand out: slavery and inflation.

Slaves formed the main labour force. This meant that those who did the basic work did not share adequately in its benefits. The slave, therefore, lacked incentives to improve the technique of the work that he did. Slaves not only did all manual work but were also teachers, doctors, architects, and professional men. It followed that the professions, and what we would call technology, were held in low esteem. The social climate was hostile to technical advance, which in all countries, in all eras, springs from the initiative and enterprise of the individual. Today, when one contemplates industrial giants like Imperial Chemical Industries one forgets that every one of them can be traced back to the enterprise of some small individual artisan, craftsman, or trader, at the beginning of the Industrial Revolution in Britain. A small man improved existing technique, or invented a new one, and because there was no income tax, let alone excess profits tax, he amassed capital with astonishing speed. It was the enthusiasm of hundreds of such small men, become bigger men, which launched England, and the world, on the path of change and prosperity.

The Roman Empire stagnated through lack of technological advance, while the need to keep up the supply of slaves broke the Roman peace by exhausting wars fought to extend the sources of supply.

WHY FEUDALISM AROSE

Secondly, inflation. In his remarkable new book, "Inflation and Society" (Allen and Unwin. London. July, 1960), Graham Hutton points out that the state expenditure of the Roman Empire became intolerably and inefficiently burdensome because private enterprise was squeezed out. Taxes had to be raised higher and higher, as trade, defence, law, finance, and civil administration became monolithic state enterprises. Urban and rural workers had to be "frozen" in the jobs allocated to them. Their jobs became hereditary, an ossification which was the precursor of the stratified, static, feudal society. Traders and merchants could only better themselves as state officials and their functions, too, became hereditary. Increasing taxation eliminated independent small traders and farmers, and compelled them to enrol, more or less as slaves, in big estates, which became self-contained economic units, forerunners of the feudal lord and his tenants. Thus was the international division of labour broken up and localised.

As international trade languished under progressive inflation, unemployment grew in the cities. As money lost value, a bewildering multiplication of economic rigidities, bureaucratic controls, and controllers sprang up. Soldiers and officials became all-powerful. The urban masses, mainly unemployed, had to be bought off by a Welfare state system of free rations of food and entertainments. As the demands of the proletarian voters grew for "bread and circuses," and of the soldiers for higher pay to meet the ever rising cost of living, taxes were driven higher, the Emperors bought the votes of the legions and of the masses by bigger depredations of the enfeebled tax-paying classes. The end was the dictatorship of the legions, which elected

and deposed Emperors at will, and eventually fought among themselves in support of rival puppet Emperors.

As the unitary economic, defensive, administrative, and legal territory of the Empire began to fall apart into self-sufficient feudal enclaves around the newly walled cities, so an entire civilisation fell apart. "It dissolved," says Graham Hutton in a memorable passage, "from the terrible third century onwards, into the dim outlines of modern European nations...." The popular belief that the Empire was destroyed by barbarian invasions is a half truth. The Empire was destroyed because no one could be found to defend its integrity, which had been inflated out of existence.

In a free enterprise state, power is widely diffused and a working balance struck between the individual and the necessary organs of government. But once citizens acquiesce in unnecessary enlargements of governmental power, the process snowballs. Professor C. N. Parkinson's assertion, that if you give an official an inch he will take an ell, has never been more convincingly illustrated than in the Roman Empire. Centralisation of the state's power snowballed from the time of Augustus until the collapse in the fifth century. Power could only be kept centralised by pampering, fiscally and financially, the power which had raised the Emperors to, kept them on, and abruptly knocked them off, the throne: the army. Heavy taxes on a minority of tax payers, plus inflation, gave the legions and the bureaucracy power over all other classes.

Most tax payers were urban. They were a tiny but economically important and productive minority. As their burdens grew, the elite of "decuriones" (senior civil servants in charge of a municipality) preferred slavery, flight, or the advent of the barbarians. This killed capital, trade, and cities. Outside the cities, in the countryside, the legionaries in their camps, and the biggest senatorial landlords in their estates, were exempt from taxes. Thus progressive inflation and the penal taxation to secure political power ended in the disintegration of the state. Power itself ultimately deserted the state and took to the smaller locality. There followed the Dark Ages of servitude and status.

Graham Hutton points out the contradictory behaviour of governments that yield to inflation. They undo as rapidly with their left hand what they are trying to do with their right. After centuries they are still attacking the symptoms rather than the disease. In 301 A.D. Diocletian issued an edict which made it a crime punishable by death to raise prices anywhere in the Empire. The edict laid down an exhaustive list of official prices of all consumption and capital goods throughout the then known civilized world—from chariots to women's underwear. Diocletian's object was to curb speculation while the state inflated the currency. Yet his edict was abandoned as impossible to enforce within two years. Not all his bureaucrats and soldiers could cut off the numbers of heads that would have had to roll.

None of this could happen today? It is true that we have abolished slavery, but inflation? After World War I inflation in Germany caused such misery to the middle classes that in their despair they welcomed Hitler. Inflation in post-World War II France paved the way to de Gaulle's return. I do not equate de Gaulle with Hitler, but it remains to be seen whether the French can reverse the process of administrative centralisation which a dictator inevitably quickens, and of which the logical ultimate outcome is a totalitarian state and the end of individual freedom.

P.S. There has actually been more inflation in more countries since 1945 than before. The popular idea that our present inflations originated in the war is mistaken.

Jute packs a world of goods

Australian wool, Burmese rice, Cuban sugar, Egyptian cotton, Canadian wheat, Chilean nitrate...these are only a few of the commodities that travel to the markets of the world packed in jute cloth. By providing the cheapest heavy-duty packaging material known, jute plays an important part in international trade.

India produces 55% of the world's jute goods. The Indian jute industry provides employment to millions of farmers, traders and mill-workers in the country.., earns on an average about Rs. 115 crores annually in foreign exchange.
Jute serves India in many ways, strengthens her economy.

Issued by the **Indian Jute Mills Association**

Shakespeare once observed "Beauty is an innate craving of man—so he seeks to dwell in lovely parts of the creation." No age has ever been immune to this captivating spirit of Beauty, the balm of life. Even mother Sita of our epic age fell a victim to the attractions of beauty when she noticed an illusory golden deer, and longed for having it, which resulted in the out-turn of a chain of momentous events in the social life of that epic age.

The Deer is virtually a charming and comely animal which infatuates a man at the very glance.

We do admire this instinct of man and offer our ocean deep ovation for the same. Hence, we have chosen deer as a symbolising brand for our cloth of varying varieties so exquisite, enduring and of so endearing a price.

The European Scene

THE DEFAULTER AT THE AID INDIA MEETING

From Our Special West European Correspondent

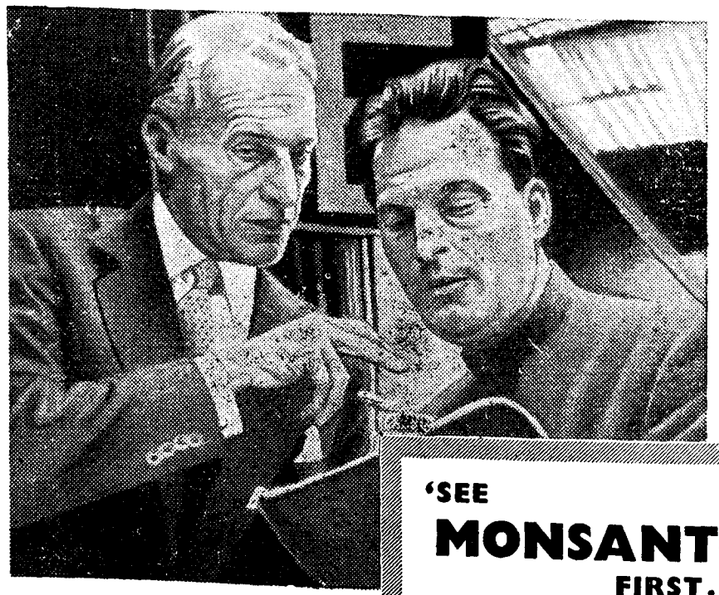
PARIS, September 18.

THE third meeting of the Aid India Club was held here, at the European office of the World Bank, this week to consider the amount of special supplementary assistance that might be given India immediately and to study the foreign aid needs implied in the Third Plan. Little is known of its discussions, for the meeting was private and the experts attending were not empowered to take final decisions. In addition to the members who were present at the Washington meetings in August 1958 and March 1959 (Britain, the USA, West Germany, Japan and Canada), there were "observers" delegated by the IMF and the Italian Government. The fact that Italy was taking an interest and the circumstance that this meeting was held in the French capital, obliged the French Government to issue an embarrassed explanation of its failure, alone among the leading economic powers of the free world, to join the Aid India Club. Recalling that France had already granted India a number of medium-term loans for her economic development, an official statement averred that Paris was "fully aware of the need to make a useful contribution" in this matter, but was prevented from joining the Club by the burden of present French aid to other developing countries, notably in Africa.

While this explanation is quite truthful, it is also the case that there was a powerful movement in favour of France adhering to the Club and the decision to abstain was taken only at the last minute and with much regret. (This is hinted at in the official statement which says that the Government "has finally decided not to send a representative".) The ultra-cautious faction in the Finance Ministry, which is opposed to placing any new strain on the economy even though it is currently working well below capacity, had its way in the end. If the invitation had been more pressing, and if relations between Delhi and Paris (more specifically, between Messrs. Nehru and de Gaulle) were more cordial, an opposite decision could have been taken because in her present position of economic strength France is perfectly capable of making a signifiant contribution to assistance for India. This might yet be done at later meetings of the Club. Meantime, it should be remembered in India that this week's decision not to undertake the special commitment of joining the Club was taken by a narrow margin, and that France remains open—and particularly certain French industries—to appeals for assistance.

All the economic indicators show that the French economy is well placed to meet such appeals. The two years since the draconian reform of 1958 have produced a transformation whose extent is often underestimated. The economy today is quite rid of inflation, it has a comfortable and continuing trade surplus, it has amassed large and growing reserves of gold and foreign exchange, it has ample unused capacity in machinery and manpower, the capital market is well nourished and interest rates still falling, prices have not yet annulled effects of the two successive devaluations and, finally, the country is itself the recipient of substantial amounts of foreign investment, particularly American. All the forebodings and criticisms aroused by the end-1958 reform have proved unfounded, save one: the rate of expansion is not yet as high as the country can afford. Two factories out of three report that they could produce more if required. Leftist critics of the regime accuse the authorities of deliberately restraining the growth of domestic demand, and the OEEC has just presented a survey of the economy that concludes by asking the Government to abandon some of its financial rigour by giving private consumption a shot in the arm. In this situation (which contrasts totally with the popular conception of France strained to the point of inflation by the Algerian war, by de Gaulle's military programme and by hand-outs to the former African colonies), an undertaking to broaden the scope of French foreign aid would be not only possible but salutary. The hesitant refusal to give it was typical of the excessive caution that is the only justified criticism one can make of the present regime.

If all the aid offered by Paris to Africa were being availed of, France would indeed be unable to make further commitments. But this is not the case. The largest sums scheduled to be invested in Africa are devoted to the Constantine Plan for the development of Algeria. Actual investment outlays are far behind the Plan proposals, largely because it is impossible to develop a country plunged in civil war. The idea of developing a country to remove the causes of the war (or rather, some of the supposed causes) puts the cart before the horse; Algerian development cannot begin properly until the armed strife is ended. When it does, the money now being wasted in the struggle against nationalist terrorism will supply as much investment capital as that under-endowed territory can digest. Much public capital is indeed being sunk in a belated but still impressive programme directed at improving Algeria's infra-structure of roads, schools and other amenities, but that does not mortgage the capacities of French industry. It has completed the costly part of the investment in oil: Saharan petrol has been located, raised, pipelined to the coast of Tunisia and Algeria, where it is stored and transported across the Mediterranean. The only other major industrial project in the Constantine Plan, the steel works at Bone, has not yet taken shape because private industry is not convinced of its profitability. So it cannot be claimed that Algeria is tying up capital resources that might be diverted elsewhere.



In Africa south of the Sahara, French investment effort continues to be considerable and Paris remains the largest lender to that continent. Yet the newly liberated Negro states cannot make use of all the capital that is theoretically available to them, because they have not prepared the industrial development plans that are needed to put incoming capital to work. The sort of political buffoonery to which Negro politicians in the Congo, Senegal and Sudan (ex-French Sudan) have devoted themselves immediately after independence suggests that the elaboration of such plans is not regarded as urgent. At all events, Negro African is not tying up the resources of French industry, though public aid is a substantial item in the French budget. More important, the notion prevalent in France that Africa must come before everything else is a political choice which may be already out of date. The dream of "Eurafrica", in which the Common Market Six were to dedicate themselves to the development of former French or Belgian colonies to the exclusion of other sorts of foreign aid, has already evaporated. The two territories that were so richly endowed with resources as to make this seem a profitable venture (the Guinea of Sekou Toure and the Congo of Lord knows who) have demonstrated that they are not interested in it, and they have demonstrated this so convincingly that one cannot conceive West German, Italian and Dutch investors joining with France in a vast development programme in which Negro Africa had a first and special place.

The French might cling to what remains of their African Community after the defection of North Africa

and Guinea (and perhaps soon of Sudan, the relic of the Mali Federation) as the prime claimant of their capital available for lending abroad. Yet that Community already has a much less coherent and family-like appearance than it had several years ago when Paris adopted the policy that the political rewards were so great that all capital must be reserved in priority for Africa. In other words, the belief that funds must flow to Negro Africa because that is a zone of French influence even when it has been liberated, but need not go to India because that is not a zone of French influence, is today arbitrary and will become more obviously so as the former colonies put a looser and looser interpretation on the bonds of the French Community. It was lately shown on this page that the projected tight links between the "associated African territories" and the Common Market were proving in practice to be so tenuous that they implied little or no discrimination against countries like India; much the same will prove to be true of the economic bonds of the French Community. In sum, the argument that France cannot assist India because of Africa's prior claim is based on wishful thinking about the solidity of the French-speaking group of Negro states.

The French Government will be the last to admit this, and that is why where the decision rests with the administration—e.g. whether or not to join officially the Aid India Club—supposed African claims will be given preference. On the contrary, French industry well knows that France is today generating capital surpluses, particularly when measured in industrial equipment, that cannot be absorbed by Africa and are available for diversion to India. The events of the next year or so may be relied upon to convince the French Government that free Africa is not a peculiarly French preserve willing and able to use all the industrial capital France can spare, and to which French benevolence should exclusively be directed. When that happens, the decision to abstain from joining the Aid India Club will be reversed. Well before then, private French industries—comfortably established in the Common Market, rapidly expanding and modernising, faced with plentiful money supplies, thanks to the French payments surplus, but left with idle capacity because export markets have stabilised at a high level before domestic demand has been allowed to revive—will be responsive to enquiries from India about investments and generous long-term credits.

For top grade Industrial Chemicals

'SEE MONSANTO' FIRST...

Monsanto works constantly to develop new, better chemicals – and to improve those chemicals you already use. In every industry, whether it be agriculture – automotive – aviation – ceramics – chemical processing – cosmetics – electrical – foods – insecticides – mining – oil – paint – paper – rubber – soaps and detergents, there is a Monsanto chemical that will help to improve production and quality.

Our West German Letter

TELEVISION SPREADS ITS TENTACLES

From Our West German Correspondent

BONN, September 15.

THE rapidly progressing television industry with its cleverly managed and continuous advertising campaigns has up till now provided over 4 million sets to the 55 million population of West Germany. The numerous restaurants and pubs with television performances provided for their guests, represent also a medium of sales propaganda as many onlookers are at first tempted and soon persuaded to buy a set. The good results of this comparatively new industry (new in the technical sense, but old and well-known electrical concerns are generally the producers) have caused remarkable damage to the film industry. The largest concern is the world-famous UFA (Universum Film Aktien-Gesellschaft), film producers as well as cinema owners, founded in 1917 and only temporarily closed after the Second World War by the occupation authorities. It showed in the last year a net loss of not less than 5.4 million DM. The General Manager Arno Hauke was ordered by the Board of Directors to go on leave till his contract is terminated by May 1961. As the main creditor is the Deutsche Bank the whole affair has created a stir in public. Whether there were some miscalculations on the part of the management or not, the main reason for the failure is, as already mentioned, the competition with television. It is, obviously, more comfortable to sit at home in an easy chair and see a picture than to go out in rain or snow and drive through crowded streets till you arrive exhausted at the cinema. But there is already a tiny ray of hope to be seen, thanks to a kind of co-existence between television and film industry in providing the first with products of the latter. The first film companies which started this kind of collaboration were called "traitors" by their rivals. But these quarrels have now stopped and film studios are happy to get employed by television. An interesting new undertaking in the realm of television is the "Freies Fernsehen G.m.b.H." (Free Television Ltd.) in which publishers of newspapers and periodicals, industrial firms and banks are participating. This company has already started its production and will send a three hours' day programme from 1st January 1961. But the whole situation is at present somewhat complicated or even confused.

To give a true picture we have to make a slight escape from the economic to the political arena. Up till now television is in the hands of the radio stations which are government undertakings of the various federal states. Since some years the Central Government which recognized in time the importance of this medium, was negotiating with the states to start a new company in which both, the Central Government and the states, should be partners. As Chancellor Dr. Adenauer saw no chance for an immediate result of the negotiations, he founded a new limited company, the "Deutschland-Fernsehen G.m.b.H." (the Germany Television Ltd.) on behalf of the Central Government and made the Minister of Justice, Dr. Fritz Schaeffer, a trustee for the states. Some of the states are headed by Chief Ministers of Dr. Adenauer's CDU party (Christian Democratic Union) and others by Chief Ministers of the main Opposition party in Parliament, the SPD (Social Democratic Party of Germany). This "coup" of the 84 years old Chancellor (latest joke: Dr. Adenauer is too old to retire) caused an uproar. Even his own party Chief Ministers refused to sign on the dotted line and two states headed by Socialist Chief Ministers have instituted legal proceedings against the Central Government. Some opposition newspapers accused the Chancellor even of trying to secure a "television mouth piece" for next year's elections. Before concluding the report on this remarkable "television muddle", it should be mentioned that advertising over television has started jeopardizing the advertising in illustrated weeklies. An institute for public opinion found out by scrutinizing 36 of these periodicals that the proportion of advertising pages to the entire number of pages of a single issue has gone down from 35.3 per cent in April to 34.7 in May and to 29.8 per cent in June.

* * *

It goes without saying that the position of the trade unions in view of the almost non-existing unemployment has never been stronger than today. The iron and metal trade unions reached for the coming year an increment of 8.5 per cent and, perhaps even more important, the gradual reducing of working hours which will be 40 hours to the week in 1965 with uncurtailed wages. It was only a question of time when other trade unions would follow suit. Now the miners are already negotiating with their employers' associations demanding an increment of not less than 12 per cent although their wage-agreement is still in force. The latter are not in a strong position as they quite rightly fear that their workers, if not satisfied, might switch over to other industries. This wage movement will shortly affect trade unions of various trades and its consequences might become rather serious. These additional expenses could reduce the means of the industries which otherwise would be spent in rationalization and automatization. Furthermore, the purchasing power of the workmen will—according to official and private estimates—increase by about 9—10 milliard DM a year which can easily lead to rise in prices or to inflationary trends. On the suggestion of Dr. H. J. Abs of the Deutsche Bank (one of the "Three Wise Men" who toured India on behalf of the World Bank) leading bankers and industrialists as well as the President of the Bundesbank, Dr. Blessing, met recently in Frankfurt to discuss the present economic situation. According to the press communique issued subsequently, it was the general opinion that the progressive trend of the economy demanded that the stability of the currency must be maintained under any circumstances. It was recommended that the efforts of rationalisation have to be strengthened to encounter the threatening tendency of rising prices. Also the Minister of Economics, Prof. Erhard, is well aware of the dangerous situation and intends to call an authoritative committee of 6 or 8 economists and market research workers, who would be asked to scrutinize all the factors of price stability. Dr. Paulssen, as representative of the employers, and Willi Richter, the chairman of the trade-unions head organisation, have given their consent to the appointment of such a consultative committee.

* * *

We have again to revert to the absorbing topic of aid for developing countries. A welcome and significant development is that the Foreign Office will shortly institute a special section which will be exclusively concerned with this subject. Up till now the Ministry of Economics and the Finance Ministry were also working in this line and, therefore, sometimes avoidable duplication of work might have occurred. The new arrange-

ment does not, of course, exclude the collaboration of the Aid-Section of the Foreign Office with the said Ministries, but it will be finally responsible for effective execution of the various actions of aid. In this connection a surprising proposal ought to be mentioned. The Director of the State Bank of Westphalia, Hugo Boegemann, suggests a new kind of additional income-tax, the revenue of which should be used for projects in developing countries. He arrives at a figure of not less than 4356 million DM per year. Without going into details how the spending of this amount would affect the German money market or the export of capital, it is quite interesting to note how the author of this scheme works out the above-mentioned amount. Six million, people not paying any income-tax at present, would have to pay 3 DM per month or 36 DM per year which amounts to 216 million DM. The next category would pay 5 DM per month or 60 DM per year, yielding 360 million DM. The following batch of 6 million, earning a higher income, would have to pay 25 DM per month or 300 per year, amounting to 1800 million DM. The last and highest group of 3 million income-tax payers would contribute 55 DM per month, or 660 DM per year, amounting to 1980 million DM. But the clue to this proposal is that the payers would have to spend their money in fact not as income-tax into the coffers of the government, but these amounts would be treated as long-term loans which will be granted to the developing countries. In other words, all the German income-tax payers and even those wage-earners not paying income-tax at all, would finance this aid. Since this certainly original suggestion was only made recently in one of the leading financial newspapers, one will have to wait for the reaction of the public as well as of the Government. Whether the Government would favour such a bold experiment seems doubtful. It should be remembered that the German people go to the polls next year.

* * *

West Germany has nowadays the reputation not only of being the country of the so-called "Wirtschaftswunder" but also of having become very materialistic. This latter observation might be true only to a certain extent. Whether cultural interests are dormant or again active is proved by the outstanding success of the German publishing house of Bertelsmann, in the small town of Guetersloh in Westphalia, which just celebrated its 125th anniversary. Its book society, founded 10 years ago, which is publishing only really good books, has a membership of 2.5 million! It is the largest book society in Europe. Bertelsmann overcame the usual opposition of booksellers against book clubs by appointing them as selling agents of the society. Since 1945 this publisher alone issued 140 million volumes, and his popular encyclopaedia sold 1.5 million copies. Every day 45,000 book parcels are being despatched by post and 40 tons of books by rail. Some years ago, Bertelsmann started a gramophone record society. Up till now 500 different classical records are supplied to 360,000 members through the relevant retail trade. The latest branch of this publishing house will be television production, specializing in decent features for families and young people. The origin of this unique firm was the publishing of Christian theological literature which plays also today a great part in its activity. On the occasion of the jubilee the workmen were promoted to clerks, which raised their social standing and gave them great advantages in social insurance. The additional contributions will be paid by the firm which employs 5,000 employees. For research work in the field of "bookselling in the changing society", the house of Bertelsmann made a donation of 1 million DM.

Economic Report from the U.S.

ROLE OF AUTOMATION IN INDUSTRIAL DEVELOPMENT

By

GUY SIMS FITCH

CHICAGO, SEPT. 13.

TWO huge industrial exhibitions here are offering a glimpse into the future, and in the process, are throwing light on current trends in the U.S. economy. These are the production engineering show and the machine tool exposition, which together make up what is described as the biggest exhibit in the world. The twin displays, revealing the latest in tools and production equipment, are staged only every five years. They thus are centres of attraction for businessmen, engineers and economists not only from the United States, but from other countries as well, who come to examine—and often to purchase—the products of American research and development. In all, more than 125,000 persons from the United States and about 50 other countries are attending the 10-day exhibits which opened on September 6. By their very nature, these exhibits traditionally have marked new trends in industrial development, and this year is no exception. Already, they are being hailed rather glowingly by their sponsors and also by many who have viewed them, as harbingers of a new industrial revolution. There is a clear stress on continuing automation of industrial processes. This, after all, was to be expected. What is more significant is the distinct trend toward combining the electronic brain and the machine, on an unparalleled scale. This technique of automation is most advanced in the metal working industry. But the next big step, from all indications, will be its application to virtually all industries, in small as well as large plants.

At the heart of the new technique is a new type of control system, called "numerical control." It tells a machine exactly what to do through symbols recorded on magnetic tape, punch cards or electronic plates. This eliminates the need for often bulky and intricate mechanical equipment built into the conventional automatic controls. As a result, it is now possible to set up new machines more expeditiously and at less cost than before. They will run with greater accuracy and to exacting tolerances heretofore unattainable. They will be able to perform many different and difficult operations, shifting quickly from one to another with a change of the control card or tape, thereby providing a new flexibility in production scheduling. In the long run, all this means more and better products, turned out faster and at less expense. It is noteworthy that this gigantic demonstration of accelerated industrial progress comes at a time when American machine tool orders have been relatively slow, and when many American companies—manufacturers of durable goods in particular—seem to be reducing their scheduled outlays for new plant and equipment. The fact, then, that some 400 American companies have put on display more than 1,000 new machines and about 10,000 production components means that they are looking beyond the present temporary situation to a continuing long-term growth of U.S. industrial and economic activity.

But even with regard to the short-term future, there are business executives who believe that the machine tool industry has been passing through a rather normal summer lull, and that orders will pick up again soon, spurred by the new equipment on display here. This, they recall, is what happened after the last machine tool and engineering exhibition back in 1955, which also showed many new and improved devices. And, they point out, the five years since then have witnessed a particularly rapid advance in technology. In addition, they note that with the American production potential at an unprecedented high, the emphasis in American industry during the past few years has been on modernization rather than expansion of productive facilities. This could help sustain tool and machinery production, even if total outlays for new plant and equipment were to lag for a time.

Another bright spot is the foreign interest in American equipment. Already strong, it may pick up even further as a result of the new advances on display here. Moreover, it is reasonable to assume that expanding economies around the world — in both developed and developing lands — will continue to offer growing markets for the tools and equipment that are representative of American technological progress and production know-how.

WORLDGRAM

India

Automobile Sparking Plug Industry: The automobile Sparking Plug Industry will continue to be under protection till December 31, 1963, with the acceptance by the Government of India of the recommendations of the Tariff Commission. The industry is under protection since 1955. The last extension of protection for five years was due to expire on 31st December, 1960. The present extension of three years will be at the existing rates of duty. The attention of the industry has been drawn to the Commission's recommendation that the industry should make efforts to tap indigenous sources for the supply of raw materials such as cement filler and high refractory cement powder.

*

Loan to ICICI: The US Government approved on September 15, 1960, a loan of $5 million (Rs. 2.38 crores) by the US Development Loan Fund to the Industrial Credit and Investment Corporation of India Ltd. Formed in 1955, ICICI seeks to stimulate India's industrial development by providing various types of long and medium term finances to private industrial enterprises. Proceeds of this loan will be used to meet the foreign exchange costs of capital equipment imported by industrial firms with the assistance of ICICI. The industrial categories to be assisted through this loan have been mutually agreed upon by ICICI and DLF.

*

Industrial Machinery: Current year's production of industrial machinery including electrical machinery and equipment is likely to be of the order of about Rs. 120 crores. This is proposed to be stepped up to Rs. 300 crores by the end of the Third Plan, the aim being to achieve self-sufficiency or near self-sufficiency, in a number of cases like paper-making machinery, cement machinery, textile machinery and boilers. Domestic demand is expected to outstrip the supply in respect of machine tools, electric transformers, and electric motors, even at the end of the Third Plan requiring considerable amount of imports.

*

New Process for Sodium Sulphate: A new process developed at the Central Salt Research Institute, Bhavnagar, will make possible production annually of about 26,000 tons of sodium sulphate from the Sambhar Lake bitterns amounting to 250,000 tons. The bitterns are obtained during the extraction of common salt from the Sambhar Lake brine in Rajasthan, the largest single salt production centre in the country. It has been estimated that an industrial plant producing 14 tons of sodium sulphate daily will require an investment of Rs. 9.6 lakhs. About 20 tons of high-grade common salt are obtained as by-product. The return on the total investment has been estimated at 31 per cent.

Japan

National Income: The gross national product of Japan in 1959 is calculated to have registered a 14.6 per cent rise in real terms over the figure of 1958. The rate of increase is said to be a post-war high compared with the previous record reached in 1951 of 13.5 per cent increase over 1950.

Brazil

Sugar Sales: Brazil which had hitherto no place in the US sugar market has now been given permission to sell 100,347 tons in the United States. Brazil got the largest share among nations which previously had held no US quota.

Ceylon

Foreign Investments: Safeguards for the security of foreign capital and the conditions on which it will be allowed to operate in the country, formed an important part of the budget speech of Mr. Felix Dias Bandaranaike, Ceylon Finance Minister when he presented the budget on September 15, 1960. In addition to the various tax and tariff concessions already available to local enterprises, the Minister stated, foreign capital would be assured that repatriation of dividends and eventually of assets, would be freely permitted.

United Kingdom

Savings: People in Britain save and invest at home and abroad about 20 per cent of their National Income. Unofficial estimates suggest that Britain has today 2,000,000 separate shareholders. Commentators of economic and financial affairs write that small investors are playing an increasing part in the stock exchange. Unit trust and investment trust movements are said to have played a big part in channelling small savings into industry.

*

Atomic Energy: At current prices, on an average, nuclear electricity is considered in UK 25 per sent more expensive than conventional electricity, while the newest conventional power stations generate power as much as 40 per cent cheaper than nuclear stations. Nuclear power, far from being considered the solution of the British economy, has now come to be regarded in some quarters as a costly white elephant. Under the current programme Britain's investment in atomic power stations is said to be around £100 million a year. Nuclear programme has been rephased considerably toning down the programme laid in 1957.

West Germany

Rising Employment: Each unemployed person in West Germany had five situations vacant for him. The number of jobs lying unfilled was 538,000 during August 1960 as against 113,000 unemployed persons at the end of August. The demand for workers from abroad is said to be increasing.

Sweden

Iron Ore: Sweden earns about Rs. 90 crores per annum, by exporting her iron ore to countries like Belgium, West Germany and Great Britain. Sweden is the second largest producer of iron ore in Europe. Mines from which iron ore is recovered for domestic use are usually owned by consumer steelworks whereas export mines are owned by Swedish companies which are in no way associated with the purchasers in Great Britain and on the continent.

Ghana

Trade with Soviet Union: A permanent showroom of the Soviet Union was opened in Accra, capital of Ghana, by Ghana's Trade Minister, Mr. F. K. D. Goka on September 17, 1960. Goods on show include cars, motor-scooters, agricultural machinery, cinema projectors and watches. Russia purchased in the first two months of this year goods worth £1,200,000 from Ghana and sold them goods worth £1,600. It is reported that co-operators of the Soviet Union and the Ghana Republic have reached agreement to start trading on a mutually beneficial basis shortly. A delegation of the co-operators of the Ghana republic, led by Labour Minister, Amuaka Robert, visited the Soviet Union in August.

Yugoslavia

Priority for Housing: 500,000 flats are to be built in Yugoslavia during the next five years. The current Five Year Plan provides for the construction of 200,000 flats. As part of the current plan, 80,000 flats are likely to be completed by the end of this year. The envisaged housing programme is expected to diminish considerably the housing crisis in that country.

*

Maize Production: With last year's production three times the average production of 1930-39, and current year's production estimated to be 6 million tons, Yugoslavia is fourth among the world's foremost producers of maize, United States, Soviet Union and Brazil occupying the first three places respectively.

Cuba

Soviet Tractors to Cuba: 'Kirovsk' Soviet diesel ship which left port Riga on September 19, 1960, is carrying, it is reported more than 300 Soviet tractors, bulldozers, and other machines for the Cuban Agrarian Reform Institute. The ship is expected to take back Cuban sugar for the Soviet Union.

*

Nationalisation: Accusing owners of cigar and cigarette firms of "open hostility" against economic development of Cuba, the Cuban Government took control of the nation's rich tobacco industry. Apart from the oil refineries, the Government of Fidel Castro has taken over American owned sugar mills, three rubber factories and a chain of American owned super markets. A decree signed by the President and the Prime Minister of Cuba was issued on September 17, 1960, ordering the nationalisation of three US banks, the First National Bank of Boston, the Chase Manhattan Bank and the National City Bank of New York. On July 6, Cuban Government got approved from the Cuban Cabinet a law authorising it to expropriate American property when deemed necessary in national interest.

*

Agreement with Hungary: Cuba and Hungary have signed a ten year agreement under which Cuba receives an $8 million credit to purchase Hungarian industrial plant. The two countries also signed a five-year commercial treaty granting each other most-favoured-nation treatment.

U.S.S.R.

Foreign Trade: Russia's total foreign trade registered a rise of more than 60 per cent between 1955 and 1959. During the same period its trade with the sterling area rose by 83 per cent. The bulk of Russia's foreign trade is still within the Communist bloc accounting for three quarters of the total. Russia has always been having a favourable balance of trade with India. The surplus dropped considerably in 1959 being only 30 million roubles as compared with 316.3 million roubles in 1958. Russia had in 1959 an unfavourable balance of trade of 503.2 million roubles with Malaya the greatest since 1955, the main item of imports being rubber.

Pakistan

Financial Assistance: A consortium of ten countries are meeting early next month to assess the possibilities of providing financial assistance to Pakistan. Pakistan's Second Five-Year Plan of Rs. 1,900 crores has a foreign exchange component of Rs. 800 crores. The broad features of the Plan have been endorsed by the World Bank. The Bank has also expressed its satisfaction of it. The foreign exchange component is expected in the form of aid loans and private investments. Finance Secretary, Mohammed Ayub is leading the three-member delegation to Washington. It is indicated that the consortium may meet annually to determine Pakistan's development requirements.

Poland

Export of Ships: The export of ships, which is playing today an important role in Polish foreign trade, will considerably increase in the coming five years period (1961-1965). The ship construction programme provides for the building in this period of 300 units of an aggregate tonnage of 1,800,000 dwt. About 150 among them (1.150 thousand dwt.) will be built for foreign shipowners. The production capacity of the Polish shipyards is nearly exhausted until the end of 1965 by orders already booked. The Soviet Union would buy half of the shipyards' production in the five year period. The flexible policy of the Polish foreign trade whereby payments in goods of the buyers are accepted, which is a boon to many countries with a shortage of convertable currency, accounts for the rush of orders on Polish shipyards. The value of the ships to be exported in the approaching five years period will amount to nearly 500 million dollars. The USSR, China, Indonesia, Switzerland, Brazil, Czechoslovakia, France and Albania are the main buyers of Polish ships.

UNDER SECRETARY TO GOVERNMENT
1 OCT 1960
PUBLIC DEPARTMENT

NEWS IN BRIEF

INDIAN

Mr. Morarji Desai went to London in connection with the two-day (Sept. 20, 21) Commonwealth Finance Ministers' Conference.

*

A new orientation is proposed to be given to the country's industrial policy in order to link industrial development with export promotion.

*

A super-thermal power station, with a capacity of 600 mw, the biggest in Asia, is to be set up by the West Bengal Government at Bandel to meet the power requirements of Calcutta.

*

High-level discussions between the Union Food Ministry and the Railway Board have revealed that the 'massive import' of PL 480 foodgrains during the next five years will not impose any excessive burden on the Railways' haulage capacity.

*

Mr. Jozef Cyrankiewicz, the Prime Minister of Poland arrived on September 21. He will stay in the country for a period of seven days. Mr. Cyrenkiewicz is on his way to Ceylon from Afghanistan.

*

India had a favourable trade balance of Rs. 8.62 crores with the USSR during the first half of 1960 against a surplus of Rs. 6.08 crores in the corresponding period of 1959.

*

To cope up with the increasing volume of work, the State Trading Corporation of India is understood to be considering the setting up of subsidiary organisations.

*

Mr. Lal Bahadur Shastri, Union Minister for Commerce and Industry laid the foundation stone recently for the Rs. 6 crores pulp and paper plant of the Sheshasayee Paper and Boards Ltd.

*

Mr. Manubhai Shah, Union Minister for Industries, recently inaugurated the New Horizon Sugar Mills, Ariyur, near Pondicherry.

*

A high official of the Reserve Bank of India will visit Kerala to hold informal talks with the banks in the State, with a view to creating strong banking units by amalgamation.

*

Maharao Madan Singhji of Kutch, Ambassador-designate of India to Chile, has been appointed envoy to Bolivia and Columbia.

FOREIGN

An agreement between India and Czechoslovakia for the operation of air services between the two countries was signed recently at Prague.

*

Indian circles in Ceylon are worried over the Finance Minister's Budget proposal to levy a tax of Rs. 400 per annum on every foreign resident visa holder, whose stay in Ceylon exceeds three months and an annual registration fee of Rs. 1,000 for every business, big or small, carried on by non-nationals.

*

The United States is likely to have a surplus in commercial exports this year to the tune of $4,000 million compared with $1,000 million last year.

*

Tanganyika achieved a £912,000 surplus instead of incurring an estimated £1.3 million deficit for 1959-60, according to Treasury accounts for the 12 months ending June 30.

*

West German trade talks with the Soviet Union will begin in the middle of October. The talks, which were to take place in September, were postponed at Russia's request.

*

A Dutch firm, N. V. Werkspoor, of Utrecht, is to supply the Hungarian railways with 380 freight trucks, worth £ 0.56 million in return of light and heavy industrial machinery. Special Dutch Government permission facilitated this barter agreement.

*

American industrial companies plan to spend $2,400 million on plants, equipment and property outside the US this year, which is about 15 per cent more than the last year.

*

Regular transmissions of television programmes have begun in Japan. The Shibaura Electric Company (Toshiba) has announced plans for mass production of colour TV receivers.

*

Soviet experts have arrived in Iraq to begin a two-year search for metallic ores.

*

The problems of the six-seven trade split are likely to be discussed in the new Organisation for Economic Co-operation and Development.

Special Article

THE RISING PRICES OF INDIA'S TRADITIONAL EXPORTS: 1959-60

IN a Special Article in "The Eastern Economist" last week it was pointed out that the rise recorded in India's export earnings during the first half of the current year was primarily due to two reasons. In the first place, trade with the Communist countries had increased and had brought in Rs. 10 crores worth of foreign exchange in addition. In the second place, India's terms of trade had improved so as to fetch an additional Rs. 25 crores in six months. Improvement in prices had mainly taken place in India's traditional commodities. Only two examples were cited last week, namely, those of tea and hessian cloth, to demonstrate the role of rising prices in inflating our export earnings. An attempt is made this week to analyse the price behaviour of all items, with special emphasis on the twenty-two traditional commodities on India's export list, which have played a major role in yielding enhanced foreign exchange.

Table I below compares the yield from both the traditional and the non-traditional items in the first half of the current year as compared to the corresponding period in the preceding year. It will be seen that the traditional items had registered a net rise of about Rs. 28.6 crores while the non-traditional items had recorded a rise of about Rs. 6.75 crores, thus making up a total rise of about Rs. 35 crores.

TABLE I

EXPORTS OF TRADITIONAL AND NON-TRADITIONAL COMMODITIES

(Value in Rs. lakhs)

Group	Jan.-June 1959	Jan.-June 1960	Variation of (2) over (1)
	(1)	(2)	(3)
1. Traditional Items			
(a) which had a rise ..	1,59,83	1,95,66	+35,83
(b) which had a fall ..	28,40	21,15	— 7,25
2. Non-traditional items ..	77,78	84,53	+ 6,75
Total	2,66,01	3,01,34	+35,33

A special study is made of the twenty-two traditional items in Table II. This table sets out both the volume and value of exports. The per unit price realised in the two half-yearly periods is also compared and in the last column the percentage changes in prices are also presented. It will be seen that except for the unimportant and small items such as sillimanite, linseed oil, carpets and floor rugs of coir and mats and mattings of coir, etc., all the major items indicated a significant rise in export prices. Even in the case of these commodities which suffered a fall in prices, the yield did not decline. In fact, they recorded a rise of Rs. 4.76 crores in export earnings. The increase registered in the case of the items for which prices have been rising came to be around Rs. 31.07 crores.

In terms of percentage increase in export prices, pepper stands at the top of the list; the prices have in this case, more than doubled from Rs. 106.40 to Rs. 286.03 for a cwt. Substantial increases in export prices have also been recorded in the case of chillies, ginger, cashew kernels, hides and skins, leather and leather manufactures, and new sacking bags.

Tea stands out as one of the major earners of foreign exchange. There has been a decline both in terms of volume as well as value, though prices have risen by about 7.2 per cent. Whereas during the first half of the last year 146.9 million lbs. of tea were exported, the volume was substantially reduced to 132.8 million lbs. during the first half of the current year. It is well-known that widespread drought in northern India brought down the volume of the crop this year. The unforeseen calamity has thus reduced the total exports of tea to the outside markets, though the main international market — London — has not been under-supplied. A part of the fall in volume was made up by an increase of about 7 per cent in prices. The export earnings in tea, therefore, recorded only a marginal fall of Rs. 1.2 crores from Rs. 36.71 crores in the first half of the last year to Rs. 35.54 crores during the first half of the current year.

In the case of unmanufactured tobacco, there was increase both in volume as well as value realised, though there was a negligible drop in prices. A substantial rise in prices was, however, recorded in the case of leather and leather manufactures. In this case there was a fall in volume from 249.8 to 208.5 ('000 cwts.) but the value realised was higher by nearly Rs. 1.5 crores because of the 35 per cent increase in prices. In other words, the rise in prices more than compensated for the decline in volume. In the case of jute goods, the overall picture shows a rise in volume as well as value, accompanied by a rise in prices as a whole. Total enhancement in yield from jute goods alone during the period under consideration was of the order of Rs. 8.7 crores. The higher increase was registered in the new sacking bags at about 26 per cent, followed by sacking cloth at nearly 13.3 per cent, hessian cloth at 11.2 per cent and hessian bags at 6.5 per cent.

It is patent, therefore, that whatever improvement in export earnings has been recorded during the first half of the current year is mostly accidental and not due to any extension in the Indian export markets. Any small down-turn in international prices may bring down the yield from export earnings to the previous year's level. The moral of this analysis is that unless concerted efforts are made to extend the field of the export markets for Indian commodities, the problem will remain unsolved. Fortuitous turns in prices, from time to time, can hardly ease the pressure on India's foreign exchange resources.

TABLE II.

EXPORTS OF TRADITIONAL COMMODITIES, 1959 - 60

(Rs. lakhs)

Commodity	Jan. - June 1959			Jan. - June 1960			
	Qty.	Value	Price per Unit	Qty.	Value	Price per Unit	Percentage change of (6) over (3)

THE BUSINESS WORLD

The Happy Warrior

By CROESUS

OF all the things that have been said or written on the occasion of the birthday centenary celebrations of Dr. Visvesvaraya—15th September, 1960—nothing has appealed to me more than this one sentence in the neat tribute paid to him by Mr. C. Rajagopalachari: "A pure soul and a great heart and a passionately patriotic citizen of India enters on his 100th Year." For that is Sir Mokshagundam Visvesvaraya, every inch of him. It is also the central theme of all that has been said this week throughout the length and breadth of the country and, more particularly, in Bombay and Bangalore where more than half of his wholly useful and purposeful life has been spent. He is truly the embodiment of integrity. What could be more appropriate for me than to devote my column this week to add my humble quota to the country-wide chorus of tributes to the grand old man whose whole life has been spent in the dedicated service of the motherland?

What is Dr. Visvesvaraya, a well-known writer has asked in a pretty pen-sketch of the great man—the man or the legend—and he has himself answered the question by ruling out the dichotomy as being inapplicable in this case. The man is what he is and any legend that may have been woven round his eventful life must or should be true, even if it be only a legend. In his case, the only thing that counts is work, good and honest work. Even whilst living in the midst of a people known for their interminable petty differences, parochial outlook, linguistic or religious fanaticism, he has remained uninhibited by any of these considerations even remotely. No sacrifice has been considered as too great by Dr. Visvesvaraya when it came to a question of having to compromise talent or merit for one or other of such considerations. It may not be knows to many that he resigned from the Mysore Service when he found himself confronted with such a situation on one occasion. It was the question of assisting the backward communities. Dr. Visvesvaraya went all out to encourage them by providing educational and other facilities, but when it came to making appointments, he insisted, the only thing that mattered was merit. This is clearly brought out by the first important appointments he made to the Mysore University—Dr. Radhakrishnan, Prof. K. T. Shah and Dr. A. R. Wadia, none of whom, incidentally belonged to Mysore of those days.

Mr. H. V. R. Iengar, speaking to the members of the National Kannada Education Society, Bombay, last week, recalled a few episodes in the life of Dr. M. V. which have their invaluable lessons not only for his but for generations to come. The "I told you so" mentality, he said, has not even once sullied the several technical reports he had to make, some times is respect of matters where his expert advice had been sought earlier and rejected.

An interesting revelation was made by Mr. Iengar. I had been under the impression that Dr. M. V.'s first reference to planning came only when he published his "Reconstructing India", but the Governor of the Reserve Bank recalled a lecture which he had attended uninvited—a privilege of the student community, he added—in 1916, at the Bangalore Engineering School, wherein Dr. M. V. had adumbrated his outline of a plan for the economic development of the country. This means, as Mr. Iengar rightly said, that he was not only ahead of all modern planners but also of the Russians. I must hasten to add here that although Dr. M. V. is for economic planning, he is certainly not for the overcentralised, highly bureaucratised plan such as we have today.

It was from Mr. M. A. Master's address to a distinguished audience of Mysoreans in Bombay that I learned that we owe our shipping today as much to Dr. M. V. as to the pioneering efforts of the Scindias. He called Dr. M. V. his "guru" in shipping and related how it was from Dr. M. V. that he first received a very useful book on shipping. Pleasantly surprising even as this was, I was not prepared—notwithstanding Dr. M. V's range of knowledge—to put him on a par with so eminent a British shipping magnate as Lord Catto in matters relating to the subject. Yet the fact was that Lord Catto found himself irrisistably and wholeheartedly endorsing a suggestion of Dr. M. V. which, by the way, some Directors of the Scindias, before hearing from Lord Catto, were not prepared to accept either as sound enough or as workable. The suggestion related to combining trading with shipping. Mr. Master also revealed, to the same audience, Dr. M. V's complete understanding of the textile industry when it fell to his proud lot to discuss the possibility of starting the first textile mill in Mysore in 1917.

As Rajaji has put it in his inimitable way, "Sir M.V.'s one passion in life has been — it still is the same when he is entering his 100th year — the desire to see India industrially developed." In wishing and working for this, he has been solely motivated by two considerations, namely (1) that, unless India becomes industrialised, she will not become a great power and (2) that the only way to relieve the unduly heavy pressure on land in India is to shift from the villages those who either have no work or only very little work to the towns where industries are located or are to be located. Because of this burning passion of his for industrialisation, he has been misunderstood or at any rate, made to appear, as minimising the importance of agriculture, but only 'pundits' with little or no knowledge of Dr. M. V. and his work could be guilty of such unwarranted misunderstanding.

Whenever Dr. M. V. went to foreign countries — and he has done this umpteen times — he could not help observing the contrast between the living conditions of people in the advanced countries of the West and those of our people. Of the few great Indians who have consciously and selflessly striven all their life to raise the living standards of their countrymen, Dr. M V. is perhaps the greatest. The criminally slow

pace of our economic development despite over half a century of missionery sloganising — industrialise or perish — by men like Dr. M. V. is a tell-tale commentary on the tempo of our dynamism.

Fortunate is this country which can pride on having produced at least a few great souls like Dr. M. V. whose one passion is not their own individual advancement or self-aggrandisement but the country's and its entire peoples' advancement. Today a grateful nation salutes this happy warrior for his venerable age, his merited rank, his splendid qualities and, lastly, his remarkable achievements. 'Warrior? Yes, has he not been fighting his incessant battle against poverty and ignorance? May the Almighty spare him for many more years to come to inspire us all.

Business Notes

Sugar

WHY EXPORT?

THOSE WHO assailed the Food Minister's move to explore the possibilities of exporting sugar to America and read politics in a genuine trade deal where none actually existed or exists, will have second and sober thoughts on the precise position. It is the pressure exerted by our foreign exchange tight situation which is impelling us to seize every opportunity to mitigate that pressure. The truth about the exports to America is that a gap exists in that country in the supply of sugar and since this gap is to be met outside the quota sugar at controlled price fixed in terms of the International Sugar Agreement, India has reasonable ground to find by negotiations if she can fill the gap partially only to remove fractionally the gap in her own foreign exchange. The fact that political developments in Cuba have been accidentally responsible for this gap, is irrelevant for this purpose. Apparently, these critics have taken a cue from the Chinese malicious comment that India is taking advantage of the difficulties of Cuba. The Government's latest decision to allow a quota of 50,000 tons for export of sugar at some loss where Cuba is not concerned should serve as an eye-opener to them.

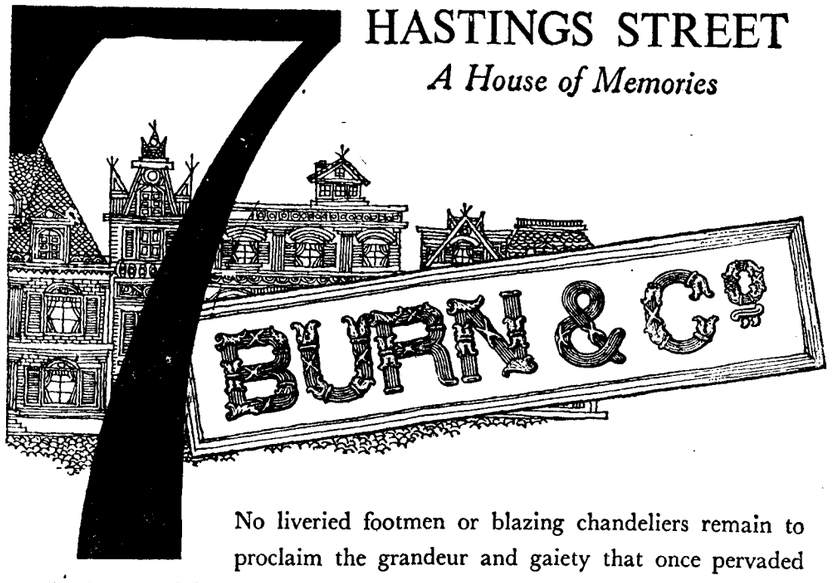
One of the specific conditions of this quota for export is that it will be directed to other markets than America. The markets where Indian sugar would be readily acceptable seem to be Malaya and the Middle East, among other possible ones. There our sugar is likely to be paid a price of about £40 per ton which is above £38 per ton as fixed currently in the International Sugar Agreement. But since these regions are not signatories to the Agreement, it has become possible to procure the higher price. On the basis of £40 per ton, it is estimated that India would incur a loss of about Rs. 2.85 crores considering the present domestic price ruling at about Rs. 1,100 per ton. The loss would accrue from two reasons, one, the sacrifice of excise duty and the cane cess which would be about Rs. 1.14 crores, and two, Rs. 1.71 crores representing the gap between the ruling domestic price (minus the excise duty and cane cess) and the above-mentioned export price which we are likely to fetch.

These exports are to be channelled exclusively through the agency of the Indian Sugar Mills' Association. How the loss resulting from export is to be absorbed is a tough question to which the Association is unlikely to find a ready and easy solution, unless the domestic prices is raised. The small margin of profit from the past exports is totally insufficient to cover it. The 'raison d'etre' of permitting this export quota is that, in view of the comfortable supply position which allows a surplus to be shipped abroad, the opportunity should be seized to acquire the much-needed foreign exchange, which has become all the more valuable in consequence of our latest acute tightness. This is a matter with which politics has not even the remotest connection. Even in the case of the projected export to America, the dominating consideration is the possibility of getting fertilizers on something analogous to a barter deal, although it may not be precisely of that nature.

Chemicals

METTUR'S STEADY PROGRESS

AT THE annual general meeting of the Mettur Chemical and Industrial Corporation Limited held recently, Mr. Narayanaswamy, who presided in the absence of the Chairman, Dr. P. S. Lokanathan, pointed out that the company was progressing well towards its expansion scheme to double the production of caustic soda. The first stage of the expansion has been fulfilled and the production of caustic soda has been stepped up to 20 tons per day and stable bleaching powder to 30 tons per day. In this connection he pointed out that the first instalment of loan of Rs. 15 lakhs from the Industrial Finance Corporation of India has been drawn out of the total sanctioned amount of Rs. 33 lakhs. The expansion programme is fairly costly and consequent on increase in the cost of plant and equipment the directors have, it is revealed, proposed to supplement the financial requirements by the issue of two lakhs equity shares of Rs. 10 each at par against the unsubscribed capital of Rs. 20 lakhs.



The Company has to go ahead with the expansion programme in view of the fact that there still is a big gap in the output and demand of caustic soda in the country. As against 77,555 tons produced in the country in 1959-60 the consumption was estimated at around 200,000 tons at the end of the Second Plan. This gap at the moment is being filled by imports which are released to the market by the State Trading Corporation. The proposed additions to the capacity of caustic soda and bleaching powder are sure to save a considerable amount of foreign exchange.

The Company has also put up an electrolytic potassium chlorate plant with a capacity of two tons per day. On account of the non-availability of power the commencement of production was delayed till quite recently, when the plant was inaugurated by the Chief Minister of Madras on August 30, 1960. Potassium chlorate is bound to be helpful to the matches industry which flourishes on a cottage scale in South India.

Cement

INDIA CEMENT PLANS FOR EXPANSION

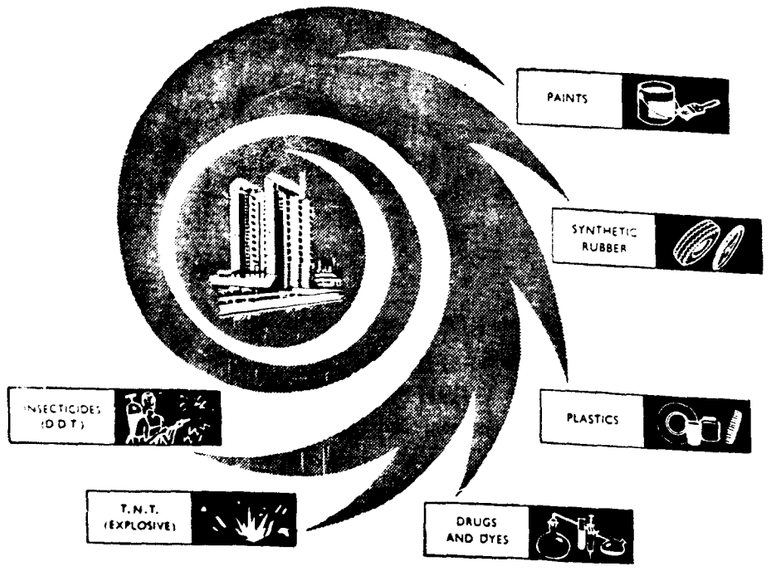
MR. P. SURYANARAYANA, Chairman, the India Cements Limited, pointed out at the annual general meeting held recently at Madras that in line with the rising output in the country, the company too had registered an increase. During 1959, there was an increase in the country's output to the extent of 6.8 million tons, which means a 13 per cent rise over the previous year as against 8 per cent during 1958. The sales of cement companies have been higher. A slowing down in the offtake which was experienced during 1958 was not witnessed in 1959 and there has been a considerable upsurge in demand. The offtake by both

HASTINGS STREET

A House of Memories

No liveried footmen or blazing chandeliers remain to proclaim the grandeur and gaiety that once pervaded the large red brick mansion that still stands in Calcutta's Hastings Street and which Warren Hastings, India's first Governor-General, built for his charming wife as her town house. For many years this fine residence was the scene of glittering assemblies and balls, the entrée to which was considered a high social privilege.

In 1827, No. 7 was acquired for the purpose of its business by the old established engineering firm of Burn & Company which occupied it for almost a century. By reason of its expanding business, Burn & Company found this historic building with its cobbled carriage drive and spacious rooms too small, and in 1925, the Company was forced to sever its link with this house of memories and moved to larger premises in Clive Street, where it joined hands with Martin & Co.



Today, the activities of Martin Burn Ltd. cover a wide range of engineering interests including those brought to it by the renowned firm of Burn & Company all of which are vital to the rapid development of India's industrialisation.

A SIDELINE OF STEEL
...By-product Coal Chemicals

A steel plant is a many-sided affair. Various iron and steel products are, of course, the main items and their effects on the economy are there for all to see. Billets from Bhilai, for instance, have already toned up an important industry in the country—the Re-rolling Mill

But the steel plants at Rourkela, Bhilai and Durgapur have another way—somewhat indirect, but no less important—of influencing the country's economy. What may be called a sideline of steelworks, the By-product Plants attached to the coke ovens, produce a variety of coal chemicals from the coke oven gas and crude coal tar obtained during the carbonisation of coal into coke. When they go into full production, these By-product Plants, set up at a cost of Rs. 20 crores, will be the biggest chemical production complex of their kind in the country.

Producing eleven different varieties of chemicals, worth Rs. 5 crores a year, the By-product Plants will stimulate a wide range of manufacturing activities. Benzene will, for instance, go into the manufacture of plastics and insecticides like DDT and will feed the proposed synthetic rubber project in Uttar Pradesh. Increased supply of creosote oil, now in short supply, will enable the Railways to treat more wooden sleepers for railway lines. The proposed intermediate dye project and the synthetic drug manufacturing projects are primarily based on by-product coal chemicals from Hindustan Steel. Other industries to be served by these chemicals are paints, disinfectants, aluminium smelting and explosives

The coal chemicals from three plants :

BENZOL PRODUCTS	ESTIMATED ANNUAL OUTPUT
Benzol/Benzene	6 million gallons
Toluene	1½ million gallons
Xylene	500,000 gallons
Solvent Naphthas	500,000 gallons
TAR DISTILLATION PRODUCTS	
Naphthalene (Hot Pressed)	2,000 tons
Anthracene (Crude)	3,000 tons
Phenol – Pure	1,000 tons
Cresol – Pure	500 tons
Xylenol – Pure	150 tons
Creosote Oils	50,000 tons
Road Tars and Pitches	75,000 tons

HINDUSTAN STEEL LIMITED

Works : ROURKELA • BHILAI • DURGAPUR
Headquarters : Ranchi
Sales Office : 2, Fairlie Place, Calcutta

PSHS / 60

the Government as well as other consumers has been growing so rapidly that some shortage of cement was felt in certain regions of the country. Apart from this, the country could export cement to the extent of 155,000 tons in 1959 as compared to 41,000 tons in 1958 which is of considerable significance because it will earn much-needed foreign exchange at the present critical moment. Thus there is the possibility of additional production capacity coming into existence.

Considering the rising demand for cement, the India Cements Limited plan to expand their capacity. Orders sanctioning the requisite mining rights for a branch factory in Vishakhapatnam district in Andhra Pradesh are expected from the State Government. Machinery, electrical and other, for the plant has already been ordered. The directors are also exploring the possibility of setting up another cement factory at Salem in Madras State. The Chairman pointed out that their preliminary investigations have shown that adequate raw materials are available for the starting of the factory. In view of the fact that construction activity during the Third Plan is bound to increase, the rising installed capacity of India Cements Limited will only be in tune with the requirements of the country.

Planning

RESOURCES SCHEME SCRUTINISED

SOME IMPORTANT features of the Third Five-Year Plan formed the main theme of the address of the President of the Indian Merchants' Chamber, Bombay, at the second quarterly general meeting of the Chamber last week. This is as it should be, now that the Draft Third Five-Year Plan has been thrown open for public criticism and comment. Mr. Pratapsinh Mathuradas, the President, who dwelt at length on the resource aspect of the Plan, maintained that, without tapping the internal resources of the economy, it would be difficult to step up the rate of investment from 11 per cent at the end of the second Plan to 14 per cent at the end of the Third Plan, as contemplated by the planners. Considering the bottlenecks prevailing in the Indian economy, such as the low level of foreign exchange resources, the 20 per cent increase in the level of prices and other factors, he said, the view held by certain sections of the community, that it is feasible to raise the rate of saving to 45 per cent, was unwarranted, as this would involve untold hardships and undue privations to large masses of the people.

Mr. Pratapsinh next referred to the Planning Commission's proposal to raise additional taxation to the tune of Rs. 1,650 crores. Pointing out this worked out to 22.7 per cent of the total investment in the public sector, he expressed serious doubts about raising the present level, additional taxation, as it meant raising the present level, which is already 8.5 per cent of the national income, to 11 per cent. He, however, conceded that there was some scope for increasing indirect taxation on selected commodities "not quite essential in the present need for restraining consumption."

As regards foreign assistance of the order of Rs. 2,600 crores or 30.7 per cent of the public investment for the Third Plan period, the I.M.C. Chief said that it was too early to postulate the possibilities of obtaining external resources of this magnitude.

Protection

COTTON TEXTILE MACHINERY

THE OPENING speeches of the Chairman of the Tariff Commission inaugurating the public inquiries into the claims of different industries for protection are important for the reason that they give a bird's-eye-view of the progress recorded by each. It is from this angle that Mr. K. R. P. Aiyangar's opening speech at the start of the enquiry into the continuance of protection to the cotton texile machinery industry is of interest.

The scope of the present enquiry is to cover, in terms of Government's reference to the Tariff Commission, spinning ring frames, spindles, spinning rings, fluted rollers and automatic looms. There are requests from manufacturers for extending the scope of enquiry to a few more items, but a decision on these requests has not been taken so far. At present there are 13 units which manufacture protected items of textile machinery and they are situated as follows: Maharashtra 6, Gujarat 3, Madras 2, Bengal 1; and Madhya Pradesh 1. The Madhya Pradesh unit produces automatic looms and it is soon to be joined by two more units to whom licences for manufacture have been granted.

The expansion in the Third Plan and the backlog of rehabilitation have pushed up the domestic demand for various items of textile machinery. The Textile Commissioner has estimated that the annual domestic demand during the Third Plan period would be 1,800 for spinning ring frames, 0.85 million for spindles, 1 million for spinning rings, 0.31 million for fluted rollers and 6,000 for automatic looms. The Mill Owners' Association, Bombay, has estimated the demand for spinning ring frames at 2,000 and for automatic looms 9,500. Besides these, there are other estimates, which the Commission will consider.

The progress in rated capacity (single shift) and in the total production of the items is tabulated below broadly for 1957 and 1959:

	Installed Capacity		Production	
Item	**1957**	**1959**	**1957**	**1959**
1. Spinning ring frames	804	1,020	1,364	1,077
2. Spindles	0.78m.	1.18m.	0.69m.	0.54m.
3. Spinning rings	0.75m.	1.08m.	0.74m.	0.67m.
4. Fluted rollers	0.26m.	0.33m.	0.15m.	0.15m.
5. Automatic looms	1,560	1,560	311	356

The production of automatic looms was severely restricted by the fluctuations of demand, but in the first quarter of 1960 it recorded an upward trend at 157.

The raw materials required by this industry are pig iron of No. (i) and (ii) grades, mild steel, free cutting steel, alloy and tool steel, hard drawn bright steel, tin plate and coke. Out of these pig iron and coke are domestically available in toto, while mild steel and tin plates are partially available from indigenous sources. The other items are imported. But even as regards indigenous raw materials there are difficulties of adequate and timely supplies in respect of different items. In so far as the quality of the home products is concerned, protection has been justified by the industry. The Textile Commissioner has informed the Commission that the quality is satisfactory. The automatic loom-producing unit is battling against difficulties and with the technical collaboration of a Japanese firm it is making a determined effort to turn out products of improved quality. The cotton textile machinery industry has been included under the special export scheme for engineering goods, efforts are being made to explore the markets in the neighbouring countries and actually a beginning has been made in exports with ring frames, spindles and spinning rings to Ceylon and Ethiopia.

FROM THE CAPITAL'S CORRIDORS

FERTILIZER DELEGATION'S INTERIM REPORT

THE Government of India has received an interim report from the six-man Fertilizer Delegation, headed by Mr. C. R. Ranganathan, which it sponsored in April last "to collect data about the performance of nitrophosphate fertilizers (manufactured by different processes like PEC—carbo-nitric process—and ODDA—refrigeration, crystallisation and centrifuging process) in West European countries." The submission of this report, it is learnt, has been expedited due to the fact that two large factories are being set up in the public sector for the production of urea and nitrophosphate, one at Trombay and the other at Kothagudem (Andhra Pradesh). The Government is anxious to find out which of these two fertilizers will be more useful for Indian soils and consequently what changes should be effected in their proposed production at these two plants. The Trombay factory has been designed to produce 97,500 tons of urea and 2,54,000 tons of nitrophosphate by making use of refinery gases and rock phosphate which will have to be imported. The proposed capacity of the Kothagudem factory is 97,200 tons of urea and 1,83,000 tons of nitrophosphate. This plant will use slack coal from Singareni instead of refinery gases.

MAIN FINDINGS

The following are main findings of this Delegation:

(1) The decision to utilise part of the ammonia produced in the projected factories for the manufacture of nitrophosphate is in keeping with the world trend towards the production of high analysis complex fertilizers which would lead to economies in fertilizer costs as well as in bagging, transport and labour costs.

(2) Manufacture of nitrophosphate has two advantages. Firstly, use the nitric acid, instead of sulphuric acid, to process rock phosphate will help cutting down imports of sulphur; nitric acid can be produced from indigenous materials in quite substantial quantities. Secondly, rock phosphate when attacked with nitric acid yields a product which has nitrogen in larger quantities.

(3) Through acidulation with nitric acid followed by neutralisation with ammonia, nitrogen in the product occurs in both ammoniacal and nitrate forms. Although paddy can take up ammoniacal nitrogen directly, for most other crops the presence of both forms of nitrogen in the fertiliser has the effect of providing both immediate nitrate and deferred ammoniacal supplies of the nutrient.

(4) When rock phosphate (phosphorite) is dissolved in nitric acid, the resulting solution consists of PO4, NO3, fluorine, hydrogen and calcium ions. This may, for the sake of simplicity, be regarded as a mixture of phosphoric acid, nitric acid and calcium nitrate. When this mixture is neutralised with ammonia, dicalcium phosphate, ammonium nitrate and calcium nitrate are formed. It is not possible to produce a free flowing granulated fertiliser with good keeping qualities out of this mixture unless calcium nitrate, which is a highly hygroscopic salt, is eliminated. The Delegation has reported on various methods evolved in West European countries to eliminate calcium nitrate from the resulting product.

(5) About the suitability of applying dicalcium phosphate, especially in the form of granulated complex fertilizers, to nearly neutral or calcareous soils—the types of soil in Andhra and Maharashtra which are contemplated to be fed by the fertilizers produced at the Trombay and Kothagudem factories—the delegation has found that the experience of West European countries in this regard is not of much help, because it is confined mainly to acid soils and to crops other than paddy (experience of these countries in regard to paddy is only limited).

The Delegation quoting the opinion of some authorities on the subject, with whom it had discussions, observes: "For short duration crops, especially for those of limited root range such as paddy, it is essential that some water soluble phosphate should be applied in order to ensure its quick availability." It adds: "The European experts consulted said that, although they had no experience of paddy cultivation, they believed, on the basis of their experience with other cereals, the nitrophosphate applied to paddy should contain between 30 and 50 per cent of water-soluble phosphate. The Delegation accepts this view and considers it a safe approach to the problem, until such time as agronomic experiments in India give a specific indication of the value of citrate-soluble phosphate to paddy." The Delegation has recommended that properly planned experiments be conducted to assess the relative fertiliser values of citrate-soluble and water-soluble phosphates in paddy cultivation. The nitrophosphates which are to be produced at Trombay and Kothagudem should be used in these experiments. Storage trials to assess the keeping qualities of the nitrophosphates under different climatic conditions should also be undertaken at the same time. It would be desirable to introduce and popularise among the cultivators who will be served by the two proposed factories the types of nitrophosphate which it is decided they should produce. The fertilisers should be imported in substantial quantities and distributed among the cultivators during the three years or so that will be required to set up the factories.

TROMBAY PLANT

Some of the other important points made by the Delegation are:

"The Delegation has taken note of the fact that for Trombay tenders stipulating the production of nitrophosphate of the PEC type have been invited and that the last date for the submission of the tenders was June 30, 1960. The Delegation sees no reason to disturb this arrangement, since the PEC plant (with such minor modifications as may be required) is versatile enough to produce nitrophosphate containing an adequate amount of water-soluble P2 O5 (phosphorus pentoxide). This can be done by using a mixture of nitric and sulphuric acids in suitable proportions for the decomposition of rock phosphate followed by ammoniation, or, alternatively, by adding appropriate quantities of single or triple superphosphate or ammonium phosphate to the slurry in the carbo-nitric process before granulation. Such an arrangement would allow of the cheaper standard product of the carbo-nitric process (16-14-0), containing no water soluble P2 O5, being produced in the quantities required for long-term crops, such as sugarcane."

"Admittedly, the sulpho-nitric process involves the use of sulphuric acid, but the quantity required will be considerably less than that required for a corresponding amount of superphospate. The Delegation does not consider the partial use of sulphuric acid as a serious disadvantage, because the position as regards the availability and price of sulphur has radically changed during the last four years. Sulphur is now available from many sources in the world in almost unlimited quantities and its c.i.f. price at Indian ports has come down sharply from about Rs. 275 to Rs. 150 per ton. Further, there are projects in India for producing sulphuric acid as well as sulphur from indigenous pyrites. Mention may also be made of the possibility of producing sulphuric acid from hydrogen sulphide recovered from middle fractions at the Trombay refinery.

KOTHAGUDEM FACTORY

"As regards the factory in Andhra Pradesh, it is understood that tenders have been invited for the production of nitrophosphate by the PEC as well as by the ODDA process. In this case, the Delegation would recommend that consideration be given to the possibility of adopting the Kampka Nitrophosphate process which is a modification and improvement of the original ODDA process. In the Kampka Nitrophosphate process, calcium nitrate which is a by-product in the original ODDA process is first separated and then treated with ammonia and carbon dioxide. From the resulting mixture, ammonium nitrate solution is separated from the precipitated calcium carbonite by filtration and is re-cycled to the mother liquid left after the separation of calcium nitrate, so as to produce a nitrophosphate containing 24 per cent N (nitrogen) and 16 per cent P2 O5. This process would eliminate the use of the objectionable calcium nitrate fertiliser and would, at the same time, yield a complex fertiliser with a higher nutrient content and a more satisfactory N: P ratio than the PEC product for Indian conditions. The by-product calcium carbonate being in a finely divided form, should find ready industrial use, including use as a vehicle for insecticidal or pesticidal formulations."

SECOND THOUGHTS ON IMPORT PLANS?

The Government of India, it is understood, is having second thoughts on the import programme for the half-year ending March next. This presumably has been necessitated by the disappointment caused by the last week's Paris deliberations of the "Aid-India Club." The Government of India had hoped that the Club would make available for immediate use credits to the tune of Rs. 70 crores and another Rs. 10 crores by March 31, 1961. These expectations have not materialised.

The joining of Netherlands in this Club has been welcomed here. It is hoped that France and Italy will follow suit in the near future.

What repercussions Mr. Khrushchev's visit to the UN had on the Paris meeting of the "Aid-India Club" is not yet known. A feeling has been expressed in certain circles here that any attempt by India at the present juncture, which results in enhancing Mr. Khrushchev's hold on the new African nations or on Asia may not have a healthy effect on aid prospects from Western countries. What repercussions, if any, the announcement of setting up a small car manufacturing unit in the public sector had on the Paris conference is also not yet known.

NDC MEETING

The National Development Council met last week and dispersed without laying down any clear-cut policy or taking any decision on the three major problems discussed by it. The Council failed to settle the issue of State trading in food grains on which, reports suggest, there has arisen difference of opinion between the Prime Minister and the Union Food and Agriculture Minister. Mr S. K. Patil is reported to be of the view that State trading in foodgrains can be usefully employed during periods of crisis, but in the present agricultural situation, there is hardly any need for it. Controls, he feels, are cumbersome and expensive and create uncertainty. The Prime Minister, on the other hand, is said to be holding the view that "State trading provides a useful apparatus of strategic control in the pursuit of price stability."

On the question of holding the price line, the Council is reported to have agreed that all measures necessary to keep the prices spiral under control should be taken. No clear picture, however, has emerged about the steps that are envisaged to be taken.

The third important problem which came up for discussion—and on which the Council was supposed to have taken a decision—was the fitting in of the State Plans into the overall Third Five-Year Plan for the country. The Council's deliberations in this regard remained inconclusive. The matter will be again taken up in December.

EXPORT OF SUGAR

The Government of India has announced its decision to release 50,000 tons of sugar for export. Exports will be effected through the Indian Sugar Mills' Association.

A Press note issued on Saturday by the Union Ministry of Food and Agriculture said that the Government had taken this decision "after taking note of the trend of production, consumption and the supply position of sugar."

In addition to the quantity now released for export, the Government of India is separately exploring the possibilities of exporting sugar to the United States.

MANUFACTURE OF INDUSTRIAL MACHINERY

Industrial machinery worth about Rs. 300 crores is expected to be manufactured in India by the end of the Third Plan period, as against the current year's production of Rs. 120 crores.

Though substantial increases in indigenous output have been planned in almost all cases, imports will still be inevitable in the case of machine tools, electric transformers and motors because of the ever-increasing demand for them. For the first time during the Third Plan period, production of heavy machinery will commence in the country on a large scale. India will also become self-sufficient in the machinery requirements of cement, sugar and textile mills.

The estimated production of various types of machinery in 1965 compared to the output during the current year is as follows:

(Rs. lakhs)

Type of Machinery	Estimated Output in 1960	Expected Production in 1965
1. Paper-making Machinery	80	650
2. Tea Machinery	100	150
3. Cement Machinery	60	475
4. Sugar Mill Machinery	500	1020
5. Solvent Extraction Plant	48	250
6. Mining Machinery	15	1600
7. Construction Machinery	88	250
8. Weighing Machinery	60	165
9. Machine Tools	600	2300
10. Small Tools	400	1500
11. Electric Transformers	700	3000/3500
12. Electric Motors	600	3000
13. Diesel Engines	630	1188
14. Power-driven Pumps	240	412
15. Jute Mill Machinery	175	230
16. Printing Machinery	5	350
17. Chemical Machinery	210	2000
18. Boilers	50	1000
19. Heavy Electrical Equipment	—*	2500
20. Heavy Machinery	—*	100

*Production just started.

ELECTRICAL GOODS

The Heavy Electrical Industries Development Council has recommended that the following installed capacity targets should be fixed for the manufacture of electrical goods in India under the Third Five-Year Plan.

(1) **Transformers:** Taking into consideration that the increase in power generation during the Third Plan period would be of the order of 6 million KW (one million KW each in 1961-62 and 1962-63, 1.2 million KW in 1963-64, 1.3 million KW in 1964-65 and 1.5 million KW in 1965-66) and assuming (a) a power factor of 85, (b) 1.5 times the step-up transformer capacity for arriving at step-down transformer capacity and (c) twice the step-up transformer capacity for arriving at demand for distribution transformers, the anticipated demand for step-up, step-down and distribution transformers and the

capacities proposed to be established are:

Year	Step-up and step-down transformers		Million K.V.A. Distribution transformers	
	Demand	Target capacity	Demand	Target capacity
1961-62	2.9	3.3	2.35	2.75
1962-63	2.9	3.3	2.35	2.75
1963-64	3.5	4.0	2.8	3.25
1964-65	3.8	4.5	3.0	3.5
1965-66	4.4	5.0	3.5	4.0

2. **Electric Motors Up to 300 H.P.:** Assuming that 50 per cent of the energy generated would be available for industries using electric motors and taking load factor at 40 per cent, the anticipated demand for electric motors up to 300 h.p. and the proposed capacity for their manufacture are:

Year	Demand	(Million H.P.) Target capacity
1961-62	1.6	1.9
1962-63	1.6	1.9
1963-64	2.0	2.35
1964-65	2.2	2.6
1965-66	2.5	3.0

3. **Switchgear and Control-gear:** Anticipated demand and target capacities proposed are:

Year	11 KV circuit breakers and switch-boards incorporating the same		(Thousand numbers) L.T. circuit breakers and switch-boards incorporating the same	
	Demand	Target capacity	Demand	Target capacity
1961-62	1.50	1.80	12.00	14.50
1963-64	1.80	2.20	14.40	17.50
1964-65	1.95	2.50	15.50	18.00
1965-66	2.25	2.65	18.00	21.00

Year	Iron clad switches		(Lakh numbers) Motor starters	
	Demand	Target capacity	Demand	Target capacity
1961-62	24	29	1.50	1.80
1962-63	24	29	1.50	1.80
1963-64	28	34	1.80	2.15
1964-65	30	35	1.95	2.25
1965-66	36	42	2.25	2.65

4. **Light Electrical Industries:** Production targets recommended for 1965-66, compared to 1960-61 targets, are:

Industry	1960-61 target	1965-66 target
Electric Fans	1,000,000 Nos.	2,500,000 Nos. (inclusive of export provision)
Radio Receivers	350,000 Nos.	1,000,000 Nos. (plus 20-30 per cent extra for small scale sector. This includes provision for exports)
Electricity Meters		
(a) AC single-phase meters	1,000,000 Nos.	1,500,000 Nos.
(b) Polyphase meters	115,000 Nos.	150,000 Nos.
Dry Batteries	205/210 million cells	350 million cells
Storage batteries		
(a) Motor vehicle batteries	600,000 Nos.	800,000 Nos.
(b) Train lighting cells	84,000 Nos.	Nil.
Electric Lamps		
(a) GLS lamps	35.5 million Nos.	58 million Nos. (Plus 10 per cent extra for exports)
(b) Other similar lamps	5 million Nos.	10 million Nos. (Plus 10 per cent extra for exports)
(c) Miniature Lamps	22 million Nos.	45 million Nos. (Plus 10 per cent extra for exports)
(d) Fluorescent Tubes	2 million Nos.	6 million Nos. (Plus 10 per cent extra for exports)
(e) Vapour Discharge lamps including mercury vapour lamps	100,000 Nos.	300,000 Nos. (Plus 10 per cent extra for exports)
(f) Photo Flash lamps		(To be assessed later on by the Panel)
Refrigerators		
(a) Domestic	20,000 Nos.	50,000 Nos.
(b) Commercial (including ice cream cabinets, bottle coolers, display and walk-in type, etc.)	—	6,000 Nos.
Room Air conditioners	25,000 Nos.	50,000 Nos.
Water Coolers	3,000 Nos.	20,000 Nos.

The Council feels that there is some shortage of fluorescent tubes and has recommended that increased production should be arranged early by allowing extra shift working in the existing units. Owing to difficulties of foreign exchange, the Council is of the view that implementation of some of the projects contemplated during the Second Five-Year Plan is being delayed.

MANUFACTURE OF TRACTORS

A new licence has been issued to David Brown/ Mahindra Tractors (Private) Ltd., under which the company can step up its output of David Brown tractors to 3500 units per year—nearly three times the production permitted under the initial manufacturing licence granted last year. The new licence also allows the manufacture of the David Brown 850-D and 950-D implematic tractors of 35 h.p. and 42.5 h.p. respectively. The previous licence authorised production of only 2-D tractors of 14 h.p.

The company is currently setting up a factory near Bombay to undertake production of these three types of tractors and implements. Until these premises are ready, part of the existing Mahindra and Mahindra plant will be utilised for assembling semi-knocked-down (SKD) tractors, the first consignment of which was shipped from the United Kingdom last month. Plans are to manufacture in course of time upto 66 per cent of the components is India. A higher percentage of indigenous manufacture may be feasible ultimately, provided the local industrial development reaches the stage envisaged under India's current development plans.

In preparation for the official inauguration of the scheme next month, a training school conducted by David Brown technicians from the United Kingdom is being established in Bombay, where service engineers and demonstrators nominated by Mahindra and Mahindra Ltd., and their branches in Delhi, Calcutta, and Madras will be trained in tractor servicing and operational techniques. The newly trained Indian technicians will then be formed into field units which, under the supervision of the British instructors, will subsequently undertake a series of country-wide demonstration tours. En route they will also conduct training courses for dealers' representatives in selected centres.

DIGJAM

TO DRESS YOU BEAUTIFULLY

The connoisseurs in fashions can now meet their needs in DIGJAM WOOLLENS pattern Suitings, Gaberdines, Tropicals, Ladies' apparel in beautiful and choicest shades to suit every style and occasion at moderate prices

COMPANY AFFAIRS

STANDARD-VACUUM: NO DIVIDENDS

During 1959 no dividends were paid on ordinary shares. The volume of crude oil processed and product sales by the Standard-Vacuum Refining Company of India Limited was slightly less than in 1958. The refinery was shut down twice during the year—once for normal inspection and the second time because new equipment installed in the Combination Unit was not meeting the Company's own quality specifications. An average of 33,812 barrels per day was processed during 1959 compared to 33,890 barrels per day for the previous year, resulting in a total production for the year of 4,111 lakhs of imperial gallons. The total sales of all refined products during 1959 amounted to 39.75 crore imperial gallons of which 35.17 crore imperial gallons were sold in India. The remainder, totalling 4.58 crore imperial gallons consisting of motor gasoline was surplus to the requirements of the country and was exported to Australia and New Zealand resulting in foreign exchange earning for India to the tune of Rs. 249 lakhs. Since the refinery went into operation in 1954 total foreign exchange earnings, including export earnings, are estimated at Rs. 792 lakhs.

Gross income increased from Rs. 28.17 crores in 1958 to Rs. 30.07 crores in 1959. At the same time net income increased from Rs. 1.10 crores to Rs. 1.33 crores. The 1959 profits represent a return of 4.44% on gross income and 6.58% on the average capital employed as compared to 3.90% and 5.69% respectively for the year 1958. However, the excise demands would have an effect of reducing the profit percentage to 2.66 on gross income and 3.99 on the average capital employed.

As anticipated, all phases of the refinery expansion programme have been completed in 1959 resulting in a capital expenditure of Rs. 102 lakhs and the Company has started supplying asphalt and other additional products required in India, thus resulting in additional foreign exchange savings to India.

THE BIRLA COTTON RECOVERS

During the year to March 31, 1960 there was further increase in the price of cotton, coal, dyes and chemicals etc. The dearness allowance paid to the employees had also to be increased. Further from 1st January, 1960, wages had to be increased in accordance with the recommendation of the Textile Wage Board. All these factors contributed to an increase in the cost of production. There was, however, an improvement in the prices of coarse and medium quality cloth manufactured by the Birla Cotton Spinning & Weaving Mills Ltd. In the circumstances the working results for the year to March 31, 1960 are considered satisfactory.

After adjusting the debit balance brought forward from the previous year and transferring a sum of Rs. 1.45 lakhs from general reserve there is a net balance of Rs. 21.59 lakhs. A sum of Rs. 6.50 lakhs has been separated towards depreciation, Rs. 4.75 lakhs to development rebate and Rs. 6 lakhs to taxation. The Directors have recommended the payments of dividend subject to deduction of income-tax under the income-tax act at the rate of Re. 1/- per ordinary share of Rs. 10/- each.

The Ginning and Pressing Factory at Malout worked satisfactorily while the Tent Factory worked only to a partial capacity on account of paucity of orders received from the Government. Steps were taken for the amalgamation of Merchandise & Stores Ltd. and Rajputana General Dealers Ltd. with the company. During the current year sanction of the Punjab High Court, Circuit Bench, Delhi, was obtained for the amalgamation of the two companies with the Company and both the companies have, therefore, been amalgamated with this Company. Necessary steps in this connection are being taken.

SIMPLEX CARRIES OUT RENOVATION

During the year to March 31, 1960 the Simplex Mills Co. Ltd., carried out heavy repairs and replacements of the plant and machinery. As a result, after providing normal depreciation etc., the year's working shows a comparatively small profit. As the expansion and rehabilitation work has been completed and finer qualities of cloth are being produced, the Directors of the Company hope that the working results in the coming years will be better. During the year the profit was Rs. 11.69 lakhs. After adjustment in respect of depreciation and taxation there was a net profit of Rs. 1.65 lakhs. Taking into account the loss carried forward from the previous year to the extent of Rs. 5.14 lakhs, there was a debit balance of Rs. 3.49 lakhs which is proposed to be carried forward. A sum of Rs. 7.56 lakhs has been transferred from General Reserve No. 1 and the Directors have recommended the payment of a dividend at the rate of Rs. 7.50 per fully paid and consolidated share of Rs. 50 each subject to deductions of income which will absorb Rs. 7.56 lakhs.

COMMODITY NEWS AND NOTES

JUTE OUTPUT AND INDUSTRY

The Indian Jute Mills Association is embarking on a jute development programme to supplement the work at present being done in this direction by the Central and State Governments. While the general trend of jute production in India has been upward, there is considerable scope for both increasing the acreage yield and improving the quality of the jute. It is essential, therefore, that urgent steps be taken to create conditions under which the growers will earn more from the land put under jute, through rationalisation of their methods of production, and the manufacturing industry will have guaranteed supplies of good quality jute at reasonable and stable prices. For this purpose, the I.J.M.A. proposes as a first step to set up Demonstration Blocks in selected districts in West Bengal to educate the cultivator in the use of modern farming techniques and demonstrate what these can achieve. This pilot project will be extended to other States in due course. At the same time, surveys of seed and fertilizer requirements will be carried out by the Association in each of the jute growing States and the machinery for their distribution reviewed. Consideration will also be given to a seed multiplication project for the complete saturation of all the jute growing areas over the next few years. Another important aspect from the point of view of fibre quality is the retting process, and the Association proposes to undertake a survey of the retting facilities in each area with a view to bringing these up to the required standard where necessary.

With regard to the current season's crop, it is as yet too early to make a firm estimate of the quantity of jute that will be available, but the I.J.M.A. hopes that the Government of India's recent policy decision with regard to the import of cuttings from Pakistan will provide a welcome addition to the indigenous production.

HIGHER RECOVERY OF SUGAR

Higher quantity of sugar from cane juice can be secured if interfering 'non-sugars' are removed out of it. This can be better achieved with the help of Ion-Exchange resin. These findings have been confirmed by the National Sugar Institute, Kanpur, as a result of large-scale experiments carried out in the pilot plant fabricated and installed for this purpose in the Institute. Cane juice contains, besides sugar, many soluble mineral salts and organic substances which are broadly termed as 'non-sugars'. Cane juice is first purified by the conventional liming and sulphuring method (Sulphitation) and then filtered to remove all the suspend impurities. Nearly 200 gallons of filtered and purified juice is then treated by the Ion-Exchange process to remove the non-sugar impurities. The demineralised juice is then concentrated and crystallised repeatedly to obtain the maximum amount of sugar. Finally, waste-molasses is obtained which generally contains 30 to 35 per cent sugar. As a result of this process, an appreciable increase in the recovery of sugar as compared to usual purification system is obtained. Besides, due to the removal of impurities, the waste-molasses so produced from demineralised juice has much better edible characteristics.

PRODUCTION AND CONSUMPTION OF RUBBER

Preliminary figures issued by the International Rubber Study Group reveal that consumption of natural rubber was still running ahead of production in June. In the case of synthetic rubber, the position was the reverse. World production of natural rubber during the month was estimated at 160,000 tons, and consumption at 177,500 tons (including estimated imports into Russia of 15,250 tons and into China of 13,500 tons). Production for the first half of 1960 was put at 960,000 tons, and consumption at 1,015,000 tons. Natural-rubber stocks at the end of June were estimated at 677,500 tons, a fall of 7,500 tons since the beginning of the year. The Study Group estimated synthetic production during June at 160,000 tons, and consumption at 152,500 tons. Stocks at the end of June amounted to 337,500 tons, representing a rise of 27,500 tons since January.

Company Meetings

THE INDIA CEMENTS LIMITED

MADRAS

Speech delivered by Sri P. Suryanarayana at the 14th Annual General Meeting of the Company held on Friday the 2nd September 1960.

GENTLEMEN,

It gives me very great pleasure in welcoming you to the 14th Annual General Meeting of your Company. The Report of the Directors and the Audited Statement of Accounts for the year ended the 31st March, 1960 have been in your hands for sometime now, and with your kind permission, I will take it as read.

It is needless for me to offer any detailed explanation regarding the financial position and the other aspects of the Company, as the figures in the Balance Sheet bear ample testimony to the continued strong and stable position of your Company.

The working of the factory during the year has been quite satisfactory and was not hampered by any power cut which was till now an annual feature. The factory is functioning with both economy and efficiency. The production has been above rated capacity. The 750 tons plant in Talaiyuthu went into production in August 1959 well ahead of the schedule as envisaged by me during the last General Body Meeting. But for some minor teething troubles, the new plant is working satisfactorily.

The infant Indian Republic completed the first decade of its existence 10 years of stress and strain but also of solid progress in many fields. The country has embarked upon successive Five Year Plans for converting an essentially agrarian economy into an industrial one, with the avowed object of making available to the teeming millions of this country the fruits of the present day scientific and technological advance that tend to raise the living standards. The economic climate has almost been revitalised, so much so that today an investment of Rs. 10 thousand crores for the Third Five Year Plan or a rise of 5% in the national income which would have been considered fantastic in 1951-52, apart from the misgivings of the economic plans as instruments of realisation of certain basic social and economic activities, is now in the realm of possibility of achievement and it is deemed inevitable to sustain a minimum rate of growth. Grave doubts were entertained about the contribution of private enterprise towards the welfare of the nation. They now stand dispelled. The part played by the private sector towards the development of the nation has been realised and the Government are planning financial and technical assistance to industries in the private sector.

The pace of industrial production which was slowed down in 1957-58 showed a marked increase in 1959. The rate of increase of general index of industrial production at 151.1 showed an increase of 8.2 per cent as compared to 1.7 in 1958, 3.5 in 1957 and 7 to 8 per cent in the three years 1954 to 1956. The cement industry also registered an impressive rise in production in 1959. The production of 6.8 million tons showed a rise of 13% as compared to 8% in 1958 due to the completion of many expansion schemes. Your Directors have always given serious thoughts about the possibilities of expansion of production in your factory and contribute their humble part in serving the expanding economy of your country. It is as a result of such constant endeavours the capacity of your factory has been increased from one lakh tons to 5 lakh tons.

Due to circumstances entirely beyond the control of the management the starting of the branch factory in Visakhapatnam District in Andhra Pradesh has been delayed. Orders sanctioning the requisite mining rights are still expected from the Andhra Pradesh Government. In the meantime, remittances have already been made towards the first instalment to the suppliers of both the main machinery and electric motors for the expansion scheme. Your Directors are at present also exploring the possibilities of starting a cement factory at Salem in Madras State. Our preliminary invesigations have shown that adequate raw materials are available near Salem for the starting of a Cement Factory.

I am glad to say that the sales of cement of your factory have been extremely good, and the temporary slowing down in the off-take which we experienced during the last year no longer exists, and as envisaged by me in my speech during the last year, there has been a revival of demand and the off-take by Government and all forms of consumers has been growing considerably, and we are today experiencing an acute shortage of cement in certain provinces in the country.

I have also referred last year to the necessity of developing the export market for the cement industry to augment the much needed foreign exchange to carry out our national development programme. It is gratifying to note that the exports of cement in 1959 were subsantially higher at 1,55,000 as compared to 41,000 tons in 1958. The exports of your factory are of the order of 25,000 tons during last year and it would have

been much more but for the fact that 20,000/25,000 tons have been diverted to Bombay and Calcutta markets to meet the acute shortage of cement in those areas.

Mention has been made in the Directors' Report regarding the repayment of the loans obtained from the Industrial Finance Corporation of India. I am pleased to confirm that the Company has completely repaid the entire loan outstanding to the Indusrial Finance Corporation of India.

As the shareholders are aware, the Preference Shares of your Company carry a dividend of 7½ per cent per annum subject to deduction of Indian Income tax paid by the Company in respect thereof. It has been contended that where the Articles of Association or the terms of the issue of Preference Shares stipulate that dividends are subject to tax, tax under Sec. 18(3D) only is to be deducted. The position has been examined by your Company. The management are inclined to agree, in all fairness to the Preference shareholders, that tax under Sec. 18(3D) only should be deducted in respect of the Preference shares of your Company and a voucher for the tax deducted at source be given to the shareholders. This view of the management is, however, subject to any further clarification by judicial decision or otherwise and is not to be regarded as any undertaking by the Company by itself creating any rights or making any representations as to the correct legal position or as any kind of estoppel. The steps to be taken to overcome the difficulties in the way of the Preference shareholders, as they now confront your Company, with a view to equitable adjustment of the rights of the Preference shareholders in the matter of entitlement to dividend are engaging the earnest attention of your Directors.

I had occasion, last year, to refer to the setting up of a Wage Board for the Cement Industry by the Government of India. After examination of the points of view of both the labour and the management, the Wage Board have submitted their recommendations to the Central Government and they have been accepted by the Government of India with some modifications, in February this year. The recommendations were varied and diversified. According to the recommendations, effective from 1st January, 1960, the basic emoluments of the workers have almost been doubled. As mentioned in the Directors' Report, no provision has been made in the Balance Sheet for the additional expenditure to be incurred for the implementation of the Wage Board recommendations. The Government of India have noted the view of the Wage Board that prima facie, the industry does not have the capacity to pay the wages recommended on the exising retention price, and they are now engaged in investigating into the question of additional burden on the industry on this account, which we expect the Government to fully pay. I am happy to inform you that your Company has the distinction of being the first to implement the recommendations of the Wage Board.

The industry is faced with an increase in the cost of packing materials and coal and increased cost of transport and labour necessitating a revision in the retention price allowed to each unit. I earnestly hope that the Government of India would give their utmost consideration to this matter.

Alive as they are, to the needs and welfare of the employees, your Directors have programmed to put up tenements for the workers under the Subsidized Industrial Housing Scheme. Labour occupies a very important place in the development of any nation, and more particularly in a relatively under-developed country like ours. It has, definitely, a responsibility to bear and a contribution to make, in solving the problems facing the country. If it exercises some control over its demands, it will help keep under check the rising trend of prices, which is the only disquieting feature in spite of the increase in industrial production. It is high time that labour realises that insistence on excessive demand will ruin the chances of building up industrial prosperity and unless it is prepared to modify its demands in the light of the capacity of the industry to pay, it will be faced with the stark reality of a structure of high industrial costs, with the inevitable consequences of lower-turnover and lower profits, leading to complete closure in the case of marginal units.

I am indeed happy to report that our relations with labour continue to be very cordial as usual. I congratulate them for their sense of realism and increased awareness of responsibility in our joint venture. Before I conclude, I should both on your behalf and on my own behalf like to tender our thanks to all employees of the Company for their unstinted co-operation and hard work. The Company looks forward to their continued loyal and devoted service in the years to come.

Before moving for the adoption of the Directors' Report and Audited statements of account, I shall be glad to answer any questions that may be raised by the shareholders.

Note: This does not purport to be the full proceedings of the Annual General Meeting.

Twenty-Third Annual General Meeting held on 12-9-1960

CHAIRMAN'S SPEECH

In the absence of the Chairman, Dr. P. S. Lokanathan, Mr. S. Narayanaswamy presided over the Meeting and read the Chairman's speech. He said:

Gentlemen,

Once again I have great pleasure in welcoming you all to the 23rd Annual Meeting of the Company.

With your permission, I will take the Annual Report and Accounts as read since they have been with you for some time. The past year has recorded better results than the previous year in spite of several handicaps in regard to maintaining continuous and full production. The first stage of our expansion was fulfilled successfully, the production of Caustic Soda having been stepped up to 20 tons per day and Stable Bleaching Powder to 30 tons.

Now that we have commenced production of bleaching powder at a daily rate which should take care of the current consumption in India, it is our earnest hope that the Government of India will take steps to ban the imports of bleaching powder into India.

We have also put up an Electrolytic Potassium Chlorate Plant with a capacity of 2 tons per day, fabricated and designed mostly by the staff of our research department; but due to non-availability of power we had to defer the commencement of production till the other day when the plant was inaugurated by the Chief Minister of Madras on 30th August, 1960. This will meet the growing demand in the country for this chemical which finds the largest application in the manufacture of matches on a cottage industry basis — a large cottage industry in South India.

As mentioned in the Directors' Report, we are considerably affected by the low price fixed by the Government of India for our stable bleaching powder. However, we hope that our efforts to get a revision in price will soon bear fruit.

I am glad to inform you that our expansion scheme to double our caustic soda production is making good progress. We have just drawn the first instalment of our loan of Rs. 15 lakhs from the Industrial Finance Corporation of India, who have sanctioned us a loan of Rs. 33 lakhs. To supplement our financial requirements consequent on increase in the cost of plant and equipment as well as other additions, your directors have decided to issue from out of the unsubscribed capital of Rs. 20 lakhs in the form of 2 lakhs of equity shares of Rs. 10 each at par, which issue I feel sure will meet with an overwhelming response as before from you.

Your Directors have once before, after the commencement of the Companies Act 1956, with the unanimous approval of the shareholders of the Company, recommended the issue of equity shares to the holders of preference shares as well. The present issue of Rs. 20 lakhs face value equity shares represents one-fourth of the existing paid up capital of the Company which includes Rs. 20 lakhs face value preference shares. our Directors have thought it fair to ask for and obtain your sanction as on the previous occasion for extending the rights to the new issue, to preference shareholders also, being in conformity with what we have done before

Another interesting point to which I would like to draw the attention of this meeting in this context, is that out of a total of 770 preference shareholers on the Company's rolls today, 553 such shareholders are also holders of equity shares of the Company. These 553 preference shareholders, hold among themselves 13,561 shares or approximately 2/3rd of the Company's preference capital. Only 217 preference share holders do not happen to hold equity shares and they hold 1/3rd of the preference share capital of the Company. The Directors have thought it appropriate that the new issue of equity shares should be offered both to equity and preference shareholders and seek your sanction for making the new issue in this manner.

Orders for the entire plant and machinery for the expansion have already been placed and the first shipments have also started arriving.

Production of Caustic Soda in the country during 1959-60 at 77,555 tons was nearly 30 per cent higher than 1958-59 production which was 60,316 tons. Consumption of caustic soda, which was estimated at 200,000 tons by the end of the Second Plan period is expected to increase to 340,000 tons by the end of the Third Plan period i.e. 1965-66. Government are taking steps to licence necessary additional capacity, consistent with the availability of foreign exchange. Meanwhile, the country is still importing large quantities of caustic soda to meet the gap between demand and production. Imports during 1959 stood at about 147,000 tons, being over double the 62,000 tons imported in 1958. Large releases of Caustic Soda to the market by the State Trading Corporation of India, through whom all imports are canalised, also created serious distribution problems to indigenous manufacturers on account of sudden gluts in the supply position. The matter was discussed by the industry with the State Trading Corporation of India who took a helpful attitude by stopping releases for some time and later agreeing to offer regular but restricted quantities periodically which would be sufficient to fill the gap. The distribution position has now considerably improved as a result. It is inevitable when external agencies are relied on to make supplies of caustic soda for purposes of rectifying shortages within the country, that shipments of caustic soda should arrive in the country at spasmodic intervals and

in such quantities as to have no relation to the requirements of the Indian consumer and cause imbalance in distribution. This naturally results in distress sales by the indigenous producers at a time when the ceiling prices fixed by the Tariff Commission leave a bare margin of profit to the producer, and more particularly at a time when the prices of the plant and machinery are going up day by day and consequential depreciation provisions call for a greater allocation out of gross earnings.

The power supply position also has shown an improvement during the year by the bringing into commission of the Madras Government's Kundah Hydro-electric Scheme. However, with the rapid industrialisation which is taking place and the increasing demands for agricultural operations, the problem of over-all power shortage still continues to exist. In this context, the Madras Government's Mettur Hydro-electric Tunnel Scheme which was recently inaugurated by the Chief Minister of Madras is a most welcome development and with the commencement of operations by the Neyveli Thermal Power Scheme, it is hoped that the power supply position will show further improvement. The Madras Government has also been impressing on the Centre the need for atomic power development in the State having regard to the restricted possibilities for further power development and it is hoped that the Centre will consider favourably the claims of Madras State in this respect.

I should like to make reference also to the steadily increasing food prices as a result of which there has been a steady and progressive increase in the Cost of Living Index, so that the monthly dearness allowance paid to workers and staff rose to Rs. 65-25nP. at the end of the year from Rs. 58-87 nP. at the beginning. The Index is still mounting and this must be regarded as a disquieting phenomenon.

You will have observed from the Report of the Directors, the manner of computation of the net dividend distributable to the preference shareholders. The Board has endeavoured to do justice to the holders of preference shares, while conforming to the changed taxation law relating to "tax free" preference shares. While in effect the net dividend receivable by the preference shareholders is lower than what it was in previous years before the law was changed, it was inevitable that the computation should be made in this manner, after the change in Income Tax Law was made.

I am, however, happy that the Central Government has introduced legislation to change the Income Tax Act in such a manner as to lay down clearly the procedure to be followed by companies that "tax free" perference shares in their capital structure and which I expect will mitigate the injustice to the holders of "tax free" preference shares. I hope this bill will be passed in the current session of Parliament.

There have been enquiries from some shareholders as to whether the benefit of exemption availed of by the Company under Section 15(c) could not be passed on to them in the form of a direct reduction in the rate of tax that is deducted from the equity dividend. It is true that under Section 18(3F) of the Income-tax Act, an authority rests with the Company to ascertain the total relief under Section 15c and to determine with the help of the Income-tax Officer the amount of tax that can be deducted after adjusting the relief provided under Section 15c. However, such a procedure in actual practice will take time as this will involve a reference of the audited accounts, after they are got ready, to the Income-tax Officer and in getting a ruling from him as to the actual quantum of income-tax which can be deducted from the 30 per cent statutory deduction under sub-section 3D. This would entail delay in payment of dividend.

The Company adopted the procedure of ascertaining the approximate relief available to them under Section 15c and deducted this amount from the total of tax provision that is made from out of the year's profits. You will appreciate that this resulted in increasing the amount available for distribution, which enabled us to decide upon a larger percentage of gross dividend than would have been possible if the approximate abatement under Section 15c had not been taken credit for in computing tax provision. This has resulted in the Board being able to recommend a rate of net dividend approximately equal to the net dividend paid in the previous year.

I must in conclusion express my warm appreciation of the very cordial relations subsisting between labour and management and the great care and drive exercised by the management to maintain a high level of production in which all the workers and staff have given their unstinted co-operation.

I would move that the Directors' Report and Audited Accounts for the year ended 31st March, 1960 be adopted.

Note: This does not purport to be a report of the Proceedings of the Annual General Meeting.

* At the end of the period.

Construction and installations carried out by E.C.C. at this Cement Factory include a slurry basin, slurry pumphouse, kiln foundations for the 750-tons-a-day clinker kiln, smoke Chamber, 200-foot high RCC chimney, clinker conveyor bridge, four cement silos, packing house, elevator, crane gantry and overhead tank

Civil Engineering—
yet another Larsen & Toubro activity

Factory extension completed at Tinnevelly to produce 1,450 tons of cement per day

For the Rs 2-crore extension scheme of India Cements Limited's factory at Talaiyuthu in Tinnevelly District of Madras—to increase its production capacity from 700 to 1450 tons a day—the civil works were entrusted to **Engineering Construction Corporation Private Limited,** a wholly owned subsidiary of **Larsen & Toubro Limited.**

The factory of India Cements Ltd. is only one of a number of factories and cement works completed by **Larsen & Toubro Limited** and **Engineering Construction Corporation Private Limited.**

Other important jobs at present on hand include: the construction of a 75 million-gallons-a-day water supply and treatment plant for the Hindustan Chemicals and Fertilisers Limited, Nangal; and a Rs 2½ crore wet dock at Madras for the Madras Port Trust. Design and construction of Industrial Buildings and ancillary works are a speciality of **Engineering Construction Corporation Private Limited.**

Crisis in the United Nations

SLOWLY, but with every sense of mounting drama, the battles of the Cold War are being enacted in the heart of the United Nations. Not, indeed, in the traditional manner in which either from General Assembly or from Security Council, the major exponents of the two blocs express themselves in hot, and often violent, debates. On this occasion, the battle has been joined by the giants themselves, both President Eisenhower and Mr. Nikita S. Khrushchev having spoken in the Assembly last week. The Russian Premier, leading a galaxy of leaders from practically all Communist countries, is playing the greatest role in his life in the field of open diplomacy. Never, one might say, in the history of international relations has so much been done openly by so few in the presence of so many.

This new point, namely, that in the year 1960, the practice of diplomacy — an instrument for the hidden exchange of views — has turned violently into an open performance for all who are not merely welcome but are forced to attend, is to be recognised. The open diplomacy of Mr. Khrushchev is, undoubtedly, a powerful weapon in the creation of world political consciousness. No longer is it necessary to talk of diplomacy, as with all other propaganda and advertisement, as the arena of hidden persuaders. The attack is direct, and mounted with as much drama and tension as the surrounding environment permits. In New York the surrounding environment has, on this occasion, permitted far more than seems proper, with every movement of the Russian Prime Minister attracting new attention and new controversy. It is certain that while open diplomacy of this kind persists, the old diplomacy has no immediate chance of operation. But one wonders whether any major problem of the world will be solved by the extravagant use of public emotion at every stage.

One can also wonder even more whether it is necessary to break the United Nations in order to underline a dramatic case. The extraordinary manner in which the Secretary-General of the United Nations has been made a victim of the new diplomacy has caused great concern in the Indian Union. It is largely as an expression of this concern, and as an advocate of dignity and moderation in international diplomacy, that India's Prime Minister is now a part of these extraordinary proceedings. It is perfectly clear that his sudden decision to depart for New York soon after his return from Pakistan was not merely wise, but essential. No figure in the international scene can better speak for Asia and perhaps the better mind of Africa, than Prime Minister Nehru. No one can speak with less bias of the United Nations though, since India's representative in the Congo, which is the heart of the trouble, is Mr. Rajeshwar Dayal, the Prime Minister cannot fail to extend to the United Nations a minimum of support. But it is not because the United Nations has done well or that Mr. Rajeshwar Dayal needs support that the Prime Minister's support of the United Nations has been so complete. It is because the breaking up of the United Nations will destroy the only instrument available to bridge a growing gulf between the Eastern and the Western world.

Because this crisis is one which affects the United Nations itself, it affects the entire world. Conversely, as the Prime Minister said before his departure, the crisis is not with the United Nations, but with the world at large. A change in the organisation of the United Nations, such as employing a divided executive against a single Secretary-General, is no answer for the problem. A candid review of Secretary-General's performance over the last few years will show that he has exercised his undoubted independence in a manner which deserves the highest popular acclaim.

The essential points for decision are fairly clear. The United Nations in its present form needs protection from the violent attacks made on it by the Russian Prime Minister. Secondly, that protection is best provided not by parties interested in the dispute, but countries from neutral territories whose credentials are not in question. This places India's Prime Minister in the highest capacity to help. Finally, the habits of mind of the new diplomacy in which almost anything can be said, and for a short time, believed, must give way again to an orderly exchange of views based upon the capacity of the U.S.S.R. and the United States to find some common ground on all the problems that now divide them: disarmament, inspection, control, and the obvious consequences of co-existence. If the Prime Minister is capable of bridging this gulf, he will have rendered to the world, and incidentally to India, the greatest service of a glorious political career. Everyone in India will wish him well; the stakes have never been higher both for us and for all the world.

Compulsory Arbitration

COMPULSORY arbitration in case of failure of the machinery of consultation and negotiation in trade disputes raised by government employees is unquestionably a phenomenal development in the evolution of industrial relations. Out of evil comes good, so it was that the recent strike of government employees resulted in a valuable offshoot

The light-heartedness with which the attempt was made to organise an all-out strike in Government services and state-operated undertakings, without regard for its foreseeable consequences on the security of the country, gave a measure of the extent to which irresponsibility could go. It is pointless to discuss whether the motives of the leadership of the strike were more political than

economic. But assuming that the grievances of government employees were economic and there was little politics in the strike, the failure of the leaders of the strike to weigh the probable repercussions of the very stoppage of the machinery of government on the maintenance of law and order was a danger signal of how the right of strike could degenerate into a potential instrument of subversion of authority.

The hard logic of facts forced the hands of the Government to come to a decision to put a ban on strikes in government services. Whether the ban should or should not have been imposed is now a purely academic issue. The Trade Disputes Act envisages such a ban in respect of essential services on the ground of emergency and the official service regulations empower government departments to prohibit participation of employees in strikes. A regular sanction to this ban in the proposed new legislation does not alter the factual situation. The ban — and there are parallels of countries which have imposed such a ban, including countries which have a considerable socialist influence in their political life — is not an innovation, much less a retrograde measure. Indeed, the larger public sector, the more "progressive" — because necessary — becomes a ban on such strikes.

This reasoning may appear straight-forward in retrospect. But it took not a little courage and unswerving determination on the part of Pandit Gobind Ballabh Pant to impress upon his colleagues in the Cabinet to accept without demur the logical conclusion of that reasoning. As Home Minister it was his primary duty to give a concrete legislative shape to the open policy of ban on strikes by government employees. But it speaks eloquently for his solicitude for the fundamental rights of labour to safeguard its interest that he incorporated in the proposed new policy two valuable principles — provision of a machinery for consultation-cum-negotiation and, in the event of its failure, compulsory arbitration. As the position now obtains, Government can straightaway refuse to refer for adjudication a dispute with its employees. From this privilged position to acceptance of compulsory arbitration is literally a metamorphosis in its policy. Advocates of the existing theoretical right of government employees to strike completely ignore this profound change.

It was this forceful brief with which Mr. Nanda was armed as he went to preside over the last week's session of the Indian Labour Conference. Vociferous opposition to the ban on strikes and to the elimination of outside leadership from the trade unions or staff associations of government employees was quite expected at the session. In fact, the first day of the session witnessed some fireworks. But the noisy opposition cooled down on the next day. The reality of the situation was that not even the flimsiest defence could be put up for the action of the organisers of the strike. The Hind Mazdoor Sabha was on the weakest ground of all. Its spokesman reminded Mr. Nanda on the first day that he ought to have resigned on the issue of the need-based formula — accepted in principle by the 14th Indian Labour Conference — and on the next day he was profuse in his praise acclaiming that "Mr. Nanda was the best Labour Minister we had." Mr. R. Ramamurthy, representing the Communist-controlled All-India Trade Union Congress, could do no less. In all seriousness he asserted that the AITUC was opposed to strike as such as it was its thesis that arbitration was the effective way for the settlement of disputes.

There is no doubt that Mr. Nanda by a skilful presentation of his views — this time really those of the Government of India — has arranged a happy conclusion to what promised to be a stormy meeting. He should be given full credit for this success; and one can hope that his more realistic leadership will gather strength over the less responsible elements in India's trade union movement.

Independence for Nigeria

ON October 1st, the Federation of Nigeria will attain its independence. This will mark yet another landmark in the history of African nationalism which is now discovering itself. With a size four times that of Britain and containing over 35 million people, Nigeria is the most populous country in Africa and with its independence, the population of Britain's colonies will be halved. The significance of Nigerian independence will be equalled only by that of Ghana and would go far in shifting the balance of forces in Africa. Again, in the context of the Congo, Nigeria provides an admirable model of decolonisation by a colonial power. Not only will the British departure be graceful and dignified but the transition has been made orderly and peaceful by the experience that Nigeria has already gone through in the responsibilities of self-government under a parliamentary system.

For, the Constitution with which Nigeria becomes independent is not one hastily devised to meet an urgent situation. It has been most carefully worked out in full agreement between Nigerian leaders and the British Government in a series of constitutional conferences that actually began in 1953. In 1958, all parties rivalled each other in protesting devotion to a united and strong Nigeria and they joined to produce a constitution which in itself should be one of the unifying forces in independent Nigeria. The Federal elections held in last December resulted in a coalition government between the governing parties of the Northern and Eastern regions, namely, the Northern Peoples Congress and the National Council of Nigeria and Cameroons, with the governing party of the Western region, the Action Group, playing the part of an effective opposition in the Federal House. It is one of the healthy features of Nigerian politics that instead of declining to be a one-party State, which is the general tendency in Africa so far, Nigeria will be blessed with a strong and sensible opposition. Though divided on other questions, all the three major parties are agreed that Nigeria should remain within the Commonwealth on the attainment of independence.

This is the wisest course. Though Britain has paved the ground in many respects including the provision of a nucleus of a Nigerian diplomatic corps that will be prepared to represent the Federation after independence, there is still a serious shortage of Nigerians for top posts in Government, education and business and the present system of training will have to be considerably expanded to meet the increasing demand for capable personnel. At the same time, the need for Western knowhow and technical skill for its economic development cannot also be under-estimated. The outstanding figures of Nigerian politics are Dr. Azikiwe, who will become the Governor-General and Alhaji Sir Abubakar Tafawa Balewa, the Federal Prime Minister. Faced with an opposition that is frankly pro-western and even pro-American, and Dr. Azikiwe, who is known to espouse Dr. Nkrumah's line of 'Africa for the Africans', the Federal Prime Minister, who is himself credited with being pro-western, has to follow a cautious middle course. Though no Nigerian politician can openly go against the "Africanist" policies of Dr. Nkrumah and President Sekou Toure of Guinea, Nigeria will have to adjust it to suit her own needs. That the Federal Prime Minister is aware of this fact is seen from his recent statement that "two generations of Britons have guided Nigeria into this era of self-determination and we wish further generations to help us to carry out our responsibility." As regards foreign policy, the Prime Minister has indicated that it will be one of non-alignment with either of the power blocs and generally based on the pattern of India. India has already appointed her High Commissioner in Lagos and the strong delegation led by the Union Law Minister, which will represent India at the Independence Day celebrations, underlines the growing friendship between the two countries.

It is a fact of great importance that the Nigerian Federation is a substantial federal achievement. The moulding of a solid Nigerian nation out of the diverse communities—the Hausas, Yorubas, Ibos, and others—demonstrates the real possibility of accommodating the ethnically heterogeneous elements within the framework of a Federal Union. Though federalism finds its enthusiastic supporters in Africa, there have not been many notable successes so far. With the split in the Mali Federation, Ethiopia with which Eritrea has been federated and Nigeria alone constitute *bona fide* federal achievements. But the Nigerian example may well provide the impetus to others, notably the Maghreb Federation consisting of Algeria, Morocco and Tunisia in the North and a confederation of states in the East including Kenya, Uganda and Tanganyika. But Nigeria seems to be in no mood to entertain any "dream" of a union of African States as conceived by Ghana and Guinea. The cleavage of opinion as regards Pan-Africanism and other kindred questions between Ghana and Nigeria has already come into the open. But there seems to be no doubt that in the further evolution of African nationalism, Nigeria, because of its size and importance, will be a stabilizing and moderating force against some of the more extreme slogans of Dr. Nkrumah and President Sekou Toure.

New Curbs on Bank Credit

THE "dearer money" policy, practised by the Reserve Bank of India for sometime now, has been taken this week a step further; the Reserve Bank has announced some measures aimed at tightening credit by the scheduled banks. Though it did not raise the Bank Rate from 4 per cent, it fixed a borrowing quota for each scheduled bank at 50 per cent of its statutorily required deposits with the Reserve Bank. If any scheduled bank seeks additional accommodation from the Reserve Bank, it has to pay a penal discount rate—one per cent more than the Bank Rate for borrowings 100 to 200 per cent over the quota and two per cent for borrowings in excess of that. Ceilings for borrowings from the Reserve Bank fixed for individual scheduled banks under the Bill Market Scheme have been made inoperative. Banks have been directed to charge from October 1 a minimum lending rate of 5 per cent on all advances, whether existing or new, clean or secured, with the exception of advances to other banks, including co-operative banks. Banks have also been asked to raise the structure of their interest rates so as to ensure an increase of at least ½ per cent in their average lending rates. No bank shall pay interest at more than two per cent below the Bank Rate on any deposit (other than inter-bank deposit) from October 1.

The announcement of these measures has, paradoxically, caused both concern and relief. Discerning observers of the Indian economic scene had been expecting even more drastic a step in the shape of an outright increase in the Bank Rate. That has been avoided by the Reserve Bank presumably owing to the fact that it would have led to a precipitate fall in the prices of Government securities. In a way, the Reserve Bank has been forced to take these measures. A few weeks ago, it had advised the scheduled banks to reduce their advances during the current slack season by about Rs. 110 crores. The scheduled banks, however, have so far effected a credit contraction of only a few crores of rupees. As against this, they have been increasing their borrowings from the Reserve Bank against usance bills and promissory notes; these borrowings went up from Rs. 7.25 crores on August 26, to Rs. 10.96 crores on September 16 (On September 18 last year these borrowings amounted to only Rs. 1.90 crores).

Will these measures achieve the object they have been designed to attain?—the object being to secure an abatement of the pressure of monetary demand which has been a contributory factor to the rise in commodity prices. There can be little doubt that they will have some effect on the price level in the country, notwithstanding the fact that in India there are large quantities of money in circulation outside the banking system. Misgivings have been expressed in some circles that the scheduled banks may circumvent these curbs by resorting to sale of Government securities on the stock market instead of borrowing from the Reserve Bank at penal rates. Any large-scale operations of this sort, however, can be ruled out for the simple reason that stock market has only a limited capacity to absorb these sales without registering a fall in prices, in which case the scheduled banks will hesitate to sell heavily the securities in their possession. Moreover, the direction of the Reserve Bank to the scheduled banks to effect a general increase of minimum ½ per cent in their lending rates will itself mean slightly more costly credit which, though it may increase cost of production somewhat especially of industrial goods, will help in reducing the holding capacity of the stockists. Coupled with some fiscal and administrative measures to hold the price line, as contemplated by the Government, these credit curbs will help the price situation to ease to some extent.

There is, however, need in recognising the necessity for a control on money supply to point to the dangers of overdoing even well-conceived policies. At present the economic system seems to be pausing; unwise restrictions by the Reserve Bank may precipitate a recession.

A DELHI DIARY

LIGHT IN DARKNESS?

I MIGHT as well confess that I have been away from Delhi throughout the week missing all comments here on the Prime Minister's Pakistan visit as well as the Prime Minister himself. I pray to be forgiven. The opportunities available to a journalist to depart from Delhi and literally bury himself in rural problems are hard to come by: when the Prime Minister is here, we are expected to stay at our posts of duty. How then do we see directly, instead of as copies of copies, in Plato's phrase, twice removed from the truth? I refer particularly to the silent revolution in the countryside where great new portents are visible if one chooses to search for them. On this particular occasion I am giving myself entirely over to rural co-operation, more precisely, to the Federal Union of Co-operative Milk Societies in Kaira District in Gujarat and the 187 co-operative societies of which it forms the apex or central servicing unit. In all the years of Independence, I cannot think of any movement of the people which can so stir one's heart as this tremendous experiment in self-help which has achieved such spectacular results. It is, in fact, later than Independence; for, in less than a decade, a rural transformation has taken place in 187 villages of a kind which must be seen to be believed.

DO PRODUCTIVE CO-OPERATIVES WORK?

In India the thousand-rupee question is: Do productive co-operative societies work? The answer in Delhi in most cases is a sceptical shrug of the shoulders, or a belief that where there is success there are such exceptional factors that the success itself is "accidental." But let the statistics speak. In Kaira District, of the 187 milk co-operative societies included in the Anand Milk Co-operative Union, over a hundred might be said to be working splendidly, something like 30 to 40 more might be described as moderately successful, and only between 25 to 30 seem to be dragging their feet. This is in respect of hard business; in "intangibles" the record is better. A new democratic pattern has grown in respect of the management of these societies and, in many of these villages, 99.5 per cent of the people with buffaloes are members of the co-operatives participating actively each day in their activities. What are these activities? One must go out at 6 o'clock in the morning to see how the milk is collected in the villages where it is tested for fat, bought at a fixed price (depending on its fat content which must be above 6.5 per cent), and where payments are made each evening for the morning's milk and the next morning for the evening's milk. All this is done on a fixed time schedule which has practically no equal in rural India. Trucks run by contractors come in precisely at time fixed (with only fifteen minutes grace) and milk is carted away to Anand where a modern dairy pasteurizes, standardizes the milk for fat content, makes butter and powdered milk and is now attempting cheese. The co-operative union is a prosperous business unit using its own resources for development, guaranteeing to the farmer or the milk supplier the highest possible price for his milk provided it comes to standard. Milk below standard is rejected ruthlessly, and discipline enforced by tests (sometimes delayed to teach erring members a difficult lesson that honesty is the best policy!).

Here is a picture, not merely of business efficiency with an integrated organisation of collection, testing, standardization and, finally, marketing both in Ahmedabad and in Bombay, but a powerful instrument of local emotional integration. I was told that, initially, there was some little hesitation in joining the society but now the fame of fair dealing has gone so far that almost every villager in the 187 societies who has a buffalo has become a member on payment of Rs. 5, the minimum share price. The elections to committees are hotly contested and in one case the polling was 99 per cent of the electorate. Some elected members of the co-operative society have learned the hard lesson that this is an educated electorate, understanding well the purposes of the co-operative society and visiting harsh judgment on negligent or unreliable members of the committee. One's first impression (I have no other!) is that here deep roots have grown and that democracy is growing as fast as milk supply.

THE ARITHMETIC OF SUPPLY

How fast is milk supply in Anand growing? I fear I have no rate of growth to which to append the current production of 2,000 maunds per day, of which 700 maunds go to Ahmedabad and about 1,000 maunds to Bombay. The arrangements for transport, particularly to Bombay, are amazingly modern. The milk is loaded on full carriages (supplied by New Zealand), similar to oil tankers, but curiously not refrigerated. It has been found that covering the 260 miles to Bombay, the temperature rises only 2 degrees F—from 45 degrees F to 47 degrees F. But of all the figures with which I have been supplied I single out two, namely, the price paid for milk at the village and to the union. The society sells at 3¼ annas per pound and the federal unit at 3½ annas, thereby netting enough to finance costs on the major operations of the federal unit. These include not merely the expansion of the Central Dairy, but also the maintenance of an X-ray hospital at Anand, and general expenditure on research and testing. There is also a happy combination of larger welfare with business. The societies are compelled to give free milk to children under five years of age under an agreement with UNICEF, by which their liability for the original machinery plus interest, valued at Rs. 12 lakhs in all, is to be discharged over a period of five years. From the little that I could see of the attitude of the people, they will continue free supply of milk to their children for all time. Thus has a gracious habit been set in operation under that old cockney adage: It is the poor what 'elps the poor."

What are the elements which go to explain the success of this gratifying picture? Undoubtedly, there is the tremendous participation of the people and their leader, the Chairman of the union from its inception, Mr. Govind Das. A factor of no less importance is the very efficient civil service run by the federal unit under the guidance of the General Manager, Mr. Kurien. "The civil service" includes engineers, dairy technologists and administrators, some of whom have been trained abroad; one particularly in Australia under the Colombo Plan, where, as he told me proudly, he acquired not only Australian know-how, but, even more happily, an Australian bride who has found her place magnificently in this dynamic society. In a microcosm, Anand is the kind of co-operative commonwealth which we should all be pursuing. Leadership of the people, participation of the people, an integrated and dedicated civil service, all held together by the common bond—which is fulfilment.

THE CHAIN REACTION

People keep on talking about chain reactions mostly in explosive and destructive senses. But here in Anand, growing on its own with a wonderful capacity to develop a self-generating character, is a chain reaction wholly peaceful and constructive in all its aspects, tangible and intangible. Perhaps urban areas cannot do exactly the same, for the centre is the land and the philosophy of the land which prevents the abstraction of the people from the areas where they have naturally chosen to live their lives; then, in order, the buffalo and its milk, the co-operative society, the village leaders, the civil service, the joy of fulfilment, and then the problems of further growth and expansion—a challenge for the future. I know of no happier chain and chain reaction in all India. Tell me: Why cannot Anand be multiplied in every State of India?

THE WEEK'S NOTES

I.F.C.

ANOTHER MILESTONE

THE INDUSTRIAL Finance Corporation's report for the year ended 30th June, 1960, shows another stride made by the Corporation. Progress is to be seen all round and in particular in respect of the amount of loans approved and the net profit earned. A qualification, however, should be made that although Rs. 17.92 crores of total loans "approved" mark the annual peak during the Corporation's existence for the last 12 years, an amount of Rs. 9.92 crores out of this was awaiting final consent of the Union Finance Ministry and as such it cannot be included in the loans actually sanctioned to which the Corporation stands committed.

The highlights of the Corporation's financial operations during the year 1959-60 deserve to be noted here. The net profit earned by the Corporation was the highest ever at Rs. 59.51 lakhs which is a striking improvement over the previous year's net profit of Rs. 35.37 lakhs. Efficiency of management and economies of large-scale operations are well reflected in the rapidly diminishing ratio of administrative expenses to gross income. Since the Corporation's transactions reached a high tempo from the year 1955-56 this ratio has been reduced from 11.74 per cent to 5.11 per cent in 1958-59 and still further to 4.66 per cent in 1959-60. This is a performance for which the Corporation can legitimately claim credit. Another important aspect of the financial dealings which deserves special mention is the increasing capacity of the Corporation not only to bear the burden of the liability for payment of dividend at the guaranteed rate of 2-1/4 per cent but to reduce the amount of subvention received in the previous years from the Central Government to meet this liability. The total subventions since the inception of the Corporation were of the order of Rs. 53.45 lakhs out of which Rs. 5.45 lakhs were repaid in 1957-58 and Rs. 10 lakhs in 1958-59. In the year under report—1959-60—the repayment again was Rs. 10 lakhs. In view of the substantially higher net earnings last year this repayment could have been more. But it is an encouraging sign of the improving vigour of the Corporation. The pattern of distribution of loans industrywise has not changed and again special mention may be made of co-operative sugar factories among the major beneficiaries of the Corporation's loan assistance.

LOAN ASSISTANCE

At the press conference held last week-end by Mr. K. R. K. Menon, Chairman of the Corporation, an issue was raised that the Corporation's loan assistance is directed, by and large, to large-scale units. The Chairman, of course, attempted to explain that it was a function of the Corporation to give assistance of Rs. 10 lakhs or upwards by way of loans and, therefore, what are ordinarily considered to be small industries have to look to the State Financial Corporations for their needs of loan finance. This explanation does not rebut the central criticism that the benefit of loans flows essentially to large units. One has only to look to Appendix B of the Annual Report to find out the precise position. Out of the 29 loans approved by the Corporation during the last 12 years in respect of applicant units, only 8 loans are of an amount of Rs. 15 lakhs or below. Taking a somewhat liberal limit to classify small loans, one finds that only 10 loans out of the total of 29 are of the value of Rs. 20 lakhs or below each. This conclusively proves that the large majority of the loans is granted to big concerns.

The position about yearly "approvals" of loans and actual disbursements from 1955-56 is tabulated below:

Year		Loans approved Rs. crores	Loans disbursed Rs. crores
1955-56	...	15.13	2.20
1956-57	...	11.91	9.78
1957-58	...	7.78	8.33
1958-59	...	3.79	7.48
1959-60	...	17.92	8.41

The actual and effective assistance of the Corporation to industry is to be judged, according to one important test, by the amounts actually disbursed. The above table would show that the disbursements in 1959-60 were not substantially larger than those in 1957-58 and actually they were lower than in 1956-57. In earlier years the annual report of the Corporation mentioned the amounts of loans "sanctioned" which signified the commitments of the Corporation after the consent of the Union Finance Ministry wherever it was necessary. Of course, this consent is ordinarily given in most cases, but if it is refused in any exceptional cases the Corporation would incur no commitment in respect of them. "Approvals" are not synonymous with sanctions. It would be desirable if the Corporation reverts to the previous practice of specifying the amounts of loans sanctioned which would give a precise picture of its commitments as at the end of the year.

Coal

NEW FINDS AND THE PRESENT CRISIS

MR. K. D. MALAVIYA, the Minister for Fuel and Oil in the Union Government, in an interview with the Press Trust of India, has broken the news of three rich deposits of metallurgical coal having been discovered in Bokaro and Ranigunje areas. He is reported to have observed that "the new deposits are likely to be sufficient not only for the existing steel plants but for 'more and more' plants that might be set up in the future." One of the deposits, he said, was almost on the surface and another one easily accessible at a depth of about 1,000 feet. This suggests that it is possible to exploit these seams at considerably lower cost.

The news is most welcome, but it is difficult to understand how in the absence of proper geological surveys and assessment through the drilling process, the Minister has jumped to the conclusion that these deposits are "vast" and of "high quality," which would solve the country's coking coal problems "for decades to come." Coal deposits in the Ranigunge area which have been mined so far are only of semi-coke and blending types. The new deposits, unless drilling proves otherwise, can only be expected of these two varieties. On what basis Mr. Malaviya has characterised them to be of coking coal needs an explanation. Perhaps his chief in the Ministry, Sardar Swaran Singh, and some technical experts would throw some light on this.

The discovery of the new deposits, however, is of limited solace in the context of the present troubles of the country on account of coking coal shortage, arising out of shortfall in production and bottlenecks in transport. It can be helpful in the immediate future only if it leads to re-orientation of the Government's coal policy so as to bring it in tune with the developmental needs of the economy. If Mr. Malaviya is sure that the new deposits are of high quality metallurgical coal, will he prevail upon the Government to allow the private sector collieries to extend their operations to contiguous and other reserve areas?

With the Railway Ministry having promised to make arrangements to provide, even by commissioning

into use "average" wagons, full transport facilities for the movement of coal, the problem now to be tackled is how to produce more coking coal quickly. As the following table shows, output of superior-grade coal has not kept pace with demand as expressed in terms of the ceiling on production. The gap between output and the ceiling continues to widen.

(Million tons)

Year	Output	Ceiling
1952 ...	7.755	8.020
1953 ...	13.741	15.182
1954 ...	13.614	14.378
1955 ...	13.355	14.386
1956 ...	13.814	15.0
1957 ...	15.080	16.7
1958 ...	15.158	18.2
1959 ...	14.566	18.4
1960 Jan. ..	1.256	18.4

A few weeks ago, schedules were drawn up for individual collieries to increase their output so as to yield a monthly surplus of 80,000 to 1,15,000 tons of coking coal. How far this has helped to increase production is difficult to say; available indications are to the effect that progress has been small.

The leeway in output can be made up considerably, and quickly, if the private sector collieries are allowed to take up mining in the contiguous areas. The Government, in view of the discovery of the new deposits, can now have little objection to releasing these areas to be exploited by the private sector. The new finds can be reserved for exploitation by the National Coal Development Corporation. As the Hoffman Mission has pointed out, the N.C.D.C. is a comparatively young organisation with very limited resources of managerial talent and skilled manpower. It will do well to exploit for coking coal areas only where it can easily and economically extend its operations. Deep mining operations need to be left to the private sector for the present since the N.C.D.C. has insufficient experience in this field

Tourism

THE HANDICAPS

THE TOURIST Development Council, which met recently in Shillong, has done well in recommending that the allocation of Rs. 5 crores under the Third Five-Year Plan should be raised substantially to meet the essential requirements of tourism. Though the foreign exchange earnings from tourism has gone up from Rs. 4.2 crores in 1950 to an estimated Rs. 17.5 crores in 1958 (the figures for 1959 not being available yet), progress can certainly be even more significant in the Third Plan if only determined attempts are made to do everything possible by an energetic programme to attract foreign tourists. The Council has made a number of recommendations with a view to making the visit of foreign tourists more pleasant. Some of them like licensing of medium sized cars as luxury taxis, provision of self-driven taxis for foreign tourists and a code of conduct for taxi operators are no doubt good insofar as they go. Again, the suggestion that liquor permits, that will be valid for all the States in India should be issued by Indian missions abroad and Directors of Tourism in India with a view to making them more convenient for the foreign tourists, is sensible since it would avoid much unpleasantness, as for instance, the recent incident connected with Frederic March. The Council has also pleaded for the establishment of more hotels in the country and towards this end has suggested the provision of Government lands to the hotel industry at reasonable market rates. Here, what is essential is not the provision of hotel facilities as such, but to see that the important tourist centres and tourist spots are provided with normal facilities for food as well as sanitary convenience. Even in such a great tourist attraction like the Taj, it is not an uncommon experience to miss even essential sanitary facilities in the vicinity. The other day, a correspondent has drawn attention in a local daily to the fact how between the Jumna and the road leading to the Taj, there is now an enormous dumping ground of human refuse emanating a stench that is sickening.

Of particular importance is the suggestion of the Council that the beggar nuisance should be prevented at the tourist centres. This is indeed one of the serious problems and unless the tourists are helped from the menace of the importunity of the beggars, there can be no doubt that it will cause a very unfavourable impression abroad. Also, what is needed is the human touch whereby the foreign tourists, wherever they go, will be made to feel quite at home at the hands of guides as well as those administering the Tourist Information Bureaus. It is also worth examining whether from the point of view of attracting western tourists even from the middle and the working classes, a system of concessions should not be provided by Air India International as well as the Indian Airlines Corporation and the Railways. All in all, there can be no denying that for a country with such a variety of places of historical, cultural and architectural interests, an ambitious programme that will bring in at least double the present foreign exchange earnings from tourism should not be an impossibility during the Third Plan.

World Bank

THE BENEFICIARIES

THE FIFTEENTH annual report of the World Bank covering the year 1959-60 now available shows that the total of the Bank's loans for reconstruction and development have risen to $5,068 milion. Excluding $1,149 million, either repaid or sold to other investors, the effective loans held by the Bank as on June 30, 1960, stood at $3,644 million, of which $2,807 million have been disbursed. The following table illustrates who are the main beneficiaries. Nine countries listed here account for about 60 per cent of the effective loans held by the Bank. Of this, India has been the highest beneficiary holding as much as 14 per cent of the effective loans and about 15 per cent of the disbursed portion of the effective loans.

EFFECTIVE LOANS HELD BY THE BANK

(Mil. U.S. $)

Members.	Disbursed Portion.	Undisbursed Portion.	Total.
1. India	428.7	88.4	517.1
2. France	245.4	14.0	259.4
3. Australia	237.4	—	237.4
4. Japan	230.5	82.8	313.3
5. Brazil	161.4	58.5	219.9

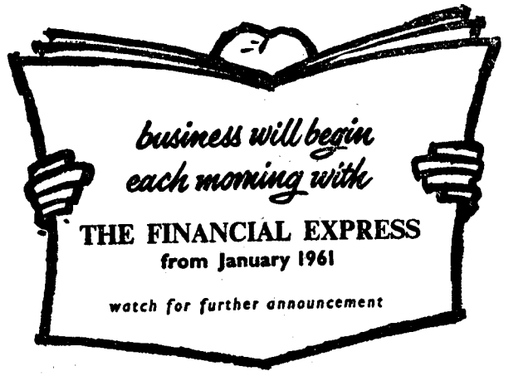
NEWS! India's First Financial Daily Newspaper

THE FINANCIAL EXPRESS

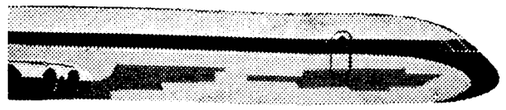
EDITED BY G. M. LAUD

Here Soon! India's First Financial Daily Paper to bring you every morning up-to-minute authentic information on market prices and trends—finance—and economic reports!



Complete Financial News Service for Bankers, Industrialists, Investors and Traders — Edited by G. M. Laud.

The Financial Express — India's first financial daily newspaper, is to be published by Indian Express Newspapers, Bombay, very shortly.



The Financial Express will be edited by G. M. Laud, the well-known financial journalist, author and banker, assisted by a team of experts specialised in finance, commodities, trade, industry, politics and foreign affairs. Augmented by news service from overseas markets, and a complete network of teleprinter communications between the business centres throughout India and overseas.

The Financial Express will tell you all the things you want to know in the world of business — accurately and faster than ever before!— It will only cost 25 nP a copy. So why not tell your newsagent today to reserve your copy.

- MARKET TRENDS AND QUOTATIONS
  Fast teleprinter communications system will give you each morning, the latest quotations and comments from all the stock exchanges and commodity markets in India.
- FOREIGN MARKET REPORTS
  London Stock Exchange—Wall Street—Continental Bourses—and commodity markets will be covered by correspondents who will give you latest news and potential developments.
- MARKET INTELLIGENCE SERVICE
  Expansion of export trading, will be assisted by well-informed exclusive reports on world's leading markets.
- BANKING AND FINANCE
  Economists will comment and analyse everyday finance—world banking policies—and international economic activities.
- INDUSTRY, TRADE AND COMMERCE
  You will receive appraisals on Government policy—problems of management and labour—new developments in production techniques.
- NEW ISSUES AND DIVIDENDS
  Details of company registrations, and impartial analyses on new issues and balance sheets will be given by experts.
- INVESTORS GUIDE
  Every week the 'Investors Guide' will give you sound advice on profitable market investments

A Publication of the Express Newspapers Group

WHAT IS INFLATION?

By

ODYSSEUS

WHAT IS (a) this inflation which (as we saw last week) was the biggest single cause that wiped out the Roman Empire, one of the greatest civilisations that the world has ever seen, and ushered in the Dark Ages, one of the unhappiest periods in the life of mankind, and which in modern times made the despairing middle classes of Germany welcome servitude to Hitler?

Inflation occurs when a Finance Minister (let us be precise in identifying the man with his finger on the trigger) authorises the printing of currency notes and the creation of credit at a faster rate than the flow of goods and services in the country. Why does he do this?

What—as Graham Hutton points out in his newly published "Inflation & Society" (Allen & Unwin, London, 160 pages. 15sh.), which should be compulsory reading for every politician, civil servant, and voter—what is striking is that most of present day inflation has occurred after, not before, the end of the war. Basically, it springs from the determination of so many governments to launch ambitious programmes of capital development, while lacking equal determination to make clear to the masses that no capital development is possible without previous saving. Either citizens must forego enough of their current consumption to set aside goods and services to build for the future, or they must find other people in other countries willing to do this and offer them attractive enough terms to induce them to lend their savings.

But in too many countries lack of courage on the part of politicians has led the masses to insist on new houses, dams, and factories, and simultaneously on higher wages to pay for higher current consumption. The longer that this is persisted in, the slower is the rate of the increase in wealth, and the faster social discontent and unrest are generated. Inflation does not increase the efficiency of any economy. It interferes with the orderly working of supply in response to demand. It distorts and weakens. Rather than face the short term unpleasantnesses that must follow a halt to inflation, governments prefer to multiply controls and controllers, permits, rationing and priorities. These do not cure the causes. They make confusion worse confounded.

Graham Hutton hammers home an all-important point: the cause of inflation is not economic. It is always a deliberate act of policy, whether positively willed by the Finance Minister or merely negatively allowed by him because he fears to stop it.

Few people realise the importance of the effect of views taken by potential savers and investors, individual and institutional, of the trend in the value of money. Their estimates of the worthwhileness of present spending against investing for possible greater gain in the future; their belief or doubt in the continuation of economic growth at past or present rates, or of inflation, or price stability—all these views jostle each other in the markets for money, credit, and capital. They swell or shrink supplies of each kind of purchasing power. Thus are determined the different rates of interest for varying periods: Rates for long-term loans to match the volume of long-term investment in durable capital goods—houses, factories, heavy machinery, harbours, schools, etc. — and, rates for shorter-term loans to match the needs of day to day working capital, bank over-drafts, hire purchase, trade credit, etc. The various rates of interest constitute the "price of money." The varying prices of money measure the different pressures of potential borrowers' needs for finance and potential savers' desires to invest. They also reflect the views of borrowers and savers on the worthwhileness of borrowing or saving at all.

LIMITATIONS OF INDIVIDUAL KNOWLEDGE

The average citizen or business man is humanly limited in the range of his knowledge when making his decisions. But where a market is freely allowed to establish values, the prices quoted act as a guide to the hesitating individual because they take into account, are settled by, and reflect, hosts of factors of which he personally may have no knowledge.

Thus the degree and rate of inflation create different attitudes in borrowers and savers towards the worthwhileness of spending or saving their current purchasing power. The faster the rate of inflation, the more reluctant will people be to tie up savings at fixed rates of interest. Firms will want more and more money as wages and all other costs rise—so will governments—both to pay for fixed, long-term assets like building, and for day to day working capital to meet current rising costs

The arguments against inflation as a policy are, first, that it arbitrarily upsets all demand and supply, and prevents prices from performing their proper function, which is to allocate resources in relation (a) to their comparative scarcity and (b) the strength of the competing demands for them—in other words to tell everyone concerned what the "real values" of all goods and services are. Secondly, inflation arbitrarily alters all legal and other social relationships built up on the assumption that real values are known and understood.

One of the more important contributions to current debate that Graham Hutton makes is to point out that if it were possible to foretell just what effects a given dose of inflation would produce, these two arguments against inflation could be ignored. Apologists for "just a little inflation" could then urge that a steady modest dose would become absorbed into the daily data on which citizens base their decisions; it would be discounted in all their calculations, would be assumed as is the level of income tax or turnover tax or company's profits tax, and would therefore make no real difference to anyone.

But that is to misunderstand the object of inflation as a policy.

Because as soon as everyone accepts a given rate of inflation (2 or 3 per cent p.a. is the proposition of many apologists) as a datum and discounts its effect in advance on all calculations of value, the government—the Finance Minister, who gets the prior benefits of inflation by giving himself the extra money to buy the goods which he wants at higher prices which prevent the rest of the citizens from being able to afford them—must step up his rate in order to secure such prior benefits of fresh inflation over and above what all the

citizens expected and evaluated in advance. If the Finance Minister does not do this, he can no longer prevent individuals and firms from securing their share of the bricks, mortar, or machinery, that he wants to complete his Five Year Plan.

"OUTRAGEOUS PROFITEERING" IN THE U.K.

To get inflationary advantages over everyone else, as a set policy, the Finance Minister can never say "Thus far and no farther will I go." He must inflate more and more. This cumulative inflation compels governments to place more and more controls on individuals, trade, industry, and institutions. Thus a democratic state which, as a policy, secures inflationary benefits for itself ultimately abolishes individual freedom—democracy itself. This was what happened in the Roman Empire (which, although not technically a democracy, did initially ensure substantial individual rights to all free citizens). This was the fate which overtook Germany after World War I. This is the path along which France has been inching her way. This the path on which Mr Heathcoat-Amory in the UK courageously called a halt. It remains to be seen whether his successor, Mr Selwyn Lloyd, will be able to shut his ears to the cries of indignation now being heard in the UK against some of the results, such as the "outrageous" rise in the values of building sites in the cities, and the "profiteering" of landlords who are at last being allowed to charge rents which reflect the current relation between the demand and supply of living space.

The problem of land values in the UK today is a typical example of (a) how inflation and controls upset the relations between supply and demand and distort the allocation of resources with repercussions over the whole economy and (b) the extremely painful, but if they are allowed to work themselves out, comparatively short-term effects of halting inflation and freeing markets.

Rents for different kinds of houses have been controlled for between twenty-five and forty-five years in the U.K. The results have been several. First, widespread waste in the use of living space. Couples, whose children have long since married and left home, have continued to occupy the whole of a rent controlled house, have not moved in order to avoid a higher rent elsewhere, and have not subdivided the house into flats because, on the rents that they would have been allowed to charge, it would not have been worth their while, added to which was the risk of being stuck with an unsatisfactory tenant for life. Secondly, millions have remained living in parts of cities, which could have been used to the greater profit of everyone for other purposes as office or industrial sites. Thirdly, the building by Socialist municipal councils of thousands of cheap flats at controlled uneconomic rents has kept the population crowded in certain cities, when it is probable that under the laws of supply and demand, new industries and new residences would have sprung up elsewhere on cheaper sites.

One of the first results of the recent freeing of some rents, and therefore of land values, is likely to be an emigration of offices and residents driven to cheaper sites. (This, in turn, will bring down costs in present high priced areas). This may help to ease London's traffic congestion problem. High costs are also forcing the more economic use of sites. For example, the old Stoll Picture House, which occupied a vast site on Kingsway, has been pulled down. A new theatre, the Royalty, has been built below ground level, while a block of offices in a taller building has been erected above ground. Another result is that people who used to try to live at all costs in a limited number of fashionable districts, such as Kensington or Chelsea, have now decided that they don't mean at all costs" and are moving into such hitherto socially disdained districts as Islington or Kennington. Why not?

A COMPLETE NEW FERTILISER FACTORY FOR INDIA

COMPLETE FERTILISER PLANTS BY

Simon-Carves Ltd

Incorporated in England,
The liability of the members is limited

STANDARD BUILDINGS,
33, DALHOUSIE SQUARE SOUTH, CALCUTTA-1

SCC-30

Simon-Carves have received a contract from East India Distilleries & Sugar Factories Ltd., to build a complete new compound fertiliser factory in Ennore near Madras.

The contract includes the design and supply of the equipment, the civil engineering work and the erection and commissioning of the plant. The factory is to come into production in two years time.

Approximately 51,000 tons a year of compound fertilisers based on ammonium phosphate will be produced. The factory will include ammonia synthesis plant, sulphuric and phosphoric acid plants and raw material and product storage and handling equipment.

MADRAS

a hive of activity

Indo-British co-operation at Durgapur is building a modern integrated steelworks for India, with a production capacity of one million ingot tons and provision for a greater output under the Third Plan. In this enterprise, thirteen leading companies of Britain's steelworks engineering industry, working jointly as ISCON, have made available their technical know-how, and are training up in their U.K. factories hundreds of Indian technicians who will man this industrial giant.

The European Scene

LESSONS FROM ITALY'S POOR SOUTH

From Our Special West European Correspondent

PARIS, September 26.

THERE are several regions in non-Communist Europe that are as poor, as backward, as undeveloped as many parts of India. Those that fall in Spain, Portugal, Greece and Turkey, moreover, compare unfavourably with equivalent Indian regions because in none of those countries has there been to date a sustained national development effort to put alongside the Indian five-year plans. Since it was decided, in a polite but inaccurate generalisation, to call all undeveloped countries "developing countries", there has been only one of these areas of European poverty to deserve comparison with India, and that is the Italian Mezzogiorno or deep south. There we can see an economy that begins from conditions that are strictly comparable with those obtaining in nearby Africa and in much of Asia, an economy to which are being applied development techniques not very different from those known in non-Communist Asia, and, finally, a process of development whose varied successes and failures are instructive for other under-developed economies.

"Instructive" does not mean yielding lessons capable of transfer elsewhere, because every process of economic development goes forward in peculiar political conditions and these can be of decisive importance. In South Italy those political conditions are determined by four entities that have no exact counterpart in India: the Mafia, the Vatican, the Italian Communist Party and the Christian Democracy. The vast criminal organisation of the Mafia, whose social power is underestimated rather than exaggerated in thrillers and movies, is a serious brake on economic development wherever this interferes with its profits; it is a much graver problem than North Indian dacoity. The Vatican has imposed on Italian politics a dogma that would never be accepted in, for example, Catholic France: the exclusion of all development policies that imply co-operation with avowed atheists, which means everybody left of the Christian Democrats. The Italian C.P., losing its strength among Northern urban workers, is relying increasingly on the peasants of the South and thus complicates the development problem with ideological disputes and political gangsterism to a degree that is, so far at least, beyond the power of the Indian C.P. Finally, the ruling Christian Democrat party is much more deeply involved with reactionary forces opposed to development (including even the Mafia) than other democratic governments, and thus it resists policies that are regarded in India as normal and necessary parts of economic expansion.

The political climate, then, is totally different. With that reservation, the economic comparison still stands. Thirty miles south of Rome, there begins the other Italy: not the one described here in July as a vigorous industrial power but the one that, as novelist Carlo Levi said, "Christ never saw". South of that invisible border, incomes fall to half those of the North and the infantile mortality rate is multiplied by ten. This is the land of hunger, over-population, unemployment, ignorance, superstition and squalor. I could burden this paragraph with statistics establishing the parallel between it and the worst parts of India, but the general impression of a student who knows both regions well might be as convincing: I know I should have to go off the beaten path in India to find countryside where human misery is as profound. One even finds diseases unknown elsewhere in Europe, such as the dreadful kala azar, and one type of hookworm is more widespread in Sicily than anywhere in the world: it affects 34 per cent of the population.

To this region Rome began in 1950—perhaps moved by the then Communist danger and the 1949 peasant uprising when landless labourers seized the latifundia, or zamindaris—to apply a coherent development plan. It had three parts: an ambitious agrarian reform, the Fund for the South which invested in the infra-structure, and the Vanoni Plan of national development which had among its chief aims to reduce unemployment and to close the gap between the North and the South. The results of the Plan have been listed here before: for Italy as a whole they have included a doubling of industrial output in five years with a 30 per cent rise in revenues, the accumulation of the world's third largest currency reserve and the emergence of North Italy as a leading industrial power. Yet the impact on the poor South has been infinitely disappointing. Starting from bare subsistence levels, incomes and consumption have indeed risen by the apparently impressive percentage of 40, yet the difference between the South and North is as great today as in 1951, unemployment has worsened by 15 per cent and the South represents a smaller share each year of the nation's gross product. Not only has the immense expansion of the North failed to communicate itself to the South, but what progress has taken place in the Mezzogiorno (and which is responsible for the apparent rise in incomes and consumption) has been limited to islands of activity lost in a sea of unchanging torpor. In short, the phenomenon familiar in developing economies: the failure of the multiplier effect to penetrate a lethargic society, resulting in mere industrial enclaves which create as many problems as they solve.

The planning authorities have many impressive achievements to their credit. The infra-structure of the region has been revolutionised and a bold redistribution of land carried through, while several new industrial centres have appeared, some of them of importance to all Europe. But in almost every case where the planners counted on local initiative or Northern private capital or a multiplier effect to exploit these advances and carry on the process of development, there has been total disappointment. Local enterprise failed to emerge and Northern capital preferred to re-invest in the booming industries of Lombardy. The land reform worked so well that it went too far: holdings have been divided into parcels that are uneconomic for rational agriculture and too small to support growing peasant families. The political effect of the land reform was unexpected: instead of becoming a stable, conservative middle class, the peasants ceased voting fascist only to begin to vote Communist. Grandiose State undertakings were successfully completed, but the host of petty works required to make use of or to complete them were neglected because (just as in India) the initiative came only from the top and the local enthusiasm needed for less costly but equally important jobs was never organised.

Also it was found, as elsewhere, that the isolation and inefficiency of markets, the absence of economic information, and the persistence of usury combined to stifle enterprise and to claim for a tiny section the greater part of any surplus that appeared.

In the face of these unsatisfactory results, the following conclusions have been drawn in Rome—often with great reluctance by the liberal dogmatists of the governing parties. Firstly, the notion of the State's obligations being limited to the non-industrial infrastructure, leaving all profitable enterprise to private initiative, will have to be revised—revised only, not abandoned, because there is no suggestion of Italy passing to socialism for the sake of the South. It is just that the point at which State activity can pass on the task to private enterprise must be set later than classic theory imagined; the Fund for the South and the other State corporations will have to venture further into the industrial field than was foreseen a decade ago. In a sense, this means that Rome has discovered the doctrine Mr. Nehru announced in India long since, but which he has sometimes abused to mean that the State must positively hamper private initiative for the sake of its own ambitions. An Italian Government that is still in the hands of liberal parties is unlikely to make that error, but it has just ruled that its petrol monopoly and its industrial corporation must henceforth make 40 per cent of their investments in the South, and the Fund for the South has been authorised to extend its activities to manufacturing and processing industries. The intention remains to stimulate private industry, but the State now feels that it is not sufficient to create suitable conditions for this; it must take positive leadership.

The failure of local initiative to organise itself, the neglect of small-scale works and the excessive division of land holdings have turned the planners' minds to the importance of co-operatives and community development schemes. As in most developing countries, even in those democracies that hold most in horror the Chinese system of communes, the conviction has grown that unemployment will not disappear by means of the mechanisms of the free market, but only when heads and hands are combined in co-operative enterprise which the market will not support. Secondarily (and this is a point that Professor Rene Dumont has lately stressed for India) a much more vigorous attack will have to be made on usury, parasitical privilege, inefficient and expensive commerce, and the sundry other petty vested interests whose selfishness is able to strangle enterprise and mute the multiplier effect of investment.

A more revolutionary conclusion that has gained ground in Rome concerns the necessity of large-scale population movements. The Italian planners now believe that the most successful measures of land improvement will never enable the improverished South to support all its population, at least not if they all stay where they are. Improvement, by means of irrigation, fertilisers, etc., in fact accentuates the difference between good land and poor land, and thus makes it possible and urgent to move people from the second to the first. A large and, on the whole, successful campaign of land impovement has been applied throughout the South and it has shown that the possibilities of poor land are strictly limited while the potentiality of superior land is greater than was thought. One-quarter of the agricultural land in the South now produces three-quarters of the crops. Instead of scattering further investment for the sake of diminishing returns, the planners favour reducing the population of the inferior regions down to what they can support while intensifying the settlement of land that has proved its worth. The project they have in mind will entail the transfer of some eight million people and if put through will be one of the most extensive operations of the kind undertaken in a democracy. This is quite separate from the question of emigration from the poor countryside to urban industry (and in Italy's special case to foreign countries). There too, the Italian planners have reached interesting conclusions. This movement needs not simply to be hastened but to be organised, for it now takes place under the worst conditions: men leave the villages totally unprepared for city and industrial life and thus find only the meanest occupations. Without seeking to retain them in villages that cannot support them, the planners propose to educate them on the spot for migration, giving them at least the rudimentary skills and information that industry will demand of them when they reach the cities.

Unless these lessons are heeded, the integration of Italy in the Common Market will not benefit the poor South. Economic expansion takes place in nodes or regions, and often means that the rich areas get richer and the poor ones poorer. The Common Market (which has already meant that cheap French sulphur has killed Sicily's main single industry, the sulphur mines) could simply repeat the experience of Italy after its unification, a date to which one can trace back the economic decay of the South. Italian development, from a century ago down to today, demonstrates that regional backwardness, even inside a unified market, cannot be remedied without positive public intervention. This is now accepted even by those who, quite correctly, see in North Italy's recent progress one of the most striking examples of the virtues of free enterprise.

Economic Report from the U.S.

U. S. ASSISTANCE TO LATIN AMERICA

By GUY SIMS FITCH

WASHINGTON, Sept. 21.

A NEW and important step in regionalized international economic development will take place when the Inter-American Development Bank (IADB) officially opens its doors here on October 1. One of the first and principal responsibilities will be to administer the new United States Aid Programme for Latin America, a programme which won approval of the recent economic meeting of American States at Bogota, Colombia. The "Act of Bogota," as the agreement is called, envisages several precedent-shattering moves. Most significant is that it launches a social as well as an economic development plan, including projects in land reform, housing, public health and education. For this purpose, the United States is making $500 million available to a special "Social Development Fund." Not since the early post-war years of relief and reconstruction has the United States embarked on a large-scale lending programme of this nature.

The Bogota agreement also foresees an increase in U.S. assistance to Latin American industrial projects, such as mining, power development and manufacturing. Estimates are placing the increase in this part of the plan at about $100 million a year, over and above the $300 million to $600 million which Washington has loaned each year to promote Latin American industrial development. In addition, the delegates of the United States and 19 other Latin-American republics agreed to study ways to expand U.S.-Latin American trade, stabilize export commodity prices, and generally strengthen U.S.-Latin American economic relations.

The new Latin-American Aid Programme departs from the pattern of the past also in the sense that the United States will not be exercising control over the aid funds which are being made available outside the United Nations. The U.S. representative to the IADB will, of course, play an important advisory role. But the IADB as a whole will take responsibility for the programme, which means that to all intents and purposes voting control will be in Latin American hands. This obviously places a great responsibility on IADB shoulders and also underscores the extent to which the new aid programme must rely on the self-help efforts of the Latin American nations themselves. Recognizing this, these nations have pledged themselves, as part of the Act of Bogota, to undertake reforms that will strengthen their economic and financial structures. Included in the planned reforms are more equitable tax and property laws and improved fiscal and monetary policies.

In practice, the IADB will handle the social development fund on a revolving basis. This means that long-term, low-interest dollar loans will be repaid in local currencies, which in turn will be available for re-lending under the programme. Beyond this, the IADB presumably would help decide which industrial projects are best suited for industrial-development assistance by U.S. lending agencies. IADB also would consult with such United Nations agencies as the World Bank and the International Monetary Fund, with respect to the Latin American assistance programme of these agencies. It remains to be seen, of course, how this new long-term co-operative effort will work out. For the immediate future, much preliminary work still must be done. After gaining approval of the Council of the Organization of American States (OAS), details will be further spelled out by working committees appointed by the Council.

Since the second World War, the U.S. Government's economic aid to Latin America has totalled about $4,000 million—fully 10 times as much as the military aid the U.S. has given the region. Included are loans and grants for capital equipment, basic industrial projects, technical co-operation, agriculture and other special purposes, from such agencies as the Export-Import Bank, The Development Loan Fund, and the International Co-operation Administration. The World Bank and the International Monetary Fund, to which the United States is the largest contributor, also have been active in Latin America. The Bank has extended to Latin American nations loans totalling about $1,000 million for such purposes as natural resources development, while the Fund has lent nearly as much to help stabilize balance of payments accounts.

None of this includes the substantial flow of private U.S. investment to Latin America, which now totals some $1,000 million, and which also has done much to help build up the region's industrial and agricultural potential. And once the new aid programme gets rolling, private investment could be further spurred to make even large contributions to Latin American development. In this light, the IADB and the new aid programme—precedent-shattering as they are—represent, in effect, only an intensification of U.S. interest in the welfare and progress of its friends in Latin America.

WORLDGRAM

India

Three U.S. Loans to Indian Firms: Two Indian industrial firms associated with the Kaiser Industries Corporation in the United States have received two Rupee loans totalling $3.2 million and a dollar loan of $13.6 million from the Export-Import Bank of Washington. The loan agreements, will finance increased aluminium and cement manufacturing facilities in India. Hindustan Aluminium Corporation, Ltd. (Hindalco) received a $13.6 million loan and a $2.1 million Rupee loan for part of the cost of an aluminium production plant already under construction near the Rihand Dam in Uttar Pradesh.

*

Mysore Cements. Ltd., was granted a $1.1 million Rupee loan under U.S. Public Law 480, which permits use of currency from the sale of U.S. agricultural products for loans to assist Indian economic development. The loan will help finance the construction of a 100,000 metric ton cement plant near Ammasandra in Mysore State. Mysore Cements, Ltd., was organised by P.K.S. Mudaliar to manufacture and market portland cement and other products. In 1958 the Willy-Overland Export Corporation and the Kaiser Engineers Overseas Corporation participated by investing in the company.

*

Assistance from the Netherlands: The Dutch and the Indian Governments have concluded agreements for the improvement and extension of a training centre for processing hides and leather and for the construction of an experimental polder in India. Holland will provide modern equipment for the training centre, three instructors in the sphere of treating hides, tanning and shoemaking and contribute Rs. 12.5 lakhs to the cost of improvement and extension. Holland will also assist in the construction and development of an experimental polder in the coastal strip of Saurashtra, Gujerat, where the Dutch Government had previously carried out investigations into modern methods of desalting the soil. The Dutch share in the development of the experimental polder is estimated at Rs. 37.5 lakhs

United Kingdom

Increase in Exports: United Kingdom exports in August—a time when they normally fall—were higher than in July. They were valued at £279,800,000, according to the full trade returns for the month issued by the Board of Trade in London on September 22. When allowance is made for seasonal factors, exports were higher in August than in June and July but, London observers point out, it is too soon to talk of a recovery, even if only a partial one. The trend will become clear after a month or two. The main improvement in exports since June—long enough to show a trend—has been in re-exports to the Sterling Area mainly due to the increases to New Zealand and Pakistan. This has compensated for the fall in exports to North America and Western Europe. Exports to Latin America also showed a rise, reflecting the delivery of a ship to Chile.

The increase in imports in recent months has slackened. While the average rate of increase in the first quarter was two-and-a-half per cent, in the second quarter it was one-and-a-half per cent. Much of the increase since June seems to have been in imports from North America.

Balance of Payments (April-June 1960): The U.K. balance of payments on current account was in deficit to the extent of £9m. in the second quarter of 1960, as compared with a surplus of £96m. in the corresponding period of 1959. Exports during this period were higher than in the corresponding period of 1959 by only £54m., whereas imports were higher by £109m. Thus, there was a deficit of £39m. on visible trade as against a surplus of £16m, in 1959. In invisibles, there was a net surplus of £30m. (Government account —£66m.; private account +96m.); giving rise to a net balance of payments deficit of £9 million.

United States

Foreign Investments: The U.S. business firms have raised the value of their foreign investments to over $30,000 million, according to a report just completed by the U.S. Department of Commerce. The U.S. companies added $2,500 million to their investments in foreign subsidiaries and branches in 1959 through a capital outflow of $1,400 million and a reinvested earnings of $1,100 million. This was a larger increase than in 1958 and substantially less than that of the peak year 1957. Reports for the first half of 1960 indicate a moderate reduction in direct investment outflows, although the rate is close to $1,000 million a year, and a like amount is being invested abroad each year out of undistributed profits of foreign subsidiaries.

U.S. firms intensified their build-up of production facilities in Europe in 1959, adding nearly $750 million through capital outflows and retained earnings. Much of the increase in the flow to Continental Europe since 1957 has gone to Germany and France with Italy and the Netherlands also showing large gains. There is a continued sizable flow of investment to Latin America. Among the countries receiving sizable flows from the United States in 1959 were Venezuela, Cuba, Argentina, Brazil and Chile. The flow to Cuba represented the continuation of large expansion programmes of mining and utility companies and extension of credit to subsidiaries of petroleum companies. This investment activity was brought to a stop when nearly all U.S. investments in Cuba were seized this year.

U.S. receipts from the direct investments through dividends, interest and branch profits totalled $2,000 million in 1959, about the same as in 1957 and slightly above the 1958 amount.

Soviet Bloc

Aid to Under-developed countries: Between 1953 and June 1960, the Soviet Union, including Communist China, promised to provide the under-developed countries $2,900 million worth of economic aid. $2400 million of this is to come from the Soviet Union. Only $550 million is said to have materialised till now in the form of goods delivered and services rendered. Military aid to under-developed countries up to June 1960 amounted $750 million, most of which is said to have already been delivered.

France

Gross National Product: The rate of growth of the gross national product, was scarcely more than 2 per cent in 1959 hardly exceeding that of 1958. 1959 is said to be a year of general progress in economic activity whereas 1958 was a year of recession. The most striking progress in 1959 was in motorcars, iron and steel, chemicals and in consumer goods. The recovery in the capital goods industries is said to be generally more favourable than in the consumer goods industry.

Agricultural production rose by 3.5% in volume in 1959 over 1958. Though the summer drought of 1959 affected the later crops (especially, potatoes, sugar beet and fruit), cereal crops and the vintage are said to be good. Main problems for French agriculture are the marketing of chronic surplus (cereals and wine) and the adjustment of production conditions and marketing mechanisms to ensure that the trend of agricultural incomes keeps in step with income from other branches of activity.

Japan

Electronics Industry: The Japanese electronics industry is expanding so rapidly that all production targets for the next five years have been revised by the Government Committee for the promotion of the industry. The target laid down for 1962 was achieved in 1959, when the overall electronics production was worth $917 million. The industry exported goods worth $110 million in 1959, of which $93 million was accounted for by 6.1 million transistor radios. This was 37% higher than the target fixed for 1962.

*

Liberalisation in exchange restrictions: The Japanese Government has liberalised the exchange restrictions as from September 10, 1960 in order to simplify procedures for foreign exchange control. Non-residents will now be able to carry with them (personally) all kinds of foreign currency into Japan. Hitherto they had to obtain the confirmation of the customs to take into Japan foreign notes including bank notes and government notes) anything more than the equivalent of U.S. $50. This restriction and the connected formalities are said to have been removed. Residents and non-residents will both be, now, free to import into Japan, Japanese yen, irrespective of the amount, provided the currency is carried personally by those entrants. The limit up to which residents and non-residents could take Japanese yen freely out of Japan, has been raised to Y20,000.

Malaya

Public Works: Malaya's public works Department will spend M$ 350 million during the Second Five-Year Plan beginning in January 1961, to provide new roads and piped water to 2 million of its rural people, now without piped water. Of the 1,500 miles of new roads which are to be constructed, 420 miles are presently under construction in various states. Since 1957, water supplies were extended to 1.5 million people in the rural areas.

Czechoslovakia

Floating Pumping Station: Last month the Czech shipyards in Prague turned out the prototype of a floating pumping station with an output of 7.5 c.m. of water per second (27,000 cubic metres per hour) said to be the largest produced anywhere in the world. It is said to require only two workers and may be dismantled if necessary and transported by railway (on 35 wagons or by road). The prototype and four more such stations are destined for irrigation of cotton fields in Soviet Uzbekistan.

Denmark

Industrial Production: Total industrial production during the months January to May 1960, showed an average which was 7½% higher than the figure for the corresponding period of 1959. Total industrial investments in 1959 were 25% more than in 1958. The figure for 1960 is expected to be 30% more than in 1959.

*

Foreign Trade: The adverse balance of trade in the first six months of this year was of the order of 1253 million kroners as against 754 million kroners in 1959. The increase in imports was accounted for by the higher imports of machinery, motor vehicles, grain and feeding stuff and base metals.

World Bank

Finance to ease the transport problem in Colombia: The World Bank advanced a loan equivalent to $5.4 million to equip the new Atlantic Railroad in Colombia on September 20, 1960. When the Railroad is completed, it will interconnect Colombia's railway systems and provide the first fast and reliable transportation between Atlantic Ocean ports, central Colombia and the Pacific. The Bank's funds will finance purchases of locomotives, rolling stock and maintenance equipment. Four private banks are participating in the loan, without the World Bank's guarantee, for a total amount of $512.000 which mature earlier than the Bank's portion of the loan. The loan is being made to the Colombian National Railroads (CNR), an autonomous entity established by the Government in 1954 to own and operate the railroads of Colombia.

In the past, the Magdalena River, supplemented by various rail and road links, was the main artery for export-import trade moving between central Colombia and the Atlantic Coast, as well as for north-south internal trade. Traffic was slow and subject to frequent interruptions, however, because of uncertain navigability in upper reaches of the river, particularly during the dry seasons. In 1952 the Government undertook the construction of a railroad to by-pass these sections of the river; it subsequently decided to extend the railroad all the way to the coast providing an alternative to river transport en route. This required the construction of a new railroad 425 miles long and the rehabilitation of a 60-mile section linking it to the port city of Santa Marta. World Bank loans, totalling $40.9 million, made in 1952 and 1955 have assisted in its financing.

Three sections of the railroad have already been opened to traffic, and the entire railroad is scheduled to be open to through traffic early in 1961. The Colombian National Railroads need additional motive power and rolling stock to meet the freight and passenger traffic demands on the Atlantic Railroad. The Bank's loan has been made for this purpose and will finance the purchase of 16 diesel locomotives, about 300 freight cars in "knocked down" condition to be assembled in Colombia, parts to rehabilitate passenger coaches, and shop equipment. The total cost is estimated at the equivalent of $6 million; the local currency costs of $600,000 will be met by the Government of Colombia.

The loan is for a term of 15 years and bears interest of 5-3/4% per annum, including the 1% commission which is allocated to the Bank's Special Reserve. Amortization will begin in May 1962. The loan is guaranteed by the Republic of Colombia. The Bank has now made 17 loans totalling $178.6 million in Colombia. The loans have been for the development of Colombia's railways and highways, and of electric power and agriculture.

NEWS IN BRIEF

INDIAN

Out of the third Plan production target of 200,000 tons of alloy, tool and special steel, 50,000 tons will be produced in a new unit which will be put up during the Plan period. The location of the new unit will be decided during the current year. It is estimated to cost about Rs. 35 crores with a foreign exchange component Rs. 20 crores.

*

It is reported that over 250 manganese mines had been closed owing to uneconomic conditions. Export of managnese from India had declined from last year's Rs. 13.61 crores to Rs. 11.93 crores.

*

The Employees' State Insurance scheme has been extended to Rajnandgaon in M.P. as a result of which 3,200 more factory workers will get medical benefit.

*

About 87,100 houses had been constructed in the country, till December, 1959. Under the subsidised housing scheme for industrial workers. Since the beginning of the First Plan sanction had been accorded for the construction of 1.21 lakh houses at an estimated cost of Rs. 38.87 crores. The total Central assistance released so far was Rs. 29.68 crores.

*

The Union Minister of Transport and Communications pointed out that he would urge the Government to increase the Third Plan allocation of Rs. 259 crores for road development.

*

Half of the Kosi project, it is reported, is complete. The flood control port of the project was fully accomplished. More than 30 per cent of the barrage and 40 per cent of canal contruction was also complete.

*

The Union Ministry of Labour has decided to undertake a safety survey of selected factories in the public sector in order to ascertain the causes of accidents and devise means of reducing the number of accidents.

*

An agreement which will quadruple Indo-Moroccan trade has been signed after negotiations at Rabat.

*

The Government of India has invited proposals from private parties for the setting up a fertilizer factory at Hanumangarh in Rajasthan. The place is suitable for the manufacture of ammonium sulphate.

*

A permanent committee is proposed to be established by the Centre to ensure better awarenes, coordination and proper working of different welfare schemes intended for the uplift of the Backward Classes.

*

More than 2,000 families of Scheduled Tribes in ten districts of Bhopal will be settled in well-planned model villages to be set up under the Centrally sponsored programme for the welfare of Scheduled Tribes.

FOREIGN

Britain was Malaya's best customer of rubber in the first eight months of the current year. Russia fell from being first last year to eighth this year.

*

The World Bank proposes to raise a loan of Swiss Frs. 60m (£5m) on the Swiss market. This will be the ninth Swiss loan floated by the World Bank, which will have borrowed about Swiss Frs. 690m. including this loan.

*

Japan and Australia would open talks in Tokyo on October 3, on a new trade agreement. The three-year agreement which was to have expired in July has been extended pending conclusion of the new pact.

*

The Export-Import Bank announced its decision to lend upto $16m. to South Africa to assist South African Airways to buy three Boeing 707 jet aircraft.

*

The Suez Canal Authority has informed shipping companies at Port Said that from December 23, ships with a 37 foot draught can use the canal. At present only vessels drawing 35 feet are allowed to pass.

*

The Federal Budget of the United States for the current fiscal year would have a surplus of only $500m. instead of $4,200 million originally forecast. The reduction would come about because of lower revenues and additional expenditure.

*

It is reported that Britain has refused to allow British Guiana to accept a Cuban Government offer of $5m. loan to develop her timber industry.

*

Plans are beginning to take shape, it is reported, for West German industry to raise a loan fund of DM 1,000m. (£85m.) to assit under-developed countries.

*

Japan intends to import iron ore from Malayan mines. A Japanese industrialists' team has visited Malaya to explore prospects to import 5m. tons next year against an import of 4m. tons expected this year and 3m. tons last year.

*

Employment conditions in civil aviation and hours of duty and rest periods of flight personnel are to be discussed at the I.L.O. ad hoc civil aviation meeting being held in Geneva.

*

Pakistan finalised an agreement with a Burmese trade mission for the purchase of about 3 lakh tons of rice for East Pakistan during 1961 to meet internal deficit.

Special Article

COMMENTS ON TARIFF PRICE FIXATION

(CONTRIBUTED)

The Tariff Commission's recent formula for gross return on capital employed as an element in fixing of "fair" prices has been the subject of controversy ending with the World Bank Mission's latest report. In this article a defender of the Tariff Commission's approach presents his view. 'The Eastern Economist' does not necessarily agree with the views presented in its contributed articles. — EDITOR.

IT is observed from extracts of the report of the World Bank Mission led by Mr. Michael Hoffman which have appeared in financial journals that the Mission has been critical of the extension of the price fixing activities of the Tariff Commission, and has expressed the view that measures to restrict profits through price controls would have a cramping effect on the future expansion of industry. The Mission is reported to have stated as follows:

> "Industries which have been referred to the Tariff Commission for price enquiries in recent years include iron and steel, paper and cement. In various other industries prices have been fixed incidentally to the grant of tariff protection; examples are motor vehicles, dyestuffs, non-ferrous metals and electric motors. Coal prices are also strictly controlled although this is not done by the Tariff Commission. The primary purpose of the Tariff Commission's enquiries is legitimate enough — namely to prevent industries which are to be granted protection against imports from exploiting their monopoly position at the expense of the consumer. The trouble is that price fixing has come increasingly to be regarded as a desirable end in itself, and the arbitrary methods employed in deciding what the limits of profits should be are liable to discourage investment. Thus prices are normally fixed on the basis of an allowance for profits ranging from 8 per cent to a maximum of 12 per cent on capital employed. As a result, after dividends have been paid, there is very little left for financing expansion."

In an earlier portion of the report the Mission is reported to have remarked that there are a number of instances, such as spark plugs, caustic soda, some types of sheet glass and calcium carbide where domestic costs are far above the landed cost of imports (ex-duty), that this is an area where constant vigilance is necessary, and that it has been favourably impressed by the action taken by the Tariff Commission to reduce or eliminate duties when they are too high. It would seem, therefore, that while the Mission has a word of praise for the Tariff Commission for the manner in which it has fulfilled its obligations to consumers, which, in its view, is the primary purpose of its enquiries and is legitimate, the Mission does not consider its price fixing activities as legitimate. One could sense an implied suggestion that the Tariff Commission has been treading on forbidden ground and messing up the terrain. Incidentally, it may be noted that the Commission has been determining prices for all commodities which are referred for protection — the reference to motor vehicles, dyestuffs, non-ferrous metals and electric motors as examples in this context is not understood—and that its staff of Cost Accountants is on this job throughout the year dealing with a variety of industries of all types.

There are two points which have to be dealt with before one proceeds further. The first relates to the legitimacy of the price fixing activities of the Tariff Commission. The Commission's functions in this regard are of a statutory nature and are laid down in the Tariff Commission Act, 1951. In framing the Act and when constituting the Tariff Commission as a statutory body in 1952, Government was guided by the recommendations of the Fiscal Commission (1949-50). Readers interested in obtaining a proper background of the whole concept of protection and price control as suited to this country may refer to Chapter XIII (Sections A and B) and Chapter XX of the Fiscal Commission Report. The underlying ideas in vesting the Indian Tariff Commission with the functions of a price fixing authority were (a) to have an independent permanent body with statutory powers to summon witnesses and compel production of evidence, and (b) to make use of the trained permanent staff available in the Commission, especilly the Cost Accountants, Technical Advisers and Economic Research Officers. While in most democratic countries there is need, off and on, to entrust the work of price investigation into monopolies, oligopolies, cartels etc. to special or ad-hoc bodies, it would seem that pragmatic considerations weighed with the Indian Government in framing the Tariff Commission Act in such a way as to include this type of work in the Commission's "legitimate" functions. Examined in this context, the World Bank Mission's comment on this point should be considered as lacking in substance. It may be mentioned, in passing, that at least four countries embarked on an investigation into the prices of rubber tyres and tubes at about the same time during 1953-55, namely, UK, Canada, South Africa and India, and among the reports produced, that of the Indian Tariff Commission was ranked high in merit and substance. Incidentally, it may be noted, the return at 10 per cent on capital employed allowed to the Dunlop Rubber Tyre Company has not resulted in retarding its prosperity or expansion, both having taken place after price fixation in 1955.

The second point concerns the characterisation of the Tariff Commission's methods relating to fixing fair profits as arbitrary and impinging on expansion. The Commission has invariably mentioned that, on the basis of the rate allowed by it on employed capital, the gross profit accruing to an industry or unit will provide sufficient funds to meet commitments under bonus and gratuity, interest on borrowed capital and debentures, dividend on preference shares, managing agents' commission and income-tax, and, "finally" leave a residue

which would provide for a reasonable dividend to shareholders. It does not appear to have laid claim to having provided for reserves, which, it is presumed, is what the Mission means by 'finance for expansion'. Judged from this angle, it would seem uncharitable to categorise the Commission's methods as arbitrary. In a limited sense, perhaps, there may be some arbitrariness in the quantum of bonus provided for—usually the Commission has assumed an average of two months' wages—and in the quantum of reasonable dividend—here again, it is believed to be six per cent tax free. But, in so far as there are no norms for bonus disbursements, nor uniformity, and in any case, Government itself would appear to be seeking a high-powered guidance on this issue, as is indicated by the proposal to constitute a Bonus Commision, there is no point in finding fault with the Tariff Commision for assuming an empirical norm for purposes of price fixation. As regards dividend, there is a fiscal levy on dividends in excess of 6 per cent so that the Commission would appear to feel justified in fixing the fair limit at that percentage. In this discussion one should not lose sight of an important fact, namely, that the Tariff Commission's "recommendations" regarding fair ex-works prices or fair selling prices in all the price enquiries conducted by it, contain specific answers to the terms of reference furnished by Government, and are not only spelt out in unambiguous terms regarding their content, but are also accompanied by the cost data and connected working papers, so that, it should be possible for Government to add, where it is found to be necessary, an element for expansion. It is understood that the Commission's reports are examined at all levels in the concerned Ministry as also in the Commerce & Industry and Finance Ministries, and possibly by the Planning Commission also, before Government's decisions are announced. In this context, therefore, the charge of arbitrariness, if any, should be laid at the doors of Government than at those of an advisory body like the Tariff Commission.

The Commission's approach to the question of providing funds for rehabilitation and/or expansion has not been doctrinaire. This is borne out by its analysis of the case of the sugar industry in its 1959 Report, paragraph 15. It has to be recognised that it is not always easy to justify the levy of an additional element in the price of a particular commodity on the community as a whole even on the plea that such a levy would go to build up the industry and strengthen national economy, as long as the several units comprising it are in uneven stages of development; further, the ultimate benefit of expansion will accrue to the sectional interests comprising shareholders, those that are already affluent getting more than those that are needy. The Industrial Policy Resolution of the Government of India dated 6th April, 1948 (paragraph 9) does, indeed, lay down that provision should be made for a fair return on capital employed in industry and reasonable reserves for the maintenance and expansion of undertakings, but the difficulty is perhaps, the absence of any indication of the norms to be adopted. It is observed that the Commission has been dealing with each situation as and when it arose, and has argued out the case for and against rehabilitation allowance in quite a few reports, as, for instance, when it conceded it for the Cement Industry (Report of 1958) and declined it for the Sugar Industry (Report of 1959) and for the Tin Plate Company of India (Report of 1958). Its reaction to the question of capitalisation of Reserves by issue of Bonus Shares is seen in paragraph 7.4 of its Report on the levy interest on special advances granted to Tata Iron & Steel Company and Indian Iron & Steel Company. Thus, it is observed from an examination of the cases dealt with by the Commission that, while the question of conceding reserves for rehabilitation and/or expansion may be accepted in principle, it is as difficult of assessment as the problem of calculating depreciation more in relation to replacement cost of plant and machinery than to the original value of the block. The element of uncertainty and arbitrariness is, indeed, very vast in both cases. The World Bank Mission Report has rightly drawn attention to the matter but, not quite rightly, blamed the Commission for it. It seems that such unsettling questions as those indicated above, as also matters relating to bonus, depreciation allowances etc. should be subject to high level examination by the Planning Commission, the Finance Ministry and the Commerce and Industry Ministry, in consultation with the Tariff Commission, and firm decisions arrived at. The Fiscal Commission Report envisaged the "closest possible liaison between the Tariff Commission and the Planning Commission" but, in practice, none would appear to exist.

It is difficult to agree with the Mission that the price fixing activities of the Tariff Commission have retarded the expansion plans of the concerned industries. While none of the industries have been adversely affected, quite a few have flourished and expanded, as for instance, Iron and Steel, Cement, Rubber Tyres, Locomotives and Boilers, Automobiles, Calcium Carbide, Caustic Soda Chlorine and Bleaching Powder, Paper and Sugar. It is also difficult to agree with the Mission that Government has been light heartedly extending the price fixing activities of the Commission, which comment is implied in the statement that the Mission was "particularly concerned". A quick examination of the list reveals the following. Iron and Steel prices have been fixed and controlled since 1949 as a measure of national policy. Tin Plate prices had to be investigated and controlled as the concerned single unit was allowed a retention price. The cases relating to Cement, Locomotives and Boilers, Registered Re-Rollers, Acetate Yarn of Sirsilk, Sindhri Fertilisers, Zinc, Sugar and Raw Rubber were referred to the Commission at the request of the industries or units concerned. The cases relating to Automobiles, Calcium Carbide, Caustic Soda Chlorine & Bleaching Powder were referred for investigation along with the review of their protection. The case of the Paper industry was referred as a difficult situation was created by the attitude of one section of the industry. The case of Rubber Tyres and Tubes was referred for conducting a fact finding investigation into the past profits of the industry and the practicability of reducing prices. It seems fairly clear that none of these enquiries can be called purposeless; indeed, a study of the Commission's reports relating to all there cases will help to clear many a misconception regarding the economics of the industries concerned, and, to that extent, the relative enquiries have fulfilled a social purpose. When large sections of the community nurse grievances against particular sectors of industry and trade on the ground that prices have been inflated or manipulated, it would be as wise for such sectors to ask for an investigation as it will be good for Government to institute one for the establishment of public confidence.

THE BUSINESS WORLD

Credit Curb Continues

By CROESUS

APPARENTLY the Reserve Bank authorities are not quite satisfied that the measures of credit restraint adopted by them so far have produced the desired effect. This was, of course, clear even from the latest report of the Central Board of Directors of the Reserve Bank issued early this month, which referred to "the rather slow contraction of credit in the 1960 slack season." It may be remembered that, some time ago, the Governor of the Reserve Band had issued a circular to all the scheduled banks to bring down bank credit during the current slack season by Rs. 110 crores. Yet, with hardly six weeks more for the end of the current slack season, the total bank credit stands at Rs. 1,127.23 crores, which means a drop of less than Rs. 5 crores since the end of April last; over the corresponding period of last year, the drop had been nearly Rs. 93 crores. But this is not all. As though to occasion even more anxiety to the monetary authorities, scheduled banks' borrowing (against usance bills and others) during the current slack season almost touched Rs. 55 crores (during the week ended September 2, 1960). Towards the third week of September last year, scheduled banks' borrowings from the Reserve Bank, including those against unsance bills and others, were less than Rs. 7½ crores. The extent of increases in these borrowings will be even more obvious from a comparison of the peak figures touched during the 1959-60 busy season and during the 1958-59 busy season; in the formar case, it fell short of Rs. 80 crores, whereas, in the latter case, it just fell short of Rs. 62 crores. To this state of affairs must also be added the disinvetment from the scheduled banks' portfolio of government securities which stood on September 16, 1960 at Rs. 729.36 crores, as against Rs. 759.92 crores on September 18, 1959. Also synchronizing with these features has been the steady decline in the total deposits of scheduled banks; from their recent peak of Rs. 1965.99 crores, this declined to Rs. 1917.48 crores as on September 16, 1960.

It is against these latest scheduled banks statistics, on the one hand, and against the background of the series of credit restrictions capped by the latest restraint measure, on the other, that we have to examine the appropriateness and the probable effectiveness of the latest scheme of restriction on scheduled banks' borrowings from the Reserve Bank. Before we pass on to this, the main features of the scheme may first be indicated. For the first time, quotas have been prescribed (equivalent to 50 per cent of the reserves maintained by every scheduled bank with the Reserve Bank) any borrowing above which will attract a rate of interest higher than the Bank Rate. Two slabs have been indicated for borrowings in excess of 100 per cent of the quota (that is 50 per cent of the reserves required to be maintained); if the borrowings are in excess of 100 per cent, but not more than 200 per cent of the quota, the rate of interest will be 5 per cent, and if the borrowings exceed 200 per cent of the quota, the rate of interest will be 6 per cent or 2 per cent above the Bank Rate. In other words, the Central Bank's re-discounting rate to the scheduled banks will henceforth be not one rate, namely the Bank Rate of 4 per cent as hitherto, but three different rates, namely 4 per cent, 5 per cent, and 6 per cent, depending upon the extent of borrowings in relation to the statutory reserves. With the introduction of the system of penalty rates as above, there are no longer ceiling limits for borrowings from the Reserve Bank under the bill market scheme, as hitherto. In other words, scheduled banks can now borrow as much as they want, provided they are prepared to pay the penal rates of interest. It may be noted here that the inter-bank sector of the money market has been generally excluded, although no scheduled bank is now permitted to pay more than 2 per cent on deposits repayable on notice or within 21 days. At present, house money at 7 days' notice fetches 3 per cent, and this is also the rate for short-term money up to one month.

Another important feature of the scheme is the levelling up of the lending rates of banks. The Reserve Bank requires all scheduled banks to impose a minimum lending rate for all advances, whether existing or new, and whether clean or secured, with effect from October 1, 1960. In the case of banks whose minimum lending rates are already 5 per cent or more, this lending rate has to be raised by a further half per cent, on an average. It is not clear from the Reserve Bank's announcement whether this directive will apply even to those banks which, only in the last few months, have stepped up their rates of interest on advances.

The banks may not be very much interested in the suspension of the ceiling limits fixed for individual banks under the bill market scheme, inasmuch as these limits have been so small that some banks have actually begun to question the utility of the scheme as an effective enabling measure for them to borrow adequately.

Most of the scheduled banks, it is common knowledge, borrow primarily against their securities at the Bank Rate. As a result of the new scheme, the borrowing rate for these banks, or, at any rate in respect of that portion which is in excess of their quotas, will be higher by one per cent or two per cent. It has been estimated that, on the basis of statutory reserves as at present, the scheduled banks can borrow no more than 2|3rd of what they are borrowing today at the Bank Rate. In view of this, it is a foregone conclusion that nearly every scheduled bank will take advantage of the Reserve Bank's directive to raise its lending rate by half a per cent. It may be recalled, in this connection, that, some time ago, attempts were made to have an inter-bank agreement to bring about a general increase in the lending rate in order to offset the steadily rising costs of banks. But the State Bank of India and a few ohers opposed the suggestion at the time and, ironically enough, it is the State Bank, as also a few other big banks which were lending against "safe risks" at 4½ per cent, who will now be obliged to raise their lending

rates. The tragedy of it is that, when this has come to pass, the State Bank of India no longer enjoys the fortuitous advantage of the PL 480 funds, which used to be pointed out by the way, as one of the factors that enabled the State Bank to compete with other commercial banks by offering loans and advances at relatively lower rate of interest. Today, thanks to the new order of the Reserve Bank, all banks, including the State Bank, are placed on the same footing.

From the point of view of banks generally, the increase in their margin of profits from 2 per cent (namely rate of advance — six per cent minus call deposit rate — three per cent) to 4½ per cent (rate of advance 6½ per cent minus call deposits rate two per cent) may help raise the margin of profit, despite the net increased cost of borrowings under the new scheme. The extent of such increase in profit will, of course, depend upon the extent to which the banks are prepared to keep on, or not keep on, the advantage of the prevailing relatively higher interest rates to their short-term depositors. As happened in the case of house money at 7 days' notice, it is not improbable that there might be deposits for more than 21 days (but less than one month). This is a minor point. What the banks are likely to do is that they will first utilise the quota from the Reserve Bank at the Bank Rate and then meet the requirements of their clients by resorting to sales of Government securities. Indeed, this process would appear to have already begun. In other words, in effect, it may turn out that the cost of borrowings to the banks might not go up to the same extent as anticipated by the authorities. And, to this extent, the contemplated deterrent effect on banks' borrowings would be neutralised.

Meanwhile, it is apprehended by the business community that borrowings from banks will henceforth become more costly and that, to this extent, there is bound to be an increase in industrial costs. On the other hand, it is also felt that the tendency of depositors hereafter would be to divert their funds from banks to more lucrative avenues, such as fixed interest bearing securities or, worse still, financing of commodities. In other words, there is genuine fear that some more money may tend to go outside the purview of the monetised sector and, if this should happen, it is feared that even the latest monetary measure may not prove as effective as expected.

According to the Press Note issued by the Reserve Bank of India, the object of the latest measure is "to secure an abatement of the pressure of monetary demand which has been a contributory factor to the rise in commodity prices." That there has been a rise in commodity prices is an accepted fact. Even when the index of wholesale prices (1952-53 = 100) reached 122.9 at the end of June, the Reserve Bank computed the net rise over the year to be 6.3 per cent, as compared to a rise of 2 per cent in 1958-59; since then prices have advanced still further and, again, according to the Reserve Bank Directors' Report, the most important contributory groups for the rise are "industrial raw materials" and "manufactures," while, under "food articles," where the rise has been comparatively smaller, the rise has been confined to items like tea, edible oils, sugar and cereals, particularly rice. It also seems clear from the experience of the past few years that, more than even the availability of supplies, it is the pressure of purchasing power that leads to the rise in prices in our country. It seems, therefore, appropriate that efforts should be made to secure an abatement of this pressure. But, in the context of the limitations inherent in semi-developed economies such as ours, especially during a period of accelerated economic development, it is difficult to say to what extent even the latest measure, which should, in fact, be regarded as the first really stringent measure of monetary control to be imposed by the Reserve Bank, will be effective. If, as some sections apprehend, more funds are drained away from the monetised sector as a result of the latest measure and some really vital sectors of the economy catering to the essential requirements of the country are adversely affected by the measure, the new scheme may prove to be a self-defeating affair. But this is not to suggest that the Reserve Bank must passively watch the trend of rising prices.

Business Notes

Coffee

THE PROBLEM OF EXPORT

IN HIS presidential address at the 50th meeting of the Coffee Board, Mr. H. Sitarama Reddy gave prominence to the problem of coffee exports which has become somewhat intractable. It is now common knowledge that currently there is an abnormal surplus of coffee in the world market and, therefore, export prices have been very severely depressed. In the world perspective, the share of Indian coffee is small, but it is looked upon as precious from the view-point of our acquisition of foreign exchange. Furthermore, whatever the share, it is only a course of prudence that a permanent foothold should be obtained by this country in the international coffee market. In the recent past the level of export prices ruled high so that it enabled the Coffee Board to hold the domestic prices of coffee at points which serve to reconcile the claims of the grower for a reasonable return and of the consumer for a fair price. But since the experience of the last four months has shown that the prices offered for Indian Coffee in the export markets are "alarmingly low", the immediate problem posed is how to dispose of the exportable surplus. The next problem is how to maintain the domestic price line which upto now was aided by the higher price of exported coffee.

It would appear that in the immediate future the way out may not be available, and the domestic price of coffee will come under a strain. In this context, Mr. Reddy drew attention in his address to Mr. Lal Bahadur Shastri's appeal to the Export Promotion Advisory Council last month for some sacrifice at home in the interest of pushing up exports. Applied to the case of the coffee industry it would mean that some disadvantage in the form of a higher consumer price may have to be borne at home if only exports can be pushed up in this manner. But looking to the long-term necessity of strengthening the hold of Indian Coffee on the world market, Mr. Reddy pointed out the need of trying to modernise the production and sales techniques. Dilating on the subject, he drew attention to the fact that the United States which is the biggest market for world coffee consumed 50 per cent of this commodity in the form of Instant Coffee. This trend towards a preference for Instant Coffee is spreading in other countries also and that explains why the coffee producing as well as coffee consuming countries are now making larger investments in setting up plants for making Instant Coffee. Mr Reddy has urged that India should give earnest attention to this new trend and enter this line of coffee sale in the Instant form. This suggestion of Mr. Reddy has been addressed primarily to coffee planters and the trade. Already a pioneer project has been installed. But if India is to fall in line with the global trend, it ought to be pursued eagerly.

Tobacco

STRESS ON QUALITY

THE QUALITY of tobacco produced in India is of significant importance, because, apart from other reasons, export of unmanufactured tobacco is possible only if it can compete, in the field of quality, in the foreign market. It may be observed that export earnings during 1959 fell to Rs. 12.92 crores from a level of Rs. 14.70 crores in 1958. During the current year exports may look up, but it seems that the lost ground may not be completely regained.

Mr. F. A. Collet, Chairman, the Imperial Tobacco Company of India, explained this fall in earnings in his address at the annual general meeting of the company held recently. He pointed out that weather had been very unkind to the producers of fluecured tobacco in India. In Andhra, the only State producing quality tobacco, heavy unseasonal rains during the months which are vital for tobacco cultivation had an adverse effect on the quality of crop.

The Chairman has stressed the need for improving the quality of tobacco produced in the country by greater emphasis on following the cultural practices recommended by the Indian Central Tobacco Committee. It is very necessary that proper attention is paid to harvesting, curing and handling of tobacco crop. The cultivation of unwanted low-grade flue-cured tobacco has to be eliminated in areas where better qualities can be grown. If proper control over the quality of tobacco is maintained there is no reason why the exports of unmanufactured tobacco should not improve during the years to come. In addition to that, consumers at home would get quality tobacco at reasonable rates.

A Trust

SOUND RECORD

H. E. H. THE NIZAM'S CHARITABLE TRUST, having assets in the form of debentures, preference shares and ordinary shares of the market value of Rs. 6.17 crores has certainly been rendering useful assistance to various needy and deserving individuals and institutions. A large number of students have been granted scholarships and travel grants to pursue research in several subjects in various foreign countries. During the year to March 31, 1960, a sum of Rs. 9.31 lakhs was disbursed as educational aid, scholarships, medical relief and maintenance allowance. In addition to this, a sum of Rs. 1.59 lakhs was paid to students towards foreign scholarships and passage money. Then, a large number of intitutions get lump sum donations and recurring monthly and annual grants. On this account the trust paid a sum of Rs. 9.87 lakhs during the year under review.

The trustees, it seems, have handled the funds with sufficient care and have included a wide variety of institutions that benefit from the grants. The list appended to the report includes educational, medical, general welfare, literary and cultural organisations. After making these disbursements out of the total income of Rs. 41.04 lakhs accruing from the assets of the trust, a surplus of Rs. 7.31 lakhs has been transferred to 'Investment Fluctuation Reserve'. The trustees have also built a General Reserve of Rs. 49.89 lakhs after setting aside Rs. 30 lakhs for the Orthopaedic Hospital Fund. If the funds of the trust are continued to be handled in such a pudent manner, the trust will surely be able to do still more important work in future.

World Bank

FIFTEEN YEARS

IT WOULD be interesting to survey the progress of the World Bank during the last 15 years of its career. By mid-1960 (June) the World Bank had agreed to loans totalling over $5 billions, over 52 per cent of which was accounted for by Asian and Latin American countries. This percentage would work out to 57, if the initial reconstruction loans of $497 million are excluded and only development loans taken into consideration. African countries accounted for 17 per cent of the development loans.

Simultaneously with the steady growth in the amount of loans approved, from $799 millions in June 1950 to $5,068 millions in June 1960, the World Bank has faced with varying degrees of success, several problems.

Being essentially a business enterprise operating on a commercial basis, paying interest on loans borrowed and charging commission on loans advanced, it was faced with the problem of finding resources. This has been a mounting problem, increasing as it is conquered. Last year the Bank increased its capital from $10 billions to $21 billions. But no calls were made on the member countries for payment of their enhanced subscriptions to the Bank's capital. Doubling of the capital was intended to strengthen the Bank's borrowing base. The Bank which was too heavily leaning on the U.S. for funds, till very recently, has made successful efforts in the last four years to widen its sources of funds. Even by mid-1956, countries other than the U.S. had made freely available to the Bank a little less than $450 millions and $65 millions of this came from Canada. Since the last four years, however, these countries have more than doubled their paid-in subscriptions.

The Bank borrows from private capital markets to supplement its funds and borrowed funds are its major resources for lending. Even here, till recently, the Bank relied for most part on the U.S. capital market and in other markets, on the guarantee of the uncalled portion of the U.S. capital subscription. By mid-1960, the Bank had sold to U.S. private investors such as pension and trust fund companies, life insurance companies, savings bank and commercial banks, securities worth nearly $975 millions. In June 1960 non-U.S. holdings of World Bank securities amounted to $1,097 millions. of which $714 millions were in dollar securities and the rest in other currencies. Recently, West Germany is also providing a considerable amount of the funds required. The widening base will put the Bank on surer ground.

The Bank has with an encouraging degree of success tried to supplement its advances, by selling portions to private capital investors such as the commercial banks, sometimes with its guarantee and lately without any such guarantees. This technique has served to channel private investment into development finance for the under developed countries.

FROM THE CAPITAL'S CORRIDORS

NEWSPRINT FROM BAGASSE

SOME details are now available of the project report prepared by the German expert, Dr. H. Muller-Clemm, on the manufacture in India of newsprint from bagasse. The report inter alia says:

At present, there is only one factory in India manufacturing newsprint, namely, the Nepa Mill at Napanagar. This factory produces cellulose from bamboo according to the sulphate process and mechanical wood pulp from salai wood. The factory was founded by private entrepreneurs, but since it could not develop on an economical basis, it was taken over by the Union Government in order to avoid its shut-down. The problems facing this concern were, in part, caused by the difficult processing of salai wood which is discoloured to a great degree, has a short fibre and, in addition, supplies very crooked trunks.

The development of the Nepa Mill upto 1958 is reflected in the following figures:

Year	Output (Tons)	Cost of Production (Rs. per ton)
1956	10,792	1,092
1957	19,645	1,020
1958	21,708	772

The world prices for imported newsprint have fluctuated to a great extent, the average import price being approximately Rs. 760—810, c.i.f. seaport.

From tests carried out it was found that the normal sulphate process would prove advantageous for India. It was found, however, that the investment of capital for a sulphate plant would be essentially higher than for a plant operating in accordance with the AZ-process. This is due to the fact that the sulphate plant requires a bleaching plant and an electrolytic installation. In addition, a chemical installation for the recovery of chemicals is required. As against this, the AZ-process cannot recover its chemicals which, due to Indian circumstances, are very expansive. Furthermore, the dissolved organic substance cannot be burnt for the generation of steam as in the case of the sulphate process. The loss in chemicals and organic substance will, according to the opinion of the experts, compensate the additional charges for the investment in a sulphate factory.

At present there are methods of dyeing according to which it is possible to establish exactly to what degree the fibres of a paper have been processed in the bleached or unbleached state. By employing these methods it is possible to establish without any difficulty whether the Aschaffenburg papers actually consist of unbleached cellulose.

THE PROPOSED PROJECT

After extensive discussions and inspection of the Nepa Mill, the Nizam Sugar Factory in Shakharnagar was visited. With regard to the possible erection of a cellulose factory and paper mill in this place, this prospective site was specially inspected.

If the difficult water conditions of the country are taken into consideration, it must be stated that Shakharnagar comes off most favourably in comparison with other places. Even during the driest season, that is before the rainy months, the large dam in front of the factory has enough water for supplies to a paper mill with an output of 150 tons. This water reservoir, designated as the Belal Tank, is only one mile distant from the factory. It encompasses an area of 50 square miles and can collect up to 456,000,000 cubic feet of water. The head flows for the dam are ensured by the Nizam Channel System.

The AZ-process requires 350 cbm. (78,000 gallons) of water for each ton of finished paper. These 530 gallons/min. can be secured in Shakharnagar. However, a proposal has been submitted to secure and improve the water supply still further by shifting the main distributing pipeline.

The cellulose factory and paper mill should be erected next to the existing Shakharnagar Sugar Factory. Provided the sugar factory generates its steam entirely by means of oil heating, approximately 50,000 tons of bagasse per year could be placed at the disposal of the paper mill after the screening and depithing process. Approximately 25,000 tons of fibre material will be obtained from the 50,000 tons which, together with the filling material required for newsprint, may result in an annual production of approximately 30,000 tons of paper.

With regard to the raw materials, transportation, and taking the water conditions into consideration, Shankarnagar is to be regarded as suitable. The site is especially favourable for the erection of the factory as well as of the workmen's dwellings. On the other hand, the site is conveniently located for the sale of paper to Hyderabad and, above all, to Calcutta.

OBJECTIONS ANSWERED

If one reverts to the initial objections and demurrers against the project to build the newsprint factory on the basis of bagasse according to the Aschaffenburg process, these objections, above all, exist in the fact as to whether it is possible to boil the unbleached bagasse according to the process so that it will be white enough as to be suitable for newsprint. This question, based on the various test boilings as well as on the various large-scale tests, can surely be answered in the positive. Owing to this unobjectionably established fact the enhancement of the price of the AZ-process by bleaching, which was mentioned in the Indian objection, becomes superfluous. Neither is chlorine required for the corrected white of the material nor will the yield of material boiled with neutral sulphite be decreased by bleaching. In addition, the entire investments for a bleaching plant and for an electrolysis process will be saved.

The next item in doubt was the consumption of chemicals, namely Na2SO3 and NaOH. According to the first planning, the recovery of these chemicals was to be abandoned. Thus the objection was raised that these chemicals are a total loss after each boiling in spite of the fact that part of the sulphur must be imported into India. Furthermore, the objection was raised that the organic substance, which is dissolved by the boiling process, is lost with the waste water due to the flowing off of the spent lye. Contrary to this it was emphasized that, according to the sulphate process, the possibility to recover the chemicals up to 75-80 per cent exists and the organic substance can be burnt in the boiler house in correspondence with its calorific value. Owing to the burning and recovery, the waste water problem will, of course, be essentially improved.

In opposition to these objections it can be stated that various observations have been made in the course of the last year with regard to the recovery of the spent lye obtained in the neutral sulphite process, that is the spent lye as it is obtained in the Aschaffenburg process. The Aschaffenburger Zellstoffwerke have contacted the American owners of the process and are today in a position to regenerate the spent lye obtained according to their process. This means that the loss of chemicals compared with the sulphate process is no longer greater, the purification of the spent lye and the recovery of the organic substance in the combustion process are guaranteed.

Furthermore, it can be mentioned that the recovery installation for this process is cheaper than the recovery installation for the sulphate process.

According to the experience gained in South Africa, it is possible to stack the bagasse for a whole year in accordance with the Ritter process. Aschaffenburg will, however, carry out large-scale tests in this field.

As far as the boiling installation is concerned, continuous boiling is to be reckoned with in both cases, that is in the sulphate proces as well as in the neutral sulphite AZ-Process.

COST COMPARISON

Comparison of costs between the sulphate process with bleaching and the neutral sulphite process without bleaching, for the manufacture of 100 tons per day of newsprint of bagasse, is as follows:

Annual output in 340 days	34,000 tons of paper with 10 per cent kaolin.
Cellulose production 85 tons per day absolutely dry	28,900 tons per year absolutely dry.

(U.S. $)

Plants	Sulphate factory	Neutral sulphite factory
Bagasse stock, transportation, ation, washing, pressing ..	576,000	546,000
Installation for continuous boiling	576,000	598,000
Preparation	548,000	548,000
Recovery (including lime kiln) boiler, causticization ..	2,415,000 with SO2 preparation without a lime kiln	2,088,000
Bleaching plant and preparation of bleaching lye ...	457,000	—
Steam, water, current ..	765,000	621,000
Laboratory, office, etc. ..	265,000	265,000
Paper Mill	3,600,000	3,600,000
Supervision, mounting etc.	1,771,000	1,358,000
TOTAL	10,973,000	9,624,000

The report concludes: "Summarizing, it may be stated that the Aschaffenburg process for the manufacture of newsprint from unbleached bagasse can be regarded as suitable. The various modifications and innovations introduced in the process may ultimately lead to a profitable outcome. If it should still be necessary to carry through tests on a large scale, the Aschaffenburger Zellstoffwerke are prepared to assume this task. If the factory should be erected, Aschaffenburg would make its staff available in order to take over the supervision at the initial stage of operations.

"The bagasse raw material is available in sufficient quantities in various regions of India so that factories with a daily output of 100 tons of newsprint can be erected near the sugar factories. If thus the factory to be erected in Shakharnagar should turn out to be successful, the way for the erection of further plants on the same basis would then be clearly indicated."

RAISING SUGAR OUTPUT

Presumably encouraged by the performance of the sugar mill industry during the last crushing season and with a view to export about 2.5 lakh tons of the commodity next year, the Government of India has decided to continue for the next crushing season the last year's concession of 50 per cent rebate in the basic excise duty on sugar production in excess of the average output during 1958-59 and 1959-60. In the case of factories which went into production only in 1958-59 season or thereafter or which did not function during 1958-59 and/or 1959-60, the question of granting rebate will be considered on merits, as during the last season.

This concession along with a rebate of 5 annas in excise duty on early crush and raising of cane prices by 3 annas, it may be recalled, helped in raising the output of sugar during the last crushing season to an all-time peak of 24.25 lakh tons—an increase of about 5 lakh tons over the previous season. In the next season, production, according to Union Food and Agriculture Ministry's estimates, will go up further by about 3 lakh tons.

The Third Plan target for sugar output, it is learnt, is also being stepped up from 30 lakh tons to 35 lakh tons.

COKING COAL AND SULPHUR DEPOSITS

Two important discoveries of mineral deposits have been announced by Mr. K. D. Malaviya, Minister for Fuel and Oil. One of these discoveries relates to metallurgical coal and the other to sulphur pyrites.

Mr. Malaviya disclosed on Sunday that three big deposits of coking coal had been found in Ranigunge and Bokaro areas. Though he did not give any approximate quantitative and qualitative estimates of these finds, he asserted that these deposits were vast enough so as to make the country self-sufficient in Grade I coal for decades to come. Detailed investigation, he added, was being entrusted to the Indian Bureau of Mines.

In Bokaro, Mr. Malaviya said, coal having coking index between 21 and 23 per cent had been discovered in an entirely new 74-ft. seam broken up into two portions separated by 8 feet of non-coal material. Another deposit discovered in this region relates to a seam which is already being worked at a depth of 2,000 feet. This seam, mapping and investigations appear to show, at places runs upwards to 1,000 ft. level. In Ranigunge area, metallurgical coal has been discovered almost on the surface over a tract about 1½ miles long.

Huge deposits of sulphur pyrite have been discovered in the Amjore area in Bihar. Exploitation of these deposits, it is said, has already been started. It is understood that as a result of this, imports of sulphur, which run to the tune of several crores of rupees annually, will be gradually reduced and eliminated altogether in course of time.

The Amjore deposits are considered to be vast enough to supply all the sulphur needed by Indian industries for many decades. Exploration work to find out deposits of "free" sulphur has also been in progress for quite sometime in the Andamans. How far this effort has succeeded is not yet known.

IMPORT POLICY ANNOUNCEMENT

The import policy for the next six months is expected to be announced on Saturday. Despite the announcement by the United Kingdom of a further credit of £35 million to this country, no liberalisation of the import programme is envisaged here. On the other hand, as indicated in this column last week, imports may be further pruned slightly.

IFC LENDING OPERATIONS

Mr. K. R. K. Menon, Chairman of the Industrial Finance Corporation of India, indicated at a Press Conference last week that in view of the recent curbs on bank credit effected by the Reserve Bank of India, the Industrial Finance Corporation might, if need arose, accommodate some deserving industrial units for their working capital needs, especially if it was necessary in the interest of safeguarding the loans granted by the IFC to such units. Normally, the Corporation did not extend such credit, he said.

FERTILIZER FACTORY IN RAJASTHAN

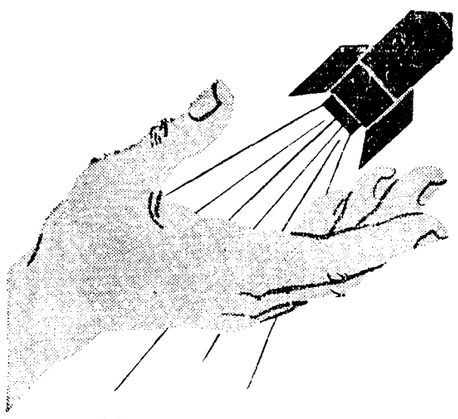
The Government of India, it is learnt, has invited proposals from private parties for setting up a fertilizer factory at Hanumangarh, in Rajasthan. Hanumangarh has been found suitable for the manufacture of ammonium sulphate based on gymsum and lignite both of which are available in plenty near the site. The Government, it is understood, has already received a few proposals for setting up this factory with foreign collaboration, but it will consider more such schemes. Final decision on the proposals will be taken in about a month's time.

TRADE CENTRE AT BEIRUT

An Indian trade centre will be shortly established at Beirut, in Lebanon, to familiarise the traders in West Asia with the range of Indian products available for export. The centre, which is being organised by the Union Ministry of Commerce and Industry, besides publicising Indian goods, will render commercial service to Indian exporters by bringing them in contact with the traders in West Asia.

The inaugural display at this centre is expected to be held in December. Intending exporters, especially those dealing in engineering goods, hardware, meters, measuring instruments, scientific instruments, laboratory equipment for schools, colleges and universities, surgical instruments, hospital equipment, drugs and pharmaceuticals and textiles, may send their exhibits to the authorised agents of the Commerce and Industry Ministry for despatch to the centre. After a period of display at the centre, these goods would be returned to the owners or, if they so desire, disposed of there itself.

TRADE WITH IRAQ



There is a good market for Indian tea, light engineering goods, hosiery and knitted garments, plastic manufactures, sports goods etc. in Iraq. This is revealed in the joint communique issued at the end of the trade talks held in Baghdad this week between representatives of the Governments of India and Iraq. An Indian tea centre will be opened in Baghdad shortly.

India imports dates from Iraq. The Iraqi Government for sometime past has been pressing India to increase these imports from there.

ALUMINIUM REQUIREMENTS AND PRODUCTION

India is expected to require nearly 1,50,000 tons of aluminium ingots per annum towards the close of the Third Five-Year Plan. Production at present is about 17,500 tons per year, to which Indian Aluminium Company contributes nearly 15,000 tons (5,000 tons from its Alwaye smelter and 10,000 tons from its Hirakud smelter) and the Aluminium Corporation of India 2,500 tons. The rated capacity will increase to 77,500 tons annually when the following already licensed expansion programme of the industry is completed:

New Aluminium Smelters Licensed	Annual Capacity
(1) Hindustan Aluminium Corporation Ltd., Bombay — Aluminium Smelter at Rihand (U.P.)	20,000 tons
(2) Tendulkar Industries (P) Ltd., Bombay — Aluminium Smelter in the Koyna Region (Maharashtra)	20,000 tons
(3) Shri R. Venkataswamy Naidu of Coimbatore — Aluminium Smelter at Mettur, Salem District (Madras)	10,000 tons
Expansion of Existing Plants Licensed	
(1) Indian Aluminium Co. Ltd., Calcutta — expansion of Hirakud smelter to	20,000 tons
(2) Aluminium Corporation of India Ltd., Calcutta — expansion of Asansol smelter to	7,500 tons

New frontiers

From the beginning of time human eyes have looked up into space and wondered, and wondering, desired to possess the moon.

Today, man has travelled far on the road of knowledge; today he is about to inherit the moon.

We may not yet know all the details of that first flight which will send him hurtling through space. But of this we are sure, he will need Oxygen to sustain him. And of this too we are sure, that Oxygen will have helped to cut or weld his space-ship and its equipment.

COMMODITY NEWS AND NOTES

PRODUCTION AND DISTRIBUTION OF WOOLLEN YARN

An order controlling the production, distribution and selling prices of woollen yarn has been issued by the Government of India recently. The Order, which has been issued under section 3 of the Essential Commodities Act, provides that, in order to co-ordinate the production of woollen yarn with public needs, the Textile Commissioner may fix the type and quantity of woollen yarn to be produced by the manufacturers. The Textile Commissioner will also fix the ex-factory wholesale and retail prices at which the different varieties of woollen yarn will be sold. The Order further provides that in order to secure proper distribution of yarn, the Textile Commissioner may direct any manufacturer or dealer not to sell any woollen yarn, except under a permit issued by him. The Order takes effect immediately. Of late, manufacturers of woollen hosiery have been experiencing considerable difficulties in securing adequate supply of yarn at reasonable prices. This question has been under Government's consideration for some time past and in July 1960, the Government of India statutorily fixed maximum prices for the different categories of woollen worsted yarn. The present measure, it is hoped, will help the woollen industry in procuring adequate supplies of yarn at reasonable prices.

ALLOCATION OF ART SILK YARN

It has been decided that the allocation of indigenous art silk yarn to the art silk powerloom weaving units for October-December 1960 quarter will be made on the basis of the number of loom-shifts worked by the units during April-June 1960. In the case of units which are submitting monthly returns in the prescribed form regularly to the office of the Textile Commissioner, the rate of allocation will be 1.6 lbs. per loom per shift. In case of units which are not submitting monthly returns in the prescribed form regularly to the Office of the Textile Commissioner, the rate of allocation would be 0.9 lbs. per loom per shift provided they submit the returns in the prescribed WAS-1 form along with their applications.

The allocation will only be made to such units which are holding valid installation permit and/or registration certificate from the office of the Textile Commissioner, Bombay, to work powerlooms on art silk/staple fibre yarn. Powerloom units whose cards against July/Sept. 1960 period have been endorsed after August 31, 1960 can secure their balance requirement from indigenous yarn manufacturers in the ensuing period along with the allotment against Oct./Dec., 1960 period. Further, particulars can be had from the Office of the Textile Commissioner, Bombay.

IMPORT OF U.S. COTTON ON RUPEE PAYMENT BASIS

The U.S. Agriculture Department has favourably received a request by Mr. A. M. Thomas, India's Deputy Minister for Food, for the sale of 150 million dollars worth of surplus cotton for rupees, it was learnt yesterday. The purchase of the cotton would be similar to the arrangement India made last May to buy U.S. wheat and rice for rupees over a long-term period. Mr Thomas' proposals were well received at the Agriculture Department. Officials recalled the failure last year of the Indian cotton crop. Another factor was the Department's readiness to reduce Government-held stocks of cotton which now total over 5,000,000 bales. In addition to normal commercial purchases, Indian purchases of U.S. cotton for rupees since 1956 have totalled about 1,000,000 bales.

It is gathered that India's chances of obtaining American cotton under the Public Law 480 on a long-term basis are fairly bright. Mr. A. M. Thomas met officials of the Agricultural Department for such an agreement on more or less the same lines as 1.3 billion dollars agreement under P.L. 480 whereby India will get 16 million tons of wheat and a million tons of rice over a period of four years. It is understood that India's requirement is in the neighbourhood of a million and a half bales of cotton over a period of next four years. Mr. Thomas also discussed with the American officials the possibility of exporting Indian sugar to the United States. Prices of sugar have been going up in U.S. since she cut off Cuban and Dominican Republic sugar.

COAL OUTPUT IN JULY

The raisings and despatches of coal during the month of July, 1960 from all fields in India were 4,048,636 and 3,590,436 tons, respectively. The corresponding figures for the month of June, 1960 were 4,141,082 and 3,690,244 tons respectively. The daily average loading for the month of August, 1960 from the West Bengal and Bihar fields was 4,444 wagons as against 3,797 wagons in the previous month. The highest loading on any day during the month of August, 1960 was 5,185 wagons and the lowest 3,160 wagons, the corresponding figures for July, 1960 being 5,501 and 138 wagons respectively. A daily average of 237 wagons was allotted for shipment traffic during August, 1960 as against 143 in the preceding month. A daily average allotment of 178.54 wagons was made to Pakistan during the month of August. About 121,770 tons of coal were despatched to Pakistan during the same month.

You owe it to yourself

Make it a habit to put away that *Extra Rupee* — regularly — and soon you will find a substantial amount at your credit. You can then confidently plan your future.

(ESTABLISHED 1895)
HEAD OFFICE: NEW DELHI

COMPANY AFFAIRS

DALMIA CEMENT: HIGHER OUTPUT

During the year 1959 production and despatches of the Dalmia Cement (Bharat) Ltd. both in the cement and ceramic industries showed considerable improvement. Clinker production and cement despatches went up from 2.25 lakh tons and 2.31 lakh tons in 1958 to 2.87 lakh tons and 2.62 lakh tons respectively in 1959. The production and despatches in the Ceramic Industry during the year under review were also considerably higher as compared to 1958. Installation of the third Cement Kiln of the Company was completed in October, 1959, and the production of clinker was commenced. The additional output of clinker could not, however, be converted into cement as the installation of the cement mill could be completed only in January, 1960. The directors have pointed out that as the clinker produced from the third kiln was not ground in the year under review and has been carried forward at cost, the benefit of the tax concession under Section 15C of the Income-tax Act would be available only from 1960 onwards. The new Cement Plant is working satisfactorily.

Further progress was made by the company in developing the mining and export of high grade iron ore mines in the Bellary-Hospet area. About 1.15 lakh tons of iron ore were shipped during the year under review. By the end of June, 1960, a further quantity of approximately 95,000 tons has been shipped, mainly under the new contract for 2.40 lakh tons which the Company has negotiated with the State Trading Corporation of India Limited. Shipments against this contract are expected to be completed by the end of February, 1961. The rail transport capacity between Hospet and Cuddalore is being increased and various works are being undertaken to increase the capacity of Cuddalore port itself. These measures should stimulate further exports of the Company's high grade iron ore. The directors have added that due to initial difficulties and teething troubles, full production according to rated capacity is not being obtained from the Salem Plant for manufacture of dead burnt magnesite. All efforts are being made to tide over these difficulties and get normal production.

The profit and loss account shows a net profit of Rs. 22.79 lakhs after providing depreciation (10.34 lakhs) and development rebate (22.21 lakhs). A sum of Rs. 5.5 lakhs has been transferred from the dividend equalisation reserve and Rs. 7.95 lakhs from general reserve to meet the demands of taxation and dividends. The directors have recommended a dividend of 12 per cent on ordinary and deferred shares, subject to reduction of tax. The dividends on preference shares cannot be grossed and therefore the shareholders were deprived of the credit which they got in the past for the tax paid by the company on its profits. It was, therefore, proposed that the provision in regard to preference dividend be modified. The resolutions were passed and the payment of dividend to the preference shareholders is being made in accordance with that amended article. Now the dividend on preference shares comes to 6 per cent after the payment of income-tax at 30 per cent.

BURMAH-SHELL

As from July 1959, the Company voluntarily surrendered all duty protection remaining on furnace oil, high speed diesel oil, light diesel oil and bitumen manufactured at the refinery which had been enjoyed from the commencement of operations. At the time the Central Government confirmed arrangements which enabled throughout of the refinery to be increased. The throughput of the refinery for the year to December 31, 1959, was 2,476,975 metric tons, an increase of 208,540 metric tons over 1958. This throughput resulted in a yield of 2,429,528 metric tons of finished producer goods including products used within the refinery. 18,300 metric tons of motor spirit were exported during the year.

The Company's gross income from refining for 1959 amounted to Rs. 1,276.9 lakhs. Profits after Company taxation at Rs. 350.5 lakhs were higher than for 1958 by Rs. 40.9 lakhs mainly due to the new rates and methods of taxation introduced by the Finance Act 1959 and to reduced operating expenses of the refinery. Net profit during the year under review after providing for taxation and depreciation came to Rs. 3.51 crores. Taking into account the balance of unappropriated profits, brought forward from 1958 total amount for distribution with the directors is Rs. 4.04 crores. The Board of Directors has recommended a dividend for the year of 18 nP per rupee of called-up Ordinary Share capital to be paid out of profits charged to income-tax. Of this dividend 15 nP per rupee of called up Ordinary Share capital was declared and paid in December, 1959, as an interim dividend. Now the remaining 3 nP per rupee of called-up Share capital is proposed to be paid as a final dividend.

Company Meetings

THE IMPERIAL TOBACCO COMPANY OF INDIA LTD.

Speech by the Chairman, Mr. F. A. Collett, at the Forty-ninth Annual General Meeting of the Company on 21st September, 1960

Ladies and Gentlemen,

I have much pleasure in welcoming you to this, the forty-ninth Annual General Meeting of the Company.

The Notice convening this meeting, the Report of the Directors and the Accounts have been circulated, and with your approval we will take them as read. I will now ask the Secretary to read the Report of the Auditors.

BOARD OF DIRECTORS

At the end of March this year, Mr. G. H. J. Clarke and Mr. D. B. St. John retired from the Board. Mr. Clarke had served the Company since the end of 1932, and had been a member of the Board for six years. He became Chairman of the Company in December 1955, and has presided over the last four General Meetings of the Company. I was appointed to the Board in December 1959, and following Mr. Clarke's retirement I was elected Chairman of the Company, in which capacity I aspire to serve you as well as my predecessor did.

Mr St. John first joined the Company in December 1928 and had been a member of the Board for six years, during which time he was mainly responsible for the Company's finances. We wish Mr Clarke and Mr St. John much happiness in their well-earned retirement.

In April this year Mr R. K. Banerjee was appointed Deputy Chairman of the Company, and I am quite sure that in this new capacity he will not only make a further substantial contribution to the progress of the Company, but will also prove invaluable in the assistance he will give me in my new appointment.

Also in April this year Mr. H. C. Reeve, who has served the Company for 27 years, was appointed to the Board.

Mr. J. R. Blaikie has recently resigned from the position of Secretary of the Company, and Mr. B. G. Pearson has been appointed as his successor.

ACCOUNTS

You will see from the Accounts in your possession that the net profit for the year has risen from Rs. 115 lakhs to Rs. 142 lakhs, some part of this increase being caused by a reduction in the rate of Income-tax and Super-tax from 51.5 per cent to 45 per cent, coupled with the discontinuance of Wealth-tax on Companies. This decrease in corporate taxation, however, has to be viewed in the context of the new basis of dividend taxation introduced by the Finance Act of 1959, whereby Income-tax is no longer deemed to be paid by the Company on behalf of the shareholders. You are all fully aware of the new provisions, and it is quite unnecessary for me to enlarge upon them.

Apart from this the Balance Sheet and the Profit & Loss Account call for no particular comment, so I will proceed with a review of the Company's activities.

PRODUCTION OF SPARE PARTS

The very necessary restriction on foreign exchange has made it difficult for the Company to obtain its essential requirements of spare parts for its production machinery. We therefore opened negotiations with the main suppliers of our cigarette making machinery with a view to obtaining increased manufacture of the required spares in India, and I am pleased to be able to tell you that on 1st July this year Molins of India Private Limited commenced manufacture in a new factory in Behala, near Calcutta. Part of the capital of Molins of India Private Limited is being subscribed by your Company, thus ensuring our active participation in the new venture, and we wish it every success.

LEAF TOBACCO SUPPLIES

You are probably aware that a very large proportion of the leaf tobacco which we use in cigarette manufacture is produced in Andhra Pradesh, where during the last two years the weather has been very unkind to the producers of flue-cured tobacco. In 1959 very heavy unseasonal rain was experienced at the end of January and the beginning of February—two vital months in tobacco cultivation—while in 1960 exceptionally high day temperatures, coupled with very low relative humidities, had a considerable influence on the quality outturn of the crop.

Events such as these, which lead to an embarrassingly large production of low-grade flue-cured tobacco, are, of course, beyond the control of the cultivator; but another, and perhaps a more serious, problem has arisen during the last few years when tobacco has been produced in undesirable growing areas, which has resulted in decided degradation in the tobacco whilst in storage. Fortunately Government are alive to this problem, which has received the earnest attention of the Indian Central Tobacco Committee, the Extension Staff of the Government of Andhra Pradesh, and the Experimental & Research Department of our main tobacco suppliers, Indian Leaf Tobacco Development Company Limited.

The efficient production of good quality flue-cured tobacco is of paramount importance not only to your Company, but also to India, for exports of unmanufactured leaf tobacco produce foreign exchange annually to the value of between Rs. 13 and Rs. 15 crores. The production of sub-standard flue-cured tobacco, coupled as it is with a tendency to increasing prices, must inevitably be viewed with disfavour by the importing countries, of which the United Kingdom is by far the most important, and they will naturally look elsewhere for their requirements if this undesirable trend is not halted.

It is most important that the cultivators lay far greater emphasis on following the cultural practices recommended by the Indian Central Tobacco Committee, and pay close attention to the proper harvesting, curing and handling of their products, for the alternative can only be continued production of unwanted low-grade flue-cured tobacco, with the inevitable loss of export markets.

NEW BRANDS

During the year under review, your Company has marketed several new brands, and with the Annual Report we have enclosed a folder depicting them. They have been designed to appeal to the changing tastes of the consumer and we are optimistic of their success. As Mr. Clarke told you last year, the marketing and advertising of new brands is expensive, particularly in the early stages, but sales in general are encouraging and we hope to reap the benefit of this year's expenditure in future years.

You will have noticed that two of the new brands depicted in the leaflet have filter tips. It is with regret that your Board has had to restrict the distribution of this type of cigarette because the filters are imported and so in short supply. However, the producers of these filters are at present negotiating with the Indiar Government for their production in India, and although the establishment of a new industry cannot be hurried, we look forward to the time when local manufacture of filters will enable us to give the consumer unrestricted supplies of this type of cigarette.

LABOUR RELATIONS

In his speech last year Mr. Clarke referred to the unsatisfactory operation of our factories at Monghyr due to the labour force being greater than was required for the output from that point. Although those conditions continued throughout the year under review, I am pleased to be able to tell you that as a result of improved forward requirements it has been possible to absorb some of the redundant labour by re-introducing a partial double-shift at Monghyr. At the same time we have, with the ready assistance of the Bihar Government and the Trade Union, been able to streamline the labour allocation to some extent and, as a result, we hope to operate more economically in future.

Elsewhere in the organisation also our relations with our employees have improved and it is now becoming more and more apparent to everybody that increased productivity is the only practical answer to increased benefits to the employees and the shareholders alike.

You will remember that in last year's Annual Report we included some photographs of the Company's residential training centre near Calcutta. The requirements of Staff development are by no means simple; however, it is felt that real progress in this field is being achieved and although the value of the staff training centre is difficult to assess accurately, your Board is convinced that it has been a worthwhile venture.

During the year we have extended our training activities and have started technical training for selected groups of employees at some of our production branches. This training is being carried out by our staff who have received the necessary guidance at the training centre, using the techniques of work study and training within industry. It is gratifying to know that as a result of these activities there has been a noticeable improvement in skills and at the same time an encouraging improvement in Management/Labour relations in the areas where the training has been carried out.

Your Company has continued to pursue its policy of providing amenities to its employees and of making working conditions as pleasant as possible. For some years the Company has provided free uniforms and subsidised canteens, given free medical attention in excess of statutory requirements and made annual donations to the sports clubs of the various branches. In addition to this, we have provided Institutes at some of our factories, the latest being the Clarke Institute at Bangalore, which was formally opened by the Governor of Mysore. A photograph of the Institute is reproduced no page 18 of the Annual Report.

A substantial donation was made to the new Saharanpur District Civil Hospital, thus helping towards adequate hospital and other medical facilities to the employees and their families at our Saharanpur branch.

Financial assistance has been given to certain Co-operative Credit Societies at branches where there was evidence of constructive self-help.

The efficacy of all these measures has been amply demonstrated by the increased output which we have been able to achieve. Under the scheme of productivity payments which is in operation in our factories, this increased output has resulted in financial benefit to our employees, all of whom I should like to thank for their continued co-operation.

PROSPECTS

During the first five months of the present financial year, sales have shown a welcome increase over the previous year, in the face of intense competition, and in fact have exceeded all previous records. It is too much to expect profits to keep fully in step with sales, partly because of rising costs and partly because of the continuing tendency of the smoker to switch to lower priced and less profitable brands. Nevertheless your Board had complete confidence in declaring a first interim dividend of 2-1/2 per cent, subject to tax, in respect of the year to 31st March 1961

THE CALCUTTA ELECTRIC SUPPLY CORPORATION LIMITED

(Incorporated in England)

NOTICE

NOTICE is hereby given that the Board of Directors of this Company have decided to recommend to stockholders at the forthcoming Annual General Meeting that a Final Dividend for the year ended 31st March, 1960, on the Company's Ordinary Stock at the rate of £4 per cent net (Tax applicable at 7.9d. in the £) be paid on the 14th November, 1960 to these stockholders whose names are registered in the Company's Stock Register on the 29th October, 1960.

Applications for transfers received in this office before 12 o'clock noon on Saturday, the 29th October, 1960, will, if otherwise satisfactory, be registered at that date for the purpose of participation in the above Dividend.

BY ORDER OF THE BOARD
H. C. BOWKER
Actg. AGENT

VICTORIA HOUSE,
Calcutta, 23rd September, 1960.

RUBY GENERAL INSURANCE CO., LTD.

CHAIRMAN'S SPEECH

Delivered at the Twenty-fourth annual General Meeting of the Shareholders of the Company held at 8, India Exchange Pl ace, Calcutta on Friday the 23rd September, 1960.

Gentlemen,

It gives me great pleasure to welcome you to the Twenty-fourth Annual General Meeting of the Company.

The Report of the Directors and the Audited Accounts for the year 1959 have been with you for some time and with your permission I take them as read.

The following net premium figures reveal the progress of the Company:

	1949 Rupees	1954 Rupees	1959 Rupees
Fire ..	20,97,000	32,76,000	57,01,000
Misc. Accident	32,31,000	37,11,000	57,13,000
Marine ..	8,15,000	12,79,000	20,04,000
	61,43,000	82,66,000	1,34,18,000

The Company has continued its progress which will be evident from the comparative premium figures of the last several years. The net premium for the year ending 31st December, 1959, and the Capital and Funds as at 31st December, 1959, stand at Rs. 1,34,18,000|- and Rs. 1,27,81,000|- as compared to Rs. 82,66,000|- and Rs. 84,53,000|- respectively as at the end of 1954.

FIRE DEPARTMENT: More attention is being given to develop the Fire Business as the results have been comparatively better. The working for the year shows a record profit of Rs. 11,50,000|-. However, there has been again a reduction in the Fire premium rates from 1st January, 1960, and it would have some effect on the working of the Department but it is hoped that with more attenion being given to develop the business of the Department, it would still show a reasonable profit.

MOTOR AND MISCELLANEOUS DEPARTMENT: The claims experience in this Department, particularly in the Automobile Section, which forms a major portion of the premium income, has been generally bad. We have however followed a cautious underwriting policy with the result that though there is a small reduction in the premium income but the working has greatly improved, which will be evident from the small loss incurred this year in the Department. The motor premium rates in certain sections have been increased from August, 1960, and it is hoped that it would result in some improvement in the claims experience of this Section. There is considerable demand of other types of Miscellaneous business and your Company is trying to develop these new types of business so that the portfolio may be more balanced and adverse results in one section do not upset the entire working of the Department.

MARINE DEPARTMENT: The working of the Marine Department shows a big loss on account of the jump in the Premium Reserve from Rs. 10,90,000|- to Rs. 16,04,000|- and the adverse claims experience, which is due to the increase in the Foreign Marine Hull business. Your Company has, however, taken steps to reduce the Foreign Hull business and it is hoped that the Department will show improved working in future.

The loss experience on the import shipments also continues to be rather unfavourable owing to unsatisfactory state of affairs in the various ports of the country. Several representations have been made to the Government, and I feel that it is high time the Government had considered necessary amendment in the Port Acts so as to define more definitely the Port Commissioners' liability for loss or damage to the cargo whilst in their custody.

Another important development which is intimately connected with the Marine Insurance Market is the introduction of a Bill in the Rajya Sabha to codify the law relating to the Marine Insurance in this country. It is understood that the matter is presently engaging the attention of the Government of India in the light of the views and suggestions offered by the various bodies and State Governments. With the passing of this Bill, which has already received the support of the various Commercial, Shipping and Insurance Organizations, a great lacuna would be removed.

You are aware, we are reorganising our Overseas business on the basis of the experience gained in the past and in view of the political changes in some countries in recent years which has resulted in contraction of the Overseas business, but it is hoped that this will show a better overall working result.

As is evident from the Balance Sheet, the Company has a very strong financial position, the Reserves amounting to Rs. 95,00,000|-, and there is an appreciation of Rs. 25,00,000|- in its Investment portfolio. It is gratifying to note that the Company continues to command the full confidence of its patrons and constituents.

It is time the Government of India and the Insurance Industry sit together and seriously consider the problems facing the industry at present and evolve practical working formulae to put this important industry on a sound footing. The Government should help the industry in maintaining its reputation and developing its business which is to the ultimate good of the country.

I hope you will join me in expressing our sincere thanks to the Executives, Staff, Agents, Field-workers and other representatives both in India and abroad for their close co-operation which enabled the Company to maintain the progress during the year under review. I also convey my thanks to our valued clients whose support has helped the Company to achieve this position.

I now move that the Directors' Report and Audited Accounts and Balance Sheet of the Company for the year ending 31st December, 1959, be approved and adopted.

Thanking you.

Note: In the absence of Shri B. M. Birla, who is out of India, the speech was delivered by Shri M. L. Shah, who presided over the meeting.

H. E. H. THE NIZAM'S CHARITABLE TRUST

SIXTH ANNUAL REPORT FOR THE YEAR ENDED 31ST MARCH, 1960

1. The Trust was created by His Exalted Highness the Nizam of Hyderabad on the 14th June 1954, with a corpus of the face value of Rs. 4,90,00,000 (Rupees four crores and ninety lakhs) for relief of the poor, support of religious institutions, provision of medical aid, advancement of education and for any other object of public utility in India in general and particularly for people in the former State of Hyderabad.

2. During the year, the number of Trustees was increased to the maximum permissible under the Deed of Trust by the appointment of Prince Mukarram Jah Bahadur and Sir Said-ul-Mulk, Nawab of Chhatari; and Prince Mukarram Jah Bahadur was unanimously elected the permanent Chairman of the Board of Trustees under Clause No. 7 of the Trust Deed. The Board now consists of:—

(i)	Prince Mukarram Jah Bahadur (from 1-2-1960	.. Chairman
(ii)	Sir Said-ul-Mulk, Nawab Chhatari (from 1-9-1959)	.. Member
(iii)	Nawab Zain Yar Jung Bahadur	.. ,,
(iv)	Shri V. P. Menon	.. ,,
(v)	Mr. Shavax Ardeshir Lal Khan Bahadur C. B. Taraporvala	.. ,,
		.. Secretary

3. During the period under review, eight meetings of the Board of Trustees were held to deal with the affairs of the Trust, including the consideration of applications received from various public institutions and individuals for donations, lumpsum grants, medical aid, scholarships etc.

4. The Trustees received during the year a very large number of applications from poor and destitute persons, from unemployed people and poor students. The procedure employed in dealing with the applications was to obtain, where possible, the report of District Officers and heads of hospitals and educational institutions and sift the recommendations before assessing the quantum of assistance in each case. In the absence of such recommendations, the Trustees themselves caused proper investigations to be made before granting relief. The applications dealt with during the year under review are classified under the following broad categories, showing the relief or assistance granted:—

A. (i) 246 poor and destitute persons and widows, who are unable to work and have, therefore, no other means of income, were granted maintenance allowances ranging from Rs. 5 to Rs. 20 per mensem.

(ii) Special maintenance allowances ranging from Rs. 25 to Rs. 50 per mensem were paid to 17 widows and poor and destitute persons who had no other source of income.

(iii) 931 poor and deserving students were granted scholarships ranging from Rs. 10 to Rs. 20 per mensem.

(iv) 33 students were awarded special scholarships ranging from Rs. 25 to Rs. 100 per mensem, for higher technical studies.

In all 5,388 beneficiaries (practically all of whom belonged to Hyderabad), including those who were recipients of financial aid before, drew either maintenance allowances or scholarships under the four categories referred to above, as on 31st March 1960, and the total of such payments during the period under review amounted to Rs. 7,28,400.

B. 1,174 patients (almost all of whom belonged to Andhra Pradesh) suffering from T.B., Cancer, Leprosy and other diseases were granted lumpsum financial aid for medical relief. The total amount of medical aid granted to such patients, during the period under report amounted to Rs. 1,05,817.40.

C. 1,069 poor and deserving students (practically all of whom belonged to Hyderabad) were granted lumpsum financial aid, ranging from Rs. 50 to Rs. 200, towards payment of their admission fees, examination fees and for purchase of books, instruments etc. The total sum of such financial aid, during the year under review amounted to Rs. 98,000.95.

5. During the year under report, foreign scholarships and lumpsum grants for higher education abroad (including passage money) amounting in all to Rs. 1.59,000 were provided by the Trust. Almost all the recipients were residents of Andhra Pradesh and care was taken to select only those who had first class degrees to their credit or exceptional merit. In all 32 students have or are receiving financial aid from the Trust in foreign countries. (Appendix 'A')

6. Special lumpsum grants aggregating Rs. 8,13,548.30 were given to Schools, Athletic Institutions, Sanatoria and other beneficial objects of public utility. Most of the beneficiaries belonged to Andhra Pradesh (Appendix 'B')

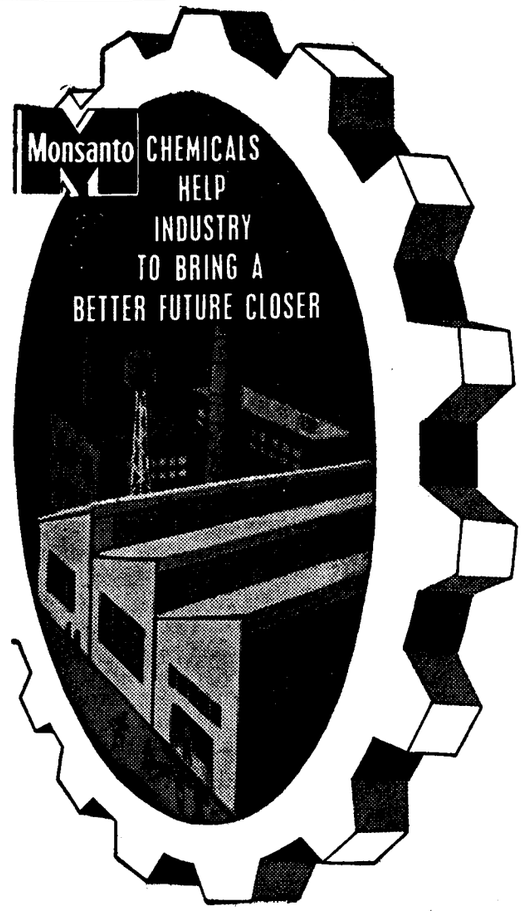
7. Recurring grants for periods ranging from 1 to 3 years were granted to various educational and technical institutions, involving an expenditure of Rs. 1,73,000 per annum. A large majority of these institutions are situated in Andhra Pradesh (Appendix 'C').

8. During the year under review, the Trustees had to hold in abeyance the policy they have hitherto pursued of judiciously investing surplus funds in safe and promising industries (thereby incidentally promoting the industrial development of India and relieving unemployment) pending the report of the Auditors appointed by the Auditor General of India in terms of the Stay Order passed by the Supreme Court on 21st December 1959 with the consent of the parties. Under the said Order, the Auditors so appointed have been specifically entrusted with the task of enquiring into "the truth, the legality and the propriety of the various transactions and investments of the Trustees" besides auditing the accounts of the Trust from its inception. The Auditor General has appointed Messrs. A. F. Ferguson & Co., Chartered Accountants, for this purpose, and they have commenced their task from the 24th March 1960, and have not completed it at the time of this report. In the meanwhile, the surplus funds have been placed in short-term deposits with various scheduled banks and the Trustees have decided to invest a sum of Rs. 50 lakhs in Government Securities (preferably of Andhra Pradesh) when the loans are floated during this year. They have also decided to invest the maximum permissible amounts in Government Small Savings Schemes, and Rs. 10 lakhs in sound Preference Shares yielding 8 per cent per annum. The Trustees wish, however, to draw attention to the fact that due to the relatively lower yield of Government Securities, the current and future years income is likely to diminish appreciably, unless the shortfall is made good by higher income from other investments.

9. As will be seen from the audited accounts, the market value of the assets of the Trust has increased to Rs. 6,17,00,000 as against Rs. 5,84,00,000 shown last year and the income of the Trust has gone up from Rs. 34,92,720 to Rs. 41,03,142 in 1959-60. The Trustees have built up a General Reserve of Rs. 49,88,660.46, after setting aside Rs. 30 lakhs in a separate Orthopaedic Hospital Fund Account. The net profit on sale of shares, amounting to Rs. 7,31,405.25, has been carried, in total, to the 'Investment Fluctuation Reserve,' which now stands at Rs. 27,31,405.25.

10. During the year under report, the Trustees received offers for the purchase, at a profit to the Trust, of the entire holdings of the Trust in three companies, as these investments were the subject of comments in certain quarters. In the light of the independent and expert advice obtained by the Trustees, they accepted the highest offers received for the same and the Trust has thereby secured capital profits amounting to Rs. 14,39,500. As these transactions were completed by delivery partly before and partly after the 1st April 1960, the capital profits relating to the former, amounting to Rs. 7,07,000, is shown in last year's accounts, while the capital profits relating to the latter, amounting to Rs. 7,32,500, will appear in the current year's accounts.

11. The Trustees have decided to set apart Rs. 30 lakhs in short-term deposits with scheduled banks to meet the capital cost of the proposed Orthopaedic Hospital. All arrangements for setting up and maintaining the Orthopaedic Hospital have now been finalised. The hospital will be known as "The Nizam's Orthopaedic Hospital," the construction and equipment of which have been entrusted to an autonomous Governing Board consisting of the Trustees and the Secretary of H.E.H. the Nizam's Charitable Trust, for the time being, and four nominees of the Government of Andhra Pradesh viz., the Secretary, Health, Housing and Municipal Administration, the Secretary, Finance Department, the Director of Medical Services, Andhra Pradesh, and the Professor of Orthopaedics and Orthopaedic Surgeon, Osmania Medical College. The Trustees have further undertaken to make, after the completion of the hospital, an annual recurring grant to the Governing Board of a sum not exceeding Rs. 7 lakhs, in two half-yearly instalments.



12. The other project to which reference was made in the previous Report, namely, the establishment of a school for training artisans and mechanics, is under the active consideration of the Trustees.

13. During the year under report, the Trustees framed Rules governing the grant of foreign scholarships from the Trust, and have invited, this year, applications for four foreign scholarships, two in Mechanical Engineering, one in Metallurgy and one in Pharmacology. In accordance with the above Rules, the Trustees have entrusted the selection of the candidates for foreign scholarships to three separate committees of experts who will make their recommendations after interviewing the candidates, if necessary.

Monsanto works constantly both to develop new, better chemicals—and to improve those chemicals already used in every major industry.

PHARMACEUTICALS
acetylsalicylic acid, phenacetin, benzoic acid, phenol, phenolphthalein, germicides are but a few of the many Monsanto products in this field.

RUBBER
Monsanto's accelerators help speed vulcanisation, add quality. Anti-oxidants improve resistance, prevent early cracking, give increased flexibility.

TEXTILES
Monsanto Syton is widely used in spinning cottons and woollens, increases yarn strength, allows for reduction in twist.

PRESERVATIVES
Monsanto's pentachlorophenol chemicals help to preserve a wide range of products. Monsanto sodium benzoate helps prevent corrosion.

PAINT
Monsanto's chemicals are used extensively in the manufacture of high-quality paints, varnishes and lacquers.

SYTON is a Registered Trade Mark

Monsanto
chemicals for every industry.

MONSANTO CHEMICALS OF INDIA PRIVATE LTD.
Wakefield House, Sprott Road, Ballard Estate, Bombay 1.
Also at: Calcutta, Delhi and Madras.

Monsanto Chemicals Limited, London. Monsanto Chemical Company, St. Louis, U.S.A. Dependable service from Monsanto companies in London, Melbourne, Montreal, Paris, Bombay, Tokyo, Mexico, D.F., Buenos Aires and from sales representatives in all principal cities of the world.

L 29.

THIS IS ONLY AN ANNOUNCEMENT AND NOT A PROSPECTUS

A copy of the Prospectus having attached thereto the documents referred to hereafter has been duly delivered for registration to the Registrar of Companies, Bombay, as required by Section 60(2) of the Companies Act, 1956.

The Subscription list will open at the commencement of banking hours on the eighth day of October, 1960 and will close at the close of banking hours on the seventeenth day of October, 1960 or later at the discretion of the Directors, but not earlier than 12th October, 1960.

Application will be made to the Bombay Stock Exchange for permission to deal in and for an official quotation of the equity shares of the Company.

ANUH PHARMA LIMITED

(Incorporated under the Companies Act, 1956 on 19th February, 1960)

SHARE CAPITAL

AUTHORISED:	
5,00,000 Equity Shares of Rs. 10/- each.	Rs. 50,00,000/-
PRESENT ISSUE:	
1,00,000 Equity Shares of Rs. 10/- each.	Rs. 10,00,000/-

ISSUE OF SHARES FOR CONSIDERATION OTHER THAN CASH:

CONSENT

The consent in writing of the Directors, Auditors, Managing Brokers, Official Brokers, Bankers and Legal Advisers to the Company to act in their respective capacities has been obtained and has been fixed with the Registrar of Companies, Bombay as required by Section 60 of the Companies Act, 1956 and none of them has withdrawn the consent given.

OBJECTS

The Company was incorporated on 19th February, 1960 with the objects mentioned in the Memorandum of Association, a copy thereof is annexed hereto and forms part of the Prospectus. The main object of the Company is to acquire and take over as a going concern the business now carried on in partnership at Bombay under the style and firm name Messrs. ANUH PHARMA.

PROSPECTS

The business being taken over by the Company from the said Partnership Firm ANUH PHARMA has been marketing for a short period of one and a half years pharmaceutical products based on the valuable research made by Dr. G. Krishna Murty since 1936 resulting in a number of drugs of scientific and commercial value. The said firm has been doing business on a small scale without any capital equipment and with limited working capital from September, 1958 to February, 1960.

The raw drugs had to be bought in small quantities and at higher prices and so the products had to be priced high. The products manufactured were all for specific diseases, and they had to be detailed only to the medical profession for which the propaganda machine was insufficient because of limited capital. For want of capital, sales and propaganda experts could not be employed. And therefore the working results of the vendor firm during the period September, 1958 to February, 1960 as disclosed in prospectus have not been profitable.

The future of the Industry cannot be based on the initial working during this short period. The results of the research of Dr. G. Krishna Murty are well-known. The drugs on which he has worked have high scientific and commercial value. When the Company can buy raw material at low cost in bulk and when the products are manufactured at the Company's own factory the selling price can be brought down. When the Company can manufacture the active principles of these drugs, they can be exported to foreign countries. In addition, with an efficient sales and propaganda department the products now marketed and other new products can have a large turnover and yield ample profits to enable payment of fair dividend on the capital employed besides provision for research and expansion work. It is estimated that the turnover during the 13 months ending 31-3-1961 may be about Rs. 5,00,000/- and in the second year it is expected that the turnover will be about Rs. 10,00,000/- with scope for further increase.

AGREEMENT

One of the main objects of the Company as contained in Clause No. 1 of the Memorandum is to acquire and take over as a going concern the business carried on in partnership at Bombay under the name and style of "ANUH PHARMA" together with the goodwill thereof and all its assets and liabilities and to enter into an Agreement referred to in Clause 5 of the Articles of Association of the Company and to carry the same into with or without modification.

The consideration for the sale of the said business is to be satisfied by allotment of shares of the Company as hereinafter mentioned and partly in Cash.

The consideration for the Goodwill of the said business is Rs. 1,00,000/-. The said consideration of Rs. 1,00,000/- is payable in two instalments of Rs. 50,000/- each. The first instalment of Rs. 50,000/- is payable on the completion of the sale of the said business and after the registration of the Company, and the same shall be paid and satisfied by allotment to the Vendors or to their nominee or nominees 10,000 Ordinary Shares of the face value of Rs. 10/- each in the capital of the Company on which a sum of Rs. 5/- per share shall be credited as Paid-Up thereon. The Vendors shall accept such partly paid-up shares of Rs. 5/- per share to be credited as Paid-Up thereon as aforesaid in payment of the first instalment of Rs. 50,000/- payable as aforesaid in part payment of the first instalment of Rs. 50,000/- payable as aforesaid in part payment of consideration for the Sale to the Company for Rs. 1,00,000/- payable

to the Vendors for the Goodwill of the Vendors' business.

The second instalment of Rs. 50,000/- shall be paid on or before 30th June. 1961 and the same shall be paid and satisfied by a further sum of Rs. 5/- per share being credited as Paid-Up on each of the Shares allotted to the Vendors as aforesaid on or before 30th June, 1961. The Vendors shall accept the same in payment of the balance of the consideration money namely Rs. 50,000/- payable to the Vendors for the goodwill of the Vendors' business.

The said 10,000 Ordinary Shares of the Company to be allotted to the Vendors as aforesaid are to be allotted by the Company as stated in the said Agreement between the Company and the Vendors for the sale of the said business.

Part of the consideration for the Sale of the said business of the Vendors shall be the payment to the Vendors the value of Stock-in-Trade and other assets of the Vendors in Cash. The value of the said Stock-in-Trade and other assets of the Vendors is to be such sum as to be certified by Messrs. Hariharan & Co., Auditors of the Company to be the fair value thereof. The Auditors have now certified the value of the Stock-in-Trade and all other Assets of the Vendors as Rs. 1,49,557/-. The liability of the Vendors as on the said date is Rs. 1,27,456/-. Accordingly the amount payable to the Vendors in cash is Rs. 22,101/- as part consideration for sale of their business to the Company. (A copy of the said Certificate is available for inspection at the Registered Office of the Company on any week day from 11-0 a.m. to 4-0 p.m., and on Saturdays between 11-0 a.m. and 2-0 p.m. except on public holidays) as on 1st March, 1960 the date on which the Company has agreed to take over the business of the Vendors.

As the residue of the consideration, the Company has undertaken to pay and discharge and fulfil all the debts, liabilities, contracts and engagements of the vendors in relation to the said business and to indemnify the Vendors against such liabilities.

Under the said Agreement from the 1st March, 1960, the Vendors have agreed to carry on the said business in the same manner as heretofore carried on, so as to maintain the same as going concern and they shall from that date namely 1st March, 1960 be deemed to have been and to be carrying on such business on behalf of the Company from 1st March. 1960 and shall account and indemnify accordingly.

As part of the Agreement for Sale, the Company has agreed to pay a remuneration of Rs. 18,000/- per year to Dr. G. Krishna Murty for services rendered and to be rendered to the Company.

As part of the Agreement, the Company has agreed for the payment of royalty at the rate of 5 per cent of the net sales value (i.e. gross value less the trade discount) of the products standardized or the formulae given by the said Dr. G. Krishna Murty.

Dr. G. Krishna Murty has volunteered to accept a reduced royalty of 2½% on net sales value instead of 5% on net sales value (as per the agreement) with a view to help the Company.

Dr. G. Krishna Murty has further volunteered to forgo the royalty of 2½% of the net sales value for the period of the first two years with a view to help the Company in the initial stages.

The Company is fortunate in securing the services of Dr. G. Krishna Murty as its Technical Expert. Dr. G. Krishna Murty who is the founder of ANUH PHARMA is a highly qualified physician in the Ayurvedic System and has an excellent background of research experience in indigenous drugs for 30 years. Though an Ayurvedic Physician, he is well versed in modern clinical medicine, pathology and method of investigations in the allopathic system. He is essentially a research worker and a therapeutic clinician and as such has succeeded in finding out a number of indigenous drugs.

Dr. G. Krishna Murty has hitherto assayed clinically six vegetable drugs which are marketed by ANUH PHARMA by their registered trade names—RUDANIL, UGRATIN, NISPAN, SISANAL, PUSHADIN and ORBITRI. Besides these there are two more products e.g. ARUPIN and SAMANIL which contain more than one ingredient and these are in accordance with the principles mentioned in the Ayurvedic texts.

RAW MATERIALS

The main raw material viz. RUDANTI fruits are available in plenty in Konkan Region in the West Coast of Bombay and Mysore States and Goa. These fruits are seasonal being plucked in April and May. Other raw materials like Embelia ribes. Acorus Calamus, Balsamodendron etc. are also easily available in plenty.

PRELIMINARY EXPENSES AND BROKERAGE & REMUNERATION

The preliminary expenses including the expenses of this issue and including brokerage and remuneration which may be payable by the Company is estimated at Rs. 60,000/-.

A brokerage at the rate of 15 nP per share will be paid on allotments in respect of applications bearing the stamp of a Bank or a Member of the recognised Stock Exchange. The Managing brokers will further be entitled to a lump sum remuneration of Rs. 10,000/- for managing the issue.

APPLICATIONS AND ALLOTMENT OF SHARES

Applications for equity shares must be for 50 shares or multiples of 50 shares.

Application for shares must be made on the forms accompanying this Prospectus further copies of which may be obtained from the Registered Office of the Company or from any of the Bankers of the Company or from the Brokers of the Issue.

Applications must be completed in accordance with the directions contained therein and delivered before the closing of the subscription lists together with the remittance of the amount payable on application to the Company's Bankers or the Company's Managing Brokers and Official Brokers.

All cheques or drafts drawn on Banks situated at places other than those mentioned above should include a sum at the rate of 25 nP per cent (minimum 65 nP) of the amount remitted to cover all the commission and Bank charges; otherwise, the application is liable to be rejected.

Allotment will be notified by the despatch of an allotment letter.

Where no allotment is made the deposit will be returned in full and where the number of shares allotted is less than the number applied for, the balance deposit will be applied towards the amount remaining payable on the shares allotted and any balance thereafter remaining will be returned. The Directors reserve the right to refuse any application wholly or in part without assigning any reasons.

"Oil has played a significant role in helping the country increase her agricultural yield...as a source of power for bulldozers engaged in the clearing of virgin land, in the construction of dams and irrigation systems, and in mechanized cultivation. The place the tractor occupies in Indian agriculture today owes something to the pioneering work done by Burmah-Shell in the early 1930's."

CURRENT STATISTICS 658

With a membership of 70 companies, comprising 100 manufacturing units, the IJMA represents almost 95% of the total jute loomage in India.

Providing employment to millions of farmers, traders and mill-workers . . . earning about Rs. 115 crores annually in foreign exchange . . . contributing large sums in taxes to the State and Central Exchequers — the Indian jute industry occupies a prominent place in the nation's economy.

Guarding the interests of this nationally important industry and guiding its destiny, is the Indian Jute Mills Association. Founded in 1884, the IJMA — representing almost 95% of India's total jute loomage — protects, forwards and defends the trade of its members. The Association carries on research . . . to improve the quality of jute products and to develop new uses of this already versatile material. In the field of export promotion the Association has been active for well over a decade, undertaking publicity and promotional work which has helped make jute goods India's largest dollar-earner. Its labour welfare activities have set standards throughout industry.

The Indian Jute Mills Association looks forward to serving the Indian jute industry in ever-increasing measure in the years to come.

Development Imports: How, When, How Much?

AT a time when the front pages everywhere are devoted to the international political debate, it may seem anachronistic to give *The Eastern Economist's* first page to import policy. There is, however, hardly any major economic problem in India which, over the next few years, can escape from the obsession of foreign exchange, and, because imports involve the expenditure of scarce foreign exchange, the priorities which now operate are of the highest national importance. It is a little odd that the current import trade policy for the licensing period October 1960 to March 1961 announced this week, has not been analysed critically either by businessmen or by the Press. On the surface, it has been made to look as though it contains only minor adjustments and that production is likely to be well maintained with only some token restrictions on certain consumer goods and a small reduction of Rs. 3 crores in the allocations of established importers. This superficial view, however, will not bear scrutiny. Beneath the skilful presentation of the new import policy and the Press release — which has attempted to sugar-coat the pill — there are hard realities which the country needs to recognise.

In the first place, there is a formidable list of items — twenty in all — for which the import policy is to be announced "later". These include certain varieties of paper, photographic negatives, watches, and tyres and tubes as well as some producer items. It is difficult to assess the order of magnitudes here, but if considerable restriction is imposed on this section — while the purpose of delay is the hope of avoiding cuts—quite severe hardship might be caused. In regard to the rest, the total savings on account of foreign exchange might be of the order of Rs. 25 crores in a half year and assuming, as is often contended, that our current imports are fairly tight, the actual cuts must cause some considerable dislocation in particular fields. But this is not in itself the major issue; the question is what is likely to happen to development imports in the future. The current trade policy has left the whole question of new orders in animated suspense. The position is that, except in respect of tied and sanctioned projects, no new orders can be placed. Development, as distinguished from maintenance, is at a standstill except for rupee imports.

If import trade policy for a year or two should continue on the basis of the half year trade policy now announced — and how can this be avoided unless very substantial credits for the Third Plan are immediately available? — a great hiatus will take place between development in the next two years as against the last three. This is, in fact, the beginning of a serious recession in the pattern of Indian development. This will not impede development in areas, such as steel and engineering, where local production rises as a result of investment which has already taken place. But if anyone should argue that the tempo in the first two years of the Third Five-Year Plan can be equal in terms of investment involving foreign exchange to what has happened between 1955 and 1959, he is clearly arguing without the facts. A sum of about Rs. 500 crores additional will need to be underwritten if the tempo of development imports is to be the same as in the last three years. This has not hitherto been underwritten and only the rupee payment sector is making headway at the present time and that, too, not markedly different in pace from before.

What can be done to make amends in local production and in any other form of self-help to avert the crisis? There is some considerable evidence that capacity has been created in excess of requirements in several industries, and that one can hold back on certain areas of the Plan in the light of the unutilised capacity which is becoming more apparent with the reduction in raw material imports. At the same time, obviously the best method by which we can obtain our imports is to study clearly our capacity for extending ourselves to the limit on the export front. Here too, there has been too little understanding of what can be done by processes of intelligent diversion from home to export markets.

If the new import policy should produce — as apparently it has been designed to produce — complacency, it will be doing a great disservice to the country. It should be understood — as, in fact, it is — as a stringent discipline applied to a country against a level of development it has so spaciously planned. Discipline implies new regulation and denial. New regulations must be reflected in the planning of new development, as well as in the planning of exports. We cannot escape from the foreign exchange bottleneck unless we analyse, far more carefully than we have hitherto done, the errors of past developments which have resulted in unutilised capacity. We must also recognise that we must export much more if our development is not to be left entirely at the mercy of our friends abroad. This and not complacency should be the fruit of the new import policy. It is obviously a call for action.

The Uttar Pradesh Debacle

THE State Congress elections in Uttar Pradesh, held on October 4, have created a crisis of a serious magnitude which threatens the Cabinet. After the last minute failure at the top level to bring about a compromise between the two contesting groups it was quite obvious that the showdown would be bitter and complete. The dissidents have won a total victory over the ministerialists in one of the most keenly fought elections, 663 members out of 674 having cast their votes. Mr. C. B. Gupta defeated the ministerial candidate, Mr. Munishwar Dutt Upadhyaya, and cap-

tured the presidentship of the UPCC by 363 votes to 309. The second key post of treasurership was won by Mr. Charan Singh, former Revenue Minister, defeating Mr. K. P. Tripathi, the Home Minister in Dr. Sampurnanand's Cabinet. These two strategic contests have put the dissident group firmly in the saddle. There have been other major victories for it, including, notably, the capture of all the four posts of vice-presidentship. Factional rivalries which were seething for at least three years past have now culminated in a rift between the organisational and legislative wings of the State Congress Party. And in the process the High Command has suffered a rebuff. One might ask to what purpose has this rift been driven into the open? Surely someone has badly erred. Probably Dr. Sampurnanand above all.

If there was any issue of principle, which may be described as such in this contest, it was the maintenance of the independence of the organisational wing to enable it to function as a critic of ministerial policies to bring them into greater alignment with the declared creed of the party. At the State level this function diminishes in magnitude inasmuch as the apex body of the party is seized of it at least in fundamentals. But some of the force in this claim of the dissidents has been lost by the noticeable stress which they have placed on the policies of the State Congress in terms of groups. Acharya Jugal Kishore, who speaks with authority for the dissidents, has given proof of this emphasis in the statement he issued in reply to the statement of Dr. Sampurnanand. The gulf between the two wings of the party in the State has grown wider and this is a development which cannot but be a source of great trouble.

Mr. C. B. Gupta's return to effective power in the U.P Congress Committee within three years of his historic defeat in the last general elections to the legislature, followed by another defeat at a by-election, once again demonstrates that frustration in the hands of men with capacity for organisation and winning mastery over the party machine can be a dangerous instrument. Technically Mr. Gupta may be right in protesting against his description as a dissident, but by accepting the leadership of the dissident group he has identified himself with it. His installation in the position of supreme control of the Pradesh Congress Committee has given an accession of strength to the dissidents.

Dr. Sampurnanand has made, unwisely it would seem, the presidential election to the PCC an issue of confidence in his Cabinet and on the eve of the election he announced that Mr. C. B. Gupta's victory would be taken by him as a vote of no-confidence necessitating his resignation and, as a corollary, the resignation of the entire Cabinet. Immediately after the declaration of the result of the election he reiterated his intention to resign and he has now sought the permission of the Congress Parliamentary Board to do so. The election dispute is an internal issue of the State Congress organisation and might have been treated as such. Dr. Sampurnanand was in error to extend its scope and interpret it as an issue of confidence. Confidence or no-confidence in the Ministry is strictly and purely a question on which only the legislature (or at the party level, the Congress Legislature Party) can pronounce a constitutional verdict. The Ministry, it must never be forgotton, whatever the internal party stresses and strains, is responsible to the legislature. To make it removable by the party wing outside the legislature will be introducing a dangerous extra-constitutional principle or convention in direct subtraction of the sovereignty of the legislature. The fact that this crisis of first rate magnitude has arisen in the premier state of India makes it all the more incumbent on the Congress High Command to safeguard the constitutional position.

Who will take Dr. Sampurnanand's place? Who can heal the breach which the factions of three years' standing have brought to a head? Will the Congress High Command learn that when dissidents are driven to desperate straits, they can, under the Congress constitution, defy the High Command? Is it too late to heal the breach? One comment heard in Delhi sounds grim. It is to the effect that only Pandit Pant himself as Chief Minister of Uttar Pradesh is equal to the task.

West Germany in Washington

A RECENT announcement from Bonn that West Germany will raise a fund of DM 1000 million (Rs. 113 crores) to aid developing countries has to be read in the context of the proceedings of the world financial institutions that met in Washington last week. Dr. Per Jacobsson, the Managing Director of the International Monetary Fund, as well as Mr. Robert Anderson, the US Treasury Secretary, even from the outset, had raised the problem posed by West Germany by its large current surplus. The British Chancellor of the Exchequer, Mr. Selwyn Lloyd, who also harped on the theme of disequilibrium in world payments, quoted figures to show how in eight years ending 1959, German reserves rose by $4.500 million, Italian by $2,000 million and French by just over $1,000 million. The fact is in spite of the piling up of foreign exchange reserves, West Germany has continued to pursue a hard money policy which has on the one hand intensified the inflow of funds from abroad for profitable investments in Germany and has made investments abroad relatively unattractive to the Germans on the other.

It was, however, evident at Washington that the persistent volume of criticism was not entirely lost on West Germany. As a matter of fact, the original speech of the President of the Deutsche Bundesbank, Dr. Blessing, which was circulated earlier, was withdrawn at the eleventh hour and the substitute speech was meant as a concession to the prevailing sentiment. Though it was made clear that West Germany had no intention of revaluing the deutsche mark, there was the undoubted recognition that the answer to her growing surplus was an increase in exports of development capital. The Federal Minister for Economics, Dr. Erhard, who outlined the Government's attitude, gave hints of three approaches; one, 'concrete' plans for raising DM 1,000m. in the private sector; two, Government efforts to make available, "very substantial public resources"; and three, mobilisation of the capital market.

It is possible that these may have been short of expectations. For one thing, there was greater reliance on the private sector on short to medium credits over an unspecified period. So far as the public sector was concerned, there were no positive arrangements for large long-term loans on easy conditions. Again, in view of prevailing high German interest rates, the mobilisation of the capital market may also prove very difficult. But there is no need to take a too pessimistic view.

As pointed out by our West German correspondent in a recent despatch, there is an increasing awareness in responsible sections of public opinion in Germany of the country's wider responsibilities in aiding developing countries in Asia and Africa. One of the moving spirits of the Development Fund project is Dr. Hermann Abs, who was one of the "three wise men" who visited India on a World Bank Mission. As one of the authors of the report submitted to the World Bank President, he is committed to the view that the assistance required by the developing countries cannot be in the form of long or short-term loans on normal commercial terms since the resulting debt service liabilities would certainly impose an intolerable strain on the balance of payments position of these countries.

This is the crux of the problem. As Mr. Iliff, Vice-President of the World Bank, showed in his address, if the tempo of progress in the underdeveloped world is not to be dangerously retarded, some other forms of development financing must be made available on a substantial scale. What these are, he did not dilate, though he threw some hints here. Firstly, there is the International Development Association. Though it has the virtue of flexibility in its lending policies, its resources are too small for it to play more than a minor role. Secondly, as Mr. Iliff urged, there is need for a greater reliance on the multilateral approach of which the Aid-India Club is a supreme example. It is also noteworthy that the promised German contribution to the Indus Development Fund will be in the form of an outright grant and it is the first time that any German contribution to a project in a developing country has not taken the form of a hard loan normally tied to the purchase of German goods. This will certainly set a new precedent. Finally, it must be clearly recognised that the responsibility of the developed countries is not confined merely to the provision of capital for financing development. Their tariff and trade policies should also be adapted to the continuous change in the structure of international trade. "The historic transformation which is going on in the underdeveloped world today," Mr. Iliff said, "defies any general solution but it does offer infinite possibilities to the practitioners of economic development." How far these will be explored and utilised will remain one of the great problems in the immediate future.

The Cost of Dearer Bank Money

THE recent credit curbs, especially the directive of the Reserve Bank of India to the scheduled banks for raising the rate of interest on all advances by at least half per cent, have already resulted in creating certain doubts as well as a hesitant trend on the stock exchanges. Rightly, the dearer money policy of the Reserve Bank of India has been interpreted as a new charge on the profits of the corporate sector, and it is natural to expect contraction in credit and slowing down in business activity as a result of the higher cost of money. What is urgent is to know the probable volume of this contraction, if it can be estimated, and the particular sectors of the industrial picture where it is likely to emerge.

It may be stated here that the Reserve Bank of India's dearer money policy in 1957 failed to curb expansion in credit. The conditions were, however, entirely different at that time. In the middle of May 1957 when the Bank Rate was increased from 3½ per cent to 4 per cent and the effective borrowing rate against usance bills was raised to 4-1|5 per cent. the latent expansionary trend had remained unchecked under the impulse of larger deficit financing and the rising prices. The tempo of deficit financing in the current year has been slowed down and the anti-inflationary measures recently undertaken, especially on the food front, are expected to hold the price line. The enhancement in the cost of money is an additional factor which is likely to contribute its weight in arresting the inflationary pressure.

A precise estimate of the volume of decline in bank advances as a result of this measure is not possible, especially because the busy season is expected to commence within a fortnight. However, it is possible to determine in which sectors of organised industry the impact of the curbs might be heaviest. If the percentage of gross profits yielded by an industry in relation to the capital employed is lower than the rate of interest payable to the bank, it is likely that the industry would prefer to lower its volume of output by reducing the size of credit, instead of incurring losses by paying a rate of interest higher than the yield on capital. On the basis of this principle which is widely applicable because of its intrinsic validity, the analysis of profits made by the Reserve Bank of India may be used for locating the industries under pressure. In the August, 1959 monthly Bulletin, the Reserve Bank of India had published figures of gross profits as a percentage of total capital employed in 18 major industries covering 1001 companies. The results related to the years 1955 to 1957. It was shown that the gross profits had steadily fallen, on the average, between 1955 and 1957 from 10.2 per cent in 1955 to 7.4 per cent in 1957. There were wide variations in the return on capital employed amongst the 18 industries under scrutiny. The mineral oils industry in 1957 stood at the top of the list with gross profits at 16.3 per cent of the capital employed; at the other end of the scale stood the vegetable oil industry with a yield of only 2.5 per cent.

Let it be assumed that the present rate of return on the capital employed in Indian industry corresponds approximately to the average for the period 1955 to 1957. This is a legitimate assumption because it represents an average of a good year, a bad year and a normal year. If it is further assumed that the average rate of interest paid by industry before October 1, was 6 per cent and that it is now to be raised to 6½ per cent, it is certain that the bank borrowings will decline in the case of vegetable oil, jute textiles and trade. Without doubt, there would be units in other industries as well where, even though the average rate of return for the industry as a whole had turned out to be higher than 6½ per cent, the yield would be lower than this figure. There are other marginal industries such as chemicals, coal, cotton textiles and shipping where the yield on capital employed was very near the crucial 6½ per cent level. The pressure of higher cost of money in the case of these industries would be severe, though not as harsh as in the case of vegetable oil and jute textiles. If advances on this account dropped even five per cent and industrial production fell proportionately the gain of more stable prices might be deemed to be heavily bought. The danger, however, is greater. It is likely that the higher interest rate will work very unequally between large and small producers. Thus does the socialist pattern of society lose on the swings what it might gain on the roundabouts.

A DELHI DIARY

BIFOCALS, PLEASE

WITH the United Nations splashed heavily on every front page, Delhi has been in two minds as to whether or not international affairs merit the extraordinary attention which the Prime Minister's presence in New York imparts to them. There are some querulous people who think the Prime Minister has exhibited a wrong sense of proportion, leaving the crisis in Uttar Pradesh to overflow, while our efforts to provide a bridge in New York are not notably successful. I myself cannot help feeling that, while Prime Minister's presence was necessary in order to acquaint ourselves with the intractable obstacles to agreement, the powerful manner in which he has expressed himself is not likely to make greater friends for us in the West. I believe our support for China's candidature has been overdone. This, in fact, was contrary to a statement made by Mrs. Lakshmi Menon in the Rajya Sabha that, on this occasion, India would not sponsor the entry of China into the United Nations. Second thoughts have prevailed, it is believed here, under the influence of Mr. Nikita S. Khrushchev. If this is the only concession we are to make to the Russian Prime Minister, it would be well worthwhile. How else can one become a bridge unless one has some particular point of contact with both sides? Perhaps, the Prime Minister has rightly decided that he must balance his support to the West on the issue of the Secretary-General of the United Nations with his support to the entry of China into the United Nations, her act of aggression notwithstanding. It is a nice balancing act, but the question arises: Does an act of balance produce a political bridge? In this particular case, it is anybody's guess, but the first reaction seems to have been that the Prime Minister has leant a little to the Russian side, thereby dislodging his contact with the Western frontier. I am one of those who believe, unrepentantly, that efforts of this kind are not to be judged by whether or not they are successful. The Prime Minister has placed India's point of view well, though, it seems to me, a little too angrily for diplomatic exchanges. On the whole, public opinion in India will support his demand that the smaller nations cannot be excluded from expressing their opinions in the General Assembly on every issue of importance. Europe and America, in other words, cannot monopolise world decisions. Asia and Africa intend to force themselves on the attention of the World Assembly and, if necssary, to break their way in. Surely in the year 1960, when "the winds of change" have already been felt in South Africa, no sensible person will deny the claim of Africa and Asia to speak their minds out as frankly as both Jawaharlal Nehru and President Soekarno did. We, however, must recognise that, having said our piece, we cannot compel the West, or for that matter, the U.S.S.R., to deviate very markedly from the path which they have planned for themselves. At present our powers are not commensurate with our rights. Authority is getting dispersed but all too slowly!

CHARITY AT HOME?

This is a melancholy thought. But perhaps there is some consolation to be found that a similar dispersion of authority is becoming noticeable at home. Thus, in Uttar Pradesh this week neither the Prime Minister's influence nor that of the Home Minister has stopped a major ministerial reverse. Does this imply that dissident groups are likely to prove as inconvenient in domestic politics as the Asian and African elements in the World Assembly? The dispersion of power abroad is naturally welcome by all Indians, but will the Congress High Command look with equal satisfaction at the dispersion of its own power under the operation of democratic processes such as we have recently seen in Uttar Pradesh? I venture (greatly daring) to doubt whether the High Command will recognize that just as diversity of opinion is necessary in the World Assembly, it is equally desirable at home. If we are to modify the distribution of international power, may not someone suggest that charity begins at home? The dissidents at home surely have as much right to be heard as those that exercise power.

THE SPIRIT OF INDIA

Let me extricate myself from this hazardous position by referring to something on which complete unanimity is possible. This is in paying a tribute to the pageant play presented by the Catholic schools of Delhi on September 29 and October 1. The theme "The Spirit of India" was splendidly conceived and presented by children of four convent schools, Carmel Convent, Convent of Jesus and Mary, Presentation Convent, and Mater Dei Convent.

It was a splendid tribute to India's past, the period of Independence and then, in a somewhat more adventurous mood, into the needs of the future conceived partly in terms of the Plans and partly in terms of India's becoming an arch of peace and concord in the world. There were good likenesses of past greatness in Asoka, Manu, Akbar, Shivaji and more recently to Tagore, until one came by, as a process of natural growth, to Mahatma Gandhi, the presentation of whose message was splendidly done avoiding the dangers of presenting a glorious legend in human form. The whole of the tribute had a singleness of conception that Hindus, Muslims, Sikhs, on the one hand, and great periods of Indian history—Buddhist, Hindu, Muslim and Christian—on the other, all looked as though they formed a single piece. Perhaps that is a grotesque over-simplification of the conflicts that there have been within, but as an ideal of unity it looked at least for two hours and a half to be a real and abiding thing. The moral was well driven home that unity is the source of strength and that unity had to be found in the Spirit of India—which was one of spiritual values arrayed against materialism, godlessness and impurity. Not, indeed, that this spiritualism had to be otherworldly; there was need for engineers, doctors, teachers, and, of course, practical businessmen, in every walk of life. The little doctors and engineers, I noticed, got the greatest cheers of all. But the emphasis was always on two-way progress and working with loyalty to a spiritual, yet practical, tradition; maintaining a balance between material progress and the lofty ideals of the Gandhian vision.

Hillaire Belloc once said in a debate in the Oxford University Union, where the subject was: "Should women in Oxford be admitted to University degree?", that the subject was nonsensical "for where all are perfect, there can be no question of degree." In much the same way, I will not choose to allocate praise. It seemed that the whole conception was so good that there can be no question of degree!

ARGUS

THE WEEK'S NOTES

External Aid

NEW PROBLEMS

THE ADDRESS of Mr. W. A. B. Iliff, Vice-President of the International Bank for Reconstruction and Development, last week is refreshingly frank in its approach to the new problems which are being posed in the sphere of external aid. To start with, he has attempted to focus attention on the emergence of country after country in Africa to the sovereign status. Very soon the total membership of the community of free nations will rise to 100 and it is only reasonable to assume that most of the new independent countries will join the World Bank. The state of their development in the economic, administrative and social spheres during their colonial status has left them totally unprepared to face the problems created by independence and the aspirations which it invokes in the hearts of millions for progress and development. The new administrations are hustled into launching programmes of development which must satisfy at least a fraction of the hopes held out before independence. Already requests for technical assistance to international agencies and aid-giving countries are taking diverse forms, besides putting on their resources the quantitative strain of numbers of personnel in demand. A collective broad approach on the basis of consultation is necessary to meet the new challenge.

Mr. Iliff has stressed the fact that so sudden will be the expansion of demand for external aid that the resources of the agencies prepared and willing to provide them will be stretched to their limit. Hitherto, with what would now appear a limited pressure on external resources, action at an individual level on the part of the aid-supplying agencies has met the situation fairly successfully. But the scene is rapidly changing even in regard to countries like India, Pakistan and others which achieved independence much earlier in the post-war period. The case of India has been singled out by Mr. Iliff as a representative illustration which is likely to be a common case in respect of aid-receiving countries. The external debts obtained by India for her development programmes are now beginning to mature for repayment in stages and even the partial obligations that are maturing are putting a strain on her balance of payments. The problem of the ratio of foreign debt repayment obligations to current earnings of foreign currencies is disturbing her balance of payments position, and this phase is likely to be experienced by some other countries too.

If the tempo of progress of developing countries is not to be seriously retarded, Mr. Iliff urges, "some other forms" of development financing must be adopted and placed at the disposal of the receiving countries. The consortium of creditor countries which met recently at Paris to give preliminary thought to India's Third Five-Year Plan and a similar consortium which is soon to examine Pakistan's Development Plan are indications of a new and dynamic approach. This technique of consortium approach needs to be extended progressively. Mr. Iliff, however, has cautioned aid-receiving countries that efficient and effective (realistic?) programming of plans is as important as estimating the magnitude of external assistance. The responsibilities are posed both ways by the new problems for external aid. Mr. Iliff has not elaborated what are the "other forms" development financing should take but it is fair to assume that by implication he means to utter caution against any rigid emphasis on tied loans.

Food

F.A.O. SURVEY

THE STATE of world Food and Agriculture for 1959-60 presented in the Annual Report of the Food and Agriculture Organisation is somewhat depressing. According to the preliminary estimates of this organisation, world production (excluding Mainland China) shows a rise of about 2 per cent in 1959-60 whereas in the previous year, production was some 5 per cent higher than in each of the two preceding seasons. It, however, points out that an encouraging feature has been that in the year under review much of the increase in world production was in densely populated Far East which is one of the most poorly nourished regions of the world. While total world agricultural production (excluding Mainland China) is estimated to have risen by about 2 per cent, production either fell in some regions like Africa or remained constant as those in Near East and Oceania. On the other hand, in the previous year, it had gone up everywhere.

On the question of production and population, the report points out that while the increase in production is a little less than the average for recent years, it slightly exceeds the estimated annual population growth of 1.6 per cent. Elsewhere, in the statistical section is contained a table giving the indices of per capita food production by countries and regions. While it contains figures up to 1958-59 (preliminary) it is not known why the figures for 1959-60 are also not given for purposes of comparison. On the other hand, a table is given in an earlier chapter of the indices of per capita food production for the regions alone to include the figures for 1959-60 also as shown in the table below:

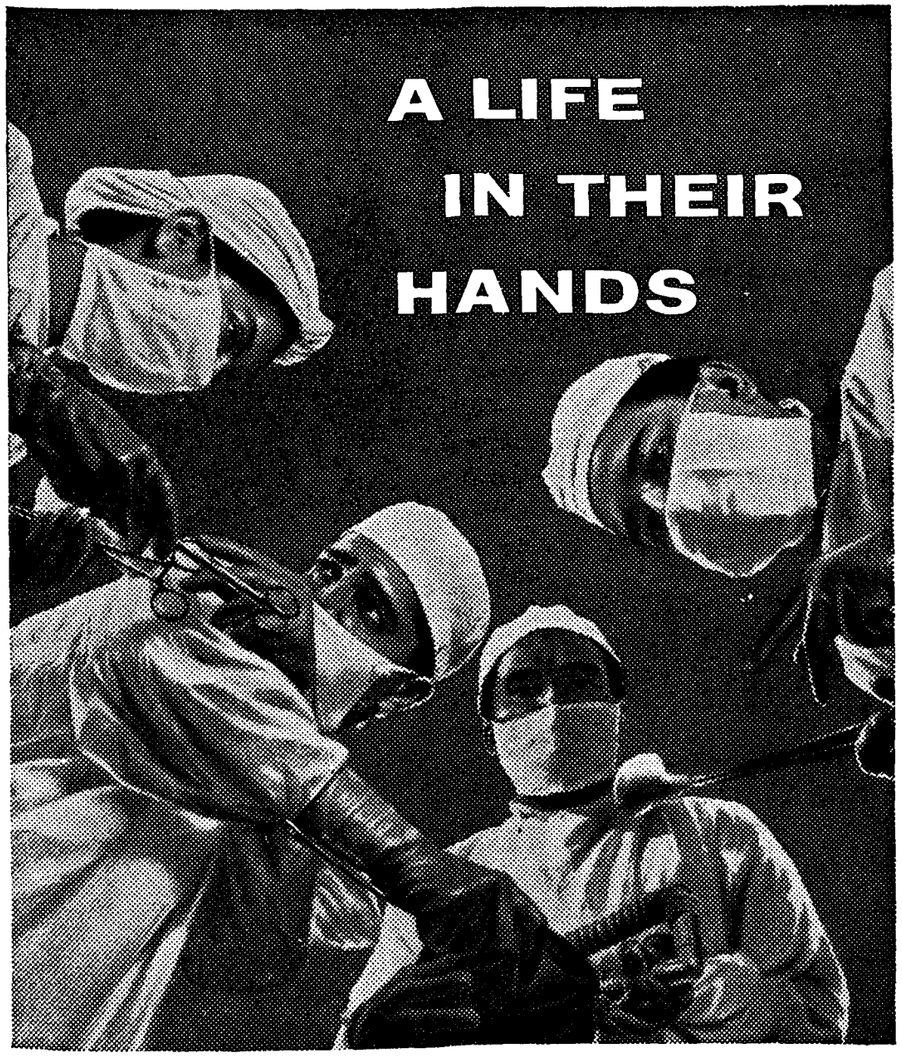
(Base: 1952-53 — 1956-57 = 100)

Region	1948-49—1952-53**	1958-59	1959-60*
Western Europe	89	106	109
Eastern Europe & USSR	91	123	122
North America	99	102	101
Oceania	102	105	99
Latin America	97	103	100
Far East†	92	103	105
Near East	91	105	103
Africa	96	96	92
All Regions	**94**	**107**	**107**

† Excluding Mainland China.
* Preliminary
** Average.

It can be seen from here that taken by regions the per capita index rose only for Western Europe and the Far East and for all other regions, it declined. If the indices for the different regions were available, it should have been possible to provide figures for individual countries also for 1959-60. Apart from this, the report contains an interesting chapter on "Programming for agricultural development" which reviews some of the pre-conditions for agricultural progress from the standpoint of governments. While commenting on this chapter, the Director-General has made an observation that deserves reproduction, "The establishment of targets, the allocation of investment resources, or even the working out of detailed schemes ..... are essential," he says, "but by themselves they are not enough. They will have only a fraction of their potential effect unless means are found of enlisting the co-operation of thousands, often millions, of farmers". Though this may sound as commonplace, the ultimate success of agricultural production must surely revolve around the extent to which such co-operation is enlisted.

Common Market



IMPLICATIONS FOR ASIA

IN A note submitted to the Ninth Session of the Commission on Asian and Far Eastern Affairs of the International Chamber of Commerce, to be held in Karachi in December, the Rapporteurs have analysed the implications of the European Common Market and European Free Trade Association on the trade and economies of Asian countries. They point out that most of the Asian countries have expressed their concern over several aspects of the European Economic Community and especially the provision of the Rome Treaty pertaining to common tariffs, quotas, agricultural policy and association of overseas territories and countries with the six European countries. Apart from resulting in higher tariffs or greater restrictions on trade with the outside countries, they apprehend that the promotion of intra-regional trade of the EEC by means of reduction and ultimate abolition of the import duties and import quotas may have some adverse effect on the trade of the Asian countries particularly semi-manufactured and manufactured goods. There is also the fear that the preferential treatment now granted to the products of the metropolian country will now be extended to the products of all the countries of the Common Market, besides leading to monopolistic tendencies and stimulating agreements on prices among the exporters of capital goods. Though in the case of the European Free Trade Association, the tariffs and quotas for the goods of third countries will remain the same as before, it is pointed out that exports of some of the goods, particularly semi-manufactured and manufactured goods, to countries of the Free Trade Association are likely to be adversely affected because of the competition they will have to face from the products of the other EFTA countries which will bear lower rates of duties in the transitional period and no duties later on. They, therefore, suggest that the Asian delegations to the GATT should study the two schemes carefully and understand its implications. In particular they suggest that, among other things, the scheme of agricultural protection in the Community with its paraphernalia of quotas, a common marketing organisation and minimum prices requires modification, the common tariffs of the European Economic Community should be as near as possible to the tariffs levied by the low tariff member-countries of the community and that the Common Market and Free Trade Association should agree to the principle that in case total imports of the area of any commodity from the non-member countries are continuously lower as compared to the average imports before the schemes came into operation, the external tariff on the item in question should be suitably reduced.

THE PROSPECTS

The note also examines the feasibility of establishing a common market or a free trade area in Asia. While it concedes that such an economic integration aiming at specialisation of industry and freer flow of trade would protect the economies of the countries from some strong competition coming from outside the region, it also points out how for a number of years to come, it would be difficult for the countries of the area to think in terms of uniform programme for the removal of import and export duties and other restrictions on foreign trade. Viewed from the present levels of intra-regional trade in the ECAFE region, the prospects for a common market do not seem to be quite bright. But it points out there is no reason why steps should not be taken for promoting intra-regional trade and establishing institutions in which the countries of the region may work in co-operation with each other. Specifically it suggests two steps for the promotion of intra-regionol trade: one is that the countries of the region should undertake to gradually extend the most favoured import and export tariffs and quotas applicable to any country in the world to all the countries of the region as well. The second is the question of free trade being allowed in certain selected commodities between the countries of the region may be examined by a group which may be appointed for the purpose. It is quite likely that the resulting experience in mutual co-operation flowing from this as well as from the opportunities for industrial development that will arise by specialising in the manufacture of different items in different countries may lead to a greater awareness of the advantages of a larger market eventually.

SKILFUL HANDS... that know the innermost secrets of the human body... that bring new hope to the suffering. These are the hands of a friend be it surgeon or physician, dedicated to the service of mankind. WHAT INFLATION DOES

By

ODYSSEUS

WHAT does inflation do?

All people with debts owed to them, and claims to fixed sums, lose more and more purchasing power the longer and more rapidly that inflation continues. But workers at all levels of income can (sooner or later) secure higher money incomes. Those organised in trade unions or professional bodies exercise greater pressure more quickly than others. But the longer that inflation goes on, the higher go all incomes in the existing brackets of income and surtax, so inflation takes more from the better paid, more responsible producers. The Finance Minister, too, has a vested interest in rapid inflation because it automatically brings "buoyancy of revenue." On Budget day, he can secure an easy cheer by announcing with a flourish that he does not propose to "impose fresh burdens" on taxpayers. But just leaving income taxes, surtax, and profits taxes as they are must give higher yields because rising incomes in depreciated money are pushing taxpayers into higher brackets of progressive taxation.

Graham Hutton, in his authoritative and popularly written "Inflation and Society" (Allen & Unwin, London. July, 1960, Price 15 sh.), observes that ten years ago the ordinary British weekly wage earner could not have dreamt that he would ever be liable to surtax, which begins—as forty years ago—at £2,000 p.a. But today a number of weekly wage-earners are paying it. And he adds wryly, by 1969, if inflation proceeds as in 1949 to 1959, one-third of all the UK's weekly wage earners will be surtax payers! (With 1938 as 100, purchasing power of the £ had fallen to 50 in 1949 and to 36 in 1958).

FIVE RESULTS OF INFLATION

In all countries with progressive taxation (Are you listening there in New Delhi?) the result of inflation is:

(1) Increasingly to penalise those in positions of responsibility in government, industry, commerce, and public life;

(2) Progressively to add to the "buoyancy" of the State's tax revenue, thus giving the Finance Minister an automatic hedge against the inflation that he is inflicting on others;

(3) Relatively to benefit, and therefore to stir up demands for increased wages and salaries from, the best organised groups, and therefore also to stimulate more and more groups to organise themselves;

(4) To advantage the lower income-earners whose MONEY incomes can rise farthest before getting into brackets of progressive taxation, in which heavy taxes become payable.

(5) Increasingly to punish all claimants to fixed money incomes in the future: pensioners, holders of policies with the Life Insurance Corporation of India (unless they have taken out "with profits" policies in which case the extent of their loss will be mitigated, but to what extent is another matter!) holders of all fixed interest securities at medium or long-term (government bonds, industrial debentures, preference shares), owners of properties leased for medium or long terms at fixed money rents, recipients of annuities bought by down payments earlier, owners of patents, copyrights or other "know-how" who have foolishly granted royalties or licences at fixed money fees, beneficiaries of trusts, covenants, and any other funds the money income from which depends on fixed interest securities.

The social discontents, envies, jealousies, and unrest set up between (a) all such claimants to fixed money incomes and (b) all other income receivers in a democracy have become all too well-known in too many countries since 1918. Governments try to alleviate them by granting different reliefs: raising old age state (but not privately secured) pension rates, for example. But this only creates new tensions and injustices. Above all, it leads to competition between the political parties to outbid each other for the votes of the groups most aggrieved by inflation. Graham Hutton asks us to note that these groups are mainly those which are unproductive (the retired, dependent, or sick) and/or those hitherto unorganised. Thereupon new bodies spring up to group those suffering most from inflation, organised as much for party-political as for economic or equitable purposes.

What is the result, then, of the Finance Minister's decision either deliberately to promote, or negatively to allow, inflation to snowball along?

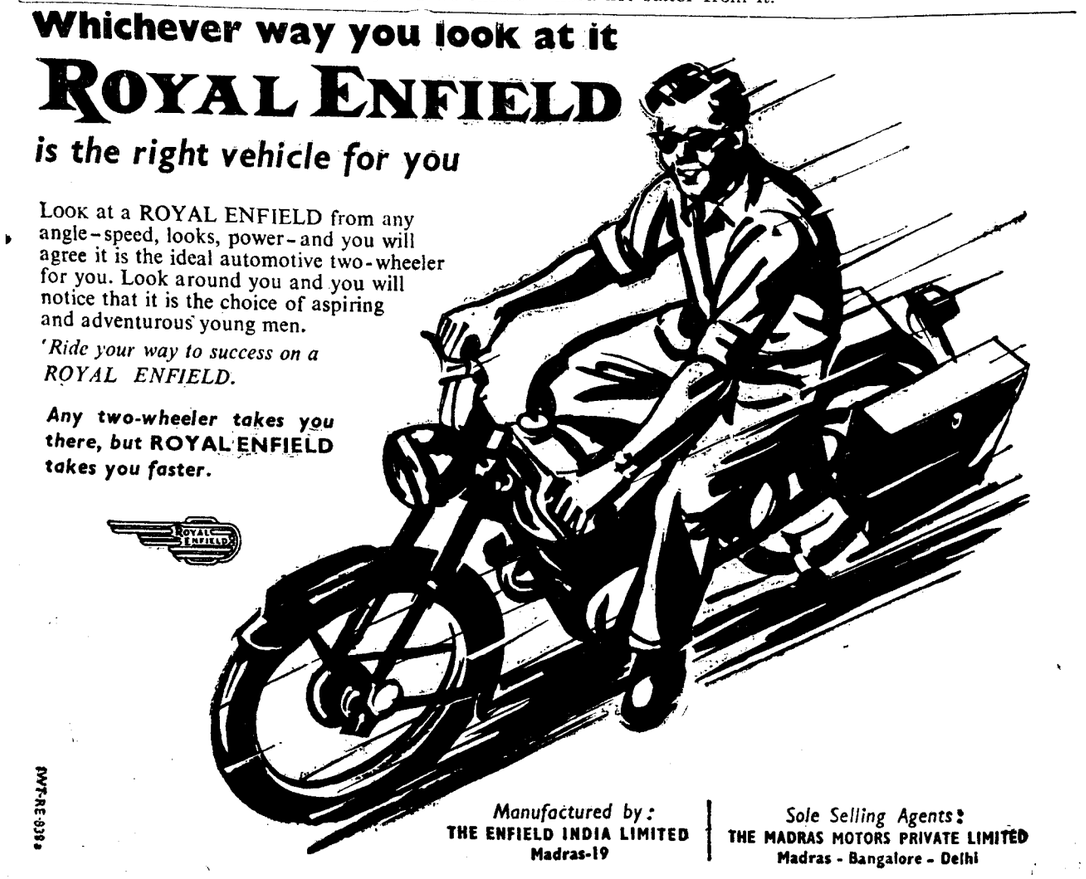
It is generally to inject into democratic politics, by an inflation conceived as a policy to AVOID awkward social or political decisions, such a doubly awkward collection of dilemmas as would never have been willingly or wittingly incurred at the outset, had the Finance Minister and his advisers realised what they were piling up for themselves and their unfortunate fellow citizens. Should the party in office be outbid for votes and the Opposition come into power, the incoming party is likely to run away from its doubly awkward dilemmas by falling back on further inflation, thus making them quadruply awkward! And I cannot repeat often enough that inflation is not an economic but a political problem. That is precisely why Graham Hutton is at pains to warn us that the process of undoing democracy proceeds cumulatively until controls reach out into every branch of life and the ultimate end is collapse, as in the Roman Empire, or as in Germany under Hitler.

INFLATION DISINTEGRATES THE NATION

That society flourishes which promotes best the interests in common of its citizens, which integrates them. Inflation disintegrates the nation by adding to the inevitable stresses between groups and by creating new resentments. One lot of people with fixed incomes have their standards of living forcibly cut. They are forced to sell capital if they own it. Another lot who can push their incomes up do so, despite liabilities to heavier income tax—e.g. those not yet in the highest brackets, or those who can make even bigger trade profits, after tax, than the rise in money costs would warrant. These people buy the capital of those forced to sell.

Inflation makes most businesses highly profitable in paper money; they can pay their taxes, all their rising costs, and good dividends. Other businesses, especially exporters (countries with balance of trade deficits please note!) may be badly hit; so may their workers and shareholders. The interests of the old and retired are set in opposition to those of the young or middle aged; those of the unproductive against those of the productive; those of the prudent who saved at long term fixed interest for the future against those quick in-and-out operators who make their profit by not holding on to

any money. The interests of all who save, contribute, build, and create for a long-term future are set against those dependent for profit on the highest velocity of circulation of money. Thus does inflation tear to pieces any close-knit nation.



With a stable currency, those firms make money which are efficient in supplying demand; those which are inefficient lose money and are squeezed out. Resources are thus re-allocated more profitably and the national income grows. But inflation causes arbitrary, windfall distribution of inflationary profits, which have nothing to do with efficiency or productivity.

Businesses MUST make more profits in an inflation in order to be able to replace their old capital equipment at much higher prices. The higher replacement costs must be covered by savings—either by the business ploughing back its profits (in which case its shareholders must do without), or by new savings from individuals or institutions. Governments MUST allow enough "profiteering" in an inflation for there to be enough savings, for otherwise, as Graham Hutton rightly insists, society's capital would run down, dragging employment and standards of living with it. So that the more that the Finance Minister inflates, the more dilemmas he piles up. If he taxes more and more windfall profits away, he himself must allocate them to productive investment, which makes society more and more state controlled, and eventually totalitarian. Or he must leave windfall profits to the companies which make them, which means that new savings are only available to existing concerns. This makes for a static economy. It is, I have often submitted here, the duty of directors not to plough profits back but to pay them out in dividends, so that the shareholder can exercise his function of deciding what the most profitable sphere for new investments is. If Thomas Edison had worked in a period of violent inflation, he could not have found investors to lend him money and we should have had to wait years before the gramophone came into general use.

This leads me on to another important point made by Graham Hutton: Of all the distortions of inflation possibly in the long run the most dangerous to society is that which disrupts the appropriate, normal, "indicated", requisite pattern of development and growth. The capital structure of a society at any moment implies, in its very proportions, a logical pattern of further investment for both its replacement of outworn assets and its extension and expansion (cf. Edison's new gramophone, Watson-Watt's invention of radar). This pattern is a schedule over time. Building and other durables fall due for repair slowly, and therefore in small yearly proportions; less durable assets, like machines, fall due in greater bulk every year; other short purpose capital assets may only last two years or even less. By undermining confidence in savings, investment, and the future value of money, inflation saps this structure, much more for long term, less for short term investment. This tilts the pattern towards short term investments and more quickly turned-over profits in depreciating money. Long term assets are neglected. So the entire process of production, distribution, consumption, and investment, is at sixes and sevens. The rates of growth of the economy in its component sectors—agriculture, services, houses, communications, etc., etc.,—go awry, tilted towards the present and away from a remote future. Windfall profits, on short term capital, quickly transferable, "in-and-out", impede a steady, compounded rate of growth.

I have done. Next week we will discuss another topic. I leave you with this thought:

There are many mistakes for which economists must accept responsibility. Inflation is not one of them. Inflation results from a political decision taken by the Finance Minister. If he does not want inflation, you need not suffer from it.

The European Scene

EUROPE'S BACKWARD AREAS

From Our Special West European Correspondent

PARIS, October 1.

THROUGHOUT modern times, the nations of Europe could be fairly easily divided into a prosperous and progressive north-western group and a southern and eastern group of Mediterranean and Slav peoples whose economic development has not differed greatly from that of their North African and West Asian neighbours. The line of demarcation was not simple because it cut through the middle of a nation that is politically one but economically two (Italy), because it required classing Portugal with the Mediterranean group and because Ireland had to be excluded from the north-western group and placed among the backward; now it has been further complicated by the disappearance of many of the latter class into the Soviet empire. But in what remains of non-Soviet Europe, this rough division still stands, and — this is what is less known — it has been becoming more evident since the war. Although, as we shall see, some creditable progress has been made in the backward parts of Europe, the immense economic expansion that has occurred in north-west Europe in the last decade has had these two striking results: it has diminished the differences between the nations of the prosperous group, and it has widened the gap between them and the undeveloped nations of the south. In other words, inside the group comprised by Britain, Scandinavia and the Common Market countries, there has been both rapid progress and a levelling up, while the poorer Mediterranean nations — just like the overseas developing economies — have seen the gap widening between them and the advanced industrial powers.

Thus in the 20 years since the beginning of the war, national income per head has grown by 45 per cent in the industrialised West European nations, but only by 29 per cent in the southern group. This widening disparity may be seen in other indicators: industrial production per head is now only one-quarter of the West European figure; the rate of capital formation is less than two-thirds of West European saving, which means of course that, as far as investments account for economic progress, the gap will go on widening; the contribution of the poor group to the imports of industrialised Europe has fallen by one-third in 30 years, and their share of world trade has diminished by almost as much. The phenomenon of the rich getting richer while the poor, for all their progress, fall further behind is familiar in comparisons between the West and Afro-Asia; here we see it inside Europe itself.

The per capita figures for the backward European economies would probably look a lot worse were it not that they enjoy a privilege denied most of the overseas developing nations: the possibility of exporting a part of their surplus population as migrants — as migrants moreover who contribute to the payments balance by continuing, with the tenacious loyalty of the poor, to send remittances home to a country to which they have no intention of returning. This factor is most important for South Italy if we count as migration not only the constant movement of Italians abroad but their transfer to the booming industrial regions of North Italy. In Ireland's case, emigration has continued (as throughout the past two centuries) to annul the increase in the population, and it has been helpful in Greece and Portugal. Nevertheless, among the whole it is only Ireland and Yugoslavia that have managed to keep their agricultural labour force stable; all the others have had more people on the land after the war than before. The first objective of economic progress, to get people out of low productivity occupations such as agriculture and small industry into big industry where their productivity can be multiplied several times, is not even in sight for countries like Turkey and Portugal.

Leaving aside the special case of South Italy, which was anyhow dealt with here last week, the backward economies of Europe can be classed according to their performance over the past decade. Portugal and Ireland have put up the worst showing, with rates of growth so inadequate as to constitute stagnation, and with governmental indolence and ignorance being passed off as laissez-faire liberalism. Turkey and Spain have both tried valiantly but unwisely to get out of the rut by putting their trust in inflation, and this ended in both cases where inflation always ends: in disorder, national bankruptcy and a lot of cardboard "achievements" that collapsed before the first puff of international competition. Turkey was forced into a rigorous deflationary reform in 1958 and Spain in the following year; the consequences of this cure have been obscured in Turkey by the recent revolution but in Spain's case, while disappointing as I wrote from San Sebastian in the summer, they are by now encouraging enough for Madrid to be considering non-resident convertibility for the peseta Greece and Yugoslavia have done best. Greek performance is due to the fact that the disillusion with inflation now going on in Spain and Turkey was achieved as long ago as 1953-54, when devaluation, stabilisation and total reform of the monetary system put an end to the wild post-war inflation. Yugoslavia (and I say this who am no admirer of dictator Tito) stands in a class by itself. While still definitely belonging in the group of Europe's backward areas, this economy has achieved progress in agriculture which the ECE holds up as a model to the other members of the group, has been the only one to save more than 20 per cent of her national income and has invested 9 per cent of the national product in industry (against 3 to 5 per cent for the others), thus managing to transfer labour from the land to the factories.

Granted this disproportion between progress in each economy, some general observations may be made about development experience in the group. As everywhere else, industrial expansion has been faster than agricultural expansion: annual rates of growth of 9 per cent and 3 per cent, respectively, are a common contrast. This discrepancy has been paid for in inflationary pressure on food prices and in a failure of traditional exports of primary produce to finance imports needed for industrialisation. The resulting external deficit has run down exchange reserves to the point where progress, even in industry, has had to be throttled back, leaving

all governments face to face with the problem they should have tackled first: the increase of agricultural productivity so that it can absorb the revenues generated by industrial investment, and the promotion and diversification of agricultural exports to bear the foreign exchange cost of national development. In short, these backward countries, like many others, have been fascinated by the industrial achievements of the West and missed the point that the root of their backwardness lay in an agriculture that has been stagnant for centuries. Just lately, Greece, Yugoslavia and Ireland have succeeded in increasing agricultural efficiency. The ECE experts who recently surveyed the agriculture of these countries gave advice that no doubt has application elsewhere. They warned against putting much more money into vast irrigation projects which at once generate revenues out of proportion to their delayed return in extra crops; rather, effort should be concentrated on improving dry farming methods and on (this point came out last week regarding South Italy) settling more people on the best land instead of trying to upgrade poor land. They warned against increasing the fleet of tractors except where manpower shortage made this essential. They advised more attention to animal husbandry, which is characteristically neglected in poor countries. Finally, they praised Yugoslav ingenuity in improving output with small investments and simple equipment.

In the matter of industrialisation, these nations have fallen into one or the other of two contrary snares: the bigger ones (Spain, Turkey, Yugoslavia) have had too much State enterprise, leading to inflation; the smaller ones (Greece, Portugal, Ireland) have had too little, and by leaving everything to a non-existent "free enterprise" have stagnated much too slowly. The limitations of State enterprise are being recognised in Spain and Turkey, while in the smaller countries (as in South Italy) the lesson has yet to be learnt that industrial progress will never be adequate until the State plays a more active role. Still, industrial progress has been heartening in most of the region, and if these nations could escape the cycle of inflationary-deflationary expansion-contraction and manage to keep the rate of increase of industrial output steady at about 7 per cent a year for 20 years, they would attain the present West European level of industrial production per head. (By then of course West Europe will have current American standards.) That is largely, but not entirely, a question of maintaining investments at the maximum permitted by the size of the agricultural surplus and/or the export surplus (and since exports are mainly primary produce, that comes to the same thing.) I say "not entirely" because the different returns achieved in these countries for comparable sums of investment show that numerous other factors are involved: the degree of co-ordination of investments, the spread of literacy and technical knowledge, the efficiency of markets and the credit system, the attractiveness of speculative diversions, etc.

The main point, however, is certainly the size of export earnings. Whatever the ultimate causes — lagging agriculture, domestic inflation — the development crisis everywhere shows up as a foreign exchange shortage. The export performance of all these countries has been disappointing; they have not participated in the global expansion of international trade and their share in world commerce has fallen in 20 years from 3.1 per cent to 2.2 per cent. Above all, they have lost their stake in West European markets, because they are still offering traditional produce which advanced industry has learnt to do without or at least to use more economically. Only those, like Yugoslavia, that have succeeded in attuning their export list to the needs of modern industrial economies have been able to keep exports expanding. The parallel with the export failure of other developing countries, not excluding India, is too plain to need stress.

"Powells" Stop Man-handling in Industry

Economic Report from the U.S.

RISE IN WORLD PRODUCTION AND TRADE

By GUY SIMS FITCH

WASHINGTON, SEPT. 28.

WORLD production and trade are expanding. The inflationary threat has to a large extent been met as many countries are experiencing a high level of prosperity with relative price stability, and an increased flow of capital from the industrialized nations holds out the promise of accelerated economic progress for developing lands. It is against this backdrop of economic criticism, of a kind virtually unknown since the end of World War II that the International Monetary Fund (IMF) and the International Bank for Reconstruction and Development (IBRD) are holding their 15th annual meeting here in Washington. This optimism is reflected in the annual reports the two United Nations Organizations have presented to the meeting.

The IMF, which helps stabilize the international balance of payments accounts of its member nations, points out in its report that industrial production among the free countries— Communist States by their own choice are not members of these two U.N. bodies—rose 10 per cent last year, and international trade six per cent. Most of this rising trade is now conducted in convertible currencies which can be exchanged freely. This has helped widen the channels of commerce, and reflects the fact that the leading trading nations, by and large, have built up their monetary reserves to the point where they no longer need to restrict their international payments as they did in the past. In this regard, the IMF report notes that in the year ended last April 30, nations with balance of payments problems drew $165.5 million from the Fund's currency pool but others repaid $537.3 million, more than three times as much. Furthermore, IMF officials foresee continued increases in world trade and further strengthening of the international payments system in the year ahead.

The country that now faces the largest balance of payments problem is the United States, which by its liberal policies of the past 15 years has contributed significantly to the improvement of international economic conditions. Here, too, the IMF sees many reasons for optimism. For one thing, the turn around in the U.S. international financial position reflects the very success of U.S. policy in rebuilding war-torn Europe and aiding other nations. For another, the U.S. Government has in the past year turned a large internal budget deficit into a surplus, and over the years has consistently followed enlightened monetary and credit policies at home. Finally, with world economic conditions strong and U.S. exports soaring, there is good reason to expect that the U.S. payments deficit will be substantially reduced this year. Many other countries also have been following enlightened and constructive policies. In keeping with their growing economic strength, for instance, nations in Western Europe have been repaying their dollar debts and have been reducing their restrictions on the purchases of dollar goods. A number of Western countries, moreover, have indicated that they are ready to undertake larger aid efforts for developing lands than in the past. This is a goal keenly desired not only by the two U.N. bodies but also by the United States, which has been shouldering and will continue to shoulder the major assistance load. Their need for economic assistance notwithstanding, the developing countries—many of them largely exporters of raw materials—also have experienced some improvement in over-all trade position. The IMF figures show that as a group countries exporting raw materials of all kinds actually had a $1,000 million surplus in their payments balance last year, as against a deficit of about that same size in 1958.

Nevertheless, the situation of the developing lands is the one that seems to require the most urgent attention right now. It is to this problem that the IBRD—or World Bank, as it is more popularly known—has addressed the main burden of its report. The bank, as its name implies, is concerned principally with making funds available for economic development programmes of its member states. And it sees an important and heartening change taking place in this field, in the form of increasing supplies of capital from industrial nations, particularly in Western Europe, coupled with a new awareness of the need to evolve effective ways of providing the funds to aid the developing countries. Much of the projected increased investment in economic development is still in the blue-print stage. But in its report, the Bank is able to cite a number of significant steps that are preparing the way not only for increasing the export of more development capital, but also doing it with a wider base of participation among the industrial countries, with a greater co-ordination of their efforts, and on more flexible terms of repayment than have heretofore generally been available.

First and foremost, there is the formation of the International Development Association (IDA), now coming into being as an IBRD affiliate. IDA will help promote economic advancement by making loans to developing lands on terms more flexible than those of the Bank's own loans. As of this writing, some 15 countries already have made nearly $700 million available to IDA, including $320 million from the United States. When all 68 member states (the present World Bank complement) have joined, IDA's total initial capitalization will be $1,000 million. In addition, the old Organization for European Economic Co-operation (OEEC) is in the process of being replaced by the new Organization for Economic Co-operation and Development (OECD), in which the United States and Canada will be members along with the countries of Western Europe, and which will embrace development assistance as one of its chief concerns. The United States also has joined with eight other leading industrial nations to form the Development Assistance Group (DAG), with the objective of studying ways of better co-ordinating economic aid to developing lands. Another new organization just starting operations is the Inter-American Development Bank (IADB), a regional body designed to help finance development projects in Latin American countries. The United States also is the largest contributor to this organization, which, like IDA, will offer special development financing on more flexible terms than are usually available from conventional sources. There also are cases of less formal co-operation among World Bank members. An example is the $1,050 million plan to harness the waters of the Indus Basin for the use of India and Pakistan development projects.

Finally, the Bank took on a new role during the past year when, as part of its technical assistance endeavours, it became executing agency for the projects of the U.N. Special Fund. This means that in the important realm of pre-investment studies, the Bank will be surveying the feasibility of specific development projects, with one such survey already completed and five others under way. All this, of course, is in addition to the Bank's regular lending activities. In line with the current needs and capabilities of its member nations, nearly all the $659 million lent by the Bank last year went to countries in Asia, Africa and Latin America, with only $69 million going to Europe. If the IMF report can be said to describe a new era of international economic prosperity and stability, the IBRD report can be said to describe a new era in international economic co-operation, one that has as its principal objective the acceleration of economic growth in developing lands and around the world.

Australian Economy

RAPID GROWTH IN POST-WAR ERA

By Rt. Hon. H. E. HOLT,
Treasurer of the Commonwealth of Australia

AUSTRALIA'S economic growth in the post-war period has been rapid and sustained. It has, in fact, been a major aim of the Australian Government's policy to promote and maintain the maximum possible development of resources without jeopardising economic and financial stability.

A major factor in our post-war economic growth has been the strong upward movement in population. A considerable addition to the capacity and output of the Australian economy was required to meet the needs of the increased population and employ the growing work-force. In fact, the economy has expanded much more rapidly than population. Let us look at the record.

In the past decade, rural production has increased by more than one-third. The pastoral industry accounts for almost one half the gross value of rural production. Wool production, chiefly fine merino wool, has risen by more than 50 per cent in the past decade. The average weight of fleeces has been increased by selective breeding and the carrying capacity of the land has been added to by scientific pasture improvements and pest eradication including the highly successful introduction and spreading of the rabbit killing virus, myxomatosis. Meat production has also gone up appreciably in the past decade. Production of grain crops has fluctuated with seasonal conditions, but the general trend has favoured greater output. Sugar production has also increased. These are the products that earn the bulk of Australia's export income.

Mineral production has been increasing even more quickly. Over the last ten years, mineral production has increased by more than 50 per cent. Production of lead, zinc, silver, coal, uranium and copper has risen sharply. Each of these minerals is produced in sufficient quantity to supply the home market as well as to contribute to Australia's export income, 10 per cent of which now comes from minerals.

The manufacturing industries, however, have been the fastest growing sector of the economy. Changes there have been rapid and dynamic, transforming the very nature of the economic base. Ten years ago manufacturing industries had a net value of recorded production slightly less than that of all primary industries. By 1958-59 the contribution of manufacturing was more than half as great again as that of the primary industries.

Some indications of the speed of Australia's industrial growth can be found in the figures for steel, cement and electricity production in the past decade. In the past ten years steel production has almost trebled, and production is currently running at about 3½ million tons a year. Nevertheless, the development of the economy is so rapid that demand for steel is tending to run ahead of supply. Over the same ten-year period, cement production increased by 1 million tons to 2.7 million tons. Electricity production, which is now about 23,000 million kilowatt hours a year, has more than doubled over the same ten years.

While existing industries have been expanded and modernised, there have come up some completely new industries. Among these are the industries producing motor vehicles, petroleum products, chemicals, tinplate, diesel electric locomotives and heavy earth-moving equipment. Each year sees further diversification and expansion of secondary industry in Australia.

How has this rapid growth in the economy been brought about? It was in part made practicable by the increase in population, in particular the increase in the number of new settlers from abroad, who added to the work-force at a time when the number of Australian-born entrants to the work-force was relatively small because of the low birth rate in the nineteen-thirties. However, an increase in numbers by itself would not have sufficed, as the experience of many countries shows well enough.

The successful application of science to the problems of the agricultural and pastoral industries, and the adoption of advanced production and managerial techniques in manufacturing have been important factors. These have to be backed by the investment of large sums in new equipment and so on, and supported by an enlargement of the whole economic structure—its transport and power facilities, schools, hospitals and the rest.

This has meant that throughout the post-war decade Australia has been investing a very large part of its national product. The high savings rate of the Australian people, and a large amount of self-financing by Australian businesses have helped to make this possible. In addition, the Government has devoted substantial amounts of taxation revenue to capital works expenditure. Lastly, the combination of rapid growth and economic and political stability has attracted large amounts of capital from abroad.

Rapid growth in the economy has presented the Government with the not unfamiliar problem of reconciling rapid and sustained economic growth with internal stability and a sound balance of payments. Particularly in the past twelve months, internal demand has been increasing rapidly and there are some indications that labour and material shortages have developed or are imminent.

The Government's aim is to maintain economic expansion in conditions of internal and external equilibrium and in furtherance of this aim it has adopted a number of measures designed to reduce the pressure on costs and prices. One of these measures, of interest internationally, was the virtual abolition of quantitative restrictions on imports announced last February.

To sum up, the decade of the 1950's saw one of the most rapid and sustained rates of economic growth in Australia's history. Much of this growth was groundwork upon which we will build in the 1960's. The population is continuing to increase rapidly and the number of new entrants to the work-force should increase even more rapidly owing to the post-war boom in births. The expanding internal market is bringing with it valuable gain in greater efficiency at a larger volume of output. Looking ahead, we see every reason to expect continuance of rapid economic growth.

WORLDGRAM

India

Central Revenue Collections: The revenue realised from important dutiable items in the first four months of the fiscal year 1960-61 amounted to Rs. 230.14 crores. Of this Rs. 57.16 crores were collected during July, 1960. The corresponding figures for the first four months of the fiscal year 1959-60 were Rs. 199.84 crores and Rs. 51.40 crores for July 1959. Details under various heads are as follows:

(In lakhs of rupees)

	July		April July	
	1960	1959	1960-61	1959-60
1. Customs	12,63	12,52	49,36	47,50
2. Union Excise Duties (excluding coal cess and salt cess)	33,20	29,51	130,43	111,21
3. Corporation tax	3,63	1,39	19,12	8,19
4. Income Tax	7,09	6,16	24,92	25,95
5. Estate Duty	0,11	0,19	0,46	0,30
6. Taxes on Wealth	0,14	0,24	0,95	0,83
7. Expenditure Tax	0,03	0,03	0,07	0,11
8. Gift Tax	0,03	0,02	0,13	0,12
9. Railway Passenger Fare Tax	N.A.	1,18	3,37*	4,35
10. Opium	0,30	0,16	1,33	0,98
Total	57,16	51,40	230,14	199,84

N.A. Not available.
* Provisional up to June.

*

British Loan To India: Further evidence of Britain's continuing interest in India's development plans was the Treasury announcement in London on September 23 that further loans amounting to a total of £35,000,000 are to be made. India's Minister of Finance, Mr Morarji Desai, and the British Chancellor of the Exchequer, Mr Selwyn Lloyd, discussed the possibility of further loans during Mr Desai's recent visit to London for the Commonwealth Economic Consultative Council meeting. The Treasury announcement stated that it was agreed that the United Kingdom would make a fresh loan of £5,000,000 to finance a broad range of Indian imports from the United Kingdom during the present financial year—the final year of India's Second Five-Year Plan. This brings the amount of United Kingdom loans to India during the year to £15,000,000. The statement continues:: "As regards India's third Five Year Plan, which is to come into operation next year, Mr Desai explained India's need for assurances of future financial assistance to enable India to place orders within the next year or so for which payment would be made in subsequent years. In response, the Chancellor of the Exchequer informed Mr Desai that the United Kingdom would be prepared, as an initial act of assistance for the Third Five Year Plan, to make further loans amounting to £30,000,000 to finance orders to be placed in the United Kingdom for the capital goods required for implementation of the Plan. "In addition, it was agreed that further discussions should take place to explore the possibilities of finance from the United Kingdom Government and from private United Kingdom sources to meet the foreign exchange cost, estimated at roughly £20,000,000, of the proposed extension of the Durgapur steelworks in India. "The external costs of the first stage of this steelworks have already been met to a substantial extent out of earlier Government loans and private credits from the United Kingdom."

Tungsten Carbide Factory at Poona: At the beginning of this year a Swedish company, The Sandvik Steel Works Co., Ltd., obtained from the Indian Government a licence permitting them to build a Tungsten Carbide factory in Poona, about 200 kilometres east of Bombay. For the planned tungsten carbide production in India there will be a new company formed, Sandvik Asia Limited, with a share capital of Rs. 6 million. Out of this figure 40 per cent will be Indian capital and 60 per cent Swedish capital. The factory will produce Coromant tungsten carbide as well as finished products with tungsten carbide tips. The production will start as from 1961 and will gradually increase during the coming years. The factory is to be started under the supervision of Swedish production methods. As soon as possible, a staff of Indian technicians will be trained. The main part of the machinery and furnace equipment, which cannot be obtained in the open market, will be of Sandvik's own construction. In so far as Indian machines are available, these will be ordered from local suppliers. Swing Limited, AB, manufacturers of safety razors and razor blades, are to transfer their plant at Sandviken, Sweden, to India, where a factory will be established near Bombay with representatives of Indian industry, according to the Managing Director, Mr George Zeidlitz. The new company, Indo-Swing Private Limited will have a share capital of Rs 10,00,000. Some of the Swedish factory's workers will take up posts with the Indian company. Swing's sales organisation in Sweden will be retained. At the same time, it will act as agents for Indian export goods to Sweden.

U.S.S.R.

Ten New Hydro-electric Stations: The U.S.S.R. will build 10 more big hydro-electric power plants, in addition to those envisaged by the Seven-Year Plan to keep up with the rapid advance of the national economy and of the heavy industry particularly. The total capacity of the new electric stations will run into 10 million k.w. One big hydro-electric station will be built on the Vakhsh River, near the city of Stalinabad, capital of the Tajik Republic. The station will have the world's tallest dam—300 metres high. The blueprints have been completed for a hydro-electric station that is to go up near the city of Cheboksary on the Volga. It will be the third largest project on the Volga, after Stalingrad and Kuibyshev.

*

Automatic Checking Machine: The Kalibr plant in Moscow is a major supplier of control and measuring instruments. So far a big army of checkers are working in the national economy. However, in many places this responsible and painstaking job has been taken over by automatic machines bearing the Kalibr plant's trade mark. Recently a test model of an automatic electronic checking machine which measures and sorts out high-precision bearings was manufactured and delivered to the bearing industry. One such machine replaces ten checkers. Another important work of the factory designers are standard units for automatic checking machines. This will make it possible to design and launch serial production of such machines much faster.

*

Machines for Pattern Making: Pattern making is one of the most labour-consuming jobs in foundry work. Highly skilled pattern makers have to perform a great deal of work by hand. The Institute of Wood Working Machinery decided to try and improve on the work of pattern-makers. A group of research workers together

with rationalisers and engineers of the Stankolit plant has produced an automatic unit for cross-cutting sawed timber. Recently two such units went into operation at the plant's pattern-making shop.

China

Steel Production: A nationwide drive to increase production and at the same time to practise strict economy is sweeping through China's steelworks, from Anshan in the north-east to Szechwan and Yunnan provinces in the south-east. July and August are months of extreme heat and heavy rains in most parts of China. But despite the disconcerting weather, China's steel workers are boosting output. Determined to keep the production graphline climbing, they took effective measures to counteract the weather long before summer set in. As a result initial successes for the third quarter are reported from Kunming, Shanghai, Chungking, Taiyuan, Wuhas and Urumchi in Sinkiang. Workers of Kunming in the south-western province of Yunan scored notable victories in July. In the first 20 days of the month their output of steel and rolled steel rose 53 and 110 per cent respectively over the corresponding period of last month. Steel works in other parts of the country have reported similar successes.

United Kingdom

Britain to Repay Further £20 Million to IMF: It was announced in Washington on September 28 at the annual meeting of IMF by the Chancellor of Exchequer, Mr. Selwyn Lloyd, that Britain will repay a further £20 million to the IMF. This repayment is in discharge of outstanding U.K. obligations to IMF incurred originally in 1956, when Britain sought assistance from the Fund to help with balance-of-payments difficulties. In August, Britain paid £25 million to the Fund, representing an advance payment covering the monthly instalments due for the rest of this year. The further payment of £20 million now announced means that only about £30 million of the original amount borrowed is left outstanding. The United Kingdom Government has made these advance payments as part of its policy of accelerating the discharge of its obligations whenever possible, and also with a view to helping IMF in its task of stabilizing the general world payment situation.

U.A.R.

Russia to help in laying railway lines: An agreement between the U.A.R. and the Soviet Union had been reached on the execution of projects to the value of 285 million roubles. The new protocol amending the 1957 agreement between the Syrian Region and the Soviet Union provides for leaving the door open for future contracts to the value of not less than 100 million roubles. Northern Region Minister of Communications has declared that agreement has been reached to replace the Homs-Akkary, Tartus, Lattakia railway line by the direct line between Aleppo and Lattakia. The Minister added that the railway lines contract provides for the delivery of 81 million roubles worth of goods and equipment to the Northern Region with the possibility of an additional 61 million roubles worth of future contracts. This is in addition to technical experience, supervision of work, the provision of rails and sleepers, road testing machines as well as the iron and steel necessary for metallic constructions. Besides, the door is left open for concluding contracts concerning goods, wagons, locomotives, signals and telecommunications equipment. The entire line from Kameshli to Aleppo and Lattakia will be completed by the end of 1966.

France

Renault Automobile Production: During the first seven months of 1960, the Renault Company produced 361,544 automobiles compared with 287,595 during the same period of last year, which is an increase of approximately 25%. In addition, the Agricultural Tractor Division produced 9,907 tractors. In July, Renault produced 43,509 automobiles including 35,771 "Dauphines", 3,611 "4 CVs", and 3,008 Estafettes," 1,268 tractors were also produced in July.

Australia

Big skim milk sale to India: A Melbourne exporting house, Nederveen & Co. Pty. Limited has obtained a contract to supply the Government of India with 500 tons of skim milk powder at a cost of about £50,000. The milk powder will be produced by two Victorian butter factories controlled by subsidiary companies of Peters Ice-Cream (Victoria) Ltd. Shipments will be made to Bombay immediately. The Indian Government had sought tenders for the order from all soft currency areas. Twice previously, Nederveen & Co. has obtained contracts to supply milk powder for India, once for 500 tons and next for 200 tons.

*

Coal Plant Gift to Thailand: A coal-handling plant made by a Queensland company, to operate at a huge brown coal field at Mae Moh (Thailand) was shipped recently by the Australian Government under the Colombo Plan. The plant designed and made by Scotts of Ipswich Pty. Ltd. was shipped in parts because of 300 ton weight. It will handle lignite for the generation of electricity to supply a large rural area around Mae Moh 500 miles North of Bangkok.

Yugoslavia

Maize Production: The first unofficial estimates of this year's maize production of about 6 million tons point out to the fact that Yugoslavia is still among the leading world producers of this crop. The figures on production of maize in the world show that Yugoslavia is fourth behind the United States, the Soviet Union and Brazil. Characteristically, the increase in maize production in Yugoslavia proceeds at the most rapid pace. Thus, for instance, the quantities produced last year were three times above the average 1930-39 production. Yugoslavia has achieved a steady increase in maize yields, thanks to the crops of hybrid maize which are being used of late. So far, hybrid maize is sown only on the quarter of the total surface under maize, so that the average yields are still low.

During his recent visit to Madras State, Mr. Lal Bahadur Shastri, Minister for Commerce and Industry, participated in two important functions that are of importance to the industrial future of the State. One was the laying of the foundation stone of Rs. 6-crore Pulp and Paper Plant of the Seshasayye Paper and Boards Ltd. at Pallipalayam Village in Salem District and the other the commissioning of the Rs. one-crore factory for the manufacture of insulators, both high-tension and low-tension, transformer bushings and the associated hardware, started by the Seshasayye Industries Limited, at Vadalur near Chidambaram. Speaking at the latter function, Mr. Shastri pointed out how the total production of high-tension and low-tension insulators in India was not more than 20,000 tons annually and they had to import about Rs. 1.5 crores worth of these materials. It was imperative, therefore, he said, that they should develop their indigenous capacity.

NEWS IN BRIEF

INDIAN

The Government of India have constituted a special Reserve Fund of Rs. 20 lakhs, under the Employees Provident Fund Scheme, to help subscribers or their nominees in the event of employers failing to pay in full the provident fund accumulations in the subscribers' accounts.

New Zealand's import schedule for 1961, announced recently by the Customs Minister, is based on an unchanged global total of £240m. A feature, however, is the increased flexibility, which will make some domestic manufacturers more competitive, and widen the range of goods.

*

Associated Portland Cement Manufacturers of London, is to establish a £A4m. cement factory near Geelong, Mr. Henry Bolte, Premier of Victoria, announced recently.

*

Daily average crude oil output in the U.S. in the week ended September 16 amounted to 6,630,000 barrels, compared with 6,640,000 in the corresponding week of last year, according to the American Petroleum Institute.

*

According to Mr. Konstantin Petchou, who heads the Soviet State Committee for Automation and Mechanisation, the Russians have developed a process in open hearth and blast furnace operations which are 30 to 40 per cent more efficient over the most modern U.S. iron asd steel plants.

*

For the first time in 20 years, Norwegians may now buy a car without a special permit. Practically all import restrictions have now been lifted, except in the case of ships.

Special Article

ARBITRATION ARRANGEMENTS IN INDIA

By

SHRI G. L. BANSAL

Secretary General, Federation of Indian Chambers of Commerce and Industry.

THE PRIMARY and fundamental purpose of arbitration is to effect a "summary and extra-judicial settlement" of controversies as between disputing parties. Arbitration, in the commercial sphere, connotes the process by which businessmen submit disputes which arise in the ordinary course of their business to one or more persons whom they select to decide their case. The increasing recourse by businessmen to arbitration 'vis-a-vis' litigation, in modern times, is due to the inherent defects in the latter, such as delays in settlement of disputes, heavy costs and the like. In this light, arbitration is more than an adequate substitute for litigation. Not only does it provide a speedy settlement of disputes, but the costs involved are not prohibitive and future business relations between disputants also remain unimpaired.

With business developing at a tremendous pace and consequent increase in the practice of arbitration, many countries including India have invested it with legal validity. Arbitration laws have been enacted by them recognising it as a semi-judicial process which provides for the enforcement of arbitral awards in the Courts of Law. The Indian Arbitration Act which was passed as early as in 1940, regulates arbitration within the country and recognises it as a valid method of settling disputes. Under this Act an award by a Tribunal is more or less final and is enforceable in a Court of Law. A Court of Law can interfere in arbitration proceedings only when there is a difference of opinion among the contestants on the selection of arbitrators or when an arbitrator proves to be incompetent and no method to choose an alternate arbitrator is prescribed in the arbitration agreement. Furthermore, even when an award is referred to a Court of Law it generally pronounces judgments in accordance with the terms of the award. Only in cases where special circumstances obtain and which warrant changes in the judgment, do the Courts alter the award of a Tribunal.

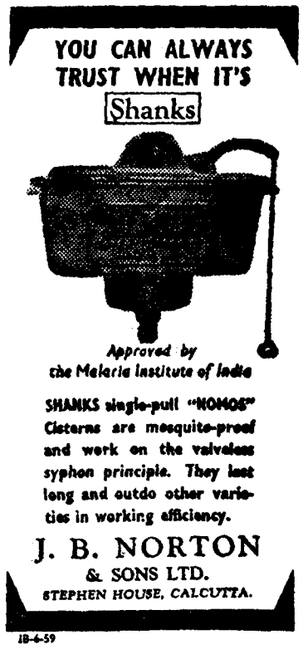
Any study of arbitration arrangements available within a country can be conveniently made in two parts: (a) arrangements for settling disputes where both the parties are nationals of the same country, and (b) arrangements for settling disputes arising in the course of international trade i.e. where the contestants are of different nationalities.

ARBITRATION IN INTRA-NATIONAL TRADE

As far as disputes arising between Indian businessmen are concerned the existing facilities within the country would seem to be quite adequate. Many Chambers of Commerce have established Arbitration Tribunals whose services may be availed of to settle disputes arising between their members or between their members and non-members or outsiders. The establishment of such Tribunals has, however, taken place in accordance with varying conditions obtaining in particular branches of trade or in particular regions. The arbitration facilities for settling disputes among Indian businessmen can also be divided into two categories viz., arbitration Tribunals dealing with disputes arising in certain specific commodities and tribunals dealing with all types of disputes. Those specialising in disputes arising out of particular commodities or trade have developed considerably and their working has proved highly successful. Their services are mostly utilised by their members in disputes among themselves or with non-members. Outsiders generally do not avail their services much though they have ready access to them. Others which deal with disputes of a general nature are established by the more important Chambers of Commerce and are located in all the major ports in the country. But their services are not utilised to the same extent as of those dealing in disputes arising in trade of specific commodities. This is due to the absence of a standard clause of arbitration in business contracts. The popularity of the Tribunals dealing with specific commodities or branches of trade is due to the fact that they are well organised and efficient. Moreover, there is a practice among businessmen of this category to include a standard clause of arbitration in their contracts. By and large, the development of arbitration facilities within the country for settling disputes among Indian businessmen are satisfactory but more has to be done by way of propaganda, education etc. to make arbitration a standard practice.

ARBITRATION IN INTERNATIONAL TRADE

Arbitration arrangements for settling disputes arising in the course of international trade have somehow not reached the level of development which would ensure a smooth and speedy mode of settling disputes. Excepting a few commodities the arbitration clause inserted in an agreement generally mentions a foreign tribunal and in case of disputes the arbitration proceedings have to be held in that country where the tribunal is situated. Due to the high costs involved under these arrangements the Indian traders are not in a position to present their cases properly and mostly lose by default. Further in the case of a dispute arising out of verification of standards, greater veracity is attached to the inspection certificates issued by foreign surveyors rather than those issued by the Indian chambers of commerce. These difficulties can be overcome by concluding proper arbitration agreements with the countries we trade with. At present, particularly in the case of general export trade, disputes under arbitration are normally looked after by our Trade Representatives abroad. In cases where complaints are to be locally investigated they are handled by the Director General of Commercial Intelligence and Statistics or Export Promotion Councils or Commodity Boards concerned. In the import trade also the arbitration clause inserted in the agreement is generally that of a foreign tribunal. In these cases also difficulties of presenting the case effectively before foreign tribunals are formidable and justice may not always be got. This does not however has anything to do with the impartiality of foreign tribunals. The point to be emphasised relates only to the initial handicap with which the Indian parties have to start.



The Federation of Indian Chambers of Commerce and Industry in view of its responsibilities towards the Indian Business Community as also in the interest of a smooth and steady flow of international trade successfully entered into arbitration agreements with the American and Japanese Arbitration Associations as early as 1955. These Agreements have gone a long way in protecting the interests of Indian importers and exporters trading with these countries. The Federation is further endeavouring to conclude arbitration agreements with the Federal Republic of Germany, the German Democratic Republic, Poland, Czechoslovakia and the Soviet Union. Arrangements with the Federal Republic of Germany and the German Democratic Republic are in the advanced stage of finalisation. Negotiations are also in progress with other countries and it is hoped that they would yield fruitful results.

UNITED NATIONS CONVENTION

One of the major difficulties encountered in this sphere of arbitration in international trade in the past was that of enforcement of arbitration awards in foreign countries. The validity of these awards was constantly in danger of being put in doubt, and its effects were often uncertain or unsettled owing to the differences in legislations from country to country and due to the difficulty of ascertaining the law governing the validity of such awards. The purpose of having an arbitration clause in a contract was nullified as it was difficult to enforce an award in another country. The procedure for enforcement was cumbersome and difficult in-as-much as the award had to be recognised by the courts of both the countries. This lacuna has been done away with now by the United Nations Convention on Recognition and Enforcement of Foreign Arbitral Awards, 1958. All the signatories to this convention, India being one of them, guarantee under Article III that they shall "recognise arbitral awards as binding and enforce them in accordance with the rules of procedure of the territory where the award is relied upon". By virtue of signing this convention, awards made under Indian arbitration agreements with foreign countries are enforceable in all the signatory countries and 'vice versa'. This facilitates our entering into arbitration agreements with many countries.

In the ultimate analysis what is more important is not the provision of numerous facilities or arrangements but to make our businessmen and traders arbitration conscious. It is more a question of making them realise the advantages flowing out of this system for settlement of disputes in trade and commerce and establishment of arbitration as a standard practice among them. This calls for an effort to be made in educating our businessmen and propagating among them the necessity and advantages of arbitration. Specially in international trade, the need is for the Chambers of Commerce to require all the exporters registered under them to include a standard clause of arbitration in their contracts. The registered exporters can have recourse to Federation's arbitration arrangements and include in their contracts its provisions in this respect. Even trading organisations like the State Trading Corporation may consider the feasibility of including arbitration as a means of settling disputes arising out of its dealings. This will be a pointer to the business community in general. The present facilities available in the country are adequate and it is to be hoped that the increasing popularity and utilisation of arbitration will lead to smoother flow of trade and commerce which in turn will bring brighter prospects for the future.

THE BUSINESS WORLD

Steel: Shortage of Technicians?

By CROESUS

COMING in the wake of the disconcerting news that the third blast furnace at both Rourkela and Bhilai could not be commissioned in time due to short supply of metallurgical coal as a result of inadequate transport facilities, (neither of which changes, by the way has been accepted by the concerned ministry), it was indeed heartening to find Mr. K. D. Malaviya, Minister for Oil and Mines, disclosing that three big discoveries of metallurgical coal, which are expected to make India self-sufficient in grade one coal for decades to come (sic), have been made in Bokaro and Raniganj areas. Of course, as usual, when questioned about the quantitative and qualitative estimates of the new deposits, Mr. Malaviya gave a guarded and, therefore, not a quite satisfying reply. He said: "We have yet to prove the quantitative dimensions of the new deposits. Investigation of a detailed quantitative projection in this regard is being handed over to Indian Bureau of Mines".

Be that as it may, atleast in so far as the country's requirements of metallaurgical coal, in particular for the indigenous steel industry, are concerned, it does not now seem necessary to bother ourselves as much as hitherto. But this still leaves the problem of inadequate railway transport unsolved, although we may expect that, with the new find of coal deposits, the quality of coal that would be available for the railways would improve and, with it, also the railway transport facilities, to some extent. Nevertheless, it does not appear that the steel plants in the public sector can yet afford to remain complacent. For, if the report of Mr. Leo Werts, the Ford Foundation Man Power Consultant to the Union Ministry of Steel, is to be believed, the Hindustan Steels Ltd. is faced with a serious shortage of trained technical personnel. It is believed, Mr. Werts has, in his report, analysed the factors responsible for current and future shortages of trained technical personnel in the heavy industries and suggested measures to overcome them. The position, as he seems to view it, is quite serious. If, as he says, as much as about 40 to 45 per cent of key positions, such as those of managers, superintendents and foremen, have been vacant since April last in Rourkela, Bhilai, and Durgapur, the position is indeed serious and should cause considerable anxiety. As per Mr. Werts' estimate, it would appear that even to operate at current capacity, about 1,400 more foremen are needed at Durgapur and Rourkela, while a further 1,000 would be needed to meet the requirements of expansion of these two steel plants during the Third Five-Year Plan. In addition to these, when the proposed fourth steel plant is also put up at Bokaro, the additional number required of engineers alone would be 740 !

All these only go to show that the most urgent need of the country, if it must proceed with its present heavy industry-biased plans, is a comprehensive programme of technical training. I think Mr. Werts has done well, therefore, in suggesting the appointment of a high level technical advisory committee, comprising officers from both the public and the private sector steel plants, not only to draw up such a programme, but, what is even more important, to implement it speedily. In this connection, the following relevant extracts from the Fourth Annual Report of the International Finance Corporation bears reproduction.

"Before embarking on a new project or expansion, it is established practice in the best modern business to make intensive studies covering requirements for management, plant location, labour supply, capital, markets and profit margins. Comparable studies are relatively rare in projects presented to IFC. This is often due to the sponsor's inexperience, to the lack of proper trained personnel or outside experts, or because of reluctance to take the time or spend the money required for such studies. Even experienced companies considering foreign industrial ventures often neglect to investigate factors which they would study as a matter of course in their own countries."

Obviously, nearly every one of the factors mentioned in the above extract applies to our steel projects. The tragic aspect of it is that some of them are there, although they need not be there. Take, for example, the shortage of personnel. According to the finding of Mr. Werts, this does not seem to be always due to the absence of the required personnel. Even when such personnel is available, it would appear, there have been delays, because the final decisions happen to rest with the Ministers. It is fantastic that even so responsible a body as the Board of Hindustan Steel Ltd. should not have the authority to appoint personnel, Indian or foreign, at all levels. Evidently it is not fully realised by the powers-that-be that delay in employing essential personnel will not only cause serious damage to capital equipment but also lead to a postponement of the date for reaching the production target, let alone the effect on the cost or the quality of manufacture. It is to be hoped that atleast now, when their attention has been pointedly drawn to this serious lacuna, the authorities would wake up and act.

Expanding Demand for Tinplate

(Contributed)

TINPLATE is a confusing material: how many laymen realise that it consists mostly of steel? The familiar "tin" which is an indispensable feature in any urban household in India contains on an average rather less than 1% of tin, approximately 1/40th the thickness of human hair, applied by dipping, or more recently electrolytically, to a rolled sheet steel base.

This popular failure to identify steel with tinplate probably does not stop with the lay public. Government's 30-member Iron & Steel Advisory Council has not seen fit to include the representation of tinplate interests in it, either manufacturers, fabricators or consumers. Yet the fact is that some 140/150,000 tons of this material worth Rs. 15/17 crores is required annually in India by fabricators employing some 25,000 men. More important, tin container production occupies several lakhs of workers packing and distributing consumer goods worth Rs. 250 to Rs. 275 crores, and accounting for something of the order of 2% of the national income.

A visitor to the Western world is bound to notice amongst other features the tremendous volume of sales of canned products. The price stability of the markets of these countries is to no small extent dependent upon the ready availability of essential articles packed so as to enable safe and ready distribution and efficient preservation. Though many competitive materials have entered the field (aluminium, thermoplastics, cardboard, foil and laminates), the use of tinplate continues to grow as living standards improve. In Britain—and the picture is similar in the USA—between the years 1954 and 1958, a period which witnessed a spectacular rise of plastics as a packaging medium, the tonnage of tinplate used for packaging increased by 51%. Indeed, a tin container manufacturer claims to be the largest single user of steel in Britain. Such is the position of tinplate in the more highly industrialised economies that since the war, 25% of steel expansion in the West has been devoted to it.

In India tinplate is used for the bulk packing of liquid and semi-liquid products or for consumer packaging in smaller containers. Despite the wide use of tanker wagons, approximately one-third of the tinplate is consumed in packing kerosene, the familiar four-gallon can having an extensive afteruse as a domestic utensil in the rural areas. Tinplate's most significant use, however, is probably by the growing industries packing processed foodstuffs, dairy products, food oils, cashews and other foods; drugs and pharmaceuticals; paints, varnishes and chemicals; lubricating and brake oils, etc., requiring tamperproof containers which will get their goods to the consumer unpilfered by the ingenious and abundant rocketeers in spurious goods. The table set out in this article shows that according to the National Council of Applied Economic Research 41% of tinplate is in fact used for packaging foodstuffs.

By the end of the Third Five-Year Plan, according to the same table, an 80% growth in plate consumption will have taken place, a figure which is based on the anticipated growth of the consumption of packaged goods as the pattern of spending changes with Plan-generated income increases. It must also be based on the reasonable assumption that the new alternative materials, namely, aluminium, plastics and laminated foil/plastics/paper combinations, the manufacture of which is now steadily developing, will only affect quite marginally the demand for tinplate.

This is because tinplate, and no other material of similar cost, provides the answer to the acute packaging problems arising out of the country's exacting climatic variables, the vast distances, the inadequate transportation facilities responsible for localised glut and the wastage of valuable food products, e.g. fish in Kerala, pineapples in Assam, mangoes in North Bengal, apples in Kumaon.

Similar factors and the flow of imports from the West account for the strong demand in the markets to which we export goods packaged in tinplate. This is being exploited by the tinplate fabricating industry which expects this year to be responsible for between 3% and 4% of the engineering industry's exports. More important are the exports in tinplate containers, the exact value of which is more difficult to assess. Cashew exports in tins total Rs. 15 crores; that much is certain. For the rest—if the figures of one major fabricator are typical—it may be claimed that approximately Rs. 5 crores worth of canned fish, vanaspati, vegetable oils, toilet goods (to 16 different countries), canned fruits, vegetables, confectionery and biscuits are exported. This clearly is just a beginning of potential exports.

What are the prospects of the packing industry's developing at the rate forecast by the National Council of Applied Economic Research? By the end of the [illegible] tinplate can and will be manufactured in Tatanagar and Rourkela from billets, called tinbar, made in the country. In the short run, however, disturbing news keeps appearing. Only half the country's requirements are made in India; the rest are imported. Next year, however, there is liable to be a serious loss of The Tinplate Company's production on account of the fact that Tatas will be shutting down, for an overhaul which will take six months, the mill which up to now has been used for producing their tinbar. It is understood that the Government has under examination ways and means of making good the shortage. If action is not promptly taken by the authorities either to make available an alternative local source of supply of tinbar or to permit its importation, there may be a shortfall of as much as 35,000 tons of tinplate, a material of which there is already some scarcity. Some one hundred and twenty firms registered with the Development Wing as tinplate fabricators and the many small units which operate under the aegis of the State Departments of Industries have been complaining bitterly about acute shortages which they have chronically faced over the last three years and which have now been brought to a head.

A substantial excise duty was imposed this year by the Finance Minister, primarily to check consumption and secondarily to spread the base of indirect taxation. It would appear that in the interest of price stability, of beating the food adulteration racket, and of continuing the expansion of many small-scale packing industries, realistic planning perspective is required. This industry seems to have a good case for imports worthy of careful consideration inasmuch as the domestic shortfall is arising out of an exigency and denial of import licensing would hit some non-conventional exports at a critical time when their diversification is urgently required. What the country may gain by not making temporary imports may well be lost in health, inflation and unemployment. Furthermore, if the necessary expenditure of foreign exchange is not made to keep this important packaging material in reasonably free supply, a good deal more than just food packing development and the volume of goods available for sale (worth 15 to 20 times the cost of the tinplate) on the home markets is at stake. The growth of packaged exports will be seriously inhibited because the period of gestation in establishing new export markets is long and the ability of packing industries to develop exports is inextricably tied up with the development of the home markets.

REQUIREMENTS OF TINPLATES FOR DRUMS AND CONTAINERS

(In tons)

Consumer Group	1960-61	1965-66	1970-71
1. Milk and allied products	3,800	10,000	20,000
2. Fruit, vegetable and fish industries	2,600	10,000	18,000
3. Confectionery and biscuits	5,700	9,000	12,000
4. Vanaspati and other edible oils	35,700	54,000	80,000
5. Cashew	4,900	7,600	10,000
6. Other food products	4,400	10,000	20,000
Food Products Total:	**57,100**	**100,000**	**160,000**
7. Paint and varnishes	4,500	8,000	15,000
8. Pharmaceutical and toilet industries	4,200	10,000	20,000
9. Petroleum products	50,000	85,000	130,000
10. Other non-food products	7,100	14,000	25,000
Non-Food Products Total:	**66,400**	**117,000**	**190,000**
11. Tea chests	1,500	3,000	5,000
12. Miscellaneous uses	15,000	30,000	45,000
Grand Total:	**140,000**	**250,000**	**400,000**

Extract from "Appraisal of Steel Demand", a report of the National Council of Applied Economic Research Published by the Council of Scientific & Industrial Research — Table 56

Business Notes

Raw Cotton

INTENSIVE PRODUCTION

THE IMMEDIATE problem facing the country today is the need to bring about a substantial increase in the domestic cotton production, as Mr. Madanmohan R. Ruia, President of the Cotton Buyers' Association, observed at the last Annual General Meeting of the Association. How serious this problem is will be obvious from the sharp decline in the total availability of raw cotton that developed during the last season, when there was an unprecedented failure of the cotton crop in the country. The total crop in 1959-60 was no more than 37.50 lakh bales (commercial), as against 46.83 lakh bales in the previous year. Together with carry-over of 18.47 lakh bales, the total availability was no more than 55.97 lakh bales. As against this, the overall mill consumption alone was 44 lakh bales, which too was possible due to the liberal imports that could be arranged. Even so, after providing for exports and extra factory consumption, the carry-over at the end of 1959-60 was hardly 9½ lakh bales, or in other words, about three months' mill consumption on the basis of the present average monthly consumption of 3.3 lakh bales. In all conscience, this is a serious enough situation, and it is not surprising, as Mr. Ruia averred, that the authorities should have been obliged to tighten control measures with a view to ensuring equitable distribution until the arrival of new crop cotton. Being only too conscious of the difficulties of the situation, thus, Mr. Ruia could at best counsel patience for the time being. He, however, thought that the possibility of a normal crop during the current season (which the latest weather reports seem to point to) should raise hopes that the present restrictions would not last.

But all this is no lasting solution to the problem. The problem basically is one of increasing the indigenous production of raw cotton both substantially and speedily, and it is not too much to say that the future of the entire cotton trade — and also our cotton mill industry — hinges on how effectively this problem is tackled. Now, production of any crop can be increased either by bringing more area under cotton or by raising the per-acre yield. Let us see what are the possibilities in regard to cotton in either of these directions. In the context of the prevailing food shortage, we must rule out, both for the present and for as long as we can visualise in the forseeable future, any large-scale diversion of the area under other crops for raising more cotton. For even more urgent than self-sufficiency in cotton is the question of self-sufficiency in foodgrains. Therefore, we are left with a Hobson's choice, that is to increase the productivity per acre, which is deplorably low today. If we can combine the rapidly expanding irrigational facilities with the use of more fertilisers, it should not be difficult to increase the size of our cotton crop somewhat. But only a collective effort made by the farmers, the Government, and the cotton trade can ensure results. And, to the extent that the proposal to set up an expert body to inquire into production, price fixation, and allied questions, recommended by the Indian Central Cotton Committee and accepted by the Union Minister for Food and Agriculture, is promptly and effectively implemented, the task in question becomes feasible.

New Issue

ANUH PHARMA

ANUH PHARMA LIMITED, that has been formed with the main object of taking over as a going concern the partnership firm of Anuh Pharma, will be entering the capital market on October 8. The subscription list will open on October 8 and close on October 17, 1960. or later at the discretion of the Directors, but not earlier than October 12, 1960. The authorised capital of the company is Rs. 50 lakhs divided into 5,00,000 equity shares of Rs. 10 each. The issued capital is of Rs. 10 lakhs consisting of 1,00,000 equity shares of Rs. 10 each. Out of this, 10,000 shares would be allotted to the vendors for consideration, and 10,000 shares have been arranged to be taken up by the Directors and their friends. The balance of 80,000 equity shares of the full value of Rs. 10 each is offered for public subscription at par. A sum of Rs. 2.50 per share is payable on application and Rs. 2.50 per share on allotment. The balance of Rs. 5 per share will be called in two instalments of Rs. 2.50 each at the discretion of the Directors at intervals of not less than three months between each call and prior notice of at least 30 days shall be given in respect of each call. Full particulars will be found in the prospectus published in the issue of this journal dated September 30, 1960. The company proposes to make indigenous drugs of various kinds. The concern in its new form will strengthen the predecessor enterprise and equip it for larger responsibilities. Optimism about its bright future is justified.

Industry

PAPER PRODUCTS

IT GOES to the credit of Paper Products Ltd. whose Silver Jubilee was celebrated the other day that from a humble beginning it has risen to its present position of strength. Its turnover last year was almost Rs. 110 lakhs and a complement of about 500 workers and staff on the rolls. This fairly is a good achievement when the turnover of the company of a mere Rs. 35,000 in its first year is taken into consideration. The new factory of Paper Products Limited which was inaugurated very recently by Mr. Manubhai Shah is located at Thana. The cost of the new factory building, including land, electrical installations and furnishings works out to approximately Rs. 20 lakhs. The factory has been planned to accommodate the expansion envisaged in the near future.

While giving the background of the Paper Products Ltd. Mr. S. L. Talwar, the Managing Director, in his welcome address at the Silver Jubilee celebrations and inauguration of the new factory at Thana highlighted the importance of the packaging industry in the developing economy of the country. Now that emphasis is being laid on increasing exports, it is imperative that there should be a planned development of flexible packaging industry in the country. As to how it could be attained is answered by Mr. Talwar in a four-fold approach which provides for the creation of an independent development council for the packaging industry, liberal licensing of raw materials, and specially, equipment for this infant industry; proper distribution of benefits and concessions to the packaging industry for providing packaging material for export products; and establishment of a packaging institute devoted solely to the problem of finding ways and means of making the best use of indigenously available materials and creating protective and functional packages to suit our climatic conditions. These suggestions are worthy of close consideration.

FROM THE CAPITAL'S CORRIDORS

IMPORT POLICY

THE import policy for the current half year, October 1960 to March 1961, has been announced. As indicated earlier in this column, the commercial imports bill has been pruned further.

Import of cotton fabrics, velvets and velveteens has been totally banned and drastic cuts have been effected on many items of consumer interest, such as, wines, whisky, sheet and plate glass, time-pieces, etc. Import quotas of established importers have been scaled down in the case of a number of other items whose indigenous production has gone up. These items include pipes or tubes flexible. malleable iron pipe fittings, cast iron pipe fittings, iron and steel wire ropes, boot and shoe grindery, copper manufactures, brass manufactures, leather belting, electric insulations, house service meters, industrial and street light fittings, paste board, mill board, water meters, vulcanised fibre sheets, certain chemical items such as hydrosulphite of soda, bleaching powder, calcium carbide, textile preservatives carboxy methyl, acetic acid, anhydrous ammonia, certain items of motor vehicle parts such as gaskets, radiator assembly, shock absorbers, piston assemblies, piston rings, thin walled bearings and certain items of drugs and medicines. The quota for raw films has been reduced from 66-2/3 per cent Gen. and 66-2/3 per cent Soft to 50 per cent Gen. and 50 per cent Soft. Newsprint imports have been reduced by 10 per cent.

Although the quota for drugs and medicines n.o.s. has been scaled down, a provision has been made according to which quota licences issued for specified items can also be utilised for imports of drugs and medicines not otherwise specified so that adequate quantities of drugs and medicines may still be imported within the lower cost ceiling. The reduction in the quota for raw films has been effected on an understanding with the film industry which has shown its willingness to reduce the length of films. The industry, it is said, has voluntarily fixed the following ceilings on the length of films: Bengali films 12,000 ft. Hindi films 13,000 ft.; Tamil films 15,000 ft. Cut in newsprint imports also is not envisaged to hit the newspaper industry; the gap will be made good by indigenous production. Reduction of established importers' quota in the case of some items to nil also does not mean that a total ban on these imports has been imposed. Imports of some items in this category, for instance palm oil, will be effected through other means.

ACTUAL USER LICENSING

With a view to make adequate provision to sustain industrial activity and to ensure adequate utilisation of the country's industrial potential, the list of items for which actual user licensing will be undertaken has been expanded to include calcium molybdate, molyte and other molybdenum products, ferro tungsten, ferro-molybdenum, ferro-titanium, ferro-phosphorus, ferro-calumbium (also known as ferro-nibium), ferro-selinium, silico-manganese, silico-spiegel, feero-silicon zinconium, ferro-boran, panel pins of size 1" and below, ball bearings of 1" in bore internal diameter and below, knitting machines (including hosiery machines and embriodery machines) etc. for replacement purposes, cam Dobbies, linen thread, cadmium carbonate, cadmium chloride, cadmium iodide, cadmium nitrate, cadmium oxide. cadmium sulphate, compounded nickel, electroplating salts like Albo Wivo, Hexa-volt etc., potassium permanganate, sillica gel, tyre retreading moulds, synthetic ion exchange resins for softening and demineralising of water and other liquid.

The basic period for fixing quotas has been extended to include the year 1957-58 in the case of powdered milk containing not less than 18 per cent cream intended for infant feeding and tape and wireless recorders, all sorts (import of magnetic tapes, magnetic perforated films, spares and recording wire only is permitted). In the case of some items such as solubilised Vat dyes other than banned types, wheeled and Crawler tractors above 50 D.B.H.P., shovels, excavators, motorised graders, vibrating soil compactors, vibrators, stone granulators, tar and bitumen boilers sprayers, core drilling machine, concrete mixers, asphalt mixers, and mortar mills, and some motor parts, the basic period has been extended to include the year 1958-59.

QUOTAS INCREASED

Quotas for the import of spare parts of sugar manufacturing machinery and spare parts of earth-moving machinery have been slightly increased. The face value provisions for the import of certain items such as bolts and nuts, ball bearings, garage tools against licenses for certain machinery items have been liberalised.

Some more items have been brought under Export Promotion Scheme. Imports of (a) abrasive grains. glass paper, felt bob and putty powder, (b) essences, (c) graphite, (d) polishing rouge, (e) art silk yarn not less than 300 D and asbestos mantle yarn, (f) hemp twine, and (g) fishing hooks will be allowed against exports of (a) monumental stones and granite slabs, (b) vegetable and food products, canned or bottled (other than mango chutney), (c) pencils, (d) lenses, (e) gas mantles, and (e) shark fins and fish maws.

The period of validity of licences has been extended in respect of motor vehicle parts and films made from transparent cellulose or viscacella. The period has been extended from nine months to twelve in respect of the former and from six months to nine in respect of the latter.

Imports of mercury will be canalised through State Trading Corporation. This has been done to reduce speculative spurt in its prices. The Pakistan OGL has been extended for a further period of six months.

With a view to curtailing procedural delay in the issue of licences, the scheme of "Repeat" licensing introduced during the period October 1959 — March 1960, is being continued during the period October 1960 — March 1961.

ANNOUNCEMENT INCOMPLETE

A spokesman of the Ministry of Commerce and Industry, explaining the new import policy, pointed out that the cuts in the quotas of established importers will save the country about Rs. 3 crores. The overall effect of the policy, however, is not yet clear for import programme for 20 items has still to be finalised. These items are: card clothing and card accessories; dates; cardamoms; cassia and cinnamon; cloves, all sorts, whether ground or unground; nutmegs; mace; betelnuts; cork manufactures, not otherwise specified; printing paper; paper including poster and stereo and all coated paper except art papers, all sorts not otherwise specified excluding cigarette paper and packing and wrapping paper; filter paper; packing and wrapping paper; cotton yarn of 80 counts and above; photographic negatives and printing paper — excluding X-ray films; watches; giant motor, motor cycle and bicycle tyres and tubes and flaps and solid tyres, but excluding tractor and off-the-road tyres and tubes; diamonds unset and imported uncut, excluding bort and industrial diamonds; wheeled and Crawler tractors upto and including 50 D.B.H.P.; surgical instruments; apparatus and appliances, not made mainly of rubber and also not made mainly of glass; machine tools (for established importers).

The policy in regard to these items will be announced only after the return of the Finance Minister, Mr. Morarji Desai, from United States when the results of the deliberations of the "Aid-India Club" will be clearly known. Last week-end's announcement is aimed at keeping the economy "ticking" and allows for "some expansion" within the foreign exchange resources available.

Imports during the first seven months of the current year totalled Rs. 613 crores and exports Rs. 408 crores, leaving a trade deficit of Rs. 205 crores. The deficit for the full year is, however, expected to be no more than for 1959, namely Rs. 264 crores. The outlook for the remaining five months is considered 'hopeful' because of the seasonal spurt in exports towards the end of the year.

A pertinent comment heard in the Capital on the import policy of the Government of India is that whereas every six months the Ministry of Commerce is called upon to cut down imports even of such items as the life-saving drugs, the Ministry of Industry has been allowed to go on merrily licensing industries which do not form the core of the development plans. Again, some of the Union Ministries are also allowed to go in for programmes involving quite an appreciable amount of foreign exchange, which the country can very well postpone for a future date. In this connection it is pointed out that railways can go slow with the dieselisation programme of theirs and establishment of more than one atomic power station can be deferred for some time. It is high time, it is stressed, that not only import policy but industrial expansion should also be linked to the availability of foreign exchange.

JUTE GOODS EXPORT OUTLOOK

Considering the present trend, it is expected that exports of jute goods from this country this year will be maintained at a slightly higher level than last year. Exports during the first six months of the current year amounted to 39,202,000 tons as against 37,607,000 tons during the corresponding period last year. Compared to the period July to December, 1959, exports in the first half of the current year were down by 88,480 tons, but this comparison is not of much significance because of the seasonal influence; exports during this period always are on the high side. Exports of hessian and "other" jute goods have registered a significant rise, those of sacking having registered a slight fall. In terms of value, exports of jute goods in 1959-60 amounted to Rs. 111.92 crores, as against Rs. 101.91 crores in 1958-59. Higher jute goods prices since December, 1959, have resulted in a comparatively better return at Rs. 30.58 crores in the first quarter of this year.

Traditional buyers of Indian jute goods, especially in the USA, are said to have reacted adversely to the renewed evidence of price instability after almost a year of comparative quiet; the current prices are considered to be rather high in view of the fact that the main virtue of jute fabrics is their cheapness, and jute bags have to compete with paper bags and bulk handling in the industrially advanced countries. Restoration of price stability around lower levels is considered to be essential if the Second Plan target of 900,000 tons of jute goods exports annually is to be achieved.

Among the factors which have been helpful in increasing exports of jute goods in the recent past are recovery in the off-take by Argentina, entry of Japan into the Indian market for the first time with the half-year off-take of 5,000 tons, and increased shipments to Belgium, West Germany, Egypt and Sudan. China and U.S.S.R. have maintained their off-take. There has been a decline, on the other hand, in the shipments to some other important markets such as Australia, UK and USA. There has also been a drop in exports to East and West Africa. This has been largely due to high prices of Indian goods and greater competition from Pakistan.

The last few months have witnessed distinct revival of the jute goods industry on the Continent. The UK industry, which substantially increased its production in 1959, does not appear to have suffered any ill-effects from the reduction in the protective "mark up". The French industry, whose production was declining in 1959, has since staged a recovery. West Germany has stabilised its production, while liberalising its imports. Belgium continues to hold its share of the American market for carpet backing and its production in 1959 was well above the 1958 figure. Japan is understood to be increasing its loomage to meet the growing domestic consumption.

India's main competitor, Pakistan exported during the year ending June last an estimated 1,96,800 tons of jute goods as against 1,37,300 tons and 1,03,000 tons in 1958-59 and 1957-58 respectively. Pakistan's exports to UK, Australia, Cuba, Burma, Argentina, and East and West Africa have shown improvements in 1959-60 over the previous year's figures, whereas India's exports to these countries have declined.

Out of approximately 8,000 looms installed in Pakistan, about 7,800 are said to be presently in regular operation, most of them working on 2 and 3 shifts. The Pakistan Industrial Development Corporation has plans to install 4,000 more looms in the next two years.

WIDE HESSIAN

In India, wide hessian which is exported to USA, for use in making tufted carpets, has done well both in production and exports. Exports of this rose from 20,000 tons in 1958-59 to 30,000 tons in 1959-60. Exports of cotton bagging, a low cost wide-mesh fabric used in USA, went up from 30,000 tons in 1958-59 to 45,000 tons in 1959-60. Other specialities have more or less maintained their position, except twine whose exports have declined sharply because of competition from Pakistan. At the end of 1959, 521 broad looms had been installed in the Indian jute industry. This figure has since risen to 676. Another 190 such looms are to be installed shortly.

The world demand for jute goods in 1960-61, on present indications, is expected to be maintained at or above the previous year's level.

The fourth delegation of the Indian Jute Mills' Association to USA and Canada, which visited these countries in October and November last year, has exphasised the primary importance of maintaining burlap prices in line so that burlap can compete favourably with paper in the bag market. The delegation anticipates a further, though slower, growth in the demand for wide hessian and considers that there should be a growing market for burlap luminated with other materials. The Indian Jute Mills' Association proposes to send another delegation to the USA in the coming winter. This delegation will also visit Argentina.

RAISING COKING COAL OUTPUT

Impression appears to be gaining ground here that in order to step up coking coal output, the Government of India may have to slightly increase its prices. Knowledgeable circles reveal that if coking coal is not available from new mines in substantial quantities or, alternatively, production from the existing mines in Jharia does not increase, the Government may be compelled to readjust its steel production programme under the Third Five-Year Plan.

LICENSING OF FERTILIZER FACTORIES

The Government of India, it is understood, is planning to introduce ordinary system of licensing for

Shakespeare once observed "Beauty is an innate craving of man—so he seeks to dwell in lovely parts of the creation." No age has ever been immune to this captivating spirit of Beauty, the balm of life. Even mother Sita of our epic age fell a victim to the attractions of beauty when she noticed an illusory golden deer, and longed for having it, which resulted in the out-turn of a chain of momentous events in the social life of that epic age.

The Deer is virtually a charming and comely animal which infatuates a man at the very glance.

We do admire this instinct of man and offer our ocean deep ovation for the same. Hence, we have chosen deer as a symbolising brand for our cloth of varying varieties so exquisite, enduring and of so endearing a price.

Our Specialities are:

PRINTS, SHIRTING, COATING, LENOS,

FLANNEL and TOWELS, etc.

the establishment of fertilizer factories in the private sector. Some applications, it is expected, will be considered at the meeting of the Licensing Committee to be held shortly.

As already reported, the Government is contemplating fixing of a retention price for fertilizers to be produced both in the public and the private sectors. It is presumed that this retention price would not be below the level at which fertilizers produced by the public sector units are sold.

IMPRESSIONS OF DR. PAUL KREBS

Views of Dr. Paul Krebs, who visited India and Pakistan early this year as Economic Adviser to Dr. Hermann Abs, one of the three members of the International Economic Mission—popularly known as the Three Wise Men Mission—on the future economic development of the Indian sub-continent, make an interesting reading. Dr. Krebs has made a powerful plea for increasing economic aid from the Western countries for this region. In particular, he has urged for more West German capital investment in India.

The following are some extracts from his report:

"Whatever happens in India and Pakistan in the years to come will have its profound effects, both countries being, politically as well as economically speaking, two of the most important developing countries, and by the number of their inhabitants being foremost among the non-Communist States in the East, upon practically all other countries of the Far East. A decisive reversal of these two countries' political course, for instance in the direction of Communism, will, to say the least, have a strong influence also on the Near and Middle East as well as on Africa."

"India and Pakistan together have a population of about 500 million, and this population is increasing each year by about 10 million souls. Economic development in Pakistan, and particularly in India, is far more advanced than in Africa, barring the South African Union, and other overseas areas. Both countries, therefore, constitute an enormous potential market for the sale of our own industrial manufactures and those of our Western neighbours. For the present and for some years to come, one has to admit that the purchasing power, and thus the potential demand for investment and consumer goods in these countries, admittedly still is and will be far beneath our own level, even beneath the level in countries like Brazil and Argentina....In addition, difficult foreign exchange problems will continue to call for artificial restrictions as to normal imports, especially consumer goods imports....Despite all the difficulties which India and Pakistan are having to fight, I venture to predict that in the not too distant future —in India I should say in no more than 15 to 20 years, and in Pakistan a generation from now at the earliest— the effective, realizable demand for commodities will have become substantially greater, provided, however, that the necessary volume of financial aid and technical assistance expected from friendly nations, combined with energetic efforts on the part of both these developing countries, is forthcoming at the right time and is economically and otherwise suitably applied so as to ensure that economic growth is organic and befitting the local circumstances."

"First and foremost both countries must concentrate all their energies on increasing the volume of agricultural production. This, by itself, is an enormous task in which the human factor plays a commanding role, and it would be fatal if both Governments were to give way to the temptation to rely on the delivery of American surplus food and neglect their own agricultural programmes."

WHY RAPID DEVELOPMENT?

"It may seem regretable for many reasons that India and Pakistan are trying to force ahead industrial development in relatively too short a time. On the other hand, we cannot but admit, after having studied the conditions in these two countries, that they have no choice but to enter this field. I shall try to explain to you why the Western world must become more active, but also more sensible than before, in promoting industrial development in these and other areas. In Western Germany we must do so in our own interest, so as not to lag behind our competitors. I am far from denying that many objections might be raised against the development plans of the pre-industrialized countries, for instance against those conceived in Pakistan and India, both as regards their nature and organisation and the speed at which the various projects are to be realized. But, if my prognosis is correct, 15 or 20 years are only just sufficient for a fundamental and systematical preparation in developing these future markets which are being studied with increasing attention and coveted by other countries, particularly Great Britain and the USA."

"The general conditions in India and Pakistan, their raw material resources, their economic problems and needs, certainly differ in many respects from those in other developing countries. This must be taken into account in judging the situation and the nature and measure of foreign assistance. It is necessary, therefore, to make a careful study of each individual developing country before undertaking to carry out an assistance progremme. This applies both to State assistance and private capital exports, either in the form of capital goods deliveries or by direct investment in agencies or manufacturing plant."

"Apart from these differences, practically all of the important developing countries, barring those like Brazil where the agricultural and industrial potential is in an advanced stage already, are faced with certain identical or at least similar problems. The first and foremost is the necessity to produce sufficient nourishment for populations which are growing at a terrifying rate in many developing countries, especially India and Pakistan. In the second line, the populations must be provided with other bare necessities without which life is not worth living, that is proper clothing, simple consumer goods, adequate housing, electricity, and last but not least education and technical training for as many people as possible, so that they are fit to be employed in the administration, in agriculture and industry."

"ON THE SPOT" ASSISTANCE

After discussing the changes brought about by partition in the economies of India and Pakistan, Dr. Krebs says: "It is true that here assistance has been granted by the West in many respects, not in the least by the Federal Republic of Germany and a number of large German concerns. But, if economic development is to proceed according to plan, assistance of this kind (technical and material assistance for both industry and agriculture) must become considerably greater, particularly on the spot."

"After Independence in 1947, the old, qualified personnel in India and Pakistan had to cope with a specific handicap in that they, first of all, had to become accustomed to their role as 'masters of their own house'. From one day to the other they were confronted with the task to make decisions in particular when sudden difficulties arose, and to train young people to succeed them in the administration and in business. This process of adaptation will take some time yet to be completed. It is held back by the typically oriental aversion with respect to systematical work and personal initiative, which contrasts with a natural disposition in these parts to make great plans. The philosophy of the man in street, especially the villager, who is always looking more or less towards the next world and believes in predestination, makes it very difficult to induce people to work more and accept modern economic prin-

ciples and production methods. Therefore, one of the chief questions which the Mission repeatedly put to Ministers of State and officials, particularly to the planning authorities, was: 'Are you willing and able to enforce your economic plans in the rank and file, so to speak, that is among the peasants in your villages and the workers in your factories? Provided you receive adequate foreign assistance, will you succeed in taking proper precautions at the right time and in the right place to give your people suitable training in agriculture and industry, procure raw materials, fertiliser and insecticides, seed and credit, so that your plans may be carried out in time?' The fate of both countries, Pakistan perhaps more than India, and the perpetuation of their present political structure largely depend on an affirmative answer to this question."

LESSON LEARNT FROM EARLY MISTAKES

"As a result of our conversations, and after visiting farms, factories and training establishments, we are convinced that responsible quarters in both countries are fully aware that this problem is eminently important. Former mistakes of economic policy, especially in the field of agriculture, have taught a good lesson." (Here Dr. Krebs makes mention of the steps taken by the two countries to improve their agricultural economy).

"The mistakes which both countries made in former years, among other circumstances, gave rise to a serious balance of payments crisis in 1957-58, produced mainly by (1) an inordinately liberal import policy, and (2) excessive investments which had to be financed largely by 'deficit spending', the foreign exchange requirements of which had to be met by drawing on the foreign exchange reserves, the measure of domestic savings and income derived from taxation and foreign aid having been grossly overrated. The crisis was aggravated by a very unfavourable development of the 'terms of trade' and crop failures. As a result, the foreign exchange reserves of both India and Pakistan, which had been substantial after World War II, were reduced to a hardly bearable minimum. The more lavish money supply, which was not supplemented by a proportionate rise in the supply of commodities, brought forth inflationary tendencies, particularly in Pakistan. Here the bottom of foreign exchange reserves was touched at about $260 million. In India the lowest point was reached at about $640 million, which is almost unbearable considering the substantial dependence on imports, the relatively small volume of exports, and the large volume of indebtedness towards foreign creditors. Since that time exchange reserves have gone up slightly thanks to import controls and other restrictive measures."

"I am aware that complaints are frequently made about the lacking qualification of entrepreneurs and technical personnel in India and Pakistan. Other difficulties, too, have prevented German firms from acquiring an interest in manufacturing and other businesses in these countries. But, as experience shows, suitable partners can be found there provided that careful and patient investigations are made. Consultations with local credit institutes, development banks, chambers of commerce, and the like will eventually lead to satisfactory results. Institutions have been established recently both in India and Pakistan whose purpose it is to make it easier for foreign investors to prepare and carry out private investment projects. The Bankers' Mission found that in almost all of the places they visited new consumer goods industries have been built up with foreign technical and capital aid. Nearly all of them operate to full satisfaction and show good profits in spite of relatively high taxes."

"As far as India is concerned, which is much more advanced industrially than Pakistan, and if suitably assisted might take the hurdles much faster than her neighbour despite the present problems and difficulties, our need to think differently is even more acute. So far, German private investments in India's industries are negligible compared with those of Great Britain and the U.S.A. Today India has much more positive and flexible attitude toward private foreign participation than a few years ago. That this country, like Pakistan, desires to attract foreign capital, the Mission were able to find out on their visit. In both these countries considerable tax reliefs, whilst still inadequate, are now being granted to new manufacturing concerns which come under the Five-Year Plan. Such relief will enable foreign investors to survive the initial operating years with a minimum of tax burden."

"Competent personalities in India, too, gave us the impression that they seriously intend to take the lesson of past mistakes. We found that the Third Five-Year Plan, which is to begin in April, 1961, is first and foremost intended to raise the volume of agricultural production. By increasing the grain crop from 75 to 105 million tons the country is to be made independent of imports within the five years. Top priority is given to investments in the fields of water and power supply. fertilizer and insecticide production, irrigation, drainage, and communications. Certain industrial projects may seem out of proportion and over-hasted. In this respect, matters must be corrected as far as possible in co-operation with the assisting countries. However, contrary to the opinion of many critics, the proposed extension of iron and steel capacities and the industries needed to improve iron and steel output, which is already proceeding, partially with Soviet aid, would seem logical and right for the above mentioned reasons. However, measure and timing of these investments require careful examination on the basis of a correct estimate of the requirements, the available economic and manpower resources as well as transport facilities."

"Contrary to other developing countries which are carrying out or are contemplating steel projects on a large scale more or less for ambitious reasons, India has sufficient and easily accessible ore and coal resources. Nor must we forget that India can produce steel cheap, cheaper than the West. In the meantime, the domestic demand for iron and steel has grown so considerably in many sectors that the country is forced to meet these requirements by extending the capacities, because it is impossible for foreign exchange reasons to satisfy the demand by importing steel."

A NOTE OF CAUTION

"But, India, too, ought to realize more readily than is the case here and there that precautions must be taken in time to assure that the development plans are carried right down to the front, that is in the Provinces and in the last village. Good beginnings have been made, but they are not anything like adequate to enable the envisaged increase in production to materialise within a short time. In India many believe the country already has enough technical and managerial personnel to operate existing and new factories. This is a grave mistake. Though both in India and Pakistan workers today, if properly trained over a number of years, are able to attain about 90 per cent of the European workers' productivity (this we were able to prove in quite a number of well-managed enterprises), this will only be possible as far as new factories are concerned, if foreign countries do their share in providing qualified workers and managers and in training local personnel. A contribution of this kind on our part is one of the chief conditions for sound industrial development, and one should not hesitate to explain this over and again to Government agencies and business partners in India and Pakistan."

DELEGATION TO GATT

The Indian delegation to the forthcoming meeting of GATT, it is learnt, will be led by Mr. N. Kanungo, Minister for Commerce in the Union Government. Other members of the delegation will be Mr. T. Swaminathan, Mr. D. C. Joshi, Mr. G. L. Bansal and Mr. M. G. Mathur (from the Ministry of Commerce and Industry).

PUBLIC DEPARTMENT

COMPANY AFFAIRS

THE KHATAU MAKANJI PREPARES FOR RENOVATION

Although there was a shortfall in the output of indigenous cotton, the supply was made good by imports. As is revealed by the results of the Khatau Makanji Spinning and Weaving Company Ltd., the additional supply of foreign cotton, which was made available at a premium of 20 per cent under the export incentive scheme, expanded the company's manufacture of superfine varieties to meet the growing demand in the market. During the year to June 30, 1960, the company made a net profit of Rs. 72.73 lakhs out of which Rs. 34.20 lakhs were transferred to provision for taxation and Rs. 17.52 lakhs to general reserve. The directors have recommended the payment of dividend, subject to appropriate reduction of tax, at the rate of Rs. 5.71 per share on preference shares which gives 4 per cent free of income tax. On ordinary shares the dividend proposed is at the rate of Rs. 32 per share.

An estimate of company's preparedness to bring about renovation can be made from the fact that new machinery of the value of Rs. 26.34 lakhs was received during the year. Orders for new machinery of the value of 59.03 lakhs for replacement and renovation were placed.

MYSORE SPINNING'S SATISFACTORY RECORD

The annual report of the Mysore Spinning and Manufacturing Co. Ltd. reveals that efforts are being made to stream-line the mills of the company with a view to bring about rehabilitation and renovation. The company has purchased from Minerva Mills Limited their Bleach and Dye House and adjuncts, together with the dyeing and bleaching machinery for a total consideration of Rs. 8.8 lakhs in order to develop it into a full-fledged and up-to-date Processing Factory for carrying on joint operations of bleaching, dyeing, mercerising and printing of cloth of both the Mills more efficiently and economically. Following the programme of renovation and expansion, the company has received under the export promotion scheme permission to instal 144 automatic looms. The company is also received permission to instal a Waste Spinning Plant which could spin the soft wastes of its mills as also of Minerva Mills Ltd. which, at present, have to be sold in the market. A licence has also been received for the import of new Whitin Combers from the U.S.A.

To finance a portion of the above capital expenditure the company proposes te issue further equity capital to the extent of Rs. 9.93 lakhs and offer the same at par to the existing shareholders in the proportion of one new ordinary share for every three ordinary shares held on a date to be decided upon later by the Board of Directors.

During the year to Feb. 29, 1960, the company made a profit of Rs. 7.35 lakhs. After making certain adjustments Directors have proposed to transfer Rs. 3.5 lakhs towards machinery rehabilitation reserve. Dividend at the rate of Rs. 7 per share of Rs. 50 each less income-tax is proposed to be paid on ordinary shares. Another dividend of Rs. 2.25 per share (less tax) is proposed to be paid on 4½ per cent cumulative preference shares of Rs. 50 each.

KINNISON JUTE'S FINE PERFORMANCE

The chairman of the Kinnison Jute Mills Co. Ltd. in a statement has pointed out that the current year has been a reversion to the unhappy state of affairs. The quality of the 1959-60 crop was not up to the standard of 1958-59. In view of the fact that U.S. consumption was maintained at a high level, world offtake considerably improved. With the demand for goods and the satisfactory stock position in Calcutta the I.J.M.A. in its efforts to increase exports decided as a first measure to unseal one per cent of its loomage as from May 2, 1960. But the short raw jute crop and tight situation for fibre which developed made further unsealing impracticable. In order to meet the need of the industry and also with a view to curbing speculation in raw jute and manufactured goods the Government of India made licences available for the import of jute cuttings from Pakistan.

The Directors of the company appear to be quite conscious about the needs for modernisation. They have pointed out that despite the growing scale of indigenous manufacture, there will always be necessity for the import of certain types of machinery.

During the year to March 31, 1960, the company made a profit of Rs. 34.70 lakhs which shows a fair amount of improvement over the previous year's results. After providing Rs. 7.94 lakhs for depreciation, Rs. 6.64 lakhs for taxation and Rs. 3 lakhs each for machinery replacement reserve and general reserve, there is a sum of Rs. 13.94 lakhs at the disposal of the directors. An interim dividend at the rate of 3½ per cent on cumulative preference shares and Rs. 7 on each ordinary share was declared on June 13, 1960. Now the directors have proposed the payment of a final dividend at the rate of 3½ per cent on cumulative preference shares making the total of 7 per cent and Rs 13 per ordinary share making a total of Rs. 20 per annum.

WANTED

MANAGER TO TAKE CHARGE OF THE ENGINEERING DIVISION OF A LARGE ALL INDIA COMPANY, INCLUDING THE SALES ORGANISATION OF THE PRODUCTS OF ITS SUBSIDIARY MANUFACTURING UNITS

ONLY APPLICANTS HAVING DRAWN MORE THAN RS. 2,500/- WITH GOOD BUSINESS EXPERIENCE, PREFERABLY WITH ELECTRICAL AND MECHANICAL QUALIFICATIONS, WILL BE CONSIDERED. AGE BETWEEN 40 AND 50.

APPLY WITH FULL DETAILS OF QUALIFICATIONS TO THE ADVERTISER C/O THE EASTERN ECONOMIST LTD., P.O. BOX NO. 34, NEW DELHI.

COMMODITY NEWS AND NOTES

U.K. SIGNS INTERNATIONAL COFFEE AGREEMENT

Britain has signed the International Coffee Agreement for the "coffee year" in respect of Kenya, Uganda and Tanganyika. The signing took place in Washington on September 26 at a meeting of the Board of Directors of the International Coffee Agreement. Under the agreement, Kenya, Uganda and Tanganyika will have an export quota for the year of 2,380,000 bags of coffee beans. This is 200,000 bags less than the first estimate of exportable production. If the estimate is revised upwards in March 1961, then the quota will be increased by the same amount as the estimate is raised. The announcement goes on to say that although the three East African territories voluntarily restricted their exports last year by a unilateral declaration, they had not hitherto accepted the obligation of full membership of the agreement. They will now play a full part in the agreement for the coming year. The announcement ends by saying that the decision to accede to the agreement in 1960-61 and to accept the quota on exports "was taken in a spirit of international co-operation and understanding of the problems of other major coffee-producing countries, as well as in the light of East Africa's own problems."

WORLD RICE PRODUCTION

World production of paddy in 1959-60 is now estimated at the record figure of nearly 139,000,000 tons, according to the latest report of the Commonwealth Economic Committee. "The current crop has, however, been adversely affected by weather conditions in a number of Asian countries," the report adds. In a general review, the report says: "Exports of rice so far this year have been nearly half as great again as in the corresponding period of 1959, Burma, Thailand, South Viet-Nam, and the United States all showing a substantial increase. Thai rice prices hardened during the month ending mid-August, heavy sales being followed by a restriction on exports from September; Cambodian prices also continued to rise." Giving details of weather damage to the current crop, the report says: "In India, heavy flooding has been reported in Orissa, although damage to crops appears less than apprehended; insufficient rain in East Pakistan at planting time has, however, reduced the autumn crops by about one-third (details of the main winter crop are still to come). "Planting conditions in Burma were favourable and, despite some shortfall in rain thereafter, an increase in production is looked for, as a result of the reclamation and improvement schemes which have permitted an increase in the area sown; plantings in Thailand were delayed by lack of rain, but the acreage was expected to equal that of last year."

Favourable weather in Japan has encouraged hopes of another record crop, but because of heavy rains the Philippines crop is expected to be somewhat below that of last year; Formosa's crop suffered from a typhoon, while in South Korea crops have suffered from drought followed by a typhoon. Burma exported 1,208,000 tons (about half-a-million tons more than in the corresponding period of 1959) during the first half of this year. India took more than in the whole of last year; consignments to Ceylon rose by nearly one-half.

SUGAR PRODUCTION AND STOCKS

According to the Indian Sugar Mills' Association the total sugar production for the season 1959-60 upto 31-8-60 was 24,05,000 tons as against 19,10,000 tons produced last season by this date. The off-take of sugar from factories during the month of August, 1960, was 1,76,000 tons as against 1,66,000 tons during the corresponding period last season. The total despatch upto 31st August, 1960, was 16,68,000 tons as against 17,43,000 tons by the same date last season. The total closing stock of sugar with factories on the 31st August, 1960, was 8,94,000 tons as against 5,06,000 tons on the same date last season.

ASBESTOS DEPOSITS IN ANDHRA PRADESH

Reserves of 256,200 tons of asbestos in the Brahmanapalle and Chinnakudala belts in Andhra Pradesh have been estimated by the Geological Survey of India. The reserves, which lie within a depth of 660 feet along the dip slope, are of high grade and chrysotile variety. India produced 9,666 metric tons of asbestos during 1950 to 1959. The produce was exported to United Kingdom, Thailand, Japan, Belgium, Italy and West Pakistan. The value in terms of rupees from the exports during 1951 to March 1960 is of the order of 23,35,000. Of the produce the quantity utilised in the manufacture within the country is estimated at 13,354 and 22,745 metric tons during the years 1958 and 1959 respectively.

DISCOVERY OF THE SINGRAULI COALFIELD

Nearly 676 million tons of coal in two seams with an area of 6.3 square miles in the Singrauli coalfield in Madhya Pradesh have been proved by the Geological Survey of India. The recently discovered Singrauli coalfields extend over an area of 800 square miles in the State of Madhya Pradesh. The geology of the area indicates that the seams are likely to extend over a larger area and, therefore, the potentiality of the coalfield as a whole is considered fairly substantial

NOTICE

Extension of date for submission of coupons and applications in respect of new Ordinary Shares

Notice is hereby given that the extended period for submission of coupons in respect of the new Ordinary shares in terms of the Company's Circular dated the 12th October, 1959, expires on the 29th September, 1960. As some shareholders have not yet exercised their right to obtain shares by submitting the requisite new Ordinary share coupons, the Directors have extended the period for submission of such coupons to 31st December, 1960, and the Company's bankers have accordingly been authorised to receive applications on and after the 1st October, 1960, up to but not later than the 31st December, 1960, in respect of such coupons provided that along with each such application with the required coupons and the moneys to be received with such application interest at the rate of 9% per annum (which the Directors have decided to charge) shall be paid to the Company's bankers as under:

(i) For applications with new Ordinary share coupons from **resident** shareholders from 16th December, 1959, to the date of payment; and
(ii) For applications with new Ordinary share coupons in the case of non-resident shareholders from 1st June, 1960, to the date of payment.

The Directors have also resolved that the last date for receiving applications in respect of new Ordinary shares from the non-resident shareholders which was 29th September, 1960, be extended up to 31st December, 1960, provided that along with each application and the moneys to be received with such application interest at the rate of 9% per annum thereon (which the Directors have decided to charge) from 1st April, 1960, to the date of payment shall be paid to the Company's bankers.

No applications received from resident shareholders on and after the 16th December, 1959, and from non-resident shareholders on and after the 1st June, 1960, in respect of new Ordinary share coupons and no application received from non-resident shareholders on and after the 1st April, 1960, in respect of rights to new Ordinary shares will be entertained by the Directors unless interest is paid as aforesaid. No such application will be entertained after the 31st December, 1960.

The above extension of date does not apply to applications in respect of "A" Second Preference shares or "A" Second Preference share coupons, the last date for submission of which was 29th July, 1960.

Dated at Bombay this 28th day of September, 1960.

By Order of the Directors,
For and on behalf of
The Tata Iron and Steel Company, Limited,
Tata Industries Private Limited,
Managing Agents,

J. J. Bhabha
Agent.

Company Meeting

INDUSTRIAL FINANCE CORPORATION OF INDIA

Speech delivered by Shri K.R.K. Menon, Chairman, Industrial Finance Corporation of India, at the Twelfth Annual General Meeting of the Corporation held on the 24th September, 1960.

Gentlemen,

I have pleasure in placing before you the Annual Accounts of the Corporation and the Report of the Board of Directors for the year ending 30th June, 1960. Printed copies of the Accounts and of the Report are before you. These have also been circulated to all the shareholders. I shall, if you agree, take them as read.

2. The year that has passed has been a noteworthy one for the Corporation from many points of view. Our gross profit for the year came to Rs 2 crores 50 lakhs, which represents an increase of nearly 25% over that of last year. Our reserves now exceed Rs one crore, after finding a sum of the order of Rs 50 lakhs to meet a bad debt that we wrote off in 1957. We have put away Rs 10 lakhs this year also towards repayment of the Government subvention received in the past, and I confidently hope that the balance of our debt to the Government on this account, which now stands at Rs 28 lakhs, will be repaid in the course of the next three years, if not earlier. The total amount of loans approved by your Board of Directors during the year aggregated Rs 17 crores 92 lakhs, out of which final sanctions were issued for Rs 9 crores 15 lakhs, the balance Rs 8 crores 77 lakhs having been held over pending receipt of Government's orders. The total amount approved by us during the year, viz., Rs 17 crores 92 lakhs, besides being a very big advance from our last year's figure of Rs 3 crores 79 lakhs, is also better than the highest figure ever reached by us previously, viz., Rs 15 crores 18 lakhs in 1955-56. Progress was made in the field of underwriting also, the total for the period ending 30th June, 1960, being Rs 1.87 crores. And last, but not least, during this year, our efforts, dating from as long ago as 1951, to obtain credits in foreign currency, were crowned with success with the sanction by the DLF of the United States Government of a loan of 10 million dollars to us towards the end of the year for being sub-loaned to industrial concerns in this country.

3. Loans continued to constitute the bulk of our business operations. We had reached in 1955-56 what till now has been the peak, viz., Rs 15 crores 18 lakhs. It will be recollected that this figure represented a marked advance on the previous two years' figures of Rs. 7 crores 34 lakhs and Rs. 5 crores 27 lakhs respectively. The peak year of 1955-56 was followed by three years of steady fall—11.91 crores in 1956-57, 7.79 crores in 1957-58 and 3.79 crores in 1958-59. It is all the more gratifying therefore that this has been followed in 1959-60 by the remarkably steep rise to Rs. 17 crores 92 lakhs. It is noteworthy that this phenomenal improvement in our loan operations during the last year, though it partly reflects the strident advance in industrial production that has been taking place recently, cannot be attributed to any easing in the foreign exchange situation or the liberalisation to any appreciable extent in the licensing of the import of capital goods in that year. Out of the Rs. 17 crores 92 lakhs mentioned by me, only Rs. 5 crores 68 lakhs represent loans to concerns which obtained import licences during the year 1959-60; Rs. 1 crore 46 lakhs represent loans to concerns which had obtained import licences in previous years. The balance, Rs. 10.78 crores, is, in the main, accounted for partly by loans to concerns who were to utilise our rupee loans for obtaining foreign currency credits from the Central Government or directly from foreign financial institutions, and partly by loans to concerns—mostly sugar co-operatives—the large bulk of whose capital goods requirements were planned to be obtained by indigenous fabrication. This latter factor has indeed been a very welcome development, particularly the institution by Government of the consortia for the manufacture of sugar factory machinery in the country. We in the I.F.C. may, I think, look forward with great hope to further and faster progress in this line in the period covered by the Third Five-Year Plan, in the confident expectation that we should thereby be enabled to play our part adequately in our function of industrial financing, in spite of the continued deficiency in foreign currency resources which has been the major obstacle in our way during the past few years.

4. I must, however, make it clear that impressive as has been our achievement in this regard in the past year, the picture that I should have been able to present to you today would certainly have been a very much brighter one indeed if only we had had a certain amount of foreign currency funds also at our disposal. In January, 1960, when we were negotiating for a foreign currency loan from the Development Loan Fund of the United States Government, the position was that, for want of import licences alone, loan applications aggregating Rs. 6.15 crores had had to be treated as withdrawn, and out of the remaining applications which we then had on our hands, there were applicants who were counting on foreign exchange credits of the total value of as much as Rs. 20.93 crores to be able to implement the schemes for which our financial assistance had been sought. These figures provide an index of the significance of the foreign currency component in the financing by our Corporation of large-scale industrial enterprises in India at present. Every little assistance in this direction helps, and we have therefore reason to be thankful to the Development Loan Fund authorities for the loan of Rs. 4.7 crores in U.S. dollars which they sanctioned to us in April this year. How much of a real need even this small loan has helped to serve can be gauged from the fact that already we have received requests for this entire amount, and we are hoping to process these before the end of a couple of months or so from now. Considering that there was a good deal of initial apathy to be overcome, arising from the fact that, except for individual loans not exceeding a hundred thousand dollars—which is less than 5 lakh rupees—loans from this D.L.F. credit can be availed of in dollars only, and must be utilised for purchase of capital goods exclusively in the U.S.A., I think we may rightly claim that we have made good and swift use of the facility already given to us. I confidently hope that this will pave the way for further credits from the D.L.F. in the future. I am also hopeful that, with the continued good offices of the Government of India, we should succeed in persuading the World Bank, at whose doors also we have been knocking persistently during the last few years, to give us a substantial loan in convertible foreign currency to meet the pressing needs of our constituents.

5. You will no doubt be interested to know what the main terms and conditions of the D.L.F. loan that we have already obtained are. Briefly, the loan will be available to the I.F.C. for grant of sub-loans to industrial concerns in the private sector in India for approved projects in any industry except textiles including manufacture of wearing apparel and made-up textile goods, ship-building, tobacco, beverages, petroleum refineries and hotels. Each specific project for which a sub-loan is given by us out of the D.L.F. credit will need to be approved by the D.L.F., if the sub-loan exceeds two hundred and fifty thousand dollars, which is roughly the equivalent of 12 lakhs rupees. The payment of the sub-loans will be made to foreign suppliers of capital goods, materials and services, on behalf of the loanee concerns in India, by arrangements made by the D.L.F. through a bank in the U.S.A. The sub-loans will be for periods ranging from 5 to 25 years according to the needs of the industrial concerns. Repayment will be made in Indian currency. Purchases of capital equipments, materials and services out of the sub-loans must, as already stated, be made in the U.S.A. only, except where the loan is for less than $100,000 in which case, purchases can be made in any country included in Code 899 of the International Co-operation Administration Geographical Code Book of the U.S.A. Government; this includes U.K. and most of the Western European countries. The sub-loanee, i.e., the Indian concern, will have to give an undertaking that the procurements of the capital equipments, materials and services are made in the U.S.A. or elsewhere, at reasonable prices approximating to the lowest competitive price having regard to quality, time, cost, delivery, etc.; this is certainly a wholesome provision which should curb any tendency towards extravagance. Cost of shipment of capital equipments and materials under sub-loans of amounts above $100,000 will be financed only if these are transported in U.S. vessels. 50% of the gross tonnage of such items will have, in any case, to be transported in privately owned U.S. commercial vessels if such vessels are not declared unavailable. Import duties, tariffs, etc., will not also be financed out of the sub-loans. The rate of interest to be charged by the I.F.C. on the sub-loans has not yet been decided, but it will not, under our arrangements with the D.L.F., exceed 8% p.a. in any case.

6. I will turn now for a moment to our rupee resources on which we have been wholly dependent up to the end of the past year. As I have stated in the Annual Report before you, we went in for a bonds issue again last year, and it proved to be a tremendous success, the required amount of Rs. 5 crores having been over-subscribed within a few hours of the list being opened. In accordance with the usual practice we retained an additional sum of Rs. 48 lakhs 87 thousand out of the total amount subscribed, which resulted in the total allotment aggregating Rs. 5 crores 49 lakhs. The bonds were for 12 years this time, as against 10 in the preceding year, and the rate of interest offered was 4% only as against the previous year's 4½%, the discount offered being also less, at 0.25% as against the previous year's 1%. I am sure you will share with me our gratification at this encouraging sign of public confidence. You will also be interested to know that, out of the sum of Rs. 5 crores 49 lakhs which was allotted in all, as much as Rs. 3 crores 81 lakhs were accounted for by allotments to the private sector alone, and Rs. 1 crore 68 lakhs to the Life Insurance Corporation of India.

7. Coming now to the distribution of our loan approvals as among the various industries, Sugar continued to take the first place in the past year also, followed by Paper and Rayon. It is to be noted that the bulk of the loans to the Sugar industry (Rs. 4.20 crores out of Rs. 5 crores) went to co-operative societies, the total amount of our loans to which now stand at Rs. 18 crores 89 lakhs distributed among 32 societies located in Assam, Andhra Pradesh, Gujarat, Maharashtra, Madras, Mysore, Punjab and Uttar Pradesh. Out of these 32 sugar co-operatives, 28 availed of loans to the extent of Rs. 14.11 crores. Of these, barring five which are still in the construction stage and one which has already repaid the loan availed of by it, the output of the remaining 22 during the year under review came to 2.45 lakh tons of sugar; this is equivalent to nearly 10 per cent of the country's entire production of sugar. The societies have put the loans advanced by us to proper use, and, in the matter of meeting their commitments relating to the payment of interest and repayment of principal, their record has been satisfactory, which is gratifying in view of the fact that quite a few of these societies are still in the initial stages of production and have had their share of the many teething troubles which beset newly set up factories.

8. In the matter of the actual drawal from us of amounts against loans approved there was appreciable increase during the past year, the total disbursements having aggregated Rs. 8.41 crores as against Rs. 7.48 crores of the preceding year. We continued to make interim payments against approved loans on the same liberal scale as we did in the past, and this has helped considerably towards eliminating the delays that usually arise in connection with the completion of legal formalities before loan documents are finalised. A sum of the order of Rs. 6 crores was paid out during the year under report by way of interim loans alone.

9. A larger percentage of loanee concerns was inspected in the course of the past year than in the previous one, and I am glad to say that in the case of the large majority of them we were completely satisfied with their progress in implementing their schemes and with their general financial position and the progress of their production. Quite a few of them also declared handsome dividends with our prior concurrence. The defaults committed by loanee concerns in the payment of interest and repayment of principal tended to come down further in the past year, the percentage being 1.2 and 4.3 as against 1.4 and 5.4 respectively of the previous year. I would add that, in spite of our vastly increased activities, our administration expenses were not allowed to shoot up on Parkinsonian lines. As a percentage to our gross income they came down in the past year to 4.66 from 5.11 of the previous year, and 15.65 of four years prior to that.

10. I am glad to say our relations with the various Chambers of Commerce and other similar organizations continued to be as close and friendly as in the previous year, and so were our relations with our loanee concerns too. We went ahead during the year with the programme that we had initiated a few years ago of having suitable non-officials nominated as our representatives on the Boards of Directors of our loanee concerns, and I take this opportunity to thank these gentlemen on my behalf, and on behalf of our Board of Directors, for the very valuable work they have done in this capacity.

11. It is also my very pleasant duty before I conclude, to convey our hearty thanks to the members of our five Advisory Committees—non-officials and officials—for the very able and effective assistance they have rendered to the Corporation. My thanks are due also to my colleagues on our Board of Directors for their very valuable co-operation and wise counsels, and their generous response to the many calls I have had to make on their time. Finally, I have also great pleasure in conveying the thanks of the Board of Directors, as well as my own, to the General Manager and the entire staff of the Corporation for another year of loyal and devoted work on their part.

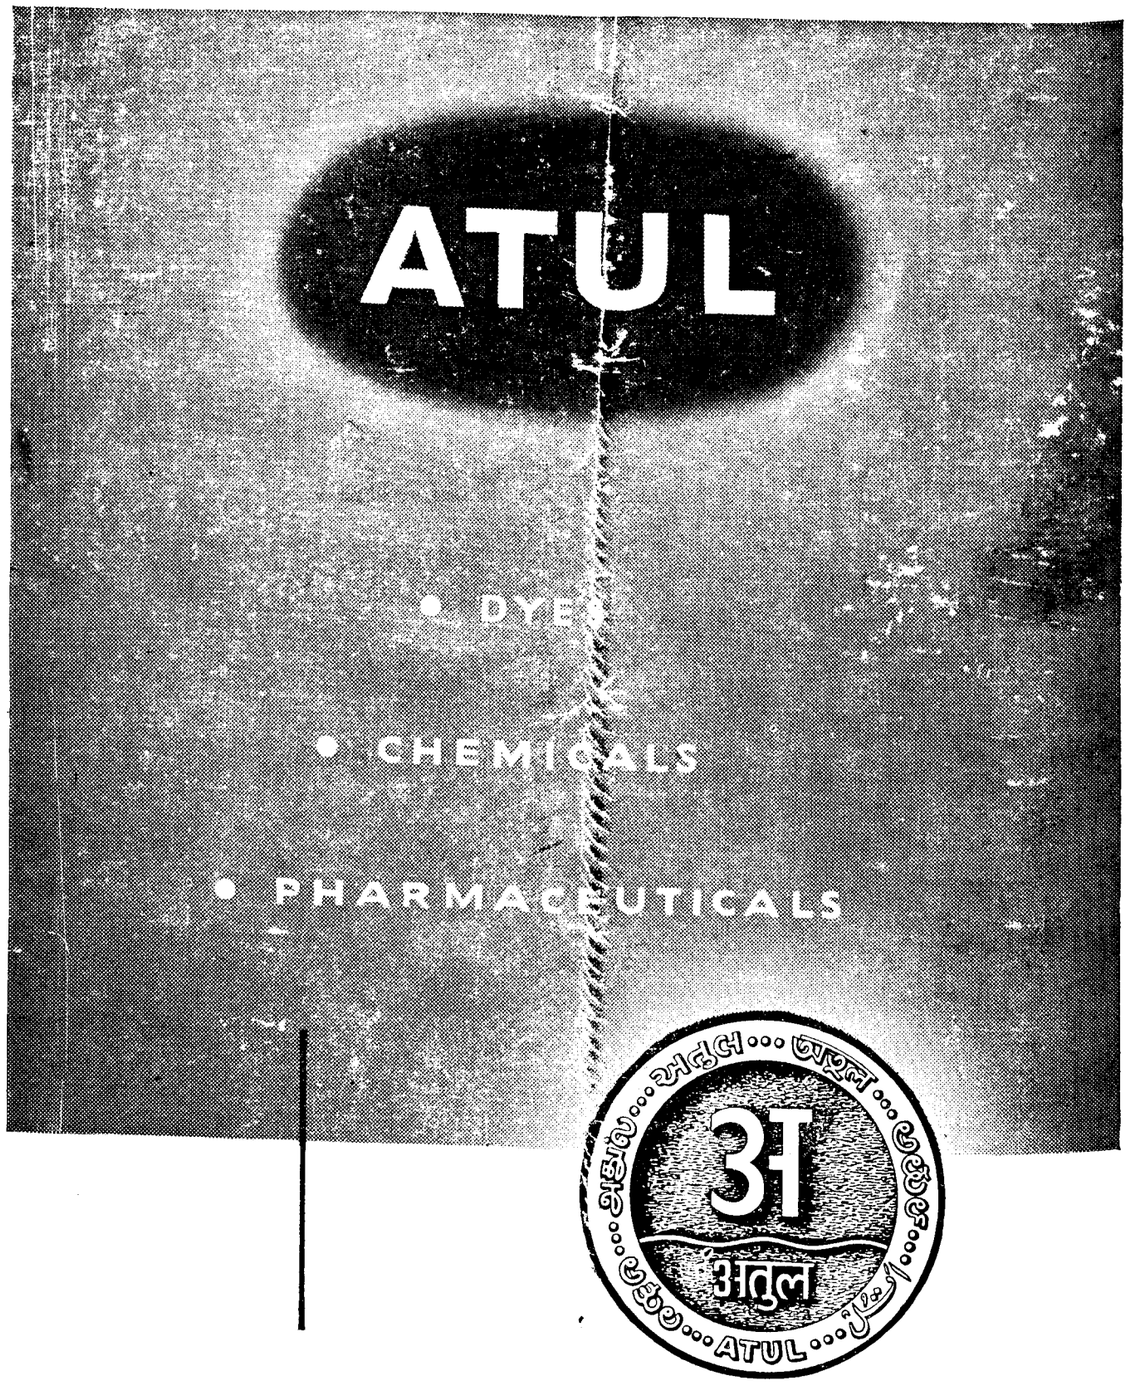
BIRDS are stepping up it

To sustain its expanding output, India's steel industry needs increased quantities of essential raw materials like iron and manganese ore, coal, limestone and refractories. By meeting a large part of this demand, Bird & Company (Private) Limited have been making significant contributions to the progress of the steel industry.



Birds have now launched on a programme of expansion, which when completed will step up considerably the annual output of these raw materials.

	PRESENT PRODUCTION	EXPECTED INCREASED PRODUCTION
Iron and manganese ore	825,000 tons	3,000,000 tons
Coal	2,250,000 tons	3,400,000 tons
Limestone	1,250,000 tons	2,100,000 tons
Refractories	90,000 tons	120,000 tons

This expansion will assure the steel industry of increased supplies of these vital raw materials.

Memoirs of an Elephant - 5

You know, I really can't understand these people at the AOC. After all the trouble they take to find the oil, they tell me that when they do, it is "crude" and that it has to be "refined".

It is now about 60 years since they started this "refining" business in Assam. They say that their plant in Digboi was the first in India operating on modern lines. During these years, many additions have been made to the plant. Among others they added a Dubbs Cracking Plant, an Edeleanu Plant, Atmospheric and Vacuum Tube Stills, and Oil Heaters. A new petroleum plant and a new Lubricating Oil Distillation unit were added in 1954.

One thing, they seem to keep right up-to-date in Digboi utilising all the latest technical "know-how" and equipment.

From what I have heard, this "crude" oil can produce many different things like—Motor Spirit, Kerosine, Diesel Oil and at least another hundred products.

The Digboi refinery is the only one in India producing petroleum products from indigenous "crude"oil.

—And to think that all this is due to me!

The Perils of Unreality

THE Prime Minister returned to Delhi on Tuesday after what must have been his saddest trip abroad. The events of the last fortnight and, in particular, the central drama staged in the United Nations should have made all the world sadder for its exhibition of glaring differences pursued to the point of corrupting the processes of democratic debate by making cynical craftiness its ruling procedure. Most intelligent observers in India have been completely baffled by the extraordinary circumstances surrounding both the introduction and the defeat of the five-power neutrals' resolution. Some have been dismayed by the fact that the rebuff administered improperly to our Prime Minister led him to intemperate language on more than one occasion and to an unwise television broadcast. There has been too much impulsiveness on every side in an operation which has shown the world unmistakably that the tension in international affairs is deeper than ever before.

It is vital, at this testing time, that we should recognise that events themselves are far less important than the hidden realities which provide their motivation. Obviously, India's delegation in the United Nations, no less than the American, British and Australian delegations, was incapable of seeing exactly what realities were likely to dominate an apparently innocent resolution, such as the one which was proposed under the Prime Minister's sponsorship immediately after his arrival. It has been argued that the resolution in itself might have, in an election year, placed the Republicans at a disadvantage, should Mr. Khrushchev have chosen to drop all his conditions for a Summit meeting and invited President Eisenhower to conform to the neutral nations' resolution. This is certainly understandable. But if the force of opinion in the United States was such as to prevent the acceptance, at any time, of this kind of invitation, surely the Indian delegation should have been aware of the force with which the State Department held this particular view. By the same token, if the United States, Britain and Australia had any conception of the extent to which they would be isolated on the Australian amendment, surely in common wisdom they would not have submitted to so terrible humiliation as a summary rejection with only five nations voting for the amendment. There is something much deeper wrong than the weaknesses of the resolution. India, Britain and the United States are equally to be blamed for a lack of contact which has resulted in this failure which redounds to the credit of none.

What then are the realities which all three have neglected to take into calculation? Obviously, the first is that no neutral country can force either the West or Russia to a conference table against their will. Both are individually strong enough — in the last analysis militarily and industrially — to resist paper pressure of this kind. Therefore, a resolution, however good, is no alternative to the bridging of gaps in the minds of the leading protagonists of the cold war. Secondly, while the current position is such that neither the Russians nor the Americans can be driven by the force of world opinion to a resumption of talks, the fact remains that there was enough in this session to indicate that world opinion is exasperated by the stalemate of which India's Prime Minister rightly spoke with deep passion. And if we have erred in underestimating the power of the West to negative our moves — whether our moves are supported by the Communists or not — the West is equally at fault in underestimating the growing power in the United Nations Assembly of the uncommitted nations and all that is involved in Afro-Asian solidarity. Again, while India has underestimated the force of the Atlantic Alliance and the capacity of the United States to dictate Western policy, the United States has clearly underestimated the coming power of the Afro-Asian world in democratic debate in the United Nations. The voting in this session should make this clear.

It would be foolish to expect after a brawl of this kind, sometimes lacking in dignity and consideration, that everything would go on smoothly as before. Undoubtedly, British and Australian tempers have been somewhat rattled, perhaps as much as our own. India has to learn another hard lesson in that, as between the Commonwealth and the Atlantic Alliance, British policy will always be dictated by the Atlantic Alliance. In point of fact, this might mean some disruption inside the Commonwealth unless both Mr. Macmillan and Prime Minister Nehru take action here and now to build a bridge. The only base on which this can be done is the recognition of the recent errors that both have made as a result of ignoring the hard realities which now dominate international affairs.

Finance for the Corporate Sector: 1955-58

GREAT interest centres round the manner in which the corporate sector tends to raise finance for its continuously expanding activities from year to year. An analysis of the balance sheets of 1001 companies, covering about 76 per cent of the corporate sector in the Indian Union, has just been published by the Reserve Bank of India in its Monthly Bulletin for September, highlighting the main movements in the domain of company finance during the four years 1955 to 1958. According to the findings of this study, a dramatic change seems to have taken place in

1958 in the pattern of financing assets formation. While external sources constituted 72.3 per cent of the total assets formation in 1957, the percentage was drastically reduced to 51.5 per cent in 1958. In other words, the share of external sources in 1958 stood reduced to half of the assets formation as against three-fourths in the preceding year.

As a matter of fact, 1958 was a year of slack industrial activity in the sense that the general index of industrial production had slowed down its pace with a rise of less than two per cent over 1957 as against the rise of 4 per cent in 1957 over 1956. The basic cause of this downturn was the paucity of essential raw materials whose imports had to be curtailed due to the pressure on the foreign exchange reserves. It was reflected in the reduced volume of additional funds raised in 1958 for financing the new industrial ventures as well as for expanding the established ones. As against the total additional funds of Rs. 259 crores raised in 1956 and Rs. 237 crores raised in 1957, the volume of fresh funds raised was significantly lower at Rs. 160 crores only, indicating a fall more than 30 per cent on the average. The major decline occurred in borrowings which fell from Rs. 103 crores in 1957 to Rs. 41 crores in 1958. The fall in bank borrowings was much steeper from Rs. 49 crores in 1958 to Rs. 8 crores in 1958. (In the utilization of funds, this factor was demonstrated by the sharp fall in additions to inventories which declined to Rs. 3 crores only in 1956 as against Rs. 52 crores in 1957 and Rs. 91 crores in 1956). Depreciation Reserves, Taxation Reserves, General and other Reserves, on the other hand, all staged improvements which increased the share of these internal sources from 27.7 per cent in 1957 to 48.5 per cent in 1958. This analysis, thus, suggests that in a year of diminishing activity, the importance of external finance tends to drop and is accompanied by a steep fall in inventories.

It may be stated here that despite the reduced share of external finance in 1958, the dependence of the corporate sector on external finance during the period 1956-58 continued to be relatively heavy in relation to the five-year period 1951-55. The Reserve Bank, in an earlier study covering 750 companies, had established that external finance was relatively less important as it financed only 40 per cent of the additional investment in 1951-55. The average share of external finance was 63.5 per cent of assets formation during 1956-58, indicating that even though there was a steep fall in the share of external finance in a particular year, namely, 1958, the average for three years still indicated its superior rank.

The increased dependence on external finance, it seems, reduced the profitability of the company sector. During the period 1951-55, when external finance occupied a relatively junior position in the scheme of new finance, profits as a percentage of the capital employed worked out to be 9.2 per cent. The performance in the first three years of the Second Plan (1956-58) was rather poorer at 8.4 per cent. While profitability is a function of a number of factors, the increased interest payments have certainly tended to reduce the margin of profits. Interest payments rose during 1955-58, not only because of the higher volume of external finance but also of the higher cost of money. The average interest rate was 4.9 per cent in 1958 as against 4.1 in 1955.

Despite the fluctuations in the volume of profits over the years under study, it is interesting to note that dividends as a percentage of paid up capital underwent little change. The lowest rate at 8.3 per cent was recorded in 1957 while the highest was 9.5 per cent in 1958. This endorses the view that the dividends of most of the important companies tend to stay around a certain stable level. There is little likelihood of an inroad into dividends to assist new financing.

Problems of Productivity

IN spite of the fact that the recent seminar on productivity has appeared to be fruitful, the framing of the 15-point programme and the unusual publicity given to it are apt to create a complacent feeling that the stage of application of productivity techniques is round the corner. Apart from the complex prospect of having to grapple with the diversity of issues which any formula for sharing the gains of productivity is bound to raise, there are other questions demanding business-like solutions. Participants in the seminar did not minimise their magnitude. But it would be no unfair criticism of the seminar to stress that attention is sought to be focused too much on the 'agreed' nature of the 15-point programme and the approval to set up an expert committee to prepare the formula for allocation of gains which is believed to give immediately a green signal to the process of intensive assimilation of the techniques.

It is essential to recognise in any appraisal of the progress of the movement for productivity that the major achievement which can be claimed so far is the creation of productivity-conciousness among the workers. It would be a mistake to infer, however, that this incipient attitude is taking firm roots in the minds of the workers. Fears are still lurking that pitfalls lie ahead and the productivity campaign may be a surreptitious move to extract intensive work and enhance work-loads for labour. These feelings are freely ventilated from time to time. An effective remedy to remove this attitude of distrust is for the trade union organisations to set up their own research units as urged in the programme. It will be the function of these units to subject any proposals for productivity improvements emanating from managements to a scientific scrutiny for their real worth and to assess their minimum benefits to workers. Suspicions generated by a negative attitude will continue to raise barriers against wholehearted co-operation of labour The proposed 'scientific' approach is the real answer to them.

It would appear that more has been attempted (and also achieved in some measure) in building the superstructure than in strengthening the base. The number of Local Productivity Councils has been raised to 40 drawing their membership from 2,500 industrial units. This has a semblance of an impressive build-up in a brief period of time. But productivity techniques will need marked variation and adaptations not only from industry to industry but at the individual plant level. This is the crucial point. Plant lay-out and the condition of the machinery installed differ sharply from unit to unit in the same industry. The techniques to be proposed will need similar variations or modifications. Establishment of joint consultative machinery at the plant level is a condition precedent to the drive for management-labour co-operation to make a success of the productivity techniques. Proceedings at the seminar do not appear to have thrown any light on the progress in this basement activity.

It would serve little purpose to ignore the fact that the hardest nut to crack is the supreme problem of arriving at a formula for sharing the gains of productivity. The agreed 15-point programme (in itself a recommendatory document) to which labour is a party could not fail to revive the issue of the need-based formula as representing the minimum wage level. The text of the programme skips this issue by emphasising that due attention should be paid to it and immediately goes on to say that a scheme of incentive payment as a reward for individual productivity performance should be introduced. This is an appealing alternative, but not in all cases is it practicable to measure individual performance in isolation. Probably the alternative proposed by Mr. Manubhai Shah is likely to prove acceptable. He proposed that until labour is able to earn a living and fair wage (and it may be added, until industry in the marginal segment is able to afford it), the larger share of the gains of productivity may have to be allocated to labour than to management and the community. But how can units without resources strengthen their position if they give everything to labour and none to capital formation?

The National Productivity Council is not entirely to blame that so little has been actually achieved after two years of hard work. And the Executive Director, in particular, has shown marked imagination. But it would be foolish to deny that the imposing edifice of the National Productivity Council is being increasingly questioned. Can it not have more practical success to stop the doubters?

The Federation and the Third Plan

IN a study published this week, the Federation of Indian Chambers of Commerce and Industry has given its comments on the Draft Outline of the Third Five-Year Plan. In the introduction are given certain basic criteria which are of considerable importance from the point of view of developmental planning. For instance, it refers to bureaucratisation and the plethora of paperwork consequent on the proliferation of rules and regulations and points out how industry and business are put to considerable loss of time and energy in fulfilling the countless requirements that come in the way of execution of projects. It has also drawn attention to the fact that management is the most critical factor in economic development. These are unexceptionable.

The major point of criticism of the Federation over the Third Plan relates to the allocation of investment outlay to the private sector. It makes much of the fact that whereas the investment outlay for the public sector is placed at Rs. 6,200 crores as against the investment of Rs. 3,650 crores in the Second Plan, that for the private sector has been just placed at Rs. 4,000 crores compared to the Rs. 3,100 crores in the Second Plan, showing a rise of only 29 per cent. But it has itself pointed out how the original target for investment in the Second Plan was only Rs. 2,400 crores which has, however, subsequently grown into Rs. 3,100 crores. So, as a matter of fact, the increase of the private sector investment outlay shows a rise of about 66 per cent compared to about 70 per cent for the public sector. And going by the vigour displayed during the Second Plan by the private sector, its target for the Third Plan may in all probability be again exceeded. Also, public sector allocations contain substantial orders on the private sector. It is extremely unlikely generation of income by the private sector in 1965-66 will be less than 80 per cent of total income. There is, however, a good deal of justification in the Federation's suggestion that in respect of coal, for example, the allocation requires to be reviewed so that the overall requirements are met without placing rigid restrictions on the private sector to achieve what it can at lower costs. The Federation has also done well in drawing attention to the need for providing a larger allocation for power, since shortage of power should not be allowed to hinder industrial development. Again, in respect of shipping, the Federation is on solid ground in asking for provision of more resources.

Discussing the question of resources, the Federation points out how apart from continuous efforts for increasing exports, the overall foreign exchange gap can be covered by a larger inflow of private foreign capital. Nobody would deny that the country's economic policies should be so oriented as to create the necessary climate for greater and more fruitful collaboration with Indian and foreign entrepreneurs. But it is not known how the Federation feels that it should be possible gradually to substitute the ordinary flow of private investment for the exceptional forms of aid negotiated by Government. The Plan estimates that the budgetary receipts corresponding to external assistance for financing the public sector outlay will be of the order of Rs. 2,200 crores and evidently these have to be only on Government-to-Government level. A greater flow of private investment cannot obviously reduce the pressure on external assistance needed for the public sector, though theoretically arguing, it is conceivable that the public sector projects may also seek the help of private capital abroad.

Finally, on the question of regional disparities arising in the course of developmental planning, the Federation says while no doubt the planners must have these disparities in mind and ensure dispersal of industry, it would be wrong to sacrifice in the process locational and other advantages derived from external economies. These latter are no doubt necessary, but the point is whether the inequalities between one region and another can be allowed to be aggravated. As the Second Plan has itself pointed out, often the disadvantages of comparative cost are only a reflection of the lack of basic development and once this is taken in hand, the initial handicaps progressively disappear. This is an aspect that surely cannot be ignored, but political considerations cannot be ignored equally. Where is the balance to be struck?

A DELHI DIARY

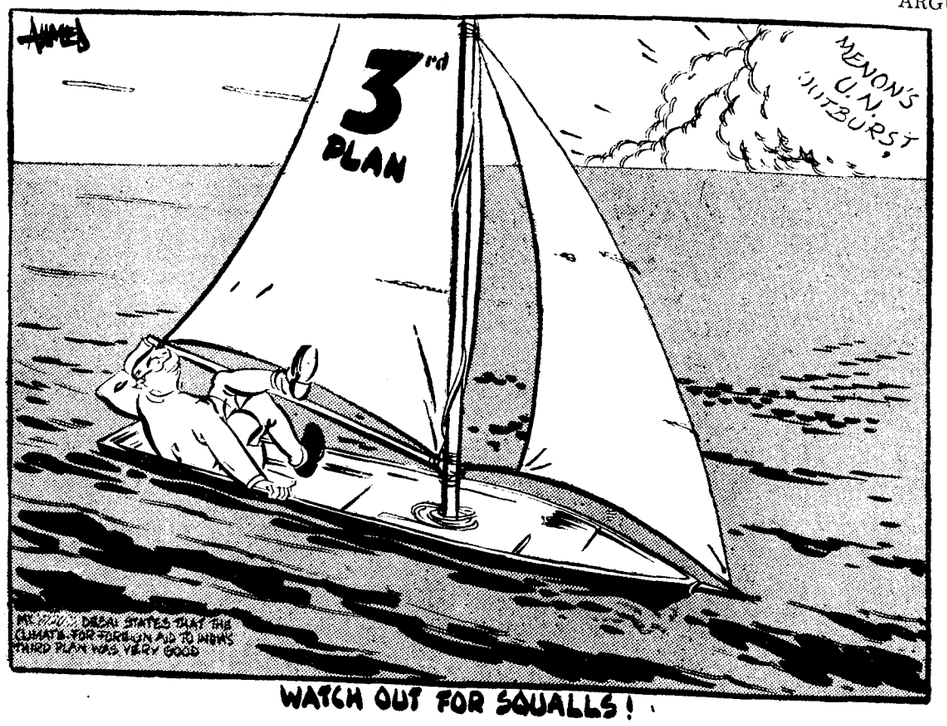
BREVITY ABOVE ALL?

BREVITY remains the soul of wit. I am hoping that this Delhi Diary, purposely reduced to half its normal size in the hope that it might be mistaken for wit, will not be deemed dereliction of duty. Voltaire (or was it Beaumarchis?) once said that what could not be said could always be sung: meaning, I suppose, that the lyrical manner covers a multitude of sins. In much the same way, I am hoping that what I have to say on international affairs and the Third Plan will be adequately dealt with by a picture. It may be that what cannot be said can always be drawn!

TREADING WARILY

Indeed, so hesitant have I become this week (in which the torrent of political debate in Delhi has not been stemmed) that I propose only to ask three questions and then let the dust settle on the controversies raised. In the first place, am I correct in stating that Mrs. Lakshmi Menon, Deputy Minister for External Affairs, categorically stated in the Rajya Sabha in August that on this occasion India would not sponsor the admission of China to the United Nations? If I read the Prime Minister's speech and Mr. Krishna Menon's clarification in New York, I am inclined to believe that India did, in fact, sponsor China's admission to United Nations and fought rather hard in pursuit of its sponsorship. Now all the world contradicts itself, and I am not considering contradiction is a crime. It is pertinent to remember Walt Whitman's proud declaration: "Do I contradict myself? Very well, then, I contradict myself. I am large. I contain multitudes." But is it not pertinent to ask which view represents the Government of India's mind at the present time — that stated by Mrs. Lakshmi Menon as Government policy for Parliamentary purposes, or that stated by Mr. Krishna Menon for United Nations purposes? If the law on political utterances were the same as the law of perjury under the Indian Penal Code, it would not be necessary to prove that either statement is sound policy. It would be enough to show that they are in contradiction with one another and, therefore, the prisoner in the dock is guilty. Who is the prisoner in the dock?

WHAT DELEGATION OF WHAT POWERS?



My second question relates to the high office of the Secretary-General of the United Nations. I have a distinct recollection that the Prime Minister stated before he left for New York that any dispersion of the powers of the Secretary-General would be unworkable and, therefore, he himself did not favour a change. The current reflections in Delhi, as well as apparently a press comment in New York, show the Prime Minister in favour of a delegation of powers to counsellors or something of that kind. Now if the powers of the Secretary-General are unaltered, conceivably there is no contradiction. But everyone in Delhi is a little confused as to what is really in the Prime Minister's mind. Are the new counsellors to be purely advisory, in which case what is the trouble about? Why should not the Secretary-General have as many advisers as he likes so long as he is free to reject all their advice? On the other hand, if a junior counsellor is to overrule the Secretary-General, will we not have a pretty kettle of fish? Surely, the world is entitled to know what the organisation proposed for the United Nations is in place of what exists at the present time.

THE PLAN

My third question is very brief. What is likely to happen to India's foreign exchange position in the Third Plan? I do not think the cartoonist has said the last word! Perhaps I may only add one cynical comment on the arithmetic of the Plan. It is from A. E. Housman's 'Last Poems'.

To think that two and two are four,
And neither five nor three,
The heart of man has long been sore
And long 'tis like to be.

THE WEEK'S NOTES

Labour

VERDICT ON A MAJOR STRIKE

WHEN FLINT strikes flint, sparks must fly. A classic example of this fact in respect of employer-employees relations in industry was, perhaps, provided by the marathon strike in the Premier Automobiles Ltd., in 1956, in which the management suffered a colossal loss of production and sales worth nearly Rs. 5 crores and the workers had to forego their wages and salaries to the tune of Rs. 36 lakhs. An interesting, instructive and cogently argued study of this strike from the point of view of the Code of Discipline—which incidently became effective during the course of this strike—made by Mr. R. L. Mehta, Joint Secretary in the Union Ministry of Labour, who was appointed the Inquiry Officer for this strike, is now available. The detached way in which Mr. R. L. Mehta has gone into the causes leading to the strike is testified by his report which sums up the position regarding the apportionment of the blame for the strike thus: "Though both the management of the Premier Automobiles and the Engineering Mazdoor Sabha (affiliated to the Hind Mazdoor Sabha), the majority union in the concern, were guilty of violation of various provisions of the Code, the Union's share of infringements is greater."

The strike, Mr. R. L. Mehta opines, was illegal for it was over a personal issue and not over any industrial question of wages or bonus or similar claim; the primary cause for the strike, in his opinion, was the management's withdrawing the facilities it had given to Mr. R. J. Mehta, the Secretary and Treasurer of the Union. This action of the management has been justified by the Inquiry Officer, who apparently concurs with its allegations that Mr. R. J. Mehta had abused the privileges granted to him, that he was following a policy of keeping alive an atmosphere of restlessness and discontent among the workers by pressing one set of demands after another, and that he was in the habit of playing to the gallery by shouting abuses at the management and threatening to let loose hell at the slightest provocation. A pertinent observation made by Mr. R. L. Mehta on the conduct of Mr. R. J. Mehta as the Union leader deserves particular notice. It is to the effect that not only in day-to-day matters, but also in major issues like giving a strike notice, signing an agreement, launching a strike or calling it off, Mr. R. J. Mehta acted independently of all authority. When so much power was concentrated in a single person, the plural society which a trade union represents perishes to give way to the monolithic. The management, in the opinion of the Inquiry Officer, must share some blame for the strike due to its failure to tackle the day-to-day problems of workers and to implement agreements with expedition. It was also guilty under the Code for refusing arbitration. The strike ended ignominiously for the workers by their unconditional surrender; even Mr. R. J. Mehta agreed to give up his office.

SANCTIONS BEHIND CODE?

The study, obviously raises two important issues. Firstly, should or should not outsiders—Mr. R. J. Mehta was an outsider in the Engineering Mazdoor Sabha—be debarred from holding offices in a trade union? Secondly, what sanctions are required to enforce the Code of Discipline if either the management or the workers and their leaders flout its provisions? The issues are of vital interest in the present day conditions of the Indian economy when peace is absolutely necessary for the ambitious programme for industrialisation. Happily, as the recent deliberations of the Indian Labour Conference reveal, the two problems are exercising the mind of the Government. Banning of outsiders from holding offices in a trade union may not be desirable and advisable at the present juncture, but there is need to enforce the Code in a more effective way. The operation of the Code during the first 1½ years of its coming into effect has produced some wholesome results — the number of man-days lost, which were as much as 4.7 million during the six-month period January-June 1958, prior to the coming into force of the Code, declined to 3.20 million in the first half of 1959 and to 2.89 million in the period January-June 1960. But complete harmony and peace in industry can be realised only if there were no breaches of the Code. Are some sanctions necessary against those who err in this respect? Judgment should be deferred on this until the Code is given a fair trial on a voluntary basis for sufficiently long time.

Britain

AFTER SCARBOROUGH

EVER SINCE last month's annual conference of the Trades Union Congress, it was evident to many discerning observers of the British political scene that the die was loaded heavily against Mr. Gaitskell. Partisans of the Gaitskell school of thought as well as that of Mr. Cousins were making preparations for a showdown at Scarborough. However, it will not be correct to view the present troubles of the British Labour Party as a conflict between personalities. As a matter of fact, since the Labour Party's defeat in the last General Election, opinion has been divided in the party as to the reasons for the defeat, some attributing it to the lack of radicalism and some others due to an excess of radicalism. The split in the party came into the open first over the question of amending clause four of the party constitution relating to public ownership. After a good deal of argument, a compromise was evolved leaving the entire question vague. This was construed as a personal triumph of Mr. Gaitskell, but the "leftists" led by Mr. Cousins soon concentrated their attention on the foreign and defence policies. Unilateral nuclear disarmament became a vital issue for those who wanted to inject an element of radicalism in the Labour Party. What they actually wanted was that Britain should not only give up the idea of being an independent nuclear power, but that she must abandon the NATO and the American alliance which involved reliance on nuclear weapons.

The defeat of Mr. Gaitskell at the party conference on this question has posed a very big problem for the British Labour Party. Going from the comments of the British Press, it is difficult to say how exactly it will affect the shape of events because of the closeness of the voting. While the official party policy was defeated by a narrow margin of 297,000 votes out of the six and a half million that were cast, the motion for unilateral renunciation of the H-bomb was passed by a

majority of just over 4,00,000 votes. However, there can be no doubt that it presages the beginning rather than the end of a prolonged and bitter campaign for reshaping Labour policy. Mr. Gaitskell has suffered defeat because of the block votes of the trade unions but since he has a majority in the Parliamentary Labour Party, it is generally taken for granted that at the end of this month when Parliament assembles, he will be re-elected leader and given a renewed vote of confidence. But this will not be the end of his trouble since he has to take the entire labour movement with him if he has to retain the leadership. The party constitution does not clearly define to what extent the Party's National Executive Committee or the Annual Conference can lay down policy. But 24 hours before the unilateralist resolution was passed, the Conference had declared itself the final authority of Labour policy. This means that Mr. Gaitskell has to go all out to campaign for a reversal of policy taken at Scarborough if he is to continue as the leader. This, on present showing, seems to be a remote possibility. But even if he can summon enough votes to keep him in leadership by next year's conference to endorse his policy, it is obviously difficult for the Labour Party to carry on with a considerable section gnawing at its body. On the other hand, it is on the cards that the ideological fervour which the unilateralists have shown at Scarborough is not likely to wane and they do not hold out any promise of their retraction. Therefore, there is a widespread impression that a split in the party is inevitable. It is in this context that one should consider the possibility of the Gaitskellite section joining hands with the Liberals whose defence policy is identical with it. This would leave "pacifists and the leftists" to pursue their ideology separately. It will be hazardous, however, to make any prediction about the possibilities ahead. But there can be hardly any doubt that the Labour Party is now faced with the biggest crisis in its history.

Central Africa

THE MONCKTON REPORT

THE MONCKTON COMMISSION was charged with the unenviable task of recommending the best possible solution for a fresh constitution for the three territories of Northern Rhodesia, Southern Rhodesia and Nyasaland when the prospect of finding a solution satisfactory and unanimously acceptable was extremely difficult. Judged as a whole, the report makes balanced recommendations and aims at preserving the multi-racial character of the Federal State with the utmost accommodation to Africans and the whites. In any situation, the Commission could not countenance the idea that the contemplated constitutional revision should accept the defeatist view that a multi-racial state is impracticable.

It has shown great vision and basic faith in the ability of the people to rise above racial differences in the achievement of the goal of harmony and prosperity of the Central African Federation. A common roll has been prescribed for the two racial groups, the widest possible measure of autonomy is given to the three federal territories, equality of status has been conferred on them in the Federal Council of States and, what is vitally important, a bill of rights has been proposed and made justiciable. Likewise, the setting up of a machinery to watch racial discrimination in any of the federal units aims at removing possible fears of inferiority of status and treatment.

Even before the report was released, leakage of the information that the Commission had made suggestions on the right of secession had caused considerable stir. Now that the report has been published this controversy has come up foremost in the minds of the leaders in the three territories and it would appear that it has eclipsed all the other valuable recommendations contained in this laboriously prepared document. Sir Roy Wellensky, the Federal Prime Minister, has been, perhaps, too vehement in his opposition to Chapter 16 of the report, which deals with the issue of the right to secede or likely dissolution of the Federation. He has declared in very categorical terms that his United Federal Party would reject the report outright. He takes the legalistic view and raises the technically tenable contention that the Commission was not competent to make recommendations on the question of secession because this issue was beyond its terms of reference. However, the option to secede was such a fundamental question and not to deal with it would have made the report so unreal that the Commission seems to have been impelled to make a constructive approach to this question. It has not made any positive recommendation as such, but it has suggested that, under specified circumstances, after a fair and long trial is given to the federal form of government, a qualified option to secede may be incorporated in the constitution. Dr. Hastings Banda, leader of the Nyasaland Malawi Congress Party, is equally opposed to federal constitution in any form. Distrust and mutual suspicion seem to be at the root of this attitude on both the sides in Central Africa, as in any other region where problems of multi-racial or multi-religious controversies are involved.

The entire trend of the Monckton Report is to stress the incalculable benefits of a federal constitution in order to bring first, racial harmony for which the Commonwealth stands and, second, economic viability which would be seriously jeopardised in case dissolution comes about. In the last resort, a federal form of constitution cannot be maintained by the super-imposition of any statute, but it must rest on the solid and enduring foundation of the free consent of the two racial groups in the population. Assuming the Commission had not touched this delicate question, as the statement issued by the Commonwealth Relations Office in London on October 11 emphasizes, the review conference, which is to be convened to decide upon the revision of the present federal constitution, must be left free and competent to discuss not only the issue of secession but any other relevant issue. In the light of this position, it would be in the interest of the entire Central African population not to allow the initial reactions to influence judgment on the report.

TARAPUR ATOMIC POWER STATION

The Department of Atomic Energy has invited global tenders for India's first atomic power station to be built near Tarapur, about 62 miles north of Bombay. The "enquiry specification", outlining in detail the requirements of the station, has been prepared and will be issued from October 17 from the office of the Project Administrator, Tarapur Atomic Power Project. The tenderers have been given about 7½ months' time to formulate and submit their tenders.

The station will produce about 300,000 kw of electric power and will consist of two nuclear reactors of equal capacity. The specification has laid emphasis on the need for keeping the foreign exchange component to the minimum. The tenderers are to employ, to the greatest extent possible, Indian materials, locally fabricated equipment and Indian personnel. The station is expected to be completed in 1965 when it will contribute substantially to meeting the power needs of the States of Maharashtra and Gujarat.

This expert has won the trust of millions in the label *'Sanforized'*

Meet our American-trained expert who makes sure that any fabric marked 'Sanforized' won't shrink. Every day, all through the year, he tests fabrics bearing this international label; so that your clothes won't shrink out of fit—even after many, many washings!

This is how he does it:

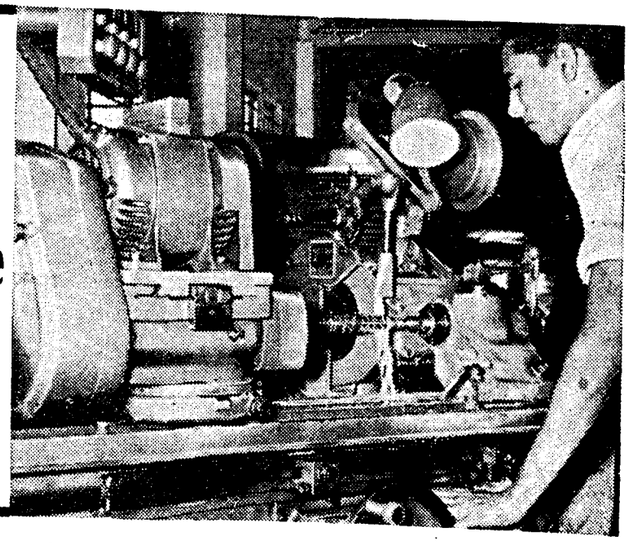
Travelling from mill to mill, he advises and helps them with their technical problems; and makes on-the-spot tests that ensure value in the cloth you buy labelled "Sanforized".

Whenever he visits the mills, he takes at random several samples from their godowns as well as off the processing machine. These samples are first measured, and then given a standard wash test.

And then, the samples are re-measured. This is the first stage of ensuring quality. All fabric must meet the Company's strict anti-shrinkage specifications *before* it can use the label 'Sanforized'.

These tested samples are sent to the New York office for re-checking, and with them goes the expert's detailed report. These documents record the progress and prosperity of each individual mill.

The New York office checks thousands of samples from all over the world. This is your assurance that fabric labelled 'Sanforized' is of a uniformly high standard, and is welcomed *everywhere* in the world!



Look for SANFORIZED REGD TO GHK *on the label and your clothes will never shrink out of fit!*

Issued by Cluett, Peabody & Co. Inc., (Incorporated in the U.S.A. with limited liability) proprietors of the Registered Trade Mark 'Sanforized'. The use of the trade mark 'Sanforized' is permitted only on fabrics that meet this Company's rigid anti-shrinkage requirements.

For information: 'Sanforized' Service, 95, Marine Drive, Bombay-2

Product performance counts...

For the speedy production of machine parts to close size tolerance with good surface finishes, Grinding Wheels of high quality, efficiency and precision are essential. The picture above shows a Hardened Steel Machine Shaft being precision ground by Carborundum Universal Grinding Wheel on a Jones & Shipman Universal Cylindrical Grinder.

CARBORUNDUM UNIVERSAL manufacture a wide variety of Grinding Wheels and other Abrasive products of the highest quality for every industry. These products are helping top firms to make better products, to cut costs and to speed production. Whatever the Grinding operation, Bonded Abrasives by CARBORUNDUM UNIVERSAL cannot be beaten for high quality and economy.

We are now in a position to manufacture and supply large wheels upto 36 inches in diameter, thus offering our customers a complete range of Vitrified and Resinoid Grinding Wheels.

BONDED ABRASIVES:
Grinding Wheels, Segments, Rubbing Bricks, Sticks, Sharpening Stones, Valve Grinding Compound, etc.

CARBORUNDUM UNIVERSAL LTD.

Head Office: 52/53, Jehangir Street, MADRAS-1 Telephone: 2941 (4 lines)

The World Abroad

A LETTER TO MR. MORARJI DESAI

From ODYSSEUS

DEAR FINANCE MINISTER,

May I take five minutes of your time by directing your attention, and that of your senior officials, to a new book by Professor F. A. Hayek, "The Constitution of Liberty" (Routledge & Kegan Paul. London. July, 1960. Price 45 sh.)? Let me explain why.

Adam Smith (1723/90) was the first person to see that the problem of why some nations become richer than others was a specialised branch of knowledge. His "Wealth of Nations" (1776) speeded the Industrial Revolution by its epoch-making recognition that the combination of individual freedom in enterprise with the specialisation of labour multiplied wealth. But his book was also a tract for the times It attacked the established ideas of the day; it criticised institutions adapted only to mediaeval conditions; it revealed the futility of mercantilism—the attempt by governments to regulate trade and industry in order to try to secure a constant surplus of exports over imports in the belief that this would ensure national wealth. Adam Smith blew the "wind of change" into a static world. He released individual initiative from the bondage of centuries.

Professor F.A. Hayek's book is another "Wealth of Nations." Like that work, it is (a) in its scope and breadth of vision, a positive statement of the basic principles of a free society, and (b) a tract for the times, attacking established ideas. It cuts away accretions of neo-mercantilism, protectionism, and state regimentation which have obscured the truths revealed by Adam Smith. It re-states the fundamentals of economics in contemporary terms.

Professor Hayek brings Smith up to date by outlining the history of ideas right down to the economics of Socialism and the Welfare state. It is open to you to disagree with Professor Hayek's arguments, but he presents a reasoned, documented case, which his critics must answer. I draw your attention to Professor Hayek's exposition of one of the major problems of the day; the burden of progressive taxation.

It is often argued that progressive taxation is unavoidable because without it vast increase in public expenditures would place intolerable burdens on the poor. The facts suggest the opposite. Not only is the revenue derived from the high rates levied on large incomes, particularly in the highest brackets, so small compared with total revenue as to make hardly any difference to the burden borne by the rest, but for a long time after the introduction of progression it was not the poorest who benefited from it but the better off working classes and lower strata of the middle classes (who constituted the largest number of voters). It is the illusion that progressive taxation shifts the burden onto the wealthy that has (a) helped to increase taxation and (b) led the masses in many countries to accept a heavier load than they would if they understood the facts. The figures for the UK, which has one of the steepest scales of progressive taxation, reveal how small is the contribution of these punitive taxes. All UK surtax, which starts at £2,000 a year, brings in about 2½ per cent of all public revenue, and if the whole of every £1 of income over £2,000 were taken, it would only net an extra 1½ per cent of revenue. Indeed, the massive contribution to income tax and sur-tax comes from incomes between £750 and £3,000 p.a. (Rs 9,750 and Rs 39,000), i.e., those which begin with foremen and end with managers, or begin with civil servants just taking responsibility and end with those at the head of departments. It is probable that the gain to revenue from progressive taxation is less than the reduction of real income that it causes. It is certain that it is a powerful disincentive to individual initiative and enterprise.

Professor Hayek advocates proportionate taxation which, if I understand him correctly, would mean a flat rate (of, say, 10, 15, or 20 per cent) on all incomes irrespective of their size. He argues that where this principle is not applied (a) it is not necessarily those in greatest need but more likely the classes with the greatest voting strength which will be taxed the most lightly, and (b) all that is obtained by progression could be obtained by taxing the masses with modest incomes as heavily as the poorer groups. Democracy, he says, must learn that, in order to be just, it must observe general principles. What is required is a rule which, while leaving it open to a majority to tax itself for the benefit of a minority, does not authorise the majority to impose on a minority whatever burden it chooses to think right. That a majority, merely because it is a majority, should be entitled to apply to a minority a rule which it does not apply to itself destroys the basic principle of democracy.

Proportional taxation provides a rule likely to be accepted by (a) those who pay absolutely more and (b) those who pay absolutely less; it creates no separate rule applying to a minority. Progression discriminates by shifting the burden from those who decide what the rate should be onto others who do not.

The use made of particular resources depends on the net reward for services. If the resources are to be used efficiently, taxation must leave the relative rewards received for particular services at the levels fixed by the market. But progressive taxation makes the net reward for a particular service depend on the individual taxpayer's other earnings over the year. Professor Hayek points out that if, before taxation, a surgeon gets as much for an operation as an architect for designing a house, or a salesman as much for selling ten cars as a photographer for taking forty portraits, the same relation survives if proportional taxes are deducted from their receipts. But progressive taxation destroys this relation. Not only may services, which before taxation receive the same pay, bring different rewards, but A, who receives a relatively large payment for a service, may be left with less than B, who receives a small payment. Can anybody blame A if instead of continuing to contribute to the national wealth by a full working week, he diminishes the national wealth by giving himself a four day week and three months' holiday in the year? Indeed, the more that consumers value A's services, the less worth while will it be for him to exert himself further. Progressive taxation offends the only universally recognised principle of economic justice: "Equal pay for equal work."

The net income after taxation left to millions of highly qualified middle class men and women in the West compels them to take time off to do jobs about the house for themselves. For example, a skilled author, taxed at 19sh. 6d. in the £ (i.e. 97½ percent), must earn £200 in order to have the money to pay £5 to get his study redecorated. He may decide to do the job himself. But only if he is forty times more productive in writing than in re-decorating will it be profitable to him to practise the division of labour and exchange his writing for the re-decoration. When you consider the millions of middle class men and women in the West, expensively educated to do brain work, who spend time in doing unskilled work when they could be engaged either in other more productive work, or in raising their efficiency for it by rest and recuperation, the loss of "real" wealth to the nation imposed by progressive taxation must be stupendous. A Welfare state depends for its progress on the middle and higher incomed classes. Without senior business executives, industrialists, mathematicians, engineers, teachers, economists, doctors, editors, lawyers, chartered accountants, chemists, etc., today's Common Man would sink to the level of the African Bantu tribesman. For the

sake of "social justice" the "rich" are taxed to relieve the burdens of the "poor"; the middle and higher incomed classes are denied the leisure which, for them, is an occupational necessity. Alternatively, if the higher paids prefer to cease to exert themselves beyond a certain point because further earnings would be swallowed by taxes, the nation is not getting all that it could out of them. This is Social Nonsense.

Too many people think of income as conferring an appropriate status rather than as arising from the value of services rendered. Professor Hayek points out that you see this in the argument that "no man is worth £10,000 a year, and in our present state of poverty with most people earning less than £6 a week, only a few very exceptional men deserve to exceed £2,000 a year." (This was written in 1949. Today's average weekly industrial wage in the UK is nearly £12). To suggest that no act that any individual can perform in a year can be worth to society more than £10,000 is absurd. However much Shahjehan (1627/58) paid the architect of the Taj Mahal it can only have been a pittance for the creation of one of the beauties of the world which has now given pleasure to millions for over 308 years. Have you ever heard of the Edinburgh professor, Alexander Graham Bell (1847-1922)? He did not die a rich man, but he left the world permanently in his debt. With the aid of his invention of the telephone, hundreds of millions throughout the world are multiplying the wealth of nations. Were neither of these men worth £10,000 a year? There is no necessary relation between the time that an action takes and the benefit that a nation, or the whole world, derives from it.

The idea that large gains are not necessary, and socially undesirable, originates with workers who sell their time for a fixed wage and who therefore regard pay per so much unit of time as normal. It is meaningless to apply it to men whose role is to manage resources at their own risk and whose aim is to increase the resources under their control out of their earnings. Profits and losses are a mechanism for redistributing capital among entrepreneurs rather than for providing their current income. The idea that current net receipts are for current consumption, although natural to the wage earner or salaried man, is alien to the entrepreneur whose aim is to build up a business.

Professor Hayek points out that the large gains of a successful innovator meant in the past that, having proved his capacity to employ capital profitably in new ventures, he would soon be able to back his judgement with larger means—as did William Morris, who, from small beginnings in a cycle shop in Oxford, eventually revolutionised the manufacture of cheap cars in the UK.

The individual's formation of new capital, since it is offset by capital losses of others, is part of a continuous process of redistribution of capital among entrepreneurs according to their efficiency. Heavy taxation of such profits is a brake on that turnover of capital which is part of the driving force of a progressive nation.

The worst consequence of confiscatory taxation of capital formed by individuals is to restrict competition, to favour Company against individual saving, to strengthen existing big business against new comers. Because taxes absorb so much of the newcomers's "excessive" profits he cannot grow big enough to compete with vested interests. It is true that taxation also impedes capital formation by the big company, but why should it care? It has arrived. The tax collector is its friend because he prevents dangerous newcomers from forcing the old firm onto its toes.

So, whether progressive taxation falls on the professional man or on the entrepreneur, it ensures that resources are used wastefully, checks the rate of growth of the nation's wealth, and builds up an inflexible economy, slow to adopt new techniques.

This week, I have drawn attention to that part of Professor Hayek's book that seems of importance to you as Minister of Finance. Next week, and in a final letter the week after, I will draw attention to parts that seem important to every lover of freedom in India. I take it that means about 400,000,000 people.

US* knows about steels

Our grammar is fine. So are our steels. US is United Steel, the group of companies which produce the widest range of steels and steel products in Britain.

Not just steel—but steels. Each with its specialised qualities and specified uses . . . steel for motor cars, watches or umbrellas. Mining machinery, saucepans or railway lines. Over one-eighth of Britain's steel is produced by the 37,000 people employed in United Steel.

Companies in the United Steel group retain their individuality to a remarkable extent. They are specialists—geared to understand the manifold problems of modern industry. You will see their work in straight-forward railway axles, or the complex structure of the Jodrell Bank radio telescope.

The many special steels that nuclear reactors demand, steel for the Ganga Bridge or the Boeing 707—US makes them all. And to specialisation, United Steel adds the benefits of large-scale co-operation in research and marketing. That's why it pays to know US.

This is US

17 OCT 1960 PUBLIC DEPARTMENT

RESERVE BANK OF INDIA

Applications are invited for the following posts in the Bank:

(A) **POSTS AND SCALES OF PAY**

(i Banking Officers: Rs. 375-55-815 E.B. 55-925-60-1,045

(ii Probationary Assistants: Rs. 250-25-450 E.B. 25-650

(iii Banking Assistants: Rs. 175-12.50-300 E.B. 20-440.

Note: Candidates possessing exceptionally good qualifications and experience of value to the Bank may be given a higher starting pay in the prescribed scales.

In addition to pay, the selected candidates will be eligible to draw local pay, house allowance and dearness allowance at the rates prescribed by the Bank from time to time.

(B) **QUALIFICATIONS:**

(i) **Banking Officers:** Applicants should have:—

(a) a first or high second class Master's degree of any recognised Indian or foreign University with Economics, Banking, Commerce or Accountancy as a special subject of study and should also have proficiency in drafting. They should possess at least 10 years' practical experience of work in a commercial bank and should have held responsible positions such as an Agent or an Inspector of branches for some time; or

(b) they should be Chartered Accountants with a minimum standing of 5 years.

Preference will be given to those who have passed the examinations of the English or Indian Institute of Bankers.

(ii) **Probationary Assistants:** Applicants should have a brilliant academic record and a first or high second class Master's degree of a recognised Indian or foreign University with Economics, Banking, Commerce or Accountancy as a special subject and should also have some proficiency in drafting. Educational qualifications may be slightly relaxed in the case of candidates who have passed the Institute of Bankers' examinations and|or possess practical banking experience in a supervisory capacity in a commercial bank. Candidates who have applied recently for these posts in the Department of Banking Operations or the Agricultural Credit Department in response to previous advertisements dated the 6th February and 13th August 1960 need not apply again.

(iii) **Banking Assistants:** Applicants should have a high second class Master's degree or a first class Bachelor's degree of a recognised Indian or foreign University in Economics, Commerce, Banking or Accountancy and also have some proficiency in drafting. Educational qualifications may be slightly relaxed in the case of candidates who have passed the Institute of Bankers' examinations and|or possess some practical commercial banking experience.

THE SELECTION BOARD WILL INSIST ON A VERY HIGH STANDARD OF SUITABILITY IN MAKING SELECTIONS FOR THE ABOVE POSTS AND ONLY THOSE CANDIDATES WHO POSSESS HIGH ACADEMIC QUALIFICATIONS AND ADEQUATE EXPERIENCE OF THE TYPE SPECIFIED ARE ADVISED TO APPLY.

(C) **AGE LIMITS AS ON 1st NOVEMBER, 1960:**

(i) **Banking Officers:** Candidats should not ordinarily be over 35 years of age but the age limit may be relaxed in the case of candidates with exceptionally good experience of value to the Bank.

(ii) **Probationary Assistants:** Between 21 and 25 years.

(iii) **Banking Assistants:** Between 18 and 24 years.

In the case of (ii) and (iii) the maximum age limit is relaxable but not beyond 30 years in the case of:

(i) candidates possessing special qualifications and experience of value to the Bank;

(ii) candidates with approved war service;

(iii) ex-employees of banking institutions whose services had to be terminated for reasons of economy or as a result of the banks going into liquidation;

(iv) personnel retrenched from Government offices after at least one year's service applying through Employment Exchanges; and

(v) candidates belonging to the Scheduled Castes or Scheduled Tribes.

2. Candidates who wish to apply for more than one category of posts must submit **separate** applications accompanied by separate application fees and **should clearly indicate the post for which they have applied.**

3. Applicants for the posts of Banking Officers and Probationary Assistants must remit with their applications a fee of Rs. 7.50 for each post by cheque or bank draft on a **Scheduled Bank** payable at Bombay or by Postal Order. Applicants for the posts of Banking Assistants must remit a fee of Rs. 2.00. **The application fee is in no case refundable.** Bonafide refugee candidates **not in employment** applying through Employment Exchanges are exempted from payment of application fees while in the case of candidates belonging to Scheduled Castes|Tribes, the fee will be reduced to one-fourth.

4. Applications in the candidate's own handwriting in the prescribed forms obtainable from the Reserve Bank's offices at Bombay, Calcutta, Kanpur, New Delhi, Nagpur, Madras, Bangalore, Lucknow, Trivandrum and Patna accompanied by copies **(originals should not be sent) of certificates regarding age and educational qualifications, statements of marks secured in the Graduate and Post-Graduate degree examinations and two testimonials** should be forwarded to the Secretary, Central Recruitment Board, Reserve Bank of India, Central Office, Post Box No. 406, Bombay No. 1 so as to reach him on or before the 5th November 1960.

5. **Candidates should also indicate in their applications whether they had applied previously for a similar post in the Reserve Bank and if so with what result.**

6. Candidates already in service will be required to produce a proper discharge certificate from their employers in the event of their being selected, at the time of their appointment in the Bank's service.

7. Candidates belonging to Scheduled Castes|Scheduled Tribes should mention this fact prominently in their applications and also enclose a copy of a certificate to that effect from a competent authority.

8. Selected candidates must be prepared to serve in any office of the Bank in India and to undertake tours when required.

9. Appointments will be subject to candidates being found medically fit for service in the Bank by the Bank's Medical Officer.

10. If any candidate desires to have his application acknowledged, he should send it "Registered Post—Acknowledgement Due". Apart from those who may be specially called, interviews will not be granted to candidates nor will the Bank enter into correspondence with them.

11. **Canvassing will be regarded as a disqualification.**

NO CUSTOMS UNION FOR WEST EUROPE

From Our Special West European Correspondent

PARIS, October 10.

SINCE Britain's Common Market plan was outlined here in the issue of August 26, it has been submitted to careful scrutiny by the nations liable to be affected, which means all the important trading countries of the non-Communist world: the Commonwealth countries at the London Finance Ministers' meeting, Britain's partners in the Free Trade Area, the Americans and of course the Common Market six. Opposition has crystallised, so that during the Commonwealth conference London had to deny that any firm plan had been written by Messrs Macmillan and Adenauer at their Bonn meeting (contrary to the confident assertions of Fleet Street at the time); rather, certain suggestions had been thought worthy of further investigation. Apparently, in capitals other than Bonn, these suggestions have not had a good reception, and when Mr Edward Heath, who is responsible for European affairs in the British Cabinet, arrived in Paris this week for talks with M. Debre, he declared that he was not bringing with him any new plan for a union between the Six and the Seven.

The main features of the British proposal may be recalled. Abandoning the dogma of tariff autonomy for which Mr Reginald Maudling fought so hard up to the breakdown of the free-trade talks at end-1958, London contemplated accepting a common external tariff for a customs union that would include all West Europe, that is, the Six and the Seven. But that tariff would apply only to manufactures; there would be no common tariff and therefore no customs union for agricultural produce. The least protectionist countries of West Europe, Switzerland and Sweden, would raise their import duties on manufactures from outside the area, while the most protectionist country, Britain herself, would lower here to the common level. In the process, the Commonwealth countries would lose many of the imperial preferences their manufactures enjoy in Britain, but in return they were offered the prospect of supplying a vast West European ensemble of considerable import potential.

At a rough guess it seemed to us in August that, on balance and in the long run, this arrangement would advantage India. It appears that the Indian Government took the same view, and at the Commonwealth conference India and Australia expressed willingness to explore this avenue further. On the contrary, most of the other members, led by Canada and New Zealand, declared themselves hostile and told London, with a vigour that caused some surprise, that they were not ready to have Britain buy Europe's good graces at their expense; the two birds in the European bush mattered less than the one they held thanks to imperial preferences. The balance of Commonwealth opinion seems to be against the proposal and this limits Britain's freedom of movement. Obviously, every imperial preference withdrawn by Britain could cost British exports loss at the other end when the Commonwealth country affected retaliated, and this might outweigh gains in West Europe. Any dismantling of the imperial preference system that went on in an atmosphere of acrimony and retaliation would constitute a Commonwealth crisis. Conversely, the determined defence of imperial preference by a country like Canada confirmed Continental opposition to any customs union in which imperial preferences were not eradicated. The Continentals have been told that they were exaggerating the importance of those preferences and that they no longer amounted to very much, but the reluctance of the beneficiaries to part with them gave a different impression.

The next source of opposition lay in the Free Trade Area that unites Britain and six "peripheral" Continentals countries. That system is built on tariff autonomy for each member, but the British proposal would remove that autonomy. The resulting Europe-wide customs union would have no political institutions, so the neutrals did not raise the objections that they have kept them out of the Common Market, which is supposed to lead on to political integration. Yet they had serious commercial objections. Low-tariff countries would have to raise their duties on imported manufactures and they foresaw that they would be accused by overseas countries of that very "discrimination" they have complained of in the Common Market—naturally, because you cannot build a viable customs union of any sort without giving preference to members, which means discriminating against outsiders. The keen opposition of Switzerland to the Carli Plan that was mooted some years ago and aimed at "a certain harmonisation" of OEEC tariffs was a foretaste of Swiss criticisms of a proposal to institute a common external tariff in West Europe.

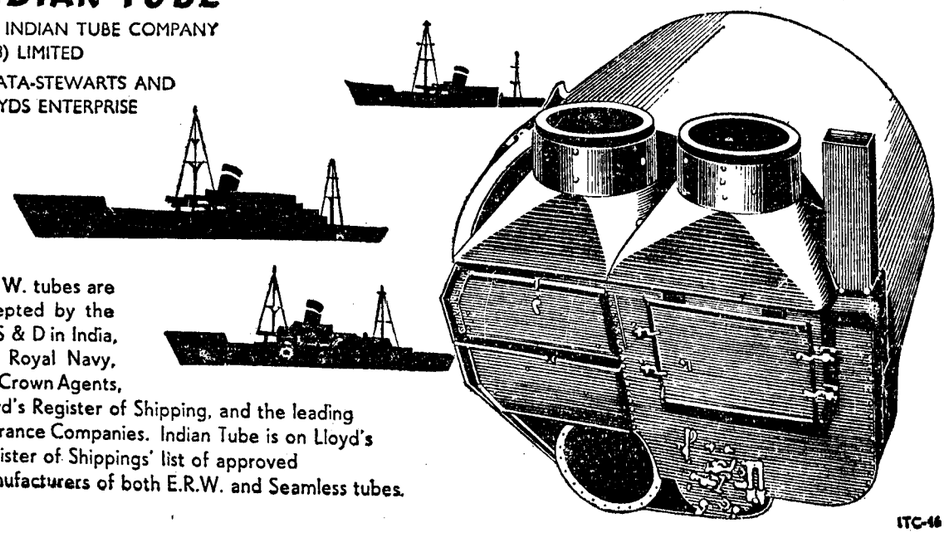
The USA, also, lined up with opponents of the British suggestion. A regional organisation in which such highly industrialised nations as Britain, West Germany, France, Italy, Switzerland and Scandinavia were all giving each other's manufactures preference over American goods would make life harder for US industries, which are already finding life difficult enough The USA could make similar objectons to the Common Market, though much less urgently because that does not include Britain; they felt that such objections were outweighed by the political advantage of Europear unity. With the British scheme, commercial discrimination against the USA would be more serious and there would be no counterveiling political gain.

Finally, there is opposition from the side of the Common Market six, above all from France, and this alone is enough to ruin British hopes of a settlement. The determination of French opposition has nothing particular to do with Prsident de Gaulle; before de Gaulle's return, as since, French doctrine has been that a country can get the benefits of the Common Market only by accepting the obligations of the Rome Treaty concerning the equalisation of conditions of competition. That means that the introduction of a customs union must be accompanied by the co-ordination of social legislation (equal pay for women, comparable

social security charges, etc.) and of commercial and financial policies. French industrialists and farmers are firmly attached to this doctrine and there is not the slightest sign that they will abandon it for the sake of a wider market for industrial manufactures. Many West German producers are ready to do so, because they have counted the cost of bringing their social overheads up to the French level, at the same time as they raise their import duties to the Continental average and allow the cheap French agricultural surplus into their protected market.

However, the West Germans are bound by treaty to do these things and, though they are procrastinating to give time for alternative solutions to be explored (such as the British customs-union plan) there is no suggestion that they will not do them. What has caused the cooling of Little European ardour in recent months is not so much the alternative commercial temptations felt by the Germans as the discordant political ambitions of President de Gaulle. De Gaulle wants to go ahead with the economic unification of the six-nation region, and there are few really serious economic obstacles to progress in that direction. But he wants this adventure to take on a quite different political significance from what the architects of the Rome Treaty had in mind. It is this that Bonn is uneasy about, more than the cost of pursuing economic integration—though of course economic costs that seem justified for one political purpose may not seem so for another. So it is not the production of some new commercial plan, such as the British customs-union scheme, that is going to decide matters, but a political agreement between Paris and Bonn.

Outsiders care little for the relative merits of the supranational integration process favoured by Bonn and the international confederation suggested by Paris. Whichever method of uniting Europe is adopted, it will lead, provided all the six nations co-operate, to some sort of European entity and will enable the process of economic integration to go forward in the Common Market. That is all that matters to the rest of the world. How much sovereignty each capital retains, or how decisions are taken on Europe's behalf (whether by supranational officials or by national ministries in congress) will be of little interest to India alongside the fact of a single European economic policy on questions such as trade agreements and foreign investment. So the issues that now divide Paris and Bonn are academic for us, once we are assured that European economic unification, in one form or another, is going to go forward. On that point there is one certitude amidst current confusion : the British suggestion for an alternative Common Market, which would have totally changed the meaning and consequences of European economic integration, has not secured enough support in any quarter to constitute a threat to further progress with the implementation of the Rome Treaty. The six Continental capitals have run into certain difficulties and they are at loggerheads about President de Gaulle's conception of their ultimate political goal, but meantime it would be safer for the overseas world to assume that the Common Market will come into existence as planned.



Recognised for their outstanding performance E.R.W. steel boiler tubes, manufactured by Indian Tube, are specially designed for protracted use in land, loco and marine boilers. High frequency current ensures efficient welding, and normalising is carried out in controlled atmosphere furnaces to produce a ductile tube with a smooth, blue finish. Rigid quality control from the raw material stage to the finished product guarantees that Indian Tube's E.R.W. tubes will meet all the tests specified by Lloyd's Register of Shipping. E.R.W. tubes are, in every respect, the equivalent of seamless tubes of similar dimensions.

Brown Recording-Integrating Flow Receiver

What is the cost of process flows for the various production departments of your plant? You must have accurate records of the quantities of steam, water, air, chemicals, fuel oil and other fluids supplied to each department to know where your money goes and why. Honeywell Flow Meters aid cost accounting by providing the information you need.

Honeywell is the recognized world's leader in the design and manufacture of automatic control equipment. An organization of more than 30,000 persons, with factories in the United States, Canada, France, Germany, Holland, Japan and the United Kingdom, Honeywell products are used in scores of widely diversified fields.

Honeywell products—more than 13,000 of them—fall into these three principal categories:

Heating and air conditioning controls and control systems for residences and industrial, commercial, public and educational buildings.
Instruments and instrumentation systems, process controls and control systems, valves, precision switches and data processing systems for business and industry.
Precision electronic instruments and control systems for aircraft and missiles.

Economic Report from the U.S.

ECONOMIC ACTIVITY

By GUY SIMS FITCH

WASHINGTON, October 4.

REASONABLY optimistic forecasts of U.S. economic activity continue to come from official sources. Last week, in a report to the annual meeting of the World Bank and the International Monetary Fund on the state of the U.S. economy — a report that has become something of a ritual at these meetings — Treasury Secretary Robert Anderson stressed the underlying strength and prosperity of the U.S. economy. He expressed the view that if the economy has not been advancing as rapidly this year as had been predicted, it is because of a fundamental adjustment to a new environment, one marked by abatment of the inflationary pressures of the past two decades. Highlight of this adjustment, in his view, has been the sharp shift in business inventory policy, from heavy accumulation to actual liquidation, as businessmen have grown more confident of a stable price level. Now, with the period of inventory liquidation apparently nearing its end, Mr. Anderson sees the U.S. economy poised for another healthy upsurge.

In contrast to some earlier experiences, the Treasury Secretary notes, this adjustment has proceeded smoothly, and has been accompanied by a continued high level of final demand for goods and services. As a result, total U.S. economic activity still has managed to climb to new peaks even during this year of basic economic change. Significantly, the adjustment to which Mr. Anderson refers, and the Government's underlying confidence in the national economy, are both reflected in the revisions which have just been announced in the Federal Budget for the 1961 fiscal year that began July 1. Last January, the 1961 budget estimates projected a surplus of $4,200 million, based on the expectation of a spending total of $79,800 million and a revenue total of $84,000 million. Now the anticipation is that expenditures will rise moderately to $80,000 million. A large change, however, concerns U.S. Government receipts, which now are expected to aggregate $81,500 million, or $2,500 million less than the January estimate. The net result is a projected 1961 budge surplus of $1,100 million, just about the same as the actual 1960 surplus.

Mainly responsible for the lowered revenue estimate is a decline in corporate tax receipts of about $2,000 million. This decline is attributable to lower profit margins than had been estimated earlier — a development that could well be tied to the kind of non-inflationary adjustment Mr. Anderson and other Government experts see taking place in the economy. On the other hand, receipts from individual income taxes are seen holding at just about the same level estimated last January. This is based on the expectation that the total personal income of all Americans will remain its record rate of about $405,000 million a year. In drawing up the revised budget estimates, Government experts now anticipate that the Gross National Product (GNP) — the total output of goods and services — will fall about 1 per cent short of the original January projection of $510,000 million for the calendar year 1960. But this is considered a rather minor deviation, one that indicates no significant slowdown in economic activity. It would still put the 1960 GNP at a record all-time annual high, about 5 per cent above the previous 1959 record. As a matter of fact, budget officials see indications that the usual seasonal improvement in business conditions, normal for the fourth quarter of the year, is getting under way. And as of now they see no reason for special concern about economic trends during the first half of 1961.

Among the important indicators showing signs of continued or renewed strength, they cite automobile sales, homebuilding, construction contracts, new orders for manufactured goods, department store sales, and freight carloadings. These are viewed as offsetting any lag in steel producton or any disappointment over the failure of unemployment to show a sizable decline. In this connection, it might be kept in mind that while unemployment has remained close to the 4 million mark, employment this year has climbed to a record high of better than 68 million. Developments in the coming months will test the accuracy of these official appraisals of U.S. economic conditions and prospects. But it is a fair conclusion, in any case, that the economy has indeed weathered the sharp inventory adjustment of the past eight months in fine style. And whether the economy starts moving up briskly again in the months immediately ahead or sometime in 1961, it undeniably has given sufficient proof of its underlying soundness and flexibility in the face of a changing situation. In fact, U.S. Budget Director Maurice Stans is more than a little hopeful that the Federal Budget for the next (1962) fiscal year also will show a surplus, under the combined influences of strong economic activity and enlightened public policies.

IOB 747 a

We are rather proud of ourselves

TODAY, banking is almost a public utility. Its success depends on its ability to give friendly and helpful service.

We modestly believe that our progress shows that our clients, whether they are industrialists, exporters or just men who want to deposit Rs. 10/- in a Savings Bank account, realise that in IOB they have an institution that has made friendly service the basis for all their activities.

WORLDGRAM

India

New Schemes for Supply of Machinery on Hire-Purchase: The National Small Industries Corporation has introduced two new schemes for the supply of machinery to small-scale units on hire-purchase basis. A sum of $10 million has been provided by the U.S. Development Loan Fund to the Corporation for the import of machines under the schemes. The DLF credit is convertible into any form of currency, except that purchase of machines valued at Rs. 2.5 lakhs would have to be made from the U.S.A.

*

Setting Up of Three Regional Labour Institutes: For the establishment of three Regional Labour Institutes at Calcutta, Madras and Kanpur, with the assistance from the United Nations Special Fund, operational plans were concluded recently. Extending the activities of the Central Labour Institute at Bombay to other regions of India, viz. Calcutta, Madras and Kanpur, these three Regional Labour Institutes will be modelled, although on a reduced scale, on the Central Labour Institute, Bombay, which was set up to provide facilities for research on the human factors involved in rapid industrial development, and for education and training of persons drawn from Government service and employees and workers organisations in most suitable techniques for investigating and controlling the mental and physical stresses which may be responsible for accidents, diseases, discomfort and diminished productivity. Each institute will comprise of a museum of industrial health, welfare and safety and industrial hygiene laboratory, a library and information centre and a training centre. Training research programmes will be related to the worker in his environment to physiological factors of work, method study, productivity and supervisory skills.

*

Trade Arrangement with Afghanistan Extended: To renew the existing trade arrangements between India and Afghanistan until July 20, 1961, an agreement has been concluded in Kabul following the visit to Afghanistan of an Indian Trade Delegation. The two Governments have reaffirmed their desire to promote trade between them and take such special steps, in terms of the Treaty of Friendship and Commerce between them, as might be found practicable. It has been agreed that facilities will be afforded to registered importers for importing into India, dry and fresh fruits, hide and skins, etc. Likewise, facilities will be afforded for import into Afghanistan from India of goods like cotton and woollen textiles, tea, light engineering goods, pharmaceuticals, drugs and chemicals.

*

Foreign Trade in Merchandise in August 1960: The provisional figures of India's trade in merchandise by all routes—sea, air and land—on private and Government accounts, during August 1960, according to information available in the Department of Commercial Intelligence and Statistics, Calcutta, are given below:

Exports	Rs. 56,03 lakhs
Re-exports	Rs. 1,01 lakhs
Imports	Rs. 82,73 lakhs
Balance of Trade	Rs.—25,69 lakhs

These figures exclude overland trade with Nepal, Tibet, Sikkim and Bhutan. The import figures are exclusive of the value of certain consignments of Government stores awaiting adjustment and of private merchandise under reference to customs for verification.

Table I below brings together the provisional figures for August 1960, along with similar figures for July 1960, August 1959 and the revised figures for August 1959.

TABLE I

India's Foreign Trade During August 1960 July 1960 and August 1959

(In lakhs of rupees)

Foreign trade in Merchandise	For the month of			
	August 1960	July 1960	August 1959 Provisional	August 1959 Revised
Exports	56,03	47,91	58,26	56,89
Re-exports	1,01	1,53	26	26
Imports	82,73	73,70	58,37	65,23
Balance of Trade in Merchandise	—25,69	—25,16	+ 15	—8,08

The cumulative total for the five months ended August 1960, are shown along with the corresponding figures for 1959 in Table II below:

TABLE II

India's Foreign Trade During the Five Months April-August 1960 and April-August 1959

(In lakhs of rupees)

Foreign Trade in Merchandise	Cumulative totals for the five months April to August		
	1960	1959	
		Provisional	Revised
Exports	245,16	241,03	235,73
Re-exports	5,38	2,13	4,01

Balance of Trade in Merchandise	—158,37	—102,13	—154,37

U.S.S.R.

New Irrigation System In Tajikistan: Construction of a new irrigation system has been started in the South-East of Tajikistan to bring water to the large Maida-Patta region at the foot hills of Kara Tau Range on the bank of Kzyl-Su river not far from the border of Afghanistan. In one year's time 4,000 hectares of land will be irrigated in South-East Tajikistan wherefrom 10,000 to 12,000 tons of cotton will be grown annually. The 20-kilometre long trunk canal forms the backbone of this irrigation system. After the completion of this project work will be started on the other bank of the Kzyl-Su river where another irrigation system to water 6,000 hectares of virgin land is to be built.

United Kingdom

Motor Car Factory in Scotland: For the first time since 1928, motor car production is returning to Scotland. A £22 million factory is to be built at Linwood, Renfrewshire, for the production of new Hillman model, smaller than the Minx, within the next two years. Covering more than 200 acres, the factory will give employment to 5,500 and an initial output of 1,50,000 cars a year is planned. The Baby Hillman will be a high quality small car, the manufacturers, Rootes Motors, promise.

France

The Agricultural Situation: Following is a resume of the agricultural situation in general in France at the beginning of September 1960: Wheat: Harvest estimates are for more than 107.5 million quintals. Hard wheat will produce only 7,00,000 quintals. Barley: An estimated harvest of 55.7 quintals, which would be the best since 1956. Oats: An estimated 27.5 million quintals. Maize: A very large harvest is expected. Initial estimates are for 26 million quintals, which is almost 8 million quintals more than the record harvest of 1959. Potatoes: The harvest will only be an average one. Industrial beets: the harvest would nearly total 154 million quintals, which will be by far the largest ever recorded. The average yield of 373 quintals per hectare will also set a new record. Fruits and vegetables: The harvest of green vegetables would be excellent. The pear harvest is excellent and the apple harvest which is just beginning would be large. Wine: The predicted harvest as of first September was more than 58 million hecto-liters. From the quality point of view 1960 will not be a particularly good year. Animal produce: Seasonal milk production is good. In many places there is difference of 15 to 20 per cent in the outputs of August 1959 and August 1960.

Australia

Decimal Currency Plan: The decimal currency committee, appointed by the Federal Government, has recommended that Australia replace its present system of pounds, shilling and pence with a decimal currency on the second Monday of February, 1963. The Government has already adopted, in principal, the idea of a decimal currency. The Committee recommended a new major unit equal to 10 in the present currency subdivided into 100 cents, with the following subsidiary coins:

Decimal Coins	Present Value
20 Cents	2/-
10 Cents	1/-
5 Cents	6 d.
1 Cent	1.2d.

The Committee did not favour a half cent coin, and suggested that the halfpenny be used as a half-cent coin during the transition from £ sh. d. to decimal currency. It is stated that the new currency would effect savings in time and effort which would outweigh the inconvenience and costs of the changeover. The estimated costs of converting machines to decimal operation—the major cost involved—would be £3,10,00,000 spread over four years. A number of smaller costs could not be measured. In the transition period of about 2 years following the changeover, the Government should allow both new and old coins to operate concurrently, it was suggested. The banks should operate in decimal currency from the changeover date because of their key role in the system.

Canada

Supply of Wheat to India: Canada has offered to supply to India $7m. worth of wheat under the Colombo Plan. This is part of a total Canadian assistance of $25 m. allocated under the Colombo Plan for 1960-61. The Government of India has accepted the Canadian offer. Counterpart funds from sale proceeds of wheat will be utilised in projects of economic development in India. Canada has been giving aid to India under the Colombo Plan for purchase of wheat during the last several years. In 1959-60, Canadian wheat worth $7 million was received under this programme; in 1958-59, the quantity received was worth $18 million.

Japan

Net Export Earnings in 1959: Net Export earnings of Japan have been increasing year after year since they touched bottom in 1954. The rate of net export earnings for all commodities, measured by the Economic Planning Agency, stood at 84.3 per cent in 1959, an increase of 0.8 per cent from the previous year. The high rate for 1959 is attributed to the greater relative importance of exports whose rates of net earnings are high in the composition of exports, and the continued improvement in the terms of trade.

Yugoslavia

Decentralised Banking: Yugoslavia has launched several new schemes recently in an endeavour to bring her banking and credit system in conformity with her changed economic needs. Within the said reorganisation quite new functions of certain banks are provided. This refers in the first place to the National Bank which is to become the bank of other banks. Its principal tasks will include the transactions concerning the emission of money, the whole payment turnover in the country and abroad, public accounting service and certain functions regarding the regulation of relations with foreign countries. There are two very significant novelties. The National Bank will no longer appear as creditor of economic organisations (except in special cases). This business will be taken over by business banks. On the other side, the National Bank will assume the role of general social treasurer, through which the whole payment business in the country (except that which is made in favour of private persons, housing councils and housing communities) will be carried out. It is estimated that in this way a basis will be created with the National Bank for a successful performance of the tasks resulting from the Law on Public Accounting. In addition to this, the National Bank will in future also be regulator of the whole credit policy.

Poland

New States and the Polish Foreign Trade: As more and more States are emerging into independence in Asia and Africa, Polish foreign trade with these areas is rising. In 1956, the value of Polish export to the countries of Asia, Africa and Latin America amounted to 60.5 million dollars, while in 1959 it rose already to approximately 76 million dollars. A still higher rate of increase was shown by the Polish import from these countries raising from 46 million dollars in 1959 to 113 million dollars last year. The share of these countries in the Polish foreign trade turnover rose, in the years 1956-59 from 6.1 to 6.7 per cent in the import. The main trade partners of Poland from the point of view of turnover, are Brazil, Argentina, U.A.R., Turkey, India, Sudan and Morocco. They account for 80 to 90 per cent of the Polish trade turnover with Asia, America and Latin America. Particularly noticeable is the Polish trade with Africa, Egypt, Ghana, Sudan, Morocco, Tunisia and Guinea which accounted for approximately 90 per cent of the Polish-Africa trade.

Uruguary

Tallow Imports: Uruguay has decreed that tallow may be imported for any surcharges or prior deposits. In recent months soap manufacturers have begun to import tallow because of reduced domestic supplies. Since December 1,045 metric tons have been bought from Argentina, and a 1,000 shipment from the United States was delivered in May. Soap makers expect tallow imports to reach 6,000 tons by the end of the year, and the United States may gain a substantial share of this market.

Chile

Land Reform Programme: As a part of its general programme to increase self-sufficiency in food output and reduce farm imports, Chile has passed a law accelerating land reform and colonisation activities. The law permits the President, through the Colonisation Bank—a semi-government agency—to expropriate private lands for colonisation when it is determined that owners are not utilising them effectively.

NEWS IN BRIEF

INDIAN

The Government of India have decided to permit the setting up of new units for the manufacture of different types of machine tools. This step is being taken to step up the domestic output of machine tools and reduce the country's dependence on imports as much as possible.

*

Eleven projects for the construction of 3,452 houses were approved by the Government of Maharashtra, Orissa, Andhra Pradesh, Madhya Pradesh, Madras, Mysore and West Bengal under the subsidised industrial housing scheme in August, 1960.

*

The President has given assent to the Madras Buildings (Lease and Rent Control), Bill, 1960. The new measure, among other things, provides for regulation of letting out of residential and non-residential buildings, control of rent and prevention of unreasonable eviction of tenants from such buildings in the State of Madras.

*

The National Development Council has recently laid down that 3,200 pilot projects for co-operative farming should be undertaken, in addition to the programmes for the development of co-operative farming to be formulated by the States for the Third Plan period.

*

The Mysore Geological Department has discovered extensive deposits of iron ore estimated to be of the order of three crore tons near the Kodachtdri Hills in the Chickmagalur district.

*

India had a favourable trade balance of Rs. 84 lakhs with Poland in the first quarter of the current year against an adverse balance of Rs. 39 lakhs in the corresponding period of last year.

*

Mechanisation of rice cultivation through use of improved farm implements will be introduced in India with Japanese collaboration.

*

The Government of India has decided to permit the import of a limited quantity of seed potatoes from Burma on rupee payment during the half year October 1960 — March 1961, says a Government press note.

*

The President has given assent to the Madhya Pradesh ceiling on Agricultural Holdings Bill, 1960. The bill seeks to provide for a more equitable distribution of land in the State of Madhya Pradesh by fixing ceilings on existing holdings as well as on future acquisition of agricultural lands.

*

The Central Board of Trustees of the Employees Provident Fund recently recommended that the Central Government should extend the Act to as many remaining industries as possible.

*

There was an increase of 1.4 per cent in employment opportunities in the public sector during the quarter ended December, 1959, according to the data collected by the Employment Exchanges.

FOREIGN

To the end of June this year world agricultural output showed a rise of about 2 per cent as compared with the estimated annual population growth of 1.6 per cent.

*

Grey cloth exports to Britain in the third and final year of the Hong Kong-Lancashire pact will be reduced to 44 million square yards under a unanimous agreement reached recently by eight interested organisations.

*

Yorkshire Imperial Metals and Imperial Chemical Industries have decided to combine their activities in the marketing of polythene tube. Following this it has been agreed that Yorkshire Imperial Metals should assume sole responsibility for marketing "Alkathene" polythene tube. The combined product of the two companies is to be known as "Polyorc - Alkathene."

*

West Germany's gold and foreign currency reserves rose by DM 220.6 million in the third week of September. On September 23, gross reserves stood at DM 29,950.2 million. Foreign liabilities were DM 427 million.

*

An agreement has been signed by the Pakistan Government, the International Labour Organisation and the United Nations (Emergency Fund) for a Rs. 10 million project for the establishment of an industrial centre in East Pakistan.

*

The Polish Government has offered Ceylon a fleet of cargo vessels and trawlers on long term credit. Negotiations will be initiated by Ceylon soon on details of the offer, which was reported to have been welcomed against the background of the Ceylon Government's decision to build up its own merchant marine.

*

The West German business world is making available DM 1000 million for long term united credits to underdeveloped countries at an interest rate probably below 6 per cent.

*

The International Finance Corporation increased its number of investments by more than 50 per cent (from 22 to 33) and the dollar volume of its commitments by 100 per cent (from $21 million to $42 million) in the year from July 1, 1959 to June 30, 1960.

*

Benson and Hedges (Canada) will build a $2 million cigarette factory in Peel Village Industrial Park, South of Brampton, Mr. S. Basch, the Vice-President of Canadian Operations, announced recently.

*

What is claimed as Nigeria's biggest industrial project yet, a £4 million cement works, is now being erected by West African Portland Cement at Ewekoro, 40 miles north of Lagos. Production is expected to commence toward the end of October and will be at the rate of 200,000 tons a year.

*

A new bank, the Swiss-West Indies Bank Limited, is to start operations in October at Port of Spain, Trinidad. With a capital of 480 million West Indies dollars (over £97 million), the new bank will take part in the financing of various development projects in the British West Indies.

Special Article

ROAD TRANSPORT IN THE THIRD PLAN

By

M. R. MASANI

"INDIA has set its feet on the path of economic development so that the standard of life of the people may be raised, and transport has a vital part to play in ensuring that the country is opened up increasingly for the movement of passengers and the transport of goods. Plans of agricultural and industrial development alike can founder if the arteries of transport harden and do not perform their function", observes the Report of the Road Transport Reorganisation Committee appointed by the Union Government. The Report elaborates on this thought by pointing out that "education, health and national prosperity all depend in a large degree on an efficient road transport system. Good road communications encourage the production and marketing of perishable articles, such as fruits, vegetables, milk and eggs, give the cultivator access to the outer world from which to obtain fertilisers, oil engines, and know-how about improved methods of agriculture, promote the development of industries and facilitate the exploitation of mineral and other natural resources. The role of road transport in the context of a modern State and a planned economy is perhaps so self-evident as scarcely to require to be mentioned."

The Report of the Road Transport Reorganisation Committee was endorsed with unanimity in a discussion that took place in the Lok Sabha and the then Minister for Transport and Communications, Mr. S. K. Patil, warmly welcomed it and gave the assurance that Government would carry out its recommendations.

RECENT STUDIES

Two recent studies made by the National Council of Applied Economic Research have highlighted the importance of road transport to our economic development. The first of these studies, which was on "The Contribution of Road Transport to the Public Exchequer", comes to the conclusion that the financial contribution of road transport to the national revenues is greater than that of the railways, both in absolute terms and in terms of the return on capital invested. The gross contribution made by road transport works out to Rs. 133.55 crores for 1957-58, while the overall net contribution excluding the cost of road construction is placed at Rs. 95.55 crores. In terms of return on capital invested in roads, the net contribution works out at 16.59 per cent considering operational payments only, while it comes to 19.11 per cent considering all payments. The net contribution works out to 21.7 per cent on capital invested in the road transport units in terms of operational payments only and to 25 per cent in terms of all payments not taking into account the net profits of the operators. Relating the net contribution to the overall national capital invested in roads and road transport, the rate of return works out to 9.4 per cent in respect of operational payments and 10.8 per cent in terms of all payments by the industry.

The Report also points out that there has been considerable capital formation at the level of the road transport operators. The system of hire purchase of vehicles offers itself as a means of capital formation out of profits. Road transport corporations have reserves which work out to 9.5 per cent of their capital outlays, while in the Punjab private operators show reserves forming 36 per cent of the capital at charge.

The other study, which is on the "Employment Potential of Road Transport", is equally encouraging. Pointing out that road transport accounts for a considerable volume of employment widely dispersed regionally and occupationally and, on the whole, in the lower income categories, the Report comes to the conclusion that road transport provides livelihood for far more people than the railways. The employment provided by road transport is estimated at 2.4 million persons and employment per commercial vehicle at 12.63 persons inclusive of direct and indirect forms of employment. The Report points out that there is a certain amount of under-utilisation of roads in terms of vehicle miles making use of the track. This is obviously traceable to the restrictive policies of regional transport authorities towards motor transport operators and, to a lesser extent, to the bad condition of roads. Improvement under both these heads is likely to raise the utilisation factor in regard to roads and to increase still further the employment potential of the industry.

PROVISION FOR ROADS

It is against this background that the provision made in the Third Five-Year Plan for the development of roads and road transport can be properly evaluated. The provision for roads in the Third Plan is Rs. 250 crores, out of which about Rs. 25 crores are expected to come from the Central Road Fund. This provision is practically the same as that made during the Second Five-Year Plan. In view of the fact that, in point of allocation of funds in the State sector, the Third Plan is 1.6 times the size of the Second, the allotment to roads should proportionately be Rs. 400 crores. It is thus obvious that road transport has this time been relegated to an inferior position. This setback is further underlined by the fact that the Chief Engineers of all the States have submitted to Government a 20-year Road Plan estimated to cost about Rs. 5,200 crores and that the allocation suggested by them for the Third Five-Year Plan period was Rs. 590 crores. Instead, only Rs. 250 crores have been provided.

It looks only too likely that, if this allotment is not radically revised, it will not be possible even to build major bridges on the National Highways during the Third Plan period as was originally intended. Traffic on the roads has been increasing from day to day and the estimated production of all commodities requiring long distance transport in 1965-66 has been estimated at about 300 million tons as against about 180 million tons in 1960-61. The gap in our National Highways left by unbridged rivers is a serious bottleneck and, even after ten years of planning, it has not been found possible for the National Planning Commission to remove it. The Indian Roads Congress through its Roads Transport Development Committee has suggested that all National Highways and 50 per cent of State Highways excepting hill roads should be upgraded by 1965-66 in respect of foundations, surfacing and bridges to carry vehicles of 27,000 lbs. of laden weight on two axles.

In the light of all this, it is obvious that the provision for roads needs to be reconsidered so as to make it possible at least for major bridges and foundations on these roads to be ensured leaving the surfacing to the Fourth Plan. Alternatively, the National Highways can be completed by 1965-66 in respect of bridges, foundations and surfacing, leaving State Highways to the Fourth Plan. Since it is mentioned on page 248 of the Draft Outline of the Third Plan that the provision in regard to roads is likely to be reconsidered, perhaps one may still not lose hope altogether on this point.

PROVISION OF VEHICLES

When we turn to road transport, we find that the targets of the Third Plan are 30,000 cars, 10,000 jeeps and 60,000 commercial vehicles per annum by the year 1965-66. These figures have to be placed against the estimated production in 1960-61 of 20,000 passenger cars, 5,500 jeeps and 28,000 commercial vehicles. The estimate of our additional requirements in regard to vehicles on the basis of an increase in the national income shows that there should be about 145,000 cars and jeeps and 215,000 additional commercial vehicles. If these figures are correct, it would follow that the targets for the Third Plan should be about 40,000 cars, 12,500 jeeps and 75,000 commercial vehicles in 1965-66.

The Road Transport Reorganisation Committee had pointed out in its Report that experience all over the world has been that road transport develops far more rapidly than rail transport and that the same thing would happen in this country also. Pointing out that road transport is about three times as fast as rail transport and that speed is of vital importance in a developing economy, the Committee had come to the conclusion that "in our future plans, road transport will inevitably play a far greater role than at any time in the past and will have to be developed on a larger scale." Suggesting that the major trends of economic and technological developments in the field of transport in other countries should be borne in mind, the Committee had suggested that "any attempt to turn back the wheels of progress and to cling to a mode of transport that is no longer the most efficient or speedy would be to do grave injury to the basic interests of the country."

BIAS FOR RAILWAYS

In the light of this, it is disturbing to find that, as against the altogether inadequate allocations made for roads and road transport, railways are still given in the Third Plan the lion's share of the funds, amounting to Rs. 890 crores in addition to Rs. 330 crores from their Depreciation Fund, as opposed to Rs. 250 crores for roads and Rs. 18 crores for nationalised road transport. This highly discriminatory and biased treatment flies right in the face of all technological or economic criteria and it raises doubts about the objectivity which has been brought by the National Planning Commission to the task of balancing various needs. Whether this distortion of the country's needs is due to the unequalled power of the Railway Board, which is the most effective lobby in this country, or whether it is because, while the Railways are a State monopoly, road transport is by and large being developed by people's enterprise, the result is equally disastrous.

Whatever its merits or demerits from any other broader point of view, those who had looked forward to the development of roads and road transport as an important aspect of our national advance will find in this Plan a cruel disappointment.

Industrial Instruments for
INDICATING CONTROLLING & TESTING

For Process Control Equipment in all Industries and for efficiency in Fuel consumption

GAS ANALYSER — H&B — M/s Hartmann & Braun, Germany. Electric and Electronic indicating, recording and controlling instruments for temperature, pressure, level, flow, pH etc. and gas analysers

COLORIMETER — REINEKE — M/s Apparatebau Josef Heinz Reineke Germany. Automatic hydraulic controllers for Caloric value of fuels and for flow and pressure of liquids, steam and gases, Automatic Calorimeters: Remote control safety valves etc.

For Material Testing of Metals, Textiles, Paper, Plastics & Rubber.

DIAL THERMOMETERS — M/s Dreyer Rosenkranz & Droop, Germany. Pneumatic controllers, indicating recording and controlling gauges, and thermometers and special temperature control equipment for dairies. TEMPERATURE CONTROL PANEL FOR DAIRIES

HAND TACHOMETER — SMITHS — M/s Smiths Industrial Instruments, London. Mechanical Indicators and counters, Hand Tachometers, Speed Indicators, Pick counters, Loom Revolution counters etc.

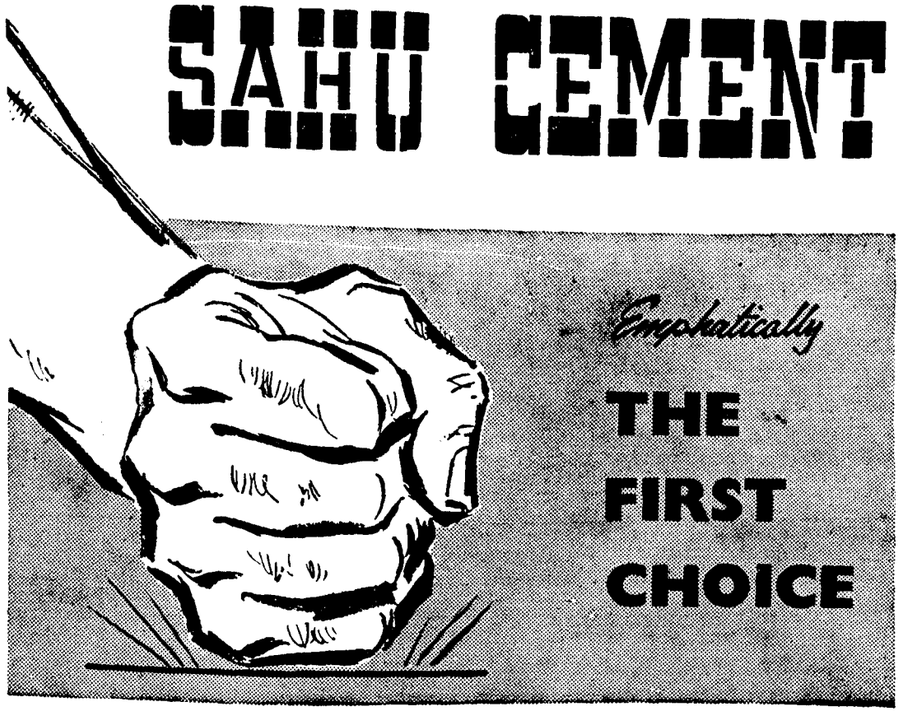
SAUTER — M/s Fr. Sauter, Switzerland. Refrigeration & air conditioning controls, pneumatic and electric controllers, time switches, timers, solenoid and motorised valves etc. REFRIGERATION VALVE

TENSILE TESTER — FRANK — M/s Karl Frank G.m.b. H., Germany. Material testing instruments for METALS, TEXTILE, PAPER, PLASTIC and RUBBER industries including Universal Testing Machines, Hardness Testers, Bursting strength Testers, Stiffness Testers, Crush testers, Abrasion testers etc.

ECHOSKOP — LEHFELDT — Dr. Lehfeldt & Co. G.m.b.H. Germany. For Non-destructive testing of metals, ultrasonic Echoskops etc.

For Quality Test in Chemical & Pharmaceutical Industries.

pH METER — BECKMAN — Beckman — M/s Beckman Instruments Inc. U.S.A. pH meters, Spectrophotometers for ultraviolet visible and infra-red regions of spectrum. Oxygen analysis, Gas Chromatographs etc. Industrial Control Equipments as pH controllers & recorders etc.



For Chemical & Spectro-chemical Analysis in Ferrous, nonferrous, Cement & Chemical Industries.

QUANTOVAC — M/s Applied Research Laboratories, U.S.A. 'Quantovac' direct reading spectrographs for complete analysis of steel, iron etc. including C.S.P. Contents, X-Ray, Industrial Polychromators for analysis of copper & copper base, alloys etc; 1.5 meter and dual grating spectrographs for general spectro-chemical analysis.

THE BUSINESS WORLD

X-Ray on Exports

By CROESUS

ARE WE doing everything in our power to step up this country's exports? This seems to have been the question that was raised and answered—not very much to our credit, I am afraid—in Bombay last week. The occasion was the meeting of the Standing Committee of the Export Promotion Advisory Council, held this time in Bombay in accordance with a decision to hold such meetings outside Delhi in all major port towns by rotation. Considering the interest that the meeting seems to have evoked by reason of this healthy departure from tradition, it is not surprising that Mr. B. C. Shroff, President of the All India Exporters' Chamber, should have suggested to Mr. Satish Chandra, the Union Deputy Minister of Commerce and Industry, that the meeting of the Export Advisory Promotion Council also should be held by rotation at the major port towns. I do not know, if the mere holding of such meetings will make the people of the place where the meetings take place any the more export-minded or remove any prejudice against exports in their minds. But the meetings are bound to make the people engaged in the export industries and in the export trade at least of the region concerned feel that their problems are being placed before the highest tribunal of export organisation in the country and thereby provide an opportunity for the latter to examine these problems or difficulties at first-hand. Perhaps, Mr. Shroff was right when he suggested that "the export consciousness of the people is not sufficiently aroused to the extent desired." However, one sees lately visible signs of such consciousness, which, I feel, is partly due to the decline in our foreign assets to below Rs. 140 crores and partly to the stark reality that a stage has been reached when our servicing and repayment obligations in respect of foreign loans are today greater than the new inflow of capital. Export promotion measures need to be thought, therefore, with greater seriousness than ever before. Our exports must receive what we call "wartime priority." It is only then that one can think in terms of fulfilling the targets adumbrated in the Draft Outline of the Third Five-Year Plan.

Viewed against this background, the efforts that are being made by the authorities or by the industries and the trade do not appear to be adequate. One fails to discern either a sense of proportion or a sense of urgency in these matters. Indicative of the absence of a sense of proportion, for instance, is the following observation by a Deputy Director of the Railway Board in an article in the September, 1960, issue of "Indian Railways," to which Mr. M. P. Gandhi is reported to have drawn the attention of the Central Advisory Council of Industries held last month: "For example, there could be no justification for granting concessional freight rates for tea or jute—our traditional items of exports—the export traffic of which was of long standing and thus even otherwise moving free." It is doubtless such complacency which explains the decline in our exports of tea.

The lack of a sense of urgency is evident from some of the observations made by Mr Satish Chandra himself at the meeting of the Standing Committee of the Export Promotion Advisory Council. Here are a couple of them: (1) "The various sub-committees appointed at the last meeting have not been able to submit their reports." (2) "This matter" (the question of the setting up of an organisation for giving status information about Indian exporters) has been discussed by this Committee several times in the past and yet we have not been able to come to any conclusion about the agency that should take the initiative in setting up this organisation."

Lest the impression should be formed from what I have said above that nothing is being done, I must hasten to refer to a few welcome decisions that were announced or are proposed to be taken by the Government. For instance, at the meeting of the Standing Committee of the E.P.A.C., it was announced that the Government of India has accepted in principle the recommendation of the Standing Committee that export houses should be set up for purposes of tapping the export potential of various commodities. The Committee seems to have felt that the establishment of three or four well organised export houses of repute in India would serve as an effective instrument to boost exports of Indian goods, particularly in the case of difficult or non-traditional items of exports. Of course, these export houses also will enjoy the same concessions and facilities as are at present allowed to other exporters. Another important decision of the Government, also announced at the meeting, was the one to appoint a committee for devising machinery for quality control and free inspection of export goods. This, it seems to me, is an instance of avoidable procrastination, for setting up a committee means stalling. This work could very well have been undertaken by the Director-General of Supplies and Disposals, as had, in fact, been recommended by the Standing Committee itself at an earlier meeting. But the Government has turned it down on the facile plea of "administrative difficulties." The decision to set up a committee no doubt, proves the bona fides of the Government in regard to this question, but it is also the way so well known to bureaucracy of putting off a decision indefinitely. Another important pre-requisite to a sound export drive which has suffered a similar fate is an organisation for giving status information about Indian exporters. It is unfortunate that the Federation of Indian Chambers of Commerce and Industry should not have found it possible to present a workable scheme; instead, it was content to reiterate its earlier suggestion for a working group to go round the country, to collect information and create a suitable climate as a preliminary to the setting up of such an organisation. Nor was the suggestion received from other quarters to call in the help of the TCM in this connection imaginative enough. As Mr. Satish Chandra pertinently observed, one is unable to appreciate why the help of the TCM experts is necessary to gather information and discuss the subject with the trading interests in our own country. Such, if I may say so, is only an indication of the unfortunate extent to which we have tended to become dependent for almost anything and everything on foreign exports. Anyway, here, again, the question has been "solved" — "or is it shelved"?—by asking the Chambers of Commerce and other trade bodies and representatives of Government

— to quote the finely worded official communique — to study the problem further with a view to investigating ways and means of perfecting or further improving the methods of collecting information in regard to the status of exporters which are at present used by the Chambers of Commerce and Banks.

Perhaps the most important decision of the Government disclosed to the meeting was the one to set up a Review Committee to evaluate the existing export promotion measures. The decision has not come a day too soon, but then, the personnel of this committee has yet to be announced, and the Deputy Minister of Commerce and Industry stated this in a manner that does not betoken any sense of urgency: "We shall shortly announce the composition of the committee."

From a perusal of the speech of Mr. Satish Chandra, it is clear that the members of the Standing Committee were provided with plenty of literature and data, some of which at least, I feel, could have been profitably passed on to the Press, if only as "background information." Be that as it may, one of such items was a copy of the Export Plan for 1960-61. This plan, we are told, covers 165 items which account for 90 per cent of our exports with a total targetted value of Rs. 650 crores. It was heartening to hear Mr. Satish Chandra refer to the record exports in August, especially after what had been stated by Mr. Lal Bahadur Shastri, the Union Minister of Commerce and Industry, at the Eleventh Meeting of the Central Advisory Council of Indusries on September 22, 1960. He had then gloomily indicated that, while, during the first half of 1960, our exports had been much better as compared to the first half of 1959, the July exports had declined and the August exports seemed to have fared no better. As against this, Mr. Satish Chandra disclosed that our exports touched the figure of Rs. 57.04 crores, the highest for the first eight months in 1960. In the period January-August, 1960, the total value of our exports, including re-exports, was Rs. 408 crores, or an increase of Rs. 34 crores over our exports for the corresponding period of 1959. In view of this, it seems that the annual export trade anticipated in the Third Five-Year Plan at Rs. 690 crores seems to be pitched rather low. As Mr. M. P. Gandhi is reported to have observed at the meeting of the Central Advisory Council of Industries, during the Third Plan period, the current year's target (Rs. 650 crores) can be increased appreciably. But this implies special efforts to promote our exports, and by far the most important of such efforts, and the one which the Deputy Minister for Commerce and Industry also underlined, is to devise methods of keeping up the reputation of our goods. As he rightly pointed out, even a few complaints give a bad impression about the country as a whole and, in the result, it is not only the business of the bad exporters but that of even the better type of exporters that will be adversely affected, which means that the whole country will stand to lose. Mr. Satish Chandra was not at all exaggerating, therefore, when he said "I feel that it is a very serious matter which must be given due attention by the Committee with a view to finding positive lines of action to be adopted by the Export Promotion Councils, Boards, and others.

Again, if the goal of more exports is to be reached, the Government cannot afford merely to sermonise and stop there. While trade and industry should, of course, do their primary function, the Government also should actively help and co-operate in the task of export promotion. As Mr. N. L. Kara of the All-India Exporters' Chamber put it "no activity under the present circumstances can fully succeed without the Government's co-operation." The Government's co-operation can take several forms. For instance, it might profitably undertake—and this was indicated by Mr. Gandhi at meeting of the C.A.C.I. — to accord top priority for export industries in setting up new industries. To quote him, "hereafter, the emphasis will have to shift towards the development of export industries in an aggressive manner." He went so far as to say that there must be "a six months' holiday from industries," meaning an almost complete suspension of issue of further licences for new industries till the existing industries settled down and, during this interval, he added, the Government should consider issuing licences only for such industries as satisfy the criterion of immediate export possibilities. There are others besides, which have all been indicated at one time or other, though they remain to be implemented yet.

Business Notes

Joint Ventures

PROBLEMS POSED

THE INTERNATIONAL FINANCE CORPORATION'S annual report for the fourth year ended June 30, 1960, makes a departure from the conventional pattern and starts with a novel chapter on "Management of Industry in the Developing Countries". The observations made and comments offered in this chapter are based on the experience of IFC during the last four years of 17 under-developed countries in which it has extended aid and 17 others in which it has investigated projects asking for investment assistance. These observations are as interesting as they are instructive. They need not be taken as representing any insurmountable difficulties, but essentially they highlight the problems that will stand in the first few years.

Foreign investors in prospective joint ventures entertain initial apprehensions to the effect that as a result of differences in the business traditions and practices of the countries inviting capital, there is a likelihood of disagreement among local and foreign shareholders and also the possibility of unduly limiting the management's freedom of action. Local investors, on their side, are so wedded to the traditional pattern of family ownership or ownership of related groups that they are many a time reluctant to break that tradition. But the volume of capital investment required is so large and it also contains a foreign exchange component of such an order and at the same time the need for technical experience is so pressing that this reluctance breaks down sooner than expected. On the whole, joint ventures give the foreign investor the superior advantage of establishing identity of interest with the local population—a benefit which unmixed foreign private investment does not enjoy. The area of joint ventures is expanding faster than anticipated.

One of the important conclusions drawn by IFC is: "In industrial operations there is more likely to be a shortage of qualified financial experience than of engineering. Technical Education is much more widespread than training in finance and business." In the capital-receiving countries there is a large number of business men well versed in financing commercial operations. But industrial finance and its management is a relatively new field. The primary tools of financial management in modern industry undoubtedly are sound accounting including cost accounting, budgeting and auditing. The general experience is that in the under-developed countries accounting practices are unequal to the needs of modern industry. To the potential investor they do not give sufficient information which would enable him to arrive at accurate facts and their objective interpretation which are vital aids to planning and programming for new ventures. Cost accounting in particular is in an unsatisfactory condition. Estimates of working capital are usually on the low side and too much reliance is placed on the likely availability of bank credit for this purpose. These features have been described in the report not as handicaps to collaboration, but as important aspects in relation to which capital-receiving countries should rationalise and strengthen their practices.

Industry

SIGNIFICANCE OF CONSUMER GOODS

CONTINUOUSLY RISING prices during the last few years have attracted the attention of almost all those who are concerned about the economy. Recently, Mr. J. R. D. Tata, Chairman of the Tata Iron and Steel Company Ltd., while presiding over the annual general meeting, stressed the significance of consumer goods as a disinflationary measure. He pointed out that large-scale investments with long drawn out periods of fruition involve pumping into the economy corresponding increases of purchasing power which are automatically translated into demand for consumer goods. In view of the limited availability of foreign exchange, the import of consumer goods is highly improbable. Criticising the Government's policy of restricting the production of consumer goods, he pointed out, as an instance, that a mere increase of 16 per cent of mill made cloth to 800 million yards, during the Third Plan was not realistic at all. The demand for cloth, like many other consumer goods, is bound to increase much more than that. Apart from internal consumption, several consumer goods have to be exported in larger quantities. It is apparant that Mr. Tata's warning is quite timely and positive steps should be taken to counter inflation through higher production of consumer goods.

In this connection Mr. Tata was of the opinion that the participation of foreign capital can play an important role. With the present shortage of foreign exchange and the large amount of capital expenditure involved in the production of certain consumer and semi-consumer goods, it is quite obvious that new ventures become more practicable if the co-operation of foreign firms is enlisted and they are induced to join the local producers more vigorously. It may be remembered that the US economy in the initial stages of industrial growth received a considerable amount of fillip through capital imported from the then industrially advanced countries. Considering the state of the economy today, the Government should adopt adequate measures so that foreign capital finds a favourable atmosphere for investment. Foreign assistance and foreign collaborations are likely to form the pivot of the success of Third Five-Year Plan.

MYSORE PAPER'S PROGRESS

AT THE 25th ordinary general meeting of Mysore Paper Mills Limited, held recently at Bangalore, Mr M. D. Shivananjappa, Chairman and Managing Director, had satisfactory progress to report to the shareholders. It is not only that production has increased during the year 1959-60 to 8,700 tons (the previous year's production being 8,000 tons) but turnover too has increased considerably. In the year under review it was Rs. 1,41,31,000, i.e., an increase of Rs. 16 lakhs over the last year. The good effects of the larger turnover and increased production have been reflected in the accounts. Rs. 7,63,175 have been provided for depreciation on fixed assets calculated in accordance with the rates allowed for normal depreciation and extra shift allowances as per Income Tax Act and Rs. 14,601 towards the Development Rebate. In regard to the dividend a payment of 15 per cent is proposed which after deduction of tax will give a net return of 10.5 per cent or Rs. 1.05 per share. Mr Shivnanjappa pointed out that the financial results would have been still better if the prices of different varieties of paper would not have been reduced. He made a strong plea for the revision of prices of paper pressing the point that there was not likely to be any prospect of any decline in prices of raw materials, coal and chemicals, wages and salaries and if prices were not revised it would affect adversely the expansion of existing units and the starting of new ones.

It is also noteworthy that industrial licence under the Industries (Development and Regulation) Act 1951 to expand the production capacity from 8,000 to 18,000 tons has been received by this enterprise from the Government of India. The capital cost of the scheme is estimated to be over Rs. 300 lakhs of which about one-half would be required in foreign currency. Negotiations are well under way with the Commonwealth Development Finance Company Ltd., London, and it is hoped that the required loan in foreign exchange would be made available. The authorised capital of the company is to be raised to Rs 1½ crores. All this is encouraging news.

Coal

IRONY IN ANDHRA

THERE HAS of late been a slackening in the tempo of industrial production in the South generally and in Andhra Pradesh in particular. According to the Federation of the Andhra Pradesh Chambers of Commerce and Industry (A.P.C.C.I.), this is largely due to the acute shortage in supply of coal, which, it alleges, has been brought about by the discriminatory practice being followed in making supplies from the State-owned Singareni Collieries. The Federation, it would appear, has already made a representation to the State Government on this subject.

The A.P.C.C.I. contends that the shortage felt by the industries in Andhra Pradesh is not due to the low output of coal from these collieries, but to the large-scale diversions to railways in general and to the Southern Railway in particular. Hitherto, it is believed, the Southern Railway used to get its supplies from Bengal and Bihar. This diversion of supplies to the railways seems to have forced the local industries to obtain their coal requirements from Madhya Pradesh at considerable expense and also avoidable wastage of wagon capacity.

The Federation also complains that new industries are being diverted to other States, because the Coal Controller allots quota only on a certificate from the Singareni Collieries that they are in a position to supply adequate coal to any newly established industry and the Singareni Collieries are unable to issue such a certificate, because of heavy prior commitments.

Among others, the Federation has also alleged—and this is rather hard to believe—that the railways have not been allocating the required number of wagons for hauling coal to the local industries, while large quantities of coal have gone from the Singareni Collieries to Mysore, Bombay, Madras, and Kerala. Surely, the railways do not have any vested interest in denying coal to industries next door to the collieries and supplying to industries located in States other than Andhra. May be, by pursuing a particular procedure, these results have followed. In any case, it would be unfortunate to attribute any motives to the railways, who, by and large, have been and are non-parochial in their outlook.

After having criticised the Singareni Collieries, the railways and industries in the other States, and, in fact, almost everybody thus, the Federation has made certain demands. In the first place, it wants that preference should be given to industries in Andhra Pradesh in the matter of allotment of Singareni coal; secondly, it wants the railways to give preference in dispatches to the industries of Andhra Pradesh to the extent of their allotted quota; and, thirdly, it wants a committee to be appointed to ensure the effective implementation of these proposals.

FROM THE CAPITAL'S CORRIDORS

INCREASING PRODUCTIVITY IN INDUSTRY

A 15-POINT programme embodying the obligations and responsibilities which should be assumed by the Government, employers and workers in the interest of attaining the goal of higher productivity in industry has been placed before the country by the Seminar on Productivity which concluded its two-day session here on Friday last.

The programme emphasizes that the Government should reorient and streamline, with a vigorous productivity bias, the organisational set-up of its agencies dealing with matters of industrial development and take positive measures to ensure that the public sector enterprises develop into models of productivity administration and demonstrate productivity techniques and benefits flowing from their introduction.

The Seminar has laid down that the Government, employers and workers should bring about conditions for maximum utilisation of the installed capacity in the country and should enable the running of three shifts in the industries, where possible. The Government should also consider ways and means of incorporating the essential fundamentals of productivity subjects in the curricula of technical studies.

The Seminar has recommended that the Government and employers should make a positive declaration that no worker would be thrown out of employment merely on account of the introduction of the productivity processes and that any worker rendered redundant in a section of the plant would be absorbed within the enterprise of the industry without loss of earning or loss of status.

EMPLOYERS' RESPONSIBILITIES

Referring to the employers, the Seminar has recommended that they must recognise that workers are entitled to the fullest consideration in their own right and not merely for the sake of production results. They should continuously strive to improve the working conditions, environment and welfare measures, for bringing about conditions which enable the workers to give of their best.

The programme lays down that employers must make positive efforts to generate an atmosphere of mutual trust and co-operation and dispel doubts and fears of workers in regard to productivity. The workers must be assured that the productivity drive does not involve any undue intensification of their effort, nor greater speed-up, and be assured that they will receive their full share of the gains resulting from the increase of productivity.

Another recommendation of the Seminar is that the employers, in consultation with the workers, should establish an effective machinery for communication and joint consultation. This would enable the workers to become correctly informed of the management objectives and policies, and facilitate their doubts and questions to be properly answered, their constructive suggestions duly considered and acted upon, and workers being taken into confidence in every project involving changes.

The Seminar has suggested that the Government, employers and workers should organise training programmes at all levels in the enterprises, including top management, senior and junior executives, technicians, supervisors and the workers. It has been accepted that an intensive programme of induction and instruction should be introduced for development of proper attitudes of workers towards productivity. The employers have agreed to consider ways and means of introducing incentive schemes for the enterprises, and to consider the scope and feasibility of introducing schemes for encouraging the workers to put forth suggestions for effecting improvements.

LABOUR AND PRODUCTIVITY

The representatives of labour organisations have accepted the principle that they must make a positive effort for creating a proper atmosphere of mutual trust and co-operation, so that the employers shed any doubts about full participation of workers in the productivity drive.

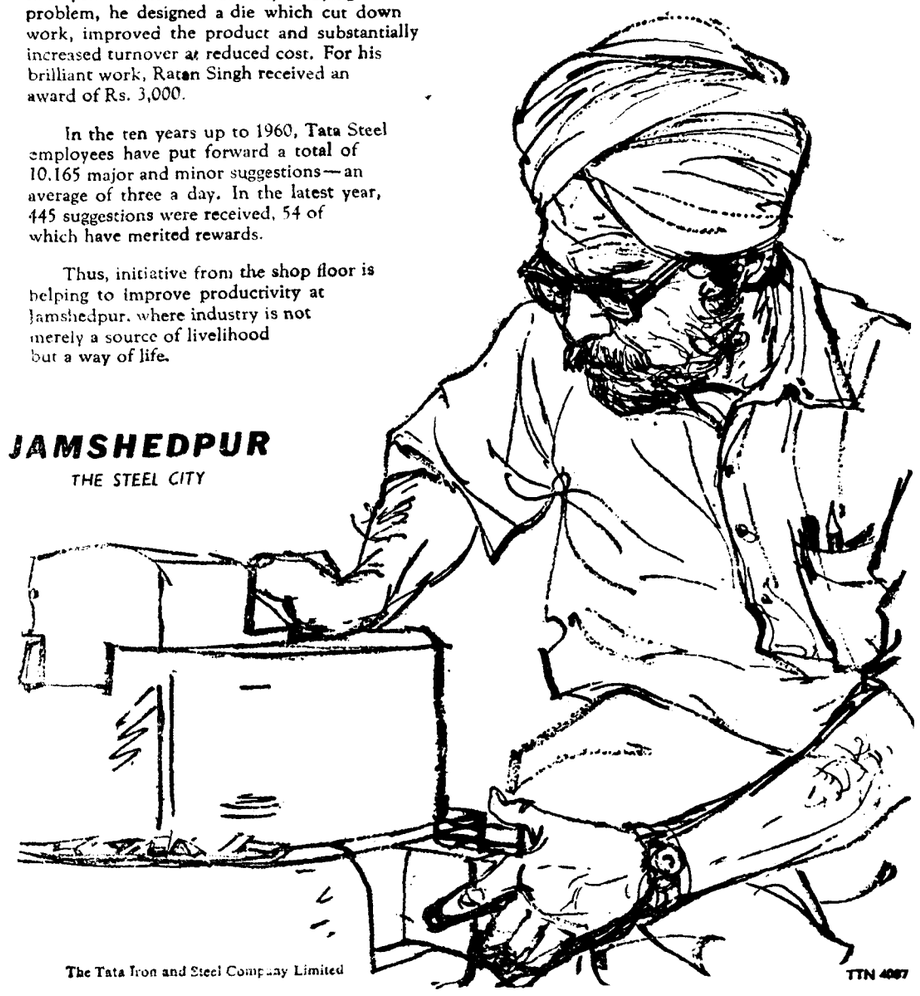
The workers' representatives have also agreed to actively associate themselves with the efforts to set up joint consultative machinery in the enterprises and ensure, in co-operation with the management, successful functioning of the machinery.

The need of building up specialists and research workers in the labour organisations has been accepted to enable objective evaluation of and active participation in the productivity measures emanating from the managements, while safeguarding the rights of the workers. The objective of maximum participation in the programme of workers' education has been accepted by the labour organisations.

SHARING OF GAINS

The Seminar considered in great detail the principles which should govern the question of sharing the gains of productivity and reaffirmed the principle of sharing the gains of increased productivity embodied in the Charter of the National Productivity Council. It was agreed that the gains of productivity should be shared between the community, the investors and the workers. The community will benefit by the lowering of prices, increase in the variety and quality of goods, increased yields from taxation and savings from development projects, and welfare measures. The investors will benefit by increased returns and opportunities for expansion and reinvestment. The workers will benefit by securing higher wages, shorter working hours, improved working conditions and increased employment opportunities.

In regard to the distribution of gains of productivity, it was felt that appropriate consideration should be given to the requirement of raising the current wages to the minimum level, where they are below the need-based minimum. The Seminar reiterated that there was considerable scope for the use of incentive schemes as a means of giving direct reward to the workers responsible for specific increase in productivity.

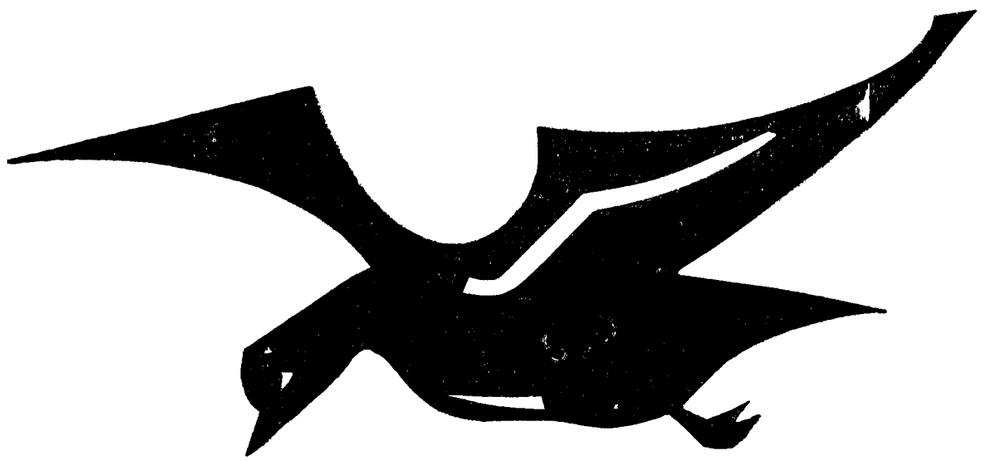


It was emphasised that the social aspects of the problem of sharing the gains must be kept in view. It

initiative from the shop floor

The manufacture of crowbars in Tata Steel's Agrico factory in Jamshedpur involved a number of time-consuming and uneconomic manual operations. Ratan Singh, a foreman, decided to do something to improve matters. Carefully studying the problem, he designed a die which cut down work, improved the product and substantially increased turnover at reduced cost. For his brilliant work, Ratan Singh received an award of Rs. 3,000.

In the ten years up to 1960, Tata Steel employees have put forward a total of 10,165 major and minor suggestions—an average of three a day. In the latest year, 445 suggestions were received, 54 of which have merited rewards.



Thus, initiative from the shop floor is helping to improve productivity at Jamshedpur, where industry is not merely a source of livelihood but a way of life.

JAMSHEDPUR
THE STEEL CITY

The Tata Iron and Steel Company Limited

TTN 4087

a BIRD'S-eye view
of service
to the economy

The Birds/Heilgers group of companies meet a substantial part of the country's demand for industrial raw materials like iron ore, coal, limestone, manganese ore, refractories ... provide tubewells for tea estates and factories ... manufacture plants for water treatment ... supply paper for a variety of uses ... make jute goods and steel castings and structurals ...

Birds have today launched on a programme of expansion to increase their output and service facilities ... And their laboratories are constantly at work exploring new uses for their products so that they may serve India's industries better.

A symbol of industrial leadership, Birds will continue to play a vital role in helping India attain industrial self-sufficiency.

BIRD & COMPANY (PRIVATE) LIMITED
and
F. W. HEILGERS & COMPANY (PRIVATE) LIMITED
Chartered Bank Buildings, Calcutta-1

would be necessary to ensure that higher productivity does not result in or add to unemployment or to demotion or loss of earnings to the workers. Productivity processes should not lead to any undue intensification of the work-loads, nor should they undermine the growth and development of trade union organisations.

The Seminar recognised the difficulties involved in the measurement of increase of productivity and determination of specific shares of the gains, which would require technical appraisal. It was decided that an Expert Committee, consisting of representatives of the employers, workers and experts, should be constituted by the National Productivity Council for recommending the indices which should be used, the methods which should be adopted in measuring the productivity gains, and also recommend the principles and methods of distributing the gains in the context of conditions prevailing in the Indian industries now and during the next 10 years.

REPAYMENT OF WEST GERMAN LOANS

The total amount of West German loans that will fall due for repayment by India at the end of the Second Plan will be DM 150 million (nearly Rs. 17 crores). India will repay DM 50 million (Rs. 5½ crores) on the stipulated dates, but defer repayment of the balance DM 100 million (about Rs. 11⅓ crores). Of this, a sum of DM 50 million will be repaid after four years of the Second Plan period, with a further option to extend the period by another four years, i.e., a total deferment of eight years. The repayment of the remaining sum of DM 50 million will be similarly deferred initially for four years, with an option to defer it further for a period of eight years. This will give India full margin of twelve years.

A similar concession in respect of repayment arising on account of aid for the Rourkela Steel Project, which falls due on December 31, 1961, is under consideration. In this case, India will repay on the due date only 10 per cent of the amount due. The balance will be split up into two equal instalments to be paid in eight and twelve years respectively.

The West German credit of $100 million (nearly Rs. 50 crores) in respect of India's Second Five-Year Plan—the last instalment of $30 million of this credit will be made available to India this month—too can be repaid in twelve years. The repayment of this credit will in no event fall due before the expiry of five years, the object of this arrangement being that the implementation of India's Third Five-Year Plan should not be adversely affected.

Another indirect help which India will continue to receive from the Federal Republic of Germany lies in the export credit guarantees which are expected to cover DM 250 million (about Rs. 28 crores) worth of supplies from West German firms during the course of the Third Plan.

CREDIT FOR DURGAPUR STEEL PLANT

Having been assured of the necessary credit for the expansion of Durgapur Steel Plant, the Union Minister for Steel, Sardar Swaran Singh, and the Secretary of the Ministry of Steel, Mr. S. Bhoothalingam, are expected to visit London shortly to "tie up" arrangements for this credit.

TRADE DELEGATION TO EAST EUROPE

An Indan trade delegation, consisting of Mr. C. M. Poonacha, Chairman of the State Trading Corporation (leader), Mr. K. R. F. Khilnani, Joint Secretary in the Ministry of Commerce and Industry, and Mr. Y. T. Shah, Deputy Secretary in the Ministry of Finance, will shortly visit East European countries to negotiate and enter into trade plans for 1961, with Rumania, Yugoslavia, Poland, East Germany and Bulgaria. With Czechoslovakia it will conclude a fresh trade and payment agreement; the existing agreement with this country is due to expire on December 31, 1960. The delegation, it is expected, will also discuss procedural methods for smooth implementation of the existing trade plan with Hungary.

A trade delegation from Russia is expected here this month to discuss import of Russian machinery by India.

The existing trade plans with these countries have been drawn up on two fundamental principles. Firstly, all payments, both commercial and non-commercial, are made in non-convertible Indian rupees. Secondly, trade between India and these countries is on a balanced basis for which purpose annual trade plans are made with each country.

An unsatisfied home market which makes it possible for a manufacturer to sell his products at his door steps with a fair margin of profit, the non-adjustment by the free world of its trade to the changed conditions in the East, the creation of trade blocs in Europe and the trade offensive of Communist countries are understood to be some of the factors which make India to look more and more to the Russian Bloc for expansion of its trade. Though India's trade with the Communist Bloc is still small compared to its trade with the Western countries, it is only this bloc with which India has favourable balance of trade. In the first six months of the current year, India's favourable balance of trade with this bloc increased sharply to Rs. 13.7 crores, compared to Rs. 2.8 crores in the corresponding period last year.

SETTING UP OF EXPORT HOUSES

The Government of India has accepted in principle the recommendation of the Standing Committee of the Export Promotion Advisory Council that export houses should be set up for purposes of tapping the export potential of various commodities.

It is felt that the establishment of three or four well-organised export houses of repute in India would serve as an effective instrument to boost export of Indian goods, particularly in the case of difficult and non-traditional items of export. The export houses will be given the same concessions and facilities as are at present allowed to other exporters.

The Government has also decided to appoint a committee for devising a machinery for quality control and pre-shipment of exported goods.

To foster trade with African countries, the Government is opening trade missions there and is considering signing of bilateral trade agreements with them. A high Government official is in Morocco at present in this connection.

CO-OPERATIVE CREDIT

All classes of cultivators, including the landless tenants, are to be provided with adequate credit on the basis of their production requirements and repaying capacity. This is in pursuance of a decision taken by the Union Ministry of Community Development and Co-operation on the recommendations of the Committee on Co-operative Credit, under the chairmanship of Mr. V. L. Mehta, as approved by the last meeting of the National Development Council. The decision has been communicated to the State Governments.

Other decisions taken by the Government of India on the Mehta Committee's Report relate to the pattern of

organisation of village co-operative societies, State partnership in share capital of primary agricultural credit societies, outright grants to primary societies and Central Banks for providing special "bad debt reserves" and grants to primary societies for managerial expenses.

Co-operatives, the State Governments have been requested, are to be organised, as a general rule, on the basis of village community as a primary unit. Where the villages are too small, a number of villages, with a total population of upto 3,000 and situated at a distance of not more than 3 to 4 miles from the headquarters village, may be grouped together in the interests of viability. Viability of a co-operative society is to be determined on the basis of its capacity to bring into the co-operative fold all rural families and to effectively implement the village agricultural production plans. Its ability to link crdit with production and marketing, as also to supervise the use of credit, undertaking distribution and supply, and to attract local savings to the maximum possible extent, as share capital and as deposits, are also to be taken into consideration.

STATE PARTICIPATION IN SHARE CAPITAL

The State may participate in the share capital of a primary agricultural society, provided that 60 per cent of its members agree to such participation and the Central Bank to which the society is affiliated supports the proposal. While the maximum contribution made by the State to the share capital of a primary society is to be limited, ordinarily, to Rs. 5,000, in the case of large villages, backward areas, and selected areas coming under irrigation or large scale reclamation for the first time, the State contribution could be upto a maximum of Rs. 10,000. State's share capital is, however, not to exceed the contribution made by the members of the society and, as a normal rule, is to be indirect, i.e. through the apex and Central Banks.

The policy to be pursued by the State Governments is to ensure that there is no rigidity in regard to the organisation and the size of co-operative societies and in the matter of State contribution to share capital, duration of partnership and the manner in which the share capital should be retired. Outright grants to primary societies and Central Banks are to be credited to the "special bad debt reserves", which would be in addition to the normal bad debt reserves created from profits, and which are to be drawn, according to rules framed for the purpose. Co-operative societies which are revitalised and actually undertake various functions of service co-operatives, namely disbursement of credit, supply of fertilizers, insecticides, seeds, implements, etc. and arrange for the marketing of members' produce, will get a management grant to the maximum of Rs. 900 spread over a period of 3 to 5 years.

NEW CAPITAL ISSUES

During the quarter ending June 30, 1960, the Controller of Capital Issues gave his consent to 59 applications for new capital floatations, involving a total amount of Rs. 48.57 crores. Eighty-six per cent of this amount was for the issue of industrial securities and the rest for the provision of capital for non-industrial companies. Of the total consents, 15 were for Rs. 1 crore and above each, involving an amount of Rs. 38.87 crores. Fifty-seven per cent of these issues were to be in the form of ordinary shares, 2.8 per cent in the form of preference shares, 5.8 per cent in the form of debentures and 34.4 per cent in the form of loans. Five companies, with a total capital of Rs. 14.22 crores, were to be in the public sector, while the other 54 companies, accounting for Rs. 34.35 crores capital issue, belonged to the private sector. Thirty-five units are to be public limited companies, with a total capital of Rs. 23.67 crores, while the remaining twenty-four are private companies, with a total capital of Rs. 24.90 crores.

Fourteen "giant companies" with an authorised capital of Rs. 28 crores, accounting for 56 per cent of the total authorised capital of all the new incorporations during the quarter, were registered in India. The following is the list of these giant floatations:

Name of Company	Public/ Private	State in which Registered	Authorised Capital (Rs. lakhs)
1. Agro-Chemicals & Fertilizers	Public	Maharashtra	100
2. India Firebricks and Insulation	Public	Maharashtra	100
3. Amrit Products	Public	Gujerat	100
4. Jayant Paper Mills	Public	Gujerat	100
5. Utkal Machinery	Private	Maharashtra	250
6. Neiveli Ceramics & Refractories	Public	Madras	100
7. Jairamdas Udyog	Private	Maharashtra	100
8. Seshasayee Paper and Boards	Public	Madras	1,000
9. India Forge and Drop Stampings	Public	Madras	100
10. Suraj Textile Mills	Public	Punjab	100
11. Gayday Iron and Steel	Public	West Bengal	100
12. General Tyres	Public	West Bengal	200
13. Ratnakar Shipping	Public	West Bengal	350
14. Wheels India	Private	Madras	100

COMMODITY NEWS AND NOTES

IRON ORE PRODUCTION IN INDIA

The production of iron ore during July 1960 was estimated at 374,000 metric tons, according to the Indian Bureau of Mines. This brings the total output during January-July 1960 to 6,237,000 metric tons which was higher by 39 per cent when compared to the output of 4,473,000 metric tons during the corresponding period of the preceding year. Orissa was the chief producing State with an output of 327,000 metric tons followed by Bihar with 196,000 metric tons. Mysore and Madhya Pradesh recorded an output of 164,000 metric tons and 143,000 metric tons respectively, while the output from Maharashtra was 14,000 metric tons. During the month, despatches of iron ore for consumption in the iron and steel plants totalled 521,000 metric tons while the despatches to the export market were 163,000 metric tons.

PRODUCTION OF WORSTED YARN

In order to co-ordinate production of worsted yarn with the needs of the general public, the Textile Commissioner has issued a direction to the worsted mills in India, requiring that the production of worsted yarn for different purposes, such as weaving, hosiery and knitting, shall be in specified proportions. As a result of the direction, out of the total quantity of worsted yarn manufactured during a quarter, the quantities of worsted yarn produced for use for weaving, hosiery and knitting purposes shall have to be 47½ per cent, 32½ per cent and 20 per cent respectively.

SHARING OF SUGAR PRICES BETWEEN FACTORIES AND CANE-GROWERS

The Government of India has referred to the Tariff Commission the question of revising the price linking formula for sharing the sugar prices between the factories and the cane-growers. The Government considers that a fresh examination of the question has become necessary, in view of the difficulties experienced in working the present formula and the representations received from the industry and the cane-growers. The Tariff Commission has been requested to examine the issue in all its aspects and suggest modification in the existing formula, with a view to improving it or to suggest a revised all India formula or regional formula, in the light of cost schedule given by the Commission in its Report on cost structure of sugar and fair price payable to the industry. The Commission will also examine whether the industry's claims for rehabilitation allowance in the matter of division of sugar price between the cane-growers and the industry is justified and, if so, the rate at which such allowance should be provided in the price linking formula. Another issue, which the Commission has been asked to examine, is whether the formula should apply to regions where ex-factory prices have been fixed and, in case the formula is not applied, how the advantage of special incentives given to factories in years of control should be shared between the industry and the growers. The Commission will also examine the effect of the price linking formula on the establishment of new factories with heavy capital outlay and see whether any concession should be allowed to them. The Commission has been requested to submit its report to the Government as early as possible.

TWO LAKH TONS OF SUGAR RELEASED

The Government of India has decided to release 2 lakh tons of sugar. There will be no release for free sale from the factories in Uttar Pradesh, Bihar and Punjab except a small quantity which will be released to each factory for sale to its employees. Allotments of sugar to Madhya Pradesh, Rajasthan, Uttar Pradesh, Bihar, West Bengal, Orissa, Madras, Kerala, Maharashtra, Gujerat, Himachal Pradesh, Assam, Manipur and Tripura from factories in the controlled region will be made only to the nominees of the State Governments. In case of Punjab and Jammu and Kashmir, allotments will be made direct to the State Governments or to their nominees. Allotments to Delhi will continue to be made on the existing basis Allotments will be made at prices fixed under Notifications No. GSR 1188|Ess.Com|Sugar dated October 25, 1959 and GSR|Ess.Com|Sugar dated April 4, 1960. The controlled ex-factory price for U.P. and North Bihar factories is Rs. 37.85 per maund and for factories in Punjab and South Bihar Rs. 38.35 per maund for ISS D-29 grade with the prescribed price differentials for other grades. The fixed f.o.r. destination prices in respect of allotments made to Kanpur and Calcutta will be Rs. 38.60 and Rs. 39.85 per maund respectively for sugar of ISS D-29 grade.

COMPANY AFFAIRS

NO DIVIDENDS FOR INDIA UNITED

The India United Mills Ltd. for the year to December 31, 1959, recorded a rise in their sales by about 15 per cent over the previous year to Rs. 11.35 crores. The Company attained this improvement by reducing their stocks considerably. This improvement was reflected in the profits which came to Rs. 29.68 lakhs. After making certain adjustments and after crediting Rs. 10 lakhs being the 'ad hoc' reduction made last year from the stock-in-trade now considered not necessary there is a total profit of Rs. 37.9 lakhs. This amount has been adjusted against the debit balance of Rs. 57.70 lakhs brought forward from the previous year. Thus there is a debit balance of Rs. 19.79 lakhs to be carried to the next year's account.

In view of this debit balance no dividends have been recommended by the directors. The Statutory Development Rebate in respect of additions to plant and machinery has been debited to the accounts under report. The normal depreciation for the two years 1958 and 1959 amounting to Rs. 12.24 lakhs and Rs. 11.44 lakhs have not been charged in the respective year's accounts.

PRAGA TOOLS: STEADY GROWTH

In order to meet the growing demand in the country for machine tool and machine tool accesories, the Praga Tools Corporation Ltd., a public sector undertaking, plans to expand its capacity not only towards co-ordinating and ensuring maximum utilisation and productivity of the existing plant and machinery, but also to the manufacture of additional items of machine tools and accessories etc. The first phase of the expansion programme which has been taken in hand is estimated to cost Rs. 38 lakhs and consists of increasing the existing capacity of the foundry, providing additional plant and machinery, isolation of the precision work from machine tool manufacture and a better layout of the factory.

The second phase of the expansion programme involving an additional investment of about Rs. 85 lakhs for buildings, machinery, utilities and services etc., was formulated by the Directors and has been approved by the Government of India who have agreed to the telescoping of the two phases wherever needed. This involves the manufacture with foreign collaboration of lathe chucks, drill chucks, tool and cutter grinders in addition to the existing range of machine tools and accessories.

During the year to June 30, 1959, the output was valued at Rs. 62.5 lakhs which is equivalent to an average monthly production of Rs. 5.2 lakhs against Rs. 4.3 lakhs achieved during the previous year. Sales during the year under review have been Rs. 73.34 lakhs. After providing Rs. 4.81 lakhs for depreciation and Rs. 85,000 for development rebate, there is a net profit of Rs. 4.92 lakhs. This profit has now been set off against the residuary loss of Rs. 9.99 lakhs which has in consequence been reduced to Rs. 5.08 lakhs.

STANDARD MOTOR PRODUCTS' HIGHER OUTPUT

The Government of India have permitted the Standard Motor Products of India Ltd. to increase the production of 10 H.P. cars from 3,000 units as at present to 6,000 units by 1963. Permits have also been granted to manufacture a 1-ton truck, making use of Vanguard Engine, Gearbox and Differential. The Company expects to start production of 1-ton truck from the middle of 1961. The Company has, however, approached the Government of India for the import of capital goods to implement the higher rate of production. The cost of extra-capital equipment is expected to be about Rs. 1.25 crores, which the Directors propose to raise through a loan or alternatively by the issue of debentures.

The Company increased its capital during 1959 to Rs. 1 crore and the issue was successful. The net profit of the Company of Rs. 11.36 lakhs together with the balance of Rs. 51,407 brought forward from last year, amounts to Rs. 11.90 lakhs.

The Directors have proposed the payment of a dividend at the rate of 6¼ per cent tax free on preference shares and 9 per cent on ordinary shares subject to tax at source. A sum of Rs. 3 lakhs is proposed to be separated towards development rebate and Rs. 3.5 lakhs as taxation reserves.

ALUMINIUM INDUSTRIES PLAN FOR EXPANSION

During the year to March 31, 1960, the Aluminium Industries Ltd. produced 34,400 miles of bare aluminium conductor and 7 million coreyards of covered aluminium conductor. The Directors have reported that a high level of production was maintained for aluminium rod accessories and tools. The covered conductor manufacturing capacity is being further increased in order to cater to the expanding market for this product.

Government of India granted a licence to the Company for establishing the manufacture of high tensile galvanised steel wire at Kundara. The requisite foreign exchange for the importation of machinery and equipment has also been sanctioned and import licences secured. Work on this project has started at Kundara and the Directors expect this factory to be in operation early in 1962. The additional share capital raised recently through the issue of 2,00,000 ordinary shares at a premium of Rs. 2.50 per share, will be utilised mainly for financing this project. The issue has been oversubscribed.

The year's working has resulted in a net profit of Rs. 19.9 lakhs after adequate provision for depreciation, taxes and contingencies. The amount together with the sum of Rs. 48,623 carried forward from last year's account makes a total of Rs. 20.3 lakhs. The Directors have proposed the payment of a final dividend of 180 nP (18 per cent) per share subject to deduction of income-tax, which together with the interim dividend of 90 nP (9 per cent) per share disbursed in March 1960 absorbs Rs. 14.40 lakhs. A sum of Rs. 4.37 lakhs has been transferred to the Development Rebate Reserve.

Company Meetings

THE TATA IRON & STEEL COMPANY LTD.

The following is the speech of the Chairman, Mr J. R. D. Tata, delivered at the fifty-third Annual General Meeting of the shareholders of the Tata Iron & Steel Company, Limited, on Thursday, October 6, 1960.

Ladies and Gentlemen,

I must first apologise to you for the delay of a little over a month this year in holding our meeting.

Although we have repeatedly urged Government to come to an early decision on our long outstanding claims and pointed out the difficulties and inconvenience caused by the prolonged delay which has taken place, I am sorry to say the matter remains undecided to this day. I am therefore unable to enlighten you any further today on this matter which is of such great importance to us. Lest, however, undue hopes are raised in the breasts of the more optimistic amongst our shareholders, I must remind you that during the last two years, including the one under review, we have, in order to pay dividends, drawn nearly Rs. 450 lakhs from our general reserves, the replenishment of which will have first claim on any amount we may obtain in compensatory price increases.

As my statement, published along with the annual report, included all I had to say directly concerning the accounts and affairs of our Company, I shall today only review briefly some matters of interest to us and to industry generally.

The past year has shown progress in many directions and in particular a welcome spurt in industrial production. It is therefore all the more disappointing that agricultural output has failed to make effective progress and that the country seems to be as far away as ever from self-sufficiency in food without which all efforts at achieving rapid economic growth must fail.

In the immediate context, however, the two most serious economic obstacles facing the country are the inflation which steadily erodes the fruits of our development plans before they can reach the people, and the foreign exchange situation which has reached another crisis even more serious than the one we faced in 1957.

The problem of inflation is perhaps the most threatening and intractable of all. In the last five years alone, the purchasing power of the rupee has fallen by about 35% and, with mounting development expenditure, inflationary pressures will increase further in the years to come. I realise the grievous dilemma and difficulty with which our Government and planners are faced in having to reconcile the need for rapid development involving large and continuous public expenditure with the need to hold the price front. May I suggest, however, that they are themselves aggravating the situation and magnifying the problem by insisting on concentrating development expenditure to the extent that is now being done on basic and capital goods industries, the products of which are incapable of absorbing the additional purchasing power pumped into the economy.

Large scale investments with long periods of fruition involve pumping into the economy corresponding increases of purchasing power which are automatically translated into demands for consumer goods. Apart from the imposition of drastic controls over the whole field of consumption, which would be both objectionable and impracticable in a country like ours, the only two possible ways of relieving this type of inflationary pressure are to meet, as far as possible, the demand for consumer goods, or to mop up excess purchasing power by additional taxation which is out of the question in India as the level of taxation is already excessive and the Third Five-Year Plan has in any case already provided upto the hilt for taxation as the principal source of internal finance. Therefore an increase in the supply of consumer goods is the only practical alternative at our disposal. In view of the foreign exchange situation which precludes imports other than of food financed by foreign aid, it is clear that we must turn to our own industries for additional consumer goods. Unfortunately, far from encouraging the development of consumer goods industries, Government impose severe restrictions on further investments in them and on increased output from some sections of the industries which could otherwise help to counter inflation. One example of this is the limitation of 800 million yards, or a mere 16%, imposed on the increased production of mill-made cloth by the end of the Plan period. While recognising the complexity of the problem, I submit that, unless positive steps are taken to counter the inflationary effect of large investments in heavy industry by the balancing growth of consumer goods, the spiral of inflation cannot but continue to grow.

The gravity of the foreign exchange situation can be judged from the fact that, except for a dangerously small working balance, we have exhausted all our past accumulation of foreign resources and have an annual deficit in our current balance of trade, while we require a further Rs. 2,100 crores of foreign exchange to finance developmental imports under the Third Plan, and during the same period we will have to repay foreign loans to the extent of Rs. 600 crores, including interest. It is therefore only too clear that unless foreign aid, loans or investments are forthcoming in full measure, the Plan will inevitably have to be pruned, and even our present rate of industrial production may be in jeopardy.

These grim figures highlight the consequences of our failure to achieve self-sufficiency in food. Since 1st January, 1948 we have spent on imports of food over Rs. 1,000 crores from our own foreign exchange resources in addition to nearly Rs. 500 crores obtained through foreign aid mainly from the United States under the PL 480 Programme. If we had been spared these imports, there would today be no foreign exchange crisis and the task of building up the country's economy would be infinitely easier. We can only hope that the dismal lesson has been fully learnt and that in future nothing will be allowed greater priority than attaining self-sufficiency in food.

An outline of the Third Five-Year Plan, was recently published and debated in Parliament. As citizens we are vitally interested in the nature, scope and objective of these Plans with which Government seek to mould our future economic destinies. As I have said on many occasions before, we in private enterprise are neither against planning nor against doing so on a big scale provided it is in due relation to available resources. We realise that the all pervading problem of the country's poverty cannot be solved without bold action and without sacrifice in which all must share. We firmly support the objectives of raising the national income as rapidly as we can and of distributing it as widely

and justly as possible. Some of us may regret that so large a part of Government's economic policies is based on the belief that these objectives can only be attained by socialistic means, as thereby much of the country's effort is wasted in a mass of costly, time-consuming and largely ineffective controls, and the initiative and creative urge of the people is stifled. So much has been said in the past on the subject, some of it by myself, that I will not weary you with a further pursuit of this unhappy controversy. I shall only repeat that, to the extent that we are desired or permitted to do so, we shall, as in the past, continue to offer our full co-operation wherever we can be of service to the nation.

Reverting to the Third Five-Year Plan, I have already mentioned the decisive extent to which our ability to raise the necessary foreign exchange will determine whether it can be adhered to or will have to pe pruned. In either case, I would plead for the maximum degree of realism, untinged by ideological considerations, in regard to industrial objectives and targets. In the Plan as it stands, the most striking feature is that 60 per cent of the investment in industry is proposed to be in basic and heavy industries, including steel. While there can be no question that a modern and fully industrialised nation must be largely self-sufficient in these basic industries, the question at issue is whether, with the strictly limited resources at our disposal, and, subjected as we are to heavy and growing inflationary pressure, we can afford at this time to give such overwhelming priority to steel and heavy industry, unless of course they can be financed in part by foreign capital which would release the pressure on our own foreign exchange resources.

In this context, we welcome the shift in our country's policies towards foreign participation in industry. We have gone a long way from the days when such participation in industry was looked upon with suspicion and discouraged and this is obviously to the good. With the persistent shortage of foreign exchange which is bound to plague us for many years to come, it is obvious that India has much to gain from an influx of foreign capital which, it may be usefully remembered, was what made possible the initial economic growth of the United States of America in the last century.

However much Government might prefer to see basic industries developed in the State Sector, I sincerely hope, in view of the tremendous capital expenditure involved in such industries, that they will not, on ideological grounds, oppose participation by foreign private enterprise in these fields if such participation can be secured, which of course is by no means certain. While no risks could arise in a controlled economy such as ours, the benefits to the country would be enormous. Not only would the objective of developing basic industries be met to that extent, but the large funds released in consequence could be diverted to equally vital projects, such as additional fertiliser production and the development of power, fuel and transport resources.

As it is, industry throughout the country, in both the Public and Private Sectors, is suffering acutely from inadequacies in the supply and quality of raw materials. All the steel plants in India today are operating on a hand-to-mouth basis in respect of coal and rail transport. In fact, during the past few months, the commissioning of three new blast furnaces with their allied coke oven installations have had to be postponed because of lack of coal. I hope that Government, now fully alerted to the dangers of this situation, will ensure that, in future, supplies of raw materials and transport do not lag behind the growth of industrial capacity.

However far and fast we may wish to travel in the next five years on the road to full industrialisation, I earnestly plead that in the final size and shape of the Third Five-Year Plan and those that follow, we do not at any time divert to expansion the resources required to maintain the full output of existing productive capacity. In the difficult circumstances which confront India today nothing could be more wasteful than to have to restrict output and employment because of a lack of power or raw materials or transport.

The fact that we may be critical of Government at times about some of their ideas or policies does not mean that we do not recognise the tremendous efforts they have made and are making to give us a sound administration and to promote the welfare of the 400 million people in their care. It is inevitable that there should be disagreements as to the best means of achieving rapid economic growth. Indeed, it is a healthy sign of vigour in our democracy that there should be such differences of opinion and that they should be fearlessly stated. So long as we share the common will to serve, there should be no possibility of misunderstanding motives and honestly held convictions.

In the formidable undertaking of freeing in a brief space of time the people of this ancient country from their bonds of poverty, I hope that we shall have a useful part to play, and on your behalf I pledge the full support of the Tata Iron and Steel Company in this great task.

Note: This is not a report of the proceedings at the above Annual General Meeting.

THE MYSORE PAPER MILLS, LIMITED
BANGALORE-9

Speech delivered by Sri M. D. Shivananjappa, I.A.S. Chairman and Managing Director, at the Twenty-fifth Ordinary General Meeting of the Company held at Bangalore on Friday the 7th October, 1960.

Ladies and Gentlemen.

Before we commence the regular proceedings of the meeting of the members of the Mysore Paper Mills Ltd., it is my painful duty to refer to the sad demise of Capt. Rao Bahadur A. Thangavelu Mudaliar on the 22nd June of this year. As you all know, Capt. Rao Bahadur A. Thangavelu Mudaliar was a Director of this Company ever since its inception and he was also connected with a number of other Institutions. By his genial temperament and modesty he had endeared himself to one and all in the State. We have lost one of our Stalwarts on the Board and I for one have lost a personal friend. May I request you kindly to stand up in silence for a minute and pay our homage to the memory of the departed soul?

With your permission I shall be sending the following Resolution to the members of the bereaved family:—

"The General Body of the Members of the Mysore Paper Mills Ltd., have learnt with deep sorrow the sad news of the demise of Captain Rao Bahadur A. Thangavelu Mudaliar on the 22nd June, 1960 and wish to convey their sincere condolences to the members of the bereaved family."

(The business was adjourned for two minutes)

Ladies and Gentlemen.

I have great pleasure to welcome you to this, the 25th Ordinary General Meeting of the Shareholders of the Company and to place before you the Report of the Directors and the Audited Balance Sheet for the year ended 31st March, 1960. These have been circulated already and with your permission I shall take them as read and would proceed to review the salient features of the year's operations.

I am glad to state that the production during the year under review has been very satisfactory. Last year the production was 8,000 tons and during the year under review, it has risen to 8,700 tons, exceeding all previous records. The successful implementation of the scheme of renovation and replacement and the reconditioning of the first Paper Machine and the fairly satisfactory working of the arrangements made for procuring the essential materials within the country and from abroad have largely contributed to this result and I can only hold out hopes of maintaining at least the same level of production during the current year, if only the arrangements made continue to work satisfactorily.

I am also happy to report that the turnover during the year has exceeded that of last year by Rs. 16 lakhs amounting to Rs. 1,41,31,000 which is also a record figure. I had informed you last year that the Government of India had referred the question of fixation of prices of paper to the Indian Tariff Commission which concluded its labours and submitted its report to the Government of India and had expressed the hope that fair and reasonable prices would be fixed. But, Government of India accepting the recommendations of the Tariff Commission have issued revised price lists, which have considerably reduced the prices of different varieties of paper with effect from 1-1-60. This reduction is bound to have greater adverse effects, particularly on smaller units like ours. I do not see any immediate prospect of decline in prices of raw materials, coal or chemicals and also in wages and salary bills. The only way to improve the position it appears to my mind, is to secure as much economy as possible from technical and operational efficiency. The installation of the recausticising unit for which orders had been placed and equipments received, will to some extent secure economies, which go to reduce production costs to some extent. I am only hoping that the Government of India would certainly take into consideration the adverse effects that the revision of prices has had on units like ours and would consider the question of revising the prices suitably in the interest of expansion of existing units and starting of new ones.

I would now like to refer to the Balance Sheet and Accounts. The good effects of increased production and larger turnover have been reflected in the Accounts as you could see. The financial results would have been still better but for the reduction of prices to which I have already referred. We have provided for depreciation on fixed assets calculated in accordance with the rates allowed for normal depreciation and extra shift allowances as per Income-tax Act, amounting to Rs. 7,63,175/-, Rs. 14,061/- towards Development Rebate and a further sum of Rs. 60,000/- towards Retirement Gratuity. A provision of Rs. 8.00 lakhs has also been made towards taxation, as the profits of the Company for the year become taxable. As on 31st March, 1959 the loan of the Industrial Finance Corporation to the Company stood at Rs. 20.00 lakhs, and during the year a sum of Rs. 16 lakhs has been paid, thus reducing the balance to only Rs. 4.00 lakhs, which represents the last instalment due to the Corporation in 1970. These payments far ahead of due dates by nearly a decade have considerably reduced the interest charges. In regard to the disposal of surplus of Rs. 7,76,968/- including carry over of last year, your Directors have decided to transfer Rs. 3,50,000/- to the General Reserve and to recommend declaration of a dividend of 15 per cent subject to tax, absorbing Rs. 3,75,000/- the balance being carried forward.

Last year, taking into consideration the increased production and larger turnover, your Directors recommended payment of 12½ per cent (10 per cent dividend and 2½ per cent bonus) and this year also taking into consideration the all round progress made by the Company and having regard to the tax deduction of 30 per cent, your Directors, after careful consideration of all relevant factors, have proposed payment of 15 per cent dividend. I am aware that deduction of tax at the rate of 30 per cent as per Finance Act will reduce the percentage to 10.5 or Rs. 1.05 per share. I am glad, however that a number of shareholders, whose income is not taxable, gets a net dividend of Rs. 1.50 per share, which is more than the dividend declared for last year by 0.25 nP. per share.

The Industrial Finance Corporation of India have communicated their approval to our declaration of 15 per cent dividend in terms of the Mortgage Deed, for which I am thankful to them.

It is indeed a matter for gratification that the labour-management relations continued to be very cordial. Your Directors were pleased to sanction a

bonus of four months' salary or wages to the employees for the year ended 31st March, 1960 and the same has been disbursed.

Reference had been made by some shareholders at the last meeting for celebration of the Silver Jubilee of our Mills on a grand scale and I recall that I had said that steps would be taken to arrange for the celebration at the appropriate time. I find that the Company has been registered as a Joint Stock Company on 26th May, 1936 and the foundation stone of the Factory was laid by His late Highness Sri Krishnaraja Wadiyar Bahadur of Revered Memory on 1st April, 1937 and the Mills went into production in 1938. Taking these several dates into consideration your Directors will be fixing up the appropriate date for the celebration of the Silver Jubilee during 1961-62.

As you are aware the question of expansion of the production capacity of your Mills is engaging attention practically ever since the first scheme of expansion was implemented. The scheme has not yet been implemented, not because of want of well-considered scheme or lack of funds, but mainly because of the difficulties of procuring the necessary foreign exchange for payment of value of plant and machinery to be imported from abroad. I informed you when we met last year about this time that we had submitted our application to the Government of India for expansion of the production capacity from 8,000 to 16,000 tons and that it was receiving active and sympathetic consideration at the hands of the Central Government and also said that if my anticipation of securing necessary licences be fulfilled, steps would be taken to place specific proposals before you for consideration. In this connection, I am happy to inform you that Industrial Licence under the Industries (Development and Regulation) Act 1951 to expand the production capacity from 8,000 tons to 18,000 tons has been received from the Government of India. As stated in the Directors' Report, the scheme of expansion has been formulated and proposals have been made to finance the scheme both by borrowings and increase of Share Capital. The capital cost of the scheme is estimated to be over Rs. 300 lakhs of which about one-half would be required in foreign currency.

In the month of July of this year I had to go abroad in connection with the work of Messrs. Tungabhadra Steel Products Ltd., Tungabhadra Dam, and as per the desire of your Directors, I took this opportunity to negotiate for a foreign exchange loan with the Commonwealth Development Finance Company Limited, London. Our General Manager Sri V. K. Subramanian also accompanied me in my tour. We had several discussions and consultations with the authorities of Commonwealth Development Finance Company Limited London, and the Industrial Credit and Investment Corporation of India Limited, Bombay, and I am happy to keep you informed that our requests have been receiving favourable and sympathetic consideration at their hands. I have every hope that, subject to the usual formalities to be observed in accordance with the Rules and Procedures, the required loan in foreign exchange would be made available to us ere long. I should also add that both the Commonwealth Development Finance Company Limited, London and the Industrial Credit and Investment Corporation of India Limited, Bombay have expressed their desire to participate in the Equity Capital, if possible. As regards the rupee loan to be obtained, we have contacted the Industrial Finance Corporation of India, New Delhi and I am sure that with the cordial relations we are having with them and record of repayment of their loan, the required support and assistance would be forthcoming.

Enquires had been sent out and quotations from well known machinery manufacturers have been received and they are under our consideration. The General Manager and myself during our visit abroad also contacted the several machinery manufacturers and had the opportunity of studying at close range the conditions and trends obtaining in Capital Goods Market in foreign countries. I am confident that after the question of foreign exchange loan is finally decided, we would be able to finalise our scheme, which would be both sound and economical. I may also keep you informed that in view of the difficult position of foreign exchange we would like to purchase as much indigenous machinery as possible and this aspect will be kept in view while finalising the scheme.

I now come to that aspect of the scheme which requires your immediate consideration. The proposal to raise the Authorised Capital to Rupees 1½ Crores is before you for approval and I have no doubt you would accord your approval to the proposition to enable us to take up the scheme for implementation. I should like to add that the amount will be collected as and when the necessity for funds arises.

Before I conclude, I wish to express on behalf of the Directors and the Shareholders our grateful thanks to the Central and State Governments for the abiding interest they have in the progress of the Mills. I am very grateful to my colleagues on the Board for the uniform courtesy, consideration and valuable guidance I have been receiving. I wish also to express on behalf of the Directors and myself our warm appreciation of the willing and efficient co-operation of all our employees.

Ladies and Gentlemen, I now move that the Directors' report and the Audited Balance Sheet and the Profit and Loss Account for the year ended 31st March, 1960 be APPROVED AND ADOPTED.

Note: This is not a report of the proceedings at the above meeting, of which proceedings a separate note will be circularised.

PAPERS

invited on

"RECENT RISE IN PRICES - CAUSES & CURE"

from persons with minimum qualifications of an University Degree

Prize for the best Paper Rs. 1,000/- and for the 2nd best Paper Rs. 500/-

Last date for submission—15th November, 1960

Papers will be judged by Eminent and Foremost Economists.

For particulars please contact:

Hony. Secretary,

Economic Committee of the Osmania Graduates' Association,

Exhibition Grounds, Mukarram Jahi Road, Hyderabad (A.P.)

Announcing
LUFTHANSA'S
fabulous
*Senator
service

ON THE EUROPE—FAR EAST ROUTE

From the 1st November, the superb Senator Service is being introduced on LUFTHANSA'S Far East flights. The little extra touches make this service the last word in sheer luxury !

On any of our twice-weekly flights to Europe, you will bask in LUFTHANSA'S lavish attention—you will breathe an air of good living, which only the Senator Service can provide.

Senator

LUFTHANSA
GERMAN AIRLINES

WHERE SERVICE AND EFFICIENCY ARE TRADITIONAL

Promoting Indo-German relations

* Senator Service on the Lufthansa portion of the Far East Pool Service route of Lufthansa, Air France, Alitalia and T. A. I.

LH/G/19

It was during the reign of Emperor Sher Shah that India's famous national highway—the Grand Trunk Road—was built. To tend the needs of the traveller and his horse, *sarais* or rest houses were built at an interval of two *kos* (roughly four miles) along the entire stretch of the road. Today, there is a network of roads covering the country, and still more are being built to convert the nation into a neighbourhood It is along these roads that merchandise can move to the remotest village or hamlet in the country. They are the highways to economic progress.

As a new source of supply of a versatile road building material, the newly commissioned asphalt plant of the Stanvac Bombay Refinery will be a big help to India's road-building programme. Completed in ten short months at a cost of 102 lakhs of rupees, this plant can turn out in one year enough asphalt to surface 12 parallel roads, each 12 feet wide, running all the way from Delhi to Calcutta. Furthermore, the plant has increased the foreign exchange savings generated by the Company's Refinery —the first large modern one to be built in India. Since its completion in 1954 more than 73.56 per cent of all the petroleum products sold by Standard-Vacuum in India has been refined here. The initial cost of the Refinery was Rs. 1,193 lakhs. Of this total initial investment Stanvac advanced Rs. 793 lakhs and Indian sources provided another Rs. 400 lakhs. Since 1954, Stanvac has made additions totalling Rs. 401 lakhs for plant expansion and improvements. It now provides more than 20 per cent of India's total needs for refined petroleum products.

STANVAC—*participating in the country's progress*

The Inevitability of Bigness?

THE sudden closure of two great newspapers in England—the *News Chronicle* and the *Evening Star*—on Monday this week, has underlined the dramatic inevitability of bigness in an age in which unruly costs can move in one direction only. There is an issue of the freedom of the Press when concentration is made greater and liberal organs go into conservative hands or die altogether. Indian readers are not, however, concerned with the problem of maintaining this freedom in Great Britain; the British people seem well able to look after themselves. Nor is there currently, in the Indian Union, a tendency for newspapers to be reduced in numbers or in profitability. There, nevertheless, is a tremendous application of this lesson to Indian economic social planning.

How many medium-size enterprises elsewhere are similarly situated, either going forward to bigness or receding to final extinction? Surely quite many; and this makes the moral inescapable. There is an increasingly small place in the current economic system in certain industries for the small static unit. They must either rise or fall, for the burden of rising costs cannot be overcome except by success in the competitive race or by the employment of increasing returns in a rapidly expanding market. The question, however, arises as to what kind of social system is written into a picture where one has either to go forward to bigness or live in peril of extinction. At first sight, it might look as if there is no future for small industries. But this is only because the disease and remedy have both been inadequately seen.

The slogan 'concentration of economic power' has become a dangerous political instrument; the implication seems to be that all large organisations are dangerous. The point that economic operation cannot in these basic industries be organised otherwise is foolishly belittled. Perhaps in all these basic industries the only escape from the burden of costs is a level of bigness at which increasing returns can be exploited. It may even be that in other areas, only considerable-sized organisations can carry through the complex processes of establishing a new industry with a new market and, inevitably, therefore, a long period of abstinence or waiting. Surely, in these cases it should be recognised that bigness is not merely right in an economic sense, but inescapable if the industry is to be established at all.

The pressure, partly expressed at the meeting last week of the Small Industries Board at Chandigarh for more facilities to small industries and less to big ones is, therefore, to be contained within some reasonable recognition of the essential place of business not only in the private but also in the public sector. On the other hand, there is much that can be done to abate the rising discontent of small entrepreneurs who find not merely the burden of fixed costs intolerable, but who are obstructed by the high costs of initial organisation which, in under-developed countries, are considerably greater than in countries where information on detail is immediately available.

What then can be the solution in the growing conflict between small-scale and big-scale industry which is now, for the first time, threatening to disrupt the solidarity of private sector operation? Firstly, there needs to be proper initial planning so that the areas of bigness and smallness, in strictly economic terms, are precisely and equitably defined. All areas where bigness is not an essential condition of economic operation might be decentralised to small or medium units. Secondly, even where bigness is inevitable, an area of smallness can be found inside the big unit by the process of subcontracting. It is perfectly true in India that this process has not gone far, and there is no harm in the Government of India and State Governments' asking bigger enterprises to investigate more thoroughly the area for economic subcontracting. Thirdly—perhaps this is more important of all—assistance to small-scale industries must not merely be financial or physical (in terms of providing equipment on a hire-purchase basis or otherwise), but also organisational, preparation of project reports and the arrangement of services such as arranging collaboration and the surmounting of routine hurdles with which the path of new industrialisation in India abounds. Last but not least, there must be an explanation both from sections of the public sector and the private sector—which dwell in big units and the smaller units—as to why their operation is necessary in the national interest. Too little has yet been done in this direction and the area of misunderstanding is wide. Is it not time that the Federation of Indian Chambers of Commerce and Industry and the Associated Chambers of Commerce devoted their attention to a co-ordination between big and small business in which a political conflict is growing, though currently heavily concealed?

Wanted: City Dykes?

THIS year's floods especially in the Punjab and Uttar Pradesh were exceptional but not all of an unprecedented nature. One was the abnormal destruction caused in the urban sector, that is, towns of important size where protection should have been available. In Punjab, Rohtak city was under water for well over three weeks. In Uttar Pradesh, the capital city of Lucknow was engulfed in water and damage and destruction were inflicted on an altogether unheard-of scale. This year's floods of the Gomti, it is true, beat the previous highest record of 1923 and reached the level

370 feet, exceeding the previous peak by a foot. It was not only these big cities which were inundated but the floods exacted their toll in the smaller towns. The entire town of Mainpuri in Uttar Pradesh was under knee-deep water. In Lucknow and Rohtak, the army had to conduct de-watering operations for over two weeks. In their wake the floods have created a tremendous problem of launching preventive measures against unprecedented spread of epidemics—cholera in particular. How long complete rehabilitation will take in both the cities it is difficult to estimate.

The submergence of cities and towns by flood waters raises a vital issue in the policy for flood control. Since the schemes of multi-purpose river projects were taken in hand, flood control policy has been almost completely identified with control of inundation of the countryside. This is undoubtedly the principal aspect of the policy. But devastation of cities and towns by floods has also taken place at intervals and many a time on such a large scale that it is a matter for surprise why protection of cities and towns against floods has not been considered in earnest as a live issue of flood control policy. This year's bitter experience of destruction caused in Lucknow and Rohtak will not have gone in vain, if amends are made for this serious lapse in policy.

A controversy has been raised by engineering experts in India as well as abroad about the effectiveness of dykes and embankments as measures of protection against floods. It would appear that in Bengal engineers still adhere to the view that embankments not only do not serve the purpose of protection against floods but invite greater destruction than would otherwise take place once the embankments either crumble or are crossed over by the inundating waters. In other States, like Orissa and Uttar Pradesh, opinion has changed from time to time. The disbelief in the efficacy of embankments and dykes to offer protection against flood waters is giving way in these two States. In fact, opinion is veering round in their favour. Experience in China on the Yellow and Yangtze rivers and in Italy on the Po river has strengthened the case for embankments as a perrennial strategy in anti-flood measures.

There is positive evidence that the value of dykes in protecting towns and cities has been proved. The Inter-Provincial Flood Conference held at Lucknow in January 1939 appointed a Technical Sub-Committee when doubts were raised about the utility of embankments to save the neighbouring areas from the ravages of floods. This Committee was manned mostly by senior engineers. It went into the problem at great length and recorded its findings with considerable force. It has corroborated the scepticism entertained about the value of "marginal" embankments on the banks of big rivers. But in so far as the protection of urban areas is concerned, the Committee's finding is quite categorical. It has recorded its considered view that isolated dykes for protecting towns and cities are technically quite permissible and therefore highly desirable.

More than two decades have passed since this positive finding of the Technical Sub-Committee on the advisability of erecting dykes as defences against flood waters in towns and cities was reached and still no action has been taken. In fact, floods such as those in Rohtak and Lucknow areas, with recurring frequency, do not appear to have produced any hard thinking on anti-flood measures beyond the immediate problems of draining water and rehabilitating the population. The grave damage caused this year to the two cities ought to focus attention on this avoidable calamity. Thorough hydrological and topographical investigations of the contiguous areas of cities and towns exposed to submergence by floods will need to be carried out since data on these two basic factors do not practically exist at the present time. Will protection of towns and cities by means of dykes as a vital and integral part of flood control policy be taken up with a real sense of urgency now at least? And will town administrators act with a little more imagination, instead of resorting to helpless innovations at the last moment and resigning to such misfortunes as acts of God?

The Commonwealth and Common Market

WHEN the Commonwealth Finance Ministers met in London last month, one of the important subjects discussed related to the European trading problem. Discussions on this subject were inconclusive since the Ministers could not be expected to give any firm opinion about a possible future settlement whose terms are yet under examination. The main question was what particular provisions of the Commonwealth preference structure the rest of the Commonwealth considered had to be preserved, if the European settlement took the form of a customs union. Though there was a general recognition that an economic settlement in Europe is of considerable political consequence to the whole of the western world, there was a feeling among the individual countries that their interests should not be jeopardised. In the final communique that was issued, it was accepted that in any negotiations between the Six and Seven that take place, the essential interests of Commonwealth countries should be safeguarded and full account taken of the continuing importance of intra-Commonwealth trade.

It is in this context, when the Commonwealth interest has acquired great importance in British policy towards the European organisations, that the recent study entitled "The Commonwealth and Europe" sponsored by a non-official body, namely, Britain in Europe, and splendidly implemented by the Economist Intelligence Unit, London, assumes great topical relevance. The main object of this study is to find out the future effects on the Commonwealth of the present moves towards freer trade in Europe and of a possible future participation by Britain in the Common Market. What it does is to find out what arrangements would be both acceptable in Europe and beneficial to Commonwealth trade as a whole. Its conclusion is clear. It is that both Britain and the Commonwealth will lose if Britain remains cut off from the Six. At the same time, it has no hesitation in pointing out that it is in the interest of European nations themselves that countries in other continents should benefit as a result of European integration and not suffer from it.

While the study finds that the impact of the European Free Trade Area on the Commonwealth will be small, it feels that the European Economic Community (EEC), on the other hand, with its common tariff and common commercial policies and its rapid economic growth, will have greater impact on the imports of the Six. Here it analyses the possible effects on the different categories of imports. It points out that the common tariff will have little effect on imports of raw materials as a whole. In respect of tropical foodstuffs, however, it feels that nearly two-thirds may suffer some pressure because of the free entry into the Six from their overseas territories and this discrimination in favour of overseas territories is the one feature of the EEC that may threaten seriously an important sector of the Commonwealth trade. As for manufactures, which form just 3 per cent of the imports, their expansion or contraction will depend very much upon the tariff and quota policies of the Six. The study also underlines the fact that imports of Commonwealth raw materials into UK, just like those into the Six, would encounter few problems arising from a common tariff, and there is no problem in reconciling Commonwealth export interests with a non-existent common tariff. It is only manufactures, which account for 7 per cent of the UK's imports from the Commonwealth, which present a more difficult problem. It, however, makes the point that for Asian manufactures, a moderate tariff is not a serious obstacle because their problems are more related to quantitative restrictions. Therefore, it pleads that the best policy would be a low tariff for the whole of Europe, with, where quotas are already imposed, the certainty that they would be enlarged in line with any growth of European consumption.

The study takes note of the fact that India is concerned about the effect on its trade by current plans for economic integration in Europe and there is a fear that Indian exports would suffer by the creation of the EEC, particularly through competition from French African produce. It also points out to the fear that European capital, which might have ordinarily come to India, may go elsewhere. These fears, are however, dismissed as groundless since it makes the point that India's claim on the political plane to find assistance from foreign countries is stronger than almost any other under-developed country and the small inflow of private capital is not likely to be much influenced by changes in Europe. So far as trade is concerned, it expresses the view that very little of India's existing export trade will be damaged by the common external tariff of the community even though over two-fifths of identifiable exports to the EEC will be subject to tariff changes.

However, its conclusion is that in the context of India's current problems, the effects of European economic integration are not of much significance. Since in the long run, India will have to rely much more on exports of manufactures, it feels that the general trend of policy, which would let more Asian goods into the markets, rather than the details of the European tariff, are of significance to her. But in the meantime as a safeguard, it suggests that the UK might reserve the right either to cut off imports from the continent or to allow free entry from the Commonwealth, should European imports from the Commonwealth fall below the agreed levels. All in all, the study is a valuable contribution to the current debate on European economic integration which is pervaded by a sense of optimism that the current economic problems created by Britain's relationship with the Commonwealth can be resolved to their mutual benefit.

The Suratgarh Farm

MAKING the desert bloom—that is the aim of the Suratgarh Central Mechanised Farm, established four years ago with Russian aid on the northern fringes of Rajasthan. Four years may be too short a period to assess the success or failure of a giant enterprise like this—the Farm covers an area of 30,670 acres—especially when one of the most important pre-requisites of agriculture, irrigational water, is still a scarce commodity here and work had to be started on this wasteland practically from scratch. But it is time perhaps to look into the affairs of this project when it is about to progress beyond its initial stage. Perennial supplies of irrigational water from the Bhakra Dam are expected to be made available to this Farm at none-too-distant a day when it is expected to go into full strides of development.

Any project of such huge dimensions has to encounter innumerable difficulties in the initial stages. But the success of entrepreneurship depends on how quickly these difficulties are removed. Behind the facade of quite impressive achievements of this Farm's management, all, it is understood, is not yet in order. No proper accounting system, it appears, has been evolved so far; no allowance is said to be made, while preparing the annual production plans of the Farm, either for depreciation of the machinery or for interest on capital employed. The management of this project is perhaps following the same cost accounting practice as followed by some other public sector enterprises, which has come in for scathing criticism by the Hoffman Mission.

Some defects are also said to have been noticed in the equipment supplied by the USSR Government. Some time ago it was reported that there were difficulties in getting spares for this equipment. That difficulty, it is understood, has been happily overcome with the Russian Government making available these spare parts free of cost or at nominal expense. More serious problem, which might very adversely affect the project, however, is the difficulty being experienced in the operation of the Russian machinery under hot climatic conditions of Suratgarh; the equipment, it is learnt, has developed some major defects to attend to which a team of Russian technicians had been flown in a few months ago. How far can these defects be removed in the absence of a well-equipped workshop at the project site is anybody's guess. And a modern workshop has yet to come up here.

Again, no norms of work for labour, it is understood, have been fixed as yet. True, the conditions at the Suratgarh Farm will stabilise only when perennial water supplies are made available. But it is high time that some tentative norms of work are fixed. Then only can proper working of the Farm be judged. It is heartening to note that the Government of India has agreed, in principle, to give incentive awards to the workers at the Farm, so that they may have a feeling of partnership in the project and be induced to work in a spirit of healthy competition. But the fruits of this can be reaped by them only when they know what is the minimum amount of work required of them. The project has been planned on a very ambitious scale. To fulfil these ambitions active co-operation of the workers will be needed. The best way to achieve this end is to fix the norms of work early and introduce the incentives scheme.

With a retired Army General at the helm of affairs of the Farm, there is hope the present difficult phase of the project will be over soon and this arid tract will become once again a lush, green and prosperous area which, as the legend goes, it was some 4,000 years ago.

A DELHI DIARY

DIWALI: A MATTER OF TIMING?

ALL Delhi has been thrown in confusion by a sudden decision to make the official holiday for Diwali Wednesday and not Thursday. For the first time, it would seem, the Prime Minister has been guided by priestly advice. But, since the almanac has been prepared for a long time, one wonders why the priests should have suddenly changed their minds on Wednesday! Can it be that the priests were not consulted in the first instance with the Government of India assuming to itself a highly religious function incompatible with the Secular State? Can the Indian (like the Russian) Government decide on the movement of the moon and satellites even though we have no satellites, political or other? On the whole, it seems its little knowledge is a dangerous thing. The net result has been that many programmes to leave the capital have been rudely torn asunder, and I regret to say that I have been compelled to abandon a wholly innocent "long week-end".

Talking about timing, and the effect of the changing planets or heavenly bodies on its making, how can one fail to remember Dr. Sampurnanand? To his great honour he has stood fast throughout the week and refused absolutely to move an inch, (or is it centimetres, now?) in response to the request of the Congress Parliamentary Board, that he should reconsider his decision to resign. In the end, after much consideration — reports say that the meeting lasted two and half hours — the Parliamentary Board regretted that "the circumstances should have arisen which have induced him to offer his resignation and his withdrawal from his high office," but left to his judgment whether to resign from his office or not, and in the event of his pressing his resignation, the U.P. Congress Legislature Party, should proceed to elect another leader in his place. Not a very inspiring resolution, but one which shows that a single determined man can overrule the persuasion of the most powerful body in India. Speculation now proceeds on who the next Chief Minister of Uttar Pradesh is to be. We have been regaled over Diwali with a new fight in the Legislature which refuses, it seems, to accept Mr. C. B. Gupta. I do not take the disrespectful view that a naughty cartoonist has taken in a Wednesday paper, but being tolerant I publish his disrespectful comment.

"Good old democracy—a government of the Congress, by the Congress, for the Congress!"

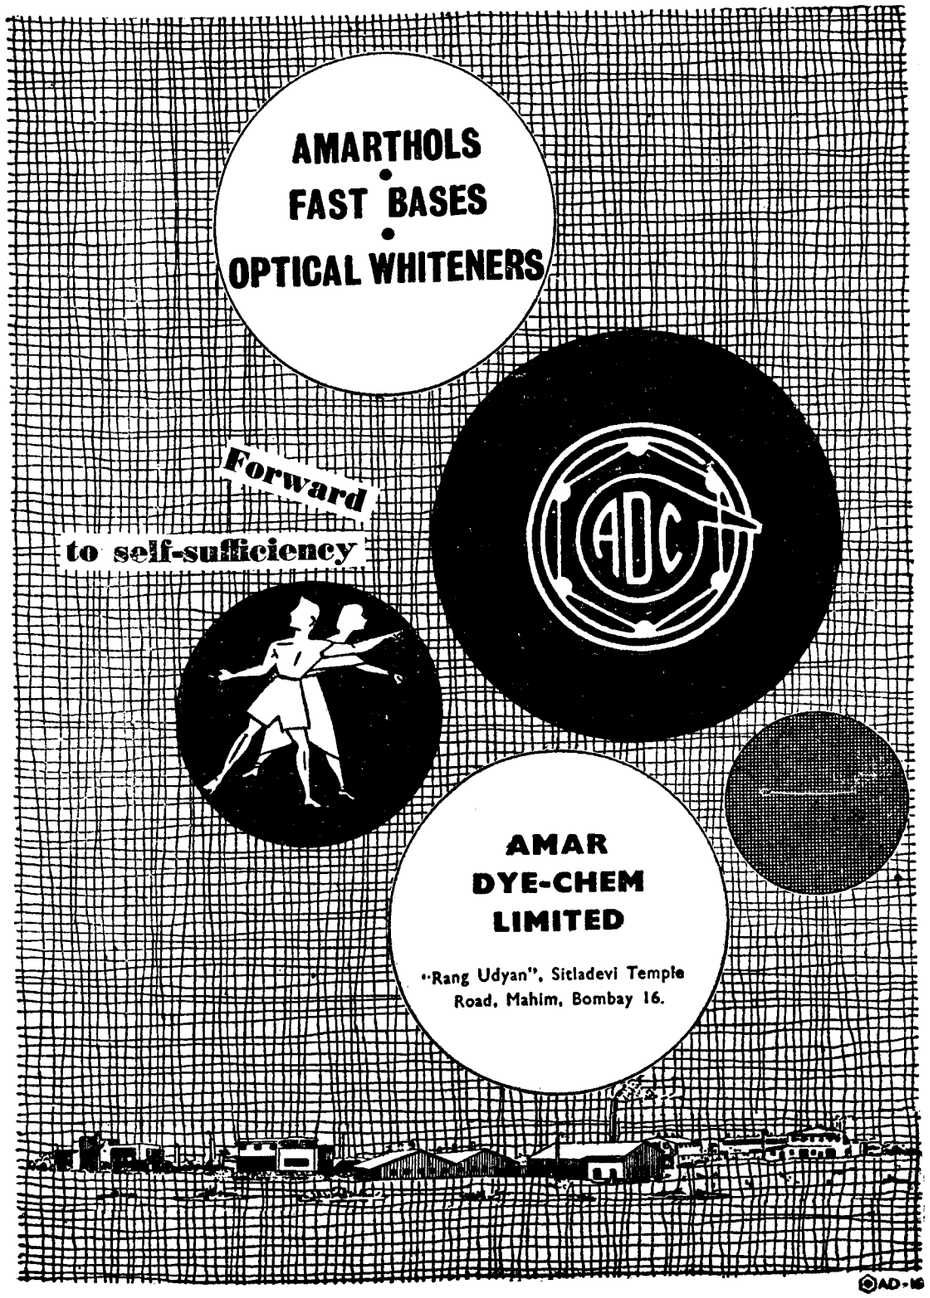
MALCOLM MACDONALD



Malcolm MacDonald left New Delhi on Monday and has been the most talked-of person throughout the week. There was a huge crowd to see him off and I noticed that, besides a liberal sprinkling of journalists, there were painters, writers and, of course, last but not least, eminent civil servants as well as members of the diplomatic corps. He must have meant many things to many people, and I will not attempt to cover ground which has been copiously poured out on his many-sided character in the daily newspapers. Curiously, the most vivid impression which comes back to my mind is one of thirty years ago. I was privileged to attend a debate in the Oxford University Union at which Malcolm MacDonald, after the formation of the National Government of 1931, was the leading guest speaker on a resolution which had something to do with the formation of the National Government. I remember he spoke for an hour and caused some little restlessness, not unusual with British audiences unused to the somewhat repetitive manner which is often used in the highest places in India. But I think he established a splendid case and when the voting was announced, Andrew Mellor, of stout orthodox Labour fame, went down fighting before him. But the impression which I wish to recall is not the debate or the arguments attendant thereon; these have been mercifully drowned in time. It is that Malcolm MacDonald is the same to me in 1960 as he was in 1931; in thirty years he has not grown a day older!

ARUNA SETH

It was appropriate that Malcolm MacDonald's last official act should have been opening Aruna Seth's exhibition of pictures at 21, Golf Links — the beautiful house of the Seths. This is not only because by making this his last act Malcolm MacDonald showed special honour to Aruna's painting, but also because it was a symbol of his many-sidedness that he could think that honouring a painter was an important function of the British High Commissioner in India. He has chosen, in this particular case, a worthy symbol of his esteem. Few people who know Aruna Seth's work will deny that here is Delhi's foremost artist in at least the fields which she has made her own. Her painting is not abundant. Of the twenty-five pictures in the exhibition, the dates of composition range from 1947 to 1960, but there is no year in which she has painted more than six pictures. She is — as is expected of all artists — a creature of moods, working herself up to a fever, doing a picture and then apparently losing all interest in it. That, I expect, is a mark of special talent; but, of course, not all moody people are talented!

The point that is of interest is that her talent has not been born out of turmoil and poverty, nor has it been oppressed by her link with successful business in the form of Manohar Seth. Most Indian art critics seem to have the peculiar idea that art can only triumph in destitution, and involves a constant struggle of the soul, somehow with a concomitant struggle for bread and butter. Perhaps it is the result of the excessive reading of numerous lives of Von Gogh and much less of the spacious life of someone like Joshina Reynolds or Leornardo da Vinci. Aruna Seth is a happy contented person who has never known, I believe, the pangs of poverty or the depredations of business. Her paintings reflect, particularly in their glorious colours, a kind of gay abandon which, I expect, comes from good living and a sense of fun. For the worldly wise, I say, as a man of the world, one should try to corner these pictures before — like Hussain's and a few others that I know — they become all the rate. The exhibition is already closed, but, I strongly advise my friends to look at it again before some of its finest pieces disappear into the darkness of private enjoyment!

ARGUS.

Announcing
LUFTHANSA'S
fabulous
*Senator
service

ON THE EUROPE—FAR EAST ROUTE

From the 1st November, the superb Senator Service is being introduced on LUFTHANSA'S Far East flights. The little extra touches make this service the last word in sheer luxury !

On any of our twice-weekly flights to Europe, you will bask in LUFTHANSA'S lavish attention—you will breathe an air of good living, which only the Senator Service can provide.

Senator

LUFTHANSA

THE WEEK'S NOTES

Assam

LANGUAGE ISSUE TO THE FORE AGAIN

IF THE Assam Pradesh Congress has its way, it is a safe bet that the State will be soon plunged into another holocaust. The Official Language Bill, introduced in the Assembly on October 10, in spite of the fact that it could not command the approval of the extremist sections, had the merit of being a compromise that should be acceptable to the moderates. It was a sequel to the recent visit of Pandit Pant, the Union Home Minister, who, in spite of the fact that he could not carry the people of the Hill districts with him, was by and large able to evolve a formula that was eminently reasonable. It would have been, of course, better if the entire language issue had been postponed till after the General Elections. When a judicial enquiry that has been demanded into the July disturbances in Assam could not be held on the ground that it would create tension, there was substantially more valid ground for deferring the language question for some more time to come. But this was not to be, since the Assamese-speaking people were determined to press their demand.

The Official Language Bill, introduced in the Assembly, makes it clear that both Assamese and English (till the latter is replaced by Hindi) should be the official languages of Assam. At the district level, Assamese will be used for administration and other official purposes in the plain districts of the valley, while Bengali would be employed in Cachar and the language in use immediately before the announcement of this law in the autonomous Hill districts. The Bill also lays down that in enforcing the use of the official language or languages, the State Government should be guided by certain principles to safeguard the rights of various linguistic groups. The Assam Congress President has, however, expressed his view this week that the Pradesh Congress Committee will not be agreeable to the Bill unless it is amended, as contained in the resolution passed by the Pradesh Congress Committee. The resolution says that "Assamese shall be used for all official purposes of the State, provided Assamese and English (the latter replaced by Hindi) shall be used for official purposes in the secretariat and the offices of the heads of departments of the State Government in the manner prescribed by the Government." The departure made in the resolution from the Bill lies in the fact that whereas the Bill provides for two languages—Assamese and English—the resolution tries to make out that Assamese should be the sole official language and therefore tries to take away the substance of the compromise.

PRESSURE TACTICS

The resolution thus makes the language structure unilingual in form though bilingual at the State level and multi-lingual at the district level. It may be recalled that when six months ago, the Pradesh Congress demanded that the Assamese should be the sole official language of the State, the Chief Minister refused to accede to it unless it had the support of the non-Assamese. However, later under pressure, he yielded to the demand for the introduction of a Bill declaring Assamese as the official language of the State. It was this which was responsible for much of the difficulties which followed later. If the Government again makes a similar mistake under pressure to water down the substance of the compromise that is contained in the Official Language Bill, it is bound to provoke widespread resentment among the non-Assamese-speaking people and especially among the people of the Hill districts. With the resignation of the Tribal Affairs Minister and the Tribal Affairs Parliamentary Secretary, the signs are already ominous. The introduction of a Bill seeking to give the Government special powers to deal more effectively with the Press (which in fact amounts to virtual gagging) is a further indication of the state of things to follow. Unless the Assam Pradesh Congress reverses its stand and eschews its extremist attitude, it can be taken for granted that the State is in for another period of uncertainty with results no less disastrous than last July.

South Africa

THE REFERENDUM AND AFTER

THE REFERENDUM held in South Africa early this month on whether she should become a republic was no doubt a victory for the Nationalists led by the Prime Minister, Dr Verwoerd. But it was only a formal victory since the republican policy secured only a majority of about 74,080 (the voting being 849,958 in favour and 775,878 against). Apart from the fact that nearly 48 per cent of the white electors were opposed to the change, it should be borne in mind that the non-white population consisting of nearly 11½ million were not allowed to vote. It would appear that the Nationalists were able to muster the support of a number of Afrikaners who are not their political adherents and a section of the English-speaking voters as the Congo crisis and the African ferment came in handy for purposes of political propaganda. The narrow majority secured, nevertheless, shows the rift between the Afrikaners and the English-speaking South Africans. There is also the fact that Natal voted overwhelmingly against the Republic and there are already heard voices of a possible secessionist move. This is, however, unlikely to happen as it would plunge the Union into a civil war on which no white group will embark with a sense of recklessness.

So, the path is clear for Dr Verwoerd to make his next major move in the pursuit of his 'white Africa' policy when the Republic comes into being in May next. To him, the change in this status is only a formality since, as he explained while introducing the Bill for a referendum in January this year, the "development of the Union of South Africa hitherto has been a continual changing of our original constitutional and other legislation in the direction of a republic." What he will now do is clear and that is to plunge himself wholeheartedly in his self-appointed task of governing twelve million non-whites without their consent and pursue to the logical extremity the apartheid doctrine. This would inevitably lead to a break with the Commonwealth Club and though this may mean a severe blow for South Africa, Dr Verwoerd is not likely to be deterred by this and to many of the Nationalist extremists nothing will be more satisfying. The attitude of Britain on this question has been so far non-committal though it came up for discussion on an informal level at the last meeting of the Commonwealth Prime Ministers. There it was agreed that South Africa should 're-apply' for continued membership of the Commonwealth if the Republicans should win in the referendum. It is already on the cards that many of the African and African Commonwealth members will take the opportunity of a change in the status to refuse permission to South Africa to continue in the Club. Here, what should be the attitude of Britain? This is what is engaging the attention of the thinking section in Britain. It has been sometimes argued that expulsion of South Africa from the Commonwealth will only exacerbate her and increase her sense of isolation to pursue her apartheid policy with greater vigour. This is to shut one's eyes to realities since the South African Government has consistently shown that nothing can deflect it from its policy and she will not be amenable to any moral pressure. On the other

hand, expulsion from the Commonwealth with its concomitant economic pressure may prove of some avail in at least convincing the supporters of Government of the perils of isolation and bring it to its senses. In any event, Britain will find it difficult to value racial affinity more than Commonwealth unity.

Agriculture

WANTED: SANCTIONS AGAINST ERRING STATES

THE WARNING given by Mr S. K. Patil, soon after he assumed the charge of the Food and Agriculture portfolio at the Centre, that the Union Government would have to devise some sanctions against the States which failed to pull their weight in matters pertaining to agricultural development, one thought, had gone home; nothing had been heard about this for sometime. That optimism, however, has proved to be misplaced. It is shocking to know from the address of Mr Shriman Narayan, Member for Agriculture in the Planning Commission, which he delivered at the recent meeting of Commission's Panel on Agriculture, that only one State has so far sent its proposals for implementing the recommendations of the Nalagarh Committee which nearly three years ago had made valuable proposals for streamlining the administration of agricultural departments in the States.

It is indeed deplorable that so scant attention should be paid by the States, which under the constitution are the primary Governmental agencies connected with agricultural development, to the crucial problem of toning up their administration when the country is embarking upon an ambitious plan for raising farm output. There is hardly any need to stress the point that howsoever imaginatively a programme or a scheme might be drawn up, it would be of little use if it cannot be implemented properly. And day in and day out new schemes for agricultural development in the country are being put forth by the Central Government and the Planning Commission. There are plans, quite big ones, for extending the area under irrigation, for providing to the agriculturist better seeds, organic manures, artificial fertilizers and improved farm implements, for pest control, soil conservation and dry farming, for reclamation of cultivable waste-lands and for making available in the countryside cheap credit. With the next rabi crop the programme for intensive cultivation, the package programme, is being extended to six more select districts in six different States. In another six months this programme will be launched in eight more districts so as to cover by the schame one district in each of the fifteen States of the Indian Union. The Union Ministry of Community Development is going ahead with its plans to bring the entire country under the community development programme by 1963.

All these steps are being taken to increase the production of foodgrains to about 100|105 million tons, that of sugarcane to 92 lakh tons (gur), of oilseeds to 92|95 lakh tons, of cotton to 72 lakh bales and of jute to 65 lakh bales by the end of 1965-66. It needs hardly to be emphasized that the attainment of these ambitious targets will require Herculean efforts both on the part of the Indian peasantry and the States' agricultural departments. The State Governments, however, do not seem to realise that streamlining of their administration is the first step in making a concerted effort towards this end. It is perhaps time to devise some sanctions against the erring States. Is it not possible to link the industrial development of a State to its efforts to develop its agricultural economy? There is, at present, a virtual scramble among the States to get included in the Third Plan as many of their industrial schemes as possible. The Planning Commission will do well to tell the States that their industrial schemes can be sanctioned only if they pull their weight on the agricultural front.

Jute

— an industry on the march

Long regarded as the cheapest heavy-duty packaging material, jute is today claiming attention as a fabric with greater possibilities and wider applications.

Laminated with paper or plastic, jute fabrics provide moisture-proof containers for fine or high-grade products. Treated with chemicals, they offer protection against rot, mildew, corrosion and attack by rodents and insects. Scientific experiments have resulted in the production of a hessian membrane for water-proof roofing... hessian in combination with asphalt is finding increasing favour as a material for canal-lining and a moisture barrier.

These and other discoveries which have dramatically widened the scope of jute usage, stem from the fundamental and applied research carried out at the Indian Jute Mills Association's Research Institute in Calcutta. Side by side, the Institute of Jute Technology—financed by the IJMA—provides facilities for training young men for important supervisory positions in jute mills.

Founded in 1884, the Indian Jute Mills Association seeks to serve India's vital jute industry in ever-increasing measure.

FREEDOM: RE-STATEMENT OF A FAITH

By

ODYSSEUS

I DO NOT KNOW how well Professor F.A. Hayek's name is known in India. In parts of Europe he is fiercely criticised. This hostility arose because in 1944, just before the end of the war, he published "The Road to Serfdom" (Routledge. 3sh. 6d.), in which he argued that from the moment that we try to establish central direction of all economic activity through a single plan, laying down how the national resources should be consciously directed towards particular aims, then liberty and democracy begin to slip from us, and we advance down the path that ends in a totalitarian state. This was published, remember, before the war had ended, at a time when most states had more or less centralised control over their economies in order to win the war, at a time, also, when memory of the inter-war years of depression had eroded faith in Free Enterprise, and when, in the UK at least, this loss of faith, coupled with war-time experience, had created a new faith in Welfarism and Socialism. Because Professor Hayek's book was at variance with the spirit of the 1940's, he was regarded as a crank and a reactionary.

Today, sixteen years after publication of "The Road to Serfdom," actual experience has in turn eroded faith in centrally directed economics in most of the West, so that there are many "mixed economies" which are neither one thing nor the other.

On the one hand, experience has shown, particularly in Germany and Italy, that if you reduce public works to the minimum, and give the profit motive free play, the index of national production soars, and you pile up fantastic balance of payments surpluses. With 1953 as 100, Germany's industrial production was 72 in 1950 and is 171 today; Italy's was 78 in 1950 and is 169 today.

On the other hand, the UK's index bedevilled by a Socialist legacy of nationalised industries and welfare expenditure, has in the same years risen only from 94 to 127. While not forgetting that the UK's contribution to Western defence is higher than that of any other country except the USA (percentages of national income spent on defence in 1958 were: US: 11.1; UK 7.7; Germany: 3.2; Italy: 4.3), the fact remains that it is politically difficult for the UK's Conservative Government to reduce public expenditure on the nationalised industries (including coal and transport, which lose millions every year) and on the social services, even though the majority of the voters have come to recognise once more that Free Enterprise is the mainspring of growth. Because it is politically difficult to rationalise public expenditure, politicians are constantly constrained to use disingenuous arguments to justify it. That is why, despite the lessons of experience, there remains much confused thought as to what the true role of the state should be.

And that is why Professor Hayek's newly published "Constitution of Liberty" (Routledge and Kegan Paul. London. July, 1960. Price 45sh.) has had a cool reception from many reviewers. Even so, the "Economist" of London, after devoting two columns to criticising Professor Hayek's exposition, concluded: "Yet there is not one point in 'The Constitution of Liberty' that does not need to be pondered." The dangers that it proclaims are real. The conflict between the desires (a) for "social security" and (b) for maximum material advance—on behalf of those very individuals that social security is intended to benefit—needs to be faced. The injustices, perversities, and economic damage caused by inflation, punitive taxation, and protection of special interests, such as groups organised powerfully enough to coerce employers or the state, need to be shouted from the housetops; the doctrine that a majority vote in a democratic election justifies disregard of the rights, political, intellectual, or economic, of the minority, needs to be challenged. Above all, it is important to recognise that no one individual or group of individuals—experts, planners, government officials, or others—can ever command enough knowledge to know all the answers, to organise and plan a society to best advantage. What is intellectually best can only emerge from the clash of opinions; what is economically best from the higgling in the market of millions of comparatively ignorant individuals.

So I am going to draw your attention to a few of Professor Hayek's points in hopes of persuading you that, even if you disagree with some or all of them, you cannot afford to ignore his book. "The Constitution of Liberty" provides the case—richly documented and soberly reasoned—which the advocates of centrally controlled economies have got to answer.

THE WEST'S LOSS OF FAITH

It has been a long time since the ideal of personal freedom and initiative which inspired Western civilisation, and whose partial realisation made possible the spiritual and material achievements of that civilisation, was effectively restated. In fact, for almost a century the basic principles on which Western civilisation was built have been increasingly disregarded. The leaders of the West have sought alternative social orders more often than they have tried to understand, or use better, the principles which made them prosperous. It is only since the world has been up against Marxism and totalitarianism, in office, that they have noticed that they have lost clear ideas of their aims and have no firm principles with which they can challenge rival dogmatic ideologies. Professor Hayek has a special message for India, as for free Asia. He seeks to rally the whole free world behind a common ideal—that of individual liberty. But he points out that few will listen to the call of liberty as long as the intellectual leaders of the West disparage the achievements of their own civilization and concentrate on the substitution of "better worlds." Many Asian countries adopted Western ideas at a time when the West had begun to be unsure of itself and had largely abandoned the very belief in liberty, which, by enabling the West to make full use of those forces that make for the growth of all civilisation, had made possible

the unprecedented quick growth of Western prosperity. Consequently, those non-Western leaders, who became purveyors of ideas to their own peoples, learned, at Western universities, not how the West achieved its astonishing material triumphs, not how it built up its civilisation, but its dreams of alternative systems.

ASIA'S TRAGEDY

To Professor Hayek this is tragic, because, though the beliefs on which these disciples of the West are acting enable Asian countries to copy more quickly a few of the West's achievements, they also prevent them from making their own distinct contribution. Not all that has resulted from the West's historical development can, or should be, transplanted to other cultural foundations; and whatever civilizations emerge in Asia, under Western influence, may sooner take appropriately modified local forms if allowed freedom to grow among the people rather than if imposed by centralised direction from above. If it is true, as is sometimes said, that the necessary condition for a free evolution—the spirit of individual initiative—is lacking in Asia, then, says Professor Hayek, no viable civilization can grow there. "So far as it is really lacking, the first task must be to awaken it: and this, a regime of freedom will do, but of regimentation will not."

A free man is one who is equal before the law, in a state itself subject to the law. Freedom is absence of coercion, which should be exercised (by the state alone) only where necessary to prevent coercion by private persons. India will be interested to note that Professor Hayek favours a written constitution, unalterable by transient majorities.

Professor Hayek's point of departure is that the advantages of a civilization arise because the individual benefits from the existence of more knowledge than he himself knows. When we consider how much knowledge possessed by other people—doctors, accountants, individuals, stenographers, bankers, economists, musicians, carpenters, scientists, engineers, lawyers, agriculturists (and even columnists!)—is essential for the success of our own individual aims, the colossalness of our ignorance of the factors on which our decisions depend is staggering.

Knowledge exists only in the minds of individuals. A society in which the individual is free enables us to profit by knowledge that we individually don't know, by enabling each person's free use of particular knowledge to help others unknown to him. The milling mass of individuals cooperate to promote their myriad aims through the interplay of such institutions as marriage, households, schools, universities, business houses, factories, garms, banks, plantations, insurance offices, government departments, trade unions, embassies, newspapers, stock exchanges, shops, markets of all kinds, legislatures, etc., etc. We do not know exactly how the process of interaction works to secure changes and growth. We can only describe it by such inadequate concepts as "individual initiative," "imitation," "free play of opposing interests," the "clash of opinion," the "higgling of the market." And Professor Hayek wryly comments that when we discover how little we know of what secures change and growth, we are, on the whole, apt to be resentful rather than struck by wonder or curiosity. "Much of our occasional impetuous desire to smash the whole entangling machinery of civilization is due to this inability of man to understand what he is doing." Certainly, society is infinitely complicated, and as some people contemplate its complications, they become exasperated by their inability to take it all in, so they comfort themselves by abuse, such as the "scramble for wealth," "suicidal competition," "exploitation," "profit hunting," and (a favourite term with British Socialists) the "free-for-all state." Yet, as another great thinker, the late Edwin Cannan (author of "Wealth," to my mind still the best introduction to elementary economics) said, whatever society is, it is organised, not chaotic. If society were really chaotic, you would be crazy to go to your office tomorrow, because, you would be just as likely to get your daily bread by staying at home.

The European Scene

A COMMON MARKET SUMMIT

From Our Special West European Correspondent

PARIS, October 17.

HOWEVER distant and complicated the wrangling about European unity may appear, especially in the confused stage it has now reached, it contains at every turn propositions of direct interest to India, as having potential repercussions on her foreign trade. For example, in the last few weeks Dr. Ludwig Erhard, the West German Economy Minister, has been canvassing a suggestion for a 30 per cent reduction in all German import duties on imported manufactures. Designed to attract Britain and the USA, this proposal would also concern India, where there has been complaint of inadequate German imports, given the volume of German exports to that country. Yet this proposition was essentially a manoeuvre to postpone, or avoid, the moment when the Common Market must pass the point of no return by beginning to build a common external tariff around the economies of the six Continental nations.

That moment is due on 31st December this year and it will mean that West Germany must raise her tariffs toward the average level while France and Italy lower theirs. This operation will already be sufficiently intricate because, since the "base-year" which is chosen to calculate the six-nation average, West Germany has decreed many unilateral duty reductions in order to facilitate imports and thus reduce the external trade surplus. If, at the end of this year, West Germany were to wipe out all these reductions, get back to her tariffs of the base-year and then raise her duties further to come into line with her partners, the shock for her economy would be immense.

So she was granted by her partners various dispensations: her duties would go up much more slowly than theirs came down, but the sense of the operation remained the same, for all the members would be moving toward a common tariff. Dr. Erhard's suggestion would, of course, ruin this enterprise since it would increase the gap between the various national tariffs on the Continent; it was, in fact, a plain repudiation of the Common Market. It had a chance of appealing to overseas countries like India (it was brought to their notice by being put about in the corridors during the World Bank meetings) only if they concentrated attention on the temporary gains from lower German tariffs and forgot that the best long-range hopes for their exports lay in letting the Common Market set up its unified tariff and then trying to get that reduced. In that way, what they lose temporarily in higher German tariffs will in the long run be more than compensated by lower tariffs over the whole six-nation region. If the West Germans are sincerely interested in freer entry for Asian goods into Europe, it will be more profitable to let them push down the common external tariff rather than have them lower their own duties and confirm the other Continental countries in protectionist practices by ruining the Common Market.

It had a better chance of appealing to other European countries like Britain. Not only would it kill the Common Market, but since Dr. Erhard proposed to accompany freer imports by a reduction of West German export incentives, it would have many of the virtues of an up-valuation of the mark: German imports would rise and her exports fall, which is the objective of British advocates of a revalued mark. The Americans, however, quite failed to rise to the bait. To the argument that this reorganisation of German foreign trade would reduce German payments surpluses and thus help relieve the dollar, they replied that previous reductions in German duties, as in 1957, had done very little to limit the German surplus; and anyhow such putative marginal gains were definitely not worth the price of undermining the Common Market.

Dr. Erhard returned to Bonn to find that in his absence the French Premier had been and gone, and that the disagreement between Chancellor Adenauer and President de Gaulle over political and military matter had been settled by a piece of high-level horse-trading: Paris agreed to toe the line of Atlantic orthodoxy in defence, while Bonn promised to go ahead with the Common Market at the end of the year. So the effort to put off the fateful day for the Common Market had failed. Not only that, but West German industry had reacted very unfavourably to Dr. Erhard's suggestion for a disguised up-valuation of the mark, and went to Dr. Adenauer with a counter-proposition that is of equal interest to India. Rather than import more and export less, German industry offered to make a spontaneous effort by raising a loan of 1,000 million marks in favour of the developing countries. Placed at the disposal of those countries in successive slices, this loan would not be "tied", i.e. it could be used for the purchase of goods elsewhere than in West Germany. The advantages of this procedure would be that it would puncture the German inflation less painfully for private enterprise than Dr. Erhard's increased imports, it would be a contribution to the Western aid effort which now falls wholly on the USA, France and Britain, and it would be consistent with German undertakings in the Common Market (just renewed by Dr. Adenauer to M. Debre.) On the other side, one needs to add that since interest on the loan would be at least six per cent and since it would be spread out over time, the windfall for the developing countries is not so wonderful; and since many of the consequent orders for manufactures would inevitably be placed in West Germany, the disinflationary effect would be only partial.

At all events, the upshot of this latest crisis in Continental economic integration was that one proposition of possible interest to India was rejected in favour of another of certain, if limited, relevance to Indian development. The point is plain, I hope, that however tangled they get, these negotiations always have an aspect that entails an impact on India's foreign trade or on on her possible borrowing. After the failure of London's plan for a customs union for manufactures (whose impact on Indian trade has been discussed here lately) and after the failure of this latest German effort to sidetrack the Common Market, the present position is that the scheduled speed-up of Continental integration should take place at the end of this year. Further duty cuts will be effected within the region and the first step will be taken toward a common external tariff. Yet, as was emphasised when these decisions were taken in the summer, the speed-up concerns only industrial goods because the six countries have not yet been able to agree on agricultural policy; in that field, the liberation of trade has been slowed down rather than accelerated.

Now this situation is unsatisfactory for Italian and French farming interests, who see liberation of trade going forward in manufactures while they are denied freer access to the protected West German market in foodstuffs. Rome and Paris might still decide that progress in the one direction is worthwhile even if the unification of primary produce markets is delayed. But the Dutch, whose main concern is necessarily the sale of their farm produce in neighbouring countries, have

fewer gains to balance against their disappointment over agricultural commerce. During the negotiations last May, they consented to the speed-up of the Rome Treaty only on the understanding that some way of freeing trade in primary produce would be found before the end of the year. None has been, and as the electoral climate becomes heavier in West Germany it becomes more and more difficult for Bonn to take measures that will indispose its farming interests. In these conditions, the Dutch would be morally justified (and would have the backing of farmers in south Europe) in calling in question the whole procedure of speeding up the integration of th Common Market. So this is the new threat that weighs on that enterprise: not diversions from without, such as Britain's customs union project, and not the hankering of German manufacturing industry for larger scope than the six-nation market affords, but the formidable difficulty of bringing the produce of various protected and subsidised farming interests to a common market where the same price is paid for the same goods.

It is here that the "Little Summit" meeting in Paris in December of the six heads of governments will be important. This meeting is the result of President de Gaulle's demand for a political confederation to take over (and dominate) the executives so far produced by economic integration (i.e. Euratom, the coal and steel authority and the Common Market commission.) This demand has been regarded most suspiciously in all the Continental capitals, where it has been seen as the prelude to a "third force" splitting NATO and Western unity, as an attempt to establish French domination on the Continent, or as a subtle affort to undo European unity by disembowelling the supranational administrations it has created. For all I know, it may be all of those things and worse, in the mind of President de Gaulle. Yet there is one point on which de Gaulle is perfectly correct, and it is illustrated in the difficulty about agricultural trade just referred to: the process of economic integration cannot go forward autonomously, under the benevolent direction of supranational administrators, because it inevitably runs into political obstacles that only political authorities (i.e. governments) can get around. Because Continental industry is converted, sincerely and irrevocably, to the concept of a common market for its manufactures, the process of integration (duty cuts, quotas, etc.) can race ahead on its own, without intervention from governments. The United-Europe visionaries then get the idea that integration is so simple that it can be left to the technocrats and experts of the supranational executives, until one day Europe wakes up to find itself one nation.

On the contrary, in all the really difficult fields—agriculture, social services, labour migration, and so on—there will arise acute political problems, setting in conflict powerful vested interests, such as the farming lobbies. Technocrats cannot deal with those conflicts, and de Gaulle is being realistic when he says that the path forward necessarily lies through co-operation between governments, which alone have the power to defy sectional interests for the sake of higher policy. After extracting every possible guarantee from Paris that de Gaulle's confederation is not really an anti-American, third-force operation, the Continental capitals are reluctantly rallying to this view and they have agreed to meet at the summit in December. From the economic point of view, which alone concerns us here, this meeting will be an epoch in European integration and will decide the future of an undertaking that impinges on all world trade, the building of the Common Market.

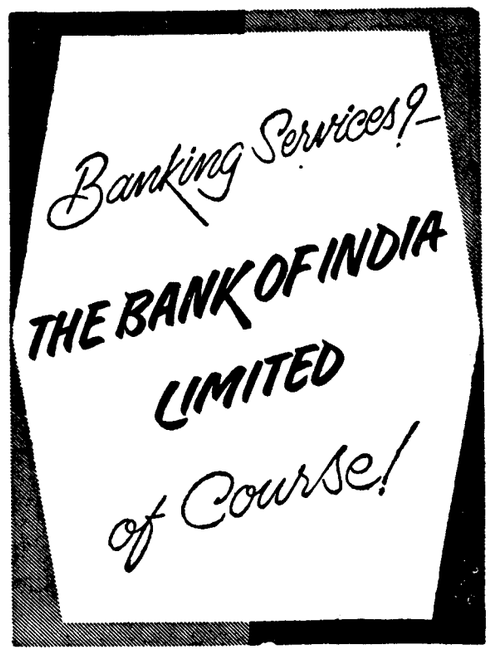
Economic Report from the U.S.

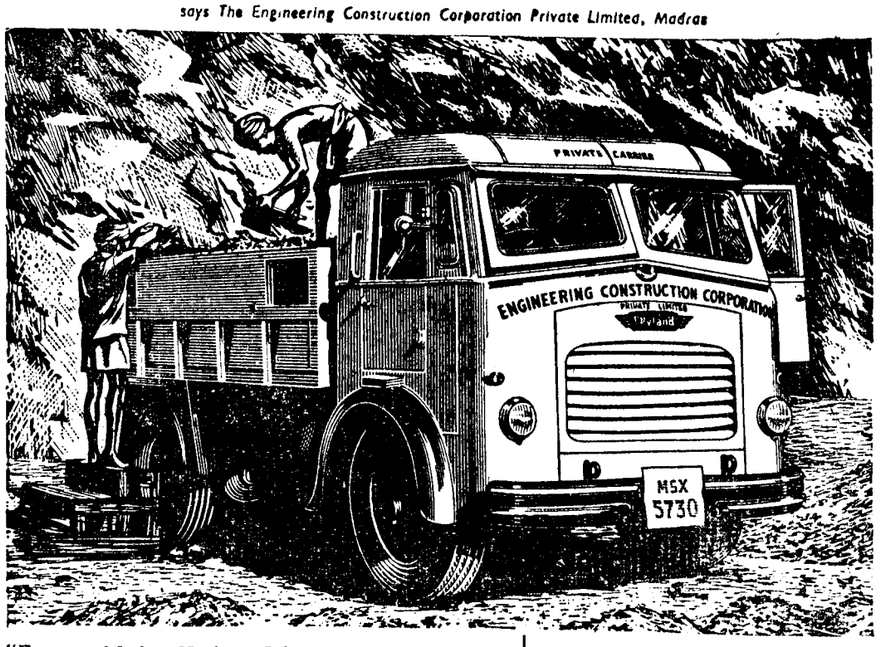
DEVELOPMENT ASSISTANCE GROUP

By



GUY SIMS FITCH

WASHINGTON, Oct. 11.



THE need for greater co-operation of Government-sponsored assistance programmes has received new emphasis with the meeting here last week of the Development Assistance Group (DAG). This group comprises ten leading capital exporting countries plus the European Economic Community (EEC), all of whom are deemed capable of making substantial economic assistance available to the developing areas—assistance over and above their contributions to such international bodies as the United Nations World Bank and International Monetary Fund. Members of the group, in addition to the EEC Commission, are the United States, Canada, Belgium, France, the Federal Republic of Germany, Italy, Japan, the Netherlands, Portugal and the United Kingdom. The inclusion of Japan underscores the global, as against the regional, nature of the cooperative development effort. At present, DAG is largely an interim body. In time, when the projected Organization for Economic Cooperation and Development (OECD) is set up officially, the group will function within the framework of that larger 20-nation body. The OECD, which encompasses virtually all the nations of Western Europe plus the United States and Canada, is the scheduled successor to the old Organizaion for European Economic Cooperation (OEEC) and will emphasize the acceleration of world-wide economic growth through enlightened aid and trade policies.

The rationale of DAG—and to some extent of OECD as well—is to provide a forum where capital exporting countries can discuss among themselves the problems of economic assistance to developing lands. Its stress is not merely on providing more aid, but especially on achieving a high degree of co-operation among its members. This type of co-operation, it is confidently believed, can help improve the nature and administration of national assistance programmes, and can relate these programmes more effectively to the recipient countries' own needs and efforts. Thus, DAG is concentrating primarily on matters of broad policy, on general aid principles, and on assistance techniques which are of common interest. It has no operational functions, nor does it administer any particular aid programme or fund. Neither DAG nor OECD is viewed as a radical departure from established assistance channels. Ideally, both are designed to complement and strengthen, rather than replace, existing aid institutions. With this in mind, relations and contacts are being worked out with all the important agencies and organizations dealing with the problem of development assistance. It is significant, therefore, that representatives of a number of international bodies took part in DAG's discussions. Among them were several UN agencies, and such regional organizations as the Inter-American Development Bank, the European Productivity Agency, and the Commission on Technical Assistance in Africa South of the Sahara.

Of great concern to them and the DAG members are the important questions of pre-investment studies and technical assistance. It has long been recognized that investment—that is, money—is not the sole answer to development needs. There must be trained people to put the money to good use and to administer sound economic and financial programmes in the developing lands. Similarly, the effectiveness of development programmes, and of the assistance given them by capital exporting countries, can be enhanced through prior studies of the resources and techniques required and the feasibility of related development projects. As with all new departures, of course, DAG inevitably has encountered some difficult and complex problems. Not the least of these has been the necessity to find common denominators in different types of aid programmes from different countries. But progress, while it may seem slow, is being made, as witness the agreement reached at last week's meeting on providing comparable data about the flow of funds from DAG countries to the developing areas. Now, as one delegate has put it, the co-ordination job can begin on an effective basis.

"Ashok Leyland COMETS
carry in 5 trips what others
would need 7 to clear"
says The Engineering Construction Corporation Private Limited, Madras

"FOR THE Madras Harbour Job we shall need upto 500 tons of blue metal a day. All this has to be moved from our Quarries at Pallavaram to the Madras Harbour 15 miles away. Since a lorry can make only a limited number of trips a day, the rger the load it can carry, the more economical it will be for us. That is why we are happy to have Ashok Leyland Comets in our fleet. They carry in 5 trips what others would need 7 to clear. We save on fuel, maintenance and overheads too. Breakdowns? No...None so far!"

Testimonials like this show why LEYLANDS are the most wanted vehicles in over 50 countries in the world. Every vehicle is built to exacting standards of precision and craftsmanship

The Forward-Controlled Leyland Comet Chassis is designed specially to combine large body space with easy handling. The quick starting, long life Leyland Diesel engine, with its high torque output combines pulling power with remarkably low fuel consumption. *The Ashok Leyland Comet is the only 7½ ton payload chassis made in India.*

INITIAL-1006

ASHOK LEYLAND COMET - precision built to give lasting service

ASHOK LEYLAND LIMITED, Ennore, Madras

WORLDGRAM

India

Steel Production at Bhilai: During September 1960, the Bhilai Steel Works produced 30,737 tons of steel against 23,824 tons produced during August 1960. The aggregate steel production totalled more than 2,41,000 tons including 196,000 tons of billets upto the end of the month. The pig iron production during September totalled 54,240 tons against 50,512 tons in August 1960. The aggregate pig iron production totalled 782,000 tons. About 558,000 tons of pig iron and 179,000 tons of steel billets had been despatched from Bhilai upto the end of September 1960 since the beginning of the year.

*

Central Board for Workers' Education: The Annual General Meeting of the Central Board for Workers' Education was held recently under the chairmanship of Mr R. L. Mehta, Joint Secretary, Ministry of Labour and Employment, Government of India. Budget proposals for 1961-62 and the revised estimates for 1960-61 were approved by the Board, which also considered the draft annual report and the Statements of Accounts for the period ending March, 1960. Amendments to the Rules and Regulations of the Central Board were also accepted at the meeting. It was decided that the present Board of Governors should continue. The Central Board for Workers' Education was set up in September 1958 and includes representatives of trade unions, employers, educational institutions and the Government. The object of the workers' educational programme is to educate workers in the principles and techniques of trade union organisations and to enable them to play an intelligent and responsible part in the affairs of the union and of the management. The Board meets once a year and its work is carried on by a governing body elected from the members of the board.

*

Alind's Ten Years of Growth: The Alind Project in Kerala has completed ten years of its industrial growth. It started with stranding machines and made cables. In the second stage, it went into rod-rolling. From rod-rolling it come to cover conductors. From cover conductors it has now gone into the production of high-tensile galvanised steel core wire. It is also interesting to note that in 1950, it had a capacity of 1500 tons of bare aluminium conductors. The annual production worked out to a value of roughly Rs. 40 / 45 lakhs. During the year 1952 it expanded further. In 1955 rod-rolling mill was established. Amongst the notable features in the growth of the Alind are the measures that it has adopted for advancing the social, financial, and cultural interests of its employees.

United States

Finance for the Trombay Fertilizer Plant: The United States Government has announced that it will finance the entire cost $58 million (Rs. 27.6 crores) of a large Government of India fertilizer plant to be built at Trombay, near Bombay city. The Trombay factory, one of the largest in Asia, will be run by Hindustan Chemicals and Fertilizers Ltd., an Indian Government Corporation. Of the total cost $30 million (Rs. 14.3 crores) to cover the foreign exchange requirements will come from the U.S. Development Loan Fund. Loans granted by DLF are repayable in rupees. Repayment in India's currency does not involve the export of goods or services from India or expenditure of India's foreign exchange reserves. Local currency costs of the factory will be met by a loan of approximately Rs. 13.3 crores (equivalent to $28 million). The Trombay factory consists of four major units. These will produce ammonia and nitric acid, as intermediary products and 1,05,000 tons of uria fertilizer and 3,00,000 tons of nitro-phosphate fertilizer annually as final products. Principle raw material will be refinery gas and nephtha from nearby petroleum refineries and imported phosphate rock. It is expected that the factory will go into full scale operation during 1962 or early 1963.

Japan

Imports of certain Products to be Freed: As from October 1, 1960, 74 items of agriculture, forestry and fishery products were added to the list of free import goods, according to an announcement made by the Ministry of International Trade and Industry. These items include frog meat, (fresh, chilled, or frozen), meat extracts, natural sausage casings, fish, rye, pine-apples, sweet chestnuts, mushrooms in air tight containers, cocoa bean, pig hides, mink furs (undressed), decorative feathers and bamboo. The value of these items imported during fiscal year 1959 amounted to Y2,400 million or one per cent of the total imports of agriculture, foresty, and fishery products, of which cocoa beans accounted for Y2,530 million, and sweet chestnuts, pig hides and natural sausage casings for more than Y100 million, respectively.

U.S.S.R.

Textile Production: The Soviet textile industry will this year turn out about 8,000 million metres of different fabrics, or more than is produced by such countries as Britain, France and the Federal Republic of Germany taken together. To increase textile production in 1959-65, the Soviet Union will put into operation 200 new high-capacity textile mills. By the end of the seven-year Plan, per capita output of textiles in the U.S.S.R. will reach 55 metres.

Yugoslavia

Income of the Population: In the course of July the total money incomes of the population have grown further so that this year they are higher by 22 per cent than the first seven months of 1959. However, the real wages per one employed, recorded a visible increase which, depending on the working post, moved from 10 to 15 per cent compared to last year. This increase in the purchasing power of the population is reflected in the growth of the retail trade which is larger than last year, as well as in the constant increase in savings. At the beginning of August, they reached the figure of about 84 billion dinars. In the first seven months of 1960 they rose by 17 billion dinars, which is double the amount of the credits granted to another section of the population. The average deposit on a savings book amounts to about 27,000 dinars, while in 1955 for example, it was only 7,000.

United Kingdom

New Plan to Harness Water Power in Scotland: Details of a new £4m plan to harness the water power resources of Glen Nevis, Inverness-Shire, to meet the increasing demand for electricity in the Scottish Highlands has been announced. Demand in the area is increasing by about 7 per cent a year. Under the scheme, 82 million units of electricity would be supplied annually into the Grid.

France

New French Pocket Camera: A French company has designed a new 24 x 36 camera, called 'Malik Reflex' with a variable-focus objective (35-75 mm.). With a diameter of 6 cm. (2⅜ inches) and a length of 8 cm. (3⅛ inches), it is the smallest instrument of its type in the world. Production trials have been successfully completed and an ultra-modern assembly line with the latest precision machines is in the process of being terminated so that the 'Malik Reflex' Camera will soon be available on the world market.

*

Increase in French Oil Production: The output of crude oil during August 1960, including the first shipment of oil from the Eastern Sahara to the Mediterranean Coast, totalled 960,800 tons for the entire French community. Of this total, 177,100 tons of crude oil were produced in metropolitan France, 709,100 tons in Algeria and the Sahara, and 74,600 tons in the other countries in the French Community.

Algeria

Industrialization of Algeria: The industrialization effort made in Algeria as of 31 August, 1960, can be summarised as follows: Of the 480 requests made by various companies, 349 were granted—167 for the expansion of existing industries, and 182 for the establishment of new industries. The capital for two hundred of these businesses is from Algerian sources, and the capital for the other 149 enterprises will come from Metropolitan French sources. A total of 829,370,000 new francs will be invested, of which 2,36,105,000 NF comes from Algeria itself and 593,265,000 NF from Metropolitan French sources.

Belgium

New Method of Mining Coal: The cable- type scraper, inspired by both the Porte and Gardin and the Estfalia systems, was designed and developed by a Belgian engineer, Mr. M. J. Martin, acting within the framework of the Collieries Underground Research Department of Monceau-Fontaine. Its fundamental principles are as follows:

(1) to devise a simple mechanical method capable of assuring an output of 100 tons per cutter, working in rooms of approximately 150 metres in length, in extra-thin seams, even in hard coal;

(2) to permit the electrification, under all circumstances, of the cutting installations by means of simple equipment;

(3) to devise an installation taking up but little room at the coalface so as to allow the retreating method to be used and to facilitate clearance of coal cut (for example, by means of a scraper gobbing installation).

The equipment used is robust and extremely simple. The manner in which the winch and its motor function ensures a very long operating life. The weight of the equipment at the coal-face is only about 1,400 kilograms.

Australia

Aluminium Plant: An expansion programme to increase output of aluminium to 20,000 tons a year will be undertaken following the sale by the Federal Government of its interest in the Bell Bay (Tasmania) aluminium plant to Consolidated Zinc, Pty. Ltd. The plant, which has been operated by the Australian Aluminium Production Commission, was sold to Consolidated Zinc for £1,09,73,000. The Tasmanian Government will retain its interest in the venture. The company and the Tasmanian Government will join in the new company to be formed on a 2/3rds and 1/3rd basis. The expansion programme will cost £94,00,000 and is expected to be completed in four years. Of this sum, Tasmania will provide £30,00,000. From the initial planned output of 20,000 tons, ultimate production will rise between 40,000 and 50,000 tons.

Poland

Polish Ship Salvaging Service: The Polish Ship Salvaging Enterprise began exports of its services last year. Despite sharp competition, Polish tug boats were able to find willing customers for their services. Among the most interesting and most difficult operation carried out so far by the Polish enterprise was the towing of the large tanker "Salimas" last year from the port of Oragange in Florida to Hamburg. The enterprise which has only three tugs operating is planning to expand its fleet with the addition of a few tug-boats of 1,200 HP.

Czechoslovakia

Czechoslovak Sugar Factory Plants for the Soviet Union: Following the pre-war tradition of production and export the Czecoslovok engineering workers are now exporting plants for sugar factories in ever increasing numbers. Among Czechoslovak's largest customers in this line is the Soviet Union. On September 6, another important contract was concluded for delivery of two sugar factory plants whose capacity is the highest ever produced in Czechoslovakia. Each sugar factory can produce 3,000 tons of sugar beet per day. This is the 21st and 22nd sugar factory plant exported to the Soviet Union since 1945. Their erection will be directed by Czechoslovak experts.

I.F.C.

Investment in Rauma-Repola Oy in Finland: The International Finance Corporotion (IFC) has announced a commitment to invest US $1,875,000 in Rauma-Repola Oy of Helsinki, Finland, to help finance expansion and modernization of the company's diversified manufacturing operations. Rauma-Repola is one of Finland's largest manufacturing enterprises, employing some 15,000 people; its 1959 sales were about $60 million. The company operates in the fields of pulp, lumber, heavy machinery and shipbuilding. Rauma-Repola is publicly owned, with some 24,000 shareholders. Largest shareholder and principle sponsor of the business is Kansallis-Osake-Pankki (GOP), one of Finland's largest commercial banks, which owns 20 per cent of the capital stock. The major portion of the expansion and modernization programme is the increase in capacity of a cellulose pulp mill from 70,000 to 150,000 tons per year. The programme also includes modernization of machine shop focilities and expansion of a shipyard. Total cost of the programme is estimated at US $18 million equivalent. The IFC investment will be in unsecured dollar notes bearing 6 per cent interest payable in dollars and maturing between 1961 and 1965. In addition IFC will receive additional payment dependent on dividends and an option to purchase stock. IFC's commitment is subject to completion of the necessary legal formalities.

*

Investment in Comentos Bio-Buo in Chile: The International Finance Corporation announced recently a commitment to invest an additional US $200,000 in Cementos Bio-Buo, SA, to help finance the construction and initial operation of a cement plant near Concepcion, Chile, about 350 miles South of Santiago. The commitment will bring IFC's total investment in the company of $1,200,000. The total IFC investment will be in unsecured dollar notes bearing 7 per cent interest payable in dollars and maturing between 1966 and 1976. IFC will also receive additional interest related to profits and an option to subscribe to stock of the company. IFC's commitment is subject to completion of the necessary legal formalities.

BIRDS cover a wide field

The Birds/Heilgers group do not produce steel. But they provide the vital raw materials that go into the making of steel—iron ore, coal, manganese ore, limestone, dolomite, refractories... They do not grow jute but their mills turn out jute goods for a variety of uses. Their interests cover a wide field from paper to engineering... coal to electricity.

Their production units are today engaged in a programme of expansion to step up output to meet the increasing demands of India's industries. And their laboratories are constantly at work to improve their products... to explore new applications.

Through their service to the country for nearly 100 years, Birds have become a significant part of India's industrial scene.

BIRD & COMPANY (PRIVATE) LIMITED

NEWS IN BRIEF

INDIAN

It is reported that Japanese Government is considering a plan for extending new credit facilities to India totalling $20 million.

*

An Indian delegation will leave for Japan in the third week of November to negotiate the price of the iron ore to be supplied by India to Japanese steel mills next year. The State Trading Corporation has entered into a long-term agreement for the supply of iron ore to Japan and the price of the ore is fixed every year.

*

Plans are under way to make additional facilities available to private ship-owners, both Indian and foreign, to get their ships repaired and refitted at the Mazagon Docks in Bombay which were recently taken over by the Government of India.

*

It is reported "Aid-to-India" discussions in Washington next March at which the foreign assistance needs of the Third Plan will be examined in detail, will be joined by France.

*

The West German Government is willing to assist India in an agricultural project primarily designed to demonstrate improved farming practices and the possibilities of higher yields.

*

It is reported the Union Government has made special arrangements for the shipment of 50,000 tons of milo from the U.S. for use in the drought-affected areas of Andhra Pradesh.

*

Fifteen thousand bales of American cotton under the Indo-U.S. barter deal will arrive in India in the next few weeks. Under the barter deal India is to supply 112,000 tons of ferro manganese and 2.16 lakh tons of manganese in return for 4.5 lakh tons of wheat and 50,000 bales of cotton.

*

The Government of India have accepted the Tariff Commission's recommendation that protection to the piston assembly industry should be continued at the existing rates of duty for a further period of three years, i.e. upto the end of November 1963.

*

The revenue realised from important dutiable items in the first five months of the fiscal year 1960-61 amounted to Rs. 290.90 crores, of this Rs. 59.47 crores were collected during August, 1960.

*

The Shri Ram Institute for Industrial Research, Delhi, has developed a new process for the manufacture of Salicyl anilide which is used as a highly efficient, non-volatile, fungicidal compound.

FOREIGN

It is reported Jordan would receive urgent aid amounting to about $13 million from the International Monetary Fund. Talks with World Bank experts have been successfully concluded and a team of its representatives would arrive in Jordan next month.

*

Details of the quotas for consumer goods to be exchanged between the U.K. and Russia in the year to June 30, 1961, were announced in London recently. The quotas allow for £2.85 million worth (f.o.b.) of goods in each direction.

*

Daily average crude oil output in the U.S. in the week ended September 30, amounted to 6,632,000 barrels, compared with 6,660,000 in the preceding week and with 6,638,000 in the corresponding week last year, according to the American Petroleum Institute.

*

The first tyre manufacturing plant in western Canada was opened in Calgary by the Firestone Tire and Rubber Company. Firestone built the plant, its second in Canada to keep pace with the increasing population and expanding economy of the four western provinces — Manitoba, Saksatchewan, British Columbia and Alberta.

*

An agreement between Leyland Motors and the Israel Ministry of Transport, under which Leyland will establish a plant in Israel for the production of buses and trucks of upto seven tons, was intialled by the Director General of the Ministry of Transport.

*

Details of Turkey's fifth global import quota have been made available. According to a statement issued by the Minister for Commerce, the quota is intended to cover a period of only three months.

*

The North of Scotland Hydro-Electric Board's £4.2 million scheme to harness the water power resources of Glen Davis, would have an annual output of 82 million units of electricity.

*

The contribution made by British shipping to the balance of payments in the form of invisible exports totalled only £100 million last year, compared with £135 million in 1958 and £221 million in 1952.

*

According to the Bank of Montreal's business review, consumer credit in Canada has multiplied eight times ever since the war and now represents about 13.5 per cent of annual personal disposable income.

*

The Government of France has raised the guaranteed minimum wage by 2.31 per cent. About 500,000 workers whose pay scales are linked to the minimum wage will benefit directly.

For top grade Industrial Chemicals

Monsanto works constantly to develop new, better chemicals – and to improve those chemicals you already use. In every industry, whether it be agriculture – automotive – aviation – ceramics – chemical processing – cosmetics – electrical – foods – insecticides – mining – oil – paint – paper – rubber – soaps and detergents, there is a Monsanto chemical that will help to improve production and quality.

HAVE INEQUALITIES IN INCOME INCREASED?

By MISS ANNAMMA MATHEW

LAST week the Government of India announced the personnel and terms of reference of the committee appointed for studying the recent trends in the distribution of income in an effort to know how the increase in national income in the first two Plans got distributed amongst various income brackets in the country. A provocative analysis was presented in the July issue of the Quarterly Economic Report of the Indian Institute of Public Opinion dealing with the structure of both urban and rural income. The results of this analysis were based on a sample survey conducted by the Indian Institute of Public Opinion in the middle of 1959 covering 1,818 rural households and 1,293 urban households. In view of the current interest in the changes in the level of living of various groups of people and the controversy whether these changes have been consistent with the socialistic aim of planning, it is interesting to examine the available data. Practically the only useful figures available at present on the subject consist of the reports of the annual socio-economic surveys of the National Sample Surveys. Unfortunately, reports relating to periods subsequent to the 11th round covering the year 1956-57 are not yet available. However, it is interesting to place side by side the findings of the 4th round (April-September 1952) and the 11th round (August 1956-January 1957) of the N.S.S., and the latest survey of the Indian Institute of Public Opinion in order to determine the improvement in the level of living in the various groups.

The reference period for the 4th round was 30 days preceding the date of enquiry and the all-India sample contained 2,388 rural and 1,074 urban families consisting of 17,068 persons. The reference period for the 11th round was 30 days preceding the date of enquiry and the all-India sample contained 7,255 rural and 2,840 urban families consisting of 49,000 persons.

Different approaches are possible in studying the difference in the level of living at two periods. One possibility is, of course, to take a particular representative set of families and to trace and study their conditions at the two periods. Another is to take the two populations, arrange them in per-centile groups in the order of their consumption-expenditure and compare these pre-centile groups—how the living conditions of the lowest one per cent of the population in 1952 compares with the living conditions of the lowest one per cent of the population in 1956-57 and so on. It will be observed that the identity of the persons in the same per-centile group at the two periods may not be the same; a person might have moved to a higher or lower per-centile group during the interval. The latter approach called the "fractile method" seems to present the easier and more practical and useful approach. This method has been used in the present comparison.

It will be seen from Tables I and II that the per capita expenditure in every per-centile group is less in the 11th round (column 5) and in the 4th round (column 4) both for the urban and rural sectors. This is difficult to explain and can hardly be caused by normal sampling flunctuations. It is more reasonable to assume that the difference is due to some difference in concept or design which has had a consistent effect on all the per-centile groups. The feature that would enable comparison would be the fraction which the expenditure of each group would constitute, when

compared to the total expenditure of the entire population. Columns 2 and 3 of Table I for all-India rural population and columns 2 and 3 of Table II for all-India urban population give these figures.

So far as the rural population is concerned, it will be seen that up to about the 65th per-centile, generally speaking, the share of each five-per-cent group in 1956-57 is greater than its share in 1952. In fact, the expenditure of this 65% of the population in 1952 was 40.44% of the expenditure of the entire population, while their share in 1957 was 42.33% showing an increase of 1.89%. (The income of this group according to the Institute of Public Opinion figures was only 32% of the total income in 1959; since the savings of the lower income groups will be lower, the percentage of income may be expected to be lower than the percentage of expenditure.) For the population from the 65th per-centile upwards, however, the position is different; the share of expenditure of every five-per-cent group was less in 1957 than in 1952 and the share of the 35% of people above the 65th per-centile has fallen from 59.56% to 57.67% during the period showing a fall of 1.89%. There is hardly any fall in the share of the highest five per-centile group. It may be observed that the 65th per-centile in the rural population corresponds to a per capita expenditure of Rs. 17.01 and the 95th per-centile to a per capita expenditure of Rs. 36.11 (vide col. 5 of Table I) which will roughly correspond to a family income bracket of, say, Rs. 90 to Rs. 200 per month.

So far as the urban population is concerned, there has generally been a decline in the share of every per-centile group up to 90%, the cumulative share up to 90% having declined from 70.39% in 1952 to 66.84% in 1956-57 showing a fall of 3.55%. This has resulted in an increase of the share of the top-most 10% from 29.61% to 33.16%, i.e., an increase of 3.55% of which most has been appropriated by the top-most five per-centile group (the corresponding share of the **income** of the top-most 10% according to the 1959 IIPO survey is only 22.5% which result does not quite fit in; since the savings of the higher income groups will be higher the percentage of income may be expected to be higher than the percentage of expenditure). The 90th per-centile of the urban population corresponds to a monthly per capita expenditure of Rs. 46 and the 95th per-centile to a per capita expenditure of Rs. 60 according to the 11th round of the N.S.S. (vide col. 5 of Table II so that the 90th to 95th five per centile group will roughly correspond to a family income bracket of Rs. 250 to Rs. 350 per month in 1957.

It is difficult to draw conclusions regarding incomes from data on expenditure, but it could be reasonably assumed that there will be greater inequality in the distribution of income than in the distribution of expenditure since the excess of income over expenditure will increase with the level of income. Judgments of inequality based on expenditure are therefore likely to be underestimates when compared with judgments based on incomes. It should also be borne in mind that a fall in the share of income or expenditure of a particular per-centile group during a period need not necessarily mean a fall in the absolute level of income or expenditure of that group. The annual per capita (**not** family) National Income at current prices was Rs. 274 in 1951-52 and Rs. 291.5 in 1956-57 showing an increase of 3.4%. Keeping these points in view, it could perhaps be said that the above figures point to the following conclusions regarding changes in the condition of rural and urban populations between 1952 and 1957. So far as the **rural population** is concerned, the share of expenditure of the lowest 65% has increased from 40 to 42%. The share of the 30% group from 65% to 95% representing a monthly family income group of roughly Rs. 90 to Rs. 200 a month in the 11th round (1957) has suffered a fall of 2% in their share of expenditure from 43% to 41%. There has hardly been any change in the share of the top-most 5% which has remained 17%. In other words, there has been a tendency towards greater equality in the rural population, but the burden has been entirely on the middle class and there has been no burden on the top-most 5% group. So far as the **urban population** is concerned, the share of all groups up to the 90th per-centile has declined, the total having declined from 70% to 67%. The share of the intermediate 5% groups between the 90th and 95th per-centiles representing an income group of roughly Rs. 250 to Rs. 350 a month in the 11th round (1957)

Dovetailing our efforts

In your export efforts, you may be in need of many difficult-to-get items and services. We can help you to get :

Foreign Exchange :
For Business tours,
Publicity,
Opening new offices etc.

Indigenous raw materials :
Steel,
Pig Iron,
Tin Plate etc.

Imported Materials :
Raw or semi finished goods,
Spareparts and Components,
Accessories & Balancing
Parts etc.

Market & Marketing Information :
Market potential,
Import regulations,
Other useful information.

Transport of Cargo :
Shipping space
Internal transport facilities
for Raw Materials and
finished goods.

ENGINEERING EXPORT PROMOTION COUNCIL

THE BUSINESS WORLD

Wanted: A Realistic Export Policy

By CROESUS

I HAVE to devote this column this week also to exports. For I cannot help drawing attention to the contrast in attitudes, as it were, to this all important question of exports which I noticed as between the proceedings of the Standing Committee of the Export Promotion Advisory Council, to which I have referred in my last despatch, and the proceedings of the Seventh Annual General Meeting of the Indian Council of Foreign Trade (I.C.O.F.T.), held on the 13th instant in Bombay. I would commend the comprehensive presidential address made on the occasion by Mr Murarji J. Vaidya to all those interested in the promotion of this country's exports. The copious extracts that he gave from the records of the GATT, which he reinforced by quoting from the report of the Three Wise Men deputed by the World Bank to India recently, are sources of comfort, in that they make out an effective case for more exports from the less developed countries to the industrially advanced countries. The sympathetic attitude taken by the GATT in regard to "the problem of low cost imports from the expanding industries of under-developed countries" augurs well for any sustained export drive on the part of the less developed countries generally and of India in particular. It is up to us, therefore, to capitalise this goodwill to the maximum extent possible, but this pre-supposes two things (1) a correct assessment of the present position and prospects of our country's foreign trade in the context of world trade, and (2) a vigorous drive for pushing our exports. It is in having provided useful information on both these that the I.C.O.F.T. President has made a distinct contribution.

Let me first allude to the conclusions drawn by Mr. Vaidya from the examination of India's foreign trade vis-a-vis world trade. On the credit side, India's foreign trade, in tune with the trend of world trade, has recovered from the setback suffered in 1958. In 1959, as well as in the first few months of 1960, this has been the happy position. On the debit side, on the other hand, the expansion of our export trade has not been keeping pace with that of world exports, while our imports have been expanding at a faster rate than world imports. This explains the dangerously low level to which our foreign exchange reserves have dwindled (around Rs. 140 crores). On the basis of our average monthly imports, this sum of Rs. 140 crores would not cover the value of even two months' imports, which is perhaps the lowest foreign exchange reserves position of any country.

One has reasons to expect that, against this dismal background, the Planning Commission would have planned for exports on a really bold scale. But, once again, as in the case of the First and the Second Plans also, our targets for exports, to quote Mr. Vaidya, "have not been bold, taking into account the foreign exchange needs of the situation. They are just estimates of the likely achievements in the normal course." In view of this, it seems doubtful whether our country would at all be in a position to secure a balance on external account within even a period of ten years, as our planners seem to be hoping to do. In this context, the I.C.O.F.T. Chief has pertinently drawn attention to the experience of many developing countries, an aspect, which does not seem to have been taken into account fully by the Planning Commission. It is that, although, as the economic development progresses we may be able to reduce such key imports as foodgrains, steel, and machinery, to name the most obvious, this reduction is likely to be offset by imports of entirely new items. In other words, the pattern of imports will undergo a change qualitatively, but not quantitively. Inasmuch as the scope for effectively curtailing imports is thus severely limited, the only realistic and correct remedy, as Mr. Vaidya urged, is to plan our export drive during the Third Plan period in such a way that our export earnings will be able to cover both the maintenance imports and the loan repayments that fall due during this period.

Against this background, it is not comforting to find that, although our production, agricultural, industrial, and mineral alike, has been rising, the proportion of our exports to production has unfortunately not been rising as much as one would like. Indeed, barring coffee, hessian, sewing machines, iron ore, chromite, and manganese ore, the position has somewhat deteriorated between 1955-56 and 1958-59. An investigation should be made into the causes of decline in the share of exports out of the production of our export commodities and proper measures should be taken to rectify the situation.

Before passing on to the measures for promotion of exports outlined by Mr. Vaidya, there is need to refer to a very disturbing trend in the pattern of our foreign trade. While there has been a decline in our trade with the Commonwealth countries, especially the U.K., there has been an expansion in trade with the U.S.A., West Germany and the communist bloc. The percentage increase in the case of India's trade with the communist countries has perhaps been the sharpest, having risen from 2.15 in 1955-56 to 5.82 in 1959. This has naturally upset our balance of payments position. This is not so healthy a state of affairs, as may appear on the face of it and so needs to be looked into. We should urge the other Commonwealth countries, especially those with whom our trade has been declining, to devise measures to restore the customary balance; in the case of countries like West Germany and the U.S.A., we must persuade the concerned Governments, even as the Three Wise Men of the World Bank team stressed in their report, "to follow an enlightened trade policy for mutual benefit." In regard to the communist countries the favourable balance of trade may lull us into a mood of complacence, but we should not forget that this is at best a temporary phase based, as it is, on bilateral agreements which invariably provide for balancing the trade over a given period.

There is yet another danger that does not seem to have received the notice that it deserves. It is the distinct possibility of our trade with the non-communist countries being adversely hit by our exports to the communist countries. Our need today is not diversion but expansion of our exports. There have been instances, we are told, where additional exports of our traditional commodities to some communist countries (of course, through the STC) has not only resulted in the diminution in our trade with some non-communist countries but also in lowering the international prices of these commodities, because the communist countries, it is alleged, dump the goods imported from our country in our own traditional export markets. As a result the prices of our traditional exports fall and even the existing level of foreign exchange earnings from these exports tend to decline. Accordingly, the ICOFT President sounded a note of warning to both the STC and the Government of India to be cautious in building up the trade with the communist bloc.

To come now to the measures for promoting exports. Apart from initiating discussions with the GATT countries to arrive at some understanding with them in regard to imports from India, Mr. Vaidya listed the following measures:

(1) Introduction of a system of foreign exchange retention on the lines of the Japanese system;

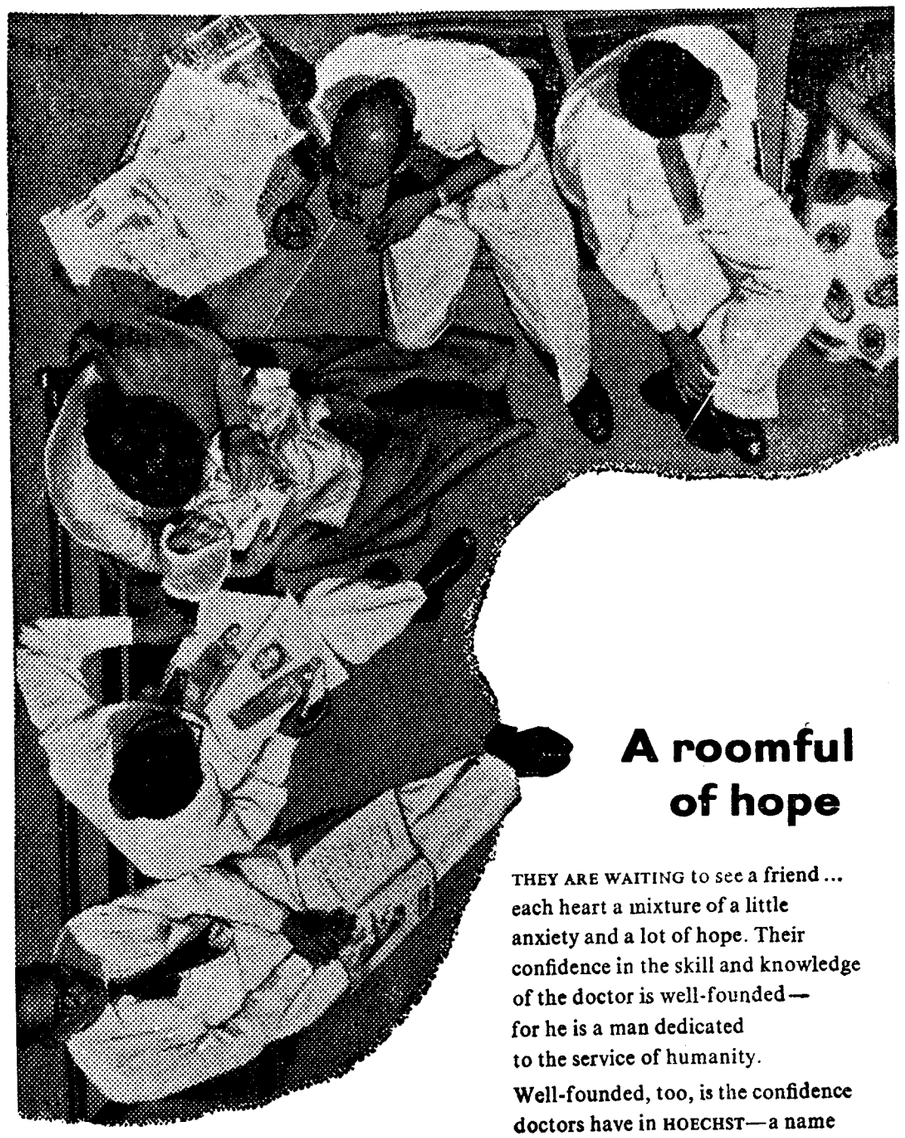
(2) Encouragement of greater collaboration and co-operation between manufacturers and exporters in the utilisation of incentive licences;

(3) Barter by Indian private agencies without any restrictions as to the country to which these agencies may export non-traditional items and import, in return, articles required for State projects or private projects;

(4) Imposition of a condition in the case of industries set up with foreign collaboration that, wherever feasible, exports should be undertaken by the Indian manufacturers to neighbouring markets (this is, in fact, being already insisted upon by the Union Ministry of Commerce), and

(5) Issue of incentive import licences to exporters in proportion to the additional efforts made by them to increase exports, that is, linking of the quota of established importers with their export performance rather than their past imports. None of these is impracticable, but will the Government view them as such and, what is important, implement them promptly?

Business Notes



Development

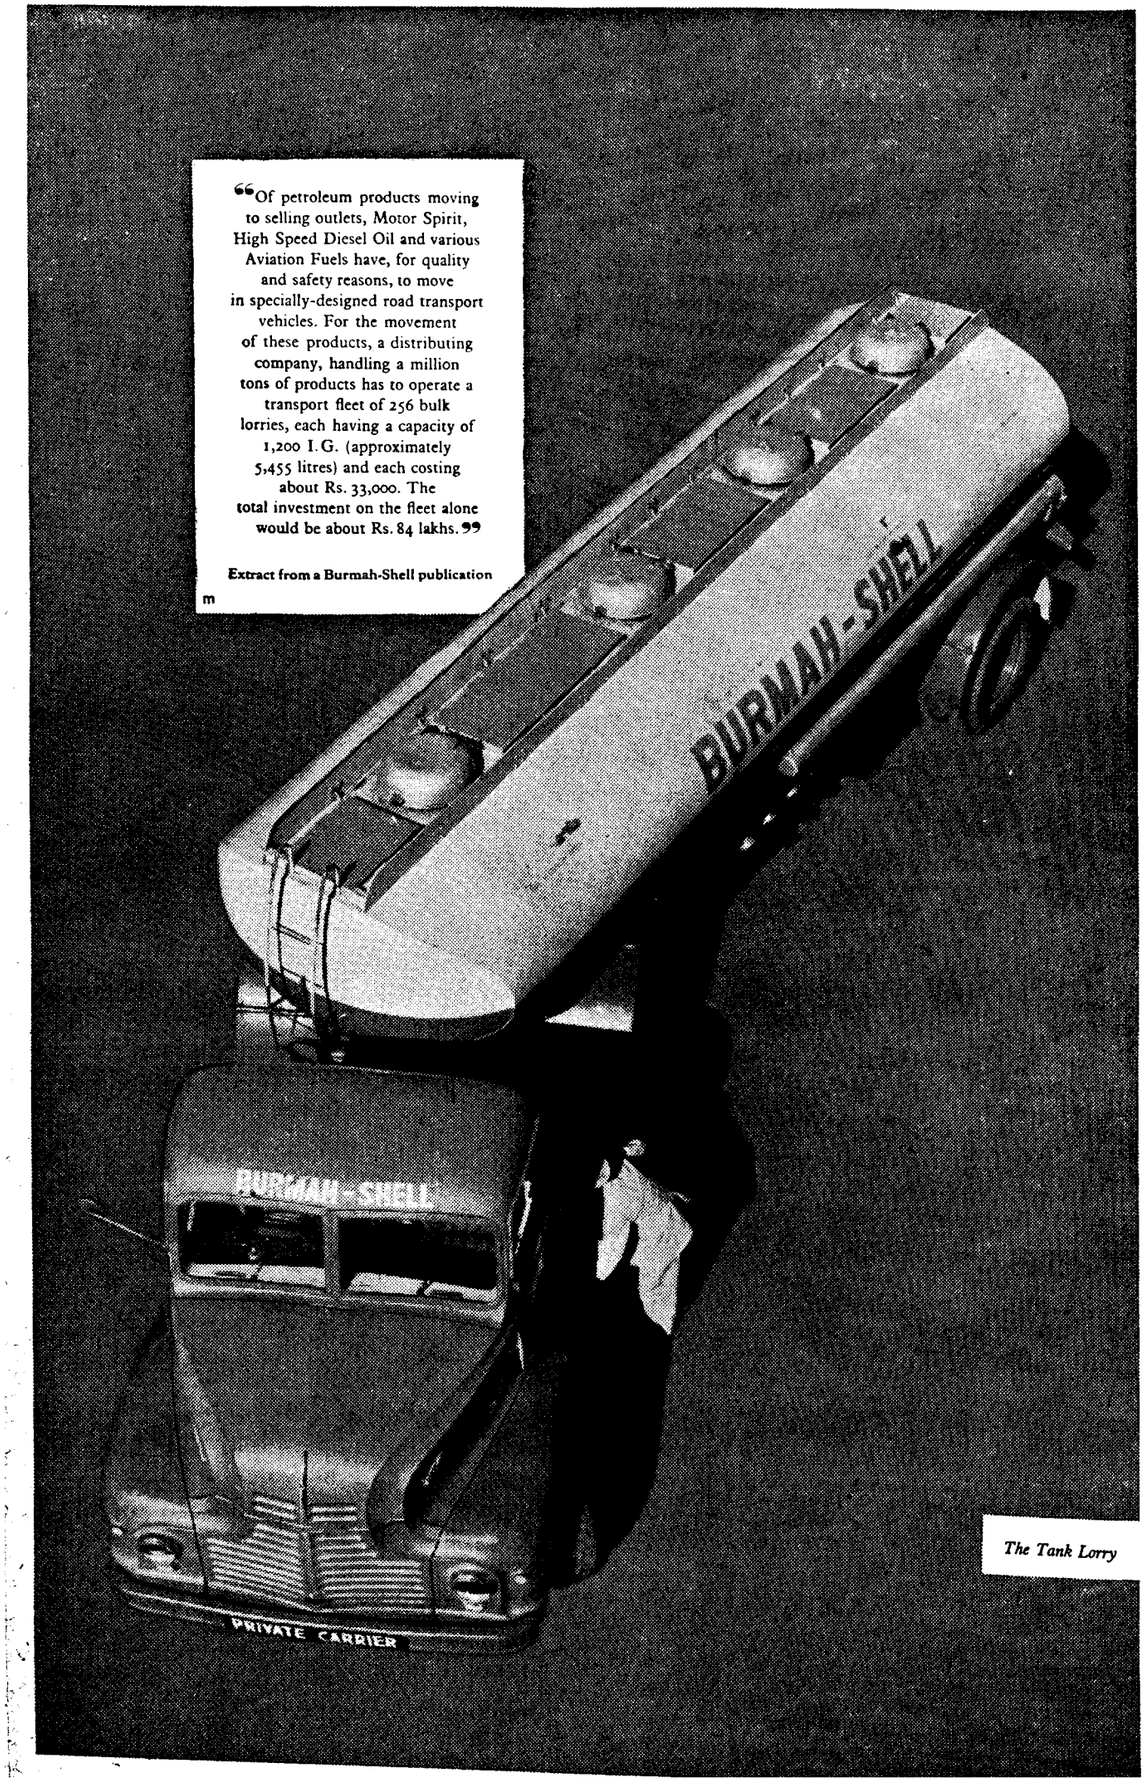
INDUSTRY IN PUNJAB

THE PUNJAB AND DELHI CHAMBER OF COMMERCE has argued a well-reasoned case of its requirements of co-operation and assistance from the State Government through its official policy to accelerate the orderly expansion of industry in Punjab in a memorandum presented to the State Minister of Industries. Relatively speaking, Punjab is making good progress—and faster progress than many other States in India—which is evidenced by the fact that the number of registered factories in the State increased from 2587 in 1953 to about 3,000 at the present time, and the number of persons employed there has risen to a little over one lakh workers. But the memorandum emphasises the fact that agriculture in Punjab has reached a saturation point in so far as its employment potential is concerned. By implication the Chamber means to argue that industrial expansion must be hastened in order to absorb the constantly increasing employable population of the State. Besides industry, the Memorandum discusses the position of agriculture, trade in foodgrains, small industry and other components of the State's economy. But it is the part of the Memorandum devoted to industry which catches immediate attention.

One handicap under which Punjab is suffering in its search for greater industrialisation is the paucity of raw materials. It is suggested that a scientific assessment of the availability of raw materials should be made and necessary steps should be taken to make the supplies adequate when industries are likely to be set up on the strength of the other factors. The Memorandum points out the necessity for the creation of a healthy climate for the growth of industries. In this context it highlights the fact that for some time past there has been "flight of our entrepreneurship" as also of capital. Then it suggests that Government should sponsor a team in order to contact the entrepreneurs from Punjab who have set up industries elsewhere and persuade them to return to the home State. This particular contention has not been corroborated by any factual data which should be in the possession of the Chamber in the ordinary course. How the climate for industry in Punjab is not as healthy as it ought to be and where exactly the flight of capital and entrepreneurship is taking place ought to have been elaborated by the Chamber which is undoubtedly more competent to deal with the subject than any other agency in the State including the Government.

The Memorandum has made some suggestions about industrial relations. It has expressed its faith in the tripartite machinery for cordial labour-management relations. But it has drawn attention to certain gaps in the policy of the State Government. Nothing will be more conducive to harmonious employer-employee relations than free and frank consultation between the parties. But the State Tripartite Committee appears to have become defunct since 1958 and the Memorandum makes a sound plea for the revival of this Committee. It also draws attention to another lacuna in the State Government's labour policy. Conciliation Officers have been appointed to bring about settlement of industrial disputes. But the absence of Conciliation Boards in the State operates as a handicap. Under Section 23 of the Industrial Disputes Act, strikes are prohibited during the pendency of the hearing of disputes before the Conciliation Board. Since the Conciliation Boards do not exist in the State and the Conciliation Officers are called upon to settle the disputes, the paradoxical position arises in which a strike can be continued during the pendency of the hearing of a dispute. Further, the Memorandum asks that model principles for reference of disputes to adjudication should be framed in pursuance of the agreement reached at the 17th Session of the Indian Labour Conference. Many other States have framed such principles which have proved helpful. Likewise, many of the industrially advanced States have declared certain vital industries within their jurisdiction as public utilities to give them a certain amount of safeguard against strikes and lock-outs. The Memorandum urges upon the State Government to take similar action in respect of the important industries, at least those on which normal requirements of the community depend. All in all, this Memorandum has brought to

A roomful of hope



THEY ARE WAITING to see a friend ... each heart a mixture of a little anxiety and a lot of hope. Their confidence in the skill and knowledge of the doctor is well-founded— for he is a man dedicated to the service of humanity.

Well-founded, too, is the confidence doctors have in HOECHST—a name that is backed by over 75 years of experience in medicine. Proud of its past, HOECHST is also forging ahead to the future...carrying out valuable research in the field of medical science.

›HOECHST‹ *A 75-year tradition in medicine*

HOECHST PHARMACEUTICALS PRIVATE LIMITED

HP. 17A-X54

The Tank Lorry

the notice of the Government a number of points at which the industrial policy can be rationalised.

Industry

TOWARDS HIGHER EXPORTS

SIR SHRI RAM KT., Chairman, The Jay Engineering Works Ltd., at the annual general meeting of the Company gave a call to his fellow industrialists to make every effort to export as many non-traditional items as possible. To those who wanted to earn easy profits in the home market where the margins were larger as compared to those in the foreign market, he reminded that they were able to do so mainly due to the Government's policy of protection. It was, therefore, the duty of the manufacturers that they justified the protection they enjoyed while they were growing and made a bid to capture the export market. Referring to Jay Engineering, he pointed out that the Company had shown very encouraging results. During the year to March 31, 1960, the company exported goods—mostly sewing machines—worth Rs. 80 lakhs. This compares quite favourably with the last year's figure of Rs. 45 lakhs. In the next year, he added, the company's exports may touch the Rs. 125-lakh mark.

While he requested his fellow manufacturers to raise exports, he suggested that the Government, too, should provide certain facilities to exporters. For instance, his proposition, that a high-power committee be formed which could take quick decisions regarding the various incentives to be given for exports, is fairly practicable and should be seriously considered by the Government. Similarly, he has made another valuable suggestion that the Government should provide long-term credit at lower rates to producers of non-traditional items for exports. This is sure to prove an effective incentive to improve the export trade. In view of the difficulties that are being faced by the economy on account of the acute shortage of foreign exchange, it is necessary that both the Government and producers should discharge their respective obligations.

DELHI CLOTH AND GENERAL MILLS

AT THE Annual General Meeting of the Delhi Cloth and General Mills Ltd., Mr. Bharat Ram, Chairman of the Company, dealt at length on the difficulties faced by the mill industry. The Chairman stressed that insufficiency of raw material as well as a considerable increase in its price was one of the major difficulties of the industry. The increase in the costs of the industry has been further brought about by the onerous recommendations of the Textile Wage Board. While the costs have risen, the machinery has become outworn and now a situation has arisen when the industry does not have the means enough for renovation to create increased productivity.

The Chairman is of the view that the situation could be eased and the industry placed on a sound footing if enough cotton was imported and a sizable buffer stock built up. In his opinion, the buffer stock would exert a healthy influence on the prices of cotton which in turn would enable the prices of cloth to be kept at a reasonable level. Adequate renovation of machinery and financial assistance for modernisation was equally necessary if the industry is to be put on a sound footing. Referring to the targets of the handloom and the mill sector in the Third Plan, Mr. Bharat Ram opined that the handloom sector can only thrive on the basis of subsidy and that its development must eventually be at some cost to the general public. The performance of the handloom industry during the Second Plan does not carry the promise that it will be able to achieve the higher targets set for it in the Third Plan. In this context the function of the mill industry as a principal earner of foreign exchange cannot be ignored. To bring about a further increase in exports it is essential that prices of cloth should be kept down in order to face competition abroad. And that could only be achieved if the mill industry's costs were kept down. In this context the suggestions of the Chairman to re-invigorate the mill industry were quite reasonable and fair.

TRAVANCORE RAYONS' EXPANSION

A NEW cellulose film plant of the Travancore Rayons was inaugurated recently by the Kerala Governor, Mr. V. V. Giri. The commissioning of the new plant is expected to double the output of transparent cellulose paper and the company thereby expects to meet all the internal requirements of the country as far as this commodity is concerned. The company has been making gradual progress during the last several years. One significant feature of its expansion, as pointed out by the Chairman, Mr. A. R. Ramanathan Chettiar, is that the company achieved it mostly by ploughing back its profits. Another salient feature of its progress is that it has gradually tried to achieve self-sufficiency as far as raw materials are concerned. These are significant points. The production of sulphuric acid was taken up recently so that at present the company produces 50 tons of acid per day. At present the company depends only on one imported item—wood pulp—which constitutes only 14 per cent of the cost of the finished products. All in all, the present plant makes another landmark in the development of the company.

Trade

AGREEMENT WITH POLAND

INDIA's trade with the Communist countries has been increasing during the last few years. Till 1958, the balance of trade was unfavourable. It is only during the last two years that Indian goods were exported to Communist countries in significant quantities. This was on the basis of bilateral trade agreemets. A similar trade agreement was signed recently between India and Poland, which is expected to increase the total trade turnover by 20 per cent. Under the agreement Poland will export to India industrial equipment, machine tools, mining machinery, rails, chemical products and paper in exchange for vegetable fibres, ores, untreated leather and food products.

India's Trade with Poland

(Rs. lakhs)

	Imports	Exports
1956	2,17	1,09
1957	4,88	1,15
1958	2,26	92
1959	4,02	3,59
1959 (first half year)	2,74	54
1960 (first half year)	1,23	1,66

The table above shows that it is for the first time that during the first half of 1960 there is a surplus balance of trade in favour of India. A commodity wise analysis reveals that it is essentially due to the purchase of de-oiled cakes by Poland, which during the first quarter of 1960 alone amounted to Rs. 84.5 lakhs. Other commodities which have found favourable market in Poland are hides and skins, tea, groundnut and mica. Indian imports from Poland have mostly consisted of capital goods. Apart from rolling stock, machine tools and steel products, items like newsprint, dyestuffs and pharmaceuticals have been among the important imports. The present agreement therefore is mostly on the pattern of the previous agreements between the two countries. There are, however, always certain items which are traded beyond the agreements.

FROM THE CAPITAL'S CORRIDORS

ELECTRICAL GOODS

Current thinking in Government circles here envisages that although the already licensed capacity for the manufacture of electric motors of 300 H.P. and below and power and distribution transformers of 33 KV and below should suffice—provided all the units are worked on double shift basis—to meet the Third Plan demand targets fully, no embargo should be placed on further expansion of these two industries in view of the expanding output of electricity. These two industries, it is stressed, are capable of considerable further development on decentralised basis which will not involve any heavy investment. It has been suggested that further licensing of capacity to about 4-5 lakhs H.P. for the electric motors (up to 300 H.P.) and 4-5 lakhs KVA in respect of power and distribution transformers (33 KV and below) might be considered, in consultation with the Development Council for Heavy Electrical Industries, for installation in the latter half of the Third Plan.

To avoid concentration of the installed capacity in a few States, it has been suggested that further licensing of capacity for the manufacture of electric motors should preferably be effected in the States like Assam, Orissa, Bihar, Uttar Pradesh, Rajasthan, and Andhra Pradesh where there are no units at present or in the States like Kerala, Gujarat and Madhya Pradesh where there has been established only a small capacity so far. Similarly, in regard to the transformers industry, applicants from Assam, Orissa, Uttar Pradesh, Punjab, Rajasthan, Madhya Pradesh, Gujarat, Andhra Pradesh, Kerala and Bihar should be given preferential treatment. There does not seem to be any necessity for further expanding the capacity of the electric motors industry in Maharashtra, West Bengal, Madras, Mysore and Punjab, and of the transformers industry in Maharashtra, West Bengal, Madras and Mysore; the existing and already licensed capacity of the respective industries in these States is considered to be quite sufficient.

ELECTRIC MOTORS

At the beginning of the Second Five-Year Plan, there were 12 units manufacturing electric motors (up to 300 H.P.) in this country, with an annual installed capacity of 263,000 H.P. Since then 8 new units have gone into production and substantial expansion has taken place in some of the existing ones, leading to an additional capacity of 339,520 H.P. At present there are, therefore, 20 units manufacturing medium-sized electric motors with an annual installed capacity of 602,520 H.P. on single shift basis.

The present State-wise distribution of this installed capacity is as follows:

State	No. of units	Annual installed capacity (H.P.)
Maharashtra	5	199,600
West Bengal ..	6	174,320
Madras	7	36,000
Mysore	1	160,000
Punjab	1	32,600
Total	20	602,520

Further capacity of 886,320 H.P. has been licensed for the establishment of 29 new units and for effecting substantial expansion in 14 existing units. This capacity is in the process of being installed. With the implementation of these schemes, there will be 49 units with an installed capacity of 1,488,840 H.P. on single shift basis. The State-wise distribution of this capacity will be as follows:

State	No. of units	Annual installed capacity (H.P.)
Maharashtra	9	423,600
West Bengal	8	368,240
Madras	23	231,000
Mysore	2	240,000
Punjab	4	206,200
Gujarat	1	1,800
Kerala	1	3,000
Himachal Pradesh ..	1	15,000
Total	49	1,488,840

Besides the above capacity, the Heavy Electricals Plant at Bhopal will also produce 50,000 H.P. per annum electric motors of 200 H.P. and above. It is not clear how many of these will be in the range of 200 to 300 H.P., but some motors within this range are likely to be produced at this plant.

The Development Council for Heavy Electrical Industries has estimated that the demand for electric motors of 300 H.P. and below would rise to 2.5 million H.P. per annum by 1965-66. The Council has recommended that a capacity of 3.0 million H.P. should be established to achieve this production. The Planning Commission has tentatively accepted these targets.

TRANSFORMERS

At the beginning of the Second Plan, there were 13 units manufacturing power and distribution transformers with an annual installed capacity of 6,57,000 KVA. Since then three new units, with an annual capacity of 45,000 KVA, have gone into production and substantial expansion has taken place in some of the existing units, raising the capacity further by 5,42,000 KVA. At present there are, therefore, 16 units manufacturing power and distribution transformers in the country, with an annual installed capacity of 12,44,000 KVA on single shift basis.

The present Statewise distribution of this installed capacity is as follows:

State	No. of Units	Annual installed capacity (KVA)
Maharashtra	5	4,19,000
West Bengal	5	3,88,000
Madras	3	1,68,000
Mysore	2	2,59,000
Kerala	1	10,000
Total	16	12,44,000

Further capacity of about 7,07,800 KVA has been sanctioned for setting up one new unit and for effecting eight substantial expansions of the existing units. With the implementation of these schemes, the Statewise distribution of the industry will be as follows:

State	No. of Units	Annual installed capacity (KVA)
Maharashtra	5	5,74,000
West Bengal	5	4,88,000
Madras	3	4,00,800
Bihar	1	60 000
Mysore	2	3,79,000
Kerala	1	50,000
Total	17	19,51,800

The Development Council for Heavy Electrical Industries has recommended targets of capacity and production for power and distribution transformers of 33 KV and below as 4.0 million KVA and 3.5 million KVA respectively for the Third Five-Year Plan. The Planning Commission has tentatively accepted these targets.

CEMENT INDUSTRY

With the demand for cement now exceeding production, the need for allowing further expansion of the cement industry is also being increasingly felt here. In the later half of 1958, the Government of India had decided to go slow with the expansion of this industry for demand at that time was lagging behind output. This decision, it is understood, will be reversed shortly. There is generally a time-lag of about two years between the sanctioning of a scheme and its execution. It is, therefore, thought necessary to consider fresh applications so that the expansion of the cement industry keeps pace with the growing demand. Applications for a total additional capacity of 1.009 million tons are understood to have been received by the Government from the A.C.C. and other cement manufacturers to be implemented on the basis of the indigenous cement making machinery programme.

This additional capacity will be over and above the 1.664 million tons capacity covered by import licences and 1.045 million tons capacity already tentatively selected for implementation on the basis of the indigenous availability of machinery. The present installed capacity of the cement industry is 8.572 million tons. The Third Plan target has been tentatively fixed at 15 million tons.

MEETING LOSS ON SUGAR EXPORTS

Who should foot the loss on export of sugar, a 50,000 tons quota which was announced by the Government of India a couple of weeks ago? The total loss on export of these 50,000 tons of sugar, knowledgeable circles opine, will be of the order of about Rs. 1.25 crores.

The Indian Sugar Mills Association a few days ago submitted a memorandum to the Government asking for an increase in the internal price of sugar to compensate the industry for this loss. The industry claims that the 50 nP. per maund allowance granted to it by the Government in 1958, when sugar prices were first fixed, to meet loss on exports has been nearly wiped out by the increase in cost of production in the past two years. The cost of production of sugar, according to the Indian Sugar Mills Association, rose by 39 nP. per maund during the last crushing season alone, compared to the cost of production in 1957-58. The following is the break-up of this increase in cost of production during the last crushing season:

Cause	Increase in Cost (per maund)
1. Implementation of the interim award of the Wage Board ..	10 nP.
2. Packaging charges	12 nP.
3. Higher prices of stores (coal, limestone, sulphur etc.)	7 nP.
4. Insurance charges (due to increase in capital employed) ..	1 nP.
5. Railway freight	3.25nP.
6. Return on capital employed ..	24 nP.
Total	57.25nP.
Deduct allowance already provided by the Tariff Commission for a season of 151 days	18.00nP.
Net increase	39.25nP.

The Government, it is understood, is not inclined to accept this view, presumably on the ground that this increase in cost of production ought to have been nullified to a large extent by the economies by large-scale production. The price of sugar, it is contended, was fixed at Rs. 36 per maund in 1958 when production was about 20 lakh tons. Now production has gone up to 24 lakh tons and may increase further to about 27 lakh tons during the next crushing season. This should bring down the over-head charges. The controlled price of sugar was raised last year to Rs. 37.85 per maund due to the 3 annas per maund increase in cane prices. From the industry's point of view, there has been no change in the price of the commodity.

The final decision of the Government on this issue is expected to be made known to the industry shortly.

COMMITTEE ON DISTRIBUTION OF NATIONAL INCOME

The personnel and terms of reference of the Committee set up by the Planning Commission to enquire into how the increased national income generated by the First and the Second Five-Year Plans has been shared by the community, has been announced. As indicated in this column earlier, the Committee will be headed by Prof. P. C. Mahalanobis, Honorary Statistical Adviser to the Government of India. The other members of the Committee are Dr. V. K. R. V. Rao, Director of the Institute of Economic Growth, Delhi; Dr. P. S. Lokanathan, Director-General, National Council of Applied Economic Research; Dr. B. N. Ganguli, Director, Delhi School of Economics; Mr. Vishnu Sahay, Secretary, Planning Commission; Dr. D. L. Mazumdar, Secretary, Department of Company Law Administration; Dr. B. K. Madan, Executive Director of the Reserve Bank of India; Mr. B. N. Datar, Adviser to the Union Ministry of Labour and Employment; and Mr. P. C. Mathew, Director, Central Statistical Organisation (Member-Secretary).

The terms of reference to the Committee are (i) to review changes in the levels of living during the First and the Second Five-Year Plans, (ii) to study recent trends in the distribution of income and wealth, and, in particular, (iii) to ascertain the extent to which the operation of the economic system has resulted in concentration of wealth and means of productin.

It is officially stated that the Committee's enquiry will be at the expert level; its primary object being "to ascertain such statistical and economic data as may be gathered at present, to identify the gaps in the existing information and to suggest steps for removing these deficiencies."

Some circles in the capital are of the view the Mahalanobis Committee will do well in not only collecting the statistical data about the distribution of the national income, but also probing into the causes which, during the past ten years, have led to concentration of wealth in a few pockets. It is pointed out that this will help the Government of India to adjust its economic policies. It is also suggested that the Reserve Bank of India, which is at present required to prepare a report on the assets of foreign undertakings operating in this country, should also be entrusted with the task of making a report on the assets of Indian undertakings since 1947. This should facilitate the work of the Mahalanobis Committee.

FOREIGN AID

The U.S. Government is expected to announce its contribution to India's Second and Third Plans this week. The contribution for the Second Plan will cover its last year of operation. According to reports, 250 million dollars are likely to be made available by the U.S.A. during its fiscal year, July 1, 1960, to June 30, 1961. Of these, 50 million dollars will be from the Export-Import Bank and the rest from D.L.F. Of the remaining 200 million dollars, 50 million dollars, it is expected, will be untied to be utilizable for imports of capital goods from the United States. At least 25 million dollars are expected to be made available to bridge the Second Plan's foreign exchange gap.

The Government of India, it is understood, is pressing the U.K. Government to give a further credit of £10 million in addition to the £15 million credit granted recently. Indications are that the U.K. will offer at least £5 million more credit shortly.

Japan, it is reported, is planning to give $20 million credit for the Third Plan.

COAL SHORTAGE — RAILWAY MINISTRY'S CASE

The Ministerial cold war over coal shortage continues, notwithstanding the fact that two blast furnaces, one each at Durgapur and Rourkela, have been lighted.

The contention of the Railway authorities is that the steel plants in the public sector were planned on certain assumptions in regard to coal and other raw material supplies. It is claimed that a number of these assumptions have not been fulfilled. Three coal washeries, for example, were to be established side by side with the setting up of the steel plants. Only one washery has been set up as yet and production there too is only small. Apart from making available right type of coal to the steel plants, the washeries were to provide bunkers which, along with the installation of tippling apparatus at the steel plants, were to mechanise loading and unloading of coal. Another assumption was that loading and unloading of coal for the steel plants had to be on all the seven days in a week. This assumption too has not come out to be true. The three steel plants had not till lately made arrangements for this. From November 1, however, loading on all the seven days in a week may be taken up. Further, iron ore mine for the Rourkela plant has not been mechanised; as a result iron ore for this plant, instead of being moved from a distance of only 36 miles, is being drawn from distant areas which cater to the requirements of Tata's, Indian Iron and Durgapur steel plants. Similar is the story of limestone supplies which are being moved from Sutna or from North-East Bengal. It is alleged that neither Rourkela nor Durgapur have installed tipplers for wagon unloading. This, prima facie, means, delay in loading, delay in unloading and non-utilisation of specially built coal wagons to be run as "coal specials."

Railway authorities are also complaining about the quality of coal allotted for their own use. This coal is allotted from the public sector collieries, where there are neither arrangements for screening of coal, nor for proper loading. The Railways, it is alleged, get inferior quality coal, which seriously affects their efficiency.

A further claim made by the Railway authorities is that from September 21 to September 30, Railways offered 5,215 wagons daily to the Coal Controller who used only 4,318 wagons a day. The average of wagons used, it is pointed out, should have been 4,915 per day. It is contended that though the Coal Controller has been informed that his first priority for the allocation of wagons should be for steel plants, actual loading for these plants as yet has been less than 1400 wagons a day. It is alleged that collieries were cancelling their allocations of wagons, which might mean that there was no coking coal available.

Apropos Railway sidings, it is stated that the National Coal Development Corporation was largely responsible for the delay. The Corporation has not yet provided a single bunker nor has it made any permanent arrangements for loading of coal. The Railways have asked for the opening of dumps at suitable places, so that requirements of coal during the busy season are easily met.

This is a very alarming state of affairs indeed and should absolve the Railway authorities of all the blame. But is it so? There is another side of the picture as well. It is no secret that coal production has not been according to the Plan and that washeries could not be ready by the time the blast furnaces in the steel plants were to be lighted. But the bigger issue from the point of view of Railways is whether they are ready with their special tippling wagons? In Bhilai, tippling apparatus was ready long before wagons were ready and were put in use. Then again, in India total automation is at a discount. The Planning Commission's emphasis is on employment. There is on record a common agreement to which the Railway authorities are a party. This agreement provides that there shall be no tippling arrangements at Rourkela and that manual labour would be used for unloading coal. What have the Railway authorities to say about this?

The case of Durgapur is slightly on a different footing. There are two types of wagons — open and closed. It was agreed that the closed and open wagons will be available for this plant in a certain proportion. It is learnt that arrangements for tippling of small wagons at Durgapur are ready. It is complained that it is the Railways which are not sending out wagons in the agreed proportion.

DIESEL LOCO SHOP

The Government of India has decided to set up a Diesel Locomotive Shop in the public sector. There are 181 diesel locomotives in service on Indian railways at present and orders have been placed for another 78 locomotives. The Third Plan target envisages 450 such locomotives to be put on the rails by 1965-66.

Due to heavy movement of goods, particularly coal, diesel locomotives have been introduced on Asansol-Rourkela, Barkakhana-Daulatganj and Gaya-Mugalsarai sections. Coal movement on these sections is said to be so heavy that there is no longer any possibility to cope with this traffic with steam locomotives. These sections will be electrified ultimately and diesel locomotives will be in use here only till then.

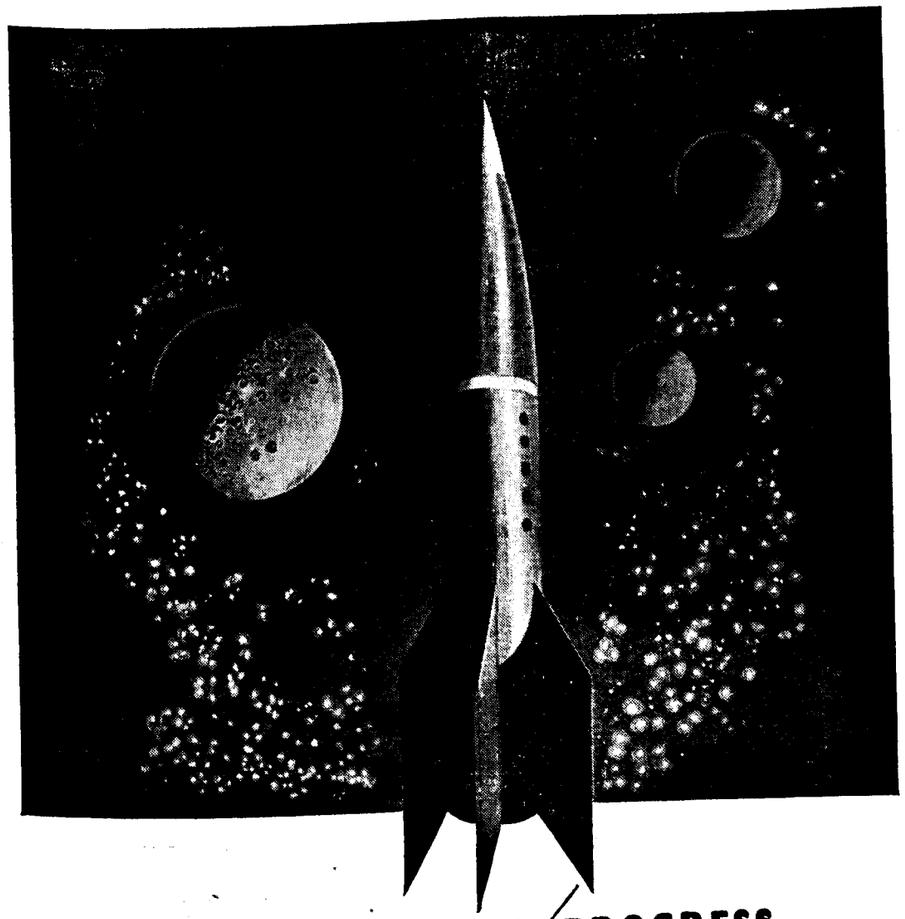
Some part of India, however, will continue to be served by diesel locomotives These include Kandla-Palampur section in Saurashtra and Barauni-Amingaon section in Bihar. For the latter section 60 diesel locomotives are about to be ordered. Hilly areas in Assam will also be served by diesel locomotives particularly due to the difficult nature of the terrain there. For quicker movement of coal, the railway system from Mugalsarai to Saharanpur via Lucknow is also proposed to be served by diesel locomotives. In fact, for this section tenders for 40 locomotives have already been called.

ALLOY STEEL PLANT

The Union Government, it is believed, is likely to decide to locate the Alloy Steel Plant at Durgapur. The initial capacity of the plant, it is understood, will be 50,000 tons annually, expandable to 200,000 tons.

The total cost of the project is estimated around Rs. 50 crores. Of this, nearly Rs. 20 crores will be the foreign exchange component.

The project report for this plant was recently submitted by Dastur and Company.



TRADE TALKS WITH RUSSIA

A Russian delegation is expected here on October 21 to negotiate trade plans for a three-year period. These plans, under the Indo-U.S.S.R. Trade Agreement, have been hitherto drawn on yearly basis. The longer period of three years will enable both the countries to plan their trade better. India, for example, may increase the cultivation of tea. As already reported, India would like to import machinery and equipment from the rupee-payment countries in general and Russia in particular.

An Indian team, headed by Dr. D. S. Kothari, of the Ministry of Defence, has left for Russia to finalise the deal for the purchase of Helicopters and certain categories of engineering equipment. According to reports, Russia is prepared to set up a Helicopter manufacturing factory in India, under "certain conditions."

IMPORT OF RICE FROM BURMA

India has invited a trade delegation from Burma to negotiate a new rice deal. Provided prices are favourable, India will like to import three lakh tons of rice from Burma during the current financial year.

COMPANY AFFAIRS

BETTER PERFORMANCE OF SHREE BHAWANI

Considerable improvement was witnessed in the working of Shree Bhawani Cotton Mills Limited during the year to March 31, 1960, as against the previous year. Sales were higher by 18 per cent and gross profits before depreciation by 90 per cent. The working results would have been better but for the fact that the mills experienced acute shortage of electric power during the year under review as a result of restrictions imposed on power supply by the Bhakra Nangal Hydel Project authorities due to reduced energy output caused by water shortage in the dams.

The cotton crop, during the cotton year 1959-60, was the lowest on record for several years and amounted to only 37½ lakh bales as against 48½ lakh bales for the previous year. This resulted in an acute shortage of cotton and a substantial quantity of cotton had to be imported from abroad at prohibitive rates. The rates of indigenous cotton also rose very considerably. Apart from this, the Wage Board set up by the Government for the Textile Industry recommended several measures resulting in increased earnings of the workmen with effect from 1st January, 1960. All these resulted in an increase in the cost of production.

The year's working results show a surplus of 8.90 lakhs out of which Rs. 6.81 lakhs have been provided for depreciation and Rs. 2 lakhs for development rebate reserve. The remaining amount has been carried forward.

MORARJEE GOCULDAS PLANS FOR MODERNISATION

During the year to June 30, 1960 the Morarjee Goculdas Spinning and Weaving Company Ltd. made additions to the plant and machinery to the extent of an aggregate value of Rs. 17.58 lakhs. Under the expansion and modernization programme undertaken by the company further orders for new machinery to the extent of approximately Rs. 24 lakhs were placed during the year. This fact is revealed from the working results which show that out of a gross profit of Rs. 41.10 lakhs the Directors have proposed to transfer Rs. 10.37 lakhs towards expenditure on plant and machinery. Provisions have been made for development rebate reserves to the extent of Rs. 3.15 lakhs, for general reserves Rs. 2.50 lakhs and towards taxation Rs. 10 lakhs. The payment of dividend at the rate of Rs. 6.43 per share (subject to tax) on 4½ per cent free of income-tax cumulative preference shares will absorb Rs. 1.11 lakhs. The payment on ordinary dividend at the rate of Rs. 21.50 per share (subject to tax) will absorb Rs. 11.13 lakhs.

The Directors have reported that in spite of the prevailing high prices of items of manufacture and more particularly of Indian cotton which had a poor crop, the company had succeeded in disclosing a satisfactory working this year.

DELHI CLOTH MILLS : MORE DIVERSIFICATION

Despite cost inflation due to appreciable rise in cotton prices owing to failure of crops and enhanced incidence of wages and dearness allowance following the implementation of Textile Wage Board's recommendations, the Textile units of the Delhi Cloth and General Mills Co. Ltd. did well during the year to June 30, 1960. The working of Silk Factory, however, was handicapped on account of short supply of raw materials. In spite of power supply difficulties, the working of Lyallpur Cotton Mills has been satisfactory. The working of the Chemical Division of the company was marked by all round improvement in production. However, profits of Caustic Soda Plant have been seriously affected by price control enforced since October, 1959. Fertilizer sales have srown an improvement but will require intentive selling effort in the next few years for enabling our plant to run on full capacity. The Vanaspati Factory of the Company showed improvement in production but the results have not been as satisfactory as last year as a consequence of selling prices not moving in parity with the steep rise in oil prices. This trend may get more emphasized in the years to come. Sugar Factories' working was normal. The Company is considering the expansion of the Sugar Factories. Slow but steady progress was maintained in the Confectionery business of the Company. The Distillery of the Company also showed a marked improvement.

In order to keep pace with the technological developments and to maintain its competitive capacity, the company had taken in hand the work of renovation and modernisation of one of its old units. Further proposals are being considered for diversification of manufacturing lines.

During the year under review the profit after deduction of depreciation and taxes etc. comes to Rs. 82.80 lakhs. The Directors have proposed the payment of an ordinary dividend at the rate of 12 per cent.

COMMODITY NEWS AND NOTES

DEMAND FOR NATURAL RUBBER

The Rubber Producers Council of the Federation of Malaya in its annual report for 1959 states that there is every indication that firm demand for natural rubber will continue in 1960 and the future outlook is promising also owing to the continuing upward trend in world usage of all rubbers over the years. Nevertheless it would be imprudent for Malayan producers not to continue in every way possible to improve their competitive position, notably by replanting and research. Total Federation output for the year, it is reported, reached 695,976 tons compared with 660,866 tons in 1958 and 635,933 tons in 1957.

WOOL EXPORTS BY AUSTRALIA

According to a report issued by the Bureau of Agricultural Economics, Australia had good prospects of increasing exports of wool to China, but wool exports to Russia and other Communist countries are likely to decline. The Bureau which has recently concluded a survey of the wool situation in Communist countries said available evidence supported the opinion that Russia could achieve the objective of its present seven-year plan for increasing wool production to 1,208 million lbs. by 1965. Self-sufficiency would allow Russia to reduce net imports of wool to insignificant amounts after that year. In the past financial year, Russia's wool purchases from Australia totalled 40 million lbs. The Bureau forecast that Russia could eventually become an exporter of fine wool to other Communist countries in Europe, which now were valuable markets for Australia.

U.S. COTTON ESTIMATE

Official estimates of the US cotton crop published by the Department of Agriculture have so far shown little variation this season. The latest figures indicate production of 14,553,000 bales, a reduction of 28,000 bales compared with a month previously. Yield per acre is 450 lbs. The regularity of the forecasts is shown by the fact that in the first official estimate in August, the crop was indicated at 1,471,000 bales and the yield at 447 lbs. In the past very considerable changes were liable from month to month, but as the forecasting system has been tightened up in recent years, variations are by no means as wide. The latest figures supplement the impression previously gained that total supplies should be more or less the same as in the past three seasons. Importing countries have rebuilt their stocks by steady purchases.

IRON ORE IN ANDHRA PRADESH

The Geological Survey of India carried out a preliminary survey of iron ore occurences in some villages near Kothagudem, Warangal district in Andhra Pradesh during 1957-58. In the southern slopes of the hill, two miles south of Nilancha village a lens shaped hematite band with an average thickness of 20 feet is seen for a distance of 900 feet along its strike and is exposed for an average distance of 300 feet down the dip. The ore content is of mixed grade. The estimated reserves of the ore in its original place as well as those of float ores are 360,000 tons and 92,920 tons respectively. The hills west of villages Ulta, Tatraiyepalli and Gopalpur also contain low grade iron ores in the form of banded magnetite-hematite quartzites with their iron content ranging between 22 per cent and 28 per cent. The reserves are estimated to be about 40 million tons. The Department also proposes to undertake systematic mapping, mineral and geological investigations for ground-water and engineering geology aspects in other regions of the State.

HAVE INEQUALITIES IN INCOME INCREASED?

(Continued from page 738)

has remained practically stationary at 13½%. The share of the top-most 5% group has increased from 16% to 19%. In other words, the change has been for greater inequality among the urban population.

Table III, which gives side by side the figures for 1952, 1957 and 1959, makes interesting comparison. The first two figures are from the N.S.S. and the last from the Indian Institute of Public Opinion. The first two indicate expenditure, but the third indicates income. The last column shows the per capita expenditure in 1957, corresponding to the upper limit of each fractile group. It may perhaps be added that the figures obtained by interpolation may differ to a certain extent from the figures which might have been obtained directly by adding the figures relating to the families in each per-centile group but it is assumed that the distortion is approximately the same in the 4th and 11th rounds so that the comparability of the figures is not affected.

Company Meetings

THE DELHI CLOTH & GENERAL MILLS CO. LTD., DELHI

Speech delivered by Lala Bharat Ram, Chairman, at the annual General Meeting of shareholders held on 17-10-60 in the office of the Company at Bara Hindu Rao, Delhi.

Ladies & Gentlemen,

With your permission, I will take the Accounts and Directors' Report as read.

It is a matter of satisfaction that the profits of the Company are better than in the last year.

The Cotton Mill Industry, as a whole, has also fared better than in the last year in the matter of profits. This, however, should not mislead us to think that the industry is set straight on the road to higher and higher prosperity and that the various difficult problems it had to face in the past no longer exist. On the contrary, it appears to me that as one set of difficulties are surmounted, another set is ready to appear in its place. During the last year I had made a reference to the difficult situation in the matter of supplies of cotton. This continued to grow worse due to the lower Indian crop and the Government not taking timely steps to import larger quantities of cotton. There was, thus, both a physical insufficiency of raw material as well as a considerable increase in its price. As is to be expected in a period of planned development, the demand for cloth kept on rising. Consequently, the prices of cloth went up all over the country. These circumstances leading to this difficult situation have, I am afraid, not been sufficiently appreciated by those who have been criticising the cotton mill industry.

Apart from the increases in the price of cotton and its physical insufficiency, the costs of the industry have been further increased by the recommendations of the Textile Wage Board which granted an ad hoc increase to all workers from 1st January, 1960, and has also stipulated a further increase with effect from 1962. At the same time, the industry has not been permitted to increase its capacity and is therefore unable to recoup these increasing costs by larger volumes of production. The cotton mill industry is one of the oldest in the country and a large part of its machinery is not only old in years but also obsolete in its working. Adequate replacement and renovation programmes call for large-scale financial outlay, which are beyond the limited internal resources of the industry. A considerable part of such machinery has also to be imported for which foreign exchange is not freely available. Financial institutions like the N.I.D.C., I.F.C. etc are no doubt assisting with loans, but these are far from adequate and are subject to many limitations. The industry therefore faces a situation in which it has to meet increasing costs without having the facilities for matching these with increased productivity through renovation of machinery and improvement in techniques.

If the industry is to be placed on a sound footing and the demands of consumers met at reasonable prices. it is essential that these basic problems must be identified and solved in a rational way. The first step to be taken, to my mind, is to increase at once the availability of cotton not only for the current season but over a period of years. For this purpose, I would suggest that the Government should immediately import cotton, not only to meet the needs of this season and to make good shortfalls of the last season, but also build up a sizeable surplus buffer stock. The mere existence of such a buffer would have a healthy influence on the prices of cotton which is turn would enable the prices of cloth to be kept at a reasonable level.

The production programme for cloth should be made out so as to ensure a reasonable balance between the supply and demand for cloth. The demand for cloth at the end of the Third Plan period has been estimated by the Planning Commission at 9,300 million yds. per annum. The Indian Cotton Mills' Federation has placed this demand somewhat higher but even the Planning Commission's target of 9,300 million yds. will call for additional cloth output of over 2,000 million yds. It would appear to be the intention of the planners that out of this increase, some 500 million yds. should be allocated to the mill industry and the rest to the handloom and powerloom sectors. It is well known that the handloom sector can only thrive on the basis of subsidy and that its development must eventually be at some cost to the general public. Apart from this, it is pertinent to consider how far the handloom industry could be in a position to achieve the increase proposed for it, because, if it fails to do so, and the mill industry's production is limited to the planned targets, there is bound to be again a scarcity of cloth, with resultant, higher prices.

The performance of the handloom industry during the Second Plan period does not carry the promise that it will be able to achieve the higher targets proposed for it in the Draft Third Plan. There is considerable doubt whether the published statistics give an accurate picture of the actual production of the handloom industry. The published statistics of production by handlooms are not based on actual reports of production but derived from the quantities of yarn released for the handloom industry and the cloth that should have been produced from these. The production, according to these published statistics is of the order of 1,900 million yds. per year whereas it is surmised that the actual production could not be more than 1,100 million yds. The gap between these two figures is so wide that one can easily imagine the situation that could arise if the increases proposed for the handloom industry were allocated to it without scientific investigation.

It is my earnest submission that we look on this as a problem, not of farming out production opportunities to this Sector or that but of providing adequate supplies of cloth to the people of the country at prices which are both reasonable and stable so that standards of living may rise. If this purpose is kept in mind all these issues fall into perspective, and it will be easy to see the need for production to be allocated on a realistic basis and for providing the industry with the means to achieve its targets, namely, sufficient supplies of raw materials at reasonable prices, adequate financial assistance for modernisation and renovation, and some restraint in fiscal and other increases in costs.

There is another important aspect which makes it desirable that we strengthen the cotton mill industry in the country. As is well known, the textile industry is one of the major earners of foreign exchange by export of cloth. But increasingly in the past years

competition in the export markets is becoming harder to face while at the same time the costs of industry at home are going up, with the result that there is a serious threat of being priced out of the export markets. The recent conspicuous rise in the prices of cloth within the country led to diversion of cloth from exports to domestic markets. From the point of view of exports also, therefore, it is essential that domestic prices should be kept at a reasonable level so that the exports do not suffer.

Incidentally you will be glad to know that the exports of your company have further increased during the year, and we are the second largest exporters of cotton textiles from India.

From these matters which are specific to the textile industry, let me dwell for a while on a subject basic to the progress of all our industries, namely, the problem of agricultural production and prices. Experience with the First and Second Five-Year Plans has taught us two important lessons. One is the imperative need, if standards of living are to rise, for keeping price-levels stable over a period of years. The other is the realisation that agricultural prices are and will continue in the foreseeable future to be a major influence on price levels. In the field of agriculture, as in that of industry, the most effective means of keeping prices low and stable is to increase productivity. In fact, there is no alternative to this, for it is only on the basis of reasonable prices of agricultural products that sustained industrial progress can be built and standards of living improved.

I know I am, perhaps, treading on delicate ground, but it does seem to me that it is time for the Government and the people to give thought to the serious indiscipline that has crept into almost every walk of life. If this is not given immediate consideration and steps are not taken to remedy the position, it is bound to lead to a permanent weakness in the structure of our society. Confining myself, however, to indiscipline among employees as a class, I would humbly urge upon the Government to consider the effect of labour legislation on this problem of discipline in industry. Our labour legislation is founded on the belief that employees are always exploited and they should be meticulously protected from such exploitation. The actual effect of such legislation, however, has often been to protect inefficiency and indiscipline on the part of the employee by making it extremely difficult for the employer to take corrective action quickly and effectively enough. I am willing to grant that in some cases individual injustices do occur but an elaborate legal structure built to protect everyone from every such injustice has resulted in large-scale indiscipline going unpunished. I would, therefore, suggest that we should weight the two evils—one of indiscipline affecting the entire fabric of society and the other of stray cases of individual injustices occuring here or there.

As is well known, the Company is required, under the new Income Tax Law, to deduct Income tax at 30% from all dividends. This would cause hardship to holders of Preference Shares with fixed rates of dividends as they would now be paid only those rates minus 30%. As this is not equitable to them, you will be pleased to know that your Directors have proposed to change the rates of dividend payable on these shares so as to ensure that after deduction of 30%, these shareholders will get the same net amount as before.

Before I close, let me convey my thanks to all my colleagues who form part of this organisation—the D.C.M.—and whose efforts have been responsible for the satisfactory working of the Company.

Note: This does not purport to be a record of the proceedings of the Annual General Meeting.

THE JAY ENGINEERING WORKS LIMITED

Speech delivered by Sir Shri Ram, Kt., Chairman, The Jay Engineering Works Limited at the 23rd Annual General Meeting of the Company held on 15th October, 1960.

Ladies and Gentlemen,

The Balance Sheet and Profit & Loss Accounts and the Directors' Report have been in your hands for some time and these with your permission I will take as read.

The comparative figures of sales etc. between the year ending 31st March, 1959 and the year ending 31st March, 1960 are :

	For the year ending 31-3-1959	31-3-1960
Sales	5,33,24,107	7,20,63,503
Profit before providing for incometax	44,22,192	51,94,362
No. of Sewing Machines made	1,97,126	2,42,035
No. of Fans made	2,70,807	3,45,772
No. of Schools	527	716
No. of Students	40,000	50,000
No. of Selling points ..	1,500	1,800

You will be glad to know that for the first time the Fan Factory was able to produce more than 50,000 Fans in the month of April, 1960.

REDUCTION IN FAN PRICES

As you know, at the time of the last Budget, when additional excise duty was levied on fans, we soon after reduced the prices to the extent of the additional excise duty, (in spite of the fact that the excise duties on aluminium sheets and ingots, pig iron etc. meant monthly increase in cost of over fifty thousand rupees) so that our customers did not have to pay net higher prices for our fans, in the hope that increased production will cover this loss.

So far we had been making electrical stampings to meet part of our requirements. We have now been granted a licence to increase our capacity for making laminations so that we may be able, not only to meet our entire requirements, but also be able to supply to other manufacturers. Steps have been taken to add necessary amount of machinery etc. for this purpose.

HIRE - PURCHASE SCHEME

We started the hire-purchase scheme not only in the case of sewing machines, but in the case of fans also, particularly for the cold weather. Although our scheme will mean higher cost and less profits, but it

will help those buyers who could not pay the full price at one time, to pay by easy instalments, total cost being the same.

Air-Circulators, Exhaust Fans,, and Fractional H.P. Motors are now in regular production.

I am sorry to say that Zig-zag Sewing Machine is still not in production, but this time I am glad that while we could have started production somewhere about July or August, but our Design Section got some new ideas, which will make the machine more efficient than before, and we are now hoping that we will start production by January or February next year.

We have now made a good study and have good experience of the foreign markets, and the export of our sewing machines can be considerably increased.

Since the present factory cannot meet the demand we have applied for a licence for a complete new unit of the capacity of 25,000 sewing machines a month, mainly of the zig-zag type, and I and my colleagues are confident of being able to export almost the whole production of the new factory. We hope the licence will be soon granted.

During the year we have fully mechanised our Foundry and it is, if not the only one, one of the very few mechanised foundries in the country.

EXPORTS

As is well known our country is in a difficult position so far as foreign exchange is concerned. In keeping with our policy of continuously increasing our exports, I am glad, that while in the year ending 31st March, 1959 our exports were worth about 45 lakhs, in the year ending 31st March, 1960 our exports were over 80 lakhs. Every effort is being made to see that by 31st March, 1961 we may be able to increase our exports to somewhere near 1,25,00,000.

While on the question of exports, I will appeal to all brother industrialists, particularly of the non-traditional type, to make every effort to export more and more year after year, and to those not exporting, to start exporting. It is true that the margin of profit by sale in India is much higher than what it would be if the goods are exported, but we have also to remember that these margins of profit by sale in India, are due to Government's policy of severe restrictions on imports. It is, therefore, the duty of all of us to help our country by increasing exports in the hour of its need.

PROBLEM OF INDISCIPLINE

I will also, in all humility, make a few suggestions to the Government. It is very necessary that quick decisions should be arrived at as regards the various incentives to be given for exports, or difficulties to be removed, and I would suggest that a high-power committee consisting of, say, the Secretary of the Finance Ministry, of the Industries Ministry, the Steel Ministry, and the Railway Ministry, with two representatives of the Export Promotion Councils be formed with very wide power, to take quick decisions, and implement them without too much of redtapism. Of course, where they may consider it necessary, they can consult higher authorities.

WANTED: LONG-TERM CREDIT

Among other incentives an important one is about the long-term credit on engineering goods for export, and the other a lower rate of interest on long-term credit. Everybody is interested in export and while the Reserve Bank gives loans at concessional rates for agricultural purposes, co-operative purposes, hand-loom purposes, etc., in this case also it can help, particularly in the case of non-traditional items. I also think, and very strongly, that concessions in the matter of income-tax etc. should also be given in the case of exports.

While no doubt it is true that in a very small way there is some increase in the exports of engineering goods, but it is not enough, and I am sure that if the Government and the manufacturers make up their minds, then by the end of the Third Five-Year Plan, the exports of engineering goods alone should go up to worth about 50 crores of rupees a year.

INDUSTRIES' ASSOCIATIONS

I would, therefore, suggest that individual industries should make their own associations to share such losses of profits as may be suffered by those whose goods are of approved quality and who export in increasing quantities. These may be shared by all manufacturers pro rata on the basis of their production. If, however, manufacturers cannot form their own associations, then even at the risk of incurring the displeasure of the business community, I would suggest that on such industries a small cess may be levied, and the export of those goods may be handed over to the State Trading Corporation, who I hope will utilise the normal trade channels for the purpose, but we must make up our own mind that every year the export of engineering and non-traditional goods should go on increasing so that in the last year of the Third Five-Year Plan we export not less than Rs. 50 crores worth of engineering goods alone, and if possible even more.

I have pleasure in saying that the relation with our staff and workers continue to be cordial, and it is the result of these relations that we have been able to steadily increase production, and we are, therefore, grateful to all over colleagues whether in the Factory side or on the Sale for their devotion and hard work.

Gold and the Dollar

THE event of the last ten days has been the dramatic rise in the price of gold in European markets. At the time of writing the price is $40, but the peak reached was $41, and since the United States statutory price for gold is only $35 to the ounce, it is obvious that demand and supply are not obeying the Treasury of the United States. This is not the first time that departures have taken place, but in the past the United States, largely because of its large gold stocks, has been able for some time to dictate its price almost everywhere in the world, where imports were committed. This does not include India because of our insulation from international prices. In any case, however, the question now arises as to whether the United States is in the same position to enforce its discipline upon the world.

During the last three years the outflow from the United States has been estimated at $3.9 billion and the short-term liabilities of the United States are in the region of $10 billion. When the dollar is under pressure, as at present, the short-term liabilities are extremely vulnerable and present an aspect of extreme discomfort to the United States Treasury authorities. The bold talk of maintaining the dollar without sufficient gold reserves and with vulnerable short-term liabilities must naturally look far less effective today than almost at any time in the United States history. It is not surprising that talks of devaluation of the dollar continue to resound all over the world. So far as India is concerned, as has already been stated, our gold price is not held by bonds of imports and, in any case, our price is more than double the ruling price in London. The question which is relevant is not the price of gold in India, but the possibility of India having to adjust herself to a devalued dollar. If the dollar should be devalued in terms of gold, it is extremely likely that the parity between the dollar and European currencies will be maintained. The view has been expressed in Bombay that India need not follow suit, but this does not take account of the extreme vulnerability of our own trade, should our main competitors in exports, such as Pakistan on jute goods, and Ceylon, Pakistan and Indonesia on tea, devalue with sterling. It is obviously a difficult problem as to what would be the net consequences of devaluation. Much depends upon the scale of devaluation.

But the first indications are to the effect that India will have no choice but to march with sterling and with the dollar. This is not recognition of the form in which Dr. B. R. Shenoy has been approaching devaluation of the Indian rupee, because that was the proposal of devaluation in isolation not in respect of gold only, but in respect of all currencies. The present suggestion is merely an indication that when world movements prescribe a change in terms of trade, some benefits should not be lost because of the arguments of prestige. If the United States dollar is devalued and the pound sterling goes with it, there is no prestige to be obtained by maintaining an artificial Indian rupee. To say that this contingency is possible should not induce any flight from the rupee and should not indeed alter the course of current trade, but it is wise to reckon with when the pressure on the dollar is greater than it may be able to sustain with an unreal gold price in the United States.

The Government and the Press

IN the course of the last eight days two events have occurred which raise some important issues of principle about the relationship between the Government and the Press as well as the function of the Press in commenting on current affairs. On Friday last the correspondent of the *Pravda* put a lengthy and involved question to the Prime Minister at his Press Conference about an article published in *The Times of India*. On Tuesday this week the question of a show cause notice to the Bhubhaneshwar correspondent of *The Statesman* figured during question-time in the Orissa Legislative Assembly. It is significant that the two contemporaries concerned are among the important dailies of this country and known for their high journalistic standards and independence of views.

The grievance of the *Pravda* correspondent was that a particular editorial published in *The Times of India* was of an anti-Soviet nature and its publication was offensive to the Soviet Union and as such it was harmful to friendly relations between India and the Soviet Union. Not stopping at that, the correspondent wanted to know whether the Prime Minister agreed that it would pro-

duce such an effect and, if so, what measures would be taken to prevent such publications in future. The Prime Minister hardly touched the crucial issues which were implicit in the *Pravda* correspondent's question. His reply was, evidently, evasive, when he stated that the views expressed by *The Times of India* were its own particular views, though he characterised them as 'ridiculously absurd' and ended up by saying that it was difficult to deal with them.

The views in question raised in *The Times of India* article related to the role of Mr. Khrushchev at the United Nations General Assembly and the kind of invectives in which he took the liberty to indulge on many occasions. There can be no doubt that the criticism of the Soviet Premier contained in the article was objective and even assuming that its tone could have been milder, there was nothing in the least to suggest that the opinions were 'ridiculously absurd'. Such denunciation can hardly refute frank criticism.

Whatever may be the concept of the freedom and functions of the Press in the Soviet Union—and apparently the assumptions made by the *Pravda* correspondent were based on that concept—the occasion demanded that the Prime Minister should have clarified the position that in a democracy the Press had the right to freedom of expression of views, no matter whether they were calculated to win the concurrence of the Government or were critical of its policies and actions. Whether they reflected the majority viewpoint or not was an irrelevant consideration and, no exception could be taken to them so long as they were objective and sincerely held. The question of Government taking any measures to prevent their publication does not arise at all in this country unless it militates against the law. Oftentimes, the fourth estate has to perform its function as a severe critic of Government policies and actions and Government on its part has to take the criticism for what it is genuinely worth. It is in this manner that Authority is constantly kept on its guard against lapses.

The assumption that any adverse criticism of the Prime Minister or the Government of a friendly foreign country constitutes an insult to them and undermines the basis of harmonious relations is hard to sustain. If this assumption were to be accepted as a criterion of the conduct of the Press, it would lead to the intolerable position that on each single issue the Press must endorse whatever policies or pronouncements are made by such Governments, irrespective of their merits. In the case of India, this assumption would lead to an untenable position. India's policy of positive neutrality and friendship with all would, on the basis of this assumption, gag the Press in this country inasmuch as diametrically opposite policies adopted by the countries of the two power blocs cannot all be endorsed. Friendly relations between any two countries are essentially grounded on the deep foundation of goodwill among the people and a certain measure of community of purpose in vital spheres of mutual as well as international interests. That friendship is by no stretch of imagination so brittle as to give way before fair and objective criticism by the Press in one country of the doings of the Government of the other country.

The Bhubhaneshwar correspondent of *The Statesman* was served with a show cause notice why his accreditation should not be cancelled as the headlines appearing at the top of his dispatch, relating to the August floods in Orissa, mixed up reports of the flood situation with the widening rift within the ruling Congress Party. The Chief Minister hastened to explain during question-time that the matter had been discussed with the Editor of the paper and settled. The matter was certainly by no means of such a magnitude as to call for the drastic action of a show cause notice. Dr. Mahatab sought to explain the by-passing of the Accreditation Committee in this case with the assertion that the Government had certain responsibilities to discharge. These are high-sounding words, but they are as much hollow, probably more. The truth of the matter appears to be that factious bickerings inside the State Congress Party have become so intractable that the Chief Minister feels touchy about any references to them. Governments, whether at the Centre or in the States, ought to take legitimate Press criticism for what it is intrinsically worth. Forbearance and not undue sensitiveness will help keep a responsive attitude.

Port Development: The Case of Mangalore

THE National Harbour Board, meeting in Delhi during the weekend, is scheduled to discuss the report of the Intermediate Ports Committee. One of the main recommendations of the Committee is in respect of the development of Mangalore Port. It is an admitted fact that the development of port capacity in this country in the context of the immediate future, is directly related to the question of export of iron ore. The geographical position of the country has enabled it to become a base source of supply to the Japanese Steel Industry as well as to the developing steel expansion programmes of the East European countries and West Europe. Again, the qualities of the iron ore available for export are stated to be suitable for use in the open hearth as well as blast furnaces and these compare favourably with the qualities available from other major sources like Brazil, Canada, Sweden, Chile and North and South Africa. It is also to be noted that the country has considerable deposits especially in areas where the prospects of setting up large steel plants are not immediate. In view of the need for maximising the country's foreign exchange resources, it is of very great importance that this source should be fully tapped by enabling further exports of substantial quantities of iron ore.

The significance of iron ore exports can be seen from the fact that whereas in 1956-57, their value was of the order of Rs. 9 crores, according to 1960-61 estimate, they are likely to go up to Rs. 20 crores. It is also estimated that in 1965-66, on the basis of existing contracts, the total export will go up to 7 million tons (from about 4 million tons in 1960-61) yielding at current prices Rs. 35 crores. A note appended to the Intermediate Ports Committee report by Mr. D. Sandilya, the then Managing Director of the State Trading Corporation, points out that there are distinct possibilities of the country being able to step up this figure to even 9 million tons, provided our capacity to export is built up to meet the potential demand. It is here that the importance of port development comes.

In the Draft Outline of the Third Five-Year Plan, it has been stated that the main objective will be to maintain and improve the existing port facilities rather than to increase port capacity. This seems to be a short-sighted view. This is because, as stated by the Intermediate Ports Committee, even in respect of iron ore export, as against the contracted demand for 4½ million tons in 1960-61, the shortfall in port capacity will be 3.5 lakh tons. It is stated that on the basis of programmes already made, port capacity for export of iron ore will aggregate to 6.4 million tons in 1965-66 whereas as stated earlier, that demand can very well go up to 9 million tons. This means that the overall deficit in the port capacity will rise from 3½ lakh tons to 2.6 million tons by 1965-66. Seen in this context, it will be clear that just as Visakhapatnam has been developed as a major one for catering to the demands of the Japanese steel mills, a major port on the West Coast for realising our trade possibilities to Western Europe has become an imperative necessity. It has also to be remembered that buyers of iron ore overseas are having programmes to build large ore carriers in order to save ocean transport costs. This makes it all the more necessary for the country to provide adequate facilities for the reception of these carriers at our ports.

The Intermediate Ports Committee has cogently argued as to why priority should be given for the development of Mangalore as an all-weather deep draft port. In view of the advantageous position of Mangalore in respect of high grade and low grade iron ore mining areas of Mysore, it feels that a traffic in iron ore of the order of two million tons per annum can be developed at Mangalore besides a general cargo traffic of 5 to 6 lakh tons per annum if an all-weather port is constructed and a railway link is made connecting Mangalore with Hassan. The cost of upgrading the port is estimated to be Rs. 12 crores. Surely, this cannot be deemed to be excessive if account is taken of the weighty advantages that would accrue from the development of the port. It is also not irrelevant here to point out that for the illusory scheme of 'National Service' by students contemplated by the Union Ministry of Education, an expenditure of Rs. 138 crores extending over a five-year period has been estimated. If a scheme of such doubtful utility over which there has been a substantial volume of criticism, can be assigned any place in planning, it is all the more the reason why Government should not stint over port development where capacity must be at least commensurate with, if not ahead of, needs. Apart from the fact that from the point of view of reducing regional disparities, Mysore has a strong case for the development of Mangalore port, the larger interests of the country demand that the recommendation of the Intermediate Ports Committee in respect of Mangalore port deserves serious examination with a view to early implementation.

Rising Prices and Replacement Costs

THE steep rise in the cost of plant and machinery since the end of World War II has complicated the problem of replacement of industrial units in this country as elsewhere. Plants and machinery procured at relatively nominal costs two decades ago cannot be replaced with anything less than five to seven times the original cost. Unfortunately, the fiscal authorities allow provision for depreciation on the "written-down-value" of the balance sheet costs, which is extremely inadequate for purposes of rehabilitation of the worn-out plants. Recently, the Tariff Commission examined the price structure of a number of industries. Rehabilitation as an item of cost has not been accepted uniformly in the case of all the industries. While in the case of cement and iron and steel, the claim for rehabilitation has been conceded and a special allowance has been permitted in the cost structure, the application of the same principle has been denied to such industries as sugar, paper, tin-plate, and so on.

Last year, the Ministry of Labour and Employment commissioned the National Council of Applied Economic Research to look into the question of provision for depreciation and rehabilitation in industrial undertakings. This Ministry has faced the special problem of the allocation of depreciation and rehabilitation in calculating bonus payable to workers. After enunciating the criteria for replacement, the Council made a thorough balance sheet study of the four leading industries, namely, jute, sugar, cement and chemical fertilizers. The findings of the Council have now been made public and it is, indeed, encouraging to note that the Council has disagreed with the Tariff Commission on the vital issue of rehabilitation. The Council has particularly recommended that every industrial undertaking must make an allowance for rising prices of machinery while estimating depreciation. The current practice followed in this respect, according to the Council, makes for an inadequate provision for replacement, particularly at a time when the rise in prices is spectacular.

The Council has rightly recommended that depreciation allowance to cover replacement cost of the fixed assets of a firm should be made "legally obligatory". The Council has also urged that while estimating the replacement costs, every firm should be asked to take into account the increases, if any, in the price of relevant assets following a simple formula evolved by the Council.

The paper and sugar industries in particular have repeatedly protested to the Tariff Commission and the Ministry of Commerce and Industry against the dis-allowance of proper provision for rehabilitation in fixing the prices of their products. The Tariff Commission in the case of these industries acknowledged that there were some factories which needed funds for rehabilitation. Just because pressure of demand for rehabilitation of various units was uneven, the benefit of rehabilitation had been denied to all the units. This is, unquestionably, unfair to these vital consumer industries and sooner this invidious discrimination is eliminated the better it will be for industry. Happily, this crucial aspect is being examined once again by the Tariff Commission while studying the working of the price-linking formula in the sugar industry. It is hoped that the Tariff Commission will make amends for its earlier mistake in this case. After the case of sugar industry is settled, other industries, such as paper and tin-plate, will certainly follow suit.

A DELHI DIARY

THE EXODUS

THERE has been exodus in two directions this week —firstly to the hills and, secondly, to Raipur. I am happy to say that I belong to the first category; but I have behaved somewhat like a lone wolf leaving the streams of people going to Kashmir. I have chosen a Southern hill station— Wellington, to be exact. There are some who talk about Ootacamund as the Queen of hill stations. All I need do at the present time is to claim that Wellington (with all its military character) might be a good Crown Prince, and, perhaps, Coonoor, more feminine, is a Princess Royal. It is not, however, the virtues of these hill stations which I wish to advertise, though I consider it a terrible pity that not more is made of both Wellington and Coonoor. There is in Wellington a somewhat military image, which does it insufficient justice. Quite apart from the numerous training institutions, there exists in the Defence Services Staff College, in my opinion, one of the effective post-graduate teaching centres in the country. I will speak on it one day, but unfortunately, on this occasion, my vision is elsewhere.

KUNDAH: WHO IS SHE?

Has any of my readers heard of Kundah, and what is more, known her in her grandeur? When I was first asking this question last week, an enlightened acquaintance of mine said: Kundah; who is she? For the edification of numerous ill-informed persons, I now declaim my piece. Kundah is the great hydro-electric project with which the Madras Government at the Nilgiris is doubling the electric supply of the State in the Second and the Third Five-Year Plans. It is a series of four power stations conceived in a grand piece in which the husbanding of the waters in the Nilgiris has been exploited by the use of water tunnels and by great heads of water to make up for the absence of volume. In its elements all the individual ingredients exist elsewhere—dams and reservoirs, penstock pipes, great turbines, and even water tunnels. Twenty years ago, I remember I was quite excited at seeing water in a canal in the Mandhya district of Mysore pass through the Hulekere Tunnel. What makes Kundah exceptional is the magnitude of operations, and the fine utilisation of both water and height so as to extract from unwilling nature (in four stages, 420,000 kwh. of electricity) almost everything she has there. It is a breath-taking performance; when it is completed there will also be for the sophisticated, some interesting statistics which may be all-time records. One of these will be a tunnel 32,000 ft. long running deep into hills in order to take water from one side of a hill to another and bring it down to the third and fourth power houses. Even the second power house which is now nearing completion has its water tunnels. One must see them to appreciate how different these tunnels are from the little aqueducts which have hitherto been more or less what has been the full extent of our ambitions in forcing water through inhospitable ground.

One day, no doubt, an artist worthy of his subject will paint the great dams which make the Kundah project, beginning from Upper Bhawani, Avalanche and Emerald. (Are not their names as beautiful as the valleys and the reservoirs created?) But for the present all I will record is the remarkable manner in which there has been a linking of rivers at the highest level possible. The operation has been powerwise abundantly fruitful. In India's Second Five-Year Plan two generators producing 20,000 kw. each and four producing 36,000 kw. each will be in operation by March 31, 1961. If my arithmetic serves me right, this makes 184,000 kw., a magnificent block of power extracted from the mountains more by their height than by their catchment area. The third stage will include an additional 20,000 kw. in the first power house and one more in the second of 36,000 kw. The remainder will be in two additional power houses and all will be rather more than 184,000 kw. scheduled in the Second Plan. Kundah might well be a grand show-piece for All-India. In my present mood of enthusiasm let me say I have not seen its equal anywhere at least in respect of economy and imaginative use of niggardly resources. The great sweeps of the Danube at Ybbs and the Sutlej at Bhakra belong to a different order; there nature has been both massive and helpful, whereas at Kundah she has done everything to prevent power from being wrung from her hands.

Apart from the greatness of the conception,—born, it seems, thirty years ago—let me pay my bouquet of tributes to our contemporaries. In the first place, there has been magnificent collaboration inside the Colombo Plan with Canada. The Canadian engineers belonging to the Montreal Engineering Company and India's engineers have worked shoulder to shoulder—one might almost say, hill to hill and tunnel to tunnel—to bring about one of the happiest cases of international co-operation which I know. The Indian engineers are desperately under-aid compared to their Canadian counterparts, but no one, as far as I am aware, has dreamt of making odious comparisons. Mr. S. Krishnaswami's team erecting the second power house must be seen in its working clothes to give one a feeling of intense pride, and even more abundant assurance in the future. Not the least of the successes of the Indian engineers has been the manner in which they have brought along in their grand sweep the small contractors. Two large contractors, Gannon Dunkerley and the Hind Construction Company, of Calcutta, have done magnificent jobs. But there are nearly fifty small contractors, each of whose work is individually small, but whose collective contribution is greater than that of the big units. Thus in this wonderful project there has been combined international friendship, vision, imagination, bigness, smallness, the public and private sectors, and all the aspects of technology—civil, electrical, mechanical—and above all human management. Work of this magnitude cannot go like clockwork without a fine capacity in the management of men—the greatest technology of all! And of dedication let me only say there is a great deal still to be found amongst India's civil servants. This is not a popular statement or a discreet one but I am compelled to say that when one sees projects going together like this, politics, so terribly overwrought in Delhi, finds its appropriate place!

Even more indiscreetly may I refer to the salaries of India's top engineers engaged on this huge project which in all will involve an expenditure of Rs. 50 crores? I cannot imagine how men separated from their families for long periods and, therefore, condemned to live with two establishments can manage as they do. The fact that they manage makes us, who are neither building nor separated, look even smaller in our own eyes. For knowledge of our unworthiness, members of the Fourth Estate, visit Kundah!

ARGUS.

1960

THE WEEK'S NOTES

Planning

SWISS CREDIT

THE IMPORTANCE of the agreement with Switzerland signed last July, instruments of ratification of which were exchanged last week in New Delhi, lies in the fact that it is for the first time that an important neutral country will be associated in the development plans of this country. The Swiss Ambassador, Dr. Cuttat, speaking on the occasion, pointed out that this was the first credit of its kind sponsored by the Swiss Government and it was significant that it had chosen India as its partner. The credit extends over a fairly long period, namely 10 years, and will cover transactions of the value of 100 million Swiss francs (Rs. 10.9 crores). It will be utilised for the purchase of Swiss capital goods. It is stated that a sum of 60 million Swiss francs will be available immediately and the balance later. A striking feature of the agreement is that the credit is provided by a consortium of Swiss banks and it is only guaranteed by the Swiss Government. It is obvious that the agreement will enable Swiss private industries to take a more active part in India's economic progress. During the last 10 years. India has drawn upon Swiss technology for many of her projects, notably, the Hindustan Machine Tools Factory in Bangalore, and the Integral Coach Factory in Perambur near Madras. A scientific research centre is shortly to be established by the biggest chemical and pharmaceutical industry of Switzerland which will be opened to the private as well as public sectors for training. Again, Swiss private industry will also lend its assistance in the establishment of a training centre for the manufacture of precision instruments.

From the speech of the Swiss Ambassador, it was evident that the present credit is only the first instalment, and there is the prospect of further Swiss credit also. At the same time, it is necessary that the prospects should be explored for improving trade relations between the two countries. The Swiss Ambassador himself pointed out that the trade was bound to improve as soon as Indian exporters were able to provide top quality products for "our high-level marketing". During the last few years, India has been having an unfavourable balance of trade with Switzerland as can be seen from the table below:

(Rs. lakhs)

	Imports	Exports	Balance of Trade
1955 ..	10,99	97	—10,02
1956 ..	16,25	92	—15,33
1957 ..	17,81	1,24	—16,57
1958 ..	9,70	81	— 8,89
1959 ..	7,83	89	— 6,94
1959 (Jan.-June)	3,76	41	— 3,35
1960 (Jan.-June)	4,22	30	— 3,92

This may, perhaps be inevitable but there is no reason why the prospects of improving Indian exports should not be examined. The main items of Indian exports that enter into the trade are given below:

(Rs. '000)

	1957	1958	1959
Coffee, tea, and spices ..	3,29	3,99	2.36
Textile fibres	12,31	6,09	7,76
Crude fertilisers and minerals	12,92	8,71	11,94
Metalliferous ores	12,47	3,18	Neg.
Essential oils	16,99	13,80	4,99
Textile yarn and fabrics ..	22,78	13,37	13.69

It is possible that with some more efforts Indian exports of such items as tea, coffee, mica, pepper and spices, for which there seems to be more demand in Switzerland, may conceivably expand. In the meantime, there is ground for much satisfaction that the agreement now ratified would help in widening the area of economic co-operation between the two countries.

Joint Sector

AN INTERESTING EXPERIMENT

THE CONSULTATIVE COMMITTEE of the Maharashtra Government on the Third Five-Year Plan took a commendable decision on making a new experiment whose progress will be watched with interest. It appears that Mr. Y. B. Chavan, Chief Minister of the State and the Chairman of the Consultative Committee, is one of the principal sources of inspiration behind this experiment. The Committee has appointed a Study Group which will examine the problem of starting new industries in the State in the "Joint Sector" to be participated in by the Government and private investors. The choice of Mr. R. G. Saraiya, for the Chairmanship of the Study Group is quite appropriate and, furthermore, at least half the members of the Study Group are known for their long and intimate association with industry. They are expected to bring an objective outlook to bear upon the consideration of the problem referred to them.

The Study Group has been charged with the function of making an assessment of the scope for establishment of industrial enterprises in the Joint Sector and also to suggest projects which could be given preference in it. Further it has to make recommendations on the terms of partnership between the State Government and the private investors as regards share-holding and control of managment.

Considering the likely differences on the views of the two categories of participants on the terms of partnership and the attention that will have to be paid to the investigation of the claims of various enterprises

for eligibility for priority, the time limit of November 15, 1960, which has been set for the completion of the Committee's work is utterly inadequate. In an important experiment of this kind impatience is the least warranted. While presenting the first budget of the State to the Legislative Assembly, the Finance Minister highlighted the fact that, barring Bombay and a few other industrial centres, the general level of industrial development in the State was low. This is another reason why the Study Group should be allowed sufficient time for its assignment.

The State Government would do well not to insist on any formula involving a marginal majority for it in shareholding, such as that involved in the formula of 51:49 to which the Central Government has attached great sanctity. Mutual trust and the stakes of the two partners will provide a reasonable guarantee of prudent and efficient methods in financial and managerial policies in operating the enterprises. It should be the aim of the State Government to attract not only private capital for the Joint Sector but entrepreneurship in which the State Government certainly cannot claim to be rich and experienced. It is now common knowledge that the Maharashtra Government had put up a hard fight in pressing its claim before the Planning Commission for a sizeable outlay for the State's Third Plan in view of the attention it will have to pay to accelarate economic expansion in the less developed regions of Vidarbha, Marathawada and other parts of Maharashtra. The Study Group would do well to keep this question in view.

Karnal Case

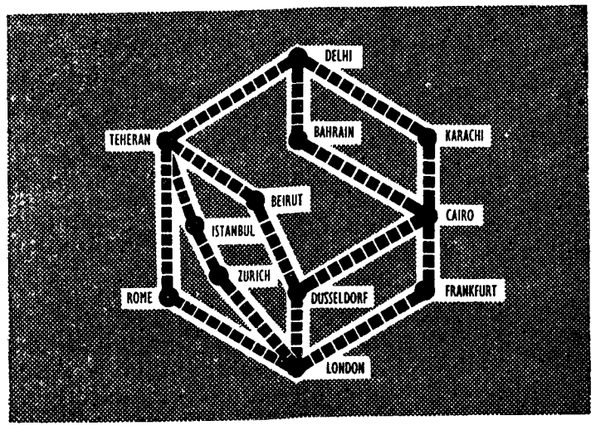
DISMISSAL OF APPEAL

THE PUNJAB GOVERNMENT'S petition to the Supreme Court for leave to appeal against the judgment of acquital passed by the Sessions Judge in the Karnal triple murder case has been dismissed. Mr D. S. Grewal, a former Superintendent of Police, who was the principal target of a painful and prolonged criminal trial, thus emerges victorious with his innocence fully vindicated. The rejection of the petition by the Supreme Court constitutes a crushing defeat for the State Government in one of the most sordid affairs in this problem State.

In the recent history of the Punjab, scarcely has a criminal case attracted so much attention both of the authorities and of the general public as this one. That the State Government showed astonishingly unusual interest in this case is evident from the fact that it spent over a lakh of rupees from its exchequer in pursuing it and preferred the appeal to the Supreme Court in a final bid to attempt to secure reversal of Mr. Grewal's acquittal along with that of other roped in this case. Reports, which need not be lightly dismissed, are freely circulating that the State Government made the petition to the Supreme Court against legal advice. The crowded court rooms and the space allotted by newspapers for the coverage of its day-to-day proceedings bear testimony to the tremendous interest of the public in the case. The keen interest roused in the public by this case is understandable because to the common man in the Punjab this case had come to be associated with the high-handedness of some high-ups in the State. The public considered it to be a test case for the judiciary to reiterate its independence of the executive. The judiciary, happily, has stood this test.

With the legal battle over, all eyes will now turn to what action the Government takes against the officials whose conduct has been censured by the Sessions Judge in unmistakable words. If these officers are not taken to task, it requires no special intelligence to point out that the confidence of the public in the administration of the State, already shaken to the roots, will be shattered. Great interest also attaches to the stand the Congress High Command takes to keep the State's Chief Minister, Mr. Pratap Singh Kairon, in the saddle. This stand has to be clarified now and expeditiously if the faith of the people in impartial administration is to be restored. Will public faith in the High Command's capacity to rise to the occasion by subordinating considerations about personalities to fair democratic conventions be justified in this case?

France



ALGERIAN ISSUE

A CENSURE motion aimed at overthrowing the Debre Government on the ostensible issue of setting up a French atomic striking force failed in the National Assembly this week since the motion could gain only 207 votes which was 70 short on the absolute majority needed to overthrow the Government. Apart from the fact that the failure of the censure motion automatically results in the adoption of the striking force, it is a victory for President de Gaulle and his personal position will now be strengthened after the trial of strength with opponents of his policy. It is, however, by no means certain that it will help in the restoration of national unity. While his recent tour of the lower Alpine region testified to his personal popularity, it is also becoming clear that a rapidly growing number of Frenchmen are becoming doubtful whether General de Gaulle can help them. On the Algerian issue, particularly, he is under growing pressure from all sides. While the army and the rightists oppose a settlement with the rebels, and there have been vague rumours of a right-wing plot to overthrow the regime, pressure for a settlement from the Left has intensified since the preliminary truce talks with the rebels broke down three months ago. The Socialists, for example, led by ex-premier Guy Mollet, who waged war in Algeria in 1956-57, recently reversed themselves to demand a speedy peace settlement. Paradoxically, however, the division over Algeria among the Opposition in fact seems to have saved the Government in this week's censure vote.

With Mr. Khrushchev repeating last week his 'de facto' recognition of the Algerian Provisional Government which now seems to be more than ever ready to accept Soviet and Chinese help, and the debate on Algeria in the UN next month, which will have the effect of causing further friction between France and her allies, there is speculation that President de Gaulle is likely to make a new move to put an end to the fighting in Algeria. Because, it must be remembered that a year ago, it was his promise of Algerian 'self-determination' that was largely responsible for preventing the passage of the African-Asian resolution on Algeria. This year, however, France has to reckon with the new African UN members, almost all of them favouring Algerian independence. In these circumstances, General de Gaulle cannot afford to follow a policy of indecision and must act with haste. At the same time, it has to be recognised that whatever may be the views of the intellectuals, led by Jean-Paul Sartre, over the ending of the French army's six-year war against Algerian nationalist rebels, the overthrow of the Gaullist regime will not help matters very much. On the other hand, if President de Gaulle disappears, it is very unlikely that a liberal Government would come to power in France to make peace with Algeria with greater determination and employing more efficacious methods.

*Six Comets Weekly Delhi London

WITH CHOICE OF SEVERAL STOPOVER POINTS

*Effective 1st November.

BOAC offers you the extra smoothness and comfort of *Comet* jetliners to these and many other destinations!

Whether you fly First Class or Economy, BOAC's cabin staff will look after your needs with personal attention—in your own language!

Take advantage of BOAC's Ticket Instalment Plan.

FLY NOW—PAY LATER!

Your local BOAC Appointed Travel Agent and BOAC offices everywhere are at your service.

BRITISH OVERSEAS AIRWAYS CORPORATION
ASSOCIATES: AIR-INDIA, EAA, MEA AND QANTAS

Your executives are your trusted lieutenants. They implement your decisions with imagination and loyalty, making a valuable contribution to output and profits. You know the worth of these men and you certainly like to pay them accordingly.

But, beyond a certain level, the more you pay them the less do they proportionately realise after taxes. And with the high standard of living they have to maintain, they cannot save for retirement.

The LIC can show you a new way of remunerating them. It is through the Group & Superannuation Schemes. These Schemes possess three unique advantages:

i Your executives can receive a part of their emoluments tax-free to build up retirement benefits and maximum family security

ii This may not involve any extra cost to the employer

iii The employer gets tax-relief on what he pays towards the Scheme

For further information, please contact the nearest LIC Divisional office and have a word with the Manager. He will be delighted to give you full particulars.

The World Abroad

THE MAINSPRING OF PROGRESS

By

ODYSSEUS

ONE of the most important points made by Professor F. A. Hayek in his newly published "Constitution of Liberty" (Routledge & Kegan Paul. London. 45sh.) is that scientific advance has popularised the belief, shared by many scientists and other "experts", that the range of our ignorance is steadily diminishing and that, therefore, we can hope to achieve comprehensive deliberate control of all human activities. This is why so many experts, intoxicated by the advance of knowledge, so often become the enemies of freedom. In fact, the advance of knowledge constantly discloses new and vast realms of ignorance. The increasing complexity of civilization, which the advance of knowledge enables us to build, inevitably increases the individual's ignorance of most of this knowledge.

Every change in conditions creates a new problem, which makes necessary some change in the use of resources. This problem is solved by moving towards a new over-all adjustment. Each individual who takes part in the process has little idea of what he is doing, and—planners please note!—we have no way of foreseeing or predicting who will, at each step, make the first appropriate move, or what particular combinations of knowledge or skill, personal aims, attitudes, desires, or circumstances, will suggest to some man the suitable answer, or by what channels his example will be communicated to others, who will follow his lead—if the State leaves him the freedom to give it. But it is from the countless steps taken by unknown individuals in the course of doing familiar things in changed circumstances that there spring the innovations that will prevail. The successful combination of knowledge and aptitude is the product of individuals imitating those who have been more successful, and who have also been guided by indicators, such as prices offered for their product, or expressions of approval, moral or aesthetic. In short, individuals succeed because they are free to use the experiences of other free men.

What is essential to enable the process of change and growth to work is that each individual should be free to act on his particular—and always unique—knowledge or intuition.

WHERE IGNORANCE IS BLISS

If we were omniscient, there would be little case for liberty. Freedom is essential to leave room for the unforeseeable. It is because we rarely know which of us knows best that we trust the independence and competitive efforts of the mass of individuals to induce the emergence of what, when we see it, and not before, we shall want.

It is because freedom means the renunciation of direct control of individual initiative and enterprise that a free society can make so much more use of so much more knowledge than the minds of the wisest ruler or of any committee of experts can grasp.

In a sentence which is one of the most memorable in a book of memorable sentences, Professor Hayek says: "Freedom granted only when it is known beforehand that its effects will be beneficial is not freedom. If we know how freedom would be used, the case for it would largely disappear. We shall never get the benefits of freedom, never obtain those unforeseeable new developments for which it provides the opportunity, if it is not also granted where the uses made of it by some do not seem desirable. It is therefore no argument against individual freedom that it is frequently abused. Freedom necessarily means that many things will be done which we do not like. Our faith in freedom does not rest on the foreseeable results in particular circumstances but on the belief that it will, on balance, release more forces for the good than for the bad."

It also follows that the importance of our being free to do a particular thing has nothing to do with whether we, or the majority, are ever likely to make use of that particular possibility. To grant no more freedom than all can exercise is to misunderstand freedom's function. The freedom that will be used by only one man in a million may be more important to society, and more beneficial to the majority, than any freedom that we all use. To insist that it is absurd to suppose that the propertyless labourer under a capitalist regime enjoys any liberty that he would lose under Socialism does not destroy the case for liberty. For it may be extremely important that some should enjoy liberty—that some few men should be able to dispose of their time as they like—although such liberty may be neither possible nore desirable for the majority. Civilization, in order to survive, requires differentiation in social conditions. If an egalitarian society had insisted in the 5th century B.C. that no citizen should be entitled to more leisure than any other, the world would have been deprived of Plato's philosophy. If Henry Ford had not been free to make himself lously rich, the world would have been deprived (a) of cheap motors and (b) of the beneficient work of the Ford Foundation. Ditto for Nuffield in the UK. If egalitarianism is allowed to prevail, it will be difficult to find successors to Plato, Ford, and Nuffield. We shall live in a static society.

The results of freedom (e.g. Plato's dialogues, the Ford Foundation, and Nuffield College at Oxford) cannot be achieved by the majority deciding what should be done by the individual, because majority action is limited to the already tried and ascertained, i.e., the majority would have to know Plato's philosophy before it could instruct him to think it out, and about mass production methods before it could instruct Ford and Nuffield to invent them.

The benefits that you derive from freedom are thus largely the result of the uses made of freedom by others, and mostly of uses of which you could not avail yourself. From this, Professor Hayek draws the important conclusion: "It is therefore not necessarily freedom that I can exercise myself that is most important for me. It is certainly more important that anything can be tried by somebody than that all can do the same thing."

FREEDOM AND THE MAJORITY

The importance of freedom to do a particular thing —to study philosophy, invent the assembly line, or write

music—has nothing to do with the number of people who want to do it. Failure to understand this in so many contemporary Welfare States has meant that, in them, change and growth is hamstrung by controls although the majority may be wholly unaware that their freedom has been significantly curtailed. To assume that only the exercises of freedom that the majority will practise are important creates a stagnant society that will be overtaken by a lively neighbour.

As a so-called "intellectual" I am the last to disparage intellectual freedom, but I am impressed by Professor Hayek's observation that the intellectual process is in effect to a large extent one of elimination, selection, and the elaboration of ideas already formed, and that the flow of new ideas springs to a great extent, from the spheres in which action, often non-rational, and material events impinge upon each other. This flow would dry up if freedom were confined to "intellectuals."

The importance of freedom, therefore, does not depend on the elevated character of the activities that it makes possible. Freedom of action, even in humble things, is as important as freedom of thought.

The endeavour to achieve certain results by co-operation and organisation is, of course, as much a part of competition as individual effort. The distinction is not, as Marxists would have us believe, between individual and group action, but between conditions in which (a) alternative ways based on different views may be tried and (b) in which one agency, be it dictator or a government department, has the exclusive right and power to prevent others from trying. It is when such exclusive rights are conferred on particular individuals or groups, presumed to have superior knowledge, that the process ceases to be one of experimental change and growth and that beliefs which happen to prevail at a given moment may become an obstacle to progress.

The argument for liberty is not against organisation as such but against all exclusive, privileged, monopolistic organisation, against the use of coercion to prevent one from trying to do better. To turn a whole nation into a single organization, built and directed according to a single plan, is to extinguish the very forces that shaped the individual minds that planned it.

Today, buses take you almost everywhere in South India

"May you have a safe journey, my son"

IT IS ESTIMATED that over 17 million people travel on buses every day in the Madras State alone. Today you can travel to almost every nook and corner of South India, thanks to a number of efficient bus services.

Back in the twenties, TVS realised that it was not enough to have an efficient bus transport system of their own. They must encourage others too to start new companies so that the whole of South India could be covered by a vast network of bus services. For this purpose they started several units to render expert and efficient service.

From supplying the chassis, building the bodies, providing the finance, right down to retreading worn-out tyres, these units meet the increasing demands of the automotive industry in all its aspects in South India.

We are indeed happy that when people wish 'safe journey' they can really mean it.

TVS UNITS INCLUDE

T. V. SUNDRAM IYENGAR & SONS PRIVATE LIMITED
Madurai, Tiruchi, Tirunelveli, Pudukkottai Salem and Coimbatore
Motor vehicle Dealers, Automobile Engineers & Body Builders

SUNDARAM INDUSTRIES PRIVATE LIMITED
Pudukkottai - Madras - Coimbatore
Tyre Retreaders

SOUTHERN ROADWAYS PRIVATE LIMITED
Madurai
Passenger & Parcel Road Transport Undertaking

SUNDARAM MOTORS PRIVATE LIMITED
Madras-Bangalore-Secunderabad
Dealers. Fiat, Plymouth, Fargo, Leyland & Ferguson Tractors

INDIA MOTOR PARTS & ACCESSORIES PRIVATE LIMITED, Madras
Distributors of GM Parts & Accessories for all India

MADRAS AUTO SERVICE PRIVATE LIMITED
Madras-Bangalore
Distributors of Motor Parts & Accessories

SUNDARAM FINANCE PRIVATE LIMITED, Madras

MADRAS MOTOR & GENERAL INSURANCE COMPANY LIMITED, Madras

The European Scene

W. EUROPE AND THE U. S. RECESSION

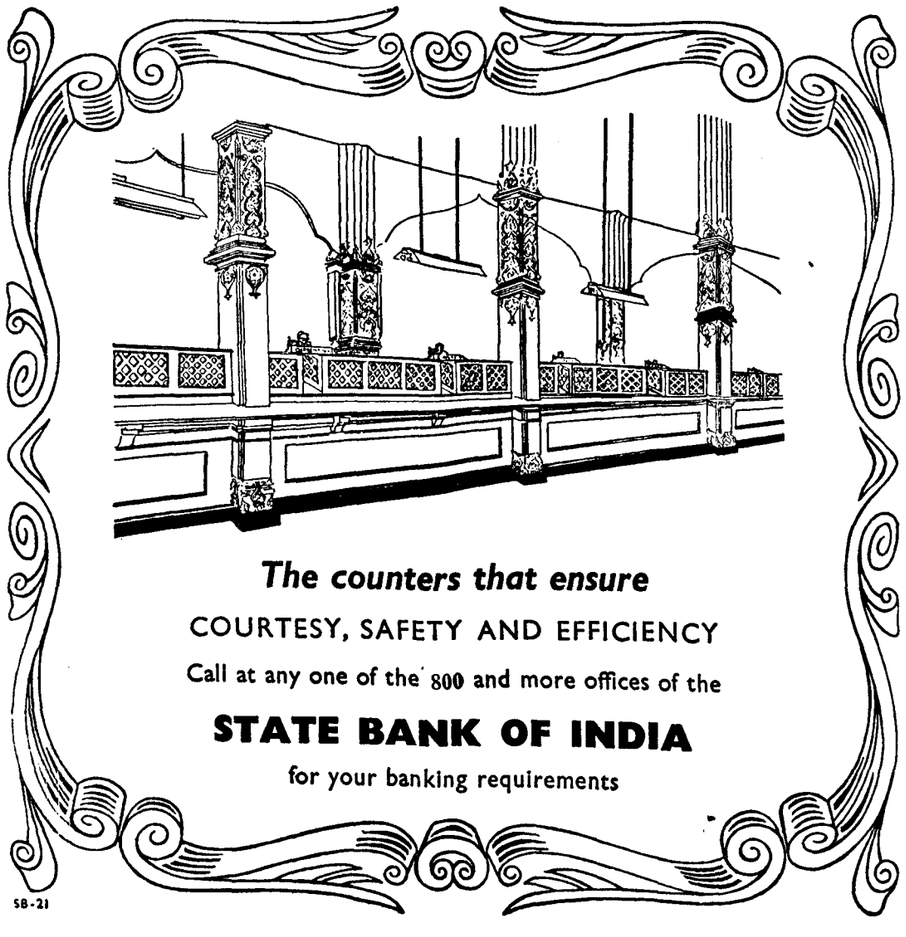
From Our Special West European Correspondent

PARIS, October 22.

IN Jules Romains' novel 'Doctor Knock' that unscrupulous medico solemnly warns a patient who has nothing wrong with him, "Good health is an unstable and precarious condition which bodes nothing but ill." Economists are of this opinion when they make their diagnoses of national economies. If a country is neither suffering from inflation nor plunged in depression, then it must be in the sorry condition of normality, which is dangerous beacuse it can be shown to contain the seeds both of depression and of inflation. Carlyle called economics the "dismal science" because it is entirely founded on the notion of scarcity (i.e. ecnomic "goods" are defined as "what is scarce"), but modern economists, living in an age of unprecedented material progress, have made it doubly dismal by defining economic well being as the brief transition from inflationary scarcity to recessionary plenty. That many Western economies have in fact succeeded in holding this intermediate position for several years together has not lessened the constant flow of warnings about imminent inflation and/or threatening depression. A Parisian journalist has just pointed out that in West Europe over the past 12 years the cyclical succession of boom and slump has been replaced by cyclical discussion of the dangers of boom or slump. "That," he added, "is progress".

The point is illustrated in the latest report of the Common Market Commission, which opens by declaring that the Continental economies are doing brilliantly but at once adds—feeling guilty about this unprofessional optimism—that governments must (a) take immediate steps to throttle a threatening inflation and (b) lay urgent plans to combat the recession that is coming in 1961! Similarly in the specific case of West Germany, the Christian Democrats are preparing to tell the electors that the "miracle" continues unabated—while Dr. Erhard proposes draconian measures to stifle inflation and while Dr. Blessing (boss of the country's reserve bank) warns that the peak of the boom is past and it is time to think of easing credit. The point about such disagreements is that they are only apparent. Everyone is right. A healthy economy that is expanding at a satisfactory rate will show contradictory tendencies to slip this way or that, but if warnings of danger are loud enough and pessimistic enough governments can take the required counter-measures and nothing catastrophic happens.

The reasons for conflicting assessments of West Europe's present situation are these. The region has made a spectacular recovery by concentrating on exports, which is why West Germany and Italy today have the second and third biggest central reserves in the world, while the rise in France's reserves is well known. This boom creates very full employment (West Germany has a labour shortage and France's unemployment rate is 0.14 per cent compared with Britain's 1.5 per cent and the USA's 5 per cent), and thus an inflationary pressure. Large export earnings increase liquidities, and to these is added an influx (or repatriation) of capital caused by confidence in the currency. Industry invests to keep up with the boom and to counter the labour shortage, and governments overspend as governments apparently must. The short-term inflationary danger is obvious. Yet, at the same time, the very reliance on exports that lies at the base of the recovery exposes these economies to fluctuations in world trade more than when they tried to keep expansion going on a watertight domestic inflation (watertight because protected from world markets by non-convertibility, quotas, etc.) At the present moment, the USA—which is the best market for their exports—is suffering what is variously described as a "recession", a "periodic adjustment" or a "pause", and is at all events importing less both from the Continental countries and from the raw-material producers who in turn patronise West European industry. Thus there is a danger of slow-down, somewhat more remote than the inflationary threat but just as real.



At a guess, one would say that West Europe is just now passing from the phase where the inflationary danger was greater to the phase where the recessionary threat becomes more important. This does not mean that there is going to be a recession; the tightrope walker leans first this way, then that, but he does not fall. The signal that marked the transition was probably the reduction in interest rates by the Bank of France; this has not yet been followed by the Bundesbank nor by the Bank of England, but the former has begun defending dear money instead of just practising it, which shows that it admits its policies are not beyond question, and London would obviously reduce its rates once Bonn has done so. The place to watch for a change in sentiment is the place where the European economies have stuck their necks out most, and that is undoubtedly the automobile industry. They have stuck their necks out here, firstly, by letting this industry become too important in their domestic economy and, secondly, by letting it account for too large a share of their exports. So this industry will be the first to feel the draught when export markets get tougher and when US spending falls, and the one whose production cuts will be most acutely felt inside the national economies.

What do you find when you look closely at this industry? First, that its monthly average output has increased by 50 per cent between 1958 and 1960, confirming the boom in Continental industries. Secondly, that its output in the first eight months of this year was a record, confirming that optimism about the future continued right up to August. Next—however—that its exports, particularly to the USA, have been falling all this year and, since exports have become 50 to 60 per cent of output (for we said the boom was based on exports), production cut-backs have just become inevitable. The British Motor Corporation put one third of its workers on shorter-time this month, Renault, the biggest French producer, has sacked 3,000 workers this month and put others on short time, and the Borgward group in Bremen has given 2,000 men notice for next month. Concurrently, various mergers and combinations (a sure sign of bad weather) have affected the Jaguar, Daimler, Simca and Citroen makes. These are the first symptoms of the automobile crisis of which something was said here several months ago. They are not necessarily the prelude to disaster, either for this industry or for the European economies, but they show that the wind has changed quarter.

Once the balance has tipped, however slightly, to the side of contraction, the West Europeans begin to take more seriously the US recession. Up to now they had been complacently pointing out the contrast be-

tween US stagnation and their own continued progress: while the expected US recovery failed to materialise this year, the Common Market countries increased industrial output by 11 per cent, against an increase of 7.5 per cent last year and 3 per cent the year before. The fact—and it is a fact—that West Europe has achieved its economic emancipation from the USA, that it is no longer tied to modest fluctuations in American activity, was taken to mean that the two regions could follow contrary courses: Europe could go on reaping the fruits of its wider market, modernisation and cheaper labour, while the USA languished in recession. In reality, emancipation does not mean isolation, or insulation from the world markets in which the USA is still a major force. The US recession (or whatever euphemism you choose to cover the present depressing state of affairs in America) will surely impinge on West Europe; that region's greater independence will show up in two factors: the transmission of depressive influences will not be instantaneous except for special cases like automobiles and steel, and those influences will not be magnified and multiplied as they cross the Atlantic. The days are gone when a 2 per cent fall in the USA was translated into a 10 per cent fall in West Europe, but the general direction of change will remain the same on both sides of the ocean, with a time-lag of 9 to 12 months. (This being the time taken for depressive influences to make the circuit via the raw-material producers to West Europe, for industries other than automobiles.)

So the recession danger is not imminent; the Common Market Commission puts it down for the second half of next year. Meanwhile, some countries in this region and notably West Germany still have the inflationary threat to cope with because capital is over-abundant and labour scarce. Fortunately, the measures required to deal with this double threat are not contradictory; it is not a question of deciding whether to put bank rate up or down. Action taken now to stop price rises will break a link in the current inflation and at the same time keep exports moving to meet the remoter recessionary influence. Steps taken now to increase imports will relieve current pressure in home markets while contributing to maintaining activity in other countries so that they will not have to reduce their imports next year. Liquidities neutralised now will be available to stimulate expansion later instead of adding to excess demand today. In sum, the best way to deal with tomorrow's recession is to deal with today's inflation. In fact, the European governments have done this over the past two years. It is because they have turned a deaf ear to the expansion-at-any-price sirens that they can now envisage the repercussions of the US setback, not with indifference, but with serenity. Their one real difficulty will be limiting the effects of the automobile crisis. My conclusion is that, although for the next few months there may be signs that West European governments are still mopping up odd patches of inflation and hesitating to cheapen money before their neighbours do so, the general drift of policy will be toward an easing of restrictions in order to preserve the region, as far as possible, from the approaching influence of the US recession.

Our West German Letter

NO ATOM BOMB IN POCKET-EDITION

From Our West German Correspondents

BONN, October 15.

BONN, the temporary capital of West Germany, harbours an old university with its Institute of Physical Chemistry. In this scientific establishment Professor Wilhelm Groth has developed a process for production of cleavable uranium by using a gass centrifugal machine. These experiments are neither sensational nor new; they are going on in fact since 1941. Not only in Bonn but also the State-owned DEGUSA (Deutsche Gold- und Silberscheideanstalt, Frankfurt), the AEG (Allgemeine Elektrizitatsgesellschaft, Berlin) and the firm of H. Matrin, Kiel are experimenting with the gas centrifugal machine for the same purpose. Also in Holland are similar experiments being executed. The final aim is to produce nuclear power for peaceful use by cheaper methods. Allegedly, on the suggestion of the U.S. Government, the West German Government has applied to the Patent Office for declaring Professor Groth's process as "State-secret." These proceedings have caused an uproar in the Communist satellite countries, especially in East Germany, as it was "assumed" for propapanda purposes that by the new procedure West Germany would be able to, produce tiny, cheap atom bombs or, as some papers put it, the Bundesrepublik could now manufacture the atom bomb for the man in the street. It is well known that the West German Government has committed itself not to produce nuclear weapons. But besides, American scientists believe that German scientists who were taken to Russia after the war as prisoners, have already developed such a gas centrifugal pump for the Soviets. And finally, Professor Werner Heisenberg, West Germany's famous physicist (Nobel Prize winner at the age of 31), declared today that he considered the new experiments or invention as "middlingly insignificant." He added that a substantial progress had not been achieved and besides, there was already far too much cleavable material. Conclusion: "Much ado about nothing!"

As far as we know, there is not yet an atom-powered aircraft. But there is already the first turbine powered helicopter, manufactured by the Bristol Helicopter Division of the Westland Aircraft Ltd. This plane, the "Belvedere" can carry 2,722 kilograms of freight or not less than 19 fully equipped troops. Several nations, amongst them West Germany, are interested in this outstanding aircraft. The first ready planes are just taken over by the R.A.F. Experts in West Germany themselves are wondering why the Indian Government (according to the "Daily Express" as reported by its New Delhi correspondent) should send a mission to Moscow to buy 8 helicopters and 8 other freight planes which are urgently needed by the I.A.F. for border defences or a border road development project. The German experts are amazed at this forthcoming deal as the British newspaper reports that 8 Russian helicopters bought by the Indonesian Government are grounded due to clutch trouble and the clutches have not yet been replaced although they went out of order last May.

* * *

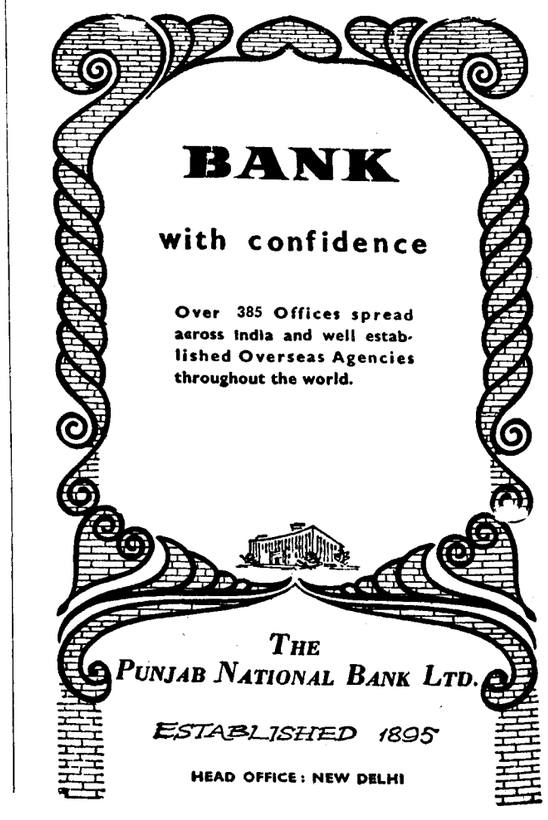
There are pretty serious differences between the Minister of Economics, Professor Erhard, and the German Industry. The President of the Combined Federations of Industry (Bundesverband der Deutschen Industrie), Fritz Berg (who headed a goodwill mission to India in 1955) attacked the Minister in a Press conference and tried to prove that Erhard's plans to weather the dangerous consequences of the present boom would prove ruinous. It would be outside the scope of this letter to go into details of this controversy, but it will suffice to quote the weekly Economic Report of the Institute of German Industry, Cologne. It says: "The industry realises that some steam must be let off now. It thinks, however, that constructive actions like promoting the export of private capital and restricting investments to those promoting rationalization, instead of enlarging capacity, are much sounder than any throttling of exports. It (the industry) is also willing to aid the Government and the Federal Bank (Deutsche Bundesbank) by raising a 1,000 million DM development aid loan from industry to siphon off excessive liquidity. Developing countries receiving loans from this fund would not be obliged to buy German goods in order to avoid the so-called boomerang effect. That means that the German boom would only become hotter if these loans were used for orders of German goods. But the German industry can only do this if there is no interference with foreign trade." (We shall refer later to the above mentioned development aid loan.) While Minister Erhard went to Teheran to open the German Industrial Exhibition and to Kabul to negotiate with the Afghan Government how Germany could further technical and financial assistance, Chancellor Adenauer received Mr. Berg to talk over the pending problems. Erhard had suggested to keep the present price level by reducing the export and easing the import. Erhard took it very badly that the Chancellor dealt with Berg behind his back. No sooner the Minister had stepped out of the plane that brought him back from the East, he had a talk with Dr. Adenauer about which both partners kept complete silence. It was not for the first time that these two outstanding personalities to whom the German people is indebted for recovering so splendidly from the aftermath of a lost war, had clashed. It will be remembered that Dr. Adenauer had tried to get rid of Erhard as Minister by suggesting his candidature for the Presidentship after the second and final term of Dr. Heuss was over.) After his latest experience, Professor Erhard cancelled his scheduled visit to Spain and Portugal which was planned for the beginning of next month.

* * *

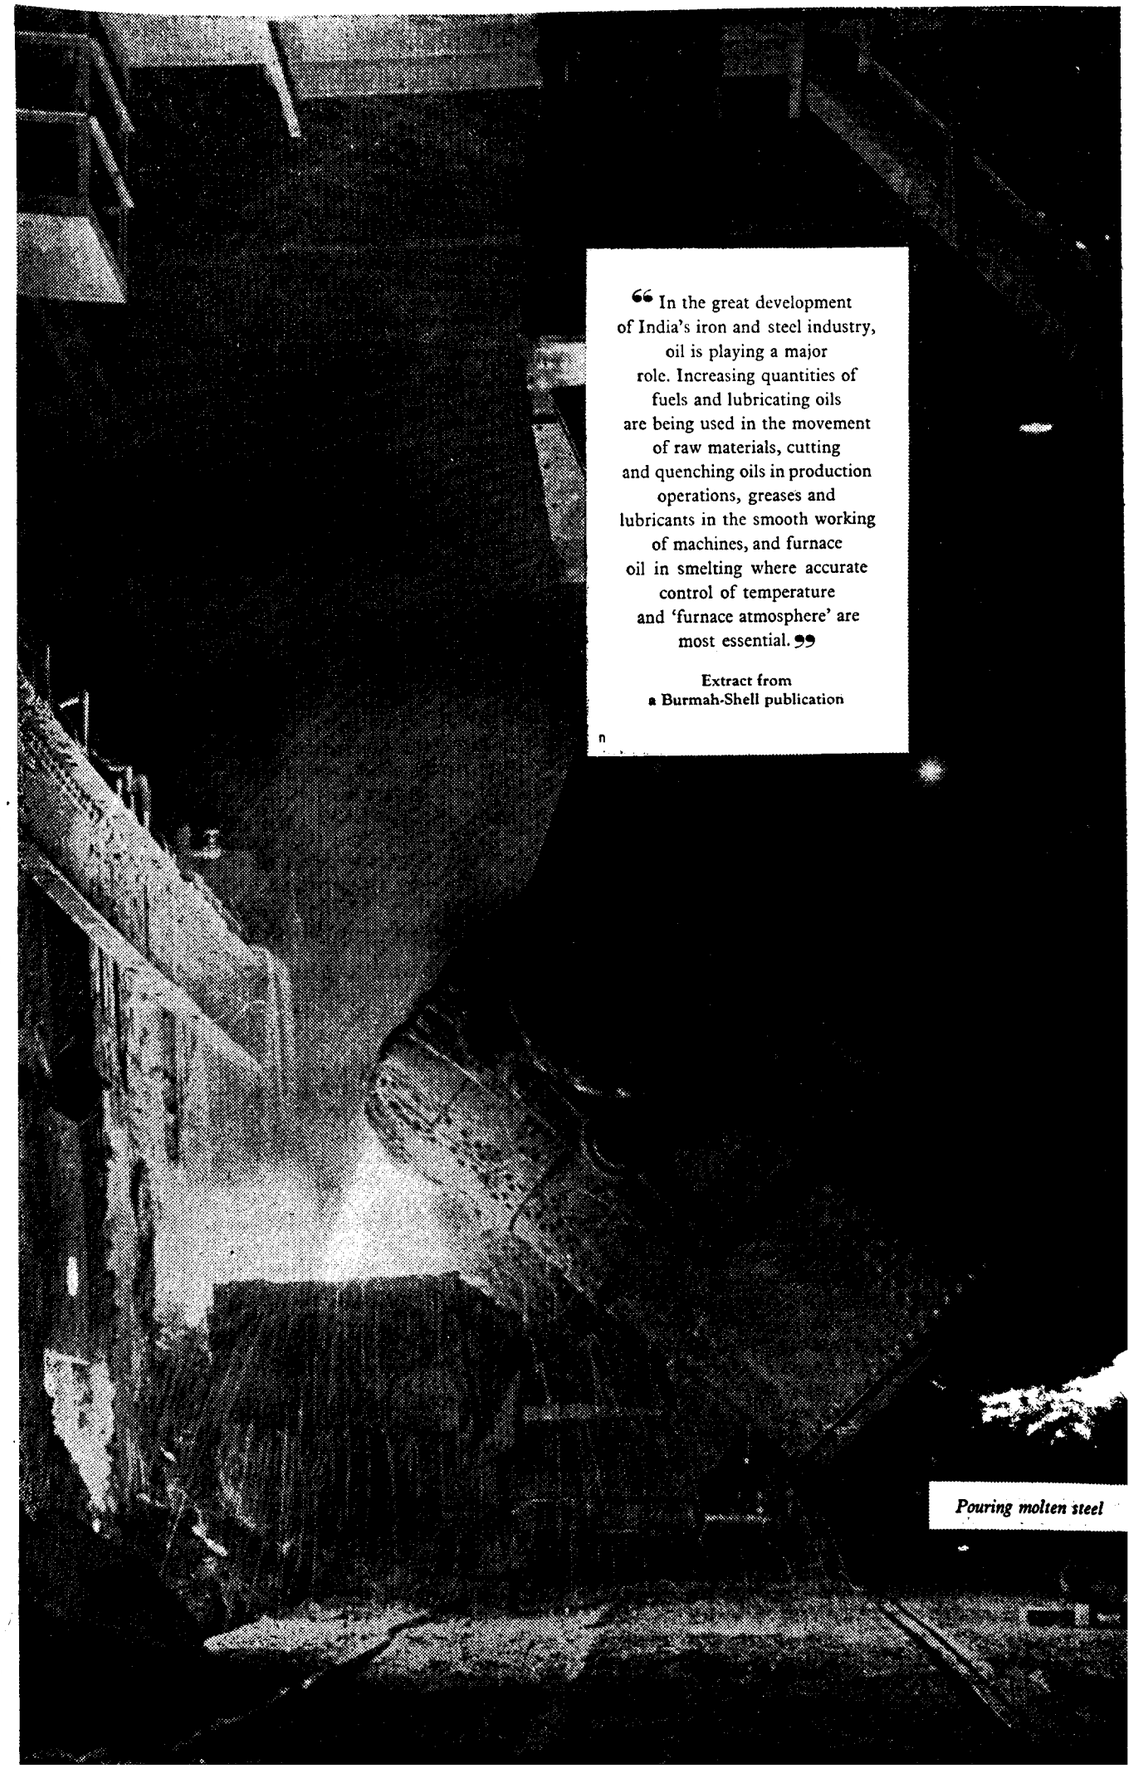
In the context of stable prices and wages, the result of an opinion survey undertaken by the leading German institute of public opinion EMNID should be of special interest. According to this survey, more than 80 per cent of the West German population prefer that the present level of prices and wages should remain unchanged. Of the 2,000 persons interrogated, 83 per cent voted against an increase of wages if this would mean an increase in prices. Only 12 per cent would prefer the increase of wages if at the same time prices would rise. The rest made no statements. One can conclude from this survey that the majority favours the possibility of financial planning in the private household at long sight. Another survey undertaken by the Statistical Section of the EWG (Europaeische Wirtschafts-Gemeinschaft of the SIX) should also be mentioned here. It is based on the answers of 2,000 families in each of the 6 countries, having careful regard to the purchasing power of each country's currency. The average yearly net income of a married steel worker with 2 children amounts in Luxemburg to 9,894 DM, in Belgium to 8,672, in France to 8,016, in West Germany to 6,791, in the Netherlands

to 6,660 and in Italy to 6,146 DM. (Compare these figures with the yearly average income in India!)

* * *



After Germany had been taken to task at the World Bank meeting in Washington for not contributing its proper share in aid for developing countries things have started moving here in this respect at a slightly quicker pace. The planned loan by the German industry of 1,000 million DM has already been quoted. No decision has yet been made in regard to its allotment to the various receiving countries. As a newcomer in the field of development aid now appear the Federal States of the Bundesrepublik. At the recent meeting of the Finance Ministers of these States in Bad Duerkheim this subject has been thoroughly discussed and the Finance Minister of North Rhine-Westphalia, Mr. Puetz, was the first who told the Legislative Assembly of his State that members should be prepared to find in the next budget this new item. The Central Government is at prestnt considering as special bill, the so-called "Entwicklungshilfe-Gesetz" which will provide a fund of 1,500 million DM. More details about the fund will probably become known during the next months. That the climate for development aid is on the whole evidently improving was proved by the meeting of the Ostasiatische Verein (East Asia Association) in Wiesbaden which was well attended by representatives of the Foreign Office and the Ministry of Economics as well as by bankers, leading personalities of the industry and diplomats. The only subject discussed there was the aid for developing countries. Dr. Reinhard Kuevary, Economic Adviser to the UNO, spoke on his experiences in Burma which, as he said, might be the same in other Asian countries under similar conditions. He admitted that the Burmese Government is encouraging private investors, but in practice all kind of difficulties and delays appear because the authorities concerned are very often not in the position to make the necessary quick and right decisions. It seems, therefore, important to give also aid in form of training suitable persons in administration of undertakings in the private and public sectors. The other speaker, Dr. Muthias Schmitt, Director of the Berliner Bank, pointed out that the time of the almost classical division between industrial countries and countries yielding raw materials is definitely over and a new relationship between industrial countries and developing countries has to be created. The problem of underdeveloped countries has become a developing problem of the entire world economy. Therefore, this kind of aid has to be considered by the West as an investment for its own economic future.



* * *

The relations between the Bundesrepublik and the Soviet-controlled German Democratic Republic have considerably deteriorated during the last weeks. The Communist regime has suddenly introduced various kinds of controls on the border between East and West Berlin. There is no justification for it at all because Berlin is still under the jurisdiction of the four powers, USA, Great Britain, France and the Soviet Union as fixed by the Potsdam Agreement of 1945. The astonishing fact was that the new strict controls were introduced while the Leipzig Fair was being held where West German exhibitors and visitors were present. Now, on recommendation of the Bonn Government, the Combined Federations of Industry have decided not to participate any longer in this fair. But much more serious is that the West German Government has terminated the so-called inter-zonal agreement with East Germany as from 31st December. It is true that Bonn has declared at the same time that it would be prepared to enter into negotiations for a new agreement. The pre-conditions for it would be that the East German Government has to drop the new controls. It remains now to be seen whether this Government considers its inter-zonal trade as an important factor or not. The West German export to East Germany amounted in 1959 to 1,078 million DM and the import from there to 892 million DM. More detailed figures of West German exports to its Communist neighbours are: Iron and steel 281 million DM, machinery 130 million DM, coal and coke 110 million DM and chemical products 100 million DM. East Germany exported to West Germany mainly lignite and petrol. Since the two Governments do not maintain diplomatic relations—in fact, Bonn does not recognize the East German regime—the semi-official intercourse is being carried out in a peculiar way. The bilateral contracts are being signed by the "Authorized Agent for the currency territories of the Deutsche Mark (DM-West)" and respectively by his counterpart DM-East. The West German cease of trade with East Germany can, of course, only succeed if the NATO partners refuse equally to have further trade relations with the German Democratic Republic.

* * *

While some nations prefer the nationalization of private enterprises, West Germany is going the other way round, which means "privatization" (if such word ever exists). The first example of this peculiar proceedings was the till then State-owned Preussische Bergwerks-und Huetten-A.G. (Preussag). Shares for 83 million DM of this unit were sold to people with low incomes. Now follows the famous State-owned Volkswagen-Werk (People's Car Works) which produces the world-famours middle class car. According to half page advertisements in dailies and weeklies, on January 16, 1961, shares of this company can be bought with rebates of 10—20 per cent by people with yearly incomes between 6,000 and 8,000 DM. If a shareholder sells his share or shares before March 15, 1963, he has to refund the amount of the granted rebate. Most probably the single 100 DM share will be offered at a rate of 350 DM. The Minister in charge of State properties, Dr. Hans Wilhelmi, assumes that there will be in future about one million shareholders of the Volkswagen-Werk.

Economic Report from the U.S.

ASSISTANCE TO DEVELOPING LANDS

By

GUY SIMS FITCH

WASHINGTON, Oct. 15.

WITH the annual meeting here a few weeks ago of the World Bank and the International Monetary Fund, followed by the third session of the Development Assistance Group (DAG), the entire subject of economic assistance to developing lands has received a renewed emphasis and a closer examination. The Bank and the Fund, of course, are twin international financing agencies of the United Nations, the former interested primarily in development loans, the latter in monetary stabiliation. DAG, a much newer body, which was set up early this year, is made up of ten leading capital exporting nations that can be expected to play important roles in governmental assistance to developing countries. As has been made clear, DAG's functions are mainly technical rather than operational, with stress on ways and means of mobilizing and co-ordinating capital flows to developing areas. It also is clear that with the inclusion of the United States, Canada and Japan as members, along with a number of Western European nations, DAG's is a global interest in development problems and progress. While DAG's principal concern is with aid methods, it is performing another useful function in bringing more nations into active participation in international assistace efforts—a basic requirement if the amount of aid to developing lands is to be increased to any major extent.

It is generally recognized that the other industrial countries, themselves the recipients of large amounts of U.S. economic aid in the past, now are in position to enlarge their own contributions to economic development around the world, to more nearly match what the United States has been doing for some years. One of the nations frequently mentioned in this context is the Federal Republic of Germany, which has made notable economic strides in recent years. A look at the record shows that in 1959, Government grants and loans by the free industrialized nations aggregated some $4,000 million, of which about two-thirds was supplied by the United States and most of the rest by the United Kingdom and France. Over the six-year period of 1954-59, the economic assistance total came to $18,000 million, of which the United States supplied no less than $12,000 million. It is highly encouraging then that a number of other industrialized countries have indicated that they are or will be expanding their assistance efforts. This includes several that were represented at the recent DAG meeting. What may be the most notable effort made so far to bring Western Europe and Japan into aid programme heretofore financed mainly by the United States is the International Development Association (IDA), just established as a World Bank affiliate. Of the $1,000 million IDA capitalization, the United States is scheduled to put up $320 million, and 16 other industrial countries an aggregate of $433 million. These contributions will be entirely in gold or "hard"—that is, convertible—currencies. But making IDA a truly global development effort is the provision for contributions from 51 less-developed countries as well, to make up the rest of the $1,000 million. In their case, however, they are permitted to subscribe with only 10 per cent of their shares in gold or convertible money, and the remainder in their own "soft"—non-convertible—currencies. IDA also goes beyond the usual international development financing in yet another way. Its loans to developing lands will be on terms that are more flexible than the normal World Bank or commercial loans, and repayment will be permitted in soft currencies.

Until now, to all intents and purposes, the United States has been the only nation officially offering soft-loan development assistance on any major scale. It has done this through its Development Loan Fund (DLF), which by this past June 30, in only 26 months of operations, had authorized 153 loans with a value of $1,450 million in 44 developing countries. In addition, the United States is associated with its Western Hemisphere neighbours, through the Inter-American Development Bank (IADB), in a new regional venture to finance economic development in Latin America. While the U.S. contribution to this Bank is by far the largest, contributions also have been scheduled from the other participating nations. And, as in the case of IDA and DLF, the IADB charter also provides a mechanism for making "soft" loans. What all this adds up to is a new concept in world banking. It is a concept which meets an important need in that it can help get soft currencies into constructive international use, while making it easier for developing countries to obtain funds required for the acceleration of their economic progress. This is especially the case with IDA, which represents the truly global effort, with the broadest assistance base and the widest potential application of the soft-loan idea. Through IDA's use of soft currencies, moreover, another interesting ingredient is added to the development picture: in effect, an aid recipient may also turn out to be an aid provider.

WORLDGRAM

India

Plant to Produce Newsprint from Sugarcane Fibre: A planned paper plant in Maharashtra State will produce 60,000 tons of newsprint annually from sugarcane fibre, using methods developed through eight years of American research. The newsprint mill at Karad, 220 miles from Bombay, will be conducted by Sahu Jain Ltd., managing agents for one of India's largest industrial complexes, comprising companies engaged in paper, sugar, cement, heavy chemicals, nitrogenous fertilizer manufacturing etc. As a result of a joint agreement between the Indian company, Crown Zellerbach Corporation, and the Hawaiian Development Company, the mill will receive technical assistance and patent permits for production of newsprint from bagasse, the fibrous residue of sugar production. The proposed Maharashtra plant, for which the Government of India already has granted an industrial licence, will represent an investment of approximately $20m.

•

New Fertilizer Factory in Madras: Madras State will soon have another new fertilizer factory to be known as the Premier Fertilisers Ltd., this new venture will be sponsored and managed by the well-known group Emcete & Sons who control the well-known institutions like the Indian Overseas Bank Ltd., and United India Fire and General Insurance Company Ltd., in Madras and Travancore Rayons Ltd. in Kerala. The factory will be located near Cuddalore, 120 miles South of Madras city in South Arcot district. It will have a manufacturing capacity of 40,000 tons of superphosphate and 16,500 tons of sulphuric acid per annum. The new company has an authorised capital of Rs. 1 crore, made up of Rs. 25 lakhs in 9% taxable preference shares and Rs. 75 lakhs in the equities. The face value of both the shares will be Rs. 10 each.

•

Durgapur Steel Works: The first battery of the coke ovens had been lighted by Mr. K. Sen, General Manager of the Steel Project on August 24, 1959, and the first coke was pushed on November 22, 1959. The battery has been working very satisfactorily and of late its daily production has been 1,484 metric tons of coke, which is more than the targetted capacity for the battery. The coke ovens form an integral part of modern steel works. The Durgapur Steelworks with its three batteries of ovens will carbonise daily 5,200 tons of dry coal into 3,900 tons of coke. Each battery consists of 78 ovens. The ovens are devised to use blast furnace gas as well as coke oven gas as fuel.

United States

Loan for Import of Capital Equipment: The U.S. Government has announced approval of a $25m. (Rs. 11.9 crores) loan to the Government of India for the importation of capital equipment. The loan will come from the U.S. Development Loan Fund (DLF); and it will be used for procuring equipment to increase the productive capacity of small and medium sized private industrial enterprises in the fields of metallurgy, electrical installations, machine tools, earth moving equipment and chemicals. The loan is repayable in rupees. The approval of a loan of this type marks a departure from the practice of DLF in recent months, during which it has given only project-type loans. In recent years India's foreign exchange resources have been increasingly devoted to large-scale projects, in accordance with India's objective of self-sustained economic growth. Consequently there is a need for foreign exchange to cover capital imports in the immediate months ahead for establishment, expansion and modernization of smaller private enterprises. Funds provided by DLF are expected to attract additional investment of Indian rupees by Indian investors and to contribute substantially to strengthening the private industrial segment in the Indian economy. This is the 22nd loan given to India by the U.S. Development Loan Fund, and brings to $3654 million (Rs. 1,739 crores) the total amount of U.S. economic assistance to India.

•

Third U.S. Loan for Steel: The United States Government has announced approval of a $25 million (Rs. 11.9 crore) loan to India for the purpose of financing importation of steel and steel-products needed by private and public enterprises. The loan was approved by the U.S. Development Loan Fund, pushing the total amount of DLF loans to India past the Rs. 200 crore mark ($420 million). Steel sheets are expected to account for more than half of the procurement under the loan announced. The remainder will consist of tin plates, strips, tool and alloy steel, billets, wire and rods. This is the third loan given by the DLF to India for steel procurement. The first agreement, signed in December 1958, provided for $40 million worth of steel for private and public sector undertakings and the second, concluded in July 1959, for $20 million for private industrial projects.

United Kingdom

Dormen, Long Ltd. Plans Expansion: The British steel firm of Dormen, Long Ltd., has announced that it is to embark on extensive development, expected to cost £36 million, to modernise rolling mill facilities. This will be additional to the £7m. expenditure announced in July, and will increase overall potential by a further 400,000 ingot tons a year, bringing the company's annual ingot production potential up to 3 million. The Company will, through this expansion, also substantially increase its capacity in the light product field. The initial part of the programme includes a new primary mill at Lackenby, Yorkshire, for the production of 22,500 tons of slabs and blooms a week from ingots of up to 20 tons.

•

Development of a High Speed Internally-toothed Saw: A U.K. firm of saw-makers have developed a high speed internally toothed saw to be incorporated in tube sawing machines. This machine, for use in the ferrous and non-ferrous tube industries, will saw a tube without inherent 'flash' associated with the normal externally toothed saw. A separate deburring operation is now, for the first time, unnecessary. The saw is unusual because the teeth are milled on the internal diameter. It is of the segmental type and has six high-speed steel, taper-ground segments which are dowelled and screwed into position on a circular plate to make the saw blade. Teeth can be reground a number of times while the repair and fitting of new segments is simple and quick. The saw blade is located inside the reciprocating head of the machine and an eccentric movement enables the saw to cut the wall of the tube only. The tube is clamped along the central axis of the saw and there is no movement across the tube's diameter.

•

Production of Television Sets: The General Electric Company Ltd., at its factory in Coventry, is pro-

ducing television sets at the rate of 5,000 a week. This reflects the successful application of a mechanisation policy which balances what is technically possible with what is economic, and in the interests of the customer. The main production line begins with the metal chassis frame work and finishes with the receiver packed in its carton, says the British periodical "The Engineer."

Japan

Trade Talk Initiated with Australia: A recent announcement made by the Ministry of Foreign Affairs states that Japan on October 4, initiated trade talks with Australia in Tokyo for the revision of the Agreement on commerce between Japan and the Commonwealth of Australia, which came into force on July 6, 1957 to be valid for three years and fell due for expiration on July 5, 1960. Provisionally, the validity of the agreement has been extended until the revised one takes effect following final deliberations in the trade talks.

*

Bank Loan for Plant and Equipment: According to a survey made recently by the Bank of Japan, all Bank's new loans disbursed during August for investment in plant and equipment to industrial sectors amounted to Y70,100 million, accounting for 56.8 per cent of the net increase of their loans and discounts in the month under review. The amount runs 19 per cent ahead of that in July and comes next to the previous record height of Y72,500 million attained in March this year. It also shows a gain of 35 per cent compared with the total of a year earlier.

U.A.R.

Shipyard Agreement with Soviet Union: An agreement was signed in Moscow on August 23, between the UAR Southern Region's Five Year Industrialisation Authority and the Soviet Import and Export Organisation, providing for the construction of a shipyard at Alexandria. Under the terms of the agreement, the Soviet Union will extend to the Southern Region, all technical facilities in connection with the designing and construction of the yard, together with the technical aid in planning the project. The necessary materials for the purpose will also be provided by the Soviet Union. The shipyard will handle ships of a length up to 70 metres. All types of ships will also be repaired in it.

Czechoslovakia

Farm Production: It is reported that farmers in Czechoslovakia will not limit themselves to increasing total agricultural output by 22 to 23 per cent during the Third Five-Year Plan (1961-65). Production costs are to be cut by two-thirds in the same period. Mechanisation is the key to increasing productivity and cutting costs, and to this end a new series of machines for almost all kinds of farm work has been completed using a large number of standardized parts. The plan also calls for some seven hundred modern all-purpose drawing kilns to be erected, six or seven to every district. Construction of communal cowsheds and other co-operative buildings will be pushed. A total of 32,000 million crowns will be invested in agriculture during the Third Five-Year Plan, of which 17,500 million will be spent on new machinery.

Yugoslavia

Leather Plant Exported to the Sudan: "Invest-Import" of Beograd recently sold a complete leather processing plant to the Sudan. Under the terms of this contract the "Kostroj" factory of Slovenske Konjice should deliver machines for the tanning and processing of leather valued at 122,000 pound sterling. This delivery will take place in accordance with the agreement concluded between the two countries in July 1959.

Brazil

Coffee Exports: Coffee exports during July hit an all-time high of 1,919,258 bags of 132 lbs. each. This, acording to the Brazilian Coffee Institute, broke the previous record of 1,830,430 bags registered in July, 1907. Coffee exports, by ports, were the following: Santos 1,380,771 bags; Rio de Janeiro, 212,154 bags; Paranagua, 181,568 bags; Vitoria, 112,093; Recife, 4,561; Bahia 1,869; Angra dos Reis, 22,342; Niteroi, 3,900 bags. This activity is indicative of Brazil's struggle to retain her traditional place among world coffee suppliers. At one time Brazil exported more than seventy per cent of the world's coffee. Today the Brazilian share of the world market is estimated at a little more than forty per cent.

Netherlands

Export of Bicycles: An increase of about 35 per cent over 1958 is reported in the total number of bicycles sold by the Dutch last year. Out of 700,000 disposed of, exports totalled about 1,97,000 which was almost 50 per cent more than in the previous year and constituted a record figure. Between 1952 and 1953 Dutch cycle exports dropped alarmingly from 185,000 to 56,000; so the jump last year indicates a remarkably successful sales campaign. In recent years there has, in fact, been a marked change in these exports. Eight years ago, 84 per cent went to Indonesia and 2 per cent to the United States. Last year exports to Indonesia dropped to zero, while those to America soared to 78 per cent with a further 14 per cent to Canada.

Morocco

Almond Harvest in 1959: The 1959 Morocco almond harvest is now estimated at 4,500 short tons, compared with 6,500 tons in 1958. Exports for the 1959-60 season through March 1, 1960 totalled 2,300 short tons. West Germany continues to be the largest purchaser of the Moroccan almonds. These data do not include bitter almond.

World Bank

Loan for Mexican Highways: The World Bank has made a loan equivalent to $25 million to assist in the development of Mexico's highway network. The loan will finance the foreign exchange cost of building or improving 13 roads having a total length of approximately 2,000 miles in Central and Southern Mexico. The roads are among the most important in a five-year programme being undertaken by the Mexican Government to develop the Federal Highway system. The first Pennsylvania Bank and Trust Company (Philadelphia) and the Grace National Bank of New York are participating in the loan, without the World Bank's guarantee for a total amount of $1,50,000 representing part of the first maturity which falls due May 1, 1965. The Bank loan is for a term of 19 years and bears interest of 5¾ per cent per annum including the 1 per cent commission which is allocated to the Bank's Special Reservation. Amortization will begin on May 1, 1965. Including this loan, the Bank has made 9 loans totalling $211.3 million in Mexico. The earlier loans were made for the extension of electric power facilities, railway rehabilitation and industry.

Announcing
LUFTHANSA'S
fabulous
*Senator
service

ON THE EUROPE—FAR EAST ROUTE

From the 1st November, the superb Senator Service is being introduced on LUFTHANSA'S Far East flights. The little extra touches make this service the last word in sheer luxury !

On any of our twice-weekly flights to Europe, you will bask in LUFTHANSA'S lavish attention—you will breathe an air of good living, which only the Senator Service can provide.

Senator

LUFTHANSA
GERMAN AIRLINES

WHERE SERVICE AND EFFICIENCY ARE TRADITIONAL

* Senator Service on the Lufthansa portion of the Far East Pool Service route of Lufthansa, Air France, Alitalia and T. A. I.

The Latest Automatic Looms

embodying all the improvements suggested by the Auto-Loom Enquiry Committee appointed by the Central Government, are now available to Textile Mills.

Foreign exchange so urgently needed for other vital development projects can be now conserved by buying the latest CimmcO Automatic Looms.

CimmcO the first and only manufacturers of Auto-Looms are also the first and only manufacturers of High-speed Warping and Winding Machines.

CIMMCO

NEW DELHI · COIMBATORE

Agents throughout India.

you have just opened A METAL BOX TUBE!

Your favourite toothpaste comes to you in a Collapsible Tube, a speciality of The Metal Box Company of India Ltd. Wherever necessary, this tube is given an inner coating of a specially devised, chemically inert lacquer that keeps the toothpaste from reacting with the metal of the tube itself. The tube collapses with reducing contents, thereby protecting the toothpaste from oxidation and dehydration. The Metal Box Collapsible Tube is therefore a functional as well as a convenient package. It is scientifically designed to ensure that the toothpaste remains fresh for months.

Backed by their knowledge and experience drawn from India and abroad, Metal Box are manufacturing a wide range of scientifically designed packages for the consumer goods you use.

Over 1000 manufacturers in India are being supplied by Metal Box with scientifically designed containers and closures that go to pack Rs 100 crores worth of consumer goods every year.

OPEN TOP CANS for processed fruit, vegetables, fish and dairy products
GENERAL LINE CONTAINERS for confectionery, tea, biscuits, baby foods, edible oils, paints, insecticides, powders, etc.
COMPOSITE CONTAINERS of cardboard & metal
COLLAPSIBLE AND RIGID TUBES for toothpaste, ointments, adhesives and pills
CROWN CORKS for carbonated drinks
R. S. PILFER-PROOF AND OTHER CLOSURES for bottled products
COMPONENTS for radio, automobile and electrical industries
PUBLICITY MATERIAL including advertising tablets and calendars
PLASTIC PRODUCTS including Diothene bags, foil laminate pockets and injection mouldings
HARDWARE including trays and table mats
MACHINERY Can Closing and Reforming and Bottle Sealing Equipment

TUBES FOR
ELECTRICAL
EQUIPMENT

Highly suitable for use in a wide variety of electrical equipment, E.R.W. Tubes manufactured by Indian Tube, can be employed to great advantage in Transformers, Condensers, Refrigerators and Air-Conditioning machinery. Close dimensional tolerances and a smooth finish are standard features of E.R.W. Tubes: in addition, their great strength combined with their light weight render them eminently suitable for electrical appliances.

NEWS IN BRIEF

INDIAN

The Uppal Committee on location and utilisation of wastelands in India has come to the conclusion that several large-sized blocks of land infested with thick growth of jungle, bushes and shrubs are available in the Punjab, and have great potentiality for agricultural production as the lands in these blocks are fertile and irrigation is available in most cases.

*

It is reported by the end of the Second Plan, 19,000 villages and small towns with a population of less than 10,000 will have been electrified in the country, as against 7,400 at the end of the First Plan.

*

Pulps of jute sticks having satisfactory brightness and strength properties for manufacture of cheap grade wrappings, newsprint and writing papers have been prepared by the mechanical process at the Forest Research Institute, Dehra Dun. The yield is 75 to 80 per cent.

*

Open hearth furnace number four of the Bhilai Steel Works was opened recently. Like the other three furnaces already in operation, this furnace also has a capacity of 250 tons and is capable of producing 500 tons of steel per day.

*

The Transmission Department of A.E.I. Telecommunications Division has announced that a £130,000 order for carrier transmission equipment has been received from Murphy Radio of Welwyn Garden City. The equipment will form part of an extensive radio network for the 720 mile Oil India Pipeline Project in Northern India.

*

The Centre has spent in Himachal Pradesh Manipur and Tripura almost 3½ times of their income since they became the Union Territories. Figures collated for the period between 1956-57 to 1959-60 show that the three territories earned Rs. 1,430.55 lakhs, while the Centre contributed Rs. 4,080.35 lakhs to the total expenditure of Rs. 5,510.91 lakhs.

*

Pictorial labels will henceforword be displayed on packages and wagons containing explosives and allied dangerous goods during transit by rail. The labels would indicate the hazards involved in handling the contents.

*

Tapioca is cultivated on 3 lakhs of acres in Kerala and the total production is estimated at about 10 lakhs tons. Only a small percentage is consumed as food by the poor and the rest is exported to various other States in India and also abroad.

*

The Government of India have decided to permit the import of fruits (dried and fresh), asafoetida, cumix seeds, and medicinal herbs from Afghanistan on an ad hoc basis, during the period ending July 20, 1961. This step has been taken in pursuance of the trade arrangement recently agreed to between the two countries.

*

The outstanding balance of the 2¼ per cent Hyderabad Loan 1955-60 (H.E.H. the Nizam's Government 2¼ per cent O.S. Rupee Loan 1365-70F) issued in O.S. Rupees in terms of the late Government of Hyderabad Finance Department Notification No. 2 dated the 10th October, 1946 is repayable at par on 1st November, 1960 and no interest will accrue thereon from that date.

FOREIGN

The question whether financing facilities for exporters are adequate is now being studied by the UK Government. The problem has arisen because there are indications that some small and medium sized companies have found it difficult during the credit squeeze to finance export orders.

*

According to figures compiled by Wood Gundy and Co., Canadian Government, Provincial, Municipal and Corporation bond financing for September and the first nine months this year was higher than a year ago.

*

As far as the basic statistical position is concerned it is hoped, that the world pepper crop, this year, will be very much the same as in 1959, that is to say about 60,000 tons.

*

It is reported Norway would be able to quadruple output of aluminium during the 1960's bringing it up from around the current level of 200,000 tons annually to between 700,000—800,000 by the end of the decade.

*

In the centre of Rotterdam, Holland's second largest city, work has started on the construction of Holland's first underground railway, which is to link some key points in the town centre on the north bank of the River Meuse with the rapidly expanding districts of the South Bank.

*

It is reported the terms of a 50 million Swiss francs loan to be offered on behalf of British Aluminium on the Swiss capital market have now been agreed.

*

The US Commerce Department has reported that the rate of personal income in the US edged slightly higher in September from the August level and established a new record. It ran at a seasonally adjusted annual rate of $408,400 million—up $200 million from the August rate.

*

The Egyptian Ministry of Agriculture reports ginnings of the 1960-61 cotton crop up to the end of September (including scarto) as 1,426,000 kantars, compared with 1,220,000 kantars a year ago.

*

Rubber imports into Singapore and the Federation of Malaya in September totalled 28,186 tons or 2,993 tons more than in August. Imports into Singapore during September were 24,680 tons against 22,105 tons in August and Federation imports amounted to 3,506 tons against 3,088 tons in the previous month.

*

World production of rubber during July is estimated at 155,000 tons, according to the latest report of the International Study Group. This compares with production of 160,000 tons during June and brings total output for the first seven months of this year to 1,115,000 tons.

*

A machine for the simultaneous spinning and doubling of cotton, mixed yarns and special yarns has been designed by engineers of a textile machinery plant in Tashkent.

RESERVE BANK OF INDIA

Applications are invited for the posts of Deputy Chief Officers in the Department of Banking Operations of the Bank.

(A) SCALE OF PAY: Rs. 1275-75-1575.

Note: Candidates possessing exceptionally good qualifications and experience of value to the Bank may be given a higher starting pay in the prescribed scale.

In addition to pay, the selected candidates will be eligible to draw local pay (at centres where it is admissible) and house allowance at the rates prescribed by the Bank from time to time.

(B) AGE LIMIT: Candidates should not be over 45 years of age as on 1st November, 1960.

(C) QUALIFICATIONS: Applicants should have a minimum of 15 years' commercial banking experience out of which not less than five years should be in a responsible position. Preference will be given to applicants with high academic qualifications who have made a special study of Economics, Banking, Commerce or Accountancy.

THE SELECTION BOARD WILL INSIST ON A VERY HIGH STANDARD OF SUITABILITY IN MAKING SELECTIONS FOR THE ABOVE POST AND ONLY THOSE CANDIDATES WHO STRICTLY SATISFY THE ABOVE REQUIREMENTS ARE ADVISED TO APPLY.

2. Applicants for the above post must remit with their applications a fee of Rs. 7.50 by cheque or bank draft on a **Scheduled Bank** payable at Bombay or by Postal Order. The application fee is in no case refundable.

3. Applications in the prescribed form, obtainable from the Reserve Bank's offices at Bombay, Calcutta, Kanpur, New Delhi, Nagpur, Madras, Bangalore, Lucknow, Trivandrum and Patna accompanied by copies **(originals should not be sent)** of **at least** two testimonials should be forwarded to the Secretary, Central Recruitment Board, Reserve Bank of India, Central Office, Post Box No. 406, Bombay No. 1 so as to reach him on or before the 12th November, 1960.

4. Candidates already in service will be required to produce a proper discharge certificate from their employers in the event of their being selected, at the time of their appointment in the Bank's service.

5. Selected candidates must be prepared to serve in any office of the Bank in India and to undertake tours when required.

6. Appointments will be subject to candidates being found medically fit for service in the Bank by the Bank's Medical Officer.

7. If any candidate desires to have his application acknowledged, he should send it by "Registered Post — Acknowledgment Due". Apart from those who may be specially called, interviews will not be granted to candidates, nor will the Bank enter into correspondence with them.

8. Canvassing will be regarded as a disqualification.

The Coatesville Declaration

By CROESUS

WHILST accepting the Ten-Point Declaration (otherwise known as the Coatesville Declaration) prepared by over fifty well-known corporation executives of the U.S., Mr. James Wadsworth, the U.S. representative to the U.N., expressed, at a meeting of the World Affairs Centre in New Work, the hope that "the Declaration would become known in the developing nations that recently became independent." I do not know whether Mr Wadsworth had India also at the back of his mind when he referred to "the developing nations that recently became independent." But, even if he intended to exclude India to respect the singularly sensitive susceptibilities of some of our countrymen, I am bound to invite attention to this Declaration of both the powers-that-be and the people at large of our country, because I feel convinced that, despite all the distortions that our leftist friends have sedulously spread, there are certain redeemable features of private enterprise that they cannot black out, try, however, much they may. It is because the Coatesville Declaration has highlighted these features that I was drawn to it.

It is a fairly common complaint one hears against private enterprise that inherent in this system is the tendency to keep up international tension so as to keep going the arms race and, therefore, arms production. But, as the Ten-Point Declaration makes it clear, the private enterprise system has made the U.S. "a true arsenal of democracy not merely with bombs and missiles, but with food for the hungry, aid for the needy, and spiritual inspiration for free men in the world over." Dedicated to a proper understanding of freedom, the document expresses the belief that needs to be shared by a very wide cross-section of the people of our country that "foes of freedom are formidable as long as freedom is not fully understood." If the foes of freedom are formidable, the task of making more and more people fully to understand freedom is no less formidable. For advocates of freedom (in any walk of life) are only too facilely dubbed as "reactionaries" or "vested interests" and, even when there is not the slightest shred of evidence to carry conviction, it is amazing how readily quite a large section of the public is prepared to accept these descriptions of even those whose 'bona-fides' cannot be qustioned. And this in spite of the clear warning of one of the greatest men of letters—"Credulity is a child's strength, but a man's weakness." Consistent—or is it persistent?—pleading is, therefore, necessary of the case of freedom, even as of free enterprise, to cultivate the requisite goodwill at least among those who love democracy (so many claim they love democracy that it is really difficult to make out who actually does it) so that we can look forward to an era of prosperity and freedom with equality of opportunity and social justice. Our people must not only understand freedom but also learn to associate that concept with freedom in as many spheres of life as possible. As Mr. Eugene Black, the World Bank President, once said, people must accept free enterprise "not as a necessary evil but as an affirmative good." In other words, or rather in the words of a well-known Indian business man, the conviction must grow that "free enterprise was born with man and shall survive as long as man survives."

There are certain basic freedoms, such as freedom of enterprise, which characterise the US economy and which may be said to be responsible for the description, "Arsenal of Democracy" that America has earned for herself. The Coatesville Declaration spells out the following ten basic freedoms:

1. Freedom of competitive private enterprise;
2. Freedom of choice of occupation;
3. Freedom of voluntary organisation for private enterprise;
4. Freedom of contract;
5. Freedom to own property;
6. Freedom to produce, buy or sell;
7. Freedom of competition;
8. Freedom to trade;
9. Freedom to make profits, and
10. Freedom of a sound currency dominated by economic, rather than political, forces.

Inasmuch as many of these freedoms have been enshrined in, and guaranteed to us under, our own constitution, we should not find it difficult to subscribe to the Coatesville Declaration at least in spirit. But then it presupposes a free understanding of freedom and a genuine love of democracy. These are essentially subjective traits and, as such, are difficult to assess accurately. But I suppose as approximately accurate an assessment as possible is within the region of possiblity, provided anyone of our steadily increasing number of research institutions takes a poll by sending out a list of these ten freedoms and calling for replies from as representative a sample as possible as to how many are for these freedoms and why, and how many are not for them and, again, why. Maybe I am over-simplifying the admittedly highly technical job of these institutes in the way I have posed the questions, but, needless to say, it is for the latter to formulate their questionnaire in their own inimitable way. In any case, I do hope the suggestion will be accepted.

Double Standards Again?

WHEN the Chairman of the Indian Cotton Mills' Federation suggested, early in September, at a press conference convened to explain the reduction in prices recommended by the Federation, that statutory effect must be given to these reductions, he must doubtless have had premonitions about some mills at least, especially those which are neither members of a regional millowners' association nor of the Federation, not falling in line. It is now feared that all the mills are not playing the game in so far as the reduction in cloth prices announced by the Federation is concerned. There are all sorts of rumours that some mills have not at all been toeing the line. It is alleged, for instance, that some Government-controlled mills are not observing the Federation's price formula. If this is so, it may be asked whether the authorities are not winking at the existence of double standards, one for mills managed by the Government, and another for mills managed by private 'entrepreneurs'. True, a categorical charge cannot be made yet, pending a scrutiny by the Price Committee of the Federation of the two proforma returns which have been asked for of all the mills. But the fact that not all the mills have yet submitted these returns could not have escaped the notice of the Textile Commissioner. If it has come to his notice, the public does not yet know of the action, if any, that he may have taken to pull up the defaulting mills. It could not also be that the authorities have not heard the rumours about some mills, which have not cared to furnish the returns, taking shelter under the excuse that the qualities of the cloth that are being produced by them were not in production in August, 1959 and deeming it fit to follow the "realisation multiplier" formula laid down by the old Tariff Board. While this may be applying the unction to their souls and salving their conscience, it is certainly not tantamount to playing cricket. There may be hard cases that would be adversely affected by the Federation's price formula. As a matter of fact, in a Press Note issued on September 3, and reiterated in a press handout on September 5, the Federation itself referred to the existence of units which had become financially weak due to the continuous crisis from 1957 and which were still making business sales in August, 1959. And, under the new price formula, such mills would again be making uneconomic sales. This means that it is open for such mills, whether managed by Government or by private 'entrepreneurs', to establish this unenviable experience of theirs by providing the information called for by the Federation (in proforma one and proforma two). But to ignore this and to take the law in their own hands, even if they are under Government management, is, to say the least, unfair to all concerned.

Business Notes

Foreign Trade

DEAL WITH RUSSIA

EVER SINCE the signing of the first Indo-Soviet Trade Agreement on December 2, 1953, the exchange of commodities between the two countries has been increasing with the result that today the Soviet Union is one of the five important countries trading with India. This week, while Mr. N. S. Potelivech, Soviet Minister for Foreign Trade, was here in the Capital, another deal was signed between the two countries. The deal, it is gathered, aims at the doubling of the present level of trade within the coming three years. With this end in view, certain new items are expected to enter the list of commodities for exchange. For instance, apart from the items already traded, fabricated materials like rolled steel products, other metal manufactures and woollen goods, would also be among the goods exported from India.

One significant feature of the Indo-Soviet trade is that the payments for any adverse balance have to be made in non-convertible rupees. Before November 1958, when the trade agreement which is now in currency, was signed, all outstanding balances of currency could be converted into sterling. But now it has been rendered non-convertible. The outstanding amount has to be carried over to the next trading period. Trade balance in the recent years has, therefore, shown positive improvement. In 1959, for instance, the balance of trade was heavily in India's favour. The exports stood around a level of Rs. 30.33 crores while imports were to the extent of Rs. 16.65 crores only. Among the important commodities for exports—apart from tea, which was the single most important item—were raw wool, raw and manufactured leather, tobacco, mica, jute manufactures and cotton textiles. Among the important commodities imported to India were: iron and steel products, newsprint, chemicals and fertilizers and agricultural implements. With the signing of the present deal, the level of trade is likely to rise much faster than in the past seven years.

Raw Cotton

EGYPT'S EXPORTS TO INDIA

INDIA IMPORTED 208,545 bales of Egyptian cotton in 1959-60, as against 56,740 bales in 1958-59, 68,137 bales in 1957-58 and 56,374 bales in 1956-57. In 1955-56, however, India had accounted for as much as 2,19,273 bales of Egyptian cotton, perhaps the highest ever intake by her. India has thus been, and continues to be, a very good customer of Egypt, accounting currently for some 12 to 15 per cent of the total exports of Egyptian cotton. Last season, her offtake was the fourth highest among all countries and the first among the free currency countries. Notwithstanding the remarkable progress achieved by Egypt in her exports of cotton to this country from the lowest levels touched in1956-57, it is significant that Egypt does not let go any opportunity to foster the Indian market. Thus, when Mr. Loutfy Mansour, a member of the Egyptian Parliament, came to attend the Inter-Parliamentary Conference in Tokyo, the Egyptian Government prevailed upon him (as he also happens to be a prominent cotton shipper) to visit India and meet as many of those as are interested in Egytian cotton and try to understand their complaints, if any, about Egyptian cotton, as also to give to them his ideas of cotton in general

The Egyptian Government could not have thought of a better cotton Ambassador than Mr. Mansour. Extremely well-informed and fully equipped with both Government and business experience, he has managed to make, or rather widen, his large circle of friends among cotton men. I do not know whether he heard any complaints about the Egyptian cotton from Indian importers—he himself mentioned, in fact, that there were very few or no complaints!—Mr. Mansour did a good deal of shop talk. He stressed the fact that India has been Egypt's very good market besides being a friendly country with which relations have been most cordial, especially since the Suez Episode. This is one of the main considerations, he said, for Egypt trying to increase the volume of trade between the two countries. Of course, he added, in view of the acute foreign exchange shortage, Egypt realised that India could purchase more from Egypt only if Egypt also purchased more from India. This the Egyptians very much appreciated, he said, and were doing their best to take or to import more from India.

While on this point, Mr. Mansour drew attention to the fact that the current season's import figures had been lagging behind, as they were late in selling, but he hoped this would be made up in the coming months. There is one other reason which Mr. Mansour gave why the UAR wants so much to increase the trade with India, namely the desire to increase trade with uncommitted countries.

TRADE WITH COMMUNIST COUNTRIES

This disclosure followed a question whether the Communist countries were not taking more Egyptian cotton today and whether some of such cotton was not being re-exported to Egypt's own traditional markets at a lower price than Egypts. There was no straight reply to this, but the special efforts that are being made by the Egyptian Government, to which Mr. Mansour alluded, namely, the insistence on certificate of marks by Egyptian consulates in the importing country, etc. are undoubtedly designed to counter this trend. Evidently, Egypt has learned from experience that trading with Communist countries is not altogether an unmixed blessing. Also the vehemence with which Mr. Mansour declared that they wanted to do away with official accounts, export accounts or special accounts and to stick to a uniform discount policy indicates the growing concern of Egypt over her cotton exports. Egypt seems to have found that the system of differential discounts has, instead of boosting Egyptian cotton exports, created complications in its wake. Hence it is that Mr. Mansour said the Egyptian Government was determined to do away with its discount policy by gradually reducing it. Already it has been reduced from 30 per cent to 6 per cent. Explaining the reasons for employing the discount system, Mr. Mansour said that the object was to bring the level of Egyptian prices to the international level, wherefore it is that the incidence of the discount goes to the importer's account; in other words, the importers get Egyptian cotton also at the same rates as comparable varieties of other growths in the world markets.

When asked about why India could not get Syrian cotton, although she would have taken it, Mr. Mansour's reply was that India came very late and the Syrian crop, being very small and also relatively cheaper had, in the meantime, already been absorbed by France, West Europe, and Spain, among others. France, incidently, always takes a lion's share of Syrian cotton.

Egypt's vigorous cotton export drive thus is understandable, because, even after allowing for all her own growing internal requirements—she has an up-to-date textile industry—Egypt would still be in a position to export a large quantity of her cotton. When the Aswan Dam is completed, it is said, Egypt hopes to raise 15 million 'Kantars' of cotton and an outlet for the bulk of this quantity must be by way of exports. The farsighted approach of Egypt to her cotton exports requires to be emulated, especially by the export interests and the authorities here who seem to take it for granted that nothing is needed to be done in respect of our traditional or established export items, a complacency which has already cost us some of these markets as, for instance, in tea.

New Issue

PREMIER FERTILIZERS

WITH THE new awakening which has made the farmers more productivity conscious, the demand for fertilizers has increased significantly. While this demand is bound to increase further, the present supply of fertilisers is not sufficient to meet the present demand. The project of the Premier Fertilizers Ltd. to establish a plant with an annual manufacturing capacity of 40,000 tons of superphosphates and 16,500 tons of sulphuric acid, is therefore, bound to be a successful proposition. The locale of the plant at Cuddalore in South Arcot District is quite appropriate because the adjoining areas are specially suited for the cultivation of paddy, sugarcane and groundnut, and the demand for fertilizers would be continuous. With this background, the new issue of Premier Fertilizers Ltd. is bound to receive a good response in the market.

Out of the total authorised capital of Rs. 1 crores, equity shares worth Rs. 50 lakhs are proposed to be issued now. Equity shares worth Rs. 12 lakhs have already been subscribed by the promotors, their friends and relatives. The ICICI too have agreed to subscribe to equity shares worth Rs. 3 lakhs. The balance of Rs. 35 lakhs (3.5 lakh equity shares of Rs. 10 each) have been proposed to be gathered from public subscription at par. The subscription list will open on Monday, November 7, 1960, and will close on November 14, 1960, or earlier at the discretion of the Directors but not earlier than 2-30 p.m. on Friday, November 11, 1960.

Agriculture

ERRONEOUS APPROACH

ALTHOUGH GOVERNMENTAL expenditures play an important role in stimulating economic growth, the Government of India must not overlook the greater importance of the decisions of private individuals to spend, save and invest. These individual or corporate decisions would be either encouraged or discouraged by a given Government policy. The Government's experimentation in re-distribution of land, for instance, has the psychological effect of discouraging the private sector from spending the sums earmarked for them of Rs. 800 crores in the Third Plan, according to Mr. M. H. Hasham Premji, President of the All-India Foodgrains Dealers' Association. It was not only land distribution that he was worried about but also distribution of foodgrains, especially distribution through the STC. In Mr. Premji's opinion, State Trading in foodgrains has resulted in gross mismanagement and colossal wastage and so, he warned, this could not be allowed to go on, particularly when the country was having meagre resources for its developmental plans. Instead, he suggested, that Government should bestow its attention on increasing agricultural production in the country by means of greater attention to animal husbandry and afforestation schemes.

Mr. Premji also pleaded for more attention to agricultural produce like cotton, jute and oilseeds, which are the main foreign exchange earners of our country. Agriculture should be given high priority in the Third Plan, he said, to prevent any lopsided economic development in the country.

FROM THE CAPITAL'S CORRIDORS

ON AGRICULTURAL DEVELOPMENT

PROBLEMS of agricultural development in the Third Five-Year Plan period have been engaging the attention of the Planning Commission and the Government of India during the past fortnight. The Planning Commission's Panel on Agriculture met here for two days last week under the chairmanship of Mr. Shriman Narayan and called for increased allocation of funds under the Third Plan for this primary industry. This, it felt, was necessary to achieve the ambitious targets of farm output envisaged under the Plan.

The Panel underlined the importance of ensuring adequate price incentives for agriculturists and keeping of the prices of consumer goods wanted by the farmers within bounds. It opined that provision of timely and adequate supply of credit to cultivators and making available to them improved seeds, fertilizers and farm implements should go a long way in stepping up output. The Panel also recommended the setting up of an expert committee to study the magnitude of the problem of soil erosion and to suggest ways and means of dealing with the problem.

About minor irrigation projects, the Panel suggested that the maximum possible allocation should be made for these in view of the urgency of increasing food production in the shortest possible time. It observed that tube-wells should not be put up by the States in areas where rainfall was heavy or where the sub-soil water level was high; in such areas, it said, open percolation wells fitted with Persian wheels or pumping sets would meet the needs of irrigation.

The Panel also called for special attention to be paid to measures for increasing the yield per acre of coarse grains. It was pointed out at the Panel's meeting that while the average yield had gone up in the past few years in the case of rice and maize, there had been no marked improvement in the yield per acre of other foodgrains.

TONING UP ADMINISTRATION

The concern expressed by Mr. Shriman Narayan in his presidential address on lack of enthusiasm on the part of the State Governments to implement the recommendations of the Nalagarh Committee to streamline their administrative set-up dealing with agriculture has had its echo in the Union Food and Agriculture Ministry. Mr. S. K. Patil, Food and Agriculture Minister, has addressed a circular to the States Chief Ministers appealing to them to personally intervene in the matter and ensure that the Committee's recommendations are implemented without delay.

How development of agriculture forms the pivot of all developmental activities in India is apparent from a pertinent observation made by Mr. Harris M. Benedict, Manager for Agricultural Research, Stanford Research Institute (U.S.A.), in an article he has written in a special number of the Institute on India in "Tomorrow's World" series. Mr. Benedict says, "Although India's ultimate agricultural potential is about two or two and one-half times its present production, achievement of this potential will require a more intensive education programme, development of much larger associated facilities and businesses, and an economic programme which can assure fair prices to the farmers. If these are not done, the present Indian food crisis will become steadily more acute, with ever-widening distress and the ultimate failure of India's entire development effort. This would inevitably lead to the displacement of the present system of Government by one which would attempt to solve the problem by totalitarian methods. India deserves better than that."

Mr. Benedict observes: "Despite an increase in total cultivated acreage, production of major food crops in India remained practically constant during the first half of this century. Cultivated land per capita decreased from 1.1 acres in 1920 to 0.84 acres in 1951, and daily consumption of food per capita declined from 18.9 ounces in 1901 to 14.7 ounces in 1945. By 1965-66, the end of the Third Five-Year Plan, at least 110 million tons of foodgrains will be required for a population of some 480 million people. If foodgrains production continues to increase at its present rate, only 80 million tons will be harvested, compared with about 70 million tons in 1958-59. Thus, instead of the needed 50 per cent increase in food supply, only a 15 per cent increase seems likely."

MR. BENEDICT'S SUGGESTIONS

What suggestions has Mr. Benedict to make about increasing agricultural output in this country? The following extracts from his article would be read with interest in this regard.

"The agricultural potential of any country is determined by the arable and grazing land and the use of that land to produce maximum yields under existing climatic conditions. Of the 806 million acres in India, almost half (372 million acres) are cultivable. Although another 150 million acres may be useful for grazing and 133 million acres are forested, the agricultural potential is primarily related to production from 372 million acres of arable land.....From 1950 to 1959, between five and six million acres of land were reclaimed for agricultural purposes—less than two per cent of the total cultivable land. Large tracts still may be reclaimed through development of irrigation systems and drainage, but the increase attainable is limited. The Government has to look to better yields from land already under cultivation to meet its food requirements."

"It is possible, in certain areas, to increase the amount of land actually producing crops in the acreage under cultivation. Land in India is generally split into small individually-owned plots, often smaller than an acre, separated by low dykes. While these dykes perhaps serve as irrigation aids, their elimination might increase the actual land for producing crops by 0.5 to 1 per cent if adjacent owners agree to grow the same crops or if the system of land tenure could be changed to provide more economically-sized units."

"Crops should be grown that allow the land to be idle for the shortest possible time. At present, more than one crop per year is grown on only about 12 per cent of the acreage, despite a climate generally favourable for year-round production. Not all of the acreage could produce two or more crops each year, but the amount could be doubled or tripled."

"Until many more Indian farm labourers have migrated to industrial centres, mechanization will be of little importance in increasing agricultural output. The availability of better hand and animal-drawn tools —namely, substitution of advanced design steel ploughs and harrows for traditional wooden ones—would, of course, be most beneficial."

"Production could be increased significantly by growing a particular crop in the part of the country to which it is best adapted. In areas best adapted to rice, rice should be grown exclusively; and in areas best adapted to potatoes, potatoes should be grown exclusively. While such practices would certainly increase the overall yield, adequate transportation facilities would have to be provided to ship crops to areas where they

are needed for diversification of diet. Custom and farmer preferences would also have to be overcome—a difficult task in India."

ANIMAL HUSBANDRY

"In India today, there are far too many animals. ....Some authorities estimate that at least one half of the cattle in India are surplus. If they could be eliminated, milk production per animal would be increased, the productivity of animal agriculture would be enhanced, and much valuable grain and forage now consumed by animals would be available for human food. While the total agricultural potential can be increased by carefully controlling the number of animals in relation to their productivity and food availability, more research is needed before quantitative estimates of the effect on agricultural production can be given."

"Adequate crop protection, including the control of plant diseases, insect pests, nematodes, predatory animals and various pests of cattle and sheep would result in considerable increases in overall yields. The extent to which pest control develops will depend on the availability of resistant strains of crops, and on the availability and cost of control chemicals. As the agricultural economy expands, the ability of the grower to purchase chemicals will also increase, but it is difficult to estimate its ultimate effect on Indian agricultural production."

"All these raw materials of agriculture must, of course, be used in conjunction with each other."

"Finally, no matter how much knowledge and facilities producers have, there must be an incentive to use these tools to capacity. Growers must have some assurance that they can dispose of crops at prices commensurate with production costs. Otherwise, there is a strong tendency to produce only enough for immediate needs."

Speculating on India's ultimate agricultural potential if all the available land were brought under cultivation, all that could be were irrigated, and the most suitable crops were grown under the best cultural practices, Mr Benedict observes: "A 25 per cent increase has been estimated from use of improved varieties, a 50 per cent increase from additional irrigation, and another 50 per cent increase from use of adequate fertilizers. While these are the major sources of improvement, we may add 10 per cent for other factors. If they are all compounded, each one acting on the other, an increase of over 200 per cent is obtained. This is probably an optimistic figure because all of the effects are not compounded, and many growers already use some of the suggested improvements. If individual increases are simply considered as additive, a more realistic increase of 135 per cent is indicated. At any rate, agricultural production of India can at least be doubled."

"Available data show that other countries in South-East and East Asia obtain double and more yields than are obtained in India. Some of this difference is caused by climate, and some by other factors that cannot be controlled, but at least double the present yield seems like a conservative estimate of India's agricultural potential."

"New varieties, new techniques, and new cultural practices are always being developed to increase yield or reduce unit production costs. Research could also increase India's potential above estimates based on presently known varieties and cultural practices. The amount is hard to estimate, because the problems become greater as agriculture is intensified. And a great deal of research is needed to maintain production at even present levels. If future knowledge can increase production by another 25 per cent, India's future potential agricultural production may well be 2.5 times its present production, or roughly 175 million tons."

THE HUMAN FACTOR AND TRANSPORT

"The real question," Mr. Benedict writes, "is: Will this potential ever be achieved? This, of course, depends on the individuals involved in agricultural production, processing, transportation, storage, and distribution. The most difficult problem is to educate the farmers to use the best varieties and cultural practices for their particular climate and soil. The tendency of Indian farmers to follow traditional practices is the greatest obstacle to the relatively rapid achievement of both the immediate goals and the actual full potential. Indian farmers, like those in other countries, are slow to adopt new methods and crops. Lack of adequate roads and transport, particularly during the rainy season, has built up an isolation that makes the work of extension agents doubly difficult. In fact, many agricultural economists believe that the first essential is not to provide more fertilizers and irrigation water, but to improve roads in order to make communication among groups easier, and markets more readily accessible."

"Along with production in excess of the immediate local needs, side businesses must develop. These involve processing plants, such as rice hulling, oil extraction, meat packing, and canning, preserving, and freezing of perishable crops. Then, tronsportation and storage facilities must be built to handle the increased supply."

INCOME-TAX PROCEDURE SIMPLIFIED

A simplified procedure has been drawn up by the Income-tax Department for dealing with the assessments of persons who derive small incomes from business sources. The procedure is intended to apply to persons who derived the whole or part of their income from business, other than speculation, in the past three years and were assessed thereon on amounts not exceeding Rs. 7,500.

The essence of the simplified procedure consists in doing away in the case of small assessees with the examination of accounts at the income-tax office. The Income-tax Officers will address letters to such assessees explaining the simplified procedure and inviting them to file balance-sheets, profit and loss accounts and trading accounts along with the returns of income. If the income shown by the assessee is found acceptable after a broad check of the statements enclosed and the details of the past assessments, the return will be accepted and a demand notice issued straightaway on the basis of the income declared. Even if the income declared is not found to be acceptable without modification, the assessee will not be called upon to attend the income-tax office with his books of accounts. A fair estimate will then be made of the income having in view all the relevant circumstances including the results of past assessments. This estimate will be communicated to the assessee and if it is accepted by him, a demand notice will be issued on the basis of the estimated income.

If the income and the tax proposed to be levied thereon as communicated by the Income-tax Officer are not acceptable to the assessee, it will, of course, be open to him to prove the income shown by him in the return with the aid of his books of accounts etc.

The idea underlying the simplified scheme is thus to cut short the time spent in the assessment of cases involving small incomes which produce very little revenue. The scheme will not apply to cases where losses are declared or where the income includes profits from speculation. The scheme is proposed to be given effect

to in November and assessees with small incomes, who have already filed their returns before November and whose assessments are still pending, will also be covered by it.

INDO - SOVIET TRADE

India's trade with Russia, it is expected, will increase by 100 per cent in the next three years. The Union Minister for Commerce and Industry, Mr. Lal Bahadur Shastri, exchanged on Monday letters with the Soviet Minister for Foreign Trade, Mr. N. S. Patolichev, covering trade plans for the remaining three years of the present Indo-Soviet Trade Agreement, signed in Moscow in November 1958.

Exports from India to the USSR during the next three years will cover both fabricated materials and agricultural products. Among the manufactures that can be exported are rolled steel products, metal manufactures for household purposes, handicrafts, leather footwear, coir goods and jute and woollen fabrics. Agricultural commodities that will be exported include tea, coffee, spices and tobacco. The USSR is also expected to purchase increasingly larger quantities of vegetable and essential oils, shellac, mica, and hides and skins (both tanned and semi-tanned varieties).

The Soviet Union will export to India non-ferrous metals, newsprint, tinplate, steel materials, oil products and machinery and equipment for the various metallurgical, power and construction projects.

India exported Rs. 30.4 crores worth of goods to the USSR last year. Imports from there amounted to Rs. 16.7 crores. During the first half of the current year India's exports to the Soviet Union were around Rs. 15 crores, against Rs. 5.4 crores worth of imports.

FOREIGN AID

The Union Ministry of Finance, it is learnt, has been holding a series of meetings to determine the projects to be financed with foreign aid. Almost all the aid-providing countries have asked the Government of India to indicate the project or projects which would be financed with their aid.

Indications are not wanting that the United Kingdom's contribution in the form of credit to be made available during the Third Plan period will be of the order of £125 million. Of this, a credit of £50 million has already been announced. This includes a credit of £20 million for the Durgapur project.

A three-man team of Swedish engineers is coming out to India shortly to study the possibilities of rendering technical assistance to this country. The team is from the well-known firm of Swedish consulting experts, S.G.O. The consulting services of this firm which should interest India include planning, supervision and inspection of industries like mining and metallurgy, pulp and paper, mechanical and chemical industries, etc. The firm also gives technical advice on matters like town planning, water supply, irrigation and sewage, construction of highways, railways, bridges, airports and harbours and setting up of power plants. Other activities of this firm cover provision of consultancy service in regard to architectural and structural designing of public buildings, schools and hospitals.

ITALIAN COLLABORATION WITH INDIAN FIRM

The well-known Italian firm Montecatini has offered its financial collaboration to a South Indian firm R. Venkataswamy Naidu to set up an aluminium factory near Mettur Dam. The factory will manufacture 7,000 tons of aluminium and 3,000 tons of aluminium alloy. Arrangements for this collaboration are nearing completion.

The foreign exchange element of the project is placed at Rs. 6 crores, including Rs. 3.5 crores for plant and equipment. Montecatinis, it is expected, will contribute Rs. one crore. The project is expected to go into production by 1962.

Montecatinis are no strangers to India. In 1957, they were entrusted with the task of setting up the Sindri fertilizers factory. In 1959, they were given another contract for putting up the Neyveli fertilizers plant. They are also collaborating with two Bombay firms engaged in the manufacture of dyestuffs.

SMALL CAR

The Government of India, in pursuance of its last month's Resolution on the Report of the Ad hoc Committee on the Automobiles Industry, has announced the personnel of the Committee constituted for advising it on the manufacture of a low-cost car in the public sector. Mr. G. Pande, former Chairman of the Railway Board and till recently Chairman of Hindustan Steel Ltd., will head this Committee. The other members of the Committee are: Mr. K. B. Lall, Additional Secretary, Ministry of Commerce and Industry; Mr. V. K. R. Menon, Director, International Labour Bureau; Mr. K. L. Ghei, Joint-Secretary, Ministry of Finance; Rear Admiral D. Shankar, Controller-General, Defence Production Organisation, Ministry of Defence, and Dr. B. D. Kalelkar, Senior Industrial Adviser, Ministry of Commerce and Industry. A full-time secretary will be appointed shortly.

The Committee will examine such models of small cars as it may consider prima facie feasible for production in India in the public sector and recommend to the Government such model or models which, in its opinion, could be manufactured within an ex-factory price around Rs. 5,000 on an annual production of 50,000 cars. The Committee will also give an estimate of the ex-factory price of such cars on an annual output of 20,000. The car so produced should, even at the beginning, have a sufficiently high indigenous content and should be made more or less wholly indigenous within a period not exceeding three years from the start of production.

The Committee's task also includes examination in detail of various other factors concerning the project such as quantum of investment involved, both in rupees and foreign exchange, and production costs. It will be free to explore, by discussion with relevant parties, the best possible terms and conditions that may be forthcoming for collaboration, foreign exchange credit and other technical, financial and organisational aspects of the project. The Committee has been asked to as well indicate the most suitable site or sites for the project.

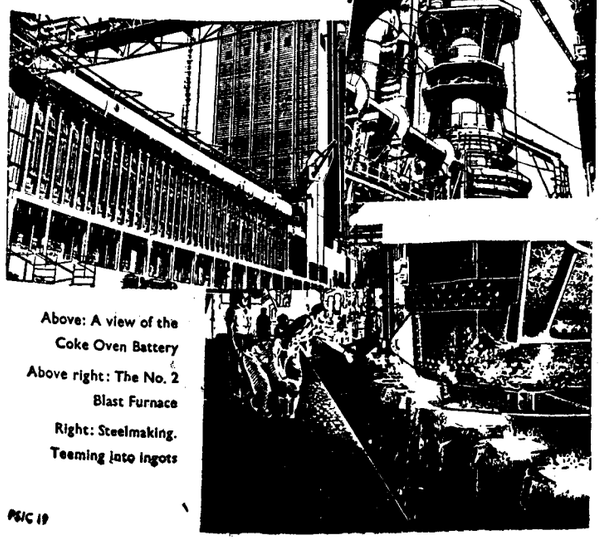
The Committee is required to submit its report within four months.

BRIEFS

The Railway Board has sanctioned the reconnaissance engineering and traffic surveys for a broad gauge railway link from Kathua to Jammu, covering a distance of about 100 miles. The surveys will be carried out by the Northern Railway Administration. The new railway line would facilitate expeditious movement of goods between the Jammu and Kashmir State and the rest of the country.

* *

The Pearl Cycle Industries Ltd., New Delhi, will be exporting 11,000 bicycles, valued at nearly Rs. 10 lakhs, to Egypt by the end of the current year.



* *

A simple and economic method of manufacturing diaminophenol sulphate, an important chemical used in photography and for dyeing hair and fur, has been developed at the Central Electro-Chemical Research Institute, Karaikudi.

COMBINED OPERATION

The know-how and equipment of British technicians and British Industry have combined with India's skill and labour to build an integrated Steelworks at Durgapur for the people of India.

COMPANY AFFAIRS

TATA IRON: A YEAR OF EXPANSION

Mr. J. R. D. Tata, Chairman Tata Iron and Steel Company Ltd. pointed out at the annual general meeting that the year to March 31, 1960 was of special significance to the company because it saw the completion of the biggest expansion programme ever undertaken in its long history and the introduction of an entirely new wage structure following three years of intensive studies and negotiations. About half of the company's plant is now wholly modern and the additional million tons capacity has been put up both in a reasonably short time and at relatively low cost. The Company has spent on it approximately Rs. 106 crores, and the total cost comes to Rs. 110 crores, including the cost of the modifications and additions. It is true, he added, that in 1955 when the project was first mooted and no detailed plans and specifications had been prepared or quotations obtained from manufacturers, the programme was estimated to cost roughly Rs. 80 crores. Later on, when the specifications were worked out and were approved by the World Bank, the cost was estimated around Rs. 95 crores. The actual excess comes to Rs. 15 crores of which about Rs. 6 crores represent increases in import duties on plant and equipment, manufaturers' escalations and increases in the initial provisioning of spare parts.

He was of the opinion that in spite of the difficulties which still exist, particularly in regard to the quality and regularity of supplies of raw materials, the company has already stabilised its production at a rate equivalent to about 80 per cent of full capacity.

In respect of the deterioration in the quality of coal and iron ore, which heavily strained the working of the company, he pointed out that to counteract the increase in the ash content of coke, which severely affects operation at the Blast Furnaces, the maximum use of washed coal is necessary. In the case of iron ore, the problem is the two-fold one of improving the quality of the ore despatched from the mines and of ensuring regular supplies of properly blended and sized ores to the plant. In order to achieve a complete and permanent solution of this problem, the company has taken in hand a programme aimed in short term at improving the performance of the ore crushing and screening plant.

During the year under review the capital of the company was increased by Rs. 8.39 crores from Rs. 30.86 crores to Rs. 39.25 crores by new capital issues. The balance of Rs. 3.69 crores in the second World Bank loan account was fully drawn during the year.

The company is awaiting Government's decision in respect of her claims for increases in retention prices. Unfortunately, Government's decision has still not been announced. There was an improvement in the working of the company mostly on account of an increased production and a consequent reduction in costs which, however, was largely absorbed by the higher charges of depreciation and interest and by the higher provision for plant rehabilitation and development rebate reserve. The dividend recommended by the Directors on Ordinory shares fulfils the assurance given to the shareholders last year that the dividends in respect of 1959-60 would be tax-free—the 30 per cent tax on dividends under the new scheme of taxation being borne by the Company. The dividend also carries out in full the assurance given to the shareholders in 1956 of maintaining a return of Rs. 10.50 on the old Ordinary shares while providing a fair return on the new Ordinary shares.

TATA CHEMICALS

The Directors have regretted that the operating profits of the Tata Chemicals Limited for the year to June 30, 1960 are lower than that of the previous year by about Rs. 15 lakhs (excluding from consideration the profit of Rs. 4.77 lakhs made in the previous year on the sale of assets), although revenue from sales was maintained at about last year's figure. The year's profits were affected by (i) the inevitable interference with the production of existing units by plants under construction, reduced operations and lower efficiencies arising from the trials and commissioning of new units under the expansion programme. (ii) the reduction of Rs. 10 per ton in the price of soda ash for the full year as against four months in the previous year and a reduction of Rs. 30 per ton in the price of caustic soda from October 1959 following the recommendations of the Tariff Commission, (iii) the higher cost of salt due to lower production, (iv) higher interest charges and (v) the increased dearness allowances to workers and staff from December last.

The Directors have decided to pay a dividend of 60 nP per ordinary share subject to deduction of tax. On preference shares the directors have decided to pay 5 per cent tax-free dividends after making an addition of 25 per cent to the stipulated dividend of 5 per cent and a deduction of tax at the rate of 30 per cent which will be paid over to the tax authorities. The net amount paid to the preference share holders will be Rs. 4.375 per share against Rs. 5 per share last year.

COMMODITY NEWS AND NOTES

IMPORT OF COTTON UNDER P.L.480.

The Textile Commissioner to the Government of India had allocated 2,75,000 bales of P.L.480 cotton stapling 1" and below but not less than 13/16" as announced in the Trade Notice issued on September 5, 1960. The allottee mills were requested to import this cotton within the time limit specified. As evidence of their agreement to import, they were requested to send to the Textile Commissioner's Office copies of the letters of guarantee sent by them to the Joint Chief Controller of Imports and Exports, Bombay. Many mills have not sent the guarantees although the time limit for the guarantee expired on the ninth of this month.

ALLOTMENT OF IRON AND STEEL

In view of the anticipated increases in indigenous production of steel in the coming months, Government have decided that the existing procedure for acquisition and distribution of steel should be further liberalised. It has accordingly been decided that the issue of quota certificates for the purpose of placing indents on Iron and Steel Controller will be dispensed with for actual users, registered stockists and controlled stockists, for the following categories with effect from October 1, 1960:

i) Blooms and billets (other than re-rollable billets).
ii) Tested and untested bars.
iii) Rods.
iv) Heavy structurals.
v) Light structurals.
vi) Heavy rails.
vii) Light rails.
viii) Second class rails.
ix) Plates.
x) Black sheets and hot rolled strips of 14 gauge and thicker.
xi) Spring steel.
xii) Hoops and strips.
xiii) Sleepers.
xiv) Fishplates.

For the above items, indents can be placed by all concerned on the Iron and Steel Controller to the full extent of their requirements for six months. Care should be taken to see that only actual requirements for the half year period are indented for. It would be the endeavour of the Iron and Steel Controller to plan the indents on the producers to the full extent possible

However, to enable the Iron and Steel Controller to exercise scrutiny on the reasonableness of the quantities indented for, it has been decided that actual users should, in their indents, furnish the following particulars:

i) The quantity and categories of steel outstanding on 1-10-1960;
ii) The categories and quantities, for which quota certificates had been issued to the indentor in the previous two half years; and
iii) The purpose for which the steel, in question, is required for October, 1960 — March 1961 period.

EXPORT OF GROUNDNUT OIL AND SALAD OIL

The Union Ministry of Commerce and Industry recently announced a scheme for facilitating larger exports of groundnut oil and salad oil. Under the scheme, for every ton of groundnut oil exported, 3½ tons of groundnut expeller cake would also be allowed to be exported. For every ton of salad oil exported, 4 tons of groundnut expeller cake would be permitted to be exported. Import of copra and palm oil would be allowed against the exports. A Trade Notice issued recently says that tenders for exporting groundnut oil and salad oil should be forwarded to Mr. M. P. Mathur, Director of Export Promotion, Ministry of Commerce and Industry, New Delhi by name before the end of this month. Tenders should indicate the quantity of groundnut oil or salad oil which the party would undertake to export on firm basis during the period ending January 31, 1961, the minimum quantity of copra and and palm oil sought to be imported against these exports, the countries to which exports would be made and the ports from which shipments would be effected. Export permits in respect of groundnut oil and salad oil would be granted immediately to those whose tenders are accepted. The export quota of groundnut expeller cake and the import quota for copra and palm oil would be granted on the production of documents proving the export of groundnut oil or salad oil.

INTENSIFYING SEARCH FOR BASE METALS

Detailed geological mapping and investigations by drilling has been taken up by the Geological Survey of India in important copper, lead and zinc districts of the country including Khetri, Daribo, Partapgarh and Zawar in Rajasthan and Singhbhum in Bihar. A Base Metal Unit has also been formed in the Geological Survey of India in early 1959 for intensifying the efforts. The exploratory work for proving copper deposits in Daribo and Khetri was started by the Indian Bureau of Mines in March and April 1957, respectively, and the exploratory work was still continuing. The Bureau has proved 28.4 million metric tons of copper ore with an average of 0.8 per cent metal content. Another area for copper ore has been taken up at Gani in Andhra Pradesh this year where the work is continuing.

The Bureau of Mines has further proved nearly 6 lakh metric tons of copper, lead and zinc ores in Bhotang mines, Sikkim, having an average of 6.9 per cent of total metal content. The Sikkim Mining Corporation has already been set up to exploit and smelt the ores of Bhotang mines. Detailed prospecting work in Pachekhani and Dikchu mines for copper, lead and zinc ores has also been taken up by the Bureau.

S. N. K. SUNDARAM, Managing Director.

This is only an announcement and not a prospectus and applications are invited on the basis of the prospectus, copies of which are available from the Company's Registered Office, the bankers, the underwriters and the brokers mentioned hereunder.

A copy of the Prospectus having attached thereto the documents referred to hereafter has been duly delivered for registration to the Registrar of Companies, Madras, as required under Section 60 of the Companies Act, 1956.

Consent of the Central Government has been obtained to this issue by an order of which a complete copy is open to public inspection at the Registered Office of the Company. It must be distinctly understood that in giving this consent the Central Government do not take any responsibility for the financial soundness of any scheme or for the correctness of any of the statements made or opinions expressed with regard to them.

A licence has been obtained from the Central Government for the establishment of this industrial undertaking of which a copy is open to public inspection at the Registered Office of the Company. It must be distinctly understood that in granting this licence, the Government of India do not take any responsibility for the correctness of any of the statements made or opinions expressed in regard to it.

The Madras Stock Exchange has agreed to grant an official quotation for the shares of the company, and permission to deal in them on the company complying with the necessary formalities after closure of the subscription list.

The subscription list will open at 10 a.m. on Monday, November 7, 1960 and will close at 2-30 p.m. on Monday, November 14, 1960 or earlier at the discretion of the Directors but not earlier than 2-30 p.m. on Friday, November 11, 1960.

PREMIER FERTILISERS LIMITED

(Incorporated under the Companies Act 1956)

SHARE CAPITAL

AUTHORISED CAPITAL:	**Rs.**
2,50,000 — 9% Taxable Cumulative Preference shares of Rs. 10 each	25,00,000

CONSENTS

The consents in writing of the bankers, brokers, legal adviser and auditors of the Company to act in their respective capacities have been obtained and have been filed with the Registrar of Companies, Madras, and have not been withdrawn.

OBJECTS

The Company was incorporated on 31-3-1960 with the objects mentioned in the Memorandum of Association. The main object is to manufacture superphosphate and other chemical fertilisers.

PROSPECTS

The supply of superphosphate is very much below our country's demand being only about 10 per cent. Before the end of the Third Plan period, our requirements will be approximately 10 lakh tons. According to certain statistics, for Madras State alone, the requirement is 5 lakh tons. With the new awakening amongst farmers, the demand for superphosphate will be in excess of supply and the prospects for the Company are, therefore, bright. As the factory is being located at Cuddalore in South Arcot District, where paddy, sugarcane and groundnut are grown, the demand for superphosphate fertiliser will be continuous. Further, the demand from Tanjore district which is very near from the factory site is also very high. Therefore, the manufactured goods will easily find a sale.

PROJECT

The Company has been granted a licence by the Government of India under the Industries (Development and Regulation) Act, 1951, for the establishment of a fertiliser plant in the State of Madras, with a manufacturing capacity of 40,000 tons of superphosphate per annum and 16,500 tons of sulphuric acid per annum.

LOCATION OF THE FACTORY

A site in the vicinity of Cuddalore O.T. Railway station in the State of Madras has been purchased for the factory, and the price for the same has been advanced by the promoters who are entitled to be reimbursed.

RAW MATERIALS

Raw materials like sulphur and rock phosphate, etc., have to be imported from abroad and hence location of the factory near a port will be advantageous. In the Third Five-Year Plan, greater emphasis has been laid on the increase of foodgrains and consequently systematic use of chemical fertilisers is advocated. There will therefore be no difficulty in getting the requisite raw materials from abroad under the actual users' import licences.

SITE

A plot of approximately 20 acres of land near the Cuddalore port has been purchased from Mr. Mohammad Ismail Maracair, Sonegar Street, Cuddalore Old Town, Cuddalore Taluk, South Arcot District, for a total cash price of Rs. 38,479 including stamp duty, registration charges etc. It is an absolute sale of free hold property in favour of the Company.

WATER SUPPLY

Water for the factory will be taken from the bore wells that have been sunk in the factory site. The site being on the coast and in an area where the water table is high, the factory will get sufficient water for its purposes.

ELECTRICITY

We do not anticipate any difficulty in getting the requisite electric power for the factory inasmuch as the power requirement itself is not very high and the Government of Madras have also given the necessary assurance for providing the required power, subject to prevailing grid conditions.

TRANSPORT FACILITIES

Cuddalore being a sea port, it is an additional advantage for the transportation of raw materials, etc., by sea route. The site being in close proximity to Cuddalore O.T. Railway junction on the Southern Railway, suitable rail transport facilities are available. In addition, suitable road transport facilities also are available, giving easy connection with other important commercial towns. The manufactured goods can, therefore, be moved easily by road or by rail to any place.

PLANT AND MACHINERY

Messrs. Chemiebau Dr. A. Zieren G.M.B.H., Koln Am Rhein, West Germany, have offered to supply all the necessary plants for sulphuric acid and superphosphate and they will be responsible for the erection and bringing into operation of the factory and the training of Company's personnel. They are well known in India and have supplied acid plants to various concerns in India which have been found very satisfactory in working. The items of machinery and equipment of indigenous origin are reserved to be procured in India.

IMPORT LICENCE

The Company has obtained an Import Licence No. CCP. 998245/60HQ/CG. dated September 23, 1960, from the Chief Controller of Imports & Exports, Government of India, New Delhi, for the import of the above plant and machinery.

FOREIGN EXCHANGE

The Industrial Credit and Investment Corporation of India Limited, Bombay, have agreed in principle to lend to the Company an amount in foreign currencies equivalent to U.S. $235,600 (approximately Rs. 11 lakhs) to pay for the cost of the imported machinery and capital equipment for the proposed factory, subject to the approval of the International Bank for Reconstruction and Development. The loan will be repayable in half-yearly instalments extending over a period of 7 years. The interest payable on this loan will be 7¾% per annum, with a commitment charge of 1% per annum on the amount of the loan undrawn from time to time. In addition, an amount equal to a quarter of one per cent of the total amount of the loan sanctioned shall be payable as an examination fee.

The loan will be secured by a first mortgage of all the existing and future moveable and immoveable properties of the company and a floating charge on other assets subject to the hypothecation to secure bank borrowings for working capital.

CAPITAL OUTLAY AND MINIMUM SUBSCRIPTION

In respect of the public issue under this Prospectus, the minimum subscription on which the Directors will proceed to allotment is Rs. 20 lakhs being 2 lakhs of Equity shares of Rs. 10 each.

The capital required to reach the stage of production is estimated as follows:

	Rs. (in lakhs)
Land and Buildings ..	9.50
Machinery and equipment including freight, insurance and erection charges	26.50
Preliminary expenses including underwriting commission and brokerage ..	2.50
Working capital	25.00
	63.50

This amount is proposed to be met as follows:

Equity share capital from the promoters and their friends, and I.C.I.C.I.	15.00
Equity share capital to be raised by this issue	35.00
Foreign exchange loan from I.C.I.C.I.	11.00
To be raised from bankers and other sources as and when required ..	2.50
	63.50

ESTIMATE OF PROFITS

The fertiliser industry in India has shown a reasonably high potentiality for profit earning. The proposed super-phosphate factory will be equipped with up-to-date plant and machinery incorporating the latest methods of fertiliser production which also effects substantial savings in cost of production. The Company, therefore, has reasonable scope for earning profits, and the Directors feel that the operation of the factory will yield a satisfactory return on the capital invested.

COMMENCEMENT OF BUSINESS

The Company has obtained a Certificate of Commencement of Business, dated 7-9-1960, from the Registrar of Companies, Madras, after filing the Statement in lieu of prospectus. The report of the auditors under Section 56 of the Companies Act and Schedule 11 is set out below and they have given their consent to the issue of the Prospectus with the Statement included in the form and context in which it is included. They have not withdrawn such consent before delivery of the copy of the Prospectus for registration.

DIRECTORS

The Articles of the Company provide that the number of Directors shall be not less than three, and until otherwise determined by a General Meeting, not more than nine excluding any director nominated by Government or financing institutions.

The qualification of a Director other than ex-officio Director and the Directors nominated by Government or any financing institutions, shall be his holding of shares in the capital of the Company of the face value of Rs. 5,000.

The Articles provide that the remuneration of each of the Directors including the ex-officio Directors and the Directors nominated by Government or any financing institutions shall be such sum not exceeding Rs. 100 as may be decided upon by the Board of Directors from time to time for every meeting of the Board or Committee attended by him.

The Articles also provide that the Company allow or pay to any director, such sum as the Directors may consider fair compensation for his expenses in connection with his attending the meeting, in addition to his remuneration.

APPOINTMENT OF DIRECTOR BY THE INDUSTRIAL CREDIT AND INVESTMENT CORPORATION OF INDIA LIMITED, BOMBAY

The Industrial Credit and Investment Corporation of India Limited, Bombay, have, as one of the terms of their giving a loan of requisite foreign exchange for the Company, the right to appoint, if they so desire and deem it necessary, an ex-officio Director to the Board, who shall not be liable to retirement and shall not be required to hold qualification shares.

MANAGEMENT AND CONTROL

It is proposed to appoint Messrs. Emcete & Sons Private Limited, 30, Coral Merchant Street, Madras-1, as Managing Agents for 15 years and an application for the approval of the said appointment and the terms of the Managing Agency, has been made to the Government of India. According to the said draft terms, the Managing Agents will be paid by way of remuneration a commission on the net profits of the Company at the following rates:

10% on the first Rs. 10 lakhs or fraction thereof
9% „ next „ 10 „ „
8% „ „ „ 10 „ „
7% „ „ „ 10 „ „
6% „ „ „ 10 „ „
5½% „ „ „ 25 „ „
5% „ „ „ 25 „ „
4% on any sum over one crore of rupees.

In the event of inadequacy or absence of profits, the Managing Agents will be paid a minimum remuneration of Rs. 50,000 per annum. The expression "net profits" shall have the same meaning as defined under Sections 349 and 350 of the Companies Act, 1956.

The Subscribed Capital of Messrs. Emcote & Sons Private Limited is Rs. 5,00,000.

The Managing Agents shall be entitled to appoint to the Board two directors or one director as the case may be according as the total number of directors is more than five or less than five, and such nominated directors shall not be liable to retire in rotation.

Subject to the Government's approval of the said appointment, the control and management of the business of the Company shall vest in the Managing Agents who will exercise all such powers of the Company required to be exercised by them as per the provisions of the Companies Act.

OPTION OR PREFERENTIAL RIGHTS TO SUBSCRIBE

No contract or arrangement has been entered into or is proposed to be entered into by the Company whereby any option or preferential right of any kind has been given or is proposed to be given to any person to subscribe for any shares, except the firm allotment to the extent of 50% of the underwriting of each of the brokers the allotment to the promoters and their friends and to the Industrial Credit and Investment Corporation of India Ltd., Bombay, for the amount subscribed by them mentioned supra.

UNDERWRITING AGREEMENTS

The Company has entered into agreements with the following bankers and brokers according to which they have agreed to underwrite Equity shares of the face value set respectively against their names:

Name	Amount Rs. (in lakhs)
The Indian Overseas Bank Ltd., Madras	10
The Bank of Baroda Ltd., Bombay	10
Messrs. Somayajulu & Company, Madras	5
„ R. R. Nabar & Company, Bombay	5
„ P. R. Subramanyam, Bombay)	
„ Maconochie & Co., Madras and)	Jointly 5
„ G. M. Pyne, Calcutta)	
Total ..	35

In the opinion of the Directors, the resources of the said Underwriters are sufficient to discharge their respective underwriting obligations.

The Underwriters are entitled to an underwriting commission of 2½% of the face value of the shares respectively underwritten by them exclusive of brokerage hereinafter mentioned.

Subject to clause 10 of the Articles of Association of the Company, brokerage at the rate of 1% will be paid on all allotments made in respect of applications bearing the stamp of a Bank or a recognised broker. Brokerage on the same basis is payable to underwriters in addition to the underwriting commission, on allotments in respect of applications made or procured by them and bearing their respective rubber stamps.

STATUTORY AND GENERAL INFORMATION

PRELIMINARY EXPENSES:

The total preliminary expenses are estimated to be Rs. 2,50,000 which is inclusive of all the expenses of this issue, brokerage and the underwriters' commission. The amount will be advanced by the promoters in the first instance and they are entitled to be reimbursed by the Company.

Save as provided above no amount or benefit has been paid or given or is intended to be paid or given to any promoter or officer of the Company.

APPLICATION FOR SHARES AND ALLOTMENT

Application for Equity shares must be for a minimum of 50 shares. All applications should be made on the form attached to the Prospectus copies of which can be had from the Registered Office of the Company, the Company's Underwriters, Bankers and Brokers.

The application forms duly completed together with cheques or drafts for the full amount of Rs. 5 per share payable on application must be delivered before the closing of the subscription list to the Company at their Registered Office or to any of the Company's bankers, underwriters, or brokers.

Remittances should be made by cheques or drafts drawn on any Bank situated in Madras, Bombay, or Calcutta. Cheques or drafts on other stations must include bank charges at 25 nP. per cent subject to a minimum of 62 nP. per cheque or draft; otherwise, the application is liable to be rejected.

Cheques and drafts should be made payable to PREMIER FERTILISERS LIMITED or to one of the Company's bankers—marked "Account PREMIER FERTILISERS LIMITED" and should be crossed. A separate cheque or draft must accompany each application form.

Allotment will be notified by the despatch of Allotment Letter but the Directors resere the full uncontrolled right of accepting or rejecting any application in whole or in part in either case without assigning any reason. Where an application is rejected or not accepted in full, the whole or any balance of the application money received will be refunded to the applicant by cheque on the Company's bankers at Madras within two months of the date of opening of the list. No interest will be paid by the Company. No allotment will be made in the names of Partnership firms, minors, non-residents or their nominees or Trusts. The shares when issued will be subject to the Memorandum and Articles of Association of the Company.

The Great Dilemma

THE disturbing decline over the last fortnight in the prices of Government securities is a symbol of a deep-seated disorder the significance of which has made bankers at least furiously to think. It is widely stated at Calcutta, Bombay and Madras that the fall in prices of about 3 per cent for most scrips in a fortnight is not by any means a full measure of the real disorder. If the greater portion of the selling orders were executed, there would be a far deeper inroad into prices. The Reserve Bank of India is not entering the market on any scale and the Life Insurance Corporation and some banks have studiously avoided selling. If, however, it should happen that the banks desired to put themselves in a more liquid position by sale of securities, a pretty crisis will be initiated. Feverish questions are being asked as to how securities, which have been over-subscribed as recently as in August, should now have suddenly lost their hold on both institutional and private holders.

Two explanations are being given. The first explanation is that with a rise of interest rates in the banks, the attractions of holding Government securities have become very small. There is, indeed, no dearth of money as applications for new issues reveal, but the rate of interest on Government scrip of 4 per cent subject to tax does not, at the present time, measure against other possibilities, particularly of capital gains in equity or in the average dividend on primary shares. But this has always been so; why had it to wait till October 1960 to exhibit itself. The second argument is that there has been a basic change in investors' view of the future. Institutional investors have been held down by Reserve Bank pressure and the Life Insurance Corporation to hold the securities, but with a 4 per cent taxable return they are now being deemed increasingly onerous as elements in the investment. For many years pressures of these kinds have been successfully made so that intrinsic confidence in gilt-edgeds could be maintained. If it cannot be maintained now, is this because institutional, as well as ordinary, investors are fearful of the ravages of inflation? If so, again how has this decline of confidence suddenly arrived?

The banks, it is rumoured, have already taken counsel and are presenting memoranda both to the Ministry of Finance and the Reserve Bank of India on the withdrawal of the rules of deposits initiated in March as an anti-inflationary measure. There is some justification for the banks to complain against the impounding of resources in this manner at a low rate of interest when they can earn on advances between 2 and 3 per cent more. The great majority of these advances are consistent with the Reserve Bank's directions and may, indeed, assist disinflation such, for example, as the utilisation of existing capacity in a manner which might produce more consumer goods. To the extent — and this is a very large extent — that production is the main answer to an inflationary situation, the banks can argue that when monetary resources are impounded, the loss of production more than offsets the reduction in money supply and, therefore, net result might be inflationary. Assuming that the banks' advances are directed into productive channels, there is much force to be attached to the view that at the outset of the busy season, the Reserve Bank of India should relax its orders on the impounding of deposits. Deposits themselves have shown an unfortunate tendency to level off in the last two months. But whether they do or whether they do not, advances cannot be held back in a developing economy. Disinflation and development are difficult to ride in double harness.

It would be foolish, however, to suppose that the mere withdrawal of the order of impounding of deposits will solve the major problem in regard to the unattractiveness of Government securities. And why have, if impounding is the cause, the evil effects come only now? Again, what about the Government resources? The mere release of bank money is no answer to the public sector's ways and means problem at the beginning of the Third Plan. Those who suggest, therefore, that all that the Government has to do is to establish the *status-quo ante* — ignoring the heart of the problem which is that the confidence in the securities market has somehow been shaken — do not solve the problem. They want fewer monetary controls, but no price rises. Almost everyone, at the present time, wishes to have it both ways. The bankers wish to have a larger Plan, but do not desire that the securities market should be an obligation on their funds for which they can find more profitable employment elsewhere. Surely, this argument applies even more to private persons or to smaller corporations which have need for both liquidity and caution in husbanding much smaller resources. If the banks are not to hold a substantial volume of Government securities, how is the capital target of the Plan to be fulfilled? If the demand for money is greater than its supply, is not the classic remedy of a rise of interest rates inevitable? Is there a rate of interest short of 5 per cent at which confidence in long-term accounting can be revived? If the rate is to be at 5 per cent, what will happen to the capital values of the current scrips? If cheap money is to be the order of the day, it can only feed the price

level, on which experience in this year has been none-too-happy. A major remedy is increased foreign aid if it is available. But if it is not available, how can we escape the dilemma of a development programme based on cheap money and the dilemma of avoiding inflation with the cheap money thus created?

The Eastern Economist has supported a disinflationary policy on the part of the Reserve Bank of India and it cannot maintain the view that this policy should be summarily reversed. Obviously, something must be done. While the Reserve Bank is making up its mind on the volume of money which can properly be injected into the system with a constant price level, Government's non-development expenditure must be cut to the bone. It is perfectly clear that the source of inflation is excessive expenditure, and, if it cannot be financed without a further rise in prices, as is becoming increasingly evident, it may even be the Plan which needs to be pruned. At the present time, the Reserve Bank of India must lend its support to the capital market in moderation to see if its intervention can stave off the immediate loss of confidence in Government paper. Thereafter, if it should fail, both the Plan and interest rates will need revision.

People's Participation in State-Owned Corporations

PEOPLE'S participation in the share capital of government-owned industries is the real subject-matter of the report recently prepared by a Study Group appointed by the Planning Commission in this behalf. The Study Group leaves no doubt that it is the *general public*, in contradiction to the *investing public*, which it has in mind as the permissible candidate for participation in the capital of State enterprises. This is not because there are any prejudices against the investing public as such, but because the Study Group is anxious to see that traditional investment is attracted to augment the total investment pool of the economy.

The Study Group, presided over by Mr. D. L. Mazumdar, Secretary, Department of Company Law Administration, and manned by three other high-ranking officials, has produced a valuable document. The type of investment policy which should be followed in permitting people's participation is in fact the hard core of its recommendations. It has approached this core in an objective manner. It has started with the premise that public participation would be meaningless and defeat the very purpose of the contemplated change, if it amounts to diversion of the present investment capital to State enterprises. Such diversion will dislocate the existing pattern of investment capital and create unwarranted problems for the public as well as private sectors. Private issues of shares or debentures and Government securities will be the victims of diversion.

The report mentions the fact that dormant sources of surplus funds exist in the organised as well as unorganised sectors of the economy and their investment potential cannot be ignored now that there will be an increasing pressure on rupee resources in our successive five-year plans. The Study Group maintains that a new, though relatively small, class of operators is springing up in the capital market and it is primarily this class whose services should be requisitioned for tapping the dormant resources of funds rather than the services of the established share-brokers or underwriters. So far the argument of the Study Group can be readily appreciated. But precisely what these dormant sources of investment capital are and what is the class of emergent operators has not been elaborated. In the result, the force of the argument is considerably weakened. Legal safeguards are proposed to ensure that holders of shares are not merely ostensible but beneficial and ownership vests in them in their own right. Small denominations of shares are suggested to place subscription within their reach. But Rs. 100 per share is by no test a small denomination and it could well be scaled down to Rs. 25. Post-allotment transfers raise the issue how far it would be feasible to restrict ownership to the new class.

Easy marketability is of the very essence of equity capital. But the restrictions proposed are likely to impede it. A divergent view expressed in the report urges that such limitations would be harmful to the very purpose of the scheme and there should be no rigid regulation of post-allotment transfers. This crucial issue has been left undecided by the Study Group. But it is clear where the balance of advantage lies. It should be enough that initial investment comes from an additional source.

The Study Group is fully aware of the fact that once State enterprises enter the capital market, they will need to face other claimants there. It has, therefore, emphasized that the pattern of the yield on investment in State undertakings should be sufficiently appealing. This raises two questions. In the first place, the profit-earning capacity of State undertakings must be raised to a sufficiently high level. Second, the policy of distribution of profits will have to take care of adequate return to the investor. These factors will require a proper readjustment of the policy of public sector enterprises on retention of profits for plough-back where they are earned. The average profits of public enterprises before tax according to a recent official estimate are 2.77 per cent only. Not many public enterprises can qualify for people's participation on the score of profitability and hence it is that three undertakings with a demonstrably good profit-earning capacity have been named for the experiment—Sindri Fertilizers, Hindustan Machine Tools and State Road Transport Services.

Altogether, the recommendations of the Study Group aim at injecting a new element of dynamism in the public sector and indirectly in the capital market. Part of the capital of the existing State enterprises will be released for employment in other public ventures. One purpose at least has been served by the report, although the necessity of further threadbare examination of the subject is indicated. It is that the role of profits and the need for following an attractive policy on dividend distribution have been put in their correct perspective. The expanding public sector of industry will have to justify its position by its profit-earning capacity and lean on partial participation of the public in its capital structure. On this one can well pardon an investor accustomed to 7 per cent tax-free if he entertains the greatest scepticism.

Guest Editorial

Imperatives of Co-operative Form

By **PUPUL JAYAKAR**

WITH the greatly widened scope of the co-operative sector and the increasing demands being made on co-operative organisations for the implementation of development schemes within the agricultural small scale and cottage industries sector, it is of importance to re-examine the nature and functions of a co-operative unit and to free it from the cloud of generalisations which today unfortunately obscure its structure and so render its functions and operations ineffectual.

One of the greatest difficulties of implementation of programmes within the cottage sector has been lack of precision in presenting the problem which, in turn, has inevitably led to lack of precision both in structure and application. A study of the manner in which schemes are conceived, formulated, budgeted, functions determined, staff appointed, and actual production processes set into operation within any development programme of the cottage small sector will bring to light the discrepancies between the scheme as conceived and the problems of the unit for which it is intended to operate. This leads to some schemes never coming into operation and others operating with a minimum of efficiency, with an inevitable wastage of resources.

The approach, therefore, needs to be from the root upwards, from problem and need to function towards ideology. Ideology, if it has to emerge, has to be a projection of need and the necessary solutions of that need.

In India co-operative ideology has been invariably applied to economic situations where there is no involvement of the persons interested in co-operative principles but rather the application of co-operative principles to individuals and groups involved in occupations that are marginal in character and who need joint or co-operative organisation to improve earning capacities. The involvement of the member of the co-operative society is not therefore in co-operative principles but in an added efficiency which will bring about higher earnings. A clear comprehension of this is necessary in order to determine the functions necessary to make a co-operative unit succeed. It is of importance to remember that it is not co-operation that succeeds or fails but a small industrial unit that either succeeds or fails.

Seen in perspective, a co-operative structure appears essential in a democratic de-centralised economy where the rural worker, industrial or agricultural, with his meagre resources and marginal living is unable to sustain a crisis in the production pattern. It also appears the only structure through which added efficiency can be introduced into the operational field of rural industry. But co-operative structure is only the framework, the corporate legal entity to house certain essential functions.

An undue emphasis, however, on co-operative ideology and the vagueness of approach as to what is meant by co-operative principles, have divorced it in India from the reality of the situation, which is that the co-operative unit as it is developing in India, is essentially a business unit with the main objective of production, making profit and marketing. In that sense the unit demands the same detailed scrutiny and planning as is given to a unit of large-scale industry.

The problem is, therefore, one of credit, raw material, planning of production processes, technical 'know-how', and efficient marketing. It is essentially a problem of business management, the gearing together of essential functions, in a sense the oiling of the rural industrial machine. The urgent problem of credit and the vital necessity of gearing credit to rural production has been widely understood and is receiving careful and detailed consideration. But in the other equally important aspects of the problem, the situation is more confused and little attention has been paid to vital elements of production and operation.

One of the weakest cells in the existing pattern of co-operative functioning has been the absence of the business or the managerial element. Co-operative structure has eliminated a key function in the pattern of rural production, that of the entrepreneur who supplied the initiative and managerial talent. No substitute has been found for this function, and this has inevitably led to a sapping of vitality and initiative in the industrial co-operative sector.

A change in the pattern of producer-consumer relationships and an increasingly complex pattern of rural distribution has only made the problem of finding initiative and business 'know-how' more acute.

It is of utmost importance, therefore, that fresh initiative be introduced into the co-operative structure, either by re-absorbing in a controlled manner the small local middle-man who has the managerial talent and by giving him limited profit incentives to utilise his knowledge and experience or by creating and training a fresh cadre of managerial talent familiar with the problems of rural production and distribution.

The second element vital to increased productivity within the rural sector of industry, is technical personnel. At present one of the weakest elements within the co-operative production sector, the undertaking of any extensive programme of co-operative organisation whether agricultural or artisan without training people to fill certain essential technical functions, will inevitably lead to diminishing of efficiency even from the present level.

A great deal of enthusiasm has been evoked recently on the necessity of training workers for the co-operative sector. But the programmes suggested and in operation in co-operative colleges have been mainly concerned with the training of secretaries and organisers familiar with co-operative law but most inadequate in terms of actual undertaking of business activities, without any knowledge of the actual techniques of production.

Another factor that has been responsible for the failure of implementation of production programmes at root level has been the weakness of the intermediary links between the programmes for research, production and marketing. By this is meant that the extension service facilities, the channels that carry the results of research to the producing unit and consumer or market reactions to the industry are of the very weakest.

What is needed, therefore, is not only microscopic examination of the structure and the functioning of a co-operative producer unit but also the drawing in and gearing together of the channels of communication of research and marketing that enable the industrial cell to function with vitality and precision.

A DELHI DIARY

RAIPUR AND AFTER

THE A.-I.C.C. session at Raipur, although it dutifully occupied the front pages of newspapers everywhere, must have been a terrible disappointment to many people who were eagerly scanning the horizon for signs of new thinking. The Prime Minister's speech on the Plan and much of the debate itself was so vague and repetitive that one might say truly that it made confusion worse confounded. Slogans can get us a portion of the way when public participation is generated by slogans. But they are wearing increasingly thin even when they come from the Prime Minister. Again, it is not now public participation that is required; there are firm managerial steps to be taken on foreign exchange, on what happens if we do not succeed in holding the price line — an ancient promise now coming home to roost — and, finally, the problem of rupee resources which in the last fortnight has become more serious by instability in India's gilt-edged market. If the Congress Party had the answer, why did they not give it at Raipur? Is it a fair conclusion that they did not have a clear mind as to whether, now that a compromise on the size of the Plan is required, it is to be effected? It was not a little suggestive that when the great debate on the Plan was going on, everyone's mind was working on the elections. And now that the elections are over, the Ginger Group, still somewhat nondescript — except that people in some mischievous manner describe it as "progressive" — says the elections were irregular. Apparently, the point at stake is whether when you are due to elect five people, you can get away with the election of four, leaving the all-important fifth member for some future occasion. A nice technical point can be made, but one wonders the way the Congress Party at this stage should engage on these technicalities instead of on the realities of the Plan. I shall not choose to comment on the priorities chosen.

DR. THEODOR HEUSS

A most welcome visitor to Delhi this week has been Dr. Theodor Heuss, former President of West Germany. Those who have met Dr. Heuss before are particularly glad that he comes in a non-official capacity, when we can separate the honour we wish to do him as a man from the honour we wish to do to his country. He was one of those great scholars, who, in 1946 and after, emerged into the political scene of Germany transforming it from an area of embattled thought to one of fine academic, yet constructive, quality. As a great writer and one who can enter controversy vigorously and yet be unscathed by it, Dr. Heuss is probably without his equal in Germany. No political party has chosen to reject his choice and anyone who has met him will see the reason at once. In his great learning and sauve manner there is a wonderful sense of humility and humour. He is capable of putting everyone at ease and hiding from all the many-sided power of his powerful philosophical mind. Everyone who has seen him in official action will now express the hope that for many years Germany and India — and he is deeply interested in this country — will find a bond of admiration in this philosophic mind.

LADY CHATTERLEY'S LOVER

To pass from high philosophy to obscene literature is always a bold and daring thing. But I must refer to Lady Chatterley's Lover since I see that all the front pages of the daily newspapers have chosen to talk about the manner in which "Lady C wins her case". I am not quite clear who has won what. The case was brought by Penguin Books, but it was really a battle between the Twentieth Century and the Nineteenth Century in England. It is not surprising that the Twentieth Century has won — though I wonder whether or not it has won rightly. Lady Chatterley's Lover is in a sense literature and although I have not read it, — is this not a complete admission of unprogressiveness? — I am told that it is not necessarily good reading for everyone. But when are cases of abnormal persons ever good readers? I would be inclined to take away the ban on the book, but arrange that, like our most interesting pictures, it is reserved for adults only. Unfortunately, this is not possible because there are no doors to home libraries which can be closed to those under twenty-one. However, if the battle has been won in Britain, need we win (or lose it) in India?

CHINESE RICE CULTIVATION

I have just time in concluding to refer to a curious phenomenon which also appears on the front pages of certain newspapers today. It is the fact that the soil of India, condemned in 32 different places to try Chinese paddy cultivation, has recoiled at the thought and found it "unsuited" to India. It seems, unlike the Japanese method of cultivation, which caught on a big way some years ago, — I am not quite sure what has happened to it since then — the Chinese method is really a matter of deep ploughing and little else. They say it is digging three feet down against the Indian practice of digging less than a foot. It is said that only a few of the 32 centres recorded a slightly higher yield, while the increase in labour and expenditure was tremendous and disproportionate. May not this be a suitable comment on the whole of the Chinese Revolution? The results obtained are not proportionate to the magnitude of the new effort and, what is worse, the loss of spiritual value in general in the process. Now that Chinese rice cultivation is found unsuited to India, will we lose some of the great enthusiasm which, amongst the 'progressive' people of this country, unnecessarily attaches to all things Communist? Slowly, and perhaps not too surely, we are beginning to find that all the wisdom of the world was not rediscovered by the U.S.S.R. and the People's Republic of China and that many of their three steps forward are in fact deceptive or at least contain within themselves Lenin's famous two steps back. On this zig-zag course let China proceed if she likes. Is it not better to be satisfied with a straight 4 per cent increase in real output per year and no periodic crises for the human soul? Do not all reply all at once!

And on Mao Tse-tung, may I publish without comment again a naughty picture by a very naughty cartoonist?

Big leap backward?

ARGUS

THE WEEK'S NOTES

U.S. Presidency

ELECTION EVE

WITH THE date of the Presidential elections (November 8) drawing near, the election fever is moving to a rising crescendo in the United States. Both Senator Kennedy and Vice-President Nixon are surrounded by loyal crowds wherever they go and each seems to be confident that success will be his. The electoral campaign, so much enlivened by the T.V., further gained in momentum when President Eisenhower joined the battle last week in favour of Mr. Nixon and ex-President Truman on behalf of Mr. Kennedy. The greatest assets of President Eisenhower are his personal charm and magnetism with the result 'I like Ike' was the slogan which won the elections for the Republicans in the last two campaigns. It is, however, doubtful whether these assets can be passed on to Mr. Nixon though he is the chosen heir of President Eisenhower. On the other hand, according to some observers, Mr. Kennedy by concentrating on the crucial issue of America's proper role and place in the world seems to have made a great impression as a popular campaigner. But despite indications that things are favourable for Mr. Kennedy (and here the support of the "New York Times" is not the least important), experts are still hesitant to make any prediction and this is understandable enough.

For one thing, President Eisenhower has raised the issue of the gold price and has charged the Democratic candidate of causing international speculation in gold prices. Though Mr. Kennedy has affirmed that he is not going to devalue the dollar if he were elected, his alleged private talks have been used to create the impression that he is responsible for creating fears abroad about the future of the dollar. Again, over the question of Quemoy and Matsu, though Mr. Kennedy has been right in arguing that these islands are of no military value in themselves and should, therefore, be vacated, Mr. Nixon has not been slow to exploit it as a concession to "appeasement". How far this will cost him in the matter of votes remains to be seen, but this so-called soft-on-communism attitude can become an element of potential mischief at the hands of Republicans. Thirdly, there is the issue of religion. Now, every forecast, contains the reservation that no one can foretell what effect the issue of Mr. Kennedy's Roman Catholic religion will have in widely scattered sections of the country. This public reticence about religion is held to be one of the main reasons for the abnormally large number of "undecided" votes which still dominate pre-election opinion surveys. Lastly, there is the question of the Negro votes. The monopoly of Negro support which the Republican party had enjoyed since Abraham Lincoln signed the Emancipation Proclamation in 1862 was broken by Franklin Roosevelt and ever since the majority of Negroes have voted for the Democratic candidates. However, though it is commonly assumed that the majority of Negro voters will once again side the Democrats, it is difficult to determine the size of the majority. Mr. Cabot Lodge, who is Mr. Nixon's running mate for the Vice-Presidency, created some difficulty for Mr. Nixon by his tactless promise that if the Republicans won, Mr. Nixon would have a Negro in his Cabinet. Mr. Nixon, however, had to deny this to avoid alienating his white supporters. In the result, he might have conceivably alienated many Negro voters. With so many issues thrown, it will be a baffling problem for any to predict with certainty the outcome.

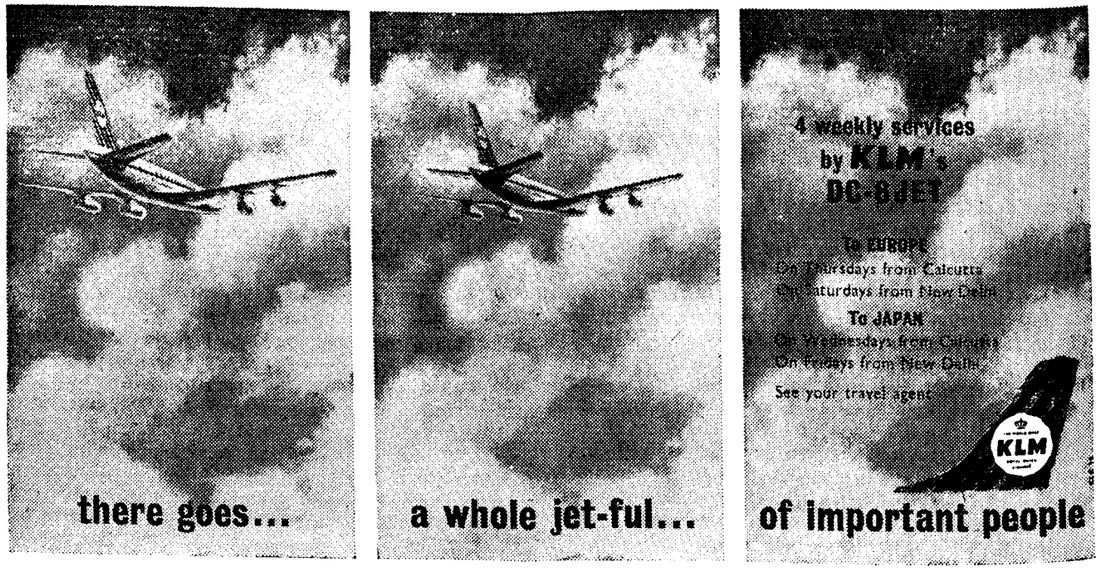
The Press

THE TRAGEDY OF THE "NEWS CHRONICLE"

THE DETAILED accounts that appear in the British Press consequent on the closure of the "News Chronicle" are indeed heart-rending. Apart from the fact that a great liberal organ has died, what adds to the poignancy is the manner of its closing. It would appear that the paper to the end commanded a core of actively loyal readers and, what is more important, a devoted core of loyal staff who did all they could to the end. It is, therefore, painful to learn that at no stage and even when the final decision was made did the management meet the staff as a whole to explain matters and express regret. It also transpires that neither the Editor called the staff together as a whole not did any one even have the courtesy to send them personal notices of dismissal. All that they received were copies of a duplicated circular from the Secretary of the company treating it as if it were a routine affair. As a matter of fact, the drama critic of the paper learnt that there was no longer the "New Chronicle" for him to serve when the "Daily Mail" came through his letter box the next day in place of his own paper. More distressing are the details of woe that read like fiction. For instance, it would seem that a young man was appointed by the editor of the paper only very recently to occupy a prominent post with promises of golden prospects and he resigned from a well-established paper and went on leave to make himself fit for the job—a big chance he apparently thought. But even before he could complete the holiday came the news that he was unemployed, and the "Daily Mail", with which the "News Chronicle" has been merged, told him that they could not possibly employ him in the position he was offered.

It is not hard to understand the feelings of disgust and bitterness that this tragedy has caused in Fleet Street and in British public life as a whole. Journalists in this country, whose lot in spite of persistent propaganda, is still far from the paradise it is painted, will certainly take this as a matter of personal sorrow. The other day, speaking at the Delhi Union of Journalists, Dr. Keskar told the working journalists that they should secure their rights by their own united strength and effort. This, no doubt, may be sane advice, but the fact is, in the ultimate analysis, it is neither legal sanction nor the weapons of trade unionism that will be of avail. Even in respect of the theoretical right of mobility, the hazards of the journalist, who wants to change, are as great as ever and it is not many who will consider the game worth the candle. It is not, therefore, law but an ethical behaviour flowing from a generosity of spirit of those that count, which alone will prove of any avail in upholding the dignity and self-respect of the Fourth Estate which is held to be one of the pillars of democracy.

U.K.'s Scheme

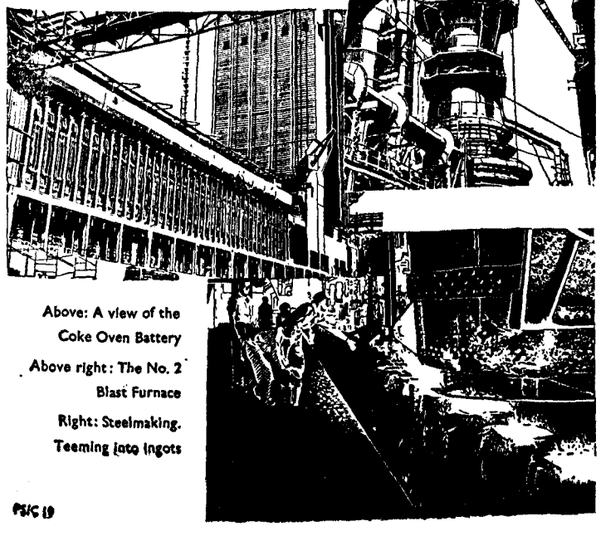


HELPING COLONIES TO RETAIN EXPERTS

THE NEW arrangements planned by the U.K. Government to enable its colonial and dependent countries which are on the threshold of achieving independence

or which have attained independence recently, to retain, after independence, the services of the experienced staff — administrative, technical and professional — recruited in Britain or elsewhere overseas, will undoubtedly be widely welcomed not only by these countries, but by the officers concerned as well. Under the scheme, outlined in a White Paper published last week, and envisaged to be put into effect on April 1 next year, the British Government will financially assist certain countries — they include all the existing British colonies and dependencies, Nigeria, Sierra Leone, Singapore, Northern Rhodesia and Nyasaland, but exclude Bahamas, Bermuda, Brunai and Hong Kong — for an initial period of ten years by contributing between £12,000,000 and £16,000,000 annually to meet the cost of keeping these officers at their present jobs till the time experienced local staff replaces them. This should enable these countries to consolidate their independence with the help of these foreign experts whose services might not be available otherwise for lack of funds. These foreign experts would also not have to worry about their future.

The British Government will re-imburse the Territorial Governments, which on acceptance of the scheme will have to sign a formal agreement with the United Kingdom, the full cost of the inducement allowance designed to attract and keep expatriate officers in service overseas, the full cost of education and allowances of the children of these officers and of additional pension or contract gratuity which an officer would earn from his inducement allowance, half the cost of passage to and from his home country for the officer and his family and half the cost of compensation awarded to an officer for loss of career on premature retirement connected with the progress to independence of the territory in which he serves. To make the scheme attractive for the officers, provision is made for revision of their emoluments at the time of a colony or dependency becoming independent and for an annual visit to them by their children receiving education abroad. To ensure full loyalty of the foreign staff to the Governments employing it, the British Government will not make any payments directly to this staff.



The scheme is a good example of enlightened self-interest also as it involves nearly 21,000 pensionable and contract officers serving in the countries contemplated to be covered by it; it would not be an easy job for the British Government to offer alternative employment to these officers in the home services. Other colonial powers faced with a similar dilemma would do well to devise such schemes. The Congo crisis has highlighted the fact that it is no easy task to keep a country attaining independent status united in the absence of an effective administrative set-up manned by local talent. The gap has to be filled up by retaining the services of foreign experts till the time local staff is fully trained. The great battle against poverty which such countries have to wage will also require assistance from foreign experts. If the services of these experts can be made available by the Colonial powers to their former colonies and dependencies on the lines of the British scheme, it will benefit both the parties and the experts too.

COMBINED OPERATION

The know-how and equipment of British technicians and British Industry have combined with India's skill and labour to build an integrated Steelworks at Durgapur for the people of India.

MOBILISING DEVELOPMENT AID

By

ODYSSEUS

MOST OF A COLUMNIST'S TIME is spent in battling for causes that he thinks important but that public opinion rejects, or to which it is apathetic. This is obvious, because there is no point in battling for victorious causes. At the same time, one cannot help feeling occasionally discouraged when the blasts of one's weekly trumpet seem to leave the walls of Jericho standing as before. However, my morale has received a tremendous lift by the appearance of a new and powerful trumpeter who ought to be able to create breaches in one particular rampart against which I have been trumpeting for years. I refer to William Clark, wellknown as a former special correspondent in India of the London "Observer," who has just been appointed Director of the newly instituted Overseas Development Institute (160 Piccadilly, London. C.W.1.), which, it is no secret, is the child of his brain.

It has been a constant theme of this column that the developed free countries of the West and the developing free countries of Asia have a common stake in the survival of democracy—a system of government intended to ensure that the state unholds the rights, and respects the personality, of the individual citizen, and rejects the Communist doctrine that the good of all is attained by subordinating the individual to the will of the party or the State. Few dispute this. The lip service is, however, far ahead of action.

I have, for example, repeatedly urged that it is useless for the West to build industries in Asia unless it is willing to buy the products of those industries. Too much is still heard about unfair competition from cheap labour. It is true that voices, like that of the "Economist" and the "Observer" of London, have been urging that as secondary manufactures increase in Asia, the UK must switch its production more and more into heavy goods, electronics, and other capital-intensive fields, in which the West will continue to have an advantage for many years. But this implies a revolution in the structure of the economies of the West, and this, in turn, means a considerable effort to educate public opinion to accept it.

The Overseas Development Institute has received a grant of $200,000 for five years from the Ford Foundation and is appealing for further funds in the UK. Offers of financial aid have already been received from Imperial Chemical Industries, Unilever, Shell Vickers, British Petroleum, Anglo-American Corporation of S. Africa, Roan Antelope Copper Mines, Mufulira Copper Mines, and others. The chairman of the Institute's council is Sir Leslie Rowan, K.C.B., a director of Virkers, and former Private Secretary to the Prime Minister.

THE INSTITUTE'S AIMS

The Institute is not just another fund raising agency. Its basic purpose is to be a centre to co-ordinate activities intended to help developing countries, and to focus public opinion throughout the free world on their problems.

Outlining his plans to me, William Clark said:

"My interest in the relations between the developed and developing (I don't like the term 'under developed'—it sounds too damned patronising) countries was, as a matter of fact, first kindled during my year as 'Observer' correspondent in India, so that I am particularly happy to have an opportunity of explaining our objectives to Indian public opinion through the "Eastern Economist."

"Up to now, the developing countries have been drawing up their plans individually, in isolation from each other, and there has been no single world centre of information where you could get a consolidated picture, or a digested assemblage of the facts.

"At present, there is no Plan for Aid in any developed country. No one knows what is wanted, where, and by whom. Without the collected information, and without an Over-all Plan, aid has hitherto been doled out in response to a series of crises—of fire alarms. This, incidentally, encourages a developing country to set its house on fire, and discourages cool, hard-headed, realistic planning.

"As you have often pointed out in your column, to invest capital in the developing countries is not enough: the West must be ready to buy the products of new industries. We need to be Partners not just Patrons. But I'm not sure that anyone has really appreciated the magnitude of the long-term revolution that this implies in the structures of the economies of the developed countries. British industry has long been accustomed to the idea of competition from German or American industry and the economies of these, and other, highly industrialized countries are adjusted, or rather are in constant process of re-adjustment, to each other. Incidentally, this process is being tremendously speeded up by the creation of the new markets of the European Economic Community and the European Free Trade Association. But highly industrialized countries tend to have one attitude towards each other's markets and quite another towards those of the developing countries, which are apt to be regarded almost as belonging to a different planet.

"Another widely prevailing misconception (due to lack of thought) is that the job of the West is to turn every Asian Banaras into a new Birmingham. I suggest, however, that we should not be thinking in terms of helping them to become us, but helping them to become themselves—to become what they want, and we know far too little of their views and aims.

"We hope," William Clark continued, "to make the Overseas Development Institute a centre of two-way traffic in ideas between developed and developing. We want it to be a forum where those directly concerned with development can meet others, and discuss their problems. We want it also to be a forum which will keep the great urgency of the problem of the developing countries before the public and responsible autho-

rities. We want to inform the public of the need of national action in each developed country, and to make sure that they know the results achieved by any action taken.

WORLD CLEARING HOUSE

"We want to spread the information collected as widely as possible among all those working on development problems in innumerable countries. If we succeed, the Institute will become the natural centre to which scattered workers in developing countries—whether civil servants, educators, engineers, or businessmen—will turn and to which they will contribute information. This will help to prevent the repetition of mistakes and speed the adoption of successful methods.

"Our first job is to try and build up a reputation for objectivity. There is a good deal of suspicion in developing countries that the prime object of Western aid is to buy friendship. Paul Hoffman, probably the world's greatest expert on aid—he administered the Marshall Plan in Europe and now administers the UN Special Fund for Developing Countries—says that experience has taught him that there is no relation between aid and friendship.

"That is one reason why he believes that we should be well advised to make our aid as international as possible. I think I agree that we should devote far more of our expenditure to UN projects. To a large extent this would only be a book-keeping change. It would mean that the projects came under the aegis of the UN and that a certain number of UN rather than British, or other, personnel were employed. This should help to bring out that the money was not being given simply as a gambit in the cold war. But I don't want to be dogmatic because I am ignorant and so are most people. My first job is to learn, before we try to teach anyone anything.

"For this reason let me emphasise that I don't envisage this as an office job, sitting at a desk in London. Our work will involve visits to, and discussions with, people and institutions active in this field all over the world. Sooner or later, perhaps the Institute will have to set up branches overseas."

I have been fortunate in counting William Clark among my friends since I first ran across him in Chicago in 1942 and spent purple hours far into the night with him, putting the world right. Since then he has been variously Press Attache at the British Embassy in Washington, D.C.; special correspondent of the "Observer" in India, South-East Asia, and at UNO headquarters; radio and television commentator; press secretary to the Prime Minister (1955-56); and editor of "The Week" feature of the "Observer", a job that he dreamed up for himself. If I assert that he is a man of outstanding intellect and an idealist, you'll envisage some humourless, intellectual prig. Whatever he is, William Clark is not that. With him cheerfulness is always breaking in. The many addresses which he has given in the past few years to bodies such as the Royal Institute of International Affairs and the Royal United Services Institution, hammering in the need to aid the developing countries, have been the most powerful single factor leading to the inauguration of the Overseas Development Institute. Its existence is the direct outcome of his head, his heart, his vision, and his drive.

The European Scene

DE GAULLE, COLONELS AND INTELLECTUALS

From Our Special West European Correspondent

PARIS, October 31.

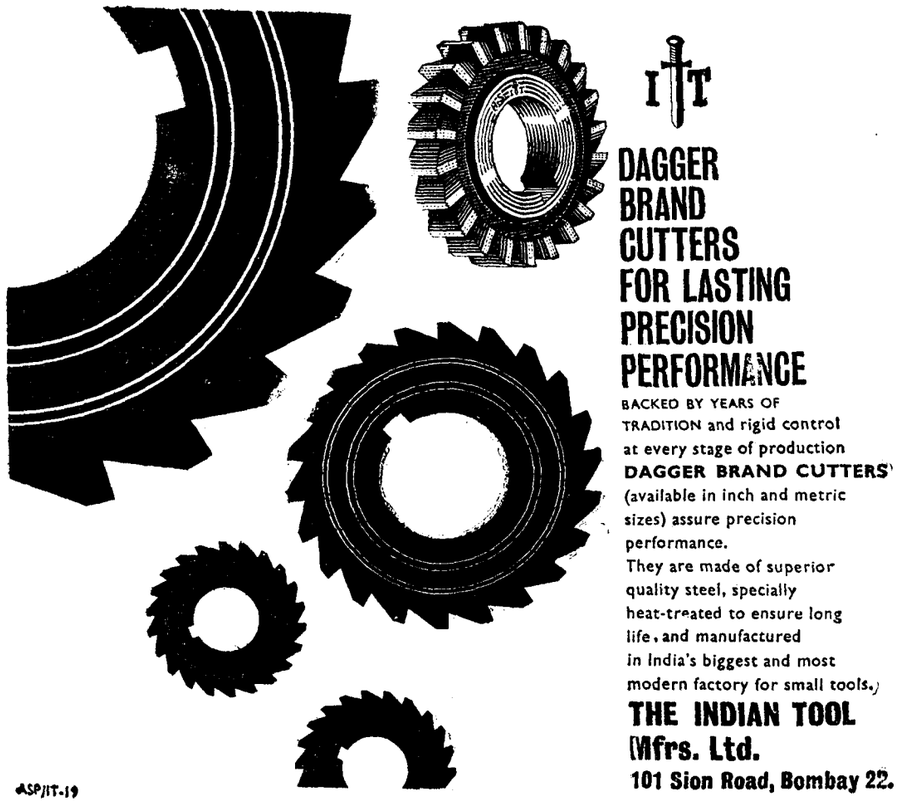
TO assess the political situation in a country at any one moment, one naturally needs to know something of the normal tone and tenor of political life there. Newspaper reports of isolated events mean next to nothing unless one has an idea, however vague, of the way political activity has historically been carried on in that place. A bomb in Calcutta means something different to a bomb in Copenhagen, and a pronouncement from a group of British generals would have a different significance to a pronunciamento from a junta of Venezuelan colonels. So it is with current reports of political troubles in this city. Rather than attempt to sketch the backdrop myself, I shall borrow it ready-painted from France's neighbours of 1,000 years, the Germans. Next month, November, for the fourth time in a century the German Army will cross the Rhine, but this time it comes with an invitation card, to take over training bases and supply depots granted by the French Government when other allies objected to West Germany establishing bases in Franco's Spain. Invitation card or no, the situation is delicate. The Germans are tactfully putting on khaki rather than sinister field-grey, but their generals wisely decided that they needed a brief course of instruction in the French character and political customs before venturing into a bistro. I have the text of these lectures and from it I take this passage.

"The Frenchman is an individualist. He is much more attached than we Germans to political discussion. For him, Culture always has first place. Frenchmen are fervent patriots; they are easily prone to enthusiams. They tend to be carried away by ideas of "grandeur", such as their notion of "glory" or of "the great nation", and yet, much more than we Germans, the Frenchman ultimately lets himself be guided by reason and not by sentiments. He is more adaptable than we are; he has both the love of tradition and the taste for progress. He is less likely than a German to join a movement or association". After the usual advice about strong French liquor, dangerous German driving and the proper attitude to take with women and Communists, our military psychologist warns against discussing warfare "because it is ten to one that any Frenchman you talk to has been in Algeria and therefore knows a sight more about war than you do".

To this, I would add the opinion of another German, Frederic Engels, in his preface to that masterpiece of political journalism, Marx's '18th Brumaire of Louis Bonaparte': "France is the land where, more than anywhere else, historical struggles are always fought out to a decision, and where, consequently, their changing political forms and their results are stamped in the clearest outlines". He gives the examples of the "classic purity" of French feudalism, the French monarchy, the Revolution and the French class struggle, and concludes, "This was the reason why Marx studied the history of France with particular predilection".

Events in Paris this autumn seem to have been arranged to substantiate these German diagnoses. Political controversy has seldom been more energetic (while, characteristically, everyone complains of the decay of democratic freedoms!) and each conflicting view is pressed to its extremest conclusion. Political parties, movements and associations have shown their traditional incapacity to canalise these passions, which find expression in dozens of 'ad hoc' groups, committees, manifestoes and demonstrations, in which a leading role is allotted to the representatives of Culture, the intellectuals. The old passion for glory and grandeur takes the shape of de Gaulle's project for an independent nuclear striking force (and next month a bill concerning artificial satellites), that has to be pushed through a skeptical and divided parliament. The battle between tradition and progress is at its sharpest in every field, from colonial policy to military planning, from economic organisation to education. The confrontation of ideals could not be starker; the intellectuals seem nowhere nobler or less realistic, the colonialists and colonels nowhere more ruthless and determined. We have been promised every week for two years the collapse of the regime into Spanish anarchy or German dictatorship, but at every dangerous turn the ballast of common sense and skepticism rights the vessel—leaving the usual minority of individualists to shoot off into terrorism and counter-terrorism.

If our Germans are correct, French politics are at present in their normal state, i.e. near crisis. The situation is nonetheless confusing.On the one hand, the country is correctly reputed to have the strongest government since Clemenceau, and on the other hand the air is thick with rumours of impending conspiracies, coups d'etat and military putsches. (Nine tenths of these can be disregarded because threats of imminent revolution are a normal weapon in French politics, e.g. they help get bills through parliament. But that still leaves another tenth.) On the one hand de Gaulle plausibly poses as the stable leader of a renascent nation that is equipping itself with super-power weapons, claiming leadership in West Europe and successfully achieving its economic independence; on the other hand, every embassy in Paris sends weekly reports home about the cracks in the regime's foundation and the small span of time left to de Gaulle to pull off a miracle. They probably did the same throughout the 72-year reign of Louis XIV.



One element in the Parisian turmoil, however, is not normal, and that is the conflict about the Algerian war. It is, of course, very much in the French tradition as our German observers have described it that the 20th century's major problem, the end of colonialism, should take its starkest and acutest form in France, from Indo-China via Suez to North Africa. It is also a familiar example of French contrariness that the same people—indeed the same government—that this year sets 14 African nations free without bloodshed or recrimination should seek to preserve by oppression and torture privileges in a 15th country that are relics of conolialism. What is less normal, what the French people have little experience of, is that a great statesman should try to solve this problem by means of a long-range policy, by means of a policy that entails stating a principle and sticking to it. For France has little acquaintance with long-sighted statesmanship, with steadfastness through adversity; her normal political style is Micawberism, drifting from stopgap to makeshift.

De Gaulle's Algerian policy is of another kind altogether. It consists in offering the Algerians independence as soon as they, or the small leadership that claims by right of arms to represent them, have given the necessary guarantees about the future of a very large minority which is of different race but also of

Algerian nationality. The symbol of those guarantees will be a referendum. The referendum would be a make-believe, in that it will not decide anything: all the important issues will have to be settled before and the referendum will ratify the settlement. So all the cavilling about who controls and guarantees the honesty of the referendum is irrelevant; once the parties involved have agreed to let it be held, the result will be a foregone conclusion. The political problem concerns the prior terms of settlement and that is what divides the FLN from the French Government today. One way of ending the war will signify that the guarantees France claims have been secured; another way would signify that the FLN had laid the basis for its totalitarian rule in independent Algeria. Having made his offer, de Gaulle's obvious course is to wait till it is accepted, since a settlement can only pass via Paris. Confident that the offer of independence is just and that the conditions attached are reasonable, a strong nation could afford to wait a considerable time, meanwhile ignoring the tolerable cost of the war and the criticism of UN "democrats" most of whom have never faced an election.

The implementation of this policy, in which patience and steadfastness are the main elements once the courage has been found to state the basic principle, would be simple if France were populated by 40 million de Gaulle's. As it is, it is imposing on the nation, or on a very vocal part of it, a strain it cannot bear. Soldiers cannot understand why one must go on making war when it is already agreed that one will "lose" it, how one can succeed in minor operations against rebellious nationalism if one announces that in the end nationalism will get most of what it wants. Intellectuals, whose political stupidity throughout history has been at least as remarkable as that of soldiers and whose nerves are weaker to boot, cannot see why, once the main concession has been made, the nation needs to fight for anything else; having said that the Algerians can have their own state, France should stop the war—and if it continues, it can only be because a clan of fascist colonels are preventing the outbreak of peace.

Although deriving from impatience and political incompetence, both dilemmas are real and painful. The Army and the liberal forces both find the long-term policy de Gaulle has chosen exasperating, and would prefer, respectively, a regime that made outright war or one that simply surrendered right away. The practice of planning ahead a complex solution to a complex problem and waiting till it prevails has never been in French customs, whereas it has always been the style of Russian diplomacy both Czarist and Communist. If President de Gaulle manages to carry through this policy to its fruition, it will be in a sense against the grain of French character. The current unrest, nervousness, conspiracy, heroics and declamation in Paris do not prove that he will not be able to do so, for these are the normal conditions in which any French politics go forward, and do not constitute a particular reaction to Gaullism.

Australian Economy

LINKING RESOURCES WITH DEVELOPMENT

By ROSS SMITH

CANBERRA, Oct. 31.

AUSTRALIA'S new explorers, less than 200 years since the beginning of modern civilisation in that country, are scientists constantly engaged in discovering new possibilities of development. This involves problems of great complexity, for although Australia is a large land mass, most of it receives little rain and is infertile. The country is still thought of as a source of primary products, and it is still true that many of Australia's exports are of this kind. Australia's income has depended primarily on wool, some agricultural products, and the more accessible of extensive mineral resources.

The first world war initiated the establishment of secondary industries which now surpass the basic primary industries both in value and labour requirements. The second world war, and rapid growth of Australia's population in post-war years, showed that development of the more obvious resources was not enough. A full and detailed knowledge of resources was essential; and so the Australian continent is now being fully and accurately explored.

Up to now, maps of large areas of Australia have been few and often inaccurate, having been based on surveys made by explorers more than 100 years ago. This is now being corrected by hundreds of scientists, cartographers and others; men of great skill and stamina, whose job takes them into some of the remotest and loneliest areas in the world, uninhabited and seemingly of no attraction or use. These men are producing new, accurate maps of the whole continent, and surveys of its resources.

Mapping and surveying in Australia is primarily a government activity, although a great deal of the search for oil and minerals is done by private enterprise. Various government departments, both State and Commonwealth, are co-operating in the production of geodetic and topographic surveys, resources surveys, economic surveys and surveys for specific projects, such as the opening up of a new mineral field or the preliminary work for a hydro-electric scheme. It is the resources surveys that are of importance here, and the most important types are land research and regional, soil potential, and geological and geophysical.

Intensive settlement in Australia has occurred where land and climate are favourable and marketing facilities are available. This has meant a concentration in areas along the east coast, and pockets on the south and west coasts. There still remain large areas where more intensive settlement will be possible when there is more knowledge about how to utilise them. Since 1946 the Commonwealth Scientific and Industrial Research Organisation's Division of Land Research and Regional Survey has carried out surveys over more than 500,000 square miles of northern and central Australia. The surveys describe and make an inventory of the resources of a region and are carried out by specialists in geology, geomorphology, soils, vegetation and climate. They have been supplemented by surveys carried out by the Bureau of Mineral Resources, the Bureau of Meteorology, the Bureau of Agricultural Economics, and the CSIRO Division of Animal Health and Production.

The surveys have established the possibilities and methods of growing rice, peanuts, grain sorghum, vegetable fodder crops and cattle in undeveloped or underdeveloped areas. Projects such as growing rice at Humpty Doo, near Darwin, have gone into operation. Thus, the surveys have shown that there are additional resources to be exploited; successful exploitation could lead to a new important economic area based on northern ports, with possible marketing outlets in the expanding countries of Asia.

The need has been greatest in the relatively undeveloped and unproductive areas with sparse population, but the techniques are now being used in a survey of a highly-developed area on the east coast of the continent. Other countries and UNESCO have also shown interest in these techniques. Research workers from the CSIRO have visited India and Pakistan, and these countries have sent their own scientists to Australia before undertaking similar surveys.

The aim of an assessment of soils is the better use of land and in a country of Australia's size, the task is enormous. The two basic considerations are the large proportion of inferior quality soils, some of very low fertility, and the availability of water. In recent years surveyors have given more attention to the patterns in which soils lie in the landscape, and their relationships to each other based on their origins and mode of development. In these surveys the physical properties are assuming an importance equal to or greater than the chemical properties. Water shortage has forced the development of poor soils in good rainfall areas, rather than better soils in bad rainfall areas. Water is the real key to how far soils can be developed; other problems such as infertility, and management and stocking, can be solved by scientific research. The CSIRO Division of Soils is responsible for most of the soil surveys in Australia. Detailed surveys over 185,000 square miles of widely separated areas in the south and south-east have so far been carried out. Soil mapping is a slow process; it has been found that only 15,000 acres of land for intensive development can be surveyed by one field party each year; for land to be used at moderate intensity the figure is 50,000 to 75,000 acres a year; and for a broad general assessment of soil groups, it is 20,000 to 50,000 square miles.

The mineral industry is one of the most important sectors of the Australian economy. It is sustained by exploration, development and research both by private enterprise and government agencies whose main role lies in providing much of the basic information for exploration programmes. The Bureau of Mineral Resources, a Federal Government body, is concerned with the mineral resources of Australia as a whole. In the States, the Departments of Mines are in charge of operations.

The tempo of mineral survey activities is increasing, not only in the search for oil. The earlier mineral discoveries in Australia, such as gold in Western Australia and silver-lead-zinc at Broken Hill, were mainly chance findings of surface outcrops. The latest upsurge of exploration and development is based more on preliminary surveys. Some of the results include the discovery of extensive bauxite deposits in northern Australia, uranium at Rum Jungle and Mary Kathleen, and the development of Mount Isa as the major producer of copper in Australia.

Economic Report from the U.S.

THE VALUE OF DOLLAR

By

GUY SIMS FITCH

WASHINGTON, Oct. 26.

RESPONSIBLE officials of the U.S. Government led by Treasury Secretary Robert Anderson, have made it repeatedly and emphatically clear—once more within the past week—that the United States has no intention of reducing the value of its dollar by raising the price it pays for gold. The unequivocal stand has been supported by virtually every important financial expert here and abroad. This includes Per Jacobsson, Managing Director of the International Monetary Fund, who has been quoted by the New York newspaper 'Journal of Commerce' as saying that he "absolutely believes in the correctness" of Mr. Anderson's position with regard to the U.S. dollar, which plays such an integral and basic role in the world's financial and trade structure. Yet, the price of gold has been fluctuating rather sharply on world markets, with some of the quoted prices in recent days well above the $35 per troy ounce which has been the fixed U.S. price ever since 1934. The question naturally arises why this happened, and what it signifies. Definitive answers are difficult to ascertain, but several reasons have widely been mentioned. The United States has been running a heavy balance of payments deficit in its transactions with other countries. Large amount of gold and dollars have been flowing out. There are some uncertainties about the course of U.S. economic activity, which admittedly has slowed down in recent months. And partly because of this slowdown, partly because of the economic expansion in Western Europe, and partly because of historical practice, interest rates are lower in the United States than in some Western European countries. This has contributed to a flow of speculative money from the U.S. to other financial centres, where it may be able to earn more. This is sometimes called "hot" money, since it never seems to stay in one place very long. The deficit in the U.S. balance of payments is not due to any deterioration of the U.S. trading position which might reflect on the U.S. ability to compete on world markets and hence on the status of the U.S. currency. On the contrary, the United States this year is running a near-record trade surplus—an excess of exports over imports—of some $ 5,000 million.

As a result, the abnormally high balance-of-payment deficits of the past two years, which aggregated more than $7,000 million, are expected to decline substantially this year to less than $3,000 million. And this deficit, as indicated, is due not to any basic trading weakness, but rather to the outpouring of U.S. government military and economic assistance funds, plus such private outflows as tourist expenditures, capital investment abroad and other remittances. The U.S. economy is essentially sound, and despite the recent slowdown is still operating at record or near-record rates. Even the more pessimistic among economic experts do not anticipate anything more than a brief and moderate slow down before a strong upturn resumes by the middle of next year.

Some of the experts, among them Treasury Secretary Anderson, hold that the current slow down is largely the result of an essentially healthy adjustment to a non-inflationary situation, featuring a massive turn around in business inventory policies from accumulation to liquidation. According to this view, these adjustments have all but been completed, and a sustained economic upturn should be visible before very long. Even should a continuance of the slow down into next year lead to further reductions of U.S. interest rates, it would not affect the U.S. position to any important degree. After all, the price of gold has risen in some prior years to levels well above the fixed U.S. price without causing any serious consequences and without putting any irresistible pressures on the flexible U.S. monetary policies. It would be noted, too, that the U.S. fiscal structure is basically sound, with a budget surplus recorded in the last fiscal year that ended June 30, and another surplus in prospect for the current fiscal year. Neither of the Presidential candidates has given the slightest indication that if elected he would alter the present gold-price policy of the U.S. Government. With all this said, there is this further point to be made. According to all reliable reports, the recent gold market fluctuations have rested on a rather narrow base—a fact that underscores their speculative nature and may account for the sharpness of the price changes. Current developments have not affected the convertibility of the U.S. dollar in the slightest, nor has it represented any flight from the U.S. dollar, which at last reports was still selling at a premium in many world markets—indications enough that there has been no loss of confidence in the U.S. currency. It should be borne in mind, in this connection, that despite the loss of some $900 million in gold this year, the United States still has reserves of more than $18,500 million. This is about one-half the entire gold stock of the free world, and certainly more than enough to ride out any short-term speculative cycle.

WORLDGRAM

India

NPC on Marketing and Distribution: The National Productivity Council has sent abroad several teams to study the working of specific industries but the team which left India the other day will be first to make a scientific study of marketing and distribution practice in industrially advanced countries. The team is proceeding with the aid of the Technical Co-operation Mission of the U.S. Government and will visit U.K., U.S.A., and West Germany. It is not expected that marketing practice in advanced countries will find immediate application in India. But the chief benefit from the NPC Team's study may well be the pin-pointing of certain aspects of marketing in India where improvements can be readily made. Market research, to which the team will give particular attention can, for instance, be undertaken by many medium scale manufacturers in India to know more clearly the tastes and habits of their consumers and thus improve their product and package designs and the system of distribution. Similarly, the business of selling to industrial firms in India, which presents completely different problems, has never been properly studied, and little is yet known about the various degrees of influence exercised on a buying decision by different levels of technical management. Improved methods of marketing and distribution in India are part of the drive to reduce final cost to the consumer and raise living standards. The NPC Team's efforts will be complemented by the visit to India, in the near future, of a foreign specialist on the subject of marketing and distribution.

*

Cellulose Film Plant: The Travancore Rayons Ltd. has started its third cellulose film plant. The present capacity of cellulose film is 10 tons per day. Production of cellulose film was first started in 1950 and the Travancore Rayons Ltd. is the pioneer manufacturer of this product in this country. The initial capacity was brought up to two tons. In 1955, a second plant with a capacity of two tons per day was installed. The third plant, which has now been started, is a high speed machine with a capacity of five tons per day.

*

Employees State Insurance Scheme: The benefit provisions of the Employees State Insurance Act, 1948 were extended to Cannanore, Tellicherry and Balipatam in the State of Kerala from the mid-night of October 29, 1960. The scheme is already in force in 9 centres in the State and with its introduction in the above three areas, about 6,500 more factory workers will be benefitted. The employers of factories covered under the scheme will now be required to pay the employers' special contribution of 1¼ per cent of the total wage bill vide Central Government Notification No. SS. 131 (9), dated February 1, 1952 instead of ¾ per cent which they were paying so far.

*

Small Savings Collections: Small Savings Collections, which have been steadily increasing during the current financial year reached a new height in September 1960. The net collections, excluding sales of prize bonds amounted to Rs. 10.16 crores. Between April and September 1960, the net collections were Rs. 37.72 crores showing an increase of Rs. 10.10 crores over the corresponding period in 1959. At this rate, the net collections for the year are likely to show a substantial improvement over the net collections of Rs. 85.01 crores last year. The major increases have been in the post office savings bank deposits and the treasury savings deposit certificates which have risen by Rs. 6.44 crores and Rs. 3.07 crores respectively. In addition to the net collections through small savings securities, a sum of Rs. 10.30 crores was realized by the sale of prize bonds during the six months of the current financial year.

United States

U.S. Credit to Help Build Paper and Board Mill in India: The United States Government has announced a credit of 20 million rupees in favour of Seshasayee Paper and Board Company Ltd. of Madras State. The loan will be channelled through the Export-Import Bank of America and will be used to help finance the construction of a paper mill at Erode, Madras State. The mill will use both bamboo and bagasee in its processes, and its location at Erode is near sources of those raw materials. Plant equipment includes two paper making machines with bleaching and other facilities. Annual output is calculated at 20,000 tons of printing, writing and wrapping paper.

U.S.S.R.

Agriculture in U.S.S.R.: Soviet agriculture will surpass the United States levels sooner than Soviet industry, Alexander Tulupnikov, Director of the Agricultural Economy Research Institute, said recently in his report to the conference on problems of the economic competition between the two world systems. He said that over the past five-six years the production of grain in the Soviet Union has been increasing twice as fast, meat 3.5 times, and milk 10 to 12 times as fast as in the United States. The process of concentration of production continues in Soviet Agriculture. At present, each State farm averages 24,000 hectares of land and 92 tractors and each collective farm averages 5,000 hectares and 22 tractors (only the biggest farms—3 per cent of all farms in the United States—have about 4,000 hectares of land each). A scientific system of agriculture in conformity with 39 climatic and soil zones of the country is now being introduced in all state farms and collective farms of the Soviet Union. Over 4,000 scientists and specialists helped in drafting the principal recommendations for scientific farms.

*

Trade With the Republic of Guinea: Leading officials of the Centrosoyuz (the Union of Consumers Co-operatives of the U.S.S.R.) and of the Guinean Co-operatives reached an understanding to start mutually advantageous barter operations before long. The delegation of the co-operators from the Republic of Guinea headed by the Director of the Co-operative Society, visited the US.S.R. at the invitation of the Centrosoyuz Board. The delegation studied the activity of the Soviet Consumers' Co-operatives and inspected co-operative enterprises in Moscow Region and Georgia.

United Kingdom

Oversea Trade: United Kingdom exports in September were valued at £259,900,000, imports at £360,300,000 and re-exports at £12,800,000, according to the U.K. Trade and Navigation Accounts for September published by the Board of Trade recently. Exports in the third quarter, seasonally adjusted, were 2½ per cent less in the second quarter and 5½ per cent less than in the first quarter. Most of the fall in exports was to North America. For the first nine months of this year, the average of exports was 6½ per cent above the average for 1959. The value

of imports was 2 per cent more in the third quarter than in the second quarter. In first nine months of this year, imports were, on an average, 13 per cent more than the average for 1959.

*

An Electric Fire-Lighter: An electric fire-lighter, produced by the General Electric Company Ltd., of London, gets a coal fire blazing in two or three minutes — without the use of paper, wood chips or matches. It incorporates a number of safety features. The barrel is surrounded by an outer case which is cooled by an independent air stream and never gets hot. The heater can only be switched on by a special key, and the key cannot be removed until the heat is switched-off again. If the fan stops working, the current is automatically switched off.

Austria

L.D. Steel Works for Brazil: Voest has received a Brazillian order to build, in co-operation with two French firms — Delattre and Frouard Steel and Machine Manufacturers, and the Cetig Engineering Office of Paris — an L.D. plant with two 75-ton L.D. crucibles and an annual output of 500,000 metric tons of raw steel, which will in the long run be extended to 7,50,000 tons a year. The L.D. plant is to be part of new metallurgical works built by the Brazillian siderurgical firm "Compania Siderurgica Paulista (Cosipa) of Sao Paulo, in the vicinity of Santos, which will comprise a coking plant, two blast furnaces, a steel mill and a number of rolling mills for the production of steel plate and sheets. Under the agreement with their French partner Voest will be responsible for the overall planning for the L.D. plant as well as for delivery of the two crucible units with all auxiliary equipment.

Bulgaria

A New Lead-Zinc Plant: A new lead-zinc plant, second of its kind in Bulgaria, is now under construction near the town of Plovdion. According to plan the zinc section of the plant would go into production by 1961, with an annual output of 30,000 tons. Besides, the present lead-zinc plant at the town of Kurdjali is being expanded with a view to raise its production to 22,000 tons of lead and 14,000 tons of zinc.

Germany

Hanover Fair: The 15th Industries Fair will be held in Hanover between April 30 and May 9, 1961. Since the Fair was first held in 1947, its importance for international trade has constantly increased. To accommodate the growing number of German and foreign exhibitors, it has been necessary to extend the exhibition area every year, but it has not yet been possible to satisfy everyone. From 30,000 sq. miles in 1947, the covered area available grew to 2,85,000 sq. miles in 1960, with 314,000 sq. miles being provided for 1961. The open air section has increased from 8,000 sq. miles in 1947 to 162,000 sq. miles in 1960 with 192,000 sq. miles being provided for next year. The 5,000 exhibitors expected for 1961 will thus have a total area of 506,000 sq. miles at their disposal. The exhibitors are solely producer firms, and play an important part in foreign trade. They are represented by top level executives which enable vital and decisive negotiations to be held.

Japan

Making of Concrete Pipes: The Mitsubishi Cement Company of Japan plans large scale manufacture of prestressed reinforced concrete pipes for water supply and other purposes, and will use Australian processes developed and perfrected by Rocla Pipes. Rocla Pipes Ltd. of Melbourne will supply the Japanese company's requirements of equipment, technical data and service under a licensing agreement recently concluded. The agreement also provides for an inter-change of developmental information for a period of 10 years. Japan is the 9th overseas country to adopt the Australian Rocla process of manufacturing prestressed concrete pipes. Other countries in which major concrete pipes manufacturers already use Rocla processes under licence arrangements include the U.S.A., France, Switzerland, West Germany, Spain, India, Pakistan and South Africa.

Switzerland

New Plastics Design Laboratory: A new plastics design laboratory to assist European industry will be built in Geneva by Du Pont de Nemours International, S.A. Purpose of the laboratory is to help European manufacturers develop new applications primarily for Derlin acctal resin and Teflon TEF and EFE Fluorocarbon resins. It will also provide new ideas on the use of Du Pont plastics, and will handle specific requests from customers. The new facility, which is expected to be ready by April 1961, will consist of an application design section, a model or machine shop and a chemical and physical testing area. The function of the application design, for example, will be to provide cost estimates, advice on product design, fastening techniques, mould lay out and dimensional control of moulded parts.

Netherlands

KLM Traffic on the North Atlantic Air Route: In the first half of 1960 KLM (Royal Dutch Airlines) carried 59,000 passengers on the North Atlantic Air Route, i.e. 8.3 per cent of total passenger air traffic on this route. KLM carried 47,000 passenger in the same period of 1959, so that there was a 24 per cent increase in the first half of 1960. The increase in freight transport on the same route was 46.7 per cent.

S.A.S.

Agreement on International Fares and Rates: Agreements on International fares and rates over most world routes for an unprecedented period of two years have been reached by the traffic conference of the International Air Transport Association, Scandavian Airlines system announced recently. In the past, international fares and rates agreements have been valid for 12 months, but if governments agree the Cannes resolutions are for the most part scheduled to become effective from December 1, 1960, or April 1, 1961, until March 31, 1963. Carriers will be able to request consideration of specific changes at the end of 12 months if there is a material change in circumstances.

United Nations

Funds for T.A. and Special Fund Programmes: An amount of $86 million was pledged by 77 governments recently to finance in 1961 the operations of the United Nations Expanded Technical Assistance Programme and of the United Nations Special Fund. This is about $10 million more than the amount made available at a similar pledging conference last year, but still $14 million below $100 million target figure set by an Assembly resolution in 1957. A recent proposal by the Netherlands Foreign Minister for a $125 million target for both programmes was endorsed by Secretary-General in a message to this year's pledging conference. The United States contribution of $40 million for both programmes is subject to a matching principle which stipulates that the U.S. share should not exceed 40 per cent of the total contributed by other Governments. The Soviet Union contributes 8 million roubles. The Federal Republic of Germany announced at the pledging a 56 per cent increase of its contribution to $5.3 million for both programmes.

NEWS IN BRIEF

INDIAN

The special rebate of thirty one naye paise per rupee on the purchase of khadi, which was available up to October 31, 1960, has been extended up to November 14, 1960.

*

The Union Government is reported to have sounded the diplomatic and consular represenatives of the UK, West Germany, East Germany, the USSR and Poland whether it will be possible for their countries to undertake the execution of ropeway projects in Jharia and Raniganj on a 'turn-key' basis on suitable credit terms.

*

Exports of Indian black pepper during the first-half of the year increased by 7,675 tons compared to the figures of exports for the corresponding half year in 1959, according to official estimates released recently.

*

The Tungabhadra Steel Products Board, a joint venture of Andhra and Mysore Governments, has decided to collaborate with a foreign firm for the manufacture of pen-stock pipes.

*

The Cotton Textile mills production in September, 1960 is provisionally estimated at 145 million lbs. of cotton yarn and 426 million yards of cotton cloth.

*

The Joint Chief Controller of Exports has announced that the export of industrial diamonds, cinematograph equipments and gogan bark and its extracts have been decontrolled. The export of bamboo used as paper making material has been decontrolled with effect from October 15, 1960, the announcement adds.

*

All States and Union Territories, excepting Andhra Pradesh, Madras and Uttar Pradesh, have agreed to the continuation, during the Third Plan, of the present arrangements for the working of the Welfare Extension Projects sponsored by the Central Social Welfare Board.

*

The rail and structural mill of the Steel Works at Bhilai went into production recently. It is the third of the four rolling mills and one of the largest and heaviest units of the Bhilai works.

*

The Government of India have sanctioned a grant of 1,00,000 dollars to the endowment fund of the International Institute for labour studies. The institute will be set up at Geneva under the auspices of the International Labour Organisation.

*

During the half-year ending September 30, 1960, the Import Trade Control organisation received a record number of 2,16,073 applications, as compared to 1,78,762 during the corresponding period last year.

*

Work on the construction of a shipyard in Haifa Bay is to start shortly. An international call for tenders was issued some time ago and the award of the contract is to be announced shortly. Eight British, Belgian, Dutch and French concerns as well as five Israeli concerns, submitted bids.

*

Industrial production in West Germany came close to all-time high in September. The Ministry of Economics has announced that the index of production (1936=100) reached 281 during the month. The existing record, 286, dates back to November of last year.

*

Czechoslovakia will grant Iraq a £12 million credit under a new economic and technical agreement. The loan is repayable in eight yearly installments. The agreement provides for co-operation in various fields, including oil refining and hydro-electric power.

*

Life assurance business in Britain last year set several new records. New individual policies totalled 939,000 compared with previous peak of 853,000 established in 1958.

*

The Cuban Government recently became the nation's only importer and exporter when the Commerce Ministry announced that all imports must be made by the Cuban Bank of Foreign trade.

*

Two important new steps designed to assist British exporters were announced by the British Government recently. The first is the formation of a new Export Council for Europe, which will be organised on the same lines as the highly successful Dollar Exports Council and will be headed by President of the Federation of British Industries.

*

Talks on the purchase of textile machinery opened recently between a Japanese mission and the Pakistan Government. Japan has ageed to finance 355,000 spindles and 3,000 looms worth $20 million for the production of finer quality cloth.

*

A special committee has been set up by the Cocoa Study Group of the United Nations Food and Agriculture Organisation to study the possibility of stabilising Cocoa prices.

*

World production of tin-in-concentrates amounted to 13,500 tons in May and 13,900 tons in June, compared with only 12,700 tons in April, according to the latest number of the International Tin Council's Statistical Bulletin.

Special Article

INDIAN SHIPPING UNDER THE FIVE-YEAR PLANS

By JAYA CHAMARAJA WADIYAR
(Governor of Mysore)

IN 1947 India had hardly about 2 lakh tons of shipping. Further, most of the ships were old and had been overworked during the war period. There was, therefore, urgent need for replacement along with that of initiating new development. The Government of Free India was not slow in recognizing the strategic and the economic importance of adequate shipping and the policy of developing Indian shipping was given high priority.

The first noteworthy record in the field is the Report of Shipping Policy Committee in 1947. Its recommendations included: (1) a national shipping policy; (2) a target of 9 lakh tons by 1950 and 20 lakh tons in about five to seven years; (3) the exclusive use of Indian ships in the coastal trade; (4) 75 per cent share in the trade with Burma and Ceylon and (5) 50 per cent of overseas trade. These targets, however, have not been reached so far and the growth has not been rapid enough.

The following table* shows the increase in the number and tonnage of Indian ships:

GROWTH OF INDIAN SHIPPING
(1951 - 1959)

As on	No of Ships	Gross Registered tons
1-4-1951	95	377,500
1-4-1956	126	479,880
1-4-1957	124	521,440
1-4-1958	132	581,522
1-4-1959	141	646,493
30-11-1959	157	740,673
31-3-1961 (Target)		901,707
31-3-1965 (Target Draft Outline III Plan)		1,100,000

Compared to the long period of stagnation before 1947, a little more than doubling the shipping tonnage in a decade of planning may appear to be impressive. But in view of the need and opportunities for expansion it may be held that the growth has been really slow. It was in the light of the opportunities that existed and of the economic soundness of the required allocation of resources that the Shipping Policy Committee (1947) fixed the targets stated above.

It would be interesting to speculate upon the relative importance of Indian shipping in the world when India's economy is transformed from an 'under-developed' to an 'advanced' economy. Among the several criteria relevant to such an estimate of the future, the basic criteria relate to the natural endowments of the country for developing its maritime strength. Fortunately India, with a long sea-coast of over 2,900 miles, has, in addition to the few already developed ports, a large number of others with potentialities for being made major ports. The experience of our nascent shipbuilding industry has revealed the great potentialities that exist by way of the raw material base for a big industry. Thus the basic requirements for becoming a major maritime country are there. The supply of other complementary factors such as capital, skill, entrepreneurship, etc., depends, in the present context of economic planning, partly upon a deliberate choice as regards the allocations made by the Planning Authority and other policy measures. On the demand side, factors like the huge size and population of the country, the large and growing volume of foreign trade and the rapid expansion of the industrial sector to which transport, including shipping, is a necessary complement, suggest a big role for shipping in India's economy. How big that role is going to be in the future advanced stage of our economy cannot be quantitatively stated at present. However, it may probably be correct, to say that India by her own right promises to occupy a far more important place than she does today among the maritime powers of the world.

The inadequacy of Indian shipping development is also brought out by an analysis of the relative shares of Indian and foreign ships in the carriage of our overseas trade. The following table presents a summary of the shares of ships of different countries in the cargo discharged and loaded—'inclusive of both coastal and overseas trade cargo'—at the five major ports of Bombay, Calcutta, Madras, Cochin and Vishakhapatnam in 1957-58.

RELATIVE SHARES OF INDIAN AND FOREIGN SHIPS IN THE CARRYING TRADE OF INDIA
(1957 - 58)†

Nationality of ships	Imports (In million dw. tons)	Exports	Total	Percentage to total
Indian	3.42	2.60	6.02	20.0
British	4.84	3.13	7.97	26.7
Panamanian ..	1.73	0.90	2.63	8.7
Liberian	0.99	0.28	1.27	4.1
Costa-Rican ..	0.33	0.10	0.43	1.5
Norwegian ..	1.58	0.33	1.91	6.4
American ..	1.73	0.48	2.21	7.3
Japanese ..	0.47	0.75	1.22	4.0
Danish ..	0.31	0.13	0.44	1.5
German ..	0.33	0.18	0.51	1.7
U.S.S.R.	0.14	0.12	0.26	0.8
Others	3.41	1.75	5.16	17.3
TOTAL	19.25	10.75	30.00	100.0

The statistics presented above illustrate the fact that for about four-fifths of the shipping services India depends on foreign ships, the contribution by Indian ships being only 20 per cent. If we take account of only the overseas trade separating the coast-wise trade from the figures given above, it will be seen that India's share in the carriage of overseas trade is less than 10 per cent and that over 90 per cent of overseas trade is carried on in foreign vessels. British ships have the biggest share, being nearly 27 per cent in the total shipping services required by Indian foreign and coastal trade, the American, Norwegian and Japan se following with a considerable share each. It may be noted that about 50 per cent of the overseas trade of a country is generally recognized to be a fair share for any maritime country to achieve and keep in its own hands.

*Indian Shipping Vol. XI. No. 11, Nov. 1959.

†Compiled on the basis of figures given in Indian Shipping.' Vo. XI. No. 11, Nov. 1959. p. 19.

One of the privileges which a free maritime country secures for its national shipping companies is the monopoly of carrying coastal trade. Several attempts by Indian interests in the pre-independent India to have the coastal waters reserved for Indian shipping were unsuccessful. Since our country became independent, though the Government of India has accepted the policy of reserving the coastal trade to Indian ships, its full implementation has still some difficulties so that foreign ships continue to play an important role even in this sphere. The following table* shows the coastal trade of India handled by Indian and foreign ships at the ports of Bombay and Calcutta, the two ports which account for the carriage of about 77 per cent of the total coastal cargo.

COASTAL TRADE OF INDIA : 1957 - 58

(In lakhs of dw. tons)

	Imports	Exports	Total
1. **Indian Ships**			
Bombay	5.30	6.06	11.36
Calcutta	7.55	12.92	20.47
TOTAL ..	12.85	18.98	31.83
2. **Foreign Ships :**			
Bombay	6.63	12.69	19.32
Calcutta	4.54	0.44	4.98
TOTAL ..	11.17	13.13	24.30
3. **Indian & foreign Ships :**			
Bombay	11.93	18.75	30.68
Calcutta	12.08	18.36	25.44
TOTAL ..	24.01	32.11	56.12

It can be noted from the above figures that the share of Indian ships in the total coastal trade of about 5.6 million tons is about 3.2 million tons, i.e., about 57 per cent and foreign ships have a share of 43 per cent still. These indicate the extent of lee-way to be made to accomplish the objective of using Indian ships for the entire coastal trade of the country.

The amount of annual net payments for shipping services is another index of the extent of under-development of India's shipping. During the Second Plan period on an average a sum of about Rs. 130 crores is paid to foreign shipping interests for carrying India's sea-borne trade. A diminution of this drain by a more rapid expansion of Indian shipping would contribute towards easing the difficult foreign exchange position in which the country finds itself today.

The building up of a strong merchant navy requires also adequate arrangements to train the required special personnel and rightly have the Government accepted the responsibility for training such personnel.

In the First Plan period a Marine Engineering College was established. Training was given to 5,500 ratings, 143 marine engineer officers and 248 navigation officers. The notable events of the Second Plan period have been the construction of a new building for the Nautical and Engineering College at Bombay and the constitution of a Merchant Navy Training Board (October 1959). The function of the latter Board is to consider all matters pertaining to the training of navy officers, ratings and other sea-going personnel. The Board has to make recommendations on measures necessary to build up an adequate and efficient merchant navy.

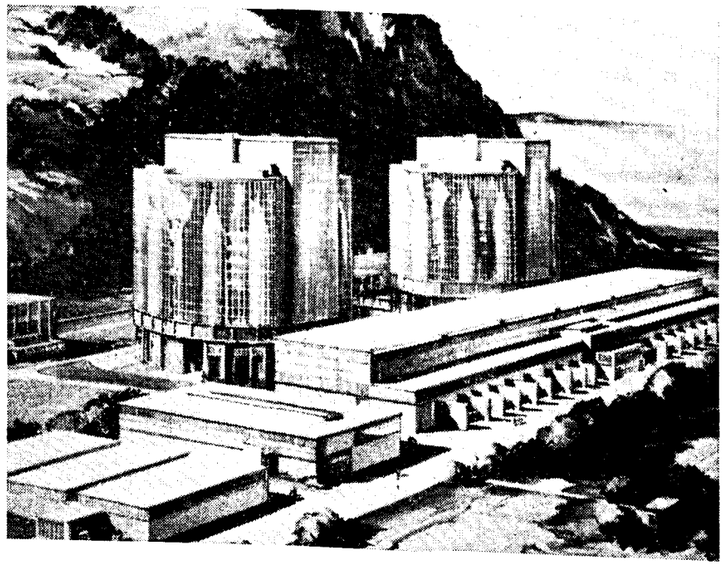
The ship-building industry in India has made a good beginning but it needs to be strengthened greatly. Since 1952 the Hindustan Ship-building Yard has built 20 ships of different types and sizes for the country. Acquisition of ships and servicing are very important aspects of shipping development and for these we still depend largely on foreign countries.

The brief survey presented above shows that in spite of the progress made since the achievement of Independence, the position of Indian shipping is still unsatisfactory in view of both the needs and the potentialities of the country. Under economic planning, the over-all as well as the sectoral rates of growth are mostly the result of deliberate centralized choice in so far as the physical and the financial targets are laid down by the planning authority and efforts are patterned to achieve these targets.

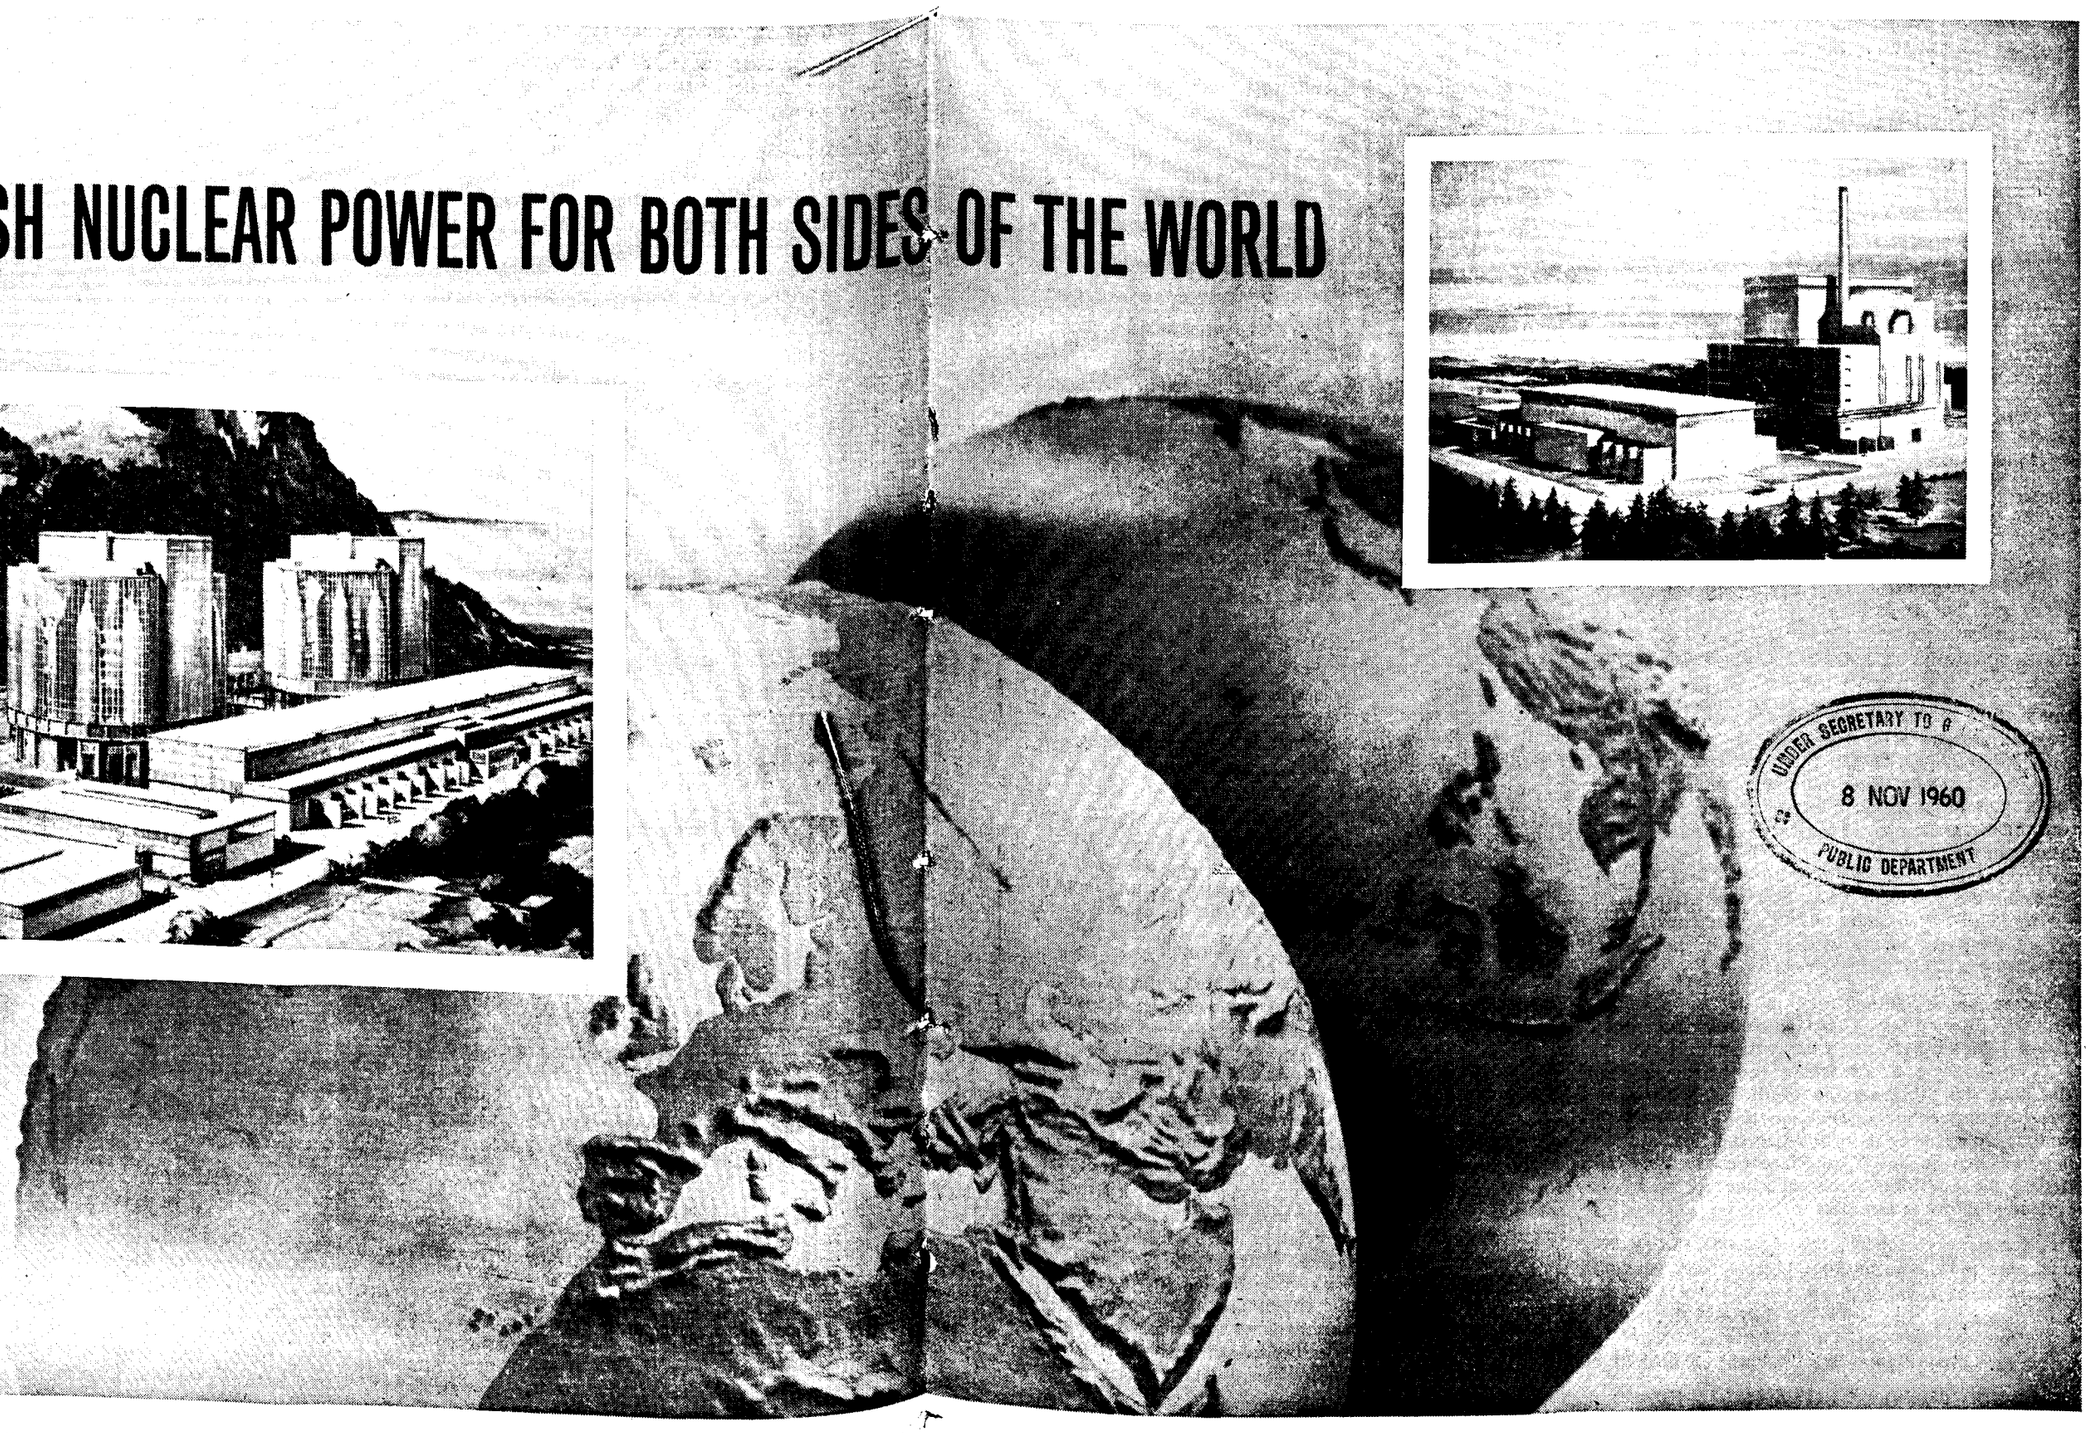
The Second Five-Year Plan lays down three objectives for the development of shipping, namely, (a) to cater fully to the needs of coastal trade with due regard to the possibility of diverting some traffic from the railways to coastal shipping; (b) to secure an increasing share of India's overseas trade for Indian shipping; and (c) to build up the nucleus of a tanker fleet.

The above statement of objectives conveys very little about the intended rate of growth with which we are at present concerned. To estimate this we have to look into the targets set forth and the measure to achieve these targets. The following figures show the rate of growth of shipping tonnage under the Plans:

(In lakhs of G.R.T.)



Date	No. of ships	Tonnage
1-4-51	95	3.78
1-4-56	126	4.80
31-3-61	(N.A.)	9.00
31-3-66 (Target) ..	(N.A.)	11.00



Unfortunately, the present indications show a slowing down of the rate of shipping growth. The draft outline of the Third Plan recently published envisages an increase of only 200,000 GRT, which is just half of what has been achieved during the Second Plan. If this is viewed against the fact that the size of the total outlay for the Third Plan is more than double the size of the Second Plan the relative decline in the rate of growth envisaged for the Third Plan becomes more emphatic. Considering this fact even the target of 1.6 million tons recommended for the Third Plan by the 'ad hoc' committee of the National Shipping Board, of which the Chairman is Sri A. Ramaswamy Mudaliar, appears very modest, indeed.

It is a moot point whether a drastic reduction in the rate of growth is proposed. It is equally helpful to examine the factors which made it possible to add 4 lakh tons during the Second Plan, as against the 2 lakhs proposed for the Third Plan and see if the possible adverse factors cannot be effectively countered. For

Indian Shipping: Vol. XI. No. 11.

BRITISH NUCLEAR POWER FOR BOTH SIDES OF THE WORLD

UNDER SECRETARY TO G
8 NOV 1960
PUBLIC DEPARTMENT

Seventy miles from Tokyo, at Tokai-Mura, The General Electric Company Limited of England and Simon-Carves Limited are building Japan's first full-scale earthquake-proof nuclear power station. When completed in 1965, this will represent a triumph for nuclear engineering. On the opposite side of the world, at Hunterston, G.E.C. and Simon-Carves are building one of the world's largest nuclear power stations to provide electricity for the south of Scotland. Both companies have joined forces to form a Group which, with vast resources, is able to design, build and install nuclear power stations to suit local conditions anywhere in the world. There are many reasons why the Group is in a unique position to do so. The G.E.C. is a world-wide engineering organisation. Founded more than seventy years ago, it now employs 70,000 people and is one of the largest electrical and mechanical engineering companies in the world. It produces a wide variety of equipment ranging from the smallest motor or switch to the complete equipment for power stations and materials handling plants. Simon-Carves Limited are one of the leading British specialists in large steam-raising plant, coal cleaning and carbonising plant, chemical and civil engineering. Both companies have large resident engineering and contracting staffs in India. They are happy to be making major contributions to the building of the new steelworks at Durgapur for the Government of India.

410

it would be a loss if the momentum that was gathering should be checked by fixing a low target.

Next we shall examine the financial allocation for shipping against the entire pattern of Plan allocations. The following table shows the financial outlay in the public sector for broad economic sectors:

Name of Sector	First Plan 1951-56 Amount (Crores)	%	Second Plan Revised Amount (Crores)	%	Third Plan Draft Amount (Crores)	%
Agriculture and C.D.	299	14.8	510	11.3	1025	14.1
Irrigation and Power	585	29.1	820	18.2	1575	21.8
Village and Small Industries	44	2.2	160	3.6	250	3.4
Industries and Minerals	56	2.8	790	17.5	1500	20.7
Social Services	423	21.0	810	18.0	1250	17.2
Miscellaneous	74	3.7	70	1.6	200	2.8
TOTAL	1481	73.6	3160	70.2	5800	80.0
Transport and Comunications	532	26.4	1340	29.8	1450	20.0
Grand Total	2,013	100.0	4,500	100.0	7,250†	100.0
† Current outlay	1050					
† Investment	6200					

It is unnecessary here to deal with the question whether the overall size of the outlays represents the 'Optimum or Critical minimum effort'* required to secure the highest possible economy, growth and balance. Assuming the size of the outlays as given, it should be considered whether the allocation between the broad categories, and more especially for shipping, can be regarded as satisfying a general sense of 'economic justice.'

One feature of the above allocation that is pertinent to the present analysis relates to the trend of allocation for transport in the three plans. While the Second Plan allotted 2½ times more than the First Plan, the Third Plan proposes an increase of only about 1.7 per cent over the Second Plan outlay. In terms of percentages of the total plan outlay, the allocation for transport represent 26.4, 29.8 and 20 per cent respectively for the three Plans. Thus, in the proposed outlays for the Third Plan there is a drastic cut by about 10 per cent compared to the Second Plan in the outlay under transport. This needs explanation.

It has to be recognised that, in the early stages of economic development, transport deserves great priority as it belongs to the basic category of investment. It is necessary to strengthen the transport base in order that the other sectors of the economy such as agriculture, industry and trade may all be stimulated to develop. There is need to increase the total allocation for transport in the Third Plan because it would benefit also the development of shipping for which a larger planned effort is essential.

The table below shows the financial outlay on shipping and port and harbour development during 1951-66:

(Rupees in crores)

	First Plan (1951-56)		Second Plan (1956-61)		Third Plan (Draft: 1961-66
	Provision	Actual	Provision	Actual (Revised)	Provision Esti-mated)
Shipping	26.30	18.71	56	56	55
Ports and Harbours	36.91	27.59	48.5	48.5	45
Total	63.21	46.28	104.5	104.5	100

* See: Leibenstein: Economic Backwardness and Economic Growth: Chapter 8.

In both the First and the Second Plans the outlay on shipping and ports and harbours together constitute 2.3 per cent of the total outlays of the respective plans. A continuation of the same percentage would secure for this group during the Third Plan an amount of about Rs. 167 crores. But the draft outline as published has provided only Rs. 100 crores. This would be a serious disappointment to the shipping interests in the country. As the final shape of the Third Plan is yet in the making it may be urged that the Government of India should consider the case of Shipping for a larger financial allocation.

Without entering here into an elaborate theoretical discussion of the allocation of resources, a few points may be mentioned in order to emphasis, in a general way, the place of shipping in a developing planned economy like ours which favour big investments on shipping.

First, shipping is one of the most significant sectors of modern economy. It represents one of the 'growing points' in the sense that investments in these focal areas set in motion a chain reaction of developments in the related and complementary sectors leading sharply to a cumulatively high rate of growth.

Second, we must consider investment on shipping in the light of our balance of payments position. A developing economy like ours is bound to experience balance of payments difficulties, especially in the early stages of the process of growth. One of the supreme objectives of investment allocation should rightly be the minimising of these difficulties. This involves adequate investment in lines which promote export capacity and reduce import dependence. National shipping secures the latter directly by substituting national in place of foreign shipping service and helps the former indirectly. As pointed out earlier, our dependence on the import of shipping services is quite considerable involving a payment of about Rs. 130 crores per year. With an increase in the total foreign trade in the future, if there is no corresponding increase in our shipping tonnage, the dependence on foreign shipping services would increase still further. On this ground the import-competing Indian shipping enterprise deserves substantial increase in investment.

Considerations like the above should help us to state in broad terms that the rate of shipping development envisaged and the allocations made in the Third Plan are much smaller than they might be and that a higher outlay would be both desirable and economically feasible.

THE BUSINESS WORLD

Gold, the Dollar and Bank Rate

By
PAUL BAREAU

(The 'Eastern Economist' introduces with this article a new series by distinguished financial correspondents abroad. Mr. Paul Bareau formerly of the 'News Chronicle', Mr. Andrew Boyd of the 'Economist', London, and Mr. Rees-Mogg of the 'Sunday Times' have kindly agreed to contribute regularly to this new series—Ed.)

WHEN we look back on the economic events of 1960, we shall probably award the palm for importance and future significance to the storm which broke over the gold bullion market in the second half of October. There had been some premonitions of trouble. Throughout September, European central banks had been converting into gold an exceptionally large proportion of their earnings of dollars. Instead of doing this through official channels in New York, as they were legally entitled, to, they showed a preference for using the London market, even though it meant paying a somewhat higher price than they would have had to pay if they had done the deal direct with the Federal Reserve Bank of New York. The reason for this choice of London as the market in which these central banks bought gold was no doubt an understandable desire to avoid the critical eye of the U.S. authorities and not to appear to be lending themselves to a wholesale conversion of dollar balances into gold.

As a result of these operations the gold price in London had, by the beginning of October, begun to edge slightly beyond the gold export point from the United States and had touched $35.25. This position could still be regarded as normal and had in no way prepared the market for the break through the parity price which occurred on the 18th October. It was no longer central banks, but private investors and speculators who suddenly rushed into the market as sellers of dollars and buyers of gold. In a matter of hours they had rushed up the price to the equivalent of $41 per ounce. This flurry did not last long and a semblance of quiet was restored to the market within a week. The position, however, remains abnormal in that the free market price of gold is still well outside the range of the official gold points. The episode is being played down by the United States but its importance is not open to question.

The world may no longer be operating an orthodox gold standard but gold still has two primary functions to perform. It is still in terms of gold that currency parities are measured, notified to the International Monetary Fund, and that in consequence exchange rates are determined. Secondly it is still gold which is used the world over, including the Communist bloc, to settle ultimate balances of payment between countries. To these should be added a secondary but nonetheless important function, namely, that it is still to gold that many private investors rush in times of trouble and uncertainty.

When, therefore, the market price of gold broke loose from the official price of $35 an ounce — a price fixed as long ago as 1933 — the whole international structure of monetary values and exchange rates was called into question.

The reasons for this rush into gold were many, but most of them can be found to focus on the dollar and in particular on a loss of confidence in this currency. For three years the United States has had to meet a persistent balance of payments deficit. This deficit, let it be said, is due in the main to the export of capital and continuing economic assistance which the United States give to other countries. But deficit it is, nonetheless, and it has led to substantial losses of gold. The U.S. Treasury's reserves have fallen since the end of 1957 from $22.9 billion to $18.5 billion.

Lack of confidence in the dollar has been accentuated by the uncertainties of the Presidential election campaign and by speculation about the economic policy that is likely to be pursued by the new administration. Above all, however, the main undermining influence has been the undoubted worsening of the economic situation in the United States and the suggestion that industrial production is likely to lag for some time to come. This has caused the U.S. authorities to engage in a really massive effort of pump priming. They have allowed interest rates to fall and they have helped this movement by considerable easing of their commercial banks' reserve requirements.

The immediate result of the fall in interest rates has been to cause a flood of hot money to leave the United States and seek temporary employment in London and other European financial centres. This has been the main pull on U.S. gold reserves and has been largely responsible for the continued reinforcement of the reserves of several European countries, including those of the United Kingdom, where the inflow of hot money has veiled an undoubted deterioration in the true balance of payments.

This explains the requests from Washington and New York to Europe to ease matters for the United States by reducing interest rates. This request has been answered by France, and more recently by the United Kingdom, but so far not by Germany, though by reason of its strong creditor position, that country should have been the first to respond.

Even if all European countries reduce their rates, it will not solve the dollar problem. The question whether the dollar can remain intact and the dollar price of gold held at the level at which it has been fixed since 1933, still has to be answered.

A confident answer can only be given when far more is known about the kind of economic policy that will be followed by the new American administration. It cannot, however, be denied that the recent flurry in the gold market has destroyed the illusion of permanence in the present relation of currencies, whether with gold or to one another. It has also raised many hopes that a concerted international effort may yet be made to remove from the present structure of exchange rates some of its grosser abnormalities, including that of a major under-valuation of the German mark.

The Crisis of the Closure of Chemicals

By CROESUS

THE Gujarat Government is known to be going all out to assist industries in the new State. Both the Ministers and the State officials, it is gratifying to learn, are extremely helpful and co-operative. Occasionally, though, one hears of some complaint or other, the existance of a sympathetic government is highly reassuring, besides being a guarantee that all genuine grievances will be duly and effectively redressed.

Some time ago, there were reports in the daily press alleging that the Government of Gujarat had made a rather fantastic proposal, namely to charge rates for supplies of water proposed to be made to the new rayon companies that are being located in the State by the meter. It is not known what has happened to this proposal, but one hopes the last has been heard of it. Meanwhile, another report in the daily press calls attention to the stoppage of supply of sea water, steam, and power to the Saurashtra Chemicals in Porbandar, thereby rendering the plant suddenly idle. Stoppage being due to **force majeure** thus, it follows that the workers will have to go without work. Incidentally, it may be noted here, that, under the existing agreement, the Government is required to supply to Saurashtra Chemicals not only power from its power house but steam and sea water as well. It is needless to say that, unless all the three complementaries are made available, the Saurashtra Chemicals plant cannot function. Accordingly, power and steam, which are believed to have since been made available to Saurashtra Chemicals have not made any difference to the prevailing stalemate. It is only when sea water also is made available that the plant can be fully commissioned again.

Now, from all available accounts, it would appear that the position regarding supply of sea water has become quite uncertain as a result of the serious damage to impellers of all the pumps installed for the purpose by the Government. No one can say that this trouble was not, or could not have been foreseen. For, four months past, there have been reports about the unsatisfactory working of these pumps, and the need to replace them atleast in part, if not wholly, seems to have been felt by those immediately concerned. But what has been, and continues to be, a mystery is the action or measures taken by those in charge to meet the situation. True, the present Gujarat Government cannot be wholly blamed for this, although, it is unfortunate, this major upset has taken place after the formation of the new State. In other words, this seems to be more a legacy from the erstwhile bilingual State of Bombay. According to informed sources, under bilingual Bombay, Porbandar was verily a neglected region, so neglected, indeed, that the then Chairman of the Electricity Board condescended to visit the power station, a major installation in the public sector there, only once in two years!

Be that as it may, what has happened has happened, and there is no use crying over spilt milk. The State Government should now make this unfortunate closure of the Saurashtra Chemicals plant an occasion to go into the whole matter of supply of power, steam, and sea water to this unit and supply of power to other industries in the region generally, in order to ensure that there is no repetition of such happenings in the future. Otherwise, not only will production of important commodities like caustic soda and soda ash in the country suffer, but unemployment also will increase, leading to industrial unrest. It is troubled waters, which occasions such as the closure of major plants like this provide, that our leftist friends would love to fish in. In fact, it is said, they have already become active in Porbandar. It is time, therefore that the Government of Gujarat work up and became alive to the realities of the situation.

There is another very important aspect to which, I daresay, the attention of the authorities has been drawn ere now. It is the possible expiry of the period of guarantee by the suppliers of the machinery. Normally, whenever a big factory such as the Saurashtra Chemicals is put up, the suppliers of machinery would be required to watch the working of the plant for an agreed period, known as the "Guarantee period", to ensure the promised performance and set right defects, if any, noticed in actual working during this period. This, of course, presupposes uninterrupted production for a reasonably long spell of time. I am not quite sure whether, right from the time the Saurashtra Chemicals started working sometime in December last, it has has been in continuous operation for a sufficiently long stretch of time to enable the suppliers of machinery properly to observe the performance of the plant and set right the teething troubles, but the unfortunate part of it is that the frequent stoppages that have occurred are due not so much to lapses on the part of the management of Saurashtra Chemicals as to the failure of the State Government to supply the three services — sea water, steam, and power — as per undertaking. The intriguing question that arises now is: who should be held responsible if the "guarantee period" draws to a close and the management is not enabled, for no fault on its part, to let the supplier of the machinery observe the working of their plant and hand it in proper and satisfactory working condition, as per specifications, to the management? Although the suppliers, in this case, who have themselves watched the entire working, may not literally stick to the letter of the agreement — they may not do so if only because of their anxiety to build up goodwill for their machinery in this country — the possibility must be faced! To a layman like me, it is obvious that the party to blame in these circumstances is the Government and none else. But, then, the Government, although it may readily accept the blame, may also get away with it by attributing the lapses to reasons beyond its control — **force majeure**, again—but who will foot the bill for rectification of any defects that may be observed after the guarantee period if, perchance, this period is not mutually agreed to be extended? I have no doubt whatsoever in my mind that, morally, at any rate, the responsibility is the State Government's.

Business Notes

I.B.R.D.

$20M FOR ICICI

WITH THE signing of the agreement on October 28, 1960 between the World Bank and the Industrial Credit and Investment Corporation of India Ltd., approving a further loan of $20 million to the I.C.I.C.I., the foreign exchange requirements of the Private sector in this country may be said to be assured for sometime to come. Actually, the I.C.I.C.I. estimates that the proceeds of the loan would help the Corporation meet the foreign exchange requirements of its would-be borrowers for the next two years. The significance of this further loan by the World Bank to the I.C.I.C.I. is all the greater, considering that the request of the Industrial Finance Corporation of India for a foreign exchange loan has reportedly been turned down by the World Bank, let alone the low level to which our foreign exchange reserves have fallen.

Together with the latest instalment of the loan, the I.C.I.C.I. will have received $40 million from the World Bank, the whole of which is used or intended to be used to meet the foreign exchange requirements of the projects financed by the I.C.I.C.I. Out of the first two World Bank loans of $10 million each, the I.C.I.C.I. has allocated foreign exchange requirements to 32 projects, including electrical, chemical, mechanical, shipping, textile, fertiliser and building material industries.

It is estimated that, on an average, each of these projects will generate annual net foreign exchange savings to the tune of at least the amount of the foreign exchange invested in that project.

It is noteworthy that as much as about 60% of the I.C.I.C.I. loans today are in foreign exchange. During the past 18 months the I.C.I.C.I.'s foreign exchange loans have been at the rate of some $10 million a year, which explains that the funds provided by the $10 million World Bank loan of July, 1959 has already been committed. This is at once an indication of the vitality of the private sector of the Indian economy and the present high rate of industrial activity in our country. It also testifies to the I.C.I.C.I's improved facilities in processing the applications, not to mention the continued shortage of foreign exchange. As the proceeds of the first two foreign exchange loans by the World Bank have been virtually exhausted, it is just as well that the World Bank's new loan of $20 million has already been assured. This should enable the Corporation to meet the foreign exchange requirements of its prospective borrowers. If the same tempo as in the past year and a half is maintained—there is, however, some doubt on this point by reason of the stringent credit restrictions that obtain today—the entire proceeds of the latest loan should be absorbed before the end of 1962. Although the latest World Bank loan is for a term of ten years, it may be extended for 14 years by mutual agreement between the World Bank and the I.C.I.C.I., wherever it is felt that a given project requires a longer period. The amortization of the new loan will begin on November 1, 1963. As in the case of the previous loans, the Government of India has guaranteed the latest loan also.

Engineering

ELECTRICAL FACTORY AT BHOPAL

THE PRIME MINISTER will perform the formal opening ceremony of the Heavy Electricals Factory at Bhopal on November 6. The construction of factory has already gone half-way through and out of the five sections, two — the maintenance building and the switchgear shop — have already been commissioned. The transformer shop is expected to be in production before the year is out and the remaining two manufacturing buildings are expected to be completed by the end of 1961. Originally the target of the factory was the annual output of heavy electricals of the value of Rs. 12.5 crores. It has been raised so that by 1966 the output would be worth around Rs. 25 crores and by 1971 worth Rs. 50 crores. Qualitative change too has been kept in mind so that the plant would gradually produce items of large capacity. For instance the maximum size of generators and transformers planned to be produced has been raised from the original 50,000 kw to 150,000 kw in view of the latest assessment of needs.

One significant feature of this plant has been that the training of necessary technical hands has been handled with utmost care. As a first step after the report of the Associated Electrical Industries, the technical consultants commissioned to prepare it, a large training school with workshop was set up. It was, perhaps, the largest and best-equipped in India and could be ranked among the good training centres in the world. At present about 3,000 persons are undergoing short-term training and some experienced engineers have been sent to the U.K. for extended training courses; 97 of them have already returned and about 90 are still there. In view of the fact that many public sector projects suffered for want of necessary technicians, this factory seems to have taken advance action in this respect.

Kerala Economy

HANDICAPS FOR EXPANSION

AT THE 103rd annual general meeting of the Cochin Chamber of Commerce, Mr. T. A. K. Nair, in his presidential address, dwelt at length on some of the economic problems facing the State of Kerala. He pointed out that lack of peaceful industrial climate had been mainly responsible for deterring private enterpreneurs from setting up large-scale industries in Kerala. The low figure of private sector investment corroborates this conclusion. Flow of foreign capital appears to have been impeded by certain disabilities which foreign corporate bodies have to face. For instance, the manner in which the provisions of Section 42 of the Income-Tax Act are being interpreted is proving detrimental to foreign concerns which would otherwise be keen on investing capital. If industrial backwardness in the State is to be removed, Mr. Nair asserted, the State Government must attract private capital and enterpreneurship in which the State Government cannot be said to be sufficiently experienced. Out of the total investment proposed of Rs. 657 crores for the entire country in the Central Industrial Sector under the Second Five-Year Plan, the actual investment made in Kerala was just Rs. 79 lakhs (for the D.D.T. factory at Alwaye) which works out to 0.1 per cent of the total.

The inadequate power supply in the State of Kerala is the worst aspect of the economy. The immediate problem facing the State is the present short-fall of about 30,000 kilowatts, which will be felt most between January 1961 and June 1962. The worst period of these eighteen months is likely to be from October, 1961, when electric energy of about 10,000 kilowatts will have to be diverted for Punja cultivation.

The only way to avert this crisis, Mr. Nair pointed out, is to install diesel sets of suitable capacity (totalling up to say 20,000 kilowatts) before June 1961. This might involve a capital expenditure of Rs. 1½ crores, but it was a must, if industrialization in this State is to make any headway. Referring to the trade aspect, Mr. Nair disclosed that the total import and export trade of the Cochin Port for 1959-60 stood at 20,46,337 tons (imports 15,24,847 tons and exports 5,21,490 tons) as compared with the total of 18,81,603 tons in 1958-59 (13,33,934 tons of import and 5,47,669 tons of exports). This incidentally underlines the importance and the progressive character of this port where the Government of India has decided to locate the second shipbuilding yard.

FROM THE CAPITAL'S CORRIDORS

PUBLIC PARTICIPATION IN STATE ENTERPRISES

THE Study Group, consisting of Mr. D. L. Mazumdar, Secretary, Company Law Department (Chairman), Mr. S. Boothalingam, Secretary, Ministry of Steel, Mr. S. Ranganathan, Secretary, Ministry of Commerce and Industry, and Mr. Tarlok Singh, Additional Secretary, Planning Commission, set up by the Planning Commission to go into the pros and cons of public participation in the share capital of State enterprises and to draw up a scheme for that, has expressed the view that "if public participation in the financing of Government companies could be arranged in a suitable form and on a reasonably wide basis, accompanied by an imaginative programme of constructive public relations work, it may be of advantage to the working of these companies." The Group thinks that any proposal which has the effect of letting in an increasingly larger number of people into the activities of Government will generate better understanding and appreciation of the processes involved in the industrialization of the country, and to that extent may help to promote and speed up industrial development.

DIVERSION OF INVESTIBLE FUNDS?

After examining in detail the issue of whether or not throwing open of the capital of State enterprises for public subscription will result in diversion of funds from the private sector to the public sector or from investment in Government securities, the Group says, "It is possible to formulate a proposal in such a way that instead of merely diverting investments from existing securities, the scheme, in effect, makes some addition to the total investments in the public and private sectors." Recent events, the Group points out, reveal the existence of pools of resources, may be of limited size, which now lie dormant both in the organized and in the so-called unorganized sector of the country's economy. It should be possible through a carefully devised scheme to draw upon these pools of resources, so that they may be utilized for participation in types of investments which provide a high degree of security, combined with reasonable rate of return, although not necessarily at competitive rates. While in the absence of any systematic exploration of this new terrain, still inadequately surveyed from the point of view of its investment potential, it would be unrealistic to expect any large-scale additional investible resources from these scattered pools of savings, the existence of these sources in the context of the present proposal should not be ignored. On the contrary, the new types of investment opportunity offered by the scheme envisaged by the Group may, under suitable conditions, succeed in activising these dormant pools and to that extent act as a catalyst and help in the gradual transformation of the country's traditional capital market. Further, if the recent trends in the investment market portend some long-term changes in its structure and behaviour pattern, the relatively small but new class of operators in this market may also be attracted to the new type of investment made available by the unfreezing of portions of the share capital of selected Government companies. If this expectation materialises, the Group considers that the measure of diversification in the utilization of the sources available to the investment market induced by the contemplated scheme may introduce a desirable element of dynamism into it. In any case, apart from all these considerations, the risk of diversification of resources from one sector to another or from one type of investment to another in the same sector, which is apprehended by some people, need not necessarily be serious, if a proper scheme which takes note of this risk is carefully worked out."

AN EXPERIMENT

The proposal, the Study Group says, will have to be tried out, in the first instance, as an experiment and worked out on a limited basis. This necessarily restricts the number of companies where the experiment could be tried to two or three. The choice of companies is further limited to those which offer the maximum possibility of absorption of private capital. The company with an expansion programme which may prove attractive to prospective investors, will also come within this category. Though, normally, companies which are still in the construction stage and, therefore, unable to offer any return on the equity capital in the immediate future, are not expected to offer sufficient attraction for private investors, the possibility of such companies also inviting the general public to share in the burden and responsibility of promoting new lines of activity in the public sector even at the construction stage should not be ruled out. If the experiment succeeds, the list could be progressively extended at the discretion of the Government. The start, in the opinion of the Study Group, could perhaps be made with (1) Sindri Fertilizers and Chemicals Ltd., (2) Hindustan Machine Tools Ltd., and (3) some selected State undertakings, namely, State Road Transport Corporations.

DEFENCE INDUSTRIES

The Study Group has expressed the view that some Government companies, by reason of the activity which they carry on or for other reasons of administrative policy, may never be suitable for inclusion in this scheme. These companies will generally fall under the categories: (a) companies engaged in the production of goods required for the defence of the country; (b) companies in respect of which security considerations would not permit public participation; and (c) companies engaged in monopolistic and quasi-monoplostic ventures, comparable to the fiscal monopolies in some countries of the world. In respect of these companies, the Group thinks, the Government will desire, as a matter of policy, to retain 100 per cent control in its own hands.

In order to enable persons of relatively modest means, including the employees serving in these undertakings, to subscribe to the shares of Government companies, the Study Group says it would be necessary to issue the shares in small denominations of say Rs. 100 each.

CORNERING OF SHARES

On the question of stipulating a limit on the holding of shares of State enterprises by individuals or corporate bodies, whether in the public or private sector, the Group has not suggested any definite policy to be followed. It, however, says that in case it is decided to exclude corporate bodies from holding the shares of State enterprises, co-operative societies should not be debarred from taking up these shares. To avoid concentration of shares in private hands to an unlimited extent, it may be necessary that Articles of Association of the Government companies, in the share capital of which public participation would be allowed, will have to be suitably amended to prevent the post-allotment acquisition of shares in excess of the prescribed limit.

Here in January!

India's First Financial Daily Newspaper

THE FINANCIAL EXPRESS

EDITED BY G. M. LAUD

Comprehensive Coverage of

- Market Trends & Quotations
- Foreign Markets
- Banking & Finance
- Industry, Trade & Transport
- Market Intelligence
- State Policies & Trends
- New Issues & Dividends
- Investors' Queries
- News of the World

Complete News and Feature Service for Bankers, Financiers, Investors, Industrialists and Commodity Traders.

With the advent of *The Financial Express* in January, business-men will be able to read each morning the trends of the world markets and economy...latest quotations from all the stock exchanges in India and the commodity markets...news about Government policies, new enterprises, new developments in production and management...impartial analyses of company balance sheets...and intelligence reports for import-export trade.

The Financial Express will be edited by G. M. Laud, the well-known financial journalist, author and banker, backed by all the resources of the Express Group of Newspapers—your guarantee of reliability.

Business will begin each morning with The Financial Express.

A Publication of the Express Newspapers Group from Newspaper House, Bombay 5.

Shakespeare once observed "Beauty is an innate craving of man—so he seeks to dwell in lovely parts of the creation." No age has ever been immune to this captivating spirit of Beauty, the balm of life. Even mother Sita of our epic age fell a victim to the attractions of beauty when she noticed an illusory golden deer, and longed for having it, which resulted in the out-turn of a chain of momentous events in the social life of that epic age.

The Deer is virtually a charming and comely animal which infatuates a man at the very glance.

We do admire this instinct of man and offer our ocean deep ovation for the some. Hence, we have chosen deer as a symbolising brand for our cloth of varying varieties so exquisite, enduring and of so endearing a price.

Our Specialities are:

PRINTS, SHIRTING, COATING, LENOS,

FLANNEL and TOWELS, etc.

Regarding the issue of shares of State enterprises to the public at a premium, the Study Group says, "It would be equitable, that having nursed these companies to their present position, Government should be entitled to ask for a reasonable price for the portion of the equity of these companies which it proposes to transfer to the public. The price at which the shares should be issued would necessarily depend on the financial position of the companies concerned, their profit-earning capacity and their estimated prospects of growth about the time of the proposed issue, and would be determined on the basis of broadly accepted accounting principles relating to the valuation of shares. This will be a matter primarily for accountants and investment analysts, and, necessarily, the price of the shares would vary from company to company." In this connection, the Group mentions the practice followed in West Germany. It recalls that when 'Preussog', the State Coal and Oil Company, was denationalized and 'privatised' there in 1959, its shares were offered to the public at a premium of 40 per cent. Another instance given is that of the shares of the recently 'privatised' Volkswagon Works. These shares were issued at a premium of 100 per cent.

The Study Group thinks it would not be desirable to impose any restrictions on the listing of these shares on the recognized stock exchanges. This would render them more attractive to the public than they would otherwise be. It will, however, be necessary to carefully watch for some time the way they are dealt with in the exchanges after their listing, so that market manipulations do not thwart the basic objects underlying the experiment.

CONSEQUENTIAL CHANGES

As a corollary to its above recommendations, the Study Group has further suggested:

(a) It would be necessary to convert the Government companies part of whose share capital is thrown open for public subscription, into public companies. The restrictive clauses incorporated in their articles, in terms of the requirements of the law relating to private companies, will have to be suitably amended by a special resolution of the companies concerned.

(b) In accordance with the provisions of section 44 of the Companies Act, the selected companies would have to file with the Registrar of Joint Stock Companies either a Prospectus or a statement in lieu of Prospectus, within a period of 14 days from the date of their conversion into public companies. While the requirements of the law would be met by filing a statement in lieu of Prospectus, if the offer to the public is to be made by unloading a portion of the existing holdings of the Government in these companies, it is suggested that, in accordance with good company practice, it would be desirable for these companies to issue a Prospectus on the broad lines of Schedule II to the Companies Act, setting forth the particulars of the offer to the public for their information. In any case, this may be necessary if the provisions of section 64 of the Companies Act are to be attracted to any offer of sale to public proposed to be made out of the present holdings of Government companies.

The conversion of the selected Government companies into public companies, the Study Group points out, will necessitate some consequential formal changes in their articles in order to enable them to fall in line with the provisions of the law relating to public companies. It has drawn attention to the following more important of these changes:

(a) At present, the directors of Government companies are all appointed by the President. Since, in the case of the Government companies selected for the purpose of the present proposal, Government would be holding at least 75 per cent of their equity capital, there should be no difficulty in complying with the requirements of section 255 of the Companies Act which lays down that not less than two-thirds of the total number of directors of a public company should be persons whose period of office is liable to termination by the retirement of directors by rotation, and who should, unless otherwise expressly provided in the Act, be appointed by the company in the general meeting. The voting strength of Government even after a portion of the share capital of the selected companies has been offered to the public, would be sufficient to ensure that suitable directors are elected by the company in the general meeting. If the Government further desires that a representative from the general public or the employees who may have participated in the share capital of these companies should be elected on the Board, it should not be difficult for it to ensure this.

(b) A suitable provision should be made in the articles of the selected Government companies, empowering the Board of Directors of these companies to refuse the transfer of any share, without assigning any reasons for such refusal, subject to the provisions of section 111 of the Companies Act, unless the present articles of the Government companies already contain such a provision.

(c) There should be no objection to the continued retention in the articles of Government companies of the usual provision contained in them, reserving certain powers to the President of India. If Government so desires, further necessary powers can be similarly reserved, provided they do not contravene the provisions of the Companies Act or are otherwise inconsistent with or repugnant to its spirit.

(d) The conversion of selected Government companies from private into public companies would not affect the present provision in their articles for the issue of directions by the President.

DIVIDEND POLICY

The dividend policy at present followed by Government companies, the Study Group observes, will also need some further consideration. If a Government company, a portion of whose equity capital is offered to the public, has been following an ultra-conservative dividend policy in the past, it would be desirable for the Government, after a portion of the capital of this company has been offered to the general public, to review its dividend policy and to consider if this policy should not be brought in line with the best company practice in a comparable field. If, for reasons of wider economic policy, it is not considered desirable to change the dividend policy of such a company, it is suggested that the management should take tne non-official shareholders into confidence and explain to them the full implications of the wider economic policy implicit in the decision of the management relating to the dividend policy of the company.

MANUFACTURE OF WATCHES

The Government of India has laid down a definite policy for the import of raw materials and components required to manufacture watches, clocks and time-pieces in the small-scale sector.

The suitable type of watch recommended for manufacture in this sector is 10½ or 11½ ligne centre second Gents' full-lever jewelled watch; the manufacture of ladies' watch is not recommended at this stage. The c.i.f. value of the watch recommended for manufacture would be Rs. 28 to Rs. 30.

To begin with, production capacity would be 1,000 numbers of watches per month per unit, increasing to 1,500 numbers per month in the third year of manufacture and 2,000 number per month in the fifth year. Each unit intending to take up the manufacture will sub-

mit a phased programme to the Director of Industries of its State for the manufacture of certain parts in its own factory. Import of components would be allowed according to the following phased programme, based on Rs. 28 as the c.i.f. value of a complete watch:

Year of manufacture	Maximum annual capacity of a unit	c.i.f. value of imported parts per watch
First	upto 12,000 nos.	Rs. 14
Second	upto 12,000 nos.	Rs. 12
Third	upto 18,000 nos.	Rs. 8
Fourth	upto 18,000 nos.	Rs. 6
Fifth	upto 24,000 nos.	Rs. 4

After the expiry of the fifth year of manufacture, the import of parts like main springs, hair springs, balance wheels and jewels would be considered, if such parts are not available from indigenous sources, upto a maximum value of Rs. 4 per watch. Import of cases, hands and dials would not be allowed from the very beginning. Licences for various parts would be issued on the basis of an essentiality certificate granted by Directors of Industries in the States.

In addition to the import of compenents that would be allowed according to the above programme, import of raw materials such as brass and stainless steel, and any miscellaneous items would be allowed according to the phased programme for the manufacture of parts upto Rs. 3 per piece.

Small-scale units can also take up the manufacture of some parts required for the assembly of watches as well as for meeting the requirements of replacement market. Some typical examples of parts which would be made by each unit are: (i) watch cases; (ii) dials and hands; (iii) plastic glasses; (iv) screws and winding buttons; (v) wheels and pinions; (vi) bottom plates, top bridges, lever bridges, balance bridges; and (vii) barrels, barrel arbours and winding arbours. All these parts will have to be made from the raw material stage and import of such raw materials would be allowed.

MANUFACTURE OF CLOCKS

Mechanically-wound pendulum clocks (striking and non-striking) and electric clocks can be manufactured in the small-scale sector for a c.i.f. value of Rs. 10 to Rs. 12. The following would be the phased programme for their manufacture and import of components, based on the c.i.f. value of Rs. 10 per clock:

Year of manufacture	Maximum annual capacity of a unit	c.i.f. value of imported parts per clock
First	upto 6,000 nos.	Rs. 2
Second	upto 8,000 nos.	Rs. 2
Third	upto 10,000 nos.	Re. 1

Import of only main springs, gong rods, suspension springs and levers would be allowed within the value mentioned above and that too on the basis of an essentiality certificate to be issued by the Director of Industries of the State in which the manufacturing unit is located. After the third year of manufacture, import of only springs would be considered. In addition to the import of parts as given above, import of raw materials — brass strips and brass rods, brushed aluminium, special steel strips, rods and wires — and any miscellaneous items would be allowed upto Rs. 4 per clock. The essentiality certificate will be required for these imports too.

On the basis of the pack value of imports suggested above and assuming that several parts would be purchased from outside sources, it would be possible for the small-scale units to commence assembly-cum-manufacture of clocks with parts made by each unit, parts procured from other units and parts imported within the pack value, with an investment of Rs. 1,00,000 on machinery and toolings to begin with and increasing the same to Rs. 2,00,000 in the third year of manufacture. A self-contained unit for the manufacture of all parts, except main springs, for 10,000 clocks per annum in the third year would require a total investment of about Rs. 3,50,000 on machinery, toolings and fixures including some tool room equipment.

Ancillary small units could be set up for the manufacture of certain parts of clocks to serve as feeder units to the manufacturers of clocks as well as for meeting the requirements of the replacement market. In such cases, the parts would have to be made right from raw materials and import of raw materials of the desired quality would be allowed. The following are some of items which ancillary units can produce:

(1) Manufacture of dials, hands, pendulum bobs, eyelets. The production of these parts can be taken up by one unit with an investment of about Rs. 30,000.

(2) Manufacture of spindles, brass collars, rivets, screws. One unit can take up the manufacture of these parts with an investment of about Rs. 45,000 on machinery and toolings.

(3) Manufacture of pinions and gears. One unit can take up the manufacture of pinions and gears with an investment of about Rs. 1,50,000 on machinery and toolings, which will give a total output of pinions and gears worth about Rs. 4,00,000.

Raw materials to be imported for the above would be decided by the Directors of Industries in the States on the basis of merits of each manufacturing programme.

Manufacture of electric clocks can also be taken up in the small-scale sector within the capacity proposed for clocks. No parts for electric clocks would, however, be allowed to be imported separately. Synchronous motors (self-starting and non-self-starting) required for electric clocks can be supplied by any Central or State agency or by the National Small Industries Corporation to the small-scale units. The National Small Industries Corporation or any Central or State agencies would either purchase such synchronous motors from indigenous sources or import the same to the extent required to bridge the gap between the requirements and the availability from indigenous sources. Imports of raw materials would be allowed on the same basis as for mechanical clocks.

ONE-DAY ALARM TIME-PIECES

Time-pieces of both lantern and solid pinion types can also be manufactured in the small-scale sector. The time-pieces proposed for manufacture should correspond to the type of the time-pieces that are being imported at present within a c.i.f. value of Rs. 8 to Rs. 10.

The following would be the phased programme of manufacture and import of components for time-pieces, based on Rs. 8 as the c.i.f. value of a complete time-piece:

Year of manufacture	Maximum annual capacity of a unit	c.i.f. value of imported parts per time-piece
First	upto 24,000 nos.	Rs. 3
Second	upto 30,000 nos.	Rs. 2-8
Third	upto 36,000 nos.	Rs. 1-8

Imports of hair springs, balance wheels, balance staffs, balance bearing screws, escape wheels, levers and main and alarm springs would only be allowed within the values mentioned above. After the third year of the manufacture, the import of parts would be considered only if the same are not available from indigenous sources. The list of parts to be imported on the above basis would have to be certified for essentiality by the Directors of Industries in the States.

In addition to the import of components that would be allowed according to the above phased programme, import of raw materials such as brass sheets, brass rods, free cutting steel and special steel, electroplating salts and chemicals and any miscellaneous items would be freely allowed upto Rs. 3 per piece.

Based on the pack value of imports as would be allowed and assuming that a few parts could be ordered from outside sources, it would be possible for small-scale units to begin with the assembly-cum-manufacture of time-pieces with an initial investment of Rs. 2,00,000 on machinery and toolings, increasing to Rs. 4,00,000 in the third year of manufacture.

There is scope for setting up one or two complete plants for the manufacture of main springs for clocks, time-pieces and watches. The raw materials required for this job would be allowed to be imported.

LOCATION OF PUBLIC SECTOR PROJECTS

The Government of India has decided to determine in future the location of public sector projects by reference to a Committee whose recommendations in this regard would ordinarily be accepted. The controversy over the location of the Heavy Machine Tools Project and the Alloy Steel Plant, it is understood, is largely responsible for this decision. Some State Governments, it is learnt, have objected to Ranchi being selected as the site for setting up the Heavy Machine Tools Project. So far as the site for putting up the Alloy Steel Plant is concerned, as already reported in this column, the Consultants' first choice is Durgapur, Rourkela being the second preference. A section in the Planning Commission, however, would like to locate this project at Bhadrawati, in Mysore.

The Committee procedure can solve the problem, provided there is no Ministerial interference with the recommendations. But will Ministerial pulls end in such matters? Doubtful. The controversy over the establishment of oil refineries at Barauni and Gauhati is not too old to be forgotten.

COMPANY LAW CLARIFICATION

The Department of Company Law Administration has clarified that the non-holding of annual general meeting of a company by its officers, as required under the Companies Act, will not be considered a defence against penalty for offences like failure to present accounts of the company before the general meeting or non-filing of the annual list of members and summary of share capital with the Registrar of Companies. A breach of each of these provisions, the Department has pointed out, is an independent offence and is liable to separate penalty, according to the provisions of the Companies Act.

GOVERNMENT DEMANDS AND PURCHASES

The Director-General of Supplies and Disposals, Union Ministry of Works, Housing and Supply, has issued a directory containing a detailed account of Government purchases in 1958-59 and the size and variety of Government demands likely to occur in the future. The purchases listed in the directory include those made by the Director-General of Supplies and Disposals, New Delhi, I.S.D., London, and I.S.M., Washington, on behalf of the Central Government departments, State Governments, and Government and Quasi-Government undertakings. The direct purchases of specialised items by the Railways and other Ministries of the Central Government have also been included in the publication.

Details regarding various types of stores for which orders were placed by different Government departments, have been classified under 17 broad groups such as foodstuffs, tobacco, textiles and footwear, paper, leather, rubber and rubber products, chemicals and chemical products, non-metallic mineral products, basic metal industries, metal products, machinery, electrical and machine appliances and supplies, transport equipment and miscellaneous goods.

The publication is of considerable interest to industrialists and should help them in the planning of their schemes for expansion of production, particularly in those lines where the existing capacity is inadequate, and in exploring the possibility of manufacturing goods at present imported in the country.

EDIBLE PROTEIN FROM LEAVES

The Union Government has planned to set up a plant to produce edible protein from leaves. Dr. N. W. Pirie, Head of the Biochemistry Department of the Rothamsted Experimental Station in the United Kingdom, who has considerable work to his credit in this field and who has developed machinery to produce about 100 lbs. of protein material a day from vegetable matter, has been invited to visit this country under the Colombo Plan for six months to advise on certain aspects of the Third Five-Year Plan programmes concerning subsidiary, supplementary and diversified foods, besides applied nutrition.

For many reasons, it is felt, India would be an excellent location for Dr. Pirie's work. There is a great need in this country for more food, particularly protein. Part of the country has high temperature and rainfall that promote abundant vegetative growth. Biochemistry and the relevant aspects of technology are also well established here.

WEST GERMAN AGRICULTURAL DELEGATION

A delegation of agricultural experts from West Germany is here at present to discuss with the Union Government the details of a project to be financed with German technical aid. This project will be fitted into our "Intensive Agricultural Programme." The delegation is headed by Dr. Koch, a leading official of the Federal Ministry of Agriculture, and includes three other experts, namely, Mr. Hinrichs, a well-known Agricultural Engineer who planned West German agricultural aid schemes for Pakistan, Tunisia, Ethiopia and South America; Mr. A. Messerschmidst, an animal production expert, with experience of this work in all parts of Africa, and a former collaborator of Sir John Hammond of Cambridge; and Dr. J. H. Gwillis, a student of Prof. Otto Schiller, Germany's agricultural expert on East Asia.

SUGAR OUTPUT

Mainly for the purpose of export, the Planning Commission has finally approved the Union Food and Agriculture Ministry's proposal to raise the sugar production target in the Third Plan to 35 lakhs tons a year from the original target of 30 lakhs tons.

The estimated annual demand of sugar by the end of the Third Plan period would be about 30 lakhs tons, raising the per capita consumption to 13.87 lbs. in 1965-66 from 11.70 lbs. at the end of the Second Plan period.

Although the installed capacity of the sugar industry is being increased to reach the target, it is considered that the position in regard to licences of additional capacity in the industry should be re-assessed sometime in 1962-63.

COMMODITY NEWS AND NOTES

FAIR PRICES FOR WOOLLEN YARN AND FABRICS

The Government of India have asked the Tariff Commission to recommend fair ex-mill prices and wholesale and retail prices for all types of woollen, shoddy woollen and worsted yarn, including hosiery yarn, and fabrics, including hosiery goods and manufactures. The Commission has also been asked to recommend fair ex-mill prices and fair prices payable by consumers in various regions. The Government's decision announced recently adds that the Tariff Commission, in conducting its enquiries, would take into account the cost of raw materials, power, wages and other relevant factors. The Government's decision to refer the question of fair prices to the Tariff Commission has been taken in order to ensure that woollen and worsted manufacturers are made available to consumers at reasonable prices vis-a-vis their actual cost of production. During the last few months, the Government have been receiving reports that woollen and worsted manufacturers have been selling at high prices, which could not be justified by the cost of production of these goods. The manufacturers of hosiery goods in particular were experiencing great difficulty in obtaining their requirements of hosiery yarn at reasonable prices. After considering the matter, the Ministry of Commerce and Industry obtained a report from the Chief Cost Accounts Officer of the Finance Ministry on the price structure of worsted hosiery yarn. Maximum buying and selling prices for these were subsequently fixed statutorily on July 2 this year. Firms and persons interested in the matter may address their representations to the Secretary, Tariff Commission, Bombay.

FORWARD TRADING IN BULLION

The Central Government have issued notifications applying Sections 15 and 18(3) of the Forward Contracts (Regulation) Act, 1952, to gold and silver in the area within the limits of Greater Bombay, and simultaneously granting under Section 6 of the Act recognition to the Bombay Bullion Association Ltd., Bombay, to conduct forward trading in gold and silver for a period of three years. Forward trading in transferable as well as non-transferable contracts is permitted in gold and silver in Greater Bombay only through the Bombay Bullion Association Ltd., Bombay, which has been recognised under the Bombay Forward Contracts Control Act, 1947. The notifications now issued maintain this position unchanged except that the Bombay Bullion Association Ltd. will now be recognised under the Central Forward Contracts (Regulation) Act, and would be supervised by the Forward Markets Commission. The position regarding forward trading in bullion in the rest of the country remains unchanged.

REVISION OF EX-WORKS CEMENT PRICES

The Government of India have asked the Tariff Commission to undertake a fresh examination of the cost of cement production in the different manufacturing units for the purpose of determining the fair ex-works prices payable to the producers from July 1, 1961. The three-year period, for which the Government had fixed fair ex-works prices on the basis of the Tariff Commission's recommendations in 1958, will expire on June 30, 1961. The Government have received a number of representations from the cement producers suggesting that production costs have since gone up due to various factors. Moreover, a few new units have commenced production and some expansion schemes have also materialised. The prices in such cases, which have been provisionally fixed by Government, require a fuller examination. The Commission, which will submit its report to Government as early as possible, will conduct a comprehensive review, will examine all aspects of the industry, such as production, prices, distribution, development, etc. All representations by firms and persons interested in the matter may be addressed to the Secretary, Tariff Commission, Bombay.

IRON ORE PRODUCTION IN INDIA

The production of iron ore during August 1960 was 826,000 metric tons, according to the Indian Bureau of Mines. This brings the total output during January-August 1960 to 7,094,000 metric tons which was higher by 40 per cent when compared to the output of 5,073,000 metric tons during the corresponding period of the preceding year. Orissa was the chief producing State with an output of 236,000 metric tons followed by Bihar with 225,000 metric tons. Mysore and Madhya Pradesh recorded an output of 187,000 metric tons and 129,000 metric tons respectively while the output from Maharashtra was 16,000 metric tons. During the month dispatches of iron ore for consumption in the iron and steel plants totalled 545,000 metric tons while the dispatches to the export market were 188,000 metric tons.

THE FINANCIAL TIMES OF INDIA

a project of prime importance to every businessman and student of economic affairs in India

The Times of India Group takes pride in announcing the addition, in the near future, of a full-fledged daily financial newspaper, *The Financial Times of India*, to bring its readers a comprehensive and sustained flow of news and comment on the country's business life.

Comprehensive Editorial Coverage

The newspaper will contain:

- economic news and comment of world-wide and Indian interest
- complete coverage of all six stock exchanges in India and of the London and New York Stock Exchanges
- spot news on planning and development from regional economic bureaux, and news about aid and collaboration from foreign correspondents
- extensive reporting on the hundreds of commodity markets spread all over the country
- periodical economic newsletters from State capitals done by trained editorial staff
- exclusive information from India and abroad for import and export trade
- investment guidance by experts on the editorial staff
- critical analysis of company balance sheets
- industrial surveys and research
- statistics, tables and graphs on economic trends
- articles on current topics by well-known economists
- informed leading articles

Vital to Businessmen

This is vital information for every modern businessman, business house, investor, banker, planner, and student of economic affairs. To satisfy their diverse requirements, The Times of India Group will devote space, talent, and money on a scale never before attempted.

Discussion of Economic Problems

The publishers feel this effort is more than justified by the need to facilitate intelligent discussion on economic problems which have assumed a new dimension and significance in India today.

Latest Reports and Reviews

With a decade of planned development behind us and with a much bigger Plan in prospect, *The Financial Times of India* will enable readers to keep a finger on the pulse of business, trade, industry, and agriculture in India and abroad.

Reliability & Integrity

The Financial Times of India will be a newspaper that no businessman can afford to go without. And it will, of course, carry the stamp of reliability and integrity associated with the Times of India Group of Publications.

Watch for further announcements about The Financial Times of India.

THE FINANCIAL TIMES OF INDIA, Times of India Building, Dr. Dadabhoi Naoroji Road, Bombay 1.

JWT-FT. 1395

DALDA FORUM

Why do we cook our food?

NUTRITIONIST: There are many reasons why we need to cook our food. For one thing, cooking generally helps improve the appearance of food. For another, it develops new flavours in it. Even some animals prefer cooked foods when given a choice.

YOU: Is this why we cook our food?

NUTRITIONIST: More important, of course, is the way cooking helps to stimulate the flow of digestive juices during eating. And it destroys many dangerous germs and parasites. So cooking makes eating safer.

YOU: But doesn't all this destroy the goodness of what we eat?

NUTRITIONIST: On the contrary. Cooking is useful for practically all meats, vegetables and cereals—if only because it makes food more digestible.

YOU: How does it do this?

NUTRITIONIST: Let's start with vegetables. Raw vegetables contain indigestible starch and fibrous substances. Cooking softens the fibres and the starch, and makes them more easily digestible. This is roughly what happens when fruits ripen. Cooking, therefore, follows nature's way in vegetables.

YOU: But surely cooking also destroys some valuable substances in vegetables.

NUTRITIONIST: Yes, unfortunately. In vegetables, cooking can destroy some mineral substances and vitamins. But this can hardly be helped. On the other hand, cooking predigests foods—does not over-burden the digestive system.

YOU: Do we cook meat for the same reasons?

NUTRITIONIST: Generally speaking, yes. Heat softens the protein in meat and so makes it easier for assimilation. And meat has to be cooked to destroy dangerous germs which might lurk in meat that is not fresh or hygienically stored. Cooking also brings out the flavouring ingredients in meat—makes it taste much better.

WE: This is all very well. But sometimes, cooking makes food lose its flavour. . . .

NUTRITIONIST: True. A lot depends on *how* you cook. The way you cook can save or destroy the flavour of food.

YOU: Well, I know that.

WE: But if the food doesn't taste as it should—does not retain its natural flavour, then it is not only because of the way it is cooked, but *what* it is cooked with.

YOU: What do you mean—'what it is cooked with'?

WE: You see, the cooking fat you use is very important. Certain cooking fats and oils impose their own taste on foods. Others, like DALDA Vanaspati, help foods keep their natural flavours.

YOU: How does DALDA Vanaspati do that?

WE: To begin with, DALDA is a bland fat. That is, it is odourless and tasteless. So it adds no flavour of its own to the food.

YOU: Yes?

WE: DALDA is double-refined to a high degree of purity. It brings out all the delicate flavours of food. All it does is add energy and nourishment to your diet.

YOU: How is it nourishing?

WE: Seven hundred International Units of Vitamin A and 56 IU of Vitamin D are added to every ounce. These are the vitamins that protect the skin, bones, eyes and teeth and keep them healthy. And all the goodness in DALDA is retained because it comes to you in hygienically sealed tins . . .

YOU: In that case, we have chosen our cooking fat well. We use DALDA Vanaspati for all our cooking—we've done so for two decades, in fact.

WE: More and more people are taking to DALDA Vanaspati every day. Can you wonder why?

SECRETARY TO ...
8 NOV 1960
PUBLIC DEPARTMENT

COMPANY AFFAIRS

INDIAN CABLE: FRUITS OF EXPANSION

The year to March 31, 1960, was the first year of full production of paper insulated power cables, which resulted in an increased turnover of the company. The profit after taxation was also significantly higher. The company therefore harvested the first fruits of expansion. The trading results have enabled the Directors to recommend a gross dividend of Rs. 2 25 per share on both Ordinary and Preference shares which, compared with the previous year's distribution of Rs. 1.50 slightly more than compensates shareholders for the amount of tax which has now to be deducted at source in compliance with the provisions of the Finance Act of 1960. In recommending this rate of distribution the Directors have taken into consideration the need for husbanding the Company's resources in order to meet increasing competition, as also the advisability of keeping a dividend level which can fairly be expected to be maintained in subsequent years.

Following the completion of the various expansion projects a certain amount of regrouping has been carried out and the factory now essentially consists of four main production units which have been grouped and approximately balanced in order to provide facilities for the steady and continuous manufacture of the Company's products. The four units are Rod Mill, Wire Mill and Scrap Recovery; Rubber Insulated Cables; Paper Insulated Power Cables; and Winding Wires and Thermoplastic Cables. All these units had a full work load during the year and the Rod Mill handled a record total of over 14,800 tons of metal. The Scrap Recovery Furnaces brought back into use over 350 tons of scrap copper and these Furnaces were utilised for the production of more than 600 tons of cadmium copper alloy which was used for the manufacture of conductors for railway electrification.

The Chairman has pointed out that the Government's import policy continues to be dictated by consideration of the foreign exchange situation but, he adds, the company received sympathetic treatment from the licensing authorities who are to be congratulated on having streamlined their procedures and greatly reduced the delays which previously occurred in the issuing of import licences for raw materials and machinery components.

CHAMPARAN SUGAR RETAINS DIVIDEND

The Champarun Sugar Company Ltd. during the year to June 30, 1960, recorded an increase in the sales and the profits after provision for depreciation, taxation etc., came to Rs. 5.8 lakhs. A sum of Rs. 3 lakhs has been separated towards rehabilitation reserves. The Directors have decided to retain the rate of dividend at Rs. 1.50 nP per share subject to deduction of tax.

Barrah factory commenced crushing on 27th November, 1959 and ended on 8th April, 1960, while at Chanpatia factory crushing started on 9th November, 1959, and continued up to 2nd May, 1960. The quantity of cane crushed at both the factories was the maximum available. At Barrah 26,49,700 mds. of cane was crushed with a recovery of 9.49% as against 9.81% in the previous years; while at Chanpatia the crush reached 32,30,980 mds. with a recovery of 9.28% as against 9.86% last year. The lower recovery is symptomatic of the general decline in the North Bihar cane delta in regard to which the Indian Sugar Mills' Association have already taken up the matter with the State Government for suitable relief.

The Company's estates continued to produce cane both for crushing and seed purposes. The utilisation of Rehabilitation Reserve to the extent of Rs. 1,60,000 is shown in the accounts of the company. Cane plantings for the current season in the areas serving the Company's factories have been on an increased scale as compared to the last year. The cane crop uptill now is considered to be satisfactory and it is expected that cane in larger quantities would be available for crushing in the ensuing season.

HASTINGS AND FORT WILLIAM

It appears from the reports of these two companies that trading conditions during the first half of the year remained difficult but in the second half the demand for jute goods improved considerably; looms were unsealed gradually to some extent. However, the jute crop of 1959|60 which was expected to be sufficient to meet the requirements of the industry proved otherwise and this together with the drought in the jute growing areas in the early period of sowing worsened the position and resulted in absurdly high prices of raw jute during April and May, 1960. As a measure to meet the serious shortage in raw jute supply, the I.J.M.A. decided to allow its member mills to close down with effect from 6th June, 1960, as many looms as mills thought fit and to allow the working hours so lost to be made up at any time after 31st October, 1960. Accordingly, the companies also temporarily sealed 2½% additional looms from 6th June, 1960, and these would be opened as soon as the new season jute starts to arrive in adequate quantities.

Hastings Mill Limited during the year to March 31, 1960, revealed a profit of Rs. 20.89 lakhs. After making provision for depreciation and taxation, etc., the directors decided to pay a dividend at the rate of Rs. 6 per cumulative Preference share subject to deduction of tax. A supplemental dividend on cumulative Preference shares at Rs. 2.57 nP per share is proposed to be paid in the event of the proposed amendment of the Articles of Association for variation in the Dividend Right of the Preference Shareholders being approved. Dividend on Ordinary shares subject to deduction of tax will be at the rate of Rs. 6 each.

In the case of the Fort William Jute Company Ltd., the profit came to Rs. 20.91 lakhs. After making usual provisions for depreciation and taxation the directors decided to pay a dividend on Cumulative Preference share at the rate of Rs. 7 per share and also a supplementary dividend at the rate of Rs. 3 per Cumulative Preference share in the event of the proposed amendment of the Articles of Association for variation in the Dividend Right of the Preference Shareholders being approved. The dividend on Ordinary shares is proposed to be paid at the rate of Rs. 2.25 per share for the year.

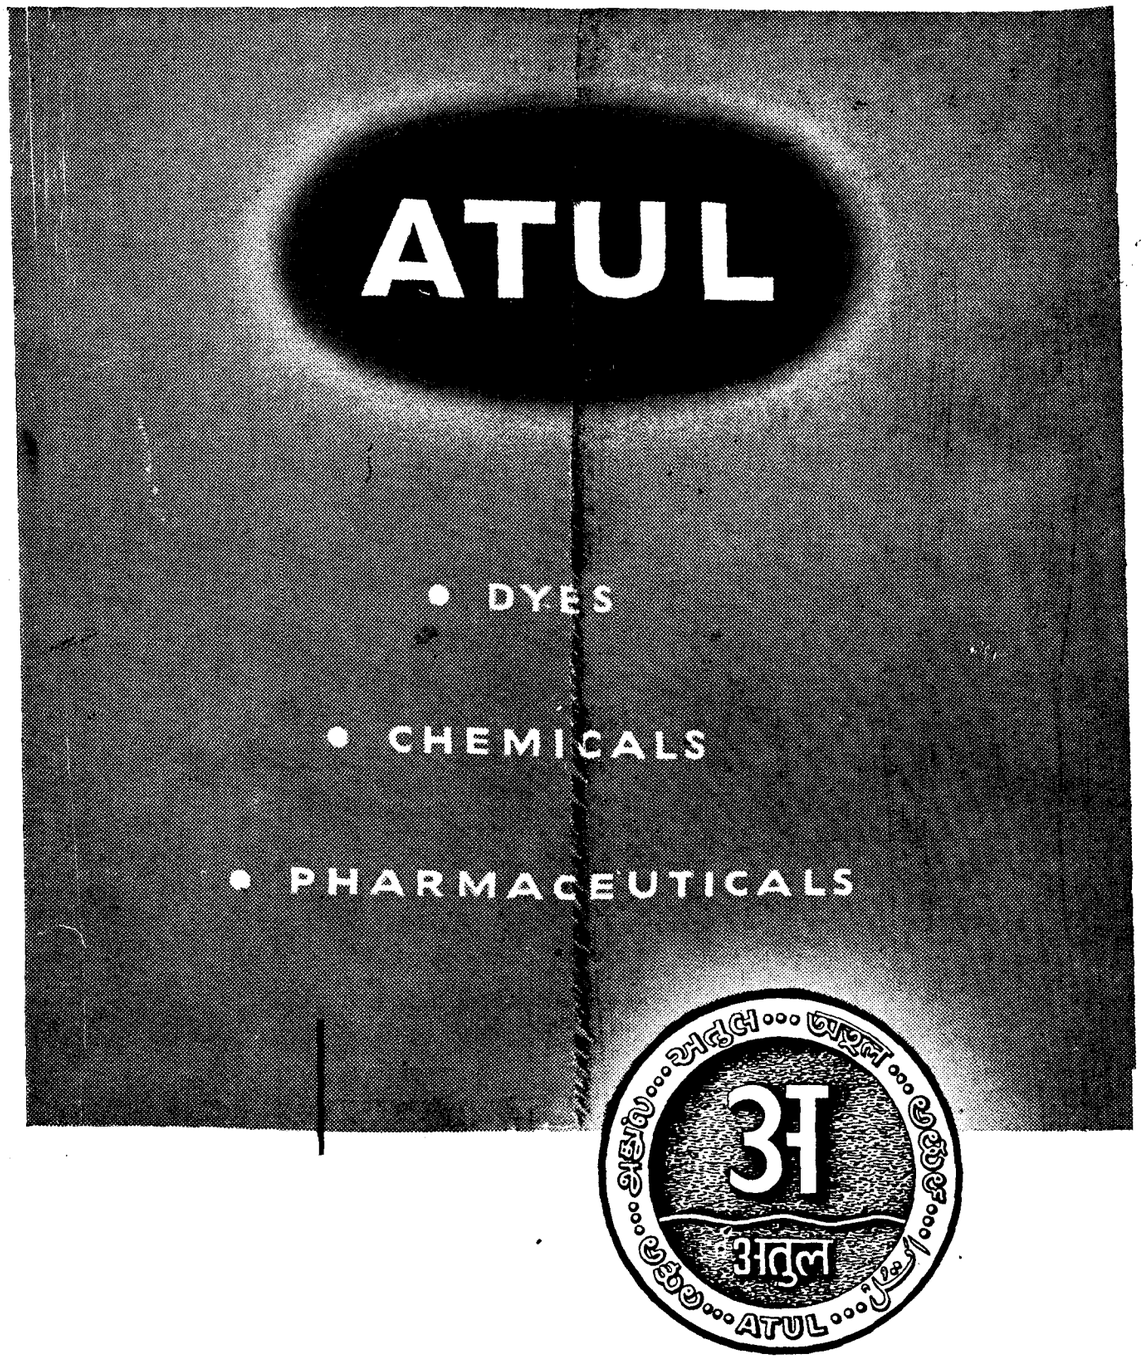
To sustain its expanding output, India's steel industry needs increased quantities of essential raw materials like iron and manganese ore, coal, limestone and refractories. By meeting a large part of this demand, Bird & Company (Private) Limited have been making significant contributions to the progress of the steel industry.



Birds have now launched on a programme of expansion, which when completed will step up considerably the annual output of these raw materials.

	PRESENT PRODUCTION	EXPECTED INCREASED PRODUCTION
Iron and manganese ore	825,000 tons	3,000,000 tons
Coal	2,250,000 tons	3,400,000 tons
Limestone	1,250,000 tons	2,100,000 tons
Refractories	90,000 tons	120,000 tons

This expansion will assure the steel industry of increased supplies of these vital raw materials.

"India can earn as much as Rs. 20 crores of foreign exchange provided she can step up her sugar exports to 300,000 tons a year. This is not difficult to achieve if control measures are undertaken to protect the sugarcane crop from the ravages of pyrilla and borers. Petroleum chemicals like aldrin and endrin have been successful in giving effective, persistent protection to one of India's most valuable cash crops."

NOVEMBER 11, 1960

America's New President

THE result, announced last Wednesday, of the election of Senator John Kennedy, the Democratic candidate, as President of the United States, brings to a dramatic end one of the fiercest election contests that the world has ever seen. It is doubtful if it could have mounted at fever pitch for so long a time except in the United States. The use of television on a scale not previously imagined has made this not merely the costliest election, but possibly also the most enduring election in terms of the personal impact of candidates on individual voters. Whether or not the medium of television is the best means of conveying the impact of personality and the battle of ideas may be seriously doubted. It seems, however, that as the election campaign moved to its dramatic close, it was the power of this medium rather than anything else that gave to Senator Kennedy, more nimble and swift of foot in debate, the marginal ascendancy which he enjoys. Both his youth and his inexperience were dismissed by the visual image of his earnest dynamism. There is no better indication of the supremacy of technology in our age than that a technological advance has now become the instrument of power. No candidate for the highest office in the United States, it seems, will be able to compete unless he has mastered the latest medium of communications in a mass communication age. This may exclude some philosopher-Presidents no less than weak photogenic personalities.

On the other hand, the campaign reaching out to every section of the country and carrying a deep personal impression was satisfying in that the personalities concerned elsewhere—both of whom also had abundant ghost writers—went straight before the eyes of the voters, so to speak without paper defence. There can be few campaigns in which the dignity of political debate was not submerged by the opportunities to be slick and clever to catch the fleeting T.V. opportunity. It is unfortunate that in the process of this debate many things were said not merely about the current administration of the United States, but of the long-term character of her system, which showed not merely the weaknesses of the current administration, but, in a sense, the weakness of free enterprise itself. It may be that the external impression thus created has had disadvantages which Senator Kennedy's internal success will not completely offset. On the other hand, it is quite remarkable, in view of the manner in which this election was fought, how great issues like Senator Kennedy's membership of the Roman Catholic Church were kept substantially in place. There is both good and bad to be found in the manner in which democracy in the sixties has been developed in the land of one of its earliest practitioners.

There is no doubt that the great majority of the people of India welcome a Democratic victory. There can be no doubt that Senator Kennedy, the young and dynamic leader, who has emerged after one of the greatest ordeals in American politics, will acquire a quick, if not very critical, appreciation in this country. There is the widely-expressed hope that youth and dynamism will reach out to the under-developed nations with all the capacity of which the United States has shown itself capable in Europe in the great period of the Marshall Plan. It is not forgotten that the resolution he sponsored with Senator Cooper two years ago was the most significant gesture of understanding India has received from the Congress of the United States. A Marshall Plan for India is already believed to be in the making in the circles at Harvard where Senator Kennedy has committed his academic loyalties. Undoubtedly, if America's balance of payments permits, there will be a great increase in foreign aid. All in all, the United States has chosen now to embark on a more lasting policy of partnership with the under-developed countries. This is, in part, the meaning of the vote which came resoundingly last Wednesday.

The period of awful suspense which arises every four years in the present leader of the Free World, has now ended. But one cannot expect, until the new administration takes shape, any vital change in existing policy. Much will depend on the new Secretary of State. He is likely to be Mr. Chester Bowles or Mr. Adlai Stevenson, both friends of India. And of the team of economic advisers, Kenneth Galbraith, Max Millikan and what is disrespectfully called "The Harvard set" know a great deal about India. They have in fact —as Max Millikan's address in Sapru House a few months ago made clear—committed themselves to "big" planning in India. The ball is now fairly and squarely in their court. With clear Democratic majorities in both the Senate and the House of Representatives, Senator Kennedy's new Brain Trusters might well exercise the influence which F.D.R.'s original conception foreshadowed but somehow failed to achieve. The world will anxiously wait to see if President John Kennedy can add a new international dimension to President Roosevelt's plans of economic rehabilitation.

The Congo in the General Assembly

BETWEEN September 21 last, when Mr. Dag Hammarskjoeld tendered his report to the UN General Assembly, and November 3, when Mr. Rajeshwar Dayal submitted the second report, the political situation in the Congo has become more confused than ever. The most important developments that have taken place in the intervening period are the emergence in the political

arena of the Army Chief of Staff, Col. Mobutu, ousting of Mr. Lumumba from the office of premiership and the closure of Parliament. Mr. Kasavubu, the head of state, is the only constitutional office-holder who remains where he should be. In the event, a very complicated and paradoxical situation has arisen. Although the Congo is a member of the United Nations, its seat in the General Assembly remains vacant because of the sheer difficulty of determining who is the legal representative entitled to occupy it. Apparenly, Mr. Kasavubu's nominee cannot be expected to represent the Congo in the deliberations of the General Assembly, as there are inhibitions on his authority that go with a symbolic status.

The rise of Col. Mobutu to potential power has created a number of complex problems and precipitated the importation of the cold war politics in the Congo problem at the United Nations. Col. Mobutu took the summary action to order the exit of the Soviet and Czechoslovak embassies from Leopoldville. It is unquestionable that Czech armaments and military equipment flowed into Mr. Lumumba's hands, obviously with the blessings of the Kremlin, but the United Nations had already taken timely and firm action to stop the supply of Czech military aid. Virtual expulsion of the two embassies was an undiplomatic and precipitate measure to be enforced. Its full consequences hardly entered into the colonel's calculations. To make a bad situation worse, he has indulged in tactless pronouncements that he would overthrow any government which would allow a come-back of the two embassies. That settles the account at the United Nations and a foretaste of it will be available at the General Assembly debate.

A swing appears to have taken place to the other extreme. Col. Mobutu is leaning too heavily on Belgian personnel at all levels—in the sphere of advice on military strategy, civil administration and technical guidance. Mr. Rajeshwar Dayal's report devotes a substantial and important part to the significance of the return of Belgian personnel and there are several observations in that report, many of them substantiated by factual information, which suggest the inference that this opportunity is being used by the Belgians for staging the restoration of their influence in the domestic affairs of the Congo.

It would be premature to come to any firm conclusion on the basis of the press summary of Mr. Dayal's report about the nature of the large-scale return of Belgian personnel, the character of their influence, or their attitude of non-intervention or intervention in the internal affairs of the Congo. Their entry as such can be hardly questioned because it is in pursuance of the direction issued by the General Assembly. The Congo's utter dearth of trained nationals, capable of undertaking the responsibility of running the administrative and technical posts, made it necessary that the vacuum should be filled by foreign personnel and, in the light of knowledge and experience of local conditions as well as of the social and political order, no one was better fitted to fill these posts than the Belgians. Therein lies the rub. Difference on the presence of the Belgians is now splitting the General Assembly. With the United States critical, Mr. Dayal's report cannot find general acceptance.

The General Assembly debate on the Congo has now been postponed. The Commission of Conciliation is being deputed to the Congo as an exploratory step to securing *rapprochement* among the leaders of the divergent groups. A mixed reception awaits the Commission, but in the prevailing mood it is not unexpected. Preservation of territorial integrity and broad unity are the first requisites to put administration on a normal footing. At the present time the United Nations can attempt no more than to bring about *rapprochement* on the basis of a coalition, which would open the way for resummoning of Parliament and restoration of constitutional authority. It is not enough for the free nations of the world to condemn the Dayal report; they will need to find something and someone more constructive to handle the crisis. This they have nowhere in sight.

The Heavy Electrical Industry

THE inauguration of the Bhopal Heavy Electricals factory by the Prime Minister on Sunday undoubtedly marked the crossing of another important milestone on India's march of industrialisation. We will henceforth be producing power generating and distribution equipment which hitherto has been imported at a high cost. Though self-sufficiency in this equipment will be achieved only over a number of years, considerable saving in foreign exchange will be effected when production at this factory goes into strides. By the end of the next year, which will mark the completion of the first phase of the project, production at the Bhopal factory is estimated to increase to Rs. 12.5 crores. By 1965-66 it will go up to Rs. 25 crores and by 1971 it will increase to Rs. 50 crores a year. Correspondingly, there will be a saving in foreign exchange.

It goes to the credit of the management of this project that in spite of heavy odds and great difficulties experienced in the early stages of construction work, production at the factory has been started according to the original schedule. The great care the management has taken to train technicians both at the training school of the factory at Bhopal and in the works of the British collaborators in England augurs well for the smooth running of the factory in the future. The factory has been rightly described as a classic case of Indo-British collaboration; the technical consultants, Messrs. Associated Electrical Industries, have ungrudgingly parted for our benefit with their vast experience and technical know-how in this field.

The tremendous effort we have to make to become self-sufficient in power generating and distribution equipment can be gauged from the fact that during the next five years, according to Planning Commission's estimates, we will be requiring additional electric power at the rate of 1.2 million kW. per annum and thereafter for another five years at an annual rate of 2 million kW. As an annual increase in generating capacity of this order will require heavy electrical equipment worth nearly Rs. 100 crores, the output at the Bhopal factory will have to be supplemented with production elsewhere. Happily, the Government of India, with aid from Russia and Czechoslovakia, has planned to set up two more big units in the public sector. They will go some way in meeting the requirements of this equipment under the Third and the Fourth Plans should, of course, electricity requirement estimates do not turn out to be on the lower side.

Taking into consideration the present lag in production in relation to demand — the Hoffman Mission in its report has drawn particular attention to power difficulties experienced in every part of India—and the impressive programmes drawn up for industrialisation, railway traction and rural electrification under the Third Plan, the target of 11.8 million kW. of electricity output by 1965-66 may, however, prove to be gross underestimate. Putting the present shortfall in electricity production compared to demand at one million kW. and with a total investment in industry, railways and agriculture during the Third Plan period running at a rate about double that under the Second Plan, demand for electrical energy by 1965-1966 may be easily in the neighbourhood of 14 million kW. If the electricity production target has to be put up by another one or two million kW. when the Third Plan gathers momentum, demand for electric power generating and distribution equipment will naturally go up correspondingly. The Government will do well to be ready in advance with schemes for the manufacture of additional heavy electrical epuipment.

An important question which arises in this connection is how far it is advisable to restrict the manufacture of heavy electrical machinery and equipment in the three public sector units. There is clearly a case for throwing open this field for private enterprise which can also play a useful role in making the country self-sufficient in this vital equipment at an early date. Certain types of electrical equipment in the heavier ranges may be earmarked for production in the private sector which is already producing light electrical equipment like electrical motors upto 300 H.P. and transformers with a capacity of 33 KV. or below. The recent experience in respect of private capital issues, particularly those connected with the production of goods for which market is assured in the country and those in which known foreign firms are collaborating, is an indication that enough capital can be raised for a manufacturing programme of heavy electricals in the private sector.

Nationalisation of General Insurance

A NON-OFFICIAL resolution sponsored by a Communist member, Mr. T. B. Vittal Rao, advocating nationalisation of general insurance will come up for discussion in the Lok Sabha on November 18, 1960—the first non-official day of the winter session. It is not for the first time that such a resolution will be debated in the House. Almost in every session, either in the Lok Sabha or the Rajya Sabha, this topic has bobbed up rather than been deliberated upon. In March this year, Mr. Bhupesh Gupta raised the same question in the Rajya Sabha. The House rejected his resolution after a full-length debate. There is no doubt that the present resolution will also meet a similar fate. It is, however, pertinent to examine once over again whether nationalisation of general insurance is in the national interest at all.

In 1956, when life insurance was nationalised, the Government of India left out general insurance for a number of considerations. The basic fact that general insurance was "part and parcel of the private sector of trade and industry" weighed heavily against nationalisation of general insurance. Moreover, errors of omission and commission in the conduct of its business did not directly affect the individual citizens.

It is widely known that the general insurance business is more complex in nature than life insurance. The contracts are of short-term duration, normally running over a single year as against the long-term life insurance contracts. Complete satisfaction of clients is a necessity if the insurer wants to obtain formal renewals of the annual contracts. Thus, quality of service rendered to the insured assumes paramount importance in the case of general insurance, though it is of no less importance in the case of life insurance as well. Recently, there have been complaints about the deterioration of service in the case of life insurance and, if general insurance were to follow the footsteps of life insurance, it is obvious that this important sector in Indian business would receive a grievous setback. Besides, many third party risks may be left uncovered causing serious legal complications.

Sometime the failure of some insurers in general insurance is cited to prove the inefficiency prevalent in this business. While there are bound to be stray failures here and there in every business, it needs to be stressed that the general body of insurers has done very well in the past and the volume of business also has been growing from year to year. The record can stand clear scrutiny. In the case of the public sector companies, the failure of one unit could not be cited to prove that all other public sector companies are also equally inefficient; by the same logic, in the private sector, the failure on the part of a few could not be used as a tool for demonstrating the inefficiency of all the companies in the private sector. This could certainly not be an argument for nationalising general insurance. In the mixed economy of this country, there is ample room for the free play of both sectors.

When life insurance was nationalised in 1956, one of the factors which encouraged the Government of India to take over life insurance was that huge funds in the hands of a large number of companies were not being properly utilised. The argument was advanced that after nationalisation they could be canalised for development purposes. What is the situation like in the case of general insurance? The Indian Insurance Book for the year 1959, issued by the Controller of Insurance, indicates that the total assets of general insurance business of Indian insurers amounted to Rs. 51.79 crores. The assets of the non-Indian general insurers were valued at Rs. 11.20 crores. Thus the total assets of general insurance business at the end of 1958 were not more than Rs. 63 crores. Almost one-third of the assets were invested in Central, State and other approved securities. This portion, thus, is already under the control of the Government. Another one-third of the assets was locked up in debentures, ordinary shares and preference shares of Indian companies while the rest was, by and large, held in the shape of agents balances, outstanding premia and amounts due from other insurers. Thus, there are no substantial resources — like the life insurance fund — which could be taken over by the Government of India for diversion to development projects if and when nationalisation of general insurance is attempted.

Nationalisation of general insurance should also be looked at from another side. What impact, it may be asked, will it have on the general climate of investment, both indigenous and foreign, in Indian business? If after solemn assurances that general insurance is outside the scope of nationalisation, it was attempted, faith in the Government policy pronouncements would be badly shaken and the investor's confidence, too, would be seriously impaired.

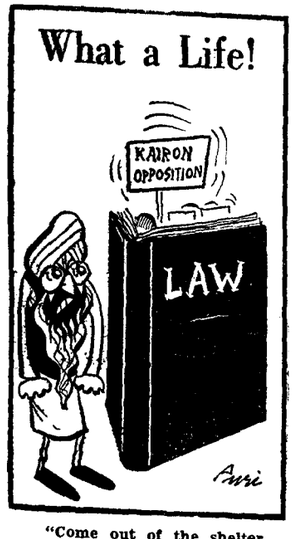
A DELHI DIARY

THE news of the week in Delhi, as I expect in all the world's capitals, has been the US Presidential election, and, more particularly, Senator John Kennedy. It is incredible how his face has become immediately familiar to Indians of all ages in the capital. This cannot be the result of television of which we have none outside the U.S.I.S. Will some deep student of human nature tell me how Senator Kennedy has become an old acquaintance? Perhaps the television debates put on the screen by the U.S.I.S. have helped, but I doubt if they covered any more than what statisticians call a random sample which, in the best circles, is always less than half per cent.

THE POLLSTERS: ALL'S WELL!

Random samples have played a notable part in this election, and greatly daring, I give credit in this particular campaign more to the pollsters than to anybody else. At least the candidates had, what might be called, a 50 : 50 chance, meaning that one of the two would necessarily be elected. But the pollsters predicting percentages of the popular vote might well have all been drawn. On this particular occasion, polling had to take place every week for three months and the random sample changed everywhere to obtain fresh cross-sections of that strange and elusive thing called 'voting intention'. There also emerged in this election a very large percentage of undecided votes; at one stage it was 12 per cent, but was subsequently reduced to 6 per cent by a process which the sophisticated called 'filtering'. As samples (outside the spacious National Sample Survey!) usually have an error, due to size of the sample of about 4 percentage points, it looked as if the game were hopeless. Had I been in this extraordinary occupation called public opinion polling, I might have quitted the race. Not so Dr. George Gallup. He persistently went on by a process of continuous analysis of the undecided vote and his last prediction was 51 per cent of the popular vote for Senator Kennedy and 49 per cent for Richard Nixon. It is a great reward to his continuous patience and ceaseless vigil that the final results showed him to be exactly right. He hit the Jack pot. Do not ask me whether this proves that random sampling is a good thing and public opinion polling an infallible instrument for predicting an election result. All I can say is: All is well that ends well.

Only a little over a year from now India will have its own election excitement and I am hoping that similar stamina will be shown by pollsters in the Indian Union on this occasion. Is the Indian voter more unpredictable than the American? From the deep worlds of my experience I can answer in the affirmative; at the present time, in the happy confusion which reigns almost everywhere, the "undecided" vote is believed to be 30 per cent. Does the Indian undecided vote, not receiving the penetrating pressure of television, break between the candidates or does it stay away? Here is a 64-dollar question to which I would like the reply as early as possible. Pollsters all over the world are eligible for a Rs. 100 prize which will be awarded in February, 1962, for the correct answer. No entrance fee is required!



SUBRUTO MUKERJEE

The same radio broadcast which brought news of Senator Kennedy's victory and all that it means in the world's politics — with leadership of the old now committed to the young — brought the deeply distressing news that Air Marshal Subruto Mukerjee had died in Tokyo. The news to those of us who had seen him the day before his departure seemed incredible; he looked in excellent health and spirits and hardly any one could believe that he was a candidate for an early departure from this world. No one believed his heart, which had beat steadily in peace as in war, could have failed him. It now transpires from the latest news that it was not a heart attack, but an even more incredible thing — that he was suffocated while eating at a special dinner in Tokyo. Most of us are still incredible, and, foolish as may seem, much of the talk in the town is concerned with an answer to the question how it all happened.

In truth, there is no more foolish question in regard to life and death. Both of them pursue their stately courses regardless of the laws of nature, although it is claimed that the laws of nature are invariably in their operation. The stars may keep to their courses (or don't they?) but the atom does not, at least in one in a billion cases. Nobody knows why. And so, I suppose, it is with human life. In the prime of life with rich distinction, with a large circle of friends and with almost all the opportunities of professional excellence still before him, he was just cut away from it all. The heart of everyone in Delhi goes out to his beautiful wife, Sharda, without whom he never seemed to be complete. There has thus been broken a twenty year partnership which was one of the most notable that existed in Delhi's official world. With the departure of Subruto, the aged parents of P.C. and Subruto, have borne two terrible blows within a year. It is difficult to say anything to them at this hour. But almost everyone who knew their distinguished sons will carry them today in his mind.

NEW PROBLEM PROVINCE?

I have just time to record what everyone in Delhi is saying that there is a new leader in the race to become India's Problem Province. For many years West Bengal held this title securely; it is now being wrested from it by the Punjab. The Governor of the Punjab, Mr. N. V. Gadgil, at the Governors' Conference this week, seemed very cocksure about the dissipation of the Akali agitation. Whether or not he is right on that point, there is evidence of another agitation of a much more abiding character. I will do nothing in support of my contention except to produce my naughty cartoonist all over again!

"Come out of the shelter you coward!"

ARGUS

THE WEEK'S NOTES

Engineering Goods

EXPORT PERFORMANCE ENCOURAGING

IT IS a matter of gratification that exports of engineering goods from India are looking up; during the nine months to September last these exports (by sea route alone) amounted to Rs. 593 lakhs, compared to Rs. 391 lakhs in the corresponding period last year. If this trend continues — and there is no reason why it should not — the current year's target for these exports, fixed at Rs. 850 lakhs, will not only be achieved, but may be exceeded. More encouraging, however, is the fact that Indian engineering goods, particularly sewing machines, are making their mark in some of the highly industrialised and such distant countries as the United States and Canada; exports to North and Central America during the first nine months of the current year went up to Rs. 109 lakhs from Rs. 97 lakhs in the corresponding period last year. The increase in exports to Europe too has not been insignificant; exports to this Continent have risen from Rs. 21 lakhs in the first nine months of 1959 to Rs. 57 lakhs during the corresponding period this year.

That light engineering goods can play a significant role in diversifying our foreign trade and increasing export earnings goes without saying. An export target of Rs. 50 crores has been fixed for achievement by this industry under the Third Five-Year Plan. This target is not beyond the capacity of the industry to accomplish — it can even be exceeded — provided the industry is enabled to lower its cost of production and some incentives are given to it to further its export effort. The industry has been long complaining of shortages of some categories of steel and their high prices; nearly 50 per cent of its installed capacity is lying idle at present. With the indigenous output of steel going up, these shortages may disappear in the none-too-distant future. But it is time that attention is paid to bring down the prices of steel. The engineering goods industry's demand that it should get steel, at least for the portion of its products that is exported, at the retention price of the commodity seems to be justified.

Mr. B. S. Agarwal, Chairman of the Engineering Export Promotion Council, addressing a Press Conference in New Delhi on Tuesday, suggested a seven-point scheme to step up exports of engineering goods. He called for interesting the established exporters in export of engineering goods by granting them import licences for the raw materials imported by the industry and allowing them to sell these to actual users, reducing the price of steel, pig iron and tinplate, granting of rebate in income-tax on export earnings as is the practice in Japan, provision of credit facilities on long-term basis and concessional rates, and lowering of shipping and freight rates. These measures can go a long way in making Indian engineering goods competitive in world markets in the crucial next five years, after which the industry itself should be in a position to look after its export business. One wonders, however, what useful purpose will be served by setting up a high-power committee, as suggested by Mr. Agarwal, to consider the problems the Indian exporter has to encounter. The Export Advisory Council is already there to focuss the attention of the Government on the difficulties faced by the exporters.

The industry on its part has, of course, to enforce a strict discipline regarding quality of exportable goods; complaints about sub-standard goods being supplied by some Indian exporters to foreign countries are not infrequent. It will do well also to strengthen its after-sale service in the importing countries for that is the way to win customers so far as engineering goods are concerned.

Land Transport

THE REVOLUTIONARY ROADRAILER

A VERITABLE revolution in the rolling stock used for the two types of land transport, namely, road and rail, now seems in the offing. This is the invention of the "roadrailer" freight vehicle which has been manufactured after several severe tests on British railways and roads by the Pressed Steel Company Ltd. The roadrailer was on show at the International Commercial Motor Transport Exhibition in London recently. It has now entered into the stage of active use on road or rail.

The construction of the roadrail is quite simple. It is a road-semi-trailer which is fitted with the minimum of extra equipment that is necessary for it to operate on rail track. The extra equipment consists mainly of retractable road and rail wheels and special couplings in order to allow the vehicle to run when coupled together in an integrated freight train on the railways. When operated on the road, it can be hauled by a standard road tractor. It is very light in weight as the body is made of aluminium. But any other body can also be fitted without detriment to the mobility of the roadailer either on road or rail.

The roadrailer can be loaded with goods at the factory or the farm and with the help of the tractor taken to the railhead. From there it can be mounted on the rails and if the destination again happens to be far away from the railhead, the roadrailer can be put on the road to carry freight where required. All costs required in transhipment of goods, marshalling at the yard (when a whole series of roadrailers are coupled into a train) as well as the delays involved can be eliminated. This motor-cum-rail transport — which means total modernised land transport — can save on costs. Door-to-door service, which is at present the privilege of motor transport, will thus become available to the combined road-rail stock. Co-ordination between these two forms of transport has defied solution in all countries and necessitated direct or indirect protection to rail transport. It will no longer be an intractable problem. But one condition that is implicit in the adoption of the roadrailer is the strength, firm surface and width of roads capable of sustaining tractor-cum-trailer transport without detriment to other vehicular traffic.

Now that the roadrailer has become a commercial proposition it would be worthwhile for transport engineers in this country to devote serious attention to the question of evolving a proper prototype for Indian road and rail conditions. As it is, from time to time Indian railways have exhibited strains of high operating costs and the plea of co-ordination has come in handy to ask for help to tide over difficulties. The potential demand for land transport in this country in the years to come requires that the cheapest and quickest mode of transport should be adopted. Here the roadrailer can be of great value.

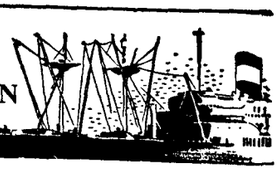
Education

NATIONAL CONSCIOUSNESS AMONG STUDENTS

THE STATE Education Ministers' conference held at New Delhi in the first week of November decided to initiate a new, vigorous campaign for promoting national consciouness and encouraging a broader pers-

pective among the students. It was suggested at this conference that the students in the North should learn one South Indian language as a part of the three-language formula. It should be made compulsory for students to know the National Anthem by heart. Community singing of the anthem should be encouraged, sectarian names of the institutions should be abolished and religious holidays should be celebrated against the national background. All these are laudable recommendations and need to be accepted without any hesitation. But not much success need be expected from such pious exhortations if the basic ills from which our educational system seems to suffer are allowed to remain.

For any scheme to be effective at the student level, it is necessary that a close association should be built up between the teacher and the student. Unluckily, the type of personal contact which is desirable cannot be maintained in the present circumstances when the number of students in relation to the teachers is extremely large. At the school as well as the university level today, for every teacher there are no less than 60 to 70 students, whereas the proper ratio would be 20 : 1. This ratio is all the more necessary in view of the fact that some departments at the University level attract only a handful of students while others are flooded with students. This uneven distribution of students amongst different departments is also one of the reasons why the number of teachers needed at the university level is much larger than available at the present moment.



Mr. C. D. Deshmukh, Chairman of the University Grants Commission, suggested the appointment of an expert committee, including both psychologists and educationists, to analyse the problem in detail. His suggestion was accepted and the composition of the committee would be made known soon. The committee would conduct a survey to assess the causes of prejudices amongst the students. It is expected that the survey would throw up workable clues for eliminating these prejudices.

Third Plan

MANAGERIAL MAN-POWER RESOURCES

INDIA'S Third Five-Year Plan will impose considerable strain on the managerial man-power available for executing the projects. It is necessary that steps should be taken to develop managerial man-power resources in the country in such a manner that no serious bottleneck is created by the paucity of experience managers. The Directorate of Man-power in the Ministry of Home Affairs is considering the broad aspects of managerial resources. It has the guidance of a capable Ford Foundation Expert in Mr. Leo Werts.

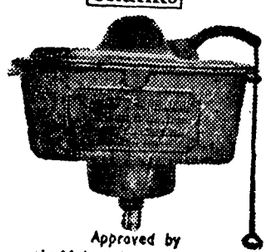
The programme for extending the training facilities for managers needs to take into account long range requirements of managerial man-power. Unless the educational programme in the institutions of higher education is planned in such a manner that the future demands are taken into account, strains on the economy may be unbearable. It is, however, gratifying to know that in the Indian Union a number of organizations have started taking interest in management and a number of institutions such as the Universities of Delhi, Bombay and Madras; the All-India Institute of Social Welfare and Business Management at Calcutta, the Indian Institute of Technology, the Indian Institute at Bangalore and the Victoria Technological Institute at Bombay have commenced comprehensive courses in management. The All-India Board of Technical Studies in Management has particularly stressed that programmes at all these institutions should emphasize principles, practices and technology of management which are common in all the enterprises, public or private. In addition to these universities, the Administrative Staff College of India at Hyderabad and the Indian School of Public Administration provide short term courses for senior managers and administrative officers. A number of experienced managers are also visiting foreign universities every year for discussions with the experts and for possible improvement in management methods in this country

TRADE PROMOTION ...is our business

Australia, New Zealand, and Fiji offer opportunities to exporters and importers and the International Division of the Bank of New South Wales can help those interested.

The Bank's complete banking service includes such specialized facilities as trade and industrial enquiries, economic and trade information, and a complete travel service. The Bank, through more than 1,000 branches and agencies, is closely and constantly in touch with industry, business, and agriculture in the areas it serves.

Enquiries may be made through your own bankers or direct to



BANK OF NEW SOUTH WALES
INTERNATIONAL DIVISION
John W. McEwen, Chief Manager

HEAD OFFICE: SYDNEY, AUSTRALIA

First and largest commercial bank operating in Australia, New Zealand, Fiji, Papua and New Guinea, with three branches in London.

you have just opened A METAL BOX CONTAINER!

The container in which your favourite vanaspati comes to you is specially designed to protect the contents from spoilage. The container is precision manufactured on specialised machines and the accurately fitting lid and diaphragm ensure that the contents remain free from contamination over long periods. For added protection, vanaspati containers are made pilfer-proof with the now-familiar aluminium foil diaphragm. An unbroken diaphragm is your guarantee that the vanaspati you are buying is genuine.

Manufacturing scientifically designed packages is the business of Metal Box, leaders in the packaging field. A result of years of research abroad and in India, the vanaspati container is another example of a Metal Box package that delivers the best in consumer goods to you.

Over 1000 manufacturers in India are being supplied by Metal Box with scientifically designed containers and closures that go to pack Rs 100 crores worth of consumer goods every year.

OPEN TOP CANS for processed fruit, vegetables, fish and dairy products
GENERAL LINE CONTAINERS for confectionery, tea, biscuits, baby foods, edible oils, paints, insecticides, powders, etc.
COMPOSITE CONTAINERS of cardboard & metal
COLLAPSIBLE AND RIGID TUBES for toothpaste, ointments, adhesives and pills
CROWN CORKS for carbonated drinks
R. S. PILFER-PROOF AND OTHER CLOSURES for bottled products
COMPONENTS for radio, automobile and electrical industries
PUBLICITY MATERIAL including advertising tablets and calendars
PLASTIC PRODUCTS including Diothene bags, foil laminate pockets and injection mouldings
HARDWARE including trays and table mats
MACHINERY Can Closing and Reforming and Bottle Sealing Equipment

Some 48,000 children are at school in Jamshedpur, where Tata Steel runs 34 schools—17 of them on two shifts—and assists 122 other schools with recurring or capital grants. Instruction up to matriculation is given in four languages to meet the needs of the cosmopolitan industrial community.

Employees' children are taught free or pay a concessional fee depending on the parents' income. Here, we see Shri Etwari of Monghyr, an operative in the steel works, and his son, Kameshwar Prasad. Kameshwar passed matriculation in the first division in 1959, qualifying for a university stipend and for a Tata Steel Jubilee scholarship of Rs. 75 per month which will see him through college without any strain on his father's modest resources.

Jubilee scholarships apart, Tata Steel provides assistance in several ways to enable deserving children to take up higher studies. Young talent is thus encouraged and nurtured at Jamshedpur, where industry is not merely a source of livelihood but a way of life.

HOW TO ENCOURAGE SAVING

By

ODYSSEUS

THE DANGER of applying to developing countries economic theories devised to explain conditions in developed countries is well brought out in a newly published book, "Fiscal Policy In Underdeveloped Countries" (Allen & Unwin, London. 25sh.) by Dr. Raja J. Chelliah. He begins by contrasting the objectives of fiscal policy in a developed and in a developing country. The basic objective in industrialized democratic countries is to regulate the flow of purchasing power, to avoid inflation, to determine the level of effective demand in order to maintain full employment, and to smooth out booms and depressions, while leaving the allocation of resources among alternative uses to entrepreneurs acting in response to the controlling power of consumers' demand.

In developing countries, on the other hand, although fiscal policy will naturally defeat its aims if it promotes inflation, its prime aim is not so much stability as movement forward — it seeks, or should seek, to accelerate the rate of savings and capital formation. Investment priority in developing countries must go to "economic overheads" — roads, railways, dams, power stations, ports, technical training facilities — and to "social overheads" — schools, hospitals, libraries, public health services — because such investments create "external economies", i.e., they raise the marginal productivity of private investment by widening markets, raising the productivity of the workers, and reducing costs of production. Once these facilities exist, new industries can be more easily established. And because private capitalists in developing countries cannot raise the huge sums required for economic overheads, the government has to raise the capital, draw up priorities for its use, and allocate it accordingly.

Dr. Chelliah goes on to observe that there is widespread opinion in favour of ensuring compulsory saving through taxation and of increasing public investment by higher taxation. Because private and business savings are low, the inference is drawn that public investment must be stepped up, even at the expense of private investment. Another argument used to support compulsory savings and public investment is the need to reduce inequalities of income. The reduction of inequalities and collective savings by means of taxation are, says Dr. Chelliah, almost articles of faith in India.

Dr. Chelliah does not dispute the need to raise more revenue, but he courageously insists that the fundamental need is to raise the rate of savings. If you put the cart of compulsory collective savings before the horse of raising the savings rate, you risk replacing private investment by public investment, whereas the real need is to raise the total of both public AND private investment.

Because private investment has to some extent, in years gone by, been directed to commerce rather than industry, to urban real estate rather than to factories, this does not mean that it should be banged on the head, but merely that it should be redirected into more productive channels. Even in Socialist Pattern India, the greater part of the economy, however measured, is left to private enterprise. The Industrial Policy Resolution of 1956 laid down that only Industries of basic and strategic importance, public utility services, and those which require investment on a scale which only the state can provide, are reserved to the state. The development of all other industries is left to private enterprise. So that if private investment is discouraged, the greater part of the economy is slowed down. To squeeze private enterprise in India is to inhibit economic development. Public and private investment must regard each other as friends, not rivals, because much public investment is intended to raise the productivity of private investment.

Public investment itself can't hope to reach the very high level necessary if private investment is not actively encouraged. Where else is the money for public investment to be obtained?

COMPULSORY SAVINGS?

All this is so obvious that it is surprising how many accept uncritically the weapon of compulsory savings. Net capital formation is about 7 per cent of national income in India. Assume that this must be raised to 12 per cent if fairly rapid growth is to be achieved. Now, tax revenue is about 8 per cent of national income. Of this, the government is able to spend little on fixed capital formation, i.e. government savings until now have been low or nil. Hence to achieve a 12 per cent increase merely by expanding public investment means that taxation must be raised to 13 per cent of national income and that all of this increase must be invested. Assuming no increase in current expenditure, tax revenues would have to be raised by 62.5 per cent above their present level. "It is doubtful," says Dr. Chelliah, "if this increase can be achieved in the near future." And it is unrealistic to lay down that current expenditure should not increase during the course of development, because to build up human capital and the social services is as important as to create plant and machinery. So, if allowance is made for increases in non-capital expenditure, the increase of taxation required would be much higher. Such a programme would require the proportion of national income taken in taxes to be increased so steeply that it would eventually include both the 15 per cent which welfare governments use on current expenditure and about another 20 per cent for gross capital formation. This is the level of taxation required — about 35 per cent of the gross national product — if a country is to rely on tax-financed investment. But India's present level of taxation is about 8 per cent of the national income! Compulsory collective saving has its place in a developing country, but by itself it clearly can't do anything like the whole job.

PRIVATE INVESTMENT'S ACHIEVEMENTS

The charge that private investment in India directed too many resources to conspicuous consumption in fine town houses, or to speculation and commerce, may have been justifiable in the past, but it was not borne by the Taxation Enquiry Commission, which analysed the balance sheets of public companies for the years 1946-51. The Commission found that corporate savings provide, on the whole, a larger source than new subscriptions in financing industrial expansion. The Reserve Bank of India studied the growth of 750 joint stock com-

panies during 1950-55. Since the total paid-up capital of the companies studied made up two-thirds of the total paid-up capital of public limited companies in the sector covered, the Bank's findings can't be shrugged off. The Bank found that gross and net fixed assets rose about 50 per cent each in 1950-55. Profits rose steadily from 1952. This rise was largely attributable to additional investment.

The rate of investment in factory enterprises is estimated (excluding expenditure on modernization and replacement) to have risen from an average of Rs. 260 million per annum in the first two years of the First Plan, to Rs. 440 million in the third, Rs. 500 million in the fourth, and Rs. 850 million in the fifth, year. These and other figures cited by Dr. Chelliah suggest that government should encourage private enterprise and strengthen its inducements to invest, while taking other measures to increase public investment.

How do you strengthen the inducements to save and invest? This question leads Dr. Chelliah to examine the principles on which India's taxes are now based. Once again, he debunks ideas that are held widely not only in India but in the West, and I suggest that Western economists and politicians have much to learn from him.

Every country in the world that enjoys (if that is the right word) a developed taxation system imposes steeply progressive taxes on the principle of "taxation according to ability to pay." Dr. Chelliah asks whether this assumption does in fact enable the state to raise the maximum amount of revenue compatible with the object of increasing savings and investment. He has no difficulty in showing that taxation according to ability to pay, which is held to justify steeply progressive taxation, is a subjective concept, which does not lead by any logical or mathematical process to the calculation of any specific scale. Nor does it logically justify steeply progressive taxation. This being so, one can only conclude that the real object of those who favour steeply progressives taxes is to reduce inequalities of wealth. Dr. Chelliah does not favour such inequalities. He merely points out that (a) taxation according to capacity to pay is incompatible with the desire to promote savings and investment and (b) there are other ways of reducing inequalities. These are two different aims, not to be confused, which would be considered and dealt with separately.

Progressive taxation may be justifiable in a developed country in which taxes are raised solely to pay for the costs of common benefits, like the armed forces and the social services, but Dr. Chelliah points out that in a developing country, the aim of taxation is "functional", i.e., taxation is a tool to raise the rate of investment. Of course, the social and other services have also to be paid for, but the volume of government services that can be undertaken in future depends on the rate of investment and development. Although Finance Ministers are loath to admit it, they do in fact recognise that there is a limit to progressive taxation which, when reached, forces them to fall back on indirect taxes. These are regressive and flout the much proclaimed principle of taxation according to ability to pay. Adherence to this principle hamstrings a developing country's ability to raise more money. If progressive taxation is increased above a certain point, it decreases savings and investment. So, whenever, with the aid of indirect taxes, revenue is increased, the tax structure remains repressive and saving is discouraged.

In a final article, next week, we will consider the way out of this dilemma.

INDIA EXCHANGE (7th FLOOR) CALCUTTA-1

historic voyage ended as the steamship "Enterprise" reached Calcutta on 9th December, 1825. The first steam-powered vessel to make the England-India run, the 500-ton "Enterprise" won a cash prize of Rs. 100,000 offered by Calcutta's trading community for this truly pioneering achievement. Her captain on the hazardous voyage round 'the Cape' was James Henry Johnson, Commander, Royal Navy, and a hero of Trafalgar.

Though the "Enterprise" was the first ocean-going, partly steam-propelled ship to arrive at any Indian port, small steam-powered craft were being built in Calcutta as early as 1823.

Among the oldest and best known marine and general engineering firms in the country, a privately-owned concern known as Reid & Company's Hooghly Dock (founded 1819), the forerunner of The Hooghly Docking & Engineering Company Limited, was already flourishing before the introduction of steam to India.

The 'Hooghly Docks' are a part of the vast industrial and engineering organisation of Martin Burn Ltd., an organisation which is playing an important role in India's industrial progress.

EUROMARKET'S AID TO DEVELOPING NATIONS

From Our Special West European Correspondent

PARIS, November 5.

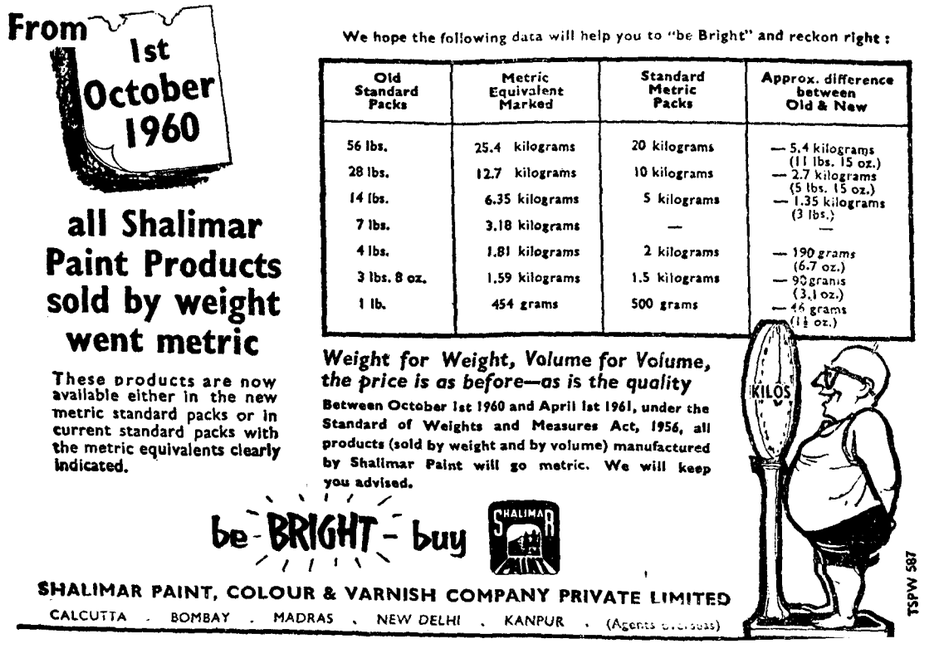
IN articles here in August (on the Common Market's ex-colonies) and in September (on the Aid India meeting in Paris), it was remarked that the outflow of development capital from this region to the backward economies was not as substantial as the prosperous Common Market Six could afford. It was pointed out that the will to assist African development certainly existed and had been formulated in investment plans, but for a variety of reasons the actual sums really invested were still modest; while, in the West German case, the will to assist was qualified by certain dogmas about the right way to give aid which, in practice, reduced the flow of capital abroad. The point about drawing Indian attention to this situation was to show that West European aid capacities were by no means strained to the limit and nor were West European capital surpluses already earmarked for other beneficiaries; so there was still scope for more energetic efforts by Indian borrowers in this region.

Not surprisingly, this state of affairs could not endure; new and pressing claims on European capital surpluses have been presented in the last few weeks. Already in September, when Dr. Erhard was in Washington for the World Bank meetings, "high U.S. officials" (I quoted a New York business weekly) "are known to have talked like Dutch uncles to their German opposite numbers. In the realm of assistance to underdeveloped countries, the latter were told in no uncertain terms, they simply aren't carrying their fair share of the load." Reports from Washington this week say that, following up that admonition, the U.S. Government "has decided to make a fresh and pressing effort to persuade West Germany to assume a larger part of the joint expenses of the Atlantic Alliance, in particular in defence and in aid to underdeveloped countries."

Simultaneously, in the first days of November, two meetings were going on in Paris between the authorities of the Six nations which will result in more substantial capital aid to two groups of backward economies: Greece, Turkey and possibly Israel on the one hand, and the new African states on the other. These two meetings are interesting because the style of assistance they discussed would meet the objections Dr. Erhard opposed to the plans of his U.S. critics in September. Dr Erhard, according to the same New York source, rather surprised his "Dutch uncles" by admitting frankly that everything they said was true; Bonn had been laggard, remiss and cautious — but that was because West Germany had a very different conception of development assistance to the U.S. practice of reckless, unco-ordinated and overlapping handouts. "Even with the best will in the world," said Dr. Erhard, "the quantity of public and private capital available for investment in underdeveloped lands falls far short of legitimate opportunities and needs. As a consequence, in order to make the most of their efforts, the nations of the West must work together far more closely in this sphere". "Furthermore," he went on "they must encourage the developing countries to help themselves." If these are really the criteria Bonn imposes for development aid, then the projects just discussed in Paris by West Germany and her Common Market partners will satisfy them, and the way is open for a faster flow of Continental capital, in the first place to Greece and Africa. If, at the same time, the American demand that Bonn should pay two-thirds of NATO expenses on her territory, while boosting her assistance to backward economies, produces the hoped for result, then the continental capital surplus I described in the summer may well disappear.

The first meeting was the quarterly conference of Common Market Foreign Ministers, and its main subject was the treaty of association between their enterprise and Greece. The principle of this association, first step toward full membership at some much later date, had already been solemnly admitted; it remained to draft the details and in particular to settle the large sum of investment capital that Athens demands as the price for opening her markets more freely to Common Market exports. The subject is delicate because, not merely are Greek demands for capital substantial in themselves, but the agreement with Greece will immediately be invoked as a precedent by Turkey, which country is also seeking associate status in the Common Market — and Turkey's needs of development capital are much larger than Greece's. Mr. Ben Gurion of Israel has also been putting out feelers on the same subject, and, of course, any agreement with that country would involve further capital outlays for the Common Market. As it happens, Israel's overtures have had a cold reception, because certain Continental countries are anxious to maintain good relations with the Arab states (not France: she has none): so Israel has been informed that associate status is limited to European countries (these being held to include all Turkey) and to African countries (not just the recently freed colonies, but all African States, such as Tunisia which is also interested in becoming a Common Market associate).

Greece is asking more than $100 million of Continental investment capital, and Turkey will no doubt ask for more than that. These are considerable sums, but they meet Dr. Erhard's requirements. The effort is not bilateral, but a joint venture by all the Six nations, and Greece and Turkey have shown willingness to adjust their economies to the needs of balanced progress. In fact, Dr. Erhard in person visited both countries and advised on the reforms he thought necessary. The treaty between the Six and Greece will probably be finalised at the middle of this month, and the Turkish project will be taken up at once. So there goes a few hundred million dollars of the Continent's capital surplus. Not that its aid capacities will thereby be reduced permanently. From a purely business point of view, investment in these two backward European countries is a much sounder proposition than investment in most parts of Africa or Asia, and will produce quicker returns. Meantime, the partial adhesion of these countries to the Common Market widens the field for Continental enterprises and reduces certain of their raw material and food costs. Progress in that direction and — even more important — the experience gained by the Six in joint lending operations will increase the Common Market's aid potentiality within a very few years.



The second Paris meeting was a "European round table" on the subject of "forms and techniques of assistance to developing countries". Its conclusions now go to the Council of Ministers of the Common Market for application. Following on the establishment by the Six of a "co-ordination group for technical assistance to developing countries," it shows that the Six are ful-

filling Dr. Erhard's wish for a co-ordinated approach by Western leaders to the problem of overseas investment. This is, anyhow, implicit in the Common Market Treaty; as the region is economically unified, it must practise joint lending abroad, and potential borrowers will be dealing not with Bonn or Paris, but with the institutions of the Community. This is important because at present these Six nations provide about half of all the technical assistance that goes each year to developing countries: about $230 million worth out of a world total of $500 million yearly. However, what concerns us now is the effect of the latest decisions on the size of the Common Market capital surplus, part of which was, theoretically, open to claims from India.

The experts gathered in Paris decided, first of all, that this capital surplus being after all limited, it would be best used by concentrating it more or less in one region, and that region was Africa. This is not at all the proposition that capital assisance and other advantages should be offered exclusively to the African "associated territories", i.e. those African regions that were still French colonies at the time the Rome Treaty was written. There is now no discrimination between those favoured wards and other African countries (or such as care to seek West Europe's help), but simply a general preference for investment in Africa rather than Asia or elsewhere, on the grounds that this will produce the best returns. This general preference constitutes no insurmountable obstacle to would-be borrowers from other continents, as was the case when only the listed associated territories had access to the Six-nation investment fund.

As to the performance of that fund, it was recognised — as stated here in previous articles — that it was not succeeding in tapping the potential Continental capital surplus; its loan commitments, even on paper, were well behind the quantum of capital offering, and its actual outlays of capital further behind still. The experts blamed the complicated working of the fund for the gap—often 15 or 20 months—between presentation of a business-like investment project and the beginning of work on the ground. They recommended total reform of its procedures in order to hurry up the outflow of capital from the Continent to Africa. This will possibly be effective, but I see no reason to revise the opinion that Africa will not be able for some years yet to use all, or even a large part of the industrial capital (as distinct from finance for public works, education, health and infrastructure) that the Common Market countries can afford to offer industrialising economies.

A third decision, also taken mainly with Africa in mind, might interest other countries also. It is well known that the Continental countries and particularly France are in profound disagreement with the Anglo-Saxon countries and particularly Britain about the possibility of helping backward economies by means of measures to stabilise commodity prices. Although the Common Market is the biggest single importer of commodities, it can do little to stabilise their prices without the active co-operation of the British and the Americans, and they dismiss such schemes as utopian. So, after stigmatising the "selfishness of certain importing countries" which is delaying efforts on a global scale to protect developing nations from wide variations in prices for their exports, the Continental experts recommended doing something on a limited scale. They urged developing countries to expand present marketing boards and stabilisation funds that seek to protect their own export industries, and to set up new ones. The Common Market would then assist these local organisms with technical help, with advice on how to co-ordinate them, and — most important — with financial aid in the shape of repayable loans. However, limited in scope, this seems a sound and practical proposition. So any country, not only in Africa, that sets up, or already possesses, a central marketing board or price-equalisation fund dealing in a raw material or other commodity that is of real interest to the Common Market (e.g. because that region buys a large proportion of that commodity) could approach the Six for help.

Economic Report from the U.S.

A LOOK AT THE ECONOMY

By

GUY SIMS FITCH

WASHINGTON, Nov. 1.

IT is an old adage that statistics can often be misleading. This is certainly true today as far as the American economy is concerned. Let us take a look at a few of the seemingly unfavourable trends. Consumer spending — the major support for U.S. economic activity — declined during the third quarter of the year at an annual rate of $500 million. This development, which reversed a long-standing upward movement, contributed to the slight dip in the gross national product (GNP) — the total output of goods and services — for that three-month period. Yet this dip in purchases was not due to any drop in the ability of consumers to maintain their buying pace. On the contrary, consumer income during the third quarter actually reached a record annual rate of $457,500 million after taxes, a rise of $3,400 million over the second quarter. This means that in terms of their aggregate financial well-being, the American people by and large were better off than they had been before. It means that total personal savings during the third quarter rose to an annual rate of $29,000 million, highest ever for any peacetime quarter on record.

Another highly publicized problem is the steel industry. Steel production has been at a low ebb in recent months, average little better than 50 per cent of capacity since July. Yet this, too, is not necessarily a valid indicator of the state of the economy. The fact is that actual consumption of steel this year appears headed for the second largest annual total on record. And few would deny the reliability of steel usage as a gauge of economic activity. It should be remembered, in this connection, that the low operating rate in steel today has been caused to a large extent by the heavy reductions in inventories by steel users. According to some calculations, if the production pace were equal to the consumption pace, steel output would be running closer to 70 per cent of capacity than to the actual 50-55 per cent. One also should keep in mind that the nation's steel capacity has grown enormously in recent years, and as of this past January 1, totalled 148.5 million tons. This means that even at reduced operating rates, steel production this year will be one of the highest on record. Moreover, an estimated 30 million tons of this capacity can be classified as reserve — as high-cost capacity to be used chiefly to meet current or prospective shortages.

Contributing to the disappointing steel production rate has been a slowing down in automotive orders for steel. Yet during the past month, the automobile industry has raised its production to the highest level since last February — an indication that this important industry has to some extent been living off its steel stocks. Even if automobile output were to fall moderately below the original production schedules for the rest of this year, the estimate is that 1960 production would still reach 6.7 million cars. This would be more than one million above the 1959 total, and would make 1960 the second-best automobile year on record. Whether or not this total actually is reached will depend in large measure on the behaviour of the consuming public. These figures show they have the money to spend. Will they spend it — on automobiles or on anything else?

In answer, it is encouraging that automobile sales during October ran well ahead of the like 1959 month. When the returns are in, they may show that automobile sales in October, 1960 set a record high for any October of any year. One should be wary, of course, of trying to reach sweeping conclusions on the basis of one month's results in one industry. But there are other clues that consumers may be stepping up their purchases. One of the more important is the jump in department store sales in recent weeks. There are some estimates that October sales were the best since July, and the third highest for any month.

Another highly publicized statistics has been the decline in industrial production, which in September was down to 107 per cent of the 1957 average from a February-July range of 109-110. Yet here again, one must be careful in assessing the underlying trends. While output was falling, new orders received by manufacturers were rising, for the second straight monthly increase; total unfilled orders also rose in September, for the first such gain since last March. None of this is meant to deny —nor can it deny—the obvious fact that the U.S. economy has slowed down perceptibly this year, and is far less exuberant than the experts would like to see it. Nevertheless, this examination of some of the more spectacular of the statistical barometers should make it clear that the business trend has by no means been uniformly downward. It also should demonstrate that even during the current slowdown, the economy has retained important elements of strength that could contribute to a renewed upsurge in the not too distant future. As a matter of fact, slowdown or no, when the final 1960 accounting is made, it undoubtedly will show that the U.S. economy still managed to attain a new high in over-all economic activity.

India

Second Prize Bond Draw: The following series of Prize Bonds will be eligible, in accordance with the terms of the Notification for the issue of Five-Year Interest-free Prize Bonds, 1965, for participation in the Second Quarterly Draw to be held on December 1, 1960:

Rs. 100|- Denomination: Series, A, B, C, D, E, F, G H, J, K, L, M, Q, U and V.

Rs. 5|- Denomination: Series AA, AB, AC, AD, AE, AF, AG, AH, AJ, AK, AL, AM, AN, AP, AQ, AR and AT.

The draws will be held at nine places, namely, Bombay, Calcutta, New Delhi, Madras, Bangalore, Nagpur, Lucknow, Patna and Hyderabad. They will be conducted, at each place, under the supervision of a Committee consisting of prominent non-officials and representatives of the Central Government, State Governments and the Reserve Bank of India. The composition of the Committees and the particular series in respect of which the draw will be held at a Centre will be announced later.

*

Reorganisation of Central Excise: The Government of India have constituted a 7-member committee to carry out a comprehensive examination of the working of the Central Excise Department and to make recommendations for its reorganisation. Mr. A. K. Chanda, until recently Comptroller and Auditor-General of India, is Chairman of the Committee and its members are: Mr. Babubhai M. Chinai, M.P.; Mr. N. P. Nathwani, M.P.; Mr. B. C. Ghosh M.P.,; Mr. J. D. K. Brown, lately President of the Associated Chambers of Commerce, Mr. A. M. M. Murugappa, Chettiar, President of the Federation of Indian Chambers of Commerce and Industry, Mr. R. N. Misra, Director of Inspection, Customs and Central Excise, who will also be secretary of the Committee. The terms of reference of the Committee will be to examine generally the organisational and administrative set-up of the Central Excise Department and advise Government on such reorganization as may be necessary for achieving maximum efficiency at minimum cost; to review the Central Excise Act as well as the rules and procedures and recommend the steps required for their rationalisation, simplification and improvement, wherever necessary, so as to better adapt the machinery to the changing conditions; to make any other recommendations germane to the objectives of the investigation. The Committee headquarters will be in New Delhi. It will submit its report to the Ministry of Finance (Department of Revenue) before October 31, 1961.

United States

Grant to India's Malaria Eradication Drive: The United States Government has given a further grant of $10,377,000 (Rs. 4.9 crores)) to India's malaria eradica programme. This brings the total U.S. aid to the programme to Rs. 44.8 crores. Under an agreement recently signed between the Governments of India and the United States, the grant will be utilized for the purchase abroad of approximately 16,730 tons D.D.T., 100 pick-up trucks with spare-parts and drugs used in the treatment of malaria. Since 1953, the United States have met most of the foreign exchange needs of the campaign against Malaria. In addition to dollar grants the United States has made available to the malaria eradication programme rupees acquired through the sale of agricultural commodities shipped to India under P.L. 480.

U.S.S.R.

Medical Education in U.S.S.R.: As many as 80 medical institutes are training doctors for the Soviet public health services. Enrolement to these institutes aggregate more than 1,70,000 young men and women. These figures, testifying the success scored in medical education are given in the latest statistical volume, 'Public Health in the U.S.S.R.', published in Moscow. At present, the Soviet people are better provided with doctors. The U.S.S.R. has five more doctors per 10,000 of population than, for instance, in the United States of America. People say, the best way to evaluate the present is to review the past. Tsarist Russia, and especially her national outlined territories, rank d among the most backward of the States. After the October revolution, in 1917, care for the health of the working people became a matter of paramount importance in the Soviet Union. Particularly great attention was paid to the establishment of higher and secondary medical schools. Today people in all the Republics of the U.S.S.R. can receive medical education. Last year, as the statistical book, 'Public Health in the U.S.S.R.' reports, the number of doctors in the Soviet Union reached 3,80,000 and it is expected that it will rise to 6,00,000 by 1975.

*

U.S.S.R.'s Rate of Growth: It is claimed by Russians that the Soviet rates of growth are higher than the American. During the past 42 years (1918 — 1959) the average annual rates of industrial growth in the U.S.S.R. were as follows (in per cent): 10.1 in the U.S.S.R. and 2.3 in the United States. During the last six years, Soviet industrial production grew at the rate of 11.2 per cent and the American 2.4 per cent. As regards pig iron, this annual increment amounted to 2.6 million tons in the U.S.S.R. In the United States, the output of pig iron did not grow on the average, but rather decreased by 2.3 million tons a year. As regards steel, the U.S.S.R. registered an increase of 3.6 million tons, and the United States a decline of 2.7 million tons. The growth of iron ore output for instance, is accompanied by an increase in coal production. The American figures, along with declining production reveal a lack of balance between the outputs of individual industries. This year's margin of increase in the Soviet industrial output will exceed 1,40,000 million roubles. Only a few years ago, the annual margin of increase was 1,00,000 million roubles.

Greece

Bartar Trade Dealings with Communist Bloc Countries: Greece is the latest country to experience costly disillusionment in bartar trade dealings with communist bloc countries. It has now been officially confirmed that Soviet bloc countries have been re-exporting Greek products such as leaf-tobacco currants, sultana raisins, raw skins, and cotton to western markets at prices 10 to 34 per cent below the prices covered by Greek exporters. The Greek products were traded to the Soviet Bloc countries in exchange for manufactured goods. The values placed on these capital goods by the Communist countries are usually inflated by 40 per cent over comparable capital goods offered by free-world countries. However, this bartar type of trade agreement is tempting to a country short of foreign exchange. The trouble is that Soviet bartar agreements often result in illicit competition which reduces a country's foreign exchange earnings from exports, as other countries have previously learned.

United Kingdom

Instruments for Indian Oil Pipeline: A British firm of automatic control manufacturers (Honeywell Controls Ltd.) of Middlesex, has received the biggest single contract in its history — worth £300,000. The order is for automatic fuel-measuring instruments on the 720-mile length of the new oil pipeline in Eastern India. A large part of the equipment involved will be made in Scotland. The builders of the pipeline Burma Oil Company (Pipelines Ltd.) placed orders with Honeywell, whose main factory is at Motherwell, Scotland. Work on the project is expected to begin soon and finish by the middle of 1961. Manpower at the factory is to be increased by one-third in the extension programme of £1 million. Work has just been started in the factory on a £30,000 contract for automatic control instruments in a Russian sugar factory. This is expected to be completed next May. The New-house (Motherwell) factory is still at work on a recent £260,000 order for similar instruments for a Russian chemical plant.

*

Consortium to Market U.K. Telemetry System: Five British Electronics manufacturing companies have formed a consortium to exploit the overseas and British markets for a major air-to-ground multi-channel telemetry system developed by them in collaboration with the Royal Aircraft Establishment at Fornborough, Hampshire.

*

New Camera Range-Finder: A new type of stereoscopic camera range-finder called the 3-D-3 which simplifies and increases accuracy in focusing has been developed by Mr. Norman Barton, a scientist at the U.K. Fighting Vehicles Research and Development Establishment. It overcomes disadvantages existing in present types which generally use a system of bringing two super-imposed images into register with one another. It is claimed that it will mean better photographs for the professional and no more 'fuzzy' snaps for the amateur.

Australia

Taxation Survey: An official pamphlet has been issued surveying the whole field of taxation in Australia. The following points relate to overseas investors: Tax on dividends paid after June 30, 1960 to shareholders not resident in Australia may be met by withholding tax, deducted from dividends at the time of their payment. These dividends are not taken into account in assessments accept where the shareholder elects to have the assessment basis applied. In the case of non-resident of Australia all income from sources wholly outside Australia is exempt income, and is not taken into aicount in determining the rate of tax payable on the taxable income. Tax is not payable by an individual unless the taxable income of the year exceeds Rs. 1,120. Individuals and companies are exempt from the tax on profits of gold and uranium mining, or, in some circumstances, gold and copper. There is a 20 per cent exemption for profits from mining of tin, copper, pyrites and a number of other minerals. Exemption is provided for income from the disposal by a bona fide prospector of rights to mine certain metals or minerals. Exemption is also given to income from sales of petroleum mined in Australia or in Papua and New Guinea upto the amount of capital expended on exploration and mining. Taxation agreements entered into with the United Kingdom, the United States, Canada, and New Zealand limit the amount of tax on dividends paid to residents of those countries.

Austria

L.D. Process Making Headway: Currently 21 steel works using the Austrian L.D. process on a licence basis are in operation in four continents. Another 36 LD steel plants are under construction in foreign countries. Recently, representative of the biggest South African steel concern, the South African Iron and Steel Industrial Corporation Ltd., in Pretoria visited Austria for negotiations on a license for L.D. steel production in Africa. The concern intends, by introducing the Austrian process in two steel works in Pretoria and Vanderdijlpark, to double its crude steel production.

U.A.R.

Trade with U.S.S.R.: In view of the fact that the volume of trade between the U.A.R. and the Soviet Union has risen from £E6 million to £E50 million in four years time, it has been decided to conclude long term trade and payment agreement between the two countries, declared the Executive Minister of Economy at a press conference at which he explained the results of his recent visit to the Soviet Union and Hungary. He said that the new long term trade and payment agreement would replace the existing one which was concluded four years ago, renewable from year to year and which no longer suits the new situation arising from the great increase in the volume of trade between the two countries. Continuing, he said "Our foreign trade policy aims at ensuring stability and equilibrium in the volume of trade and the disposal of specified quantities of important commodities within the duration of any trade agreement between the U.A.R. and any country. This policy will apply to the new long-term trade and payment agreement with the Soviet Union." The Minister disclosed that he had agreed with the authorities in the Soviet Union Foreign Trade Ministry in the formation of a sub-committee to examine the list of commodities exchanged between the two countries to find out which of them would ensure stability and equilibrium between imports as well as on the broad lines of the new agreement. This was the first time the U.A.R. had thought of concluding a long-term agreement with the Soviet Union.

T.W.A.

Jet Service Between the United States and India: On November 2, 1960, Trans-World Airlines inaugurated jet service between the United States and India. It is reported that TWA will use the world famed Boeing 707 Intercontinental superjets to provide the fastest service between the United States and India. The superjets will fly from New York to Bombay halting at Rome and Dhahran, and cover the distance of approximately 8,000 miles in 15 hours and 40 minutes flying time. The Westbound superjet will make an additional stopover at Paris. The TWA superjet service expansion to Bombay brings to a total of ten overseas cities served by TWA superjets on its 50,000 miles route network. Transworld Airlines Superjets have special features of a luxurious lounge, the widest seats and a brand new modern colour scheme specially designed for these air-lines.

NEWS IN BRIEF

INDIAN

The Central Warehousing Corporation is likely to construct 35 more Central Warehouses during the Third Plan period. It is also proposed to construct 20 specialised storages, including cold storages for perishable commodities like fruits and vegetables.

*

The production of coke at the Durgapur Steelworks has been at its maximum for the last one month. The first battery of coke ovens recorded its highest output of 1,489 metric tons of coke during the last week of September and the production is being maintained at the same level since October 3, 1960.

*

Till early this year, about 50,000 persons had got themselves enrolled in the National Register of Scientific and Technical Personnel. The Register has two sections, general and special. In the general section, meant for the Indian technical personnel living in the country, about 46,000 persons had been listed. The special section for Indian scientists abroad had about 3,800 persons on rolls.

*

A conference of the trainees sponsored by the National Productivity Council for studying modern techniques of scientific management, industrial engineering, industrial relations in U.S.A., U.K. and France discussed recently the steps for effectively utilising the knowledge and experience gained by them abroad.

Awarding of final contracts for completion of a new Styron production plant in Greece has been announced by Dow Chemical International Limited S.A. The new manufacturing facility for Dow Hellenic Chemical Industry Ltd., located at Lavrion, Greece, a suburb of Athens will be built by Foster Wheeler Italiana of Milan, Italy.

Pardon our Presumptuousness..... but.....

The beginning and the end of a Five Year Plan are vital dates in the nation's history. Each Five Year Plan is both an assessment of the past and a call for the future. It seeks to translate into practical action the aspirations and ideals of the millions in the country and gives to each of us the opportunity of service in the common cause of eliminating poverty and raising standards of living....

Today, on the eve of the Third Five Year Plan, we of the Raza Buland Sugar Co. Ltd. believe that 25 years' useful service to the Nation is something to talk about, but we will rest contented by narrating a few facts about our "achievements" and our contribution towards raising the standard of living of our people during the past 12 months.

At the close of the last crushing season we .....

Crushed..... Over 1,13,00,000 maunds of Sugarcane
Bagged..... Over 10,93,000 maunds of Sugar
Paid to Cane-growers..... More than Rs. 1,76,00,000
Paid to Workers..... Over Rs. 17,70,000

And expect to pay to the Government and National Exchequer as Excise and Taxes Over 1,55,00,000 Rupees.

On the occasion of our Silver Jubilee celebrations recently almost a hundred of our oldest workers who had served the Raza Buland Factories for over 25 years were awarded silver medals, and cash awards.

These are our humble contributions towards the cherished targets and goals of

BANKS AND THE NEW PHASE IN GILT-EDGED

By

S. NARAYANASWAMY

GOVERNMENT Securities have been regarded the world over as the symbol of fluidity in investment. It is good and pertinent to remember how it all started — with that colourful monarch Charles II who brazenly stole the deposits which London goldsmiths made with the Royal treasury and later on had the hardihood to finance his extravagances and whims by issuing tokens of royal indebtedness to men of commerce; of how some ingenious sychophant peers of the realm that frequented the Court of the carousing king, discounted these promissory notes at great profit, because of the facility available to them of helping themselves to face value of these pronotes by reason of their proximity to and influence over the King.

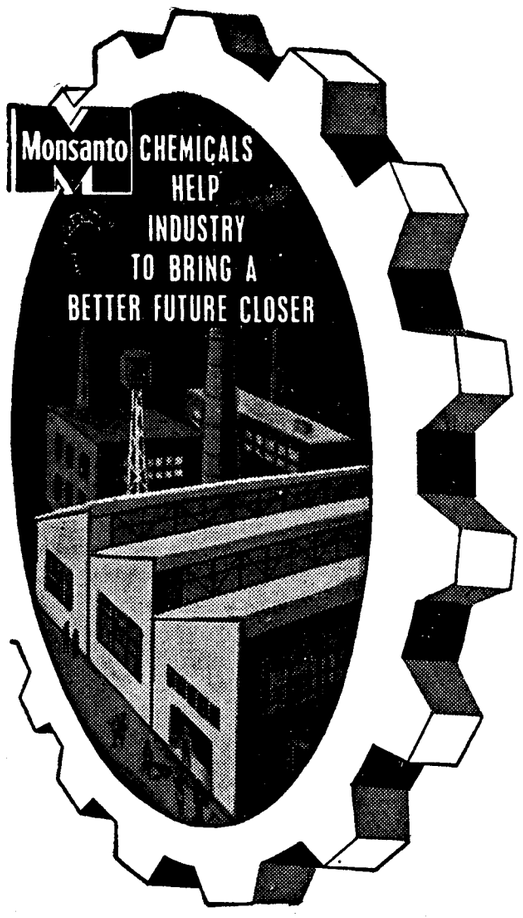
Centuries have no doubt passed since this royal hedonist was the unwitting inventor of negotiable instruments of Governmental borrowing. We can say, as we often do, that it is a far cry from the days kings and courtiers who wined and dined off the fat of the land and the Government securities market of today which are very different things from being tokens of indebtedness of whimsical kings, though the word 'Gilt-edged' traces its origin according to some, to the fact of it all having started with royalty.

It is true that Government securities are regarded as the most preferred form of investment by banks and insurance houses the world over. Their high fluidity, despite their low yield makes them the first line of defence for banks. Their easy pledgeability and saleability are regarded as valuable characteristics. Provident Funds, Trusts, Charitable and Educational Endowments are all called upon to put their "corpus" in Government Securities.

Today, however, individuals do not by and large care to put their savings in gilt-edged except where trusts for minors are created. This is because of the low yield available after taxation and the fact that gilt-edged is known to be no hedge against inflation. Thus when new loans are floated, it is observed that Governments both at the Central and State levels in India concentrate on appeals to banking institutions and believe that individual subscriptions would be small.

There has been a tendency for State borrowings to become bigger in order to achieve some degree of self-reliance in financing plan projects. In order to ensure subscriptions for the larger loan issues made by States, it was not regarded as adequate for State Governments to appeal to the banks and the Life Insurance Corporation to subscribe and sit back. They have had to press into service their revenue collecting machinery to canvass subscriptions, by the simple process of each District Collector being allotted a target of collection and he in turn mobilising his deputies and the tahsildars who fall back in turn on village officials—like some subunderwriting machinery in public share issues. These officials finding it by no means easy to induce subscriptions in driblets preferred to induce subscribers to go to banks, take overdrafts for sizeable sums and apply through the banks, depositing a small margin with the banks.

A new class of enterprising subscription promoters in rural areas has sprung up in several districts more particularly in Andhra and Madras States. I hear they are now observed to have sprung up in other States also. It is now believed that without the assistance of these loan-subscription promoters, State loan issues at any rate would have had to confront the spectre of undersubscription. They have therefore come to be regarded by the lower rungs of revenue officialdom as a valuable standby.



Let us now see how they operate. The loan subscription promoters (who for purposes of this article I shall describe as L.S.P.) have arrangements with one or more fair-sized banking institutions to give overdraft facilities to the rural subscribers for new loan issues on a margin of say 2½ per cent. The banks offer these facilities as these overdrafts are of very short duration and often banks themselves buy off these securities at a discount. The L.S.P.s go along with revenue officials to the village landowner and tell him that he is put down as a prospect for say Rs. 1 lakh subscription in the new loan. The landlord who is sensitive to the steamrolling effect of this visitation by revenue officialdom has not of course the required sum to subscribe nor even any fair part of it. The L.S.P. has a whispered consultation with the landlord and tells him that he, the L.S.P., is always there to arrange bank facilities if the landlord would plank say two per cent of the money or Rs. 2,000 as margin to be deposited for the overdraft arrangement that enables him to become a proud subscriber of Rs. 1 lakh and assures him that the loan scrip would be sold out the moment scrip is issued or even earlier by negotiating bank receipts — an interbank facility that enables business to take place in the temporary absence of scrip. The landlord is often prepared to lose his margin wholly or in part so long as he has been able to propitiate the revenue officials concerned, of whom he sincerely hopes he has seen the last for the season.

The L.S.P. either arranges an overdraft in the landlord's name with the bank paying another ½ per cent out of its own pocket as residual margin or arranges one in his own name and subscribes for Rs. 1 lakh loan. In the former case he has to take an authority letter from the landlord to sell out the loan bonds as early as possible, after issue and also a letter to the bank authorising them to deliver the bonds when received against payment as per instructions of the L.S.P. The loan issue is subscribed or oversubscribed by (a) banks investing on their own account and (b) on behalf of overdraft availing clients of the aforesaid description who never intend to hold on to the bonds because overdraft interest is high as compared to taxable bond interest. Once the subscription list is closed, the L.S.Ps get busy contacting city brokers as to possible saleable rates of the bond and endeavour

to sell quickly and often do so without waiting for bonds to be received from the public debt office and on a bank receipt basis. The L.S.P's hurried sales result in the bonds being sold below the issue price and a discount of about 50 nP. to one rupee was common till recently. The margin of 2 rupees collected from the subscriber operated as a safe cushion against such discount in price levels and there was still a retainable residue of margin which the L.S.P. trousered as the fee for his troubles.

Unfortunately this happy position has been reversed in recent weeks. Several of the recently issued State Loans have been sold at Rs. 2.50 to Rs. 3 discount on the issue price. The fall in price was caused by pressure from L.S.Ps to sell—because soon after overdrafts were given, the interest rate was raised by the banks — following Reserve Bank's directive to increase the average rate of lending by ½ per cent. The gap between the interest paid to the banks and the tax-deducted-interest on the bond widened as a result and this became a significant out-of-pocket burden which the L.S.Ps were naturally reluctant to shoulder. The scramble to sell became large as a result. Four per cent 1969, Andhra and Madras State Loans were issued at Rs. 99.75. The Andhra Loan was sold down to Rs. 96.75 and the Madras Loan down to Rs. 97, the losses being respectively Rs. 3 and Rs. 2.75 per cent — incurred in a period of 3 months from the date of issue. The L.S.Ps have all been bitten by having to sell bonds at a loss and having no recourse against the original subscribers. They incur expenses going from place to place, take the trouble to arrange overdrafts, pay out-of-pocket difference in interest on overdrafts and finally incur a capital loss on sale; all of which constitutes a rather unprofitable promotional effort.

For some years there were complaints of official pressure in securing subscriptions for loans. The revenue official cannot be obviously expected to get subscriptions by gentle persuasion and they were in a quandary when Government asked them not to use pressure. But this new class of L.S.Ps came in handy and what might have been a bagatelle 2,000 rupees subscription was increased to Rs. 1 lakh by the ingenuity of the L.S.Ps, who helped to create optical illusions of rural support for loan issues. Thanks to Reserve Bank policy of dearer money for trade and industry, these unsung bond-salesmen of rural India are making a hurried but determined retreat from promotional efforts for future loans. The million dollar question is, who will be in a less enviable position in the context of future State loan issues: the itinerant revenue official or the State Governments whose loan issues have become his pet aversion; or the bank who piled a gainful trade in the past, buying securities that were distress-sold at attractive discounts?

Monsanto works constantly both to develop new, better chemicals—and to improve those chemicals already used in every major industry.

PHARMACEUTICALS
acetylsalicylic acid, phenacetin, benzoic acid, phenol, phenolphthalein, germicides are but a few of the many Monsanto products in this field.

RUBBER
Monsanto's accelerators help speed vulcanisation, add quality. Anti-oxidants improve resistance, prevent early cracking, give increased flexibility.

TEXTILES
Monsanto Syton is widely used in spinning cottons and woollens, increases yarn strength, allows for reduction in twist.

PRESERVATIVES
Monsanto's pentachlorophenol chemicals help to preserve a wide range of products. Monsanto sodium benzoate helps prevent corrosion.

PAINT
Monsanto's chemicals are used extensively in the manufacture of high-quality paints, varnishes and lacquers.

SYTON is a Registered Trade Mark

Monsanto
chemicals for every industry.

MONSANTO CHEMICALS OF INDIA PRIVATE LTD.
Wakefield House, Sprott Road, Ballard Estate, Bombay 1.

THE BUSINESS WORLD

Is the World Shortage of Capital Coming to an End?

By WILLIAM REES-MOGG

THE key to the success of international development in the 1960's will be the price of money. In the 1950's the non-industrialised countries still for the most part had reserves to draw upon; India in particular had the sterling balances which had accumulated during the war. They were also able to undertake new debt without feeling immediate anxiety about the cost of the debt service on the balance of payments. By 1960 this had ceased to be the case for India or for most other countries in need of development. The problem was no longer a simple one of how much capital could be obtained; there arose the new problem of how much could be paid for.

As a result in recent years all developing countries have become acutely conscious of the importance to their economies of the level of international interest rates. Loans from the Communist countries often come at artificially low interest rate (Communist interest rates like Communist export prices are arbitrarily determined). Nevertheless, most foreign capital could only be obtained at rates settled in the light of the world demand for capital.

For many years we have become accustomed to the assumption that there was, in a real sense, a world shortage of capital. That was not merely taken to mean a world shortage of liquidity, of money or credit in one form or another. Such a shortage can always in theory be cured by purely monetary methods. What was meant was something quite different; it was a world shortage of the capacity to produce capital goods.

In such circumstances it was considered natural for the price of capital to be forced up. In fact, just such circumstances did undoubtedly exist for the ten years after the war. There was hardly any surplus heavy industrial or constructional capacity in any of the major industrial countries during the ten year period. As a result the attempt to hold down interest rates after 1945, particularly by the Labour Government in Britain and the Truman administration in the United States, did in fact break down. The world market price of credit was forced up by the shortage of industrial capacity to make the capital equipment that was wanted.

All this is now agreed. Yet people still take the shortage of industrial capacity for granted, after it has in fact ceased to exist. The vital factor is the position of the United States. There the level of unemployment has risen to 6 per cent, while only half of the steel capacity is being employed — and this not at the climax but at the start of a recession.

This is all the more important because the United States is still the great central investment reserve of the non-Communist world. Outside the Communist sector the U.S. has something like half the world's investment capacity. If the U.S. has surplus capacity on its present scale then there cannot exist any true world shortage. For instance, the United States present spare steel capacity is larger than the actual production of any other industrial country except Russia.

Plainly the major re-equipment period has now passed in Europe and in all the Communist countries except China. The sporadic appearance of surpluses of Russian commodities, and the growing Russian exports of capital confirm this.

However, if this is so, the concept of a long-term shortage of capital goods capacity is no longer justified. In that case the expectation of high interest rates in the period of the next few years is also likely to prove wrong. If interest rates are ultimately determined by the state of industrial capacity to produce capital goods, then they ought now to be starting a major long-term decline; comparable in significance to their rise in the early 1950's.

Certainly there are some signs that this may be happening. The United States has reverted to a frankly easy money policy, and has brought interest rates down rapidly. The British Bank Rate, though still at the comparatively high level of 5½ per cent, has also been brought down. Germany and France are expected to follow with at least comparable reductions.

The period of falling interest rates could be quite a long one. Problems such as the desire to avoid devaluation of the dollar could delay it. Plainly, however, this is a trend which would be of immense value to the Indian economy. Each one per cent off India's interest liability is the equivalent of a large increase in exports. The capital consuming countries have an obvious and vital interest in the improvement of the world's supply of capital; that is itself more a matter of physical capacity than of the creation of credit.

The one factor telling the other way is of course the need of the developing countries themselves for capital goods. However, even the most optimistic development plans are in fact comparatively small compared to the potential world resources. The world shortage of capital was created by the post-war re-equipment and expansion needs of the most advanced industrial economies; it was on the scale of their existing capacity. There seems to be no danger that the countries which are in process of industrialisation can overstrain the resources of the most advanced industrial economies; long before that they would have overstrained their own.

The Consequences of the Credit Squeeze

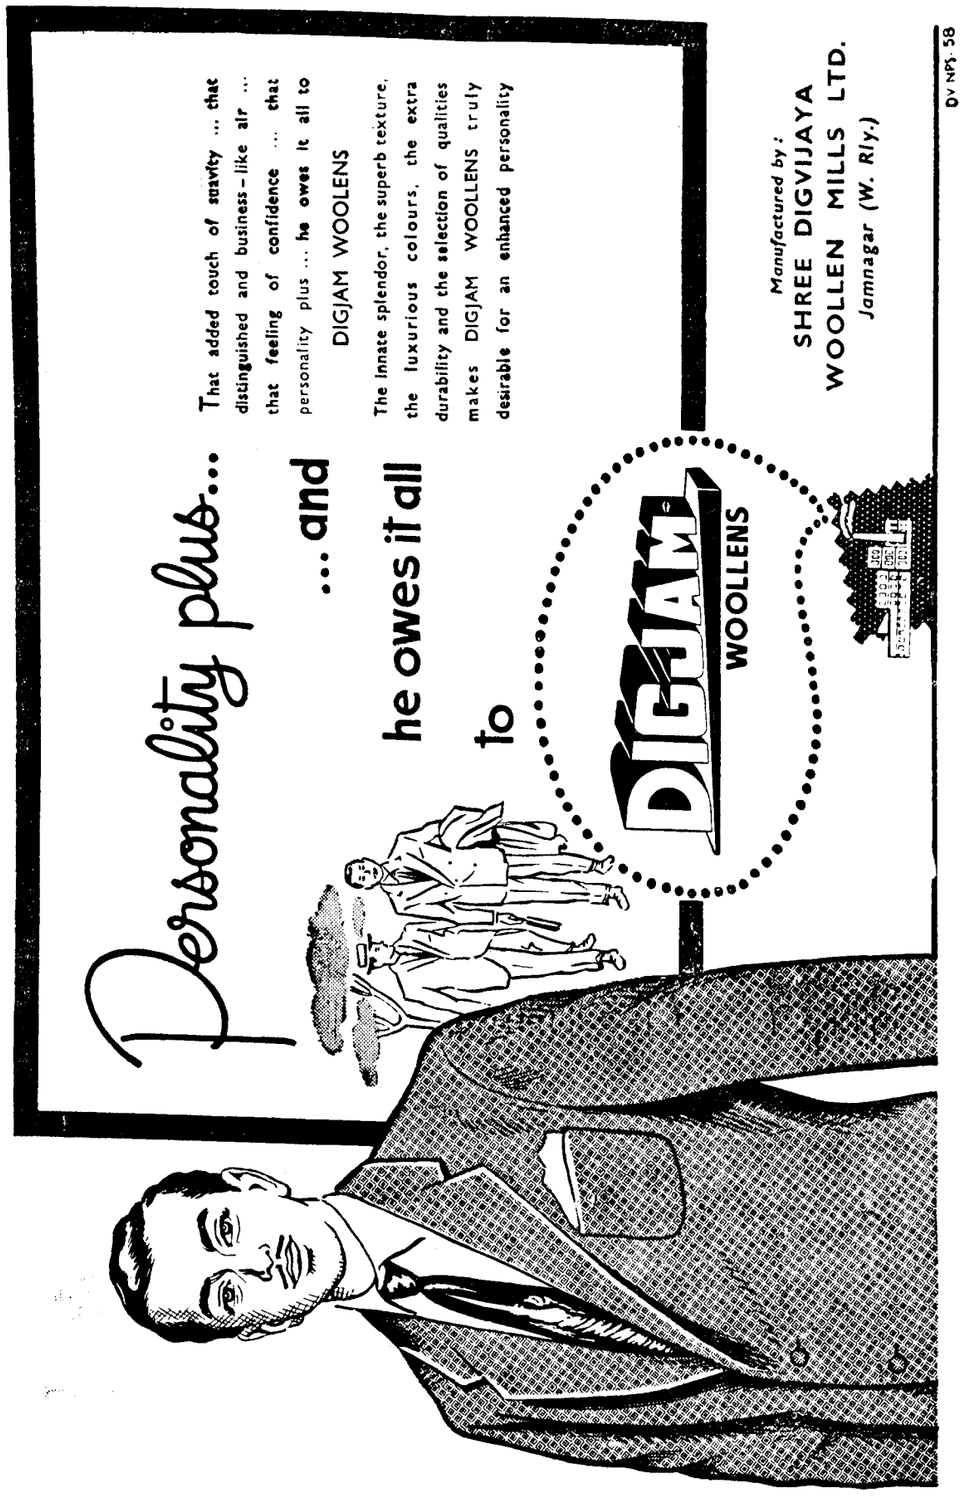
By CROESUS

HAS the latest instalment of dearer money policy of the Reserve Bank proved effective? This is the question that is currently being hotly discussed in financial circles everywhere. While the Governor of the Reserve Bank is reported to have maintained —this he is stated to have done in the course of an address to the Society for International Development, Madras Branch, last week—that the credit squeeze has helped restrain speculation and also assisted in bringing down commodity prices, the press in general and sections of the financal Press in particular do not seem to think so. Availing himself of the occasion provided by his address on "Monetary Stability and the Role of the Reserve Bank," I find that Mr. Iengar made the point that the Reserve Bank's recent policy of dearer money was aimed at reducing demand in credit for non-productive purposes like speculation on the stock exchanges and commodity markets. Combined with the monetary measures taken by the Bank previously, he said, the cumulative effect should be to exercise a downward pull on inflationary pressures. He then went on to describe the latest measure and tried to counter two criticisms, namely (1) that it increased industrial costs, and (2) that, inasmuch as it would exert pressure only on the organised market and there was a considerable unorganised money market over which the Reserve Bank has no control, the effect would only be to divert business to the unorganised sector. On both these points, as is only to be expected, he reiterated his views expressed on previous occasions. In fairness to him, I must add that nowhere in the reported speech have I come across a categorical claim by him that the results visualised by the Bank had been realised.

Be that as it may, it is appropriate, before pronouncing opinions, to examine the relevant bank statistics to see how far the latest dose of credit squeeze has produced results. It was on October 1 that the latest credit squeeze measure became effective. On 30th September last, that is, on the eve of the enforcement of the credit squeeze in question, total bank credit stood at Rs. 1121.59 crores. After four weeks, that is as on October 28, total bank credit stood at Rs. 1111.18 crores. Over the four-week period thus, there has been a decline of Rs. 10.41 crores, making an average decline of Rs. 2.60 crores per week. But even after this decline, total bank credit at the end of October. 1960 was Rs. 169.73 crores higher than at the end of October, 1959 Again, over the same four weeks of October 1960. total deposits also have shrunk, after a steady rise until mid October. Thus, from the mid-October peak level, the latest position with regard to total deposits represents a fall of Rs. 17.30 crores; even taking the absolute figures as on September 30 and those on October 28, the net difference or decline amounts to Rs. 12.14 crores. In other words, notwithstanding the credit squeeze, the ratio of total bank credit to total deposit liabilities continues to be high at 58.45 per cent — it was even higher at 58.85 per cent for the week ended October 21 — as against 52.34 per cent at the end of October, 1959. The latest figure incidentally is only less than one per cent below the peak reached during the last busy season. On the basis of these figures it cannot be contended that the credit squeeze has had any marked effect so far. At the same time, it cannot be doubted that it has created conditions which make it difficult for banks, as well as for trade and industry, to obtain their requirements of credit as freely as before. Otherwise, there would not have been any need for representations to the Reserve Bank from several quarters pleading for a relaxation of at least the latest credit squeeze. What has, in fact, happened is that, whether or no it has discouraged unhealthy speculation on the stock markets as intended by the Reserve Bank, the credit squeeze has created a degree of confusion and disturbed investors' confidence noticeably. The high call money rates in the inter-bank sector and the capital depreciation in Government securities—especially State loans—are significant pointers to an avoidable deterioration in the situation, a development the implications of which can only be ignored at our peril. Add to this the sudden cooling off of interest in new capital issues and we have a situation which can hardly be expected to foster investors' confidence.

Had any of the aims that Mr. Iengar claimed for the Reserve Bank's latest measure of credit squeeze been achieved, there would perhaps have been a better appreciation of the dearer money policy of the authorities But there is no concrete evidence to establish that the policy has had its effect on the price structure as a whole. Except where supplies have been appreciably increased as, for example, in foodgrains and sugar, prices have, in fact, tended to rise. The frantic efforts that are being made by the authorities to prevent the rise in prices in raw material of at least two of our major industries, cotton and jute textiles, are clear proofs that the policy has not proved effective. As for curtailment of credit to non-productive purposes, while it is doubtful whether this has at all been achieved, it is quite clear that the needs of atleast some essentially productive enterprises have been adversly hit. In consequence, whether by a negligable or a sizeable margin, the costs of productive enterprises have increased and, to this extent, instead of countering inflation, the policy may be said to have only added to its tempo.

This is not to say that we have no use for monetary weapons nor to underrate their effectiveness in given situations. But, as Mr. Iengar seems to admit, the best results can be expected only when there is proper co-ordination between the monetary and the fiscal fields. Maybe, a precise co-ordination is difficult to attain, but then the two must atleast not work at cross purposes. Also the desired results would not follow, if one policy is actively pursued while the other is passively or sedulously dormant. As Mr. Cobbold, Governor of the Bank of England, did in London recently, Mr. Iengar also must admit, sooner or later, that "monetary policy can only carry part of the burden of the economic adjustment and cannot be effective if it is expeted to work against, rather than in support of, government policy in fiscal and other fields." Again, as Mr. Cobbold urged, credit policy should not be too rigid. There is need for less rigidity in this matter on the part of the Reserve Bank of India. If the latest credit squeeze is not to result in more damage, especially as we are on the eve of the busy season, the Reserve Bank should take steps to ensure that a proper correlation is soon established between the demand of the forthcoming busy season and the quantum of bank credit that is to be made available.



Business Notes

L.I.C.

THE THIRD MILESTONE

THE LIFE INSURANCE CORPORATION'S third annual report for the calendar year 1959 has an encouraging account of yet another stride made in business. Most of the indicators of business justify the conclusion that progress has been much faster in this year than in the earlier two years. It can be confidently said that the life insurance business has now received a new dynamism in this country and due credit can be given to the Corporation for it. During the year 1959, new business amounted to Rs. 429 crores as against Rs. 348 crores

in 1958. In percentage terms there was an increase of 25 per cent in 1959 above the previous year as compared to the increase of 22 per cent in 1958. But the fact that the base for the percentage estimation for 1959 was higher conceals the real magnitude of increase in percentage terms. It is not necessary to repeat the performance of the Corporation in respect of each single indicator.

The report for the last year gives a clear impression that the post-nationalisation task of integration of the former private units has been successfully accomplished. Now that the Corporation has not only consolidated its progress but entered upon a distinct phase of accelerated progress attention should be drawn to the overall expense ratio. This ratio improved from 29.2 per cent in 1958 to 28.7 per cent in 1959. But here a pertinent question may be asked: Can it be said that this pace of improvement is satisfactory? At the time of nationalisation, much capital was made out of the virtues of integration, large-scale operations and the efficiency and economy which go with them. Integration must show concrete results in terms of a lower expense ratio. It is difficult to be sure that the lower expense ratio of 1959 can be reckoned as gratifying. The Corporation would do well to accept the yardstick of expense ratios in the industrialised countries where the insurance habit has spread intensively and try to measure its success with reference to it. In any event, the financial management of the Corporation at this stage ought to show progressive economies. This is for the reason that the sources where business is being tapped are confined essentially to the already explored urban sector.

This leads one to an important aspect of the future of life insurance and the new challenge which the Corporation has to face. Fresh business potential in the field of life insurance is to be sought in a substantial degree in the rural sector. How far has the Corporation succeeded in penetrating into this field? Certainly, the Corporation has no proud claim to make in this behalf. A significant fact to be noted is the frank admission of the failure of the scheme of Janata policies. It would appear that the initial pilot projects taken up for experimentation of this scheme have now dampened the original enthusiasm of the Corporation and it should be clear that the rosy picture of the prospect of the Janata policy scheme was highly exaggerated. Why have the pilot projects failed to yield the expected results? The Corporation's explanation is: "As the Corporation issues policies for Rs. 500 and above under its plans, most people prefer to go in for such ordinary policies in preference to Janata policies." This explanation is hard to accept. What exactly are the attractive features of these conventional policies which claim preference at the hands of prospective policy-holders? The preference referred to above seems to be confined to the lower income groups in the urban sector. But that is not enough. If the saving and insurance habit is to be encouraged on a nation-wide scale, the potential sphere of the rural sector ought to be tapped.

Trade

MOUNTING DEFICIT WITH GERMANY

WEST GERMANY'S foreign trade has been setting new records year after year, throughout the fifties. In 1959, her exports rose by 11 per cent to over DM 41,000 million, while her imports increased by 13 per cent to DM 35,148 million. Probably the most interesting phenomenon on the import side last year was the extent of rise in purchases from Germany's Common Market partners, which rose from DM 8,000 million to DM 10,000 million—an increase of 25 per cent. While Germany has thus had a record foreign trade, our country's trade with her has given rise to an adverse balance of trade of Rs. 80 to 90 crores! This was the gloomy picture that was disclosed by Mr. Lal Bahadur Shastri, the Union Minister for Commerce and Industry, whilst addressing the last Annual General Meeting of the Indo-German Chamber of Commerce in Bombay, last week. Expressing concern over this state of affairs naturally, he pointed out that the most difficult problem facing the country was how to wipe off this deficit.

During 1957-58, India's imports from Germany had reached the figure of Rs. 130 crores, as against which our exports to Germany were only Rs. 28 crores. There was some improvement in our trade relations with West Germany last year, because, during 1959-60, our imports fell from Rs. 130 crores in 1957-58 to Rs. 106 crores. At the same time, unfortunately, for us, our exports to Germany also dropped from Rs. 28 crores in 1957 to just over Rs. 20 crores, both in 1958 and in 1959. If the present trend should continue, it is estimated, India's trade deficit with West Germany would reach the enormous figure of Rs. 500-600 crores during the Third Plan period. It must be disconcerting for both India and West Germany to see such a trend. It must be particularly so to us, for this has been happening when German imports from the other parts of world have been showing an increase. With the exception of 1958, when the terms of trade moved sharply in Germany's favour, imports have risen steadily year by year. Among the countries which exercised a strong influence on Germany's import pattern, in the descending order, were France, the USA, Netherlands, Italy, Belgium-Luxumberg and the UK. Three others of the Outer Seven—Sweden, Switzerland, and Denmark—followed the UK.

AIDS TO EXPORTS

NOW, GERMANY'S export surplus makes it essential that other countries should have the best possible chance of increasing their exports to her. In this connection, Mr. Shastri stated that India was ready to export goods, such as tobacco, cotton textiles, shellac, mica, carpets, floor coverings, sports goods, handicrafts, leather, and tea which are all in great demand in West Germany, to bridge the trade gap. He added that a stage had been reached when India should no longer be explored as a market for West German goods, but, on the contrary, that all possible steps should be taken by Germany to import more and more from India to narrow the existing trade deficit between the two countries. The Union Minister also made certain suggestions to strengthen the trade bonds between India and West Germany. For instance, he suggested that a possibly hopeful line of co-operation was to process the material in India—this would save a considerable sum on freight—and feed German industries with the material so processed in India. There was no precise limit to which these arrangements could be worked, he added. Meanwhile, it may be noted that, for the benefit of the exporting countries, Germany which is one of the world's largest creditor countries, has lately launched on a process of liberalization of quota restrictions. This is as it should be. It remains to be seen how far she will be able to follow an "outward looking policy"—which, in the main, she has followed hitherto—inside the Common Market.

Earlier, Mr. A. B. Parakh, President of the Chamber, said that the main effort of the Chamber had been in the specialized field of promoting trade, commerce and industrial and economic relations between India and West Germany. He urged the need for setting up in the offices and organisations which represent our industrial and commercial interests in every foreign country an active and effective sales force. The stress on the words "active" and "effective" cannot be overdone in the context of reports that one hears so often from West German business men who visit our exhibits in places like Dusseldorf and find that they cannot place an order

for the bulk supply of any of the exhibits that might appeal to them. Those who are in charge of the exhibits, we are told, do not care to lift even their little finger to encourage those who make such inquiries and put them in touch with reliable parties in India. It is futile to hope for any large-scale rise in our exports even to a sympathetic West Germany, so long as this state of affairs lasts.

AGREEMENT WITH CZECHOSLOVAKIA

TRADE BETWEEN India and Czechoslovakia has been increasing during the last few years. During the year 1952, 1953 and 1954, India had a favourable balance of trade, but the trend was reversed in 1955 and in 1958 the unfavourable balance of trade was as high as Rs. 253 lakhs. Export promotion measures in 1959 had their effect and India acquired a favourable balance to the tune of Rs. 51 lakhs. In these years the commodities which found favourable market in Czechoslovakia were mostly hides, skins and fur skins undressed, metalliferous ores and metal scrap, textile yarn, fabrics and made up articles and related products etc. The table below depicts the general direction of trade since 1952:

DIRECTION OF TRADE

(Rs. lakhs)

Year	Imports	Exports	Balance of Trade
1952 ..	1,60	2,90	+1,30
1953 ..	1,28	2,75	+1,47
1954 ..	1,33	2,08	+ 75
1955 ..	2,02	1,14	— 88
1956 ..	6,28	2,91	—3,37
1957 ..	6,15	3,78	—2,37
1958 ..	6,48	3,95	—2,53
1959 ..	3,72	4,23	+ 51
1959 (Jan.-June)	1,65	2,26	+ 61
1960 (Jan.-June)	3,43	3,42	— 1

A new trade and payments agreement has now been concluded with Czechoslovakia. The agreement will remain valid for three years and will come into force from January 1, 1961. Payments relating to commercial and non-commercial transactions between Czechoslovakia and India would be effected in Indian rupees. This is in keeping with the pattern of trade agreements which has now become conventional. Besides, the two countries have agreed to grant each other most-favoured-nation-treatment and other trade facilities.

The agreement is framed on the basis of equality and mutual benefit and is, therefore, bound to increase further the trade between the two countries. It may also be interesting to note that Czechoslovakia has promised aid to the extent of Rs. 23.10 crores for the Third Plan. This in itself is an indication that the economic and commercial relations between the two countries are becoming closer.

Tobacco

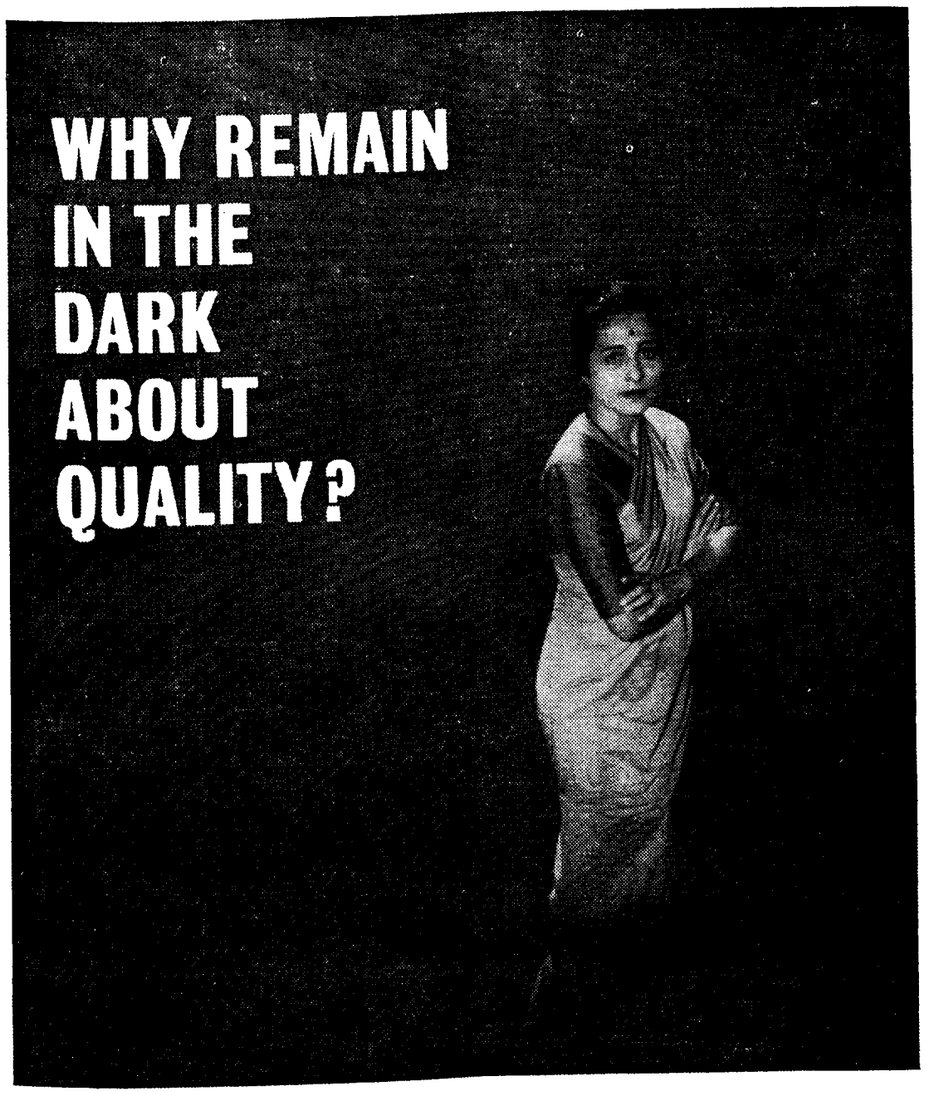
QUALITY CONTROL

QUALITY CONTROL and standardisation of products have become an integral feature of almost every economic activity these days, which is as it should be. While inaugurating the Tobacco Seminar recently at Guntur, Dr. Punjabarao Deshmukh, Union Minister for Agriculture, ascribed the growing export potentialities of Indian tobacco also to the institution of compulsory quality control on unmanufactured tobacco destined for overseas markets. This has helped to create confidence among foreign buyers, he said. An idea of the increase in exports of tobacco can be had from the following table:

Period	Export of unmanufactured Tobacco	
Average	Quantity (In million lbs.)	Value (In lakhs of rupees)
1942-43 — 1944-45 ..	21.9	97
1945-46 — 1947-48 ..	48.0	427
1948-49 — 1950-51 ..	75.40	979
1951-52 — 1953-54 ..	82.06	1,249
1954-55 — 1956-57 ..	89.76	1,163
1957-58 — 1959-60 ..	93.16	1,432

Although exports of tobacco have been increasing year after year, it is interesting to note, that, out of the total production of tobacco (590 million lbs. of all types) in the country, only about 13 to 14 per cent is exported. More than 75 per cent of the tobacco exported consists of virginia type grown in Andhra Pradesh alone. Now, there is vast scope, even as there is urgent need, for increasing tobacco exports, if need be even by curtailing internal consumption. As it is, tobacco exports accounted for Rs. 14 crores by way of foreign exchange during 1958-59 and contributed Rs. 45.8 crores to the Union Exchequer as excise duty during 1957-58.

So far so good. It would, however, be unfortunate if the fact that tobacco exports are expanding thus were to generate a sense of complacency (as is feared) to the neglect of several of the problems and, therefore, to the detriment of the industry as a whole. In spite of quality control at each stage of production, to mention only one of these, there are still complaints as regards quality from our traditional buyers, such as, the U.K. It should be remembered that our virginia tobacco is in demand because (1) of its bright and attractive colour and (2) of its quality. If no efforts are made to maintain the colour and the quality of the tobacco we export, we have only ourselves to blame if the U.K. — which is the largest importer of unmanufactured tobacco in the world — were to seek alternative sources such as the Federation of Rhodesia and Nyasaland.



Perhaps the tendency to become complacent stems from the fact that India today occupies the third place, after the U.S.A. and China, among the tobacco-producing countries of the world. World production of tobacco during 1957-58 was estimated at about 8,300 million lbs.. India's share therein being 590 million lbs. In this increasingly competitive world of ours, if India is to retain her position—and in the context of our foreign exchange crisis, we have no alternative but to maintain, nay improve upon, this—there can be no place for any complacency. The authorities, for their part, would do well to give careful consideration to certain suggestions in this behalf made by the tobacco growers. Among others, they have stressed these three: first, Indian tobacco manufacturers, foreign buyers and others should be required to indicate, well in advance, some idea of their requirements; secondly, the Government of India should enter into long-term agreements with the importing countries regarding the quantities required, and the economic price to be paid for, and, thirdly, it should be made clear that prices for Indian tobacco should be on the basis of the quality of the leaf sorted according to "Agmark" grades specified by the Government of India.

The Government of India would also do well to implement the following suggestions made by the Tobacco Seminar at Guntur:

(1) A soil survey must be taken up immediately;

(2) cultivation of flue-cured virginia tobacco should be prohibited;

(3) A "Package-programme" on the lines of the programme initiated for paddy should be launched in the case of flue-cured virginia tobacco also.

There is no reason why you should. For, quality is obtainable wherever standards are maintained, be they in social, economic, or other spheres of human activity.

Standardization helps in promoting economy and efficiency in production and use of goods and services, by providing a common ground of understanding among producers, dealers, consumers and users. The Indian Standards Institution is responsible for developing standards on a national and international basis.

Through research, tests, and quality control schemes, goods produced to specified standards can have the assurance of quality. Many consumer and industrial articles, produced to relevant Indian standards, have been granted the ISI certification mark.

The ISI mark is the guarantee of their quality.

FROM THE CAPITAL'S CORRIDORS

LOK SABHA SESSION

THE winter session of the Lok Sabha opens on November 14. Thirty sittings have been planned for this session which will come to an end on December 23. The Prime Minister's statement on his participation in the UN meet and that of the Finance Minister on his recent visit to London and the United States should be the highlights of this session. Assam controversy is also likely to be discussed. So also the problems arising out of the shortfall in coal production and its movement by the railways. The session, however, is expected to be dominated by "half-an-hour" discussions; no less than seventeen notices for such discussions have already been received by the Lok Sabha Secretariat.

Some of the important subjects on which the Members have sought to raise "Half-an-hour" discussions, along with the talking points they have indicated relating to them, are:

(a) **The Economy Car:** The motion seeks to discuss the Government Resolution setting up a Committee to select a small car to be manufactured in this country. The following talking points have been indicated in this respect: (1) Advisibility of establishing a factory in the public sector and setting up of a number of ancillary units in under-developed areas; (2) Method and extent of protection to be granted to the automobile industry; (3) Level of indigenous content in case of certain automobile manufactures and measures to be taken to increase such content; (4) Target for commercial vehicles at the end of the Third Five-Year Plan; (5) Urgency for the manufacture of cheap and strong cars of two types without delay and need to reduce manufacturing costs, in collaboration with Defence Ministry; (6) System of price fixation and the principle of fixed margins of profits for manufacturers; (7) Question of price control of trucks and cars and need for manufaturing more trucks and carriers; (8) Need for liberal provision of foreign exchange for import of components.

(b) **Cotton Industry Wage Board:** The motion seeks to discuss the decisions of the Government on the recommendations of this Wage Board on the following lines: (1) Capacity of industry to pay increased wages and the impact of recommendation on other industries and exports; (2) Discrimination in the wages suggested by the Board; (3) Merger of DA with the basic wage and neutralisation of dearness allowance; (4) Recommendations regarding gratuity; (5) Financial effect of the various recommendations, their implementation in various States and effect on uneconomic units; (6) Fixation of work-loads and rates of payment of wages; (7) Progress regarding implementation of the recommendations in various States.

(c) **Rise in Cost of Living:** This motion seeks to discuss the abnormal rise in prices of commodities "throughout the country". The following points are sought to be raised in this connection: (1) Impact of rising prices on implementation of Five-Year Plans; (2) Effect of prices on standard of living and need to check rise in prices; (3) Frustration in fixed income groups and salaried employees; (4) Expansion in money supply.

(d) **Economy Measures:** The measures adopted by the Government to keep down its expenditure are sought to be discussed on the following lines: (1) Need for adopting more stringent measures for economy and scope of various measures for effecting economy; (2) Failure to implement various measures and mounting expenditure on administration and ceremonies.

(e) **Direct Taxes:** Discussion on this subject will refer to Tyagi Committee's Report on Direct Taxes. It will be on the following lines: (1) Incidence of direct taxation and need for overhauling and rationalising the structure of direct taxes; (2) Increase in income-tax arrears and ways and means to collect dues from the assessees; (3) Prevention of tax evasion; (4) Increased punishment to tax dodgers and black-listing of tax dodging firms and individuals; (5) Abetment of tax evasion to be penalised; (6) Need to evolve simple procedure and to re-orientate the official machinery for effective implementation; (7) Need for independence of Appellate Tribunals; (8) The question of Estate Duty exemption certificates.

(f) **Public Sector Enterprises:** The discussion on this subject is to revolve around the following points: (1) Need to reduce heavy overhead costs and to run the undertakings in a profitable manner; (2) Fixing regulations to recruit personnel with due regard to the interests of local talent; (3) Profitable marketing of the products of the companies in the public sector; (4) Association of labour with management; (5) Need for imparting special training to staff and to run companies on commercial lines by cutting red-tapism; (6) Capital structure, depreciation policy, price policy, manner of calculating profits and building up of reserves; (7) Participation of private capital in the public sector undertakings; (8) Undesirability of permitting haphazard growth of public sector undertakings as corporations; (9) Need to restrict the number of corporations; (10) Ban on employment of retired officers; (11) Need to prescribe financial principles to govern (a) capital structure, (b) depreciation policy, (c) contribution by such corporations to general revenues, (d) manner of calculating net profits, (e) building up of reserves, (f) price control of commodities produced or services rendered by such corporations, and (g) other financial adjustments; (12) Parliamentary control with particular reference to (a) corporation budget, (b) laying down of policies, (c) changes in directorate, (d) control of capital issues, (e) prevention of monopolistic trends, and (f) audit control.

(g) **Sugar:** The Member sponsoring this motion has indicated the following points on which he will dwell upon during the discussion: (1) Need for change in the distribution system of sugar in view of increased production; (2) Profits being realised indirectly by several State Governments in distribution of sugar; (3) Integrated development of sugar industry in the country; (4) Country's capacity to export sugar; (5) Need for removal of all controls on sugar industry; (6) Proper and economical utilisation of molasses.

(h) **Industrial Finance Corporation:** The motion on this subject is to be taken up if time permits. The following talking points have been indicated by the Member who is sponsoring this motion: (1) Need to give assistance to deserving industries especially in the South; (2) Discrimination shown by the Corporation in giving assistance and need to fix priority for giving assistance; (3) Need to simplify procedure for giving loans and actual payment of money; (4) Review of development of industries particularly in the fields in which the Corporation has advanced loans; (5) Arrangement for training for supervisory staff of State Finance Corporation; (6) Need to grant loans for industrial co-operative societies and to promote small-scale industries; (7) Necessity of introducing checks to prevent misuse of loans granted; (8) Steps for realisation of over-due loans.

(i) **National Industrial Development Corporation:** The points indicated for discussion on this subject are: (1) Need for development of industrially backward areas; (2) Need for expanding the activities of the

Corporation; (3) Review by the Government of the working and affairs of the Corporation and steps to be taken to improve them; (4) Schemes of financial assistance rendered to the industries and the result thereof; (5) Schemes of rehabilitation, modernisation and expansion of industries; (6) Impact of these schemes on the economy of the country with particular reference to the new industries and regional distribution of credit; (7) Composition of the Board of Directors.

NEW BILLS

In addition to the fifteen pending Bills, included in which is the Bill amending the Companies' Act, twenty-one Bills have so far been planned to be introduced during this session. The list drawn up, however, does not include two Bills seeking to ban strikes by Government employees and checking of anti-Indian propaganda on the borders. The following are the important new Bills planned for the session:

(1) The Indian Telegraph (Amendment) Bill.
(2) The Indian Wireless Telegraphy (Amendment) Bill.

These Bills seeks to cover the licensing of TV sets possessed and/or worked in India.

(3) **The Constitution (Ninth Amendment) Bill:** This Bill seeks to give effect to the transfer of certain territories to Pakistan in pursuance of agreements entered into between the Governments of India and Pakistan.

(4) **The Acquired Territories (Merger) Bill:** This Bill provides for the merger with the States of Assam, Punjab and West Bengal of certain territories acquired in pursuance of agreements entered into between the Governments of India and Pakistan and for matters connected therewith

(5) **The Slum Areas (Improvement and Clearance) Amendment Bill:** This Bill seeks to quicken the pace of slum improvement and slum clearance work in Delhi and to give protection against eviction to Amladars.

(6) **The Specific Relief Bill:** This Bill defines and amends the law relating to certain kinds of specific relief obtainable in civil suits.

(7) **The Limitation Bill:** This Bill seeks to consolidate and amend the Law relating to limitation.

(8) **The Marking of Heavy Packages (Amendment) Bill:** This Bill provides for the appointment of authority for the enforcement of penalties under the Act.

(9) **The Forward Contracts (Regulation) Amendment Bill:** This Bill seeks to enable the Central Government and the Forward Markets Commission to keep a more effective watch over forward trading activities and also to remove difficulties that are experienced in the working of the Act.

(10) **The Industrial Employment (Standing Orders) Amendment Bill:** The Bill seeks to extend the scope of the parent Act and to provide for appointment of additional certifying officers etc.

(11) **The Preventive Detention (Continuance) Bill:** This Bill seeks to extend the life of the Preventive Detention Act, 1960, for a further period of three years.

A Bill is also to be introduced to define the duties and powers of the Comptroller and Auditor-General of India.

UTILISATION OF ASSAM GASES

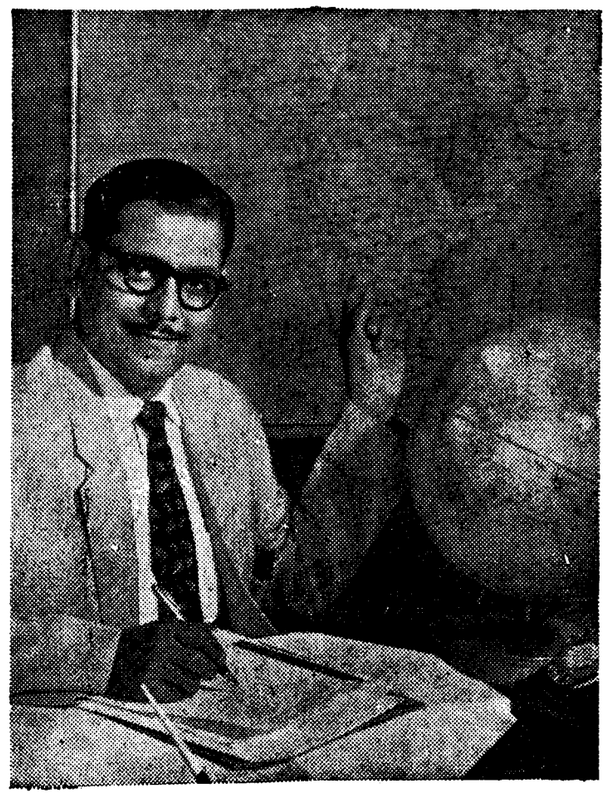
According to a report on the utilisation of Assam gases, prepared by Burmah Oil Co. Ltd., 38 million c.ft. of natural gas per day of the composition methane 90.40 per cent, ethane 5.08 per cent, propane 2.84 per cent, Iso-butane 0.47 per cent, N-butane 0.66 per cent, and Iso-pentane, N-pentane and Hexanes 0.55 per cent, would become available for use by about April, 1963. The liquifiable petroleum gases (LPG) would yield the following quantities of hydro-carbons:

Propane	39,000 gallons/day
Iso-butane	12,000 gallons/day
N-butane	14,000 gallons/day
Pentane, etc.	9,000 gallons/day

It is understood that out of the 38 million c.ft. of natural gas, 28.5 million c.ft. have already been earmarked as per details given below, leaving a surplus of 9.5 million c.ft. of gas for further utilisation:

Project	Likely date of completion	Gas Requirements (Million c.ft./day)
1. Fertilizer plant	1964	13
2. Power plant	1963-64	5.5
3. Cement factory	Under Examination	4
4 Gas distribution scheme north of Desand river	1962-63	6

The Government of India, it is learnt, has received three proposals from private sector parties for the utilisation of surplus gases. These proposals are under examination. In India a beginning is yet to be made in the field of petro-chemical industry. The best way to make a proper beginning would be to separate the constituents of liquifiable petroleum gases and use them for the manufacture of diverse products. The removal of constituents such as ethane, propane, butane etc., and the supply of the scrubbed gas would not, according to the Burmah Oil Company's report, come in the way of the commitments already made with regard to utilisation of Assam natural gas. The residual gas (after the removal of LPG) can be used with no disadvantage for the already approved fertilizer and other projects.



The following are the particulars of the proposals received by the Government from the private sector parties for the establishment of gas-based industries in Assam.

(1) **Duncan-Phillips Proposal:** This proposal is for the manufacture of (1) 4,000 tons of polyethylene, (ii) 20,000 tons of Cis-4 polybutadiene—a new type of synthetic rubber—and (iii) 5,000 tons of channel type carbon black per year. While the manufacture of the first two items is to be based on the higher fractions of natural gas, the manufacture of the third commodity is to be based on the residual gas (after the removal of LPG).

The manufarture is to be undertaken by a new public limited company/companies in tecnnical and financial collaboration with M/s. Phillips Petroleum Company (USA). On the Board of Directors of this company/companies there would be, among others, a nominee of the Assam Government, two nominees of M/s. Phillips Petroleum Company (USA) and two nominees of M/s. Duncan Brothers. M/s. Duncan Brothers propose to act as secretaries and treasurers.

The plant and machinery are to be obtained from dollar and hard currency areas. The foreign exchange required is about Rs. 5.42 crores. This will be spent as follows:

(a) Synthetic Rubber Plant	Rs. 3.75 crores
(b) Polyethylene Plant	Rs. 1.50 crores
(c) Channel Black Plant	Rs. 0.17 crores
TOTAL	Rs. 5.42 crores

SAN.58.15

The procurement of equipment from indigenous sources would be to the extent of Rs. 5.98 crores. The foreign exchange requirements of the project would be met from Phillips' contribution in the equity share to the extent of Rs. one crore and borrowings from DLF or other financing institutions in the USA.

For technical services M/s. Phillips are to be paid a fee in dollars equivalent of 10 per cent of the net profits of the new company before taxes, with an initial payment of $1,50,000 in one year after the date of signing of the technical service agreement, adjustable against future fee.

(a) **Polyethylene:** The present installed capacity in the country for the production of polyethylene is about 6,200 tons a year as against a target production of about 25,000 tons proposed in the Third Plan. There is, therefore, scope for setting up additional capacity for the manufacture of polyethylene.

(b) **Cis-4 Polybutadiene:** Duncan-Phillips have indicated their desire to undertake the manufacture of 20,000 tons per year of Cis-4 polybutadiene—a new type of synthetic rubber based on the utilisation of butane. The consumption of all varieties of rubber by the end of the Third Plan would be in the region of 100,000 tons per year as against the present consumption of about 50,000 tons. This demand would be met as follows, leaving deficit of at least 15,000 tons to be met by imports :

		(Tons)
Natural Rubber (Indigenous)	40,000	
Synthetic Rubber (SBR) (Indigenous)	30,000	
Reclaimed Rubber (Indigenous)	15,000	85,000
Natural Rubber (Imported)	..	15,000
TOTAL		100,000

There is thus scope for the execution of Duncan-Phillips' proposal, should this type of synthetic rubber be found suitable for climatic conditions in this country.

(c) **Channel Black:** Duncan-Phillips have indicatcated that they are also interested in undertaking the manufacture of about 5,000 tons of "channel black" per year utilising Nahorkatiya gas. The quantity of the gas required would be of the order of 12 to 15 million c.ft. per day, but this amount of gas would not be available because out of the total availability of about 38 million c.ft. of gas, 28.5 million c.ft. have already been ear-marked for utilisation otherwise. Further, some gas would be needed for the manufacture of polyethylene and synthetic rubber.

(2) **Kesoram Cotton Mills Proposal:** M/s. Kesoram Cotton Mills Ltd., Calcutta, propose to undertake the manufacture of 5,400 tons of channel type carbon black per year in technical collaboration with M/s. J.M. Huber Corporation (USA). There would be no financial collaboration. The manufacture is to be based on the Nahorkatiya gases. The total value of the plant and equipment would be about Rs. one crore. Out of this, plant and equipment worth Rs. 90 lakhs are to be obtained from indigenous sources. Foreign exchange required for the import of plant and machinery has been estimated at Rs. 10 lakhs.

(3) **P.J.B. Industries Proposal:** This proposal is for the manufacture of about 10,000 tons of furnace type carbon black based on natural gases. The manufacture is to be undertaken by a new public limited company is technical and financial collabration with Messrs. Continental Carbon Company (USA). On the Board of Directors of this company would be a representative of the overseas firm. The American firm is participating to the extent of 25 per cent in the equity capital of this company. The US interests are to be paid 5 per cent royalty on a maximum of 10,000 tons|year of carbon black for ten years. The foreign exchange required for the import of plant and machinery would be about Rs. 25.75 lakhs. It is stated that the capital equipment will be supplied by the American collaborators against their investment.

The current consumption of about 3,500 tons of the variety of carbon black intended to be manufactured by the applicants is likely to increase to about 7,000 tons by the end of the Third Plan period. The overseas collaborators, it is stated, are willing to export about 3,000 tons of carbon black to be produced under this project.

M|s. Devenport and Company (Private) Limited, Calcutta, have also submitted a scheme for the manufacture of (a) 24,000 tons of general purpose synthetic rubber (SBR), (b) 6,000 tons of polyethylene and (c) 6,000 tons of polystyrene per year. This scheme, however, is based on the utilisation of refinery gases and not natural gas. The manufacturing activity is to be undertaken by a new public limited company to be floated in technical and financial collaboration with M|s WITCO Chemical Company (USA).

RAW MATERIALS FOR STEEL PLANTS

The first meeting of the Raw Materials' Committee for Steel was held here last week. As could be expected, the Committee discussed the problems of coal supplies to the steel plants. The Committee endorsed the recommendation of the Vishnu Sahay Committee that the steel plants should be the first responsibility of the railways, so far as the transport of raw materials is concerned.

Further, the Committee, it is understood, has suggested a formula to meet the persistent demand of the coal industry for an upward revision of coal prices. It is said to have recommended that collieries supplying coal containing less than a stipulated amount of ash content may be paid some bonus over the controlled price.

The Committee was set up recently to assess and advise on the immediate and long-term problems of supply and movement of coal, iron ore, limestone, dolomite and other materials such as refractories to the steel plants so as to ensure efficient production and optimum utilisation of the installed capacity.

JAPANESE DELEGATION

A Japanese delegation is here to study the working of India's steel plants. Japan has decided to expand its steel production from 12 million to 18 million tons a year. The interest among the Japanese steel manufacturers to study the Indian plants, it is understood, has been provoked by the comments of the President of the Republican Steel Corporation of the United States on the Bhilai Steelworks. The U.S. steel magnate had observed that Bhilai would be the most up-to-date and modern steel plant in the world and that setting up of this plant was an uncommon task performed by uncommon people outside Russia. A British team, headed by Dr. Colclough, has also visited the three public sector steel plants in this country following this comment of the President of the Republican Steel Corporation.

The Japanese Mission includes persons who might settle the price of iron ore India is to supply to Japan next year. The ore used at Bhilai is similar to that exported to Japan. Mr. C. M. Poonacha was planning to visit Japan to settle this price matter. His tour might be cancelled if the Japanese Mission settles the issue during its current visit.

PRODUCTION OF FERRO-SILICON

Demags of West Germany are likely to collaborate with an Indian firm for the production of 7,200 tons of ferro-silicon per annum. The Third Plan production target for this commodity has been fixed at 40,000 tons. The Mysore Iron and Steel Works (Bhadravati) produce 5,000 tons of ferro-silicon per year. They are expected to expand their capacity to 20,000 tons under the Third Plan. A Calcutta firm has also been licenced to produce 5,000 tons of ferro-silicon per year. With the execution of all these three schemes, the installed capacity for the production of this important item used in steel-making will be 34,200 tons per annum.

BHADRAVATI STEELWORKS EXPANSION

Demags, along with AEG and another West German firm, have also signed an agreement with the Mysore Government to raise the capacity of Bhadravati Steelworks from 30,000 tons to 100,000 tons. The capital cost of this expansion programme is estimated around Rs. 7 crores.

SCHEMES FOR STEEL TUBES MANUFACTURE

The output of steel strips for tubes manufacture is expected to increase to around 2,00,000 tons by 1961-62. It is likely to go up further to 2,50,000 tons in 1963-64 and 4,00,000 tons in 1964-65. The Government of India, it is understood, has under examination three schemes for the manufacture of steel tubes and pipes. One of these schemes is for the manufacture of spirally welded pipes, the second one for the manufacture of E.R.W. pipes and the third one for the manufacture of seamless tubes. A West German firm, it is learnt, is prepared to meet the foreign exchange component of the cost of the second scheme, which will be executed in collaboration with an Indian concern.

RAISING CEMENT OUTPUT

To step up production in consonance with the growing demand for cement, the Government of India, it is learnt, has permitted the Associated Cement Companies to expand the capacity of four of their units as follows:

(1) Madukkarai Cement Works (Coimbatore): From 2,80,000 tons per annum to 4,00,000 tons per annum.

(2) Banmor Cement Works (Madhya Pradesh): From 60,000 tons per annum to 1,00,000 tons per annum.

(3) Khalari Cement Works (Bihar): From 1,00,000 tons per annum to 1,70,000 tons per annum.

(4) Kymore Cement Works (Madhya Pradesh): From 5,73,000 tons per annum (plus 25,000 tons per annum of white cement) to 7,50,000 tons per annum.

The following proposals from the other cement manufacturers are understood to be under consideration·

(1) **Panyam Cement and Mineral Industries Ltd.:** Expansion of the installed capacity of their works in Kurnool district (Andhra Pradesh) from 62,700 tons per annum to 1,94,700 tons per annum.

(2) **Birla Jute Manufacturing Co.:** Raising of the production capacity of the Satna cement factory (Madhya Pradesh) from 2,47,500 tons per annum to 5,17,500 tons per annum.

(3) **Saurashtra Cement and Chemical Industries:** Increasing the capacity of their Ranavar (Gujarat) factory from 2,00,000 tons per annum to 4,00,000 tons per annum.

WHEELS FOR AUTOMOBILES

A Bombay firm proposes to set up a factory, in collaboration with Joseph Sankey & Sons Ltd., of the United Kingdom, to manufacture wheels of cars, jeeps and trucks. The production in the first year will be 12,500 wheels on single shift basis. It will go up to 18,000 wheels from the second year of the company's going into production. The factory will be located at Kurla (Bombay) and will cost Rs. 25 lakhs. Rs. 22 lakhs would be the cost involving foreign exchange.

INDO-CZECH TRADE PACT

The new Trade and Payments Agreement between India and Czechoslovakia has been concluded in Prague. The agreement comes into effect from January 1, 1961, and will remain valid for a three-year period.

The agreement provides a framework for expanding trade between the two countries on the basis of equality and mutual benefit. Both the countries have agreed to grant to each other "Most-Favoured-Nation" treatment and other trade facilities to enable closer commercial and economic relations. Payments relating to commercial and non-commercial transactions between Czechoslovakia and India would be effected in Indian rupees.

Schedules listing the goods available for export from either country to the other have been included in the agreement. Among the articles listed for export from India are cotton textiles and fabrics, jute manufactures, coir yarn and manufactures, woollen textiles, vegetable oils and hydrogenated oils, spices, tobacco, tea and coffee, processed and semi-processed hides and skins, shellac and shellac products, mica, manganese and ferro-manganese, chemicals and pharmaceuticals, handicrafts and handlooms, tinned fruits, plastic goods, sports goods, engineering goods, cashewnuts, deoiled cakes, cinematograph films, books, magazines and pictures, etc.

The items of import from Czechoslovakia would be iron and steel products, special steel, alloy steel, writing and printing paper and newsprint, various types of machinery and machine tools, capital goods, dyes, intermediates and chemicals, diesel generating sets, tractor and tractor parts, ball and roller bearings, tyres and tubes, mild steel products, etc.

BRIEFS

English Electric Company of India, a subsidiary of English Electric Company Ltd., of the United Kingdom, which has set up a factory at Madras for the manufacture of combination switches and switch-boards, has drawn up a scheme to increase its production of combination fuse switches by 9,180 per year and of combination fuse switch-boards by 240 per annum.

•

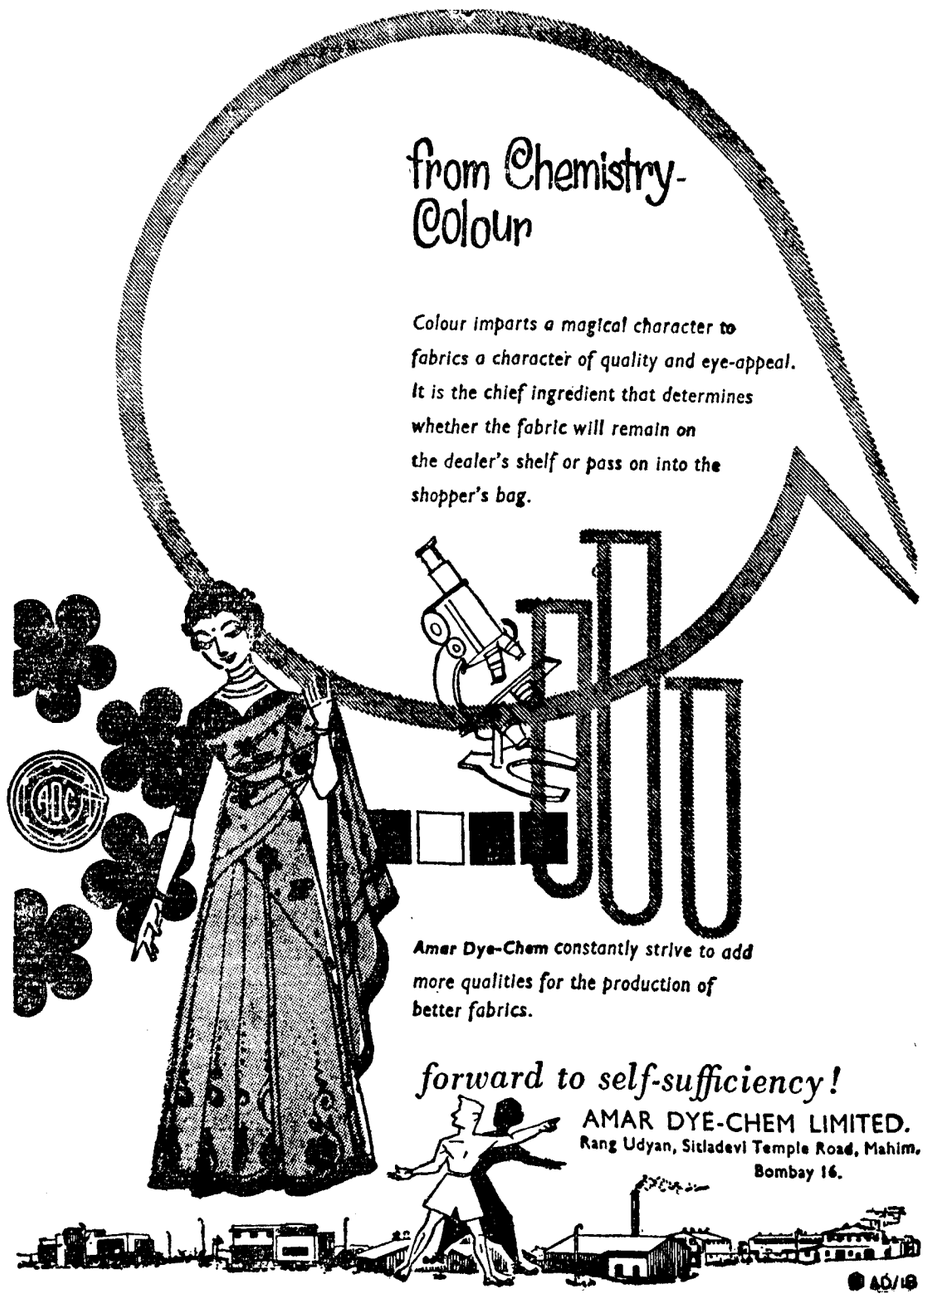
The possibility of producing pulp and paper from banana stem are being explored. In Jalgaon, near Bombay, about 1.2 lakh tons of dry banana stems are available in a year. A Bombay firm is negotiating for collaboration in this project with Aktiebolaget Difibrator of Sweden and a German firm.

•

India Cements Ltd., Madras, has a proposal to set up a new factory to manufacture P.V.O. resins|compounds; 5,400 tons per annum in terms of resin, working on three-shift basis. The firm proposes to enter into an agreement with B.F. Goodrich Chemical Co., of the U.S.A., for technical collaboration and capital participation.

•

M|s. T. V. Sundaram Iyengar and Sons have entered into a financial and technical collaboration agreement with Lucas of the United Kingdom to manufacture electrical equipment, such as dynamos for motor vehicles. The project will cost £1.5 million. Sixty per cent shares of this project will be held by Lucas.



•

Mr. Steward Mason of the World Bank is expected here shortly. He will discuss with the Government of India the present and the future lending programme of the Bank in regard to this country.

COMPANY AFFAIRS

ORIENT PAPER PLANS FOR EXPANSION

The Directors of the Orient Paper Mills Ltd. have pointed out in their annual report that the licenced capacity of the paper mill to be set up by the Company at Amlai has been increased by the Government of India from 100 to 150 tons per day. The Government recently allowed the Company to negotiate direct for a loan with the Export-Import Bank of Washington, to cover the foreign exchange cost of the Company's Amlai Project and accordingly an application has been made by the Company to the said Bank. The negotiations for purchase of necessary machinery for the said project have been finalised with Messrs Beloit Iron Works, Beloit, Wisconsin, subject to sanction of the loan by the Export-Import Bank and the issue of Import Licences by the Government of India for the same.

The upward trend in the cost of raw materials, salary, wages and other expenses continued to persist resulting in further rise in the cost of production. However, due to the expansion and modernisation carried out by the Company, most of the increased cost is being absorbed by better working efficiency of the mills and increased production. The revised prices of paper and board as recommended by the Tariff Commission and accepted by the Government of India came into force with effect from January 1, 1960.

The Directors made representations to the Orissa Government for abolition of or reduction in the rate of levy on bamboos and coal carried by any means other than railways or airways but it did not yield any results. The Company has represented inter alia this matter to the Orissa Taxation Committee. The disputes between the workmen and the management, pending before the Labour Tribunal, were amicably settled and an award was accordingly made. In terms of the settlement, the parties have agreed to maintain industrial peace for a period of five years. The Directors hope that with the mutual goodwill and the co-operation of the parties, the factory would function more efficiently in the interest of all concerned.

During the year to March 31, 1960, the Company made a profit of Rs. 184.94 lakhs. After making provision for depreciation (Rs. 72.50 lakhs), development rebate reserve (Rs. 17 lakhs), taxation (Rs. 40 lakhs), reserve for contingencies (Rs. 10 lakhs) and general reserve (Rs. 3 lakhs), there was a sum of Rs. 42.44 lakhs for disposal of the Directors. The dividend at the rate of 5.50 per cent per annum on tax-free preference shares plus such further dividend as may be payable on passing of the Preference Shares (Regulation of Dividends) Act, 1960, has been proposed to be paid by the Directors. Dividend on ordinary shares is to be paid at the rate of Rs. 2.25 each, which will absorb Rs. 33.04 lakhs.

JAY ENGINEERING: STRESS ON EXPORTS

As against the previous year when the production of sewing machines and fans was 1.97 lakhs and 2.71 lakhs respectively, the production of Jay Engineering Works Ltd. during the year to March 31, 1960, was 2.42 lakhs and 3.46 lakhs of sewing machines and fans respectively. The Company is gradually building up export business in America and the sales in England are also steadily going up. The Directors are hopeful that the zig-zag sewing machines of the Company will be in the market before the end of the year. The exports of sewing machines and electric fans last year were 23,716 nos. and 21,497 nos., and this year sewing machines were 41,930 nos. and fans 43,858 nos.

The figures of sales and profits in lakhs of rupees are given below:

Sales	1958-59	1959-60
Sewing Machines ..	257.84	322.84
Electric Fans ..	272.60	390.25
Paints ..	2.80	2.45
Miscellaneous ..	—	5.10
Total ..	533.24	720.64
Profits ..	19.22*	32.44**

* After providing Rs. 25 lakhs for Taxation including Wealth Tax.

** After providing for Rs. 19.50 lakhs for Taxation.

Export Sales ..	45.11	82.52

The Directors have proposed the payment of dividend at the rate of 17.15 per cent subject to tax on ordinary shares which will absorb Rs. 15.63 lakhs. Dividend at the rate of 10 per cent subject to tax on preference shares will absorb another sum of Rs. 5 lakhs.

The Directors have decided to separate a sum of Rs. 7 lakhs towards Development Rebate Reserve and another sum of Rs. 4.80 lakhs towards General Reserve. During the year additions to machinery and building were made to the extent of Rs. 35.05 lakhs and Rs. 9.63 lakhs respectively.

COMMODITY NEWS AND NOTES

PRODUCTION OF WOOLLEN YARN AND FABRICS

The Government of India have issued an Order empowering the Textile Commissioner to regulate the production and sale of all types of woollen yarns, and to fix the maximum prices of all types of woollen yarns and fabrics, including hosiery goods. The Order has been issued under the Essential Commodities Act, 1955. The Government had issued in September 1960 the Woollen Yarn (Production and Distribution) Control Order. The Woollen Textile (Production and Distribution Control) Order, which has now been issued, is a comprehensive measure, bringing within its scope both woollen yarns and woollen fabrics. This repeals the earlier Woollen Yarn (Production and Distribution Control) Order.

SUGAR AND SUGARCANE

Sugar production in India reached a record figure of 2.4 million tons in 1959-60. Incentives in the form of rebate on excise duty and higher sugarcane prices played a significant part in stepping up the output. For the Third Plan, a target of 3 million tons of white sugar and 6 million tons of 'gur' and 'khandsari' has been proposed so that the growing demand for sugar may be met and a surplus created for export. The consumption of sugar in India has doubled in the last eight years. India is the largest producer of sugarcane in the world. While the area under sugarcane is 1.5 per cent of the total cultivated area, 5 per cent of the total agricultural income is derived from it. The production of white sugar is valued at Rs. 200 crores per year. The output of 'gur' and 'khandsari' accounts for another Rs. 200 crores annually.

In the past few years, as a measure of deliberate policy, the setting up of sugar mills in areas other than Uttar Pradesh and Bihar, in which the industry was concentrated for a long time, has been encouraged. A large number of the new factories are in the co-operative sector. Sugarcane growers combine to form co-operatives to run sugar mills to which they supply cane. Research has been carried on at the Sugarcane Breeding Institute in Coimbatore for several years on breeding improved varieties of sugarcane so that the yield of sugar which is low can be increased. Some high yielding varieties have been evolved at the Institute and they have now replaced the low yielding varieties in the field. The National Sugar Institute, Kanpur, conducts research on the production aspects of sugar and advises the sugar industry on production problems. Research has also been carried on in regard to manurial practices and the crushing schedule of sugarcane. In recent years, considerable quantities of sugar have been exported whenever a surplus has been available. A difficulty in the way of exporting sugar is the high price of sugarcane which can be got over by increasing the yield per acre and higher recovery of sugar from cane.

NAGAUR GYPSUM — DISCOVERY OF HIDDEN WEALTH

When the railway authorities in the former Jodhpur State sunk a bore hole decades ago in the Nagaur town, they hardly realised the historic significance of the act. For what was a mere indication has now been established by the Geological Survey of India a vast reserve of gypsum opening up new possibilities of industrial development of the country. Still larger reserves are likely to be unearthed when the department undertakes further prospecting of the entire area. A basic raw material for the manufacture of portland cement, artificial fertilizers like ammonium sulphate, sulphuric acid and Plaster of Paris, gypsum is also used for the manufacture of Keen's cement, crayons, paper, paint, and as a flux in the smelting of nickel, lead and copper ores. Its value is well-known as a mineral fertilizer. With the rapid increase in the production of cement and establishment of chemical fertilier plants since Independence, there has been a phenomenal rise — 18 times between 1947 and 1957 — in the production of gypsum in the country. About 224,227 tons of gypsum were consumed for the manufacture of cement in 1957 as against 52,608 tons in 1947. Since the manufacture of ammonium sulphate from gypsum started at Sindri in 1951, the unit has become the major consuming centre having utilised 527,347 tons or approximately 41 per cent of the total production of gypsum in 1957.

By 1961 the demand for gypsum for the cement and ammonium sulphate industries alone will be nearly 2.4m. tons. The consumption is expected to rise further to about 2.6 million tons a year if the sulphur project materialises. Considering the present drive for the industrial and agricultural development in India, the rate of consumption is likely to increase in arithmetical progression.

May we help you to export your goods?

Today, the word "Export" is very much in the air. But you need full details of your market before you can take any risk. Perhaps, our branches in Bangkok, Colombo, Hong Kong, Ipoh, Kuang, Kuala Lumpur, Ludhiana, Malacca, Penang, Rangoon and Singapore may be in a position to assist you.

Why not look us up?

Guest Editorial

Must the United Nations Disintegrate?

(A Personal Evaluation by Andrew Boyd)

LUNCHING with a Russian at the United Nations during this Assembly's early days, I was puzzled when my Soviet friend complained that the television cameras in the hall were being trained on Mr. Khrushchev too often. Surely the Soviet leader had come to New York to get publicity, not to shun it? And very well he was doing, too, in that line; the American press was giving him far better coverage than the Peking newspapers gave to his words and deeds at the UN.

What worried my friend, however, was the risk of Mr. Khrushchev being seen to yawn. Yawn he did from time to time, as does everybody at some point in even the most star-studded United Nations debate. It was, indeed, easy to see that a yawning Khrushchev would not fit in with the idea that the whole 99-nation Assembly was vibrating to his galvanic energy and dynamism.

One must not underestimate the Soviet leader's impact on the United Nations. The spectacular show staged at its Turtle Bay headquarters in September and October, in an unprecedented blaze of publicity, and at a cost of around eight crores of rupees to all parties concerned (including a million hours of overtime pay for the hard-pressed New York police), was all of his making. The magnetic field he created was powerful enough to draw into his orbit such diverse, and often reluctant, personalities as Presidents Eisenhower, Nasser and Nkrumah, Prime Ministers Nehru, Macmillan, Menzies and Diefenbaker, not to mention the King of Jordan and the Crown Prince of Morocco; at one point it seemed that only the Queen of Sheba was lacking.

Each frown, each smile of his was noted, discussed, dissected by a thousand observers. All were agreed that he made the pace, that none of the other personalities present could outdo him. When he denounced the Secretary-General and demanded a drastic reconstruction of the whole United Nations structure, your correspondent (who, growing hungry during Mr. Khrushchev's long mid-day speech, had retired to the lounge to fortify himself with coffee and a sandwich while keeping an eye on a handy television screen) had a distinct sensation that the great glassy walls of the building itself trembled. The United Nations, we were assured—and not only by *Pravda*—could never be the same again. And yet, and yet....

Studying the Soviet commentaries on Mr. Khrushchev's triumphant return to Moscow, I have been struck by the frankly defensive, almost apologetic, tone that has seemed to underlie the trumpet notes of triumph. Evidently the Russian public had been led to expect more than it actually got. It was not told, of course, about the Soviet leader's wilder tantrums, but it must somehow have got wind of the fact that his behaviour had lacked dignity, for the official commentators used ingenious formulae to explain this way. More revealing still were the petulant rebukes that *Pravda* directed to the nations of Africa and Asia, and to Yugoslavia too, for their apparently unexpected refusal to give wholehearted support to Mr. Khrushchev's various proposals.

In this respect, it would seem that the late Mr. Dulles's deplorable dictum that "neutralism is immoral", having been jettisoned by America, has now been adopted by Russia. From what Russians have told me, in New York, here in London, and recently in Moscow too, I would judge that this adoption is a confused and even schizophrenic one, nothing like as dogmatic as Mao Tse-tung's verdict that "there is no third way". The whole Soviet approach to the United Nations, the approach that lay behind this year's spectacular Assembly, reflects this schizoid state of mind.

The United Nations—according to authoritative analyses published in Moscow this year—is no longer a mere American instrument; the admission to membership of so many newly independent Asian and African nations has transformed it into a very promising means of promoting the Soviet Union's international aims. All that is needed now, in the Soviet view, is the ousting of Mr. Hammarskjoeld and the reconstruction of the Secretariat and the Security Council on a tripartite basis, with power evenly divided between the Communist powers, the "neutralists", and the countries in alliance with America; each group, of course, to wield a veto. The explicit assumption is that America will become more and more isolated, and that the Asian and African states will have no difficulty in making common cause with the Communist powers.

However, even before this Assembly opened in September, it was clear that these assumptions were wrong. The very day that Mr. Khrushchev landed in New York, the Soviet group in the United Nations found itself completely isolated in the emergency debate on the Congo. Even Cuba and Guinea joined with every other non-Communist member state in backing an Afro-Asian resolution similar to the one that Russia had vetoed in the Security Council when Ceylon and Tunisia introduced it there. In both Council and Assembly,

an extraordinary procession of African and Asian spokesmen defended the Secretary-General; even those who, like President Nkrumah, had sharply criticised his actions in the Congo, went out of their way to reject the Russian charges against him. The attitude of Asian and African members to Mr. Khrushchev's plan to oust him and reconstruct the Secretariat has been correspondingly chilly. And since then the Russians have again appeared isolated in opposing the enlargement of the Security Council to provide more seats for Asian and African members.

Mr. Khrushchev's personal errors in behaviour in New York have not helped to advance his cause in this respect. When, at the end of his stay, his shoe-brandishing and shouting led the delegate of Nepal to plead for less unparliamentary conduct, his response was to ask: "By the way, is there a parliament in Nepal? I must look it up when I get home". But no amount of mere tact could have solved the difficulty for him. For the plain fact is that most Asian and African nations, and many small states elsewhere too, are in no mood to take directions at the UN from any great power.

There is no monolithic unity (in the Marxist phrase) between the Asian and African member-states, or even among the African members alone, about what exactly the United Nations should do in the Congo or in other spheres of its activity. But there is a pretty solid unity, and to my eye it is growing more solid all the time, among these states when it comes to the supreme question of the fate of the United Nations itself. In one of his angrier moments in New York, Mr. Khrushchev hailed, with relish, "the beginning of the disintegration of the UN". Disruption, if not disintegration, was threatened in a whole series of Soviet moves at the Assembly. If Russia did not get its way, it gave warnings that it would make the Secretary-General's position impossible, withdraw from the debates on disarmament, block the enlargement of the Security Council, refuse to contribute to the cost of the UN work in the Congo, and (like Belgium) intervene directly in the Congo, by-passing the United Nations. The Asian and African members' resentment of these hectoring tactics seemed to me both profound and almost universal.

These members' attitude is obviously crucial for the future of the Organisation. Not only are Africans and Asians carrying the main load of its Congo operations; they are also the only members in a position to frustrate a serious Soviet attempt to disintegrate it. Russia will neither leave the UN nor carry out its threats to paralyse it if it is plain that such actions would alienate Asia and Africa.

It is also obvious that newly independent nations have a particularly direct interest in the survival and development of the UN. Through it, they can influence and often restrain great powers; without it, the world would revert to naked power politics, in which smaller nations would increasingly face the choice between submitting to some powerful master and risking the perils of isolation. Awareness of this interest is fast growing; it explains the readiness of so many nations to contribute to the UN's shock-absorbing operation in the Congo, lest worse befall. It is not the American pressure alleged by *Pravda*, but a keen sense of this direct interest in the fate of the United Nations, that has led Asians and Africans to withstand and baffle the Soviet onslaught on the Turtle Bay waterfront. It is something new in history—and it is making history.

The Lok Sabha Winter Session

THE current winter session of the Lok Sabha is certainly not going to be the tame affair that the last session was. For a brief duration of over five weeks, the schedule of business is overloaded with Bills, motions and resolutions and a throw-forward of a substantial part of it to the marathon budget session is inevitable. The importance that attaches to the current session arises, in the first instance, from the fact that the House is meeting in the wake of some momentous developments on the international scene—the unique start of the UN General Assembly's session with the presence of heads of States or governments, the acute tension created there by some of the controversial issues and the Moscow conference with its profound ideological significance, to mention only the major ones. Clarification of the Government of India's views, where necessary, has been given on some of these issues and there is little that can be added to it on the floor of the Lok Sabha.

The Sino-Indian border dispute compels first attention. It is assuming a new and grave dimension by reason of the potential threat held out to the security of the frontiers of Sikkim and Bhutan. Government's informal note of protest to Peking is unlikely to assuage feelings of grave concern in the country and what it will look to is manifest evidence that no quarter will be given to a repetition of the dilemma of "actuality". The White Paper laid on the table of the House brings the position still up-to-date. There was a volley of questions hurled at the Prime Minister on the opening day on minor patrol incursions into our territory to serve the limited purpose of giving vent to the public mood. While talks are under way on the dispute, not much overt discussion can take place in Parliament. Perhaps of greater significance was a development outside the House —the dialogue between Mr. Nehru and U Nu.

The Indus Waters Treaty opens up a new, and one hopes, a different chapter in Indo-Pakistan relations. It is rightly hailed as such. Ratification by the Government may be in accordance with the constitutional procedure, particularly to give finality to a treaty to which other nations are signatories. However, financial liability is a province of Parliament. The Prime Minister must be supported, but why should Parliament not be advised before, instead of after, ratification! The discussion which will soon take place on the treaty in Parliament either on a resolution or at the time of appropriations, will have the post-facto complexion depriving it of live interest. The Constitution (Ninth Amendment) Bill will bring to the fore the issue of the transfer to Pakistan of Berubari on which feeling is running very high in West Bengal, but our commitment in the Nehru-Noon Pact will be honoured.

There is a legacy of 15 Bills left over by previous sessions to which should be added nearly 23 new ones. This is quite a staggering order for a short session. But debates on the motions introducing the Bills or on Select Committee reports or during the clause-by-clause discussion stage promise keen controversies. Already a departure was made from convention on Tuesday by two members of the Select Committee on the Prefe-

rence Shares (Regulation of Dividends) Bill by participating in the discussion of the Committee's report. The Companies (Amendment) Bills will be taken up for clause-by-clause discussion and considering the copious changes contemplated in the Act a keen debate is richly merited. But gross disparity in the strength of advocacy of the two sides in the House will detract from what should otherwise be a most valuable discussion. The Bill seeking to give a fresh lease to the Preventive Detention Act will give still another occasion for a storm in defence of civil liberties. Detention of Akali agitators on a mass scale will provide considerable ammunition now that the Communist and Praja Socialist Parties have declared their full support to the demand for a Punjabi Suba. They could have made considerable capital out of the police firings in Bhatinda and Patiala jails. But they will find to their chagrin that Mr. Justice Falshaw's categorical finding on the justification of the major firing at Bhatinda has deprived them of that opportunity.

The problem of Assam refugees in West Bengal and the official language enactment for Assam will be among the subjects, which, in one form or another will create excitement in the House. But easily a conspicuous feature of the agenda for this winter session is the unusually large number of motions for half an hour discussions. Issues of vital economic importance dominate these motions. Quite a number of public sector enterprises will come up for Parliament's critical attention. And, above all, during this period, Parliament's opinion on the Third Plan will be formed. At present it is conspicuous by its absence of understanding of the serious consequences of the pressures both on foreign exchange and on the growing difficulties on rupees.

The State of the Communist Rift

THE differences between China and the Soviet Union continue to attract and mystify the non-Communist world. They are not new. They date as far back as the day Mr. Mao Tse-tung emerged as a Communist Party leader, but were first publicised at the 20th Congress of the Soviet Communist Party at which the Chinese disputed Mr. Khrushchev's assessment of Stalin's role. Now the differences centre on the liberalism of Khrushchev versus the doctrinaire rigidity of Mao. Broadly, they may be grouped round three issues—inevitability of war, transition to communism, and the colonial peoples' struggles. Mr. Mao Tse-tung's thesis is "Every Communist must grasp the truth: political power grows of the barrel of the gun. The whole world can only be remodelled with the gun. As we are advocates of the abolition of war we don't desire war; but war could be only abolished through war—in order to get rid of the gun, we must first grasp it in our hand." Russia for its part, would seem to work on the hypothesis that war is no longer 'fatally' inevitable. In other words, the difference is only in approach as how best to eliminate capitalism or imperialism in Lenin's phrase. While Mr. Mao Tse-tung would like to blow it up, Mr. Khrushchev would like to give it a decent burial.

The difference in policy towards countries emerging from colonial rule is that while Russia wants to give financial and moral aid to the newly liberated countries, as she firmly believes that all freedom movements should be encouraged as stepping-stones to Communism. To the Chinese, this seems emotional nonsense. They want a more aggressive line to be pursued and are pinned to the faith that only a revolutionary military struggle can secure victory. Hence, they call for revolutionary and militant policies, which in their opinion can only forward the Communist cause. The differences of transition to communism between Russia and China whose ultimate aim is identical are even more interesting. China believes in the great leap forward, that is jumping almost straight from a pre-capitalist to a Communist stage, whereas Russia under Mr. Khrushchev is adhering to the idea of a gradual process, based upon technological transformation of economy, from feudalism to socialism to communism.

The ideological conflict between Russia and China had its impact on the Communist Party in this country and has left a cleavage within its ranks. The Dange-group at a conference of the Bombay city unit of the Communist Party supported the Union Government's stand on the Sino-Indian border dispute. Messrs. Bhupesh Gupta and Basavapunniah belonging to the extremist group are worried on that score and attempts are being made in the somewhat divided secretariat of the CPI to pave a way for solidarity between the two rival groups. Arguments by one side are being assiduously built up that the Chinese are in favour of co-existence. But can public opinion be taken in by such manoeuvres? The Chinese as we know them seldom practise what they preach.

Although the Russians disapprove the policies and thinking of the Chinese and their differences in approach, they at the same time will not let the basic unity of the Communist camp be ruptured. And so, one supposes, is the case with the Chinese. If no delegation was sent by Russia to attend the Chinese revolution celebrations on October 1, nevertheless, perfect ritual congratulatory messages were passed and articles were written in the Russian press extolling China's achievements. During the October 1 celebrations in Peking, speakers and slogans laid emphasis on China's championship of Sino-Soviet solidarity and peaceful co-existence and of Chinese acceptance of the leadership of the Soviet Union. Considerable publicity was also given to Mr. Mao Tse-tung's writings between 1945 and 1959 where he said that it was possible to overcome the dangers of a third world war.

The powerful delegation from China under the leadership of the cold dialectical theoretician of Marxism, Mr. Liu Shao-Chi that went recently to participate in the celebrations of the 43rd anniversary in Moscow may perhaps be able to thrash out burning questions of Marxist-Leninist-Stalinist-Khrushchevist doctrines across the table. The other world Communist Party leaders are also in communism's Vatican, the Kremlin. Communist ranks in India anxiously await the result for India's Communist Party still seeks *ex cathedra* statements on orthodoxy—from the Kremlin for the most part. But is Mr. Mao Tse-tung providing a major challenge as Earl Attlee asserted in the House of Lords? May the *fons et origo* of doctrine slowly shift to Peking? All one can say, this would be bad for the world, not for the Communist world only.

A DELHI DIARY

THE NEGLECT OF PARLIAMENT

WHEN the Lok Sabha reassembled this week, one might have anticipated much more excitement than has actually occurred. The Opposition has tried manfully to create a stir, firstly, on the ratification, without reference to Parliament, of the Indus Water Treaty, and secondly, and much more effectively, on the Companies (Amendment) Bill. Several statements have been made on the Indus pact ratification; they have clearly not dispersed the predominant feeling that the Government is treating Parliament as though it were, even in matters of such great importance, secondary. It is absurd to argue that Parliament now has authority under particular grants, to suspend the operation of any particular section of the Treaty. Everyone knows that once a treaty is ratified, it is binding and the debate on a financial grant can only be a token censure, without point or purpose. Undoubtedly, the Government was wrong, particularly as it has an overwhelming majority, not to place the facts before Parliament before ratification. Nothing would have been lost if ratification had been delayed by two months. With the clear majority that the Congress has, ratification was never in doubt. The question which is vital is whether or not ratification of treaties is an executive or a parliamentary function. Surely, there is wisdom in the view argued hotly by Mr. Asoka Mehta that, since Parliament is sovereign on matters relating to finance, it must be sovereign in regard to treaties which involve financial payments. I have not discovered what Government's objection is and surely the Prime Minister's statement about the non-exchange of instruments of ratification (and the terrible printer's devil which seems to have been pretty active in the final copies of the Treaty) was considerably off the mark. This is really a debate on principle, and not by any means a debate on what should in fact have taken place on the Treaty. Whatever a few disgruntled people might say, the great body of Indian public opinion is solidly behind the Indus Water Treaty. A minority, in which I dare to count myself, would even like a treaty on Kashmir!

Of much more noisy interest is the provision in the new Companies' (Amendment) Bill to allow companies to contribute to political funds. The stalwarts of the three opposition parties, Mr Asoka Mehta (P.S.P.), Mr. Hiren Mukerjee (Communist) and Mr. M. R. Masani (Swatantra) were all severe in their condemnation of the clause on which the remark has been made that it is likely to be the only occasion on which they will be in such violent agreement. Mr Masani's criticism was terribly telling. I see some force in his contention that donations of this kind should be made public immediately. Referring to the Prime Minister's accusations of the Swatantra Party as a projection of the 'Capitalist Group,' Mr Masani said the publication of such news would reveal that it was the Congress Party and Mr Nehru who were 'the biggest capitalist stooges.' A daring and disturbing statement which was received in what has been described as 'bitter silence!' Whether the silence was bitter or the truth in the attack, I have not been able to discover!

NEW LAMPS FOR OLD?

Deserting Parliament, which has not awakened much of my personal interest, I am now giving myself over to High Finance. It was reported on Wednesday that the Russian rouble is to be revalued from January 1; what does revaluation in this case mean? The current official exchange rate is 11.2 roubles to the pound and good mathematicians can tell you how much that is to the dollar. We are now told that the rouble, which is still to consist of 100 kopecks, is to be revalued at 90 kopecks to the dollar. Can anyone conversant with what is called the great 'Rule of Three' tell me how much revaluation has in fact taken place? Fortunately, I have the answer. It is that the new rouble will be 4.44 recurring times as "good" as the old one. But will someone tell me why the figure of 4.44 recurring was chosen instead of 5 or 10? Even more pedantically, may I ask why in dealing with gold one must go in Russia to 6 decimal places? In February, 1950, the rouble's gold content was established at .222,186 grams. Now the gold content is to be .987,412 grams. But for those who understand the highest of high finances—the price of gold!—what does this mean in terms of international trade?

I have come to the conclusion that the Russian rouble's revaluation on January 1, next year, is designed to help her foreign trade. It is quite easy for the Soviet Union to change its prices in such a manner that her new rouble prices represent a reduction in international prices and, therefore, an increase in Russia's competitive strength. I would not be at all surprised if this is one element in a new trade offensive designed to capture foreign markets. The Indian Oil Company, which is having some difficulty in selling its Russian imported kerosene and diesel, might look with some considerable favour on new Russian trade policy. It certainly needs some help from abroad in order to overcome the inconvenient questions in Parliament this week which showed abundant concern!

THE ARRIVAL OF WEST GERMANY

So far as the U.S.S.R. is concerned, no one has doubted the great increase of Soviet trade in the period of India's Third Plan. There has been less understanding of the role of West Germany and, therefore, it was good to find an authoritative statement from Dr. Hans Reuter, head of the great firm of Demag, who was here this week. In an impressive interview with the Press, Dr. Reuter set out his view on the future German investment in India. Firstly, he was not at all deterred by taxation and he did not think that it was a major factor in German participation; Demag have many schemes under discussion and, of course, are participating in Bhadravati Steelworks' expansion as well as elsewhere. Secondly, German industrialists have decided to set up a fund of 1.5 billion marks to which the West German Government was adding the same quantity and there would be, in a few months from now, a significant programme of aid to developing countries using this three billion mark fund as a beginning. Dr. Reuter spoke of fulfilling obligations and relieving the pressure on the United States in a manner which will suggest that the major decisions have already been taken short of the Bundestag level. There would appear to be much ground for the view that West Germany will play a substantially greater part in Indian development in 1961. It is interesting to note that, while Dr. Reuter was talking at the Ashoka Hotel, an agreement, granting India a 125 million mark West German credit, was being signed in Bonn. This was a "prolongation"—happy word!—of the liabilities of the Rourkela Steelworks falling due between November and March 30, 1961!

ARGUS

The age-old custom of ceremonial tree-planting is much more than a colourful ritual. It is an expression of faith in a worthy enterprise—no matter how modest the beginning. It symbolises faith in the future—faith in growth.

Everything which is vital grows—a seed into a tree, an idea into an enterprise, a school of thought into a way of life. Each adds to it carefully with the passage of years. Often, the transformation of an idea into reality can be accelerated by deliberate direction and effective planning.

Standard-Vacuum's Executive Development Programme is a case in point. It began as an idea more than fifteen years ago to increase the number of Indians in management positions. At the time there were only three Indians of this category with the Company. How quickly the idea has developed into reality can be seen from the fact that at the end of last year in Stanvac's Marketing Organization alone there were 897 Indians in management positions. Another 113 Indians were holding similar positions in the Stanvac Refinery. Adding the number of Indians in management positions in the Indo-Stanvac Project, the total for 1959 came to 1040.

As more and more Indians qualify for management positions, the number of overseas personnel (who at one stage held an over-whelming majority of senior jobs) continue to decline.

GOODYEAR

Corner stone of GOODYEAR'S new plant laid

On November 12th, at a sober, yet impressive ceremony, Shri Manubhai Shah, India's Minister for Industries laid the corner stone of Goodyear's new plant at Ballabgarh.

The new Factory, which involves the large investment of 6 crores of rupees, latest and modern techniques and equipment, and many years of experience will be the 59th in the series of Goodyear enterprises all over the world. When it goes into production in 1961, this factory will employ several hundred workers, and manufacture Passenger, Truck and Farm Tyres for original equipment and replacement—testimony of Goodyear's confidence in the industrial development of India.

Foreign Aid

HEARTENING DEVELOPMENTS

CONFIDENCE THAT the new US Administration under the stewardship of Mr. John Kennedy would frame its foreign economic policy to strengthen rather than reduce economic aid to the developing countries has been fortified — if corroboration were required at all — by a significant press report from Washington on November 15. The President-elect, who is already intimately known for his deep conviction, which he shared with Senator Sherman Cooper, that a massive long-term programme of aid to India should be launched on politico-economic grounds, has given a clear indication that assistance for India's economic development will get priority attention in the programme of foreign policy. First, there is the keen feeling that India must be sufficiently armed to carry to a successful finish her war on poverty. Second, India's determination to execute her programmes of economic development within the framework of the democratic way of life and on the basis of the fundamental principle of the freedom of the individual is an answer to the challenge which is posed by the emotional appeal of rapid economic expansion by totalitarian techniques, regardless of the untold cost in terms of human hardships and forced sacrifices. The Presidential election in America has given a brightening touch to the prospect for foreign assistance which is a critical component in the resources for our Third Plan. Mr. Kennedy is equally determined to enlist similar enthusiastic co-operation from the industrialised countries of the West to participate in the great experiment of economic development within the structure of democracy in the underdeveloped countries. India is treated as a vital case.

In the immediate context of the remaining period of the present Plan comes another welcome news of the formal signing of the agreement at Bonn between the Governments of West Germany and India for aid by the former of the order of 125.1 million deutsche marks equivalent to Rs. 14.2 crores. This aid, though modest in size, becomes available at a strategic time when the foreign exchange position threatens to cast a shadow on some of the development projects in the present Plan. It would appear that this aid will be free from any rigid conditions and, furthermore, the interest rate will be low. Already the West German Government has lowered its Bank Rate as a move to discourage the outflow of gold from America. Since there can be no question now of the devaluation of the dollar, it is legitimate that ways and means should be found to ease America's balance of payments deficit. Two out of the three major causes of this deficit are America's self-imposed burden of military aid and economic aid overseas. The US Secretary of the Treasury, Mr. Robert Anderson, is visiting Bonn, Paris and London to impress upon the allies either to accept immediately a greater share of economic aid or to bear a greater share in the NATO budget or both. This, however, is an immediate strategy which is urgently needed in the nature of a support to a holding action against the outflow of gold. But there need not be any doubt that the Western countries are now showing a keener realisation of the importance of liberal policies of economic aid to developing countries.

South Vietnam

A STORM WEATHERED

MR. NGO DINH DIEM, who during his tenure of office as the President of the Republic of Vietnam, has had to contend with many a trouble arising out of the activities of Cao Dai and Bin Xuen religious sects, guerilla bands in the Mekong valley and the infiltration of Communist agents from North Vietnam, has weathered another storm. He has successfully beaten off, with the help of the loyalists in the army, a revolt by a section of officers of a paratroop unit, who, in the small hours of November 11, had besieged the President's House and threatened to depose him. Though the paratroopers' coup proved abortive — apparently due to lack of popular as well as army support and perhaps also due to their folly in letting Mr. Diem gain valuable time by engaging them in parleys on the reconstitution of the National Government — it has served one useful purpose; it has revealed that the discontent with the Diem regime is confined not only to a group of prominent citizens and some former Ministers, who a few months ago made an appeal to the President to reform his administration and to impart a greater democratic touch to it, but has extended to some sections of the Viet-namese Armed Forces.

This is undoubtedly an ugly portent for a small country, situated on the periphery of the Communist world in South-East Asia and so easily vulnerable to subversion from the north. Whatever justification Mr. Diem may have had for continuing his present policies and maintaining his hold on the Government by keeping in saddle a chosen few, it needs no second thoughts to point out that he would do well in his fight against Communism to broadbase his administration and associate with it popular political figures who are no less vociferous than him in disclaiming the red creed. It is time he recognises this fact; he will strengthen his hands by giving effect to the cmpromise he accepted while negotiating with the rebels, who of course, were not pro-Communists, to reconstitute his Government.

The United States, which has been lending powerful support to the Diem regime, also has no reason to be pleased with the events of the last ten days. Its further propping up of an irresponsive rule in South Vietnam will only lead to the discontent with a discredited clique at the helm of affairs becoming more widespread. That will hardly forebode well for the Vietnam Republic. North Vietnam will be its beneficiary.

Welfare

HAZARDS OF ALL-OUT PROHIBITION

AT THE first meeting of the Central Prohibition Committee held in New Delhi last week, suggestions were made by Mr. Shriman Narayan, Member, Planning Commission and Mr. B. N. Datar, Minister of State for Home Affairs, for the launching of all-out prohibition at one stroke in all the States of the Indian Union since the phased programme, according to them, had failed to

yield the expected degree of success. The 44-member Committee set up by the Planning Commission to co-ordinate the prohibition activities in the various States seems to have arrived at certain decisions which have not been made public, though the views of Mr. Shriman Narayan and Mr. Datar have received wide publicity in the press. Great emphasis has been laid by both of them on the fact that "prohibition is a fundamental principle laid down in the Constitution". While it is conceded that the directives of the Constitution are binding on the Government, the perilous haste with which prohibition is proposed to be clamped down on the whole country is fraught with numerous complications.

The basic objection relating to loss in revenue in case complete prohibition was attempted is being watered down by suggesting that the States could increase their revenue by alternative sources. It is indeed amazing how an expert body like the Planning Commission and one of its members could make a statement which is quite contrary to facts. The States have found it extremely difficult during the last decade to add to their revenue by tapping alternative sources of revenue. New taxation measures have not met with much success. If the Planning Commission is determined to make greater allocation to the States in the Third Five-Year Plan so as to cover the deficit in the State Budgets caused by the imposition of a total prohibition programme, there could be no argument at all. But the Planning Commission will have to contribute much more than the present yield of revenue from liquor (estimated at Rs. 40 crores per annum) because the police strength in all the States will have to be re-inforced in order to tackle the likely increase in crime cases associated with illicit distillation.

It is a well-known fact that all the States are not very keen on imposing this additional burden on their finances. The Prohibition Enquiry Committee had laid down the target of April 1, 1958, for nation-wide prohibition, but the working of the scheme at the State level has shown that not all of them are in agreement with the report of the Enquiry Committee. That is why in some of the States, only limited areas (covering nearly ten to fifteen per cent of the total area) had been declared dry. If the original phased programme of introducing prohibition in slow and small degrees were adhered to, it has some chances of working out smoothly in the long run; prohibition at one stroke is such a hazardous step that it may raise many more problems than it is likely to solve. Moreover, some of the States may not yield on this vital issue at all.

A CORRECTION

People's Participation in State-owned Corporations

In the Leading Article under the above caption in the issue of this Journal dated November 4, 1960, on page 812, please make the following corrections in para 1.

Line 6: "In contradiction to" should be substituted by "in contradistinction to".

Line 9: The last sentence should read as follows:

"This is not because there are any prejudices against the investing public as such, but because the Study Group is anxious to see that additional investment is directed to augment the total investment pool of the economy."

The printing errors are regretted. — Ed.

AID FOR INDIA FROM WITHIN

By

ODYSSEUS

BECAUSE average income per head is low in developing countries, it is usually argued that savings must also be low. But what is the connexion between average income per head and potential savings? The share of the national income of the upper income groups and of income from property is the key. Mr. S. J. Patel has calculated that the share of property incomes in India and in the USA does not differ greatly. But whereas in the USA these income groups save much of their share, in India they do not. In India, the groups in the top fifth get about 55 per cent of the national income. Now in his "Fiscal Policy in Underdeveloped Countries" (Allen & Unwin, London. 1960. 20 sh.), Dr. Raja J. Chelliah reminds us that in all pre-industrial societies, agriculture contributes more than half of the national output, and that a large part of this goes to proprietors, intermediaries, merchants, and money-lenders, who don't usually have the habit of productive investment. The problem is to mobilise this surplus (which can also exist in other sectors) for productive investment. It has been estimated that India could invest 15 per cent of her income without reducing mass consumption.

The mobilization of this surplus (actual and potential — the potential being increased by using resources at present wasted or not used) is, or should be, the true basis of fiscal policy in developing countries. The Communists mobilize the surplus by socializing industry and collectivizing agriculture. In a free country, the alternatives are voluntary savings and taxation.

The basic problem is to discover the surplus and channel it into investment — without, in the process, destroying the incentives to accumulate. Dr. Chelliah's solution is that each citizen should be taxed in accordance with his unused capacity to contribute. This can be measured in terms of that part of the economic surplus accruing to him which he is not already, on his own, investing productively. His income contains a surplus if it is above the level needed to maintain (a) the minimum consumption necessary for efficiency AND (b) incentives. This minimum will obviously differ for different classes of the population — an important point.

From this, Dr. Chelliah argues that taxes must be levied on a progressive scale on that part of the income — above a certain level — that is not used for approved investment and that the tax must be framed so as to encourage saving, i.e., savings in approved investment should be partially exempted from taxation.

If we depart from the so-called principles of taxing according to ability to pay and of progressive taxation of total incomes, are we throwing social justice overbroad? In discussing this last week, we saw that (1) the principle of ability to pay is subjective and leads to no specific scale; (2) even its upholders are forced to admit that it can't be pushed beyond a certain point without destroying savings, and so, when they wish to raise extra money, they fall back on direct taxation. But this is regressive and "socially unjust"! This leads us into a sterile debate as to whether slightly regressive income taxes are more, or less, inequitable than the existing system.

The more important point is that economic development requires sacrifices in consumption and that those sacrifices must be distributed as equitably as may be possible among all classes. A tax that heavily penalizes consumption and rewards investment induces taxpayers to forego consumption. In a developing economy, equity should be understood in a dynamic setting, because it is only through progress that the standard of living of the masses can be raised. A tax system that distributes the incidence of taxation in the conventionally "equitable" way may not help the masses much. If redistributive measures lower the rate of economic progress, the absolute share going to the group most favoured by redistribution will, in the end, be less. It is not in the interests of the masses to accept redistribution in their favour if it lowers the rate of growth.

GERMANY'S EXPERIENCE

On this point post-war Germany's experience is relevant. The German "social market economy" stimulates production and lets consumption take care of itself. The Germans did not allow nice questions about social justice to distract them from the drive towards recovery and expansion. As Dr. Erhard says in his "Prosperity through Competition" (Thames & Hudson, London. 1958): ".....how much more sensible it is to concentrate all available energies on increasing the nation's wealth than to squabble over the distribution of this wealth, and thus be side-tracked from the fruitful path of increasing the national income. It is considerably easier to allow everyone a large slice out of a bigger cake than to gain anything by discussing the division of a smaller cake." Taxes not designed to extract from employers and workers the rewards of their enterprise and labour but to stimulate them to fresh endeavour in work, saving, and investment, were the chief means that Dr. Erhard used to carry out his policy. The outburst of production that followed his tax incentives was hailed outside Germany as the "German miracle". But what was miraculous was not that Erhard's policies worked — they were plain commonsense — but that politicians and voters were ready to ignore envy-creating slogans about social justice and to recognise commonsense when presented to them.

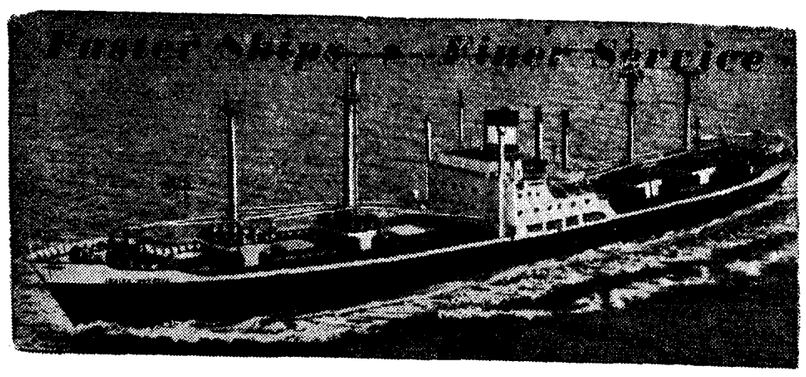
As another authority has said, "Justice has been thought of too much in terms of the division of a fixed pie rather than of encouraging the baking of more pies." Justice in taxation in a developing country cannot mean more than an attempt at equitable distribution of the burden involved in (a) capital formation and (b) the promotion of the highest possible rate of growth.

Pointing out the inequitable distribution of the burden of economic development in India at the present time, Dr. Chelliah notes that salary earners are taxed while shopkeepers escape; incomes from profits enjoy generous provisions for expenses, while salaries do not; agricultural incomes are treated leniently; and incomes from capital gains are taxed at concessional rates.

Dr. Chelliah is not against progressive taxation, but he urges that it should not be based on total income. This might mean that the tax system would be slightly regressive but it would be highly progressive on that part of the income not invested productively. Dr. Chelliah's proposal serves a double object: if a large income is not saved, much of it will go to

the state; on the other hand, if it is to avoid heavy taxation, it must go to investment. In either way the surplus is mobilized for economic development. This is Dr. Chelliah's challenging solution to the dilemma outlined here last week, namely, that more should be raised in taxation but cannot be extracted lest incentives be destroyed. Under his scheme, even if the government were to lose somewhat in tax revenue, it would have succeeded in stimulating saving of which it can take a share.

What is needed is a practical scheme whereby partial exemptions can be granted for savings invested in approved ways. Such exemptions should benefit all classes of income tax payers, not merely the recipients of dividends and owners of companies. Since encouragement to investment must not only be given to companies but to the individual, the scheme involves modification in taxation of both business and individual income.



LIGHT FROM KEYNES

Space lacks to cite in detail Dr Chelliah's carefully worked out proposals for tax exemptions, but it is worth emphasizing that they are the proposals neither of a revolutionary nor of a crank. After all, exemptions have been granted, in India, and elsewhere, for contributions to charity, insurance and provident funds, and for certain capital investments by companies. In a developing country, it is more important to encourage investment than charity. And clear social benefits arise when an individual uses his income not for personal consumption but for investments that increase the economy's productive capacity. Dr Chelliah recalls the famous passage in which Keynes described the economic system of Europe in the nineteenth century:

"Thus, this remarkable system depended for its growth on a double bluff or deception. On the one hand, the labouring classes accepted from ignorance or powerlessness, or were compelled, persuaded, or cajoled by custom, convention, authority, and the well established order of society, into accepting a situation in which they could call their own very little of the cake that they and nature and the capitalists were cooperating to produce. And, on the other hand, the capitalist classes were allowed to call the best part of the cake theirs, and were theoretically free to consume it, on the tacit underlying condition that they consumed very little of it in practice."

Under Dr Chelliah's system, the richer classes would be theoretically free to call the tax-exempt income their own, but they would not be able to consume it. Instead of relying on a "tacit underlying condition," he would "cajole" and "persuade" the richer classes to abstain from consumption through a well ordered scheme of taxation.

It is true that if partial exemption to savings were granted, income tax would be less effective in reducing inequalities. However, since the rates of income tax can be stepped up under Dr Chelliah's scheme, inequalities in the standards of consumption would be reduced. This is the best that could be done for the masses in the short run. To reduce inequalities and to prevent their perpetuation, Dr Chelliah suggests taxes on wealth and inheritance. But he rightly insists that if a nation wishes to avoid totalitarian government, it must rely on private enterprise, and it must therefore encourage the accumulation of wealth up to a point. Enterprising individuals cannot start and run large firms unless they can command substantial amounts of capital. The sooner that politicians and electors realize that a degree of inequality, far in excess of what idealist reformers will concede, is inevitable, the quicker shall we enjoy economic progress. If you don't want inequalities of wealth and at the same time you seek rapid economic progress, you had better emigrate to the USSR or to China, but even there you will not only find high, but actually growing, inequality of incomes—and you will have lost freedom.

Indian Tube is expanding again! Indeed it must, to meet the growing demand for steel tubes in step with the rising tempo of construction and industrial activity. A licence has just been received for the installation of 90,000 metric tonnes of additional capacity in continuous weld tubes, used mainly for water supply, steam and gas installations, and for a variety of structural and engineering purposes.

With the addition of a second high-speed continuous weld mill, Indian Tube's capacity in this category will go up to 200,000 tonnes, taking the total for all varieties of tube—including 30,000 tonnes of seamless, and 20,000 tonnes of electric resistance weld tubes—to 250,000 tonnes, an impressive advance achieved in the five years since the first mill came into operation. In addition, Indian Tube makes tubular steel poles for which it has a capacity of 150,000 a year.

As all the general services required for this expansion already exist at the tube works in Jamshedpur, the new mill will be completed and commissioned within a short time. This will bridge the present gap between supply and demand.

Memoirs of an Elephant—6

"See what I started"

These human beings, I tell you,
are strange creatures ; at least they are here
in Assam. As you know, one day
far back in 1889, I walked straight into the
forest and stuck my foot into that

sticky fluid—Oil. Nobody seems to credit me with the "discovery"

I remember the first oil well in Digboi was drilled in a clearing in the dense jungle. It was such a black spot that people were afraid to go there (I did not mind at all !).In the 188os there were virtually no inhabitants for miles around, the heavy smell of oil making it too unpleasant to settle in the area. But today, Digboi is one of the best towns in Assam.

In the early days the people who worked in the area were given a daily dose of quinine to keep away that terrible disease—Malaria. (No quinine for me, even in those days — I'm tough !). Today, things have changed for these human beings : Malaria carrying mosquitoes have ceased to exist in the Digboi area due to control measures.

Wherever these oilmen go they have a habit of changing the face of the place. They push back the jungle, make or improve roads and bridges, all to aid "communications" they say. (I don't like them, they give me sore feet—nothing like the jungle !)

Anyway, I have been seeing them around here for over 70 years now, since I first stepped into that pool of oil. I have been hearing the words "Assam Oil Company", "Oil Exploration know-how", "Accumulated experience", etc. .... These words all seem to go together.

The European Scene

IS ERHARDISM EXPORTABLE?

From Our Special West European Correspondent

PARIS, November 14.

ADMIRATION for the "German miracle" has been world-wide and there has often been question of exporting it, that is of applying elsewhere the formula of the man the West Germans call, half sincerely half sarcastically, the Wunderkind (Miracle Boy), Ludwig Erhard. By his book on the subject and by his visits to many inflation-ridden countries, the brilliant professor has encouraged the belief that his formula was exportable. There was even brief interest in the possibility in India some time ago, and the current efforts of the Greek and Turkish Governments to renovate their economies in association with the Common Market are partly essays in applied Erhardism—they in fact follow consultations on the spot with the author of that doctrine. The most notable attempts to imitate the West German example were the drastic French reform of December 1958 and the equally severe Spanish reform of July 1959.

Both of these followed the German model fairly closely. Indeed West Germany did more than provide advice: she pledged a part of the fruits of her own reform to guarantee the success of her neighbours', by putting up some of the large "stand-by" loans required to safeguard those economies during the difficult and dangerous early phase of the reform. In her own case, these loans were provided by the USA. The availability of these sums is an essential part of the operation, which is why it is always necessary to recall the substantial American contribution to the German miracle. The stifling of inflation entails the adoption of a new value for the currency, and this new value has to be protected from speculation, and it can only be so if powerful financial backers abroad make it known that their funds are ready to support it. It means also raising many prices in the domestic market, in order to discourage consumption, but these price-rises have to be strictly limited to the "mechanical" effects of the devaluation, higher taxation, reduced subsidies and other international public actions. If they are allowed to snowball, the results of the reform can be lost in the psychological reactions of a population accustomed by experience to take any price-rise for a new burst of inflation. So large stand-by funds are needed to finance shock imports. Finally, the reform entails opening the domestic economy, long sealed by inflation, to the corrective currents of the international markets, and this adjustment, too, demands that the country have at its disposal large amounts of foreign aid.

If all goes well, these loans may never be used but the public knowledge that they are there, ready to be used in case of need, is an essential part of the reform. It was only in the first days of this month that France repaid the total of the guarantee credits she took from the IMF at the end of 1958: about $400 million. Much more than that was publicly placed at the disposal of Paris when she undertook her reform (several hundred million dollars were put up by private banks in the USA and West Germany, for instance), but was never drawn on—which does not mean that it was useless, for it served the vital function of showing that the French reform was soundly backed, so that speculators had no chance of winning by betting against it and the general public could have confidence that the new price line was going to be held. Similarly, when Spain took the Erhard medicine last year, she received guarantees totalling $418 million from the IMF, the US Government and private banks, the European Governments and the OEEC.

This is only one aspect of an Erhard-type reform, but it is a vital one. It emerges that before there can be any thought of applying this formula to an inflation-ridden economy, one must know where the international backing is to come from, and whether it can attain such massive proportions as to make speculation and distrust look ridiculous. Naturally, before a country whose currency commands no respect (for if it did, there would be no need for drastic reform) can get that sort of international backing, it must have its reform proposals approved by the foreign creditors: this was done by the American occupation authorities in Germany in 1948, by France's Common Market partners and by the governments that agreed to return to convertibility along with the franc, in 1958, and by Madrid's American and West European backers in 1959. Thus the Erhard operation is an international concert, and never a solo performance by an heroic people that pulls itself up by its bootstraps. These international aspects of the process are less often referred to. But granted that they are fulfilled, is Erhardism exportable?

The contrasting results of the French and Spanish reforms give contradictory answers. The French reaction to the Erhard treatment is little less impressive than the West German, considering that the economy has had concurrently to bear the burden of the Algerian war and of an atomic arms programme. In a shorter time than it took for the German experiment to be recognised as miraculous, France under this regime has been able to accept those two heavy charges while paying off all her short-term debts, increasing her reserves to more than her long-term debts (thus becoming internationally solvent again), vastly increasing her exports, maintaining full employment and facing all the difficulties the Common Market implied for perhaps the most protected industrial economy on the Continent.

Spanish experience to date is very different, and shows us that whatever the virtues of the Erhard formula, it does not constitute a recipe that can be used in various types of society with equal success. I described the way the formula was being applied in Spain in an article here on November 6 last year, and reviewed the progress of the treatment a year after its inception in an article on July 1 this year. It is now 17 months that Spain has been under this regime and though it is too early to say that it has failed, it is clear that there is not going to be any "Spanish miracle". All that has been achieved in Spain is a demonstration of the consequences of deflationary, sound-money doctrine: the inflationary bubble has been burst, the economy is stagnating and the country is poorer and idler than it was before. But Erhardism is not just a savage deflation such as had been practised on

numerous occasions before, and especially in 19th century Britain and the USA; it is a technique for starting a new wave of expansion after a return to sounder foundations. Although often wrapped up in the misleading language of pre-Keynesian financial orthodoxy, it is very much a 20th century policy: expansion and full employment are its objectives while sound money, and balanced trade and budgets, are the mere instruments.

The Spanish experiment in Erhardism has so far quite failed to reach those objectives. Thanks to the foreign backing made available to Madrid, the value of the peseta has been easily preserved at its devalued level, though plans to make it partially convertible like all other Western currencies have had to be postponed. The danger of higher prices, resulting from devaluation and taxation, leading to renewed inflation has been successfully avoided (this danger is known as the "take-off skid"). Admittedly, General Franco had to use characteristic methods, unknown in North Europe, to ensure this result, e.g. threatening to shoot shopkeepers who raised prices beyond the "mechanical" limits set by devaluation and tax rises. The initial deflation was managed in a fairly orderly way: unemployment, bankruptcies and austerity were serious without reaching disastrous proportions.

On the other hand, the subsequent expansion which is the whole point of the Erhard formula has failed to appear. The sclerotic totalitarian economy has shown none of the resilience required for the success of a policy that was conceived, after all, for use in a democracy—though a firmly governed and disciplined democracy such as the West Germany of 1948 or the France of de Gaulle. The theory of the operation is that once people are convinced that the value of the currency has been stabilised without the motors of the economy being paralysed, then lenders re-appear at home and investors come in from outside. This happened in West Germany and France, but in Spain after 20 years of Francoist bluff no one had any confidence in what seemed to be just another stratagem designed to keep the regime on its feet. Spanish industrialists refused to bet on the country's chances of expansion, and the crazy "corporate" system of government (which means in practice that dozens of official agencies are operating without any over-all co-ordination) was incapable of giving the lead with a rational investment programme. The upshot has been that the psychological deflation has been much more serious than the technical deflation.

Curious as it may seem, this would not have been grave if foreign investors had been more enthusiastic in backing the reform. Though their contribution in money terms is relatively small, the role of the foreigners is vital in this sort of operation because it is they who first declare the monetary reform to have succeeded and show the way for domestic lenders. Americans were investing in post-1948 Germany before the Germans themselves, and foreign capital was pouring into Paris last year months before Frenchmen had recovered from the shock of the Pinay shake-up or had begun to believe that it was going to work. On the contrary, in Spain foreign investors (after an initial outlay in petro-chemicals) have been decidedly cautious. They have no faith in the political future of Franco, but above all the freedom of movement for their capital that they demand, and can get elsewhere, could not be granted by a totalitarian economy. The foreign exchange regulations were indeed relaxed to enable foreigners to get their profits and capital out easily, and they were allowed to obtain majority-holdings in joint businesses. But they could not be allowed to run those businesses as though they were in a democracy. A regime that refuses workers the right to strike or even to form real trade unions must pose as their protector by refusing to let employers sack them, and thus the mobility of capital is greatly reduced inside Spain even if it can cross the border more easily than before.

In sum, Spain has got stuck at mid-point of an Erhard-type reform. It has managed the deflation but cannot find the means to initiate expansion on the new foundation. The fault is mainly that of an illiberal regime, which falsely imagined that the brilliant Doctor Erhard had discovered a magical formula that could be applied anywhere and could even come to the rescue of a foundering dictatorship.

a BIRD'S-eye view of service to the economy

The Birds/Heilgers group of companies meet a substantial part of the country's demand for industrial raw materials like iron ore, coal, limestone, manganese ore, refractories ... provide tubewells for tea estates and factories ... manufacture plants for water treatment ... supply paper for a variety of uses ... make jute goods and steel castings and structurals ...

Birds have today launched on a programme of expansion to increase their output and service facilities... And their laboratories are constantly at work exploring new uses for their products so that they may serve India's industries better.

A symbol of industrial leadership, Birds will continue to play a vital role in helping India attain industrial self-sufficiency.

Economic Report from the U.S.

CENTRAL AMERICAN BANK

By

GUY SIMS FITCH

WASHINGTON Nov. 8.

ANOTHER international institution to spur regional economic integration and advancement has received the support and financial backing of the U.S. Government. This is the Central American Bank for economic integration, projected lending agency to which the U.S. has just announced it will contribute $10 million. The announcement was made within the past week by the U.S. Department of State, following talks with representatives of Guatemala, Honduras, El Salvador and Nicaragua, the four Central American nations that are joining together to organize the new lending agency. In addition to the U.S. contribution, $16 million would be provided by these four founding nations, through subscriptions of $4 million each. According to present plans, half of the subscriptions are to be paid within 14 months of a formal agreement, which is expected to be signed soon. The remainder would be payable when called for by the Bank's Board of Governors.

The Central American capital would be paid in the national currencies of the members, with provision for its free convertibility and maintenance of its U.S. dollar value. This could make it easier for the Central American States to put up the required funds, and could enhance the potential effectiveness of the bank's operations. It remains to be seen whether other Central American nations — such as Costa Rica and Panama — now will join the new regional financing venture. If they do, the Bank's capitalization obviously would increase. Discussion of closer economic integration in the Central American area go back some years. The possibilities were envisioned as early as 1950. Actual plans were underway by 1958, with the encouragement of the U.S. In March 1959, U.S. President Eisenhower and President Lemus of El Salvador, who was in Washington on a state visit, issued a joint statement favouring study of a Central American Common Market. Last February, less than a year later, the four organizers of the Central American Bank signed a treaty of economic assistance, providing for the equalization of customs duties within five years.

At a meeting with Central American representatives at Bogota, Colombia, this past September, U.S. Under-Secretary of State Douglas Dillon reaffirmed U.S. interest in Central American economic questions. He called attention to the need for a financing institution, or bank, to help speed economic progress and bring economic integration closer to fruition. It was in line with the Dillon statement that the Central American representatives and U.S. Government officials met at the end of September and discussed in some detail the establishment of the new inter-American Development Bank, which also has indicated its readiness to help the Central American Bank. Behind the establishment of the Central American Bank is the recognition that economic integration will require a balanced economic development. This will mean diversification of the economies of the member countries, and the stimulation of capital investment, both local and foreign. These are aims which the U.S. traditionally has supported and encouraged.

To help achieve these ends, the Bank's activities would be directed toward financing productive projects that tend to make the economies of the member countries more complementary and to increase Central American trade. Its operations would extend to financing the development of industry, agriculture, and what is known as the economic infrastructure — those supporting elements, such as transportation and electric power, which are vital to healthy economic progress. In addition, in keeping with the concept of a Central American Customs Union, the Bank would support the region's trade objectives by helping enterprises improve their efficiency in supplying a regional common market. Emphasis in all this clearly would be on projects of a regional rather than a strictly national scope. If all goes well, the Bank may be in position to make its first loan soon after the start of the new year. As far as the U.S. contribution to the Bank is concerned, there is some thinking that it may come from such established U.S. aid agencies as the Development Loan Fund and the International Co-operation Administration. Part of it might be made available during the current fiscal year which ends next June 30, and part in the following fiscal year. In any case, the provision of U.S. funds will require legislative approval by the next session of the U.S. Congress, which will convene early next year.

The U.S. Election

THE VERDICT ON THE AMERICAN 1960 GALLUP POLLS

By DR. GEORGE GALLUP

Director, American Institute of Public Opinion

PRINCETON, N.J., Nov. 14.

BESIDES resolving many political issues, each national election answers many questions for those who are trying to develop a scientific approach to opinion sampling.

Every field tends to move from art to science, and this has been true of public opinion research. Elections constitute a practical test of many aspects of the survey method which are developed by those engaged in this special field.

In every election, different factors or variables assume special importance. Some of those which sampling surveys had to deal with in the 1960 race were:

The Religious Issue: When the posibility first arose that President-elect Kennedy might be a 1960 contender, it was evident that the factor of religion might be a controlling one in the event he was the Democratic nominee.

As early as May, 1959, the Gallup Poll sought to determine just how much impact Kennedy's religion might have on his showing.

But unresolved was the question of whether Catholics and Protestants, in the secrecy of the voting booth, would vote as indicated in survey results.

The election supplies evidence that the survey techniques used were successful in measuring how the members of various religious faiths were voting. If this had not been the case, the final estimate of the popular vote would not have been as accurate as it was.

The Silent Vote: Many political observers and columnists claimed that surveys might be thrown off this year by the so-called 'silent vote' — that is, persons who would refuse to state their candidate preference, particularly because of the religious issue.

As a matter of fact Gallup Poll interviewers found few persons unwilling to give their preference — certainly no more than the small percentage which had been encountered in previous elections.

The Undecided Voter: One other aspect of the campaign which received a great deal of comment by political writers was the "undecided vote" — persons who had not made up their minds as to their choice.

While survey evidence indicated a larger than normal proportion of persons who did not feel very strongly about their choice, the actual proportion of persons who could not or would not state their preference — as of the day they were interviewed — was no higher than has been found in most elections.

The Gallup Poll's final pre-election estimate showed a total of only 3 per cent of likely voters undecided as of the Friday before the election.

Voting Turnout: A difficult problem in all elections is to obtain a sample which is representative of those voters who will get to the polls on Election day. To deal with this problem, a whole series of questions has been developed by the Gallup Poll in recent years to sort out a sample of likely voters.

The success of these procedures in screening out non-voters is demonstrated by the Gallup Poll's pre-election estimate of the total vote. In its final report, it was estimated that 65 per cent of the adults of the country would vote, and that this would represent a turnout of 65 to 70 million — the largest in the history of the country.

Election returns to date show that this was an accurate estimate of turnout.

Accuracy: Predicting group behaviour is always a hazardous occupation. No one can say with certainty that some unknown factor will not upset such estimates. Of course, the same is true in other fields. Even those airplanes which have been tested for years in actual flight, for example, occasionally do crash to earth, and sometimes for reasons unknown.

But proof that progress in opinion survey techniques is being made comes from the accuracy of Gallup Poll surveys in actual elections. In the six elections which preceded 1948, the average deviation between the Gallup Poll's survey estimates and election results was 3.7 percentage points.

In the six elections since 1948, the average deviation has been 1.6 percentage points. Here is the record going back to the 1950 election:

Gallup Poll	Election Result	Deviation
	1960 Presidential	
51% Kenn.	*50% Kenn.	1.0
	1958 Congressional	
57% Dem.	56.5% Dem.	0.5
	1956 Presidential

India's Foreign Trade in Merchandise in September 1960: The provisional figures of India's foreign trade in merchandise by all routes — sea, air and land — on private and Government accounts during September 1960, according to information available in the Department of Commercial Intelligence and Statistics, Calcutta are given below:

Exports	Rs.	52.68 lakhs
Re-exports	Rs.	0.41 lakhs
Imports	Rs.	75.28 lakhs
Balance of trade	Rs.	—22.19 lakhs

These figures exclude overland trade with Nepal, Tibet, Sikkim and Bhutan. The import figures are exclusive of the value of certain consignments of Government stores awaiting adjustment and of private merchandise under reference to customs for verification.

Table I below brings together the provisional figures for September, 1960, along with similar figures for August 1960, September 1959, and the revised figures for September 1959.

Table I: India's Foreign Trade During September 1960 August 1960 and September 1959

(In lakhs of rupees)

Foreign trade in merchandise	For the Month of			
	Sept. 1960	Aug. 1960	Sept. 1960	
			Provisional	Revised
Exports	52.68	56.03	60.11	57.72
Re-exports	0.41	1.01	16	17
Imports	75.28	82.73	69.33	73.75
Balance of trade in merchandise	—22.19	—25.69	—9.06	—15.86

The cumulative total for the six months ended September 1960, are shown along with the corresponding figures for 1959 in Table II below:

Table II: India's foreign trade during the six months April-September, 1960 and April-September 1959.

(In lakhs of rupees)

Foreign trade in merchandise	Cumulative totals for six months April to September		
	1960	1959	
		Provisional	Revised
Exports	295.65	301.14	293.52
Re-exports	5.79	2.29	4.12
Imports	483.91	414.62	468.01
Balance of trade in merchandise	—182.47	—111.19	—170.37

Central Revenue Collections for September, 1960: The revenue realised from items on which duty is levied and collected by the Central Government in the first six months of the financial year 1960-61 amounted to Rs. 366.65 crores. Of this, Rs. 74.68 crores were collected during September 1960. The corresponding figures for the six months of the financial year 1959-60 and for the month of September, 1959 were Rs. 328.49 crores and Rs. 77.86 crores respectively. Following are details of the revenue realised under various heads.

(In lakhs of rupees)

Revenue Heads	September		April September	
	1960	1959	1960-61	1959-60
1. Customs	13,74	14,04	77,95	74,21
2. Union Excise Duties excluding Coal Cess and Salt Cess	31,65	29,28	1,93,90	1,68,19
3. Corporation Tax	14,15	14,43	36,78	23,43
4. Income Tax	13,48	18,02	47,02	50,65
5. Estate Duty	14	19	82	97
6. Taxes on Wealth	27	52	1,47	1,58
7. Expenditure Tax	3	2	13	14
8. Gift Tax	6	4	23	20
9. Railway Passenger Fare Tax	N.A.	91	5,78*	6,33
10. Opium	80	41	2,62	1,79
Total	74,68	77,86	3,66,65	3,28,49

N.A. Not available. * Provisional upto August.

*

Goodyear Tyre Factory in Punjab: Corner Stone for the new Goodyear Tyre & Rubber Company factory at Ballabgarh, Punjab, India was set in place the other day by Mr. Manubhai Shah, Minister of Industries, Government of India. The ceremony was held at the 73-acre site of the new tyre and tube manufacturing factory at Ballabgarh, Punjab, 21 miles south of New Delhi. In addressing guests at the ceremony, Mr. R. E. O. Carey, Managing Director of Goodyear Tyre & Rubber Company of India Private Limited stated:

"This country's promising future indicates sound economic growth and the decision of Goodyear to locate this factory in India is a tribute to both the Indian Government and the business community which co-operated in bringing about this development." The new Goodyear factory, estimated to cost Rs. 60,000,000 ($12,000,000) will be equipped with modern tyre manufacturing equipment to produce passenger, truck and farm tyres for replacement and original equipment markets. Ballabgarh, Punjab, which offers excellent facilities for industry from the standpoint of water, labour and transportation, was chosen after a careful study of other areas, and by the desire of the Government to industrialise the northern part of India.

United States

New International Lending Agency Ready for Business: The International Development Association (I.D.A.) is organised and is now ready for business. I.D.A., originally proposed by the United States is an affiliate of the World Bank. It will provide financing to less developed member countries on more flexible terms than those of conventional loans. I.D.A. loans, for example, may be repayable wholly or partly in local currency, loans may be made free of interest or at a lower rate of interest, or they may incorporate some combination of these terms. Any member of the World Bank, it is reported, is eligible for membership in I.D.A. Thus far the following 22 countries have accepted membership: Australia, Canada, China, Germany, India, Iran, Italy, Jordan, Malaya, Norway, Pakistan, Phillipines, Spain, Sudan, Sweden, Thailand, Union of South Africa, U.A.R., U.K., U.S.A., Vietnam, Yugoslavia. Other countries of Africa, Asia, Europe and Latin America have completed various stages of the membership procedure. Subscriptions of the 22 present members represent the equivalent of

$726,720,000. If all members of the World Bank join the I.D.A., its initial subecription would total the equivalent of $1,000 million of which more than three quarters would be available on a fully convertible basis.

Yugoslavia

Development and Structure of Exports: Exports during January-September 1960, were valued at 118.9 billion dinars against 100.4 billion dinars during the same period last year having increased by 18.45 billion dinars. Appreciable changes occurred in the structure of exports by comparison with 1959, the chief trends noted being as follows: The rate of growth of industrial exports which rose by 14.1 per cent has been slowed down noticeably which also affected total earnings. Thus for instance exports in January-September last year were 14.7 billion dinars higher than in the corresponding period of 1958, while the export earnings obtained during January-September 1960 are only 10.9 billion dinars higher than in the same period of 1959. By contrast, farm exports which were 25 per cent lower in 1959 than in 1958, reveal a 39.1 per cent increase as compared to January-September last year. Thus while dropping by 7.7 billion dinars last year as compared to 1958, this year farm exports exceeded even the 1958 record level by 8.1 billion dinars. The favourable development of exports, particularly during the third and fourth quarter of the year was due among other reasons to the upward movement of export prices which owing to the export structure resulted in a sustained upward bias of the general export price indices notwithstanding certain fluctuations noted in May and June. Such a tendency of the general export price index was due primarily to the price fetched for maize, eggs, early fruit, vegetables and particularly sawn timber and fuelwood.

France

New Mail Sorting Machines in Paris Post Offices: Additional machines for sorting letters and packages of the type already installed in the main post office at Paris will be put into service shortly in other offices. These machines make it possible for 6 operators to sort 24,000 letters per hour to 300 different destinations. The package sorting machine require 4 operators who can sort 600 packages per hour to 100 different destinations. In comparison with similar types of machines designed and built in other countries, the French machines have the advantage that the operators can adjust the operating speed to a given volume of mail and are not restricted to the same rate of flow, regardless of whether the volume of mail is light or heavy.

U.A.R.

Big Increase in National Income Expected this Year: According to the final statistics embodied in the detailed report on the economic and social plan, the Southern Region's national income is expected to rise in the first year of the plan period from £E 1,377.5 million in 1959-60 to £E 1,501.9 in 1960-61, an increase of 9 per cent. This percentage exceeds the annual average of the total rate of increase expected in the five years, which is 40 per cent. The increase covers all sectors. In the public services sector it is expected to amount to approximately 8 per cent, rising from £E 1,224.2 million in 1959-60 to £E 1,320.1 million in 1960-61 reaching at the end of the fifth year a figure of £E 1,716.9 million. In the Government administrative sector the rate of increase is expected to amount to 18 per cent rising from £E 137.3 million to £E 165.4 million reaching a figure of £E 178.2 million at the close of the fifth year In the family income sector the rate of increase is expected to amount to 3 per cent rising from £E 16 million to £E 16.4 million.

Poland

Polish-made Sugar Refineries: The second sugar-refinery plant delivered to Iran by Poland is undergoing trial runs. This plant will process from 1,000 to 1,500 tons of sugar beet per day. The export of sugar refinery plants, which now comprises one of the most important items of complete industrial plants sold by Poland abroad, was begun several years ago by supplying to China two sugar-beet refineries, and later on a cane refinery processing 3,000 tons of sugar per day. Poland has just completed delivery of 2 plants to the Soviet Union, each of which would process 2,500 tons of sugar-beet a day. Several such plants are due to be delivered to the Soviet Union in the course of the coming year. Poland and Czechoslovakia jointly built a sugar refinery in Ceylon.

Indonesia

Exchange Rate Adjusted: There was a general reorganisation of import and export regulations towards the end of August. A week later the Bank of Indonesia fixed a new exchange rate of 562 rupiahs to the £ for goods that, though needed in the country, are not regarded as essential to its development.

Turkey

Single Rate for the Lira: The foreign exchange structure has been tidied up by establishing a single rate of 9 liras to the dollar for all transactions. Previously a good deal of business went through at the basic rate of 2.8 liras plus premium that varied according to the categories of goods involved.

Saudi Arabia

Oil Revenue Loss Assessed: The Saudi Director of Petroleum Affairs has pointed out that the annual loss of foreign exchange income to the country arising from the cuts in posted prices will be between $25 million and $30 million. He criticized the western oil companies for taking this step without consulting the producing countries concerned.

World Bank

Economic Development Institute: The sixth course of the Economic Development Institute of the World Bank is now in session in Washington D.C. and will continue until April 1961. The Institute was organised by the Bank in 1955 as a staff college for senior officials of member countries and territories to deal with problems of economic development. Twenty-three officials from 21 countries and one staff member of the world bank are taking part in this year's course. The work of the institute is based on the closely interwoven series of seminars in which all participants join. The curriculum is designed to provide a comprehensive approach to the problems of economic development, and to treat them from the point of view of officials with operating responsibility in their respective administrations. In general, the seminars deal with the preparation of development programme, the historical aspects of development, the structural relationships of the economy, public finance, money and banking, agricultural development, international trade and payments, studies of particular industries, and programme and project apparaisal. An important part of the course of study at the institute consists of organised visits to governmental agencies and to industrial, commercial, agricultural and financial institutions in the United States and other member countries.

NEWS IN BRIEF

INDIAN

The Government of India have decided to locate the proposed tele-printer factory at Madras. The Madras Government has agreed to allot a site near the industrial estate at Guindy, a suburb of Madras City.

*

Tobacco yields an income of about Rs. 49 crores to the growers and earns for the country foreign exchange of Rs. 15 crores per annum, says an official press release. Exports of this important commercial crop have been steadily going up and during the five-year period ending 1957, India exported an annual average of 85 million lbs. of unmanufactured tobacco.

*

The Demag Concern has received an order to expand the Bhadrawati steel works in the Indian State of Mysore from an annual crude steel capacity of about 30,000 tons to 130,000 tons.

*

The Government of India has accepted the Dhantiwada Reservoir Project in Gujerat for construction of a composite dam across the river Banas, near village Dantiwada in the Danesa Taluka of Banas-Kantha district of the State.

*

A joint organization of the Ministries of Food and Agriculture and Works, Housing and Supply will soon be set up for accelerating the construction of food storage accommodation in various parts of the country.

*

A number of agencies have been set up since Independence to provide credit facilities to industries in the private sector whose growth is considered important for the planned development of the country. Such assistance flows from the Industrial Finance Corporation, the Industrial Credit and Investment Corporation, the National Industrial Development Corporation and the Refinance Corporation for Industries.

*

The Government of India have constituted a National Cooperative Farming Advisory Board with Mr. S. K. Dey, Union Minister of Community Development and Co-operation as Chairman.

*

The Government of India has decided that the average retention price for steel payable to Tata Iron and Steel Company be increased by Rs. 4.85 per ton for the five-year period 1955-56 to 1959-60.

*

Yugoslavia will export to India 40,000 tons of railway tracks worth more than $4,000,000 by April next year. The first shipment of 2,000 tons has already left, the tracks are built by Yugoslavia's biggest iron and steel works at Zenica, Bosnia.

*

The Kerala Government is examining the possibility of establishing a low shaft furnace for the production of pig iron and steel with the low grade magnetic iron ore available in the State.

*

The Industrial Committee on plantations which met recently unanimously agreed to have separate wage boards for tea, coffee, and rubber.

*

The West German Government has lifted restrictions on the import of coir products, according to an announcement by the Coir Board.

FOREIGN

Steel production in Italy was 26.8 per cent higher in the first nine months of this year than in the same period last year. In the period January to September this year 6,106,419 tons were produced compared with 4,815,500 tons in the same period of 1959.

*

Middle East oil output during January to September last, rose to all-time record level for the first nine months of any year. At 193,705,000 metric tons it was more than 22m. tons or 12.9 per cent greater than in the same period of last year, the Petroleum Information Bureau announces.

*

The Soviet experts' report on the iron and steel works proposed to be set up in Ceylon has now been given to the Ceylon Government. It is understood that the project is planned to cost Rs. 150m. of which about 65 per cent would be provided by Russia under the agreement on economic and technical cooperation signed between the two countries in February 1958.

*

The plan for Sweden's first venture into petro-chemicals has now been finally worked out after protracted negotiations. It will be based on a steam cracker which Esso is building at Stenungsund, 27 miles north of Gothenburg, which will supply two plants to be built nearly for the manufacture of polythene and ethylene oxide.

*

Britain's gold and convertible currency reserves rose by £11m. in October. This was after repaying £30 m. to the International Monetary Fund—as the last instalment on the £200m. borrowed in September, 1956—and £5m. to settle European Payments Union bilateral debts.

*

In the 1959-60 coffee season, Mexico has produced 2,033,000 sacks of 60 kg. (132.3 lbs.). Exports account for 1,408,000 sacks valued at £26.3m.; 500,000 sacks have been consumed in the country leaving a surplus of 125,000 sacks.

*

Australia's earnings from wool exports dropped more than 10 per cent in the first three months of this financial year. Earnings fell from £A65.2m. to £A58.4m. The U.K. purchases at £A10.3 m. were only half those made by Japan.

*

Production in the machine tool industry in Britain is still running at a high level and orders on hand are equivalent to more than a year's work. But there are some signs in the last few weeks that the spectacular rise in new orders which began in the spring this year is beginning to level off due to slackening demand from the motor and appliance industries.

*

The U.S. Development Loan Fund has announced the signing of a $17.5m. loan agreement under which the U.S. will aid Vietnam in improving and expanding the water supply of the Saigon Metropolitan area. The four-year project will cost a total of $26.6m.

*

Shipments of tin from Malaya last month totalled 6,969 tons, compared with 6,247 tons in September, according to the Straits Trading Company. Of this total 2,693 tons were shipped to the Continent, 1,887 tons to the U.S. and 269¼ tons to the U.K. Total production in September amounted to 4,289 tons, compared with 4,390 tons in the previous month.

*

A coking plant with an output capacity of 250,000 tons of coke a year will be built in Northern Norway, near the State-owned steel plant A/S Norsk Jernverk, if the Storting (Parliament) approves a proposal recently put forward for the Norwegian Government.

THE BUSINESS WORLD

Credit Curbs Curtailed

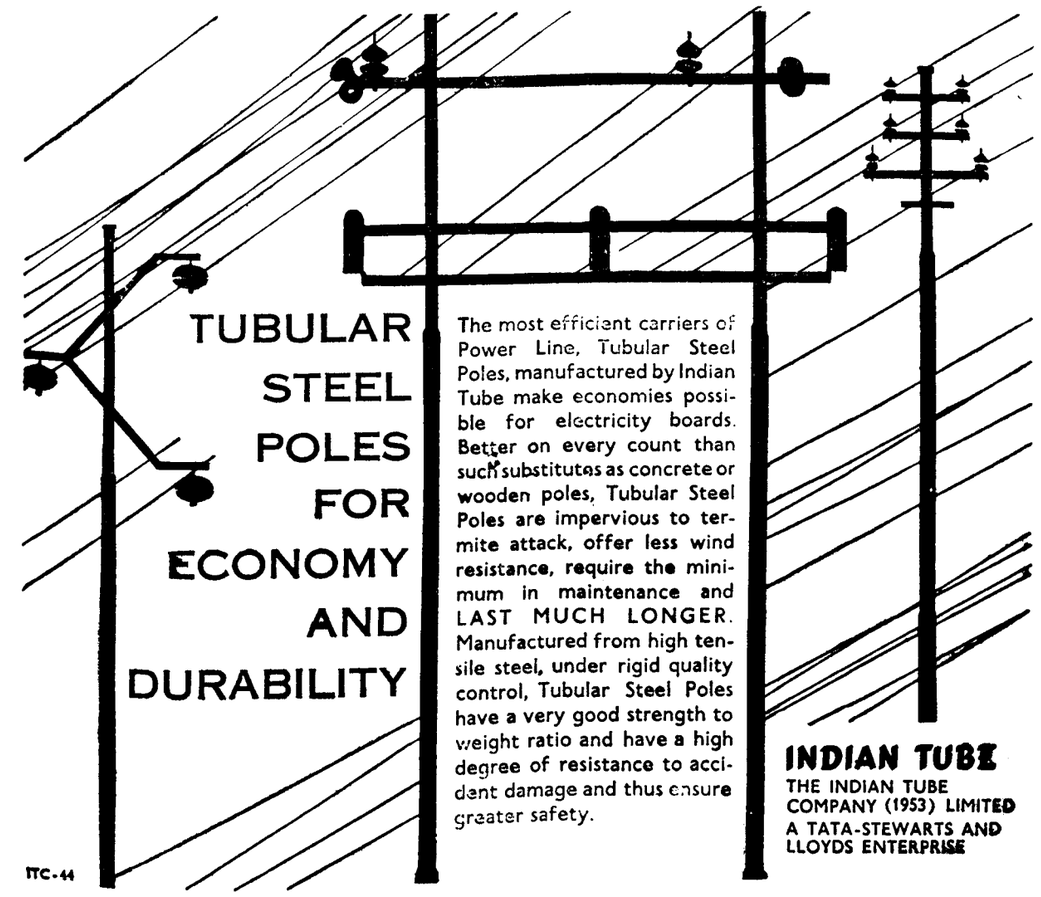
By

CROESUS

AFTER having commented on the consequences of the credit squeeze and pleading for a less rigid attitude than hitherto on the part of the Reserve Bank of India last week, I am bound to welcome the relaxation of the recently imposed credit curbs by the Reserve Bank of India. Whether the Reserve Bank has taken this action in response to the representations of the bankers and the business interests or on its own is immaterial. The presumption at any rate is that the Reserve Bank has apparently been impressed with the fact that, instead of helping production, the dearer money policy, especially the impounding of 50 per cent of the additional deposits, has affected it adversely. Of course, even now there are two opinions about the advisability or the relevance of the continuation of these credit curbs, one school of thought holding that these have been subserving a useful purpose and are, therefore, necessary, and the other school contending that, far from achieving their objective, the credit squeeze measures have been impinging at points where even the authorities might not want them to impinge.

Evidently, having realised that some harm has been done — although this has not been admitted — and bearing also in mind the imminence of the busy season, the authorities have hastened to relax the rigour of their credit curbs.

"With a view to assisting them to meet credit requirements in the ensuing busy season," says a carefully worded press 'communique' issued by the Reserve Bank of India on November 11, 1960, "the Reserve Bank has relaxed the maintenance of additional statutory reserves with the Bank by the scheduled banks." The 'communique' also adds:



(1) The additional reserve requirement will be suspended in respect of increases in liabilities over the level as on November 11, 1960; no further impounding of deposits will thus, for the time being, take place:

(2) With effect from November 11, 1960, the additional reserve requirement will be reduced from the present level of 50 per cent to 25 per cent and this reduced requirement will be applied to increases in liabilities taking place since March 11, 1960; the deposits already impounded with the Reserve Bank will thus be reduced. The deposits rendered surplus as a result of these modifications will be released to banks."

Obviously, this press 'communique' has to be read with the instructions to individual banks that must have been issued by the Reserve Bank along with the 'communique', in order fully to appreciate the implications. For instance, it does not seem strictly correct, as some seem to believe, that there will be no further impounding of deposits after November 11, 1960, because it has been made clear, I am told, that "this requirement (the relaxation) shall not apply to that part of the demand and time liabilities as is in excess of the demand and time liabilities as on November 11, 1960." Does this mean that, after the total liabilities of a bank at any time fall below the level on November 11, 1960 and the deposits thereby rendered surplus are released to it, the bank will attract the additional reserve requirement again, if its total liabilities exceed the level as on November 11, 1960? In other words, does it mean that, if the total liabilities of a bank as on November 11, 1960 amounted to, say, Rs. 50 crores and later on improved to, say, Rs. 75 crores, there would be no additional impounding of the increased deposits consequent on this increase in deposits, but that, if the liabilities come down to, say, Rs. 40 crores and the Reserve Bank released the deposits thereby rendered surplus and, subsequently thereafter, the total liabilities again went up to over Rs. 50 crores, the bank in question would attract the additional reserve requirements rule? This is a point which, I am afraid, requires further clarification.

It is significant that, while relaxing the requirement regarding the maintenance of additional statutory reserves, the authorities have made it clear that the 25 per cent of the additional reserves that would continue to be impounded even after November 11, 1960, would refer to increases in liabilities over the position as on March 11, 1960, that is the time from when the additional reserve requirements first came to be enforced. Had the Reserve Bank not made this point specifically clear, it would perhaps have been open to the banks to demand a release of the entire amount of their additional deposits now remaining impounded with the Reserve Bank. In other words, the latest measure is only a relaxation and not a wholesale lifting of the requirement regarding the maintenance of additional statutory reserves.

Although it was the idea of the Reserve Bank to impound a maximum of 50 per cent of the additional total deposits of banks, banking circles have computed that the actual volume of deposits of the entire banking system so impounded has far exceeded this percentage, the relevant estimates varying from 70 to 80 per cent. This, I dare say, is an aspect that must have come as an eye-opener even to the authorities. The impounding would have been limited to 50 per cent only of the additional deposits, had the deposits of every bank shown only an increase. Clearly this could not have been the case. For, in actual practice, in the case of some banks, the deposits would have gone up, while, in the case of quite a few, the deposits would have fallen. On the basis of the net position, which is really what should guide the Reserve Bank, it is broadly conceivable that the percentage of the impounded additional deposits would far exceed the 50 per cent ceiling. It is further conceivable that the position.

would vary from bank to bank, depending upon both the growth or fall pattern and the tempo of its deposits. Not unless a comprehensive analysis of the impact of the credit squeeze on each and every scheduled bank is available, therefore, can one accurately assess its precise effect on industry and trade. I guess the authorities have made such a study and discovered, possibly to their own surprise, that the impact of their policy has not been wholly according to their first reckoning. They must have found at least some instances where the policy has adversely affected the genuine and normal requirements of trade and industry. Anyway, it is to the credit of the authorities that, having realised the injurious consequences of their action, even if only on a section of the public, they have not been slow to move in the matter and remedy the position. Seeing this, I feel convinced that the Reserve Bank is really adopting a flexible policy in the matter of its credit regulation measures.

Be that as it may, it would appear that the immediate effect on the relaxation would be to render deposits to the extent of at least Rs. 13 - Rs. 15 crores surplus and make them available to the banks. Banking circles will certainly welcome this and there may, as a result, be a reversal of the downward trend in the volume of bank credit that has been in evidence since October, 1960. The extra funds thus released should come in handy to meet the rising demands necessitated by the rise in both industrial and agricultural output lately.

Business Notes

The Rouble

SIGNIFICANCE OF REVALUATION

AN ANNOUNCEMENT of great importance coming from Moscow on November 15, relates to the revaluation of the rouble, effective from January 1, 1961. It will be recalled that as long back as May last, Mr. Khrushchev had promised internal currency reform from the next calendar year, but the latest announcement goes a little beyond this purpose. The rouble has been revalued at 90 kopecks (100 kopecks=1 rouble) to the US dollar in place of the current official exchange rate of 4 roubles to the dollar. There has been a change in the gold content of the rouble. In 1950 the gold content of the rouble was formally fixed at 0.222,168 gram of pure gold, but last Tuesday's announcement has changed it to 0.987,412 gram of pure gold.

The revaluation of the rouble constitutes one of the most outstanding reforms undertaken by the Soviet Union in its economic policy, but its importance ought to be set in the correct perspective. Hitherto the exchange rate of the rouble had been fixed on an arbitrary basis, but it is now being placed on a cost-accounting basis. This reform is being undertaken in anticipation of the fact that in about five years' time the Soviet Union's trade will swell into such a big volume that any arbitrary basis for the fixation of prices will raise great perplexities. The major significance of this reform lies in the rationalisation of the basis of fixation of the value of currency rather than in any other claims which have been put forth—for local consumption—about the revaluation of the rouble establishing the economic victory of the Soviet Union.

Immediately after the decision on revaluation was announced, Mr. Poskonov, the Soviet Vice-Minister of Finance, explained in an article published in "Izvestia" that the change in the gold content of the rouble (and, therefore, its revaluation) would enable convenient and advantageous modifications to be made in the trade relations between the Soviet Union and other Communist countries. The implication is that the revalued rouble will be used for settlement of external accounts as between the countries of the Communist world. In so far as the non-Communist world is concerned, the rouble is not used as a currency for payments and after revaluation too external payments to which the Soviet Union is a party will continue to be made in currencies other than the rouble. Foreign trade with the non-Communist world is unlikely to be affected by rouble revaluation.

Oil

ESSO STANDARD EASTERN

A MAJOR organisational change has been announced this week in the case of the Standard Vacuum Oil Company, one of the three leading oil companies in the private sector. The joint ownership of Standard Vacuum Oil Company by Standard Oil Company (New Jersey) and Socony Mobil Oil Company (each owning 50 per cent of the capital stock) was terminated at New York on November 14 resulting in the division of the international petroleum interests between the two. This split, however, is not likely to have any fundamental alteration in India in regard to either the employees or the customers, dealers, suppliers or others having business dealings in Stanvac, including the Government of India.

It is believed that the division will be in the interest of the new Company (which will be re-named Esso Standard Eastern in place of Stanvac) because every proposal which was hitherto sent by the management in India, was considered by the Board of Directors of the two companies, which sometimes resulted in delay in case of conflicting opinion on any issue. Now, the operations of the Company are likely to have a smooth sailing with only one management to deal with.

The organisational change has been accompanied, through sheer coincidence, by the announcement that the Standard Vacuum Oil Company has decided to surrender duty protection on all products covered by the refinery agreement. Duty protection on gasoline was surrendered by the Company three years ago. The present step is likely to result in a saving of Rs. 1.12 crores to the country. It may be stated that protection in duty was granted to Stanvac under the agreement under which the Stanvac oil refinery at Bombay was put up.

Banking

TRENDS IN PROFITABILITY

HOW HAS the profitability of the scheduled banks fared during the last few years? Annual balance sheets of these banks should, of course, provide an answer. But another, and indeed, more direct way would be to trace the trend of the margin between the interest rates that are paid on deposits and earned on advances. The table below, reproduced from the October 1960 issue

of the Reserve Bank of India Bulletin, shows the actual earnings and rates of interest charged on advances as well as actual figures in respect of payments on deposits and the rates of interest paid thereon during the last three years. It is clear that the rates of interest paid on deposits went on rising reaching a significantly high annual average rate of 2.73 per cent during the half-year to December 1958. In the next half year the rate dropped considerably and another fall was witnessed during the half year to June 1960, when it reached an annual average rate of 2.07 per cent. The fall was attributed to the revision of the Inter-Bank Agreement in September 1959 by which the ceiling on interest rates was reduced by ½ per cent. The actual amount paid on inter-bank borrowings therefore increased but at the same time it proved advantageous because it was at lower rates than the rates paid on borrowings from the other sources like the Reserve Bank and the State Bank of India.

On the other hand, during the same period, the rate of interest earned on advances has been rising progressively. The average rate of interest earned during the first half of 1960 touched the highest level at 5.78 per cent. It was for the first time since June 1957 that the rate of interest earned during the first half of the year was higher than the rate for the second half year of the preceding year. Simultaneously the earnings from the bills discounted also increased; the amount of earnings from inland bills was higher than the earnings from foreign bills which showed a sharp rise in the half year to June 1960. Thus, with the higher average rate earned on advances and the lower average rate paid on deposits, the margin between the two rates has increased. During the half year to June 1960, the margin was 3.71 per cent which is the highest differential since 1957. The larger margin between the two rates, if other things remain the same cannot fail to be reflected in the over all earnings.

Margin Between Advances and Deposit Rate

Half year ending	Deposits		Advances		Margin
	Interest Paid (Rs. crores)	Rate of interest %	Interest earned (Rs. crores)	Rate of interest %	%
June, 1957	9.92	1.75	19.16	5.19	3.44
Dec., 1957	13.44	2.10	21.19	5.69	3.59
June, 1958	15.71	2.23	22.33	5.50	3.27
Dec., 1958	17.21	2.73	21.50	5.69	2.96
June, 1959	17.51	2.18	23.97	5.58	3.39
Dec., 1959	19.16	2.19	23.64	5.71	3.51
June, 1960	19.00	2.07	26.67	5.78	3.71

Electricity

CALCUTTA ELECTRICITY EXPANSION PROGRAMME

SIR HARRY BURN, K.B.E., F.C.A., Chairman of the Calcutta Electricity Supply Corporation Ltd., stressed, at the annual general meeting, the significance of the expansion schemes taken in hand by the Company. He added that during the previous decade and a half the demand on the system of the Company had more than doubled, so that the present figure was around 390 MW. This expansion of the Company's generation, transmission and distribution capacity has involved an investment of the order of £24 million. Now again, he pointed out, the Company has to expand, one reason being that the State Government of Bengal had expressed its preference to buy electricity from the Company rather than buy bulk quantities from the Damodar Valley Corporation. An agreement has, therefore, been negotiated by the Company with the Damodar Valley Corporation providing for an initial supply of 45 MW to be increased from year to year as might be required by the Company. It is anticipated that by the end of this year the D.C.V. will be in a position to supply the Company to the extent of 100 MW. The Company will, therefore, face no shortages on this score. In response to this higher demand the Chairman forecast the capital expenditure on transmission and distribution services during the next four years in the vicinity of £1.25 million.

The Chairman also stressed that he attached considerable importance to the training of young Indian engineers for employment in the Company. Under the technical training scheme which has been in operation for nearly the last 14 years, the Company has chosen young Indian graduates for a short period of training in the works here. Thereafter they are sent to the U.K. for further training and are placed on the permanent staff. In addition to this, the Company has an arrangement of sending some members of the permanent staff for further training to the U.K. These training schemes have positively added to the efficiency of the Company's staff.

Oilseeds

A HIGHER TARGET WANTED

THE VIEW that the target for the production of oilseeds at 95 lakh tons now laid down for the Third Five-Year Plan is insufficient even to meet the growing domestic demand, let alone the demand for exports, was expressed by Mr. Ramdas Kilachand, President of the Bombay Oilseeds and Oil Exchange Ltd., at the last annual general meeting of the Exchange. His thesis was that the demand for oilseeds in the country would rise to as much as 106 lakh tons by 1965-66, taking into account the fact of the increase of our population at a rate of about 2 per cent per annum which is higher than what was assumed five years back and that side by side, our standard of living also has been rising, involving the increased consumption of many articles of daily necessity. Accordingly, he urged an upward revision of the target to 110 lakh tons, and, in doing so, he suggested that this should be done in such a way as to leave a "comfortable surplus" for exports. This anxiety for maintaining our exports and earning valuable foreign exchange is understandable.

It is in this context that the B.O.O.E. President's observations regarding the export policy of the Government becomes relevant. Mr. Ramdas took strong exception to the failure of the Government of India in announcing a long-term policy. Time and again, he reminded the authorities, the Exchange had urged the Union Government that the export policy regarding oilseeds and oils should be on a long-term basis. Short-term policies have many disadvantages to the trade, he pointed out. For one thing, foreign buyers take full advantage of the country's short-term policies in respect to oilseeds, by artificially reducing prices for our export commodities. Traders in the overseas countries also quote high prices in the case of our imports. Thus, the country's foreign trade is hit both ways. Moreover, traders experience avoidable shipping difficulties when the shipping period is short. Incidentally, Mr. Ramdas mentioned, while on this point, that the abolition of the rebate system could greatly solve the shipping problem faced by the traders. For increasing exports of oils and oilseeds, Mr. Ramdas had also some suggestions to make, some of which have, in fact, been made by him many times ere now. However, for our purposes, mention may be made of the following more important among them:

(i) The Government should give the same incentives to exporters of groundnut oil as to exporters of Vanaspati; (ii) they might permit imports of copra and palm oil also to exporters of groundnut oil by fixing a specific ratio between the two; (iii) they could extend the shipping period of all H.P.S. groundnut quotas from the end of December, 1960 till the end of June, 1961.

Our Railways have another responsibility . . . of protecting costly equipment against scorching heat, lashing rain and gruelling service.

GOODLASS NEROLAC Paints share the Railway's responsibility of protecting the nation's property. Again and again, the Railways choose GOODLASS NEROLAC Speciality Paints, and Special Paints made to ISI Specifications, to preserve hundreds of coaches, wagons, bridges, signal towers and stations.

GOODLASS NEROLAC — the Paint Specialists — have twenty-five years' manufacturing experier in India, backed by a century of research in pa technology. And each year GOODLASS NEROLAC's scientists are perfecting better protective paints for every type of industry.

DEEDS
....Not merely words
PERFORMANCE
.....Not only promises

The beginning and the end of a Five Year Plan are vital dates in the nation's history. Each Five Year Plan is both an assessment of the past and a call for the future. It seeks to translate into practical action the aspirations and ideals of the millions in the country and gives to each of us the opportunity of service in the common cause of eliminating poverty and raising standards of living . . .

Today, on the eve of the Third Five Year Plan, we of Dalmia Cement (Bharat) Ltd. believe that almost 23 years of useful service to the Nation is something to talk about. Here are a few facts about our "achievements" and our contribution towards raising the standard of living of our people during the past few years.

For building the India of our dreams, the richer and prosperous India, there is little room for preaching by mere words and what are needed are DEEDS . . . DEEDS, in the terms of rebuilding of our nation, including higher production of some of the essential commodities like

CEMENT

the great modern material of building construction

In 1947, we had placed at the Nation's disposal over 67,000 Tons of Cement
In 1950, we had produced over 1,64,000 Tons of Cement
In 1954, we produced over 2,70,000 Tons of Cement
In 1957, our production reached nearly 2,80,000 Tons of Cement
And This Year.... in 1960

We expect to place at the nation's disposal over 4,25,000 Tons of Cement

BECAUSE WE NEED MILLIONS of TONS of CEMENT

for building the richer and prosperous India of our dreams . . .,

DALMIA CEMENT (BHARAT) LTD.
Dalmiapuram (Madras State)

A National Enterprise in Nation's Service

UNDER SECRETARY 25 NOV 1960 PUBLIC DEPARTMENT

FROM THE CAPITAL'S CORRIDORS

TWO RICE DEALS IN THE OFFING ?

INDIA may enter into two rice deals in the near future—one with Burma and another with the United Arab Republic.

A Burmese Trade Delegation is touring this country at present to make some on-the-spot purchases of light machinery, electrical goods, textiles, coal, jute goods, dry prawns, yarn and pulp. This delegation had preliminary discussions with the Government of India on November 11 and 12 and indicated that Burma was interested in selling rice to this country in exchange for the above-mentioned commodities. How much rice Burma will sell to India will be known when the Burmese delegation has made an assessment of the value of goods to be imported from here. Indications are that about 2 million tons of rice will be made available to India by Burma during the next five years. The deal is likely to be finalised in about ten days' time when the Burmese delegation returns to New Delhi for the final round of talks.

A representative of the Misr Forward Trade is expected here shortly to start negotiations in respect of a new Indo-UAR rice deal. Early this year, the United Arab Republic sold one lakh tons of rice to this country in exchange for Indian tea, jute manufactures, textiles and engineering goods. The entire quantity of rice has already been supplied.

MANUFACTURE OF TYPEWRITERS

Royal Mc Bee International Inc., a U.S. firm, has submitted a proposal to the Government of India to set up a typewriters manufacturing factory, with a production capacity of 24,000 units per year, in this country. The project will cost $15 lakhs, of which 60 per cent will be supplied by the U.S. firm and 40 per cent will be raised in India. A new company will be floated under the name Royal Mc Bee (India) Private Limited.

The capital contribution of the parent company will cover all the foreign exchange cost involved on account of the import of tools, jigs and equipment and on account of payment of salaries and other expenses of the foreign technicians associated with the project.

The project will be completed in three stages. The following is the phased programme:

Phase	Duration of the phase	No. of typewriters to be made	Indigenous content (CKD pack value of $90)
1	1 year	6,000	40-50%
2	1 year	18,000	70-80%
3	1 year	24,000	80-100%

A New Delhi firm, Rai & Sons (Private) Ltd., has also applied for a licence to set up a wholly Indian-owned unit to manufacture English and Hindi standard typewriters. This unit will have a production capacity of 10,000 typewriters per annum on double-shift working.

The capital requirements of this project will be met from the existing funds of the firm, contribution from its directors and by raising of loans from the Industrial Finance Corporation. Messrs. Kovo Praha, Czechoslovakia, a sister concern of Skoda, will provide the technical know-how and prepare plans and designs for the Indian company. They will also make available the services of six specialists to render help in the execution of the project. For all this assistance they will be paid a total sum Rs. 4 lakhs.

This project also will be completed in three stages. The following is its phased programme.

Phase	Duration of the phase	No. of typewriters to be made (Two shift working)	Indigenous content (in terms of CKD pack value)
1	18 months	5,000	60%
2	9 months	7,000	80%
3	9 months	10,000	100%

Two more applications for the issue of licences for the manufacture of typewriters have been received by the Government. The details of these, however, are not yet known.

There are four companies at present manufacturing standard and portable typewriters in this country. The names of their foreign collaborators, their licensed capacity and current output is as follows :

Name of the Company	Name of the foreign collaborator	Licensed capacity/ annum (Single shift)	Production	
			1959	1960 (upto June)
1. Remington Rand (India), Calcutta	This is a foreign firm	15,000 (Standard Typewriters)	15,229	4,721
2. Rayala Corporation Ltd., Madras	Atvidaberg Industries, Stockholm, Sweden.	6,000 (Standard Typewriters)	3,145	1,902
3. Godrej & Boyce Co., Bombay	Veb Optima Erfurt, of G.D.R. (Agreement concluded recently)	12,000 (Standard Typewriters)	3,063	1,536
4. Blackwoods (India) Ltd., Calcutta	This is an Indian firm	12,000 (Portable Typewriters)	—	48

The demand for standard typewriters in India has been assessed as about 45,000 numbers and 1,00,000 numbers per annum at the end of the Second and Third Five-Year Plan periods respectively. The total licensed capacity for these is 33,000 numbers. Their production in 1958, 1959 and during the six months to June this year was 15,846, 21,347 and 8,159 numbers respectively.

TRAINING OF PRECISION MECHANICS

Primarily with Swiss assistance, but with additional aid from the United Nations Special Fund, a Central Scientific Instruments Organisation is proposed to be set up in India. The Swiss Foundation for Technical Assistance has worked out this scheme to provide training to Indians in the manufacture of precision instruments and their handling. The Swiss Foundation will provide equipment costing about one million Swiss francs and make available to the Institute a Principal and several other experts. It is a five-year scheme costing the Swiss Foundation four to five million francs.

The Institute will provide:

(1) Practical and theoretical training to apprentices recruited from all parts of India with sufficient educational background for a period of three years to become precision mechanics. The apprentices would, as a rule, be of the age of 18 to 19 when they begin their training at the Institute.

(2) Specialised training to instrument manufacturing craftsmen already working in the industry. This training will be given, as the Institute progresses, in special courses, the length of which will be determined by the administration of the Institute.

(3) Carefully selected instruments of proven reliability would be produced in the training workshop, as far as the training programme permits. Other job orders would also be executed if they fit into the training programme.

(4) The Swiss personnel of the Institute shall also, within the scope of its activities and insofar as the teaching of the trainees permits, render consultative and advisory services to units of the Indian instrument industry.

At the end of the training period, there shall be a rigid trade test on the basis of which certificates will be awarded.

In some cases the Swiss Foundation will provide training in Switzerland to specially talented Indian technicians. It may also offer scholarships for advanced and vocational training in Switzerland to Indian trainees.

An allocation of $8,50,000, it is expected, will be made towards this Institute by the United Nations Special Fund to provide research facilities.

PRODUCTION OF WOOLLENS AFFECTED

Production of woollen cloth and yarn in some of the leading woollen mills in the country is being severely curtailed because of raw material shortage. The manufacturers say that because of the delay in issuing licences for the import of wool tops, they have insufficient stocks to keep going until new supplies arrive from abroad.

The management of the Raymond Woollen Mills (Bombay), it is learnt, has served a notice on its 300 employees that the third shift at the mills will be closed from November 15. Working on the other two shifts will also be affected. The Oriental Carpet Manufacturers (Amritsar) has also announced that the company's worsted spinning unit would close down from this date.

It is reported that Cawnpore Woollen Mills (Kanpur) and the New Egerton Mills (Dhariwal) also anticipate severe curtailment in their production. Smaller units have also been affected.

The final basis for the issue of licences for wool tops imports has not yet been established by the Government. "Ad hoc" licences have been issued against "essentiality certificates" granted by the Textile Commissioner.

FERTILIZERS OUTPUT

The Deputy Minister for Commerce and Industry, Mr. Satish Chandra, told the Lok Sabha on Monday that there had been some improvement last month in the production at the Sindri Fertilizer factory. Arrangements, he said, had been made for regular supply of coals in the required quantities and qualities to make proper blends for manufacture of coke.

The Government of India has set up a committee, consisting of the Commerce and Industry Secretary, Mr. S. Ranganathan, as Chairman, and Mr. K. B. Lall, Mr. L. K. Jha, Mr. K. R. Damle, Mr. E. P. Moon and Mr. B. C. Mukerjee as members, to examine and recommend applications for setting up fertilizer manufacturing units in the private sector. The Committee recently examined five applications for putting up a fertilizer plant at Vizagapatam and has asked the applicants to furnish some more details and to indicate whether they, as an alternative, are prepared to establish a project in any another State.

INDIA EXPLOSIVES' EXPANSION PLAN

Messrs. India Explosives Limited propose to expand their production as follows:

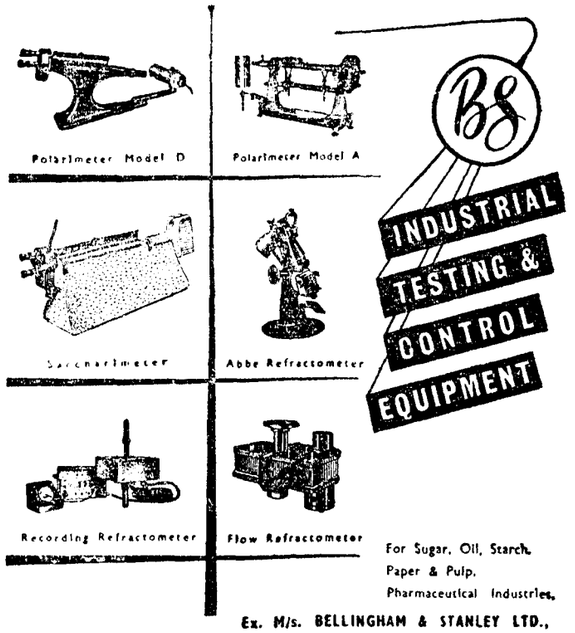
Name of product	Present annual capacity	Expansion envisaged	Annual capacity after expansion
1. Safety Fuse	5.6 million coils	4.4 million coils	10 million coils
2. Military Fuse	—	0.1 million coils	0.10 million coils—
3. Military Power	—	36 short tons	36 short tons
4. Fuse Powder	—	sufficient capacity to cover production of 10 million coils of safety fuse.	

A scheme for this expansion programme has been submitted to the Government for approval.

The Company is already engaged in the manufacture of blasting explosives. The Government of India is holding 20 per cent equity capital in this concern. The balance 80 per cent is held by Imperial Chemical Industries (India) Private Ltd., a subsidiary of Imperial Chemical Industries Ltd., of the United Kingdom.

The capital requirements of the expansion scheme are Rs. 53 lakhs. This sum is available from the existing resources of the company.

STEEL RETENTION PRICES



The Government of India has decided that the average retention price for steel payable to the Tata Iron and Steel Company and the Indian Iron and Steel Company be increased by Rs. 4.85 per ton for the 5-year period 1955-56 to 1959-60. This will be the final adjustment under the escalator clause for the 5-year price period ending March 31, 1960.

The increase will enable the Tata Iron and Steel Company to increase the contribution to its Development Fund by Rs. 2.22 per ton, i.e., to the level of Rs. 52.22 per ton for the period 1955-56 to 1959-60, and the Indian Iron and Steel Company to maintain its contribution of Rs. 7 per ton for the same period.

The present retention price of steel, including excise duty, payable to the Tata Iron and Steel Company and the Indian Iron and Steel Company is Rs. 470 per ton.

PETROL AND DIESEL CONSUMPTION

The Oil Advisory Committee, which met here last week, has recommended that immediate steps should be taken to remove the imbalance in the consumption of petrol and diesel by way of adopting technological and chemical devices in the processes of consumption and supply. It has suggested that a committee, consisting of the representatives of Ministries of Finance, Commerce and Industry, Transport and Communications and Steel, Mines and Fuel and the oil producing and refining companies in India, should be set up to collect definite

Mr. Employer: to every member of your staff add four dependants—and there you have a rough idea of the extra people who depend on your payroll. These dependants are important to your organisation because upon their financial security rests your employees' peace of mind; peace of mind which makes for greater productivity, devotion to duty and loyalty. The Life Insurance Corporation offers two Schemes which, as an employer, you should know about:

Group Insurance Scheme offers low-cost Life Insurance protection to your staff under one Master Policy.

Superannuation Scheme is the cheapest method of providing retirement pension, with or without life insurance benefit.

MORE ABOUT THESE SCHEMES:

- For tax purposes premiums on both Schemes are treated as normal business expenses
- Under certain Schemes attractive tax-relief is allowed to the employees
- Employees get the benefits of these Schemes at lower cost
- They can often be instituted at no extra cost to the employer
- Administratively, they do not involve your office in anything but minor clerical work
- It is being increasingly realised that these schemes go a long way to increasing staff productivity and length of service.

When next an Insurance man calls on you about these Schemes, give him a few minutes of your time—without any commitment of course.

data from which a mixture of motor spirit and diesel could be adopted and enforced in the country.

DEVELOPMENT OF INTERMEDIATE PORTS

The main recommendations of the Intermediate Ports Development Committee have been adopted by the National Harbour Board. A special meeting of the Board was held here last week.

The Intermediate Ports Development Committee had recommended some first priority works for the ports of Paradip, Kakinada, Masulipatam, Tuticorin, Neendakara, Beypore, Kozhikode, Mangalore, Karwar, Redi, Ratnagari, Veraval, Porbandar, Okha, Skka, and Bedi to be completed at a cost of Rs. 611.48 lakhs. It had also suggested some second priority works, costing Rs. 422.00 lakhs, for the ports of Paradip, Kakinada, Masulipatam, Cuddalore, Nagapattinam, Tuticorin, Beypore, Kozhikode, Karwar, Ratnagari, Broach, Bhavnagar, Veraval, Porbandar, Okha and Bedi, and third priority works, costing Rs. 42.50 lakhs, for the ports of Cuddalore, Nagapattinam and Bhavnagar. The development of Tuticorin and Mangalore as all-weather deep-draft ports was urged by the Committee on first priority basis. In the second priority category for development as all-weather deep-draft ports were mentioned Paradip and Porbandar.

The Board has pleaded for developing Tuticorin and Mangalore as deep-draft all-weather ports. It has pointed out that today Tuticorin is already handling about 9,00,000 tons of cargo which is expected to rise to about 1.5 million tons in the Fourth Plan. Mangalore is expected to handle a traffic of 2 million tons of iron ore in addition to general cargo of about 0.6 million tons with the development of the port and the construction of Mangalore-Hassan line. The Board has recommended that the allocation of Rs. 15 lakhs for Ratnagiri port be increased to Rs. 35 lakhs so as to make a beginning for the development of the port (at Mirya Bay site) as an all-weather port. The Board has also suggested that the traffic potential of Porbandar should be reviewed and if this review showed that the traffic was likely to rise to 5.0 lakh tons in the Third Plan period, its development as an all-weather port should be considered.

INDIA AND THE COMMON MARKET

The Economist Intelligence Unit, in a study entitled "The Commonwealth and Europe", has assessed the economic consequences of British participation in the European Common Market. The following extracts from this study would be read with interest in this country.

The study says: "With its external finances in so precarious a position (this is the conclusion drawn in the study after elaborate calculations about India's exports and imports in the Third Plan period and the quantum of foreign aid required to implement the Third Plan), India is understandably nervous about the effect on its trade of current plans for economic integration in Europe. The EFTA (European Free Trade Association) arouses no concern, but it is feared that Indian exports will suffer by the creation of the EEC (European Economic Community), particularly through competition from French African produce, and that European capital which might have come to India will now go elsewhere. These fears are probably groundless. India can put up a stronger political claim to financial assistance from foreign Governments than almost any other underdeveloped country, and the small inflow of private capital is unlikely to be much influenced by changes in Europe. It appears too that very little of India's existing export trade will be damaged by the common external tariff of the Community, even though over two-fifths of identifiable exports to the EEC will be subject to tariff changes.

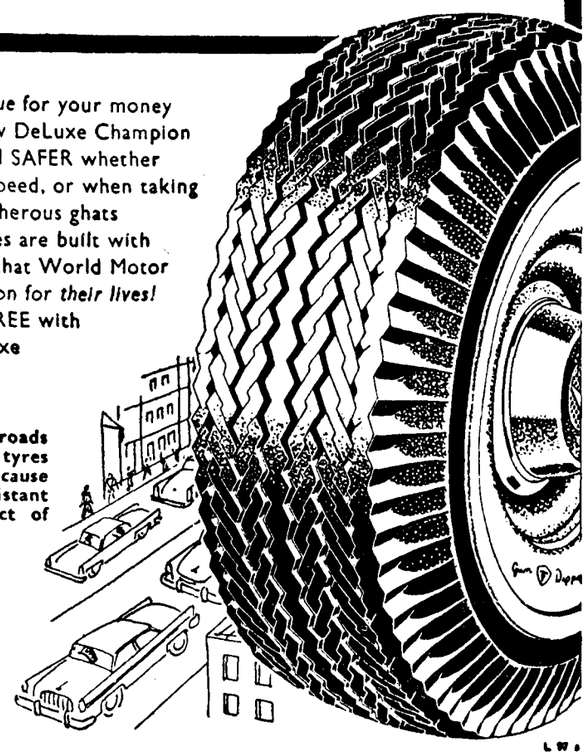
"Among the more important of India's exports to the Six hides and skins, manganese ore, raw wool, coir yarn, and raw cotton, will enter duty-free and there are many items in the enormous range of minor Indian exports of raw materials—iron ore, mica, shellac, hemp and a miscellany of vegetable and animal products—which will also continue to do so. Sales of jute and cotton textiles to the Six are very small and are unlikely to be much affected by the change in tariff levels though they could be wiped out by unfavourable quota treatment. Foodstuffs are inevitably more vulnerable. Coffee sales are safeguarded against French African competition by the excellent quality of the Indian product, but some Indian common tea, though not the higher-grade leaf, might be displaced by tea from the Belgian Congo. If, on the other hand, the EEC could be persuaded to reduce internal taxation on tea, the market might grow sufficiently to permit a substantial increase in Indian sales. India's small tobacco exports to the Six are again protected from French African competition by their superior quality, while French Africa does not compete on any significiant scale in such items as pepper, cashew nuts, castor and linseed oil. On the whole, then, the effect of the EEC on India's trade is likely to be slight.

"The effect of a merger of the UK tariff with that of the Six would also be negligible so far as raw material exports to Britain are concerned. The loss of Commonwealth Preference on tea and tobacco would be no great matter since it is shared with India's chief competitors, but a duty fixed at the EEC level on tea imported into Britain would damage India's trade by raising the price of tea and so depressing consumption. It seems unlikely, however, that Britain would in practice be asked to take such a step; the two markets could be kept separate in this instance.

"Manufactures present a more difficult problem. Few Indian goods, other than jute textiles, are sufficiently competitive to maintain their footing in the UK market if they had to sell across a tariff on equal terms with the Chinese and the Japanese and meet duty-free competition from the Continent. If trade were not to be damaged fairly severely by a merger between Britain and the Six, India would have to have a duty-free quota for grey cloth sold to the UK, and liberal quota treatment on the Continent for jute mannufactures to offset the loss of trade with Britain in other goods. UK participation in a wider European association on these terms would probably mean that any Indian losses would be neutralized; but the structure of India's exports is such that it is unlikely to secure much positive gain from more rapid economic expansion in Europe. Nor has it much to give in return for European concessions; Commonwealth Preference on Indian imports is strictly limited.

"In the context of India's current problems and policies, the effects of European economic integration fade into insignificance. Only when India begins, as it eventually must, to come to grips with the task of increasing export earnings will European trade policies impinge sharply on Indian development. Since, in the long run, India will have to rely much more on exports of manufactures, it is not so much the details of European tariffs that matter to it as the general trend of policy."

The study expresses the hope that the advanced countries can be persuaded to resign themselves to losing much of their share in world trade in cheap, simple manufactures to Asian industries and to letting more Asian goods into their own home markets.



BRIEFS

The Swedish firm SKF, known for manufacturing ball-bearings, is entering into collaboration with Tatas to set up a ball-bearings producing unit in this country. Sixty per cent of the share capital of the new company which will handle this manufacturing programme will be held by the Swedish firm and the rest by Indians.

*

The West German Government, it is learnt, has lifted all restrictions on the import of coir products into that country.

COMPANY AFFAIRS

AHMEDABAD ELECTRICITY PLANS FOR EXPANSION

During the year to March 31, 1960, the Ahmedabad Electricity Company Ltd. indicated rise in sales by little over 1 per cent over the previous year. During the last two years, however, the increases had been recorded to a larger extent as indicated in the table below:—

Year ended 31st March	Million Kwh.	Percentage increase on previous year
1958	630.6	14.9%
1959	689.9	9.4%
1960	698.2	1.2%

During the year 10,082 new consumer were connected bringing the total to 71,983 on 31st March, 1960, which includes 121 large high tension consumers and the North Gujarat Grid. The total generating capacity of the Company's Sabarmati Power Station reached 157,500 Kw. The station peak increased during the year to 140,800 Kw. After a reduction of 8.1 MW in October-November 1959 to 21.25 MW, the Grid Demand has slowly increased again and in March 1960, the maximum demand recorded was 25.6MW. During September, 1960, it was 28 MW.

To meet the ever increasing demand for power in the City of Ahmedabad and its environment, the State Electricity Board has permitted the Company to expand its generating capacity by another 30 MW. The company has taken in hand the expansion of its present power station and against the orders placed on Messrs. British Thomson-Houston Export Ltd., Messrs Babcock and Wilcox and Messrs. Strachan and Henshaw Ltd., some material has already arrived from Messrs. Strachan and Henshaw Ltd. It is hoped to commission the first 30 MW. set covered by these orders in March, 1962. On 30th June, 1960, the Company signed an arrangement with the Development Loan Fund authorities for $3.9 million. This will cover the foreign exchange component of the new plant. To meet the capital cost of the first 30 MW set in the recent extensions, the Company issued 30,000 5½% Debentures of Rs. 1,000 each at par. Out of the proceeds the Company redeemed the Second Debentures, totalling Rs. 2 crores on 14th June, 1960.

The gross profit for the year amounts to Rs. 78.4 lakhs in accordance with the provisions of the Electricity (Supply) Act, 1948. A credit to Employees' Retiring Gratuities Reserve of Rs 5.68 lakhs has also been charged against profits of the year. An ad interim dividend of Rs 2.50 nP. per share for the half year to September 30, 1959 absorbed Rs. 21.87 lakhs. Now the directors have proposed the payment of Rs. 4.50 nP. as dividend making 7 per cent for the whole year up to March 31, 1960.

ZANDU PHARMACEUTICAL

While the output and sales of pharmaceuticals produced by the Company has been increasing every year the Directors of Zandu Pharmaceutical Works Ltd. have pointed out that due to acute competition there has been a significant increase in the expenses on propaganda. The Company nevertheless has been making reasonable amount of profit. During the year to March 31, 1960 the Company made a profit of Rs. 1.58 lakhs. The Directors have recommended the payable of a dividend at the rate of Rs. 10 per share subject to deduction of income-tax on ordinary shares and Rs. 6 per share subject to deduction of income-tax on preference shares.

The Company has already applied to the Government of India for the manufacture of Tranquin Tablets and Trichovag Cones and it has also now placed Cortisone, Phenimate Tablets and Injections before the public and the public has responded very enthusiastically. The Company is also making preparations for the manufacture of Antibiotic Ointments like Pencillin Ointment and other Ophthalmic Ointments.

AMALGAMATED AND PENCH VALLEY COAL

Raisings and despatches were low during the year to March 31, 1960, owing to a number of reasons, amongst them being the inadequate supply of wagons and the delays experienced in obtaining permits from the Mines Department for depillaring. These difficulties were overcome towards the end of the year which resulted in increased Raisings and Despatches which trend, coupled with the price increase introduced in November 1959, is expected to lead to improved results during the year ending 31st March, 1961.

The Pench Valley Coal Company Limited recorded a profit of Rs. 4.07 lakhs. After making adjustments of taxation etc. there was a sum of Rs. 1.72 lakhs for distribution. The Directors have recommended the payment of a dividend at the rate of 10 per cent subject to deduction of income-tax.

In the case of the Amalgamated Coalfield Ltd. profit during the year was Rs. 4.66 lakhs. After making provisions for taxation and development rebate reserve, etc., the Directors have recommended the payment of a dividend at the rate of 10 per cent subject to deduction of tax.

COMMODITY NEWS AND NOTES

IRON ORE PRODUCTION

The productionof iron ore during September, 1960 was 835,000 metric tons, according to the Indian Bureau of Mines. This brings the total output during January-September 1960 to 7,967,000 metric tons which was higher by 39 per cent when compared to the output of 5,719,000 metric tons during the corresponding period of the preceding year. Orissa was the chief producing State with an output of 269,000 metric tons followed by Bihar with 226,000 metric tons. Madhya Pradesh and Mysore recorded an output of 153,000 metric tons and 146,000 metric tons respectively while the output from Maharashtra was 23,000 metric tons. During the month despatches of iron ore for consumption in the iron and steel plants totalled 528,000 metric tons while the despatches for export were 121,000 metric tons.

TYPES AND GRADES OF UNMANUFACTURED TOBACCO

Tobacco yields an income of about Rs. 49 crores to the growers and earns for the country foreign exchange of Rs. 15 crores per annum. Exports of this important commercial crop have been steadily going up and during the five-year period ending 1957, India exported an annual average of 85 million pounds of unmanufactured tobacco. This was nearly double the pre-war average of 47.5 million pounds. The Directorate of Marketing and Inspection of the Union Ministry of Food and Agriculture has published a monograph on types and grades of unmanufactured tobacco exported from India in 1957 to provide precise information on the nature of requirements of different importing countries as a step in boosting up tobacco exports. Besides giving information on the exports of different types of grades, the monograph provides detailed information on the exports of different types of grades, the monograph provides detailed information about the forms in which manufactured tobacco is exported to various countries.

PATTERN OF PRODUCTION AND CONSUMPTION OF PETROLEUM PRODUCTS IN INDIA

The Oil Advisory Committee, which met recently recommended that immediate steps should be taken to remove the imbalance in the consumption of petrol and diesel by way of adopting technological and chemical devices in the processes of consumption and supply. The appointment of a committee consisting of the representatives of Ministries of Finance, Commerce & Industry, Transport & Communications and Steel, Mines & Fuel and the oil producing and refining companies in India for the purpose was suggested. The report of the Steering Committee appointed by the Oil Advisory Committee at its last meeting was considered. It was also suggested that the Steering Committee should review the pattern of production and consumption of petroleum products in the country on a continuing basis. Mr K. D. Malaviya, Union Minister for Mines and Oil, who presided over the meeting, advised the committee to take an optimistic view of the consumption pattern of petroleum products in view of the speedy pace of industrialisation that was taking place in the country. He also advised them to take a long range view of various other connected problems and find a solution in a co-ordinated way.

TRANSFERABLE SPECIFIC DELIVERY CONTRACTS IN JUTE AND JUTE GOODS

The Government of India have effected amendments to the bye-laws relating to transferable specific delivery contracts in jute and jute goods with a view to enabling the East India Jute and Hessian Exchange Ltd., Calcutta to curb speculation in such contracts. These amendments, which have been announced in a notification issued in the Gazette of India Extraordinary, have been made, as under the existing bye-laws of the Exchange, the Board has not got adequate powers to take effective steps to curb speculation. These amendments, inter alia, empower the Board of the Exchange to regulate trading in any delivery or deliveries in transferable specific delivery contracts in jute and jute goods; to evolve a scheme of registration of such contracts and the pucca delivery contracts issued thereagainst; to restrict the number of transfers of pucca delivery contracts; to impose special margins on transferable specific delivery contracts; and to fix maximum and minimum prices and to vary them from time to time. All the above powers, as also the power to close out outstanding transferable specific delivery contracts in jute goods, would also be exercisable by the Forward Markets Commission if it considers that the interests of the trade or the public interest so require.

Company Meeting

THE CALCUTTA ELECTRIC SUPPLY CORPORATION LIMITED

INCREASED SALES TO ALL CLASSES OF CONSUMER

DEMAND CONTINUES TO EXPAND

Sir Harry Burn's Review

The Sixty-Third Annual General Meeting of The Calcutta Electric Supply Corporation Limited was held on November 10 in London.

Sir Harry Burn, K.B.E., F.C.A., the chairman, presided.

The following is his review, which had been circulated with the report and accounts:—

Industry continues to expand throughout the whole of the licensed area, and housing development proceeds in Calcutta and its suburbs to remedy the shortage of dwelling space for all classes of the population.

The demand for energy grows, and I am able to report increased sales to all classes of consumers during the year ended March 31, 1960. The total energy sold increased by 140 million units to 1,817 million units. The major portion of the increase in demand came from industry.

Energy sold for power purposes refers principally to industrial demand, which accounted for 90 per cent of these sales. The balance covers public water works and domestic power, the latter being mostly for air-conditioning and refrigeration. All the principal classes of industrial consumer recorded higher consumption than in any previous years. The jute industry, our largest consumer, increased their demands by 18 million units to 430 million units. Further progress in modernization and rationalization of jute mill machinery has helped to improve trading conditions for this industry, whose exports were the highest for 10 years. Next in importance are rolling mills and engineering work-shops, whose consumption increased by 32 million units to 243 million units. Expansion will continue when supplies of steel improve. Of the remainder of our industrial consumers the most important are cotton mills, chemical works and paper mills.

Further expansion took place in the demand for low tension industrial power, sales increasing by 14 million units to 114 million units and the number of consumers again increasing by over 1,000 to more than 15,500. Public water works and sewage pumping stations consumed 90 million units, an increase of 8 million units. Half of this increase was from the Calcutta Corporation, which is expanding its water supplies, and the remainder was from the State Government's Sonarpur-Arapanch Drainage Scheme. There was again a large increase in domestic power sales, which rose by 5 million units to 61 million units. The larger demand is mostly due to air-conditioning units, which are being manufactured locally.

Sales of energy for lights and fans rose by 16 million units to 243 million units. There has been an appreciable increase in residential buildings in our area of supply and greater use of fans resulting from improvements in the standards of living of many middle-class families.

Public lighting sales increased by one million units, which was almost entirely due to additional street lighting by the Calcutta Corporation.

The only consumer for traction purposes is the Calcutta Tramways Co. Ltd. Their consumption, which rose by 3 million units to 46 million units, shows some recovery in their operations, which were disrupted by labour troubles during the previous year. Provided that their operating conditions remain stable, consumption during the current year should reach that for the year ended March 31, 1958, of more than 49 million units.

There are seven distributing undertakings taking bulk supplies from the Company. Five of these undertakings are owned by the State Electricity Board, which was thus responsible for over 92 per cent of the total sales of 66½ million units and almost entirely for the increase of 3½ million units during the year.

Two-thirds of the sales under special contracts were at our special tariff to owners of large office and residential buildings, public institutions, cinemas, and hotels. Sales to these consumers increased by 5 million units to 61 million units during the year. The remaining consumers under special contracts are the Central and State Governments, the Calcutta Corporation, and the Calcutta Port Commissioners; consumption improved in each case.

Revenue Account

The effect of the increase in the demand for energy is shown in the revenue account, where it will be seen that the receipts from sales of current have risen by over £700,000 to approximately £9,000,000. Interest received amounts to £43,727, an increase of £24,858 over the previous year, and is attributable to the return on Treasury bill investments and interest on bank deposits. As a corollary to the higher demand on the system the cost of generation and distribution increased by £534,000 to £4,560,000, and of this expenditure the cost of coal, including handling and ash disposal charges, amounted to £2,826,000, an increase of £373,000 for the year. This major item of outlay represents 80 per cent of the total operating cost of generation. The cost of power purchased from the Damodar Valley Corporation shows a slight increase of £11,000. Increases in wages and costs in respect of materials are commensurate with the expansion of the Company's system.

The depreciation charge has risen by £29,000 to the figure of £929,000. The wealth tax, to which I made reference in last year's review, was not in fact abolished until April 1, 1960, and has thus entailed a charge of £99,700 in the revenue account. This final instalment has been calculated with reference to the values of the Company's assets at March 31, 1959, in accordance with the Indian Wealth Tax Act. The net revenue after taking into account the depreciation charge has increased by £200,000. Sales of energy for the current year show a satisfactory expansion and conform with our forecasts of future demands.

I will now deal with the net revenue account. As regards the Indian tax position I am glad to say that settlement has been reached in respect of the appeals which were pending a year ago and to which I made a reference in last year's review. The charges for United Kingdom and Indian taxation adjust the position up to March 31, 1960, but no relief is available in the tax element of the preference dividend for the year.

The clear profit for the year falls short of the reasonable return to which the Company is entitled by the sum of £67,353, and this has been made good by a transfer from special reserve.

It will be convenient here to explain how the special reserve, which stood at the figure of £961,113 on March 31, 1959, has been dealt with in this year's accounts. In order to meet an anticipated shortfall between the clear profit and reasonable return the State Government was asked to approve of an appropriation from this reserve for this purpose. In acceding to this request Government directed that the reserve should be allocated in accordance with the provisions of Clause II (1) of the Sixth Schedule of the Electricity (Supply) Act, 1948. Effect has been given to this decision relating the appropriations required to the reasonable returns of the periods of account concerned, i.e., the calendar years 1949 to 1952. Tariffs and dividends control reserve and consumers' benefit account receive allocations of £349,404 and £349,403, respectively, and a balance of £262,306 remains in the reserve which is available for meeting shortfalls between clear profit and reasonable return.

After providing for the shortfall disclosed in the accounts the reserve stands at £194,953, which amount, together with the tariffs and dividends control reserve, is to be set off against any future shortfalls of clear profit.

The allocation to the consumers' benefit account has been given effect to through the net revenue account as it is an appropriation which is not in the nature of a reserve and is in fact a charge related to the reasonable returns of the accounting periods to which I have made reference.

The allocation for the contingency reserve fund has been made as required by the Act and it is proposed to make the customary contribution to the retiring gratuity fund. Provision has been made for debenture interest and sinking fund charges. In view of the continued expansion of the company's operations it is essential to conserve our finances to meet the consequent capital expenditure. The board, therefore, have deemed it advisable to appropriate a sum of £575,000 to special appropriations for plant expansion and replacements. Dividends on the preference stock amounting to £65,075 have been paid and it is proposed to pay a final dividend of 4 per cent (actual) on the ordinary stock making 7½ per cent (actual) for the year. The net earnings for the year have enabled the Company further to strengthen its internal finances and also permit of an increase in the final dividend on the ordinary stock. The balance left to be carried forward on net revenue account is £108,138.

The balance-sheet shows an improvement in the cash position in the form of treasury bills and deposits with bankers. This accumulation of funds is in part being applied in payment of Indian tax now falling due on settlement of the appeals against which deposits are held with our bankers in Calcutta. Dividend payments are also covered and funds have been made available to meet commitments in respect of plant and other expenditure in the United Kingdom.

Capital Expenditure

Capital expenditure during the year amounted to £1,160,000 and was almost entirely for our transmission and distribution systems. By far the greater part of the expenditure was on mains and service connections. As a provision for capital expenditure during the year and pending at March 31, 1960 (£595,000) there was available the sum set aside for depreciation of £929,000 and the allocation to special appropriations for plant expansion and replacement amounting to £575,000 thus making a total provision of £1,504,000. During the period January 1, 1951, to March 31, 1960, capital expenditure totalled £11,925,000 and the depreciation provisions, together with reserves and special appropriations during that period, amounted to £12,140,000. These figures follow on those given in the 1959 review and demonstrate what has been accomplished during recent years, within the limits permitted by the reasonable return on the capital base, to provide internal finance for the expansion of the Company's undertaking.

The forecast of capital expenditure over the next four years based on the anticipated increase in demand indicates an annual outlay of not less than £1¼ million on our transmission and distribution systems.

In February of this year Sir William Lamond visited Calcutta and was there for a period of three weeks. During his visit he met the chairman of the State Electricity Board and the chairman of the Damodar Valley Corporation to discuss the Company's future power requirements. He also had the pleasure of meeting Dr. Roy, the Chief Minister, and discussed with him questions of interest to the Company. Dr. Roy and the chairmen of the State Board and the Damodar Valley Corporation are fully acquainted with our problems. He also took advantage of the opportunity to meet the leaders of commerce and industry in Calcutta. He found, as usual, that our officers and staff continue to devote great care and attention in promoting the interests of the Company and maintaining efficiency.

I attach importance to the training of young Indian engineers for employment in our Company. Under our technical training scheme, which has been in operation for nearly 14 years, young Indian graduates are chosen by a selection committee in Calcutta for a short period of training in our undertaking. Thereafter they are brought to the United Kingdom for further training and on their return to Calcutta they are taken on to the permanent staff. In addition to this scheme we have a phased programme for bringing to the United Kingdom various members of our permanent staff for further training and for refresher courses. We are grateful to the Electricity Council, the area boards and the various manufacturing companies who provide the facilities.

Power Situation

I should like in this review to include a note of explanation with regard to the future supply of power within the Company's licensed area. In the decade and a half that has elapsed since the end of the War the demand on the system has increased from about

150 MW sent out in 1946 to the present figure of 390 MW. To cater for this growth has entailed constant expansion of the Company's generation, transmission and distribution capacity involving an investment during the period of some £24m. This expansion has proceeded in accordance with a co-ordinated plan of development designed to bring additional plant into commission before the load outstripped the capacity of existing plant and included 110 MW of new generating plant at New Cossipore and 60 MW at Mulajore; in addition certain modifications at our Southern Station increased its capacity. These additions, which added some 180 MW of generating capacity at a cost of over £10 million would, it was anticipated, have sufficed to satisfy the demand in the area until the year 1955-56 by which date our plan of development provided for the construction of yet another station adjacent to our existing Southern Station. The arrangements for the design and construction of this station were in an advanced stage when we were informed by the West Bengal Government that they would prefer us instead of take a bulk supply from the Damodar Valley Corporation which it was then considered would have a surplus of power available for export to Calcutta. The Company were naturally prepared to defer to Government's wishes in this regard and, as stockholders will be aware from my reviews of previous years, an agreement was negotiated with the Damodar Valley Corporation providing for an initial supply of 45 MW to be increased from year to year as might be required on the tendering by the Company of appropriate notice. Supply from the Damodar Valley Corporation was connected in April, 1957, and, although that Corporation has not thus far been able to supply the Company with all the power it has required, we have been able by keeping certain of our older and less economic plant in commission to meet all demands made on us without load shedding. It is anticipated that by the end of this year the Damodar Valley Corporation will have brought into service additional plant which will enable them to increase their supply to the Company to 100 MW.

The Company's understanding of the arrangement with the Damodar Valley Corporation has been that the latter would be responsible for meeting all the Company's requirements of power in excess of that provided by its own capacity and, in fact, at the beginning of last year a supplemental agreement was completed with the Damodar Valley Corporation to govern supplies in excess of 100 MW. The Company has, however, now been advised by the West Bengal Government that it is not their policy that the Company's off-take from the Damodar Valley Corporation shall exceed 100 MW and that its import requirements in excess of that figure will be provided through the agency of the West Bengal State Electricity Board, first from the latter's new station at Durgapur and thereafter from a super-station which they propose to build at Bandel on the west bank of the river above Calcutta. The Company has been given to understand that under this arrangement the State Board will be able to afford it a supply of 40 MW by June, 1963, rising to 60 MW in June, 1964, and that shortly thereafter all the Company's requirements can be met. I need hardly say that the State Board will have the Company's full co-operation in bringing this plan to the earliest possible fruition and in this connection negotiations are already in train for the siting of the necessary supply points & c.

Meantime, the demand on the Company's system continues to grow at a rate of some 7½ per cent per annum compound, and it is feared that some restriction of supply to the public may occur before the State Board's supply is fully available. Should any such restriction become necessary it will, needless to say, be kept to the absolute minimum, and will be done under direction of Government acting under the powers conferred on it by the Indian Electricity Act, 1910.

With regard now to any possible expansion of the Company's own generating capacity, Government's policy, as communicated to the Company some years ago, was that, although the Company would not be permitted to increase its capacity, we should be allowed to replace certain obsolete plant in our Old Cossipore Station by the addition of one further 50 MW set at New Cossipore. It was, however, only this year that we could see our way clear to doing this and, in collaboration with our consultants, a plan was worked out to put in this machine and at the same time keep 30 MW of plant at the Old Station in commission for peak load operation. On putting this plan to Government, however, we have very recently been advised that , having regard to their own plans, they no longer consider this to be necessary and in consequence we have had to abandon this project.

Throughout this Company's long existence our earnest endeavour has always been to make available the necessary supply of power to run the wheels of industry and transport and meet the ever increasing domestic requirements of our area; thus contributing towards the prosperity, comfort and happiness of those who dwell and earn their livelihood in the city of Calcutta, its suburbs and in the industrial areas and municipalities which lie adjacent to the city. We have so far accomplished our aim and have at no time had to restrict supply. Having set out the power position in the light of a growing demand, we will continue to travel hopefully and, within the means at our disposal, do all that is possible for those whom we serve.

Tribute to Staff

I desire to express our thanks to the staff in Calcutta. The growth of the Company's operations and the work entailed in the implementation of the same bears witness to the interest and zeal taken in the Company's affairs by members of the staff and employees. Mr Henderson, our agent in Calcutta, has carried out his responsible duties ably and efficiently. To him and all members of our organization we express our high appreciation of the sound and loyal services rendered during the year. I also wish to record the board's appreciation of the able manner in which Mr Colley has discharged his responsible duties as secretary.

The reports and accounts were adopted.

(The above statement is not a report of the proceedings of the Annual General Meeting referred to.)

Coal: Right Wheel?

THERE is no need to beat about the bush. There has been a dramatic change in the implementation of the Government of India's coal policy, whatever the appearances of consistency claimed by its exponents. It is equally clear that what has taken place is not a conversion with a sudden blinding light to the efficiency of the private sector in matters of production, but a recognition of the failures of the public sector, because it was very ill-equipped in coal to fulfil the large targets which, mistakenly, were imposed on it by the Planning Commission. The current decision which is to recognise that the public sector cannot operate in most of the 'contiguous' areas which belong to the private companies, but which were reserved, looks enlightened only because of past obscurantism. The question is being asked how the Government of India could have entertained so wild an illusion that the public sector, incapable of exploiting its own areas, could undertake economically the exploitation of areas adjacent to private collieries far more effectively placed for expansion. Even if the National Coal Development Corporation had adequate additional resources—both foreign exchange and rupees—to deploy, it would be outrageous to deploy them in areas where the private sector could operate much more cheaply. The waste of the nation's resources cannot be justified merely on the ground that some ideological advantages might be obtained by the creation of an agency not wedded to private profit.

The revision of policy in the direction of giving private sector larger incentives and larger opportunities for operating contiguous areas, hitherto reserved, is all to the good. Whether it provides incentives, without adequate revision of prices, is still in doubt. But at least there is a marked demonstration that the Government of India, under the imperative pressure of facts, is flexible. It is true this flexibility in respect of coal has been displayed very late in the day. It may be assumed, however, that now in a Category A industry, the tenor of public policy is not necessarily to keep expansion predominently in the public sector. If this is so it is not a small victory that good sense has won. And there is some doubt whether it goes beyond coal. Mr K. D. Malaviya, has not yet admitted in the petroleum industry, where no expansion of private sector refineries have been sanctioned, that the private sector can do better than he can. At the present time, in coal, the Government of India has a policy which is ostensibly different from its policy in petroleum. It is time that in petroleum no less than in coal, the principle was accepted that a choice of agency should not be dominated by ideological shibboleths which have brought coal to its present sorry state.

While there is cause for congratulation on the pragmatism shown in the case of coal, it will be foolish to suppose that some deep change in psychology has overtaken the Government. There are too many signs to show that the concession has been extracted by the force of events and not by the power of reason or by the intense pressure of public feeling. It is being increasingly recognised that political forces have decreed the change because the Government of India cannot face the charge that, by denying private operators the opportunity to expand and restricting production, it has in fact kept its own steel blast furnaces idle and injured production in other industries, such as Sindri, which depends on higher grades of coal. The promise—Mr K. D. Malaviya has perhaps made some improper use of it—of discoveries of metallurgical coal has done nothing to alter the hard fact that the Ministry of Fuel is quite incapable of satisfying the country that it has not injured production in more fields than one. The current policy is thus merely a defensive operation of the public sector, bowing to public indignation before all faith in public sectorism disappears.

Because the current policy is not a true change of heart in the Ministry of Fuel, uncertainty continues to prevail in regard to the extent to which private operators are to be allowed specifically to exploit their "contiguous" areas. There has been some ground for the feeling that the Government of India is making the minimum concessions necessary to save its face, and is not primarily concerned with formulating a coal policy which, over a long period, will provide to both the maximum freedom to produce. If this is so, obviously the current revision of policy does not go far enough. It is time for the Prime Minister to make a policy declaration in which the freedom of operation of both sectors is guaranteed, the sole object being the attainment of as much production as possible in the shortest possible time.

Rice Prices: Right About Turn?

THE recent fall in rice prices all over India has been welcomed as a sign of good augury in the last year of the Second Five-Year Plan which might carry over into the Third. And not without reason, for prices since the turn of the current month have registered a level not touched at this time during the past three years. Rice prices started falling gradually in September last in anticipation of a good kharif crop. With the arrival of the new crop in market, the downtrend

gathered momentum in October when the rice prices index fell by 5 points to 109. The next two weeks have witnessed an impressive fall with the index going down further to 105.4. In a short period of six weeks, therefore, the rice prices index has receded by nearly 9 points, a fall not matched by any decline during the same period in the last many years. This should suggest that, apart from the seasonal decline, there has come about this year a secular downtrend in rice prices.

Looking at the picture from another angle also one is inclined to reach a similar conclusion. The amplitude of variations in rice prices during the past four years has been of the order of 21 points. This year so far it has been 13 points. The seasonal fall upto December-end, if the behaviour of prices during the past two years is any indication, should alone bring down the index further by over 8 points. But with the supply position more comfortable than during these two years, owing to an impressive 1.2 million tons stock with the Centre and another 1.2 million tons expected from the United States and Burma under the agreements signed recently, and the prospects for the rabi crop being quite encouraging—these factors alone should make the stockists hesitant to hoard — the fall in rice prices index may be even more. The lowest level of prices is likely to be reached sometime early next year when the rabi crop is marketed.

Howsoever welcome this break in rice prices may be, it cannot be viewed with complacency. The long-term interests of the economy demand that the decline in prices should be gradual while any undue rise in prices should be checked. The latter contingency may not arise for sometime thanks to the comfortable supply position. Attention in the near future has to be directed towards the former eventuality. Any precipitate fall in rice prices this year has to be obviated lest it should upset the current crop pattern, leading to diversion of land next year from foodgrains cultivation to growing of cash crops.

This aim can be achieved in various ways: firstly, through making the movement of the commodity between the surplus and the deficit States freer; secondly, by relaxing curbs on bank credit against rice so that the trade may be able to lift arrivals and stock them; thirdly, by planning a judicious policy of procurement by the State Governments directly. Rice being the staple food of the majority of Indians and the United States being not in a position to authorise any large-scale exports of this commodity under P.L. 480, as is the case with wheat, we have to, in years of poor crops, depend on imports on current account. *The Eastern Economist*, in the circumstances, is of the opinion that the sharp fall in rice prices should be checked by measures which fall in the first and the third categories. While freer movement of the commodity between the surplus and the deficit States would iron out the wide disparities in rice prices prevailing in the different parts of the country, direct procurement by the State Governments would help in building up a valuable buffer stock which can be made use of in periods of scarcity for keeping prices under control. Relaxation of restrictions on bank credit against rice should be resorted to only in case of extreme emergency, which would arise if the price index of the commodity falls to around 92, the lowest level touched during the current Plan period.

With a radical change on the food front brought about by fairly good crops in 1958-59, 1959-60 and during the current agricultural year and impressive wheat imports planned under U.S. Public Law 480, there is also need now to assure the farmer of minimum prices for his produce. The Government will do well to finalise its agricultural products support prices scheme. To successively increase farm output, the scheme can be drawn up on the French pattern which is fixing of three types of prices—"target prices" fixed three to five years in advance, "indicative prices" revising the target prices from year to year in the light of production and consumption trends and "campaign prices" announced before the sowing season.

Debate on the Companies Bill

THE Lok Sabha debate on the Companies (Amendment) Bill, with its enlarged version of amendments at the hands of the Joint Committee could not but be inadequate. Only the major amendments, including a vital one incorporated by the Joint Committee, were taken up in the course of a preliminary three-day discussion. But some other issues also coloured the debate. Mention cannot be omitted of the favourite controversy over company contributions to the funds of political parties. Here at least there was no threat of the use of non-conventional weapons in attack and counter-attack. But there were interesting exchanges.

Mr. Lal Bahadur Shastri has promised a fresh amendment to provide for completion of allotment of shares within three months of the closing of the subscription list in cases where the company floating the capital seeks inclusion in the lists of shares quotations of recognised stock exchanges. This is in response to the grievance, based on recent experience, that inordinate delays occur in the return of money to applicants who fail to get share allotments, especially where the issue is heavily oversubscribed.

Apparently, some M.P.s entertain a grouse that enforcement of the regulatory provision of the Companies Act is not as stringent and deterrent as they would desire it to be. It seems a matter of little consequence to them that the Deparment of Compnay Law Administration has to strike a reasonable balance between firm administration of the law and avoidance of vindictiveness. Their plea was that a statutory body should be especially set up for this purpose. Mr. Lal Bahadur Shastri put in a vigorous and merited defence on behalf of the Department of Company Law Administration and the judicious manner in which it was discharging its complicated but delicate assignment.

Much controversy centred round the novel provision about the special audit of the accounts of certain specified companies. The Joint Committee has incorporated this seemingly inocuous amendment in the Bill. Its scope goes much wider than the ostensible purpose of subjecting unsound companies to a re-audit. It cannot be overlooked that the existing Companies Act contains copious safeguards to protect the interests of minority shareholders against such a contingency. In terms of this new clause, a special auditor is to be appointed in three sets of circumstances — where a company fails to follow sound business principles or practices, where its affairs are conducted in such a manner as may cause serious injury or damage to the trade, industry or business which it operates and when its financial position is likely to endanger its solvency. In the last two contingencies lies the real danger of unwarranted, even if well-meant, intervention by authority.

What criteria are to be applied to determine that these contingencies attract intervention? If in spite of existing statutory provisions and the vigilance of the Department of Company Law Administration, cases of mismanagement prevail, the proper remedy is to encourage organization of shareholders and more well-informed public opinion on company matters. It is likely that the projected amendment may endanger, due to misplaced or misinformed suspicion, the reputation and credit of companies conducted on normal practices. It is a queer provision to permit appointment of the company's auditor as a special auditor for re-audit. Is he expected to display a dual personality — not without the risk of exposing himself to legal risk?

The restriction on inter-corporate investment is another provision with a powerful element of controversy. A ceiling equivalent to 30 per cent of the subscribed capital of the investing company has been imposed for inter-company investment. Not more than 10 per cent of the investment can be made in any one company and not more than 20 per cent investment can be made in companies belonging to the same group of business as the investing company. The underlying purpose of this restriction, which is to prevent acquisition of control of substantial shareholding in another company, is fully secured by the last two provisions. No justification has been made out for the imposition of the ceiling of 30 per cent. The private sector is facing increasing difficulties to find equity finance while its obligations in this respect are bound to grow progressively. The cushion of life funds is diminishing in size. The contemplated ceiling on corporate investment will deprive the private sector of funds which are seeking employment in the absence of actual or potential use in the company's business.

There will be ample time to give detailed consideration to these and other amendments, for instance, principles for the determination of the remuneration of company promoters to which Mr. Shastri made a brief reference in his reply. Will the second reading of the Bill, which should provide opportunities for a detailed discussion, bring some relief?

The Chambal Project

AMIDST colourful ceremonies and great and genuine rejoicings, the Prime Minister inaugurated the Gandhi Sagar Dam and the adjoining power house on Saturday last. Similar scenes accompanied the inauguration of the Kotah Barrage on the following day. This expression of enthusiasm by the people of Rajasthan and Madhya Pradesh at the completion of the first stage of the Chambal Multi-Purpose Project is a witness to their increasing association with the country's silent economic revolution.

The Chambal project, one of the biggest multi-purpose projects taken in hand during the post-independence period, is unique for more reasons than one. In the first instance, the total cost incurred and the foreign exchange consumed in the construction of the project have been, perhaps, the lowest on record so far. This was achieved primarily by skilful utilisation of the available man-power resources in combination with most judicious use of machinery which mostly has to be imported. In particular, the decision to use stone and sand in place of costly concrete brought about additional economies to a significant extent. The credit for such frugal planning and execution goes to Indian engineers who by themselves managed the entire construction work.

Another admirable aspect of this scheme is that it was sponsored by the two adjoining States of Rajasthan and Madhya Pradesh and was executed in an atmosphere of complete co-operation — a phenomenon which is rare where intra-regional interests are concerned. At one stage, when the construction of the reservoir necessitated the transfer of a stretch of Rajasthan territory to Madhya Pradesh, the Rajasthan Government readily agreed to the proposal in a spirit of genuine partnership. The project should create confidence in inter-State co-operation. It stands in sharp contrast to the rancour and misunderstanding witnessed among some other States during the last few years.

The full benefit of the Chambal Project will accrue only when all the three phases are completed. In the first phase now inaugurated, the Gandhi Sagar Dam and the accompanying hydel station with an installed capacity of 80,000 kw have been completed. The planners have been wise in completing in the first phase the major part of the proposed canal system. This technical readjustment of the phased creation of power and irrigation facilities based on different sets of priorities is meant to avoid wastes witnessed in previous big multi-purpose projects. Now irrigation and power facilities will be ready for utilisation as soon as the Project matures through the remaining phases. In the second phase which has now been taken in hand will be completed the Pratap Sagar Dam, some 20 miles down stream of the Gandhi Sagar. Its power house will generate about 90,000 kW of energy. Irrigation facilities for additional 3 lakh acres of land will also be provided in the second phase. In the third and the last phase the Kotah dam and its power house with a generating capacity of 45,000 kW will be constructed.

To arid and industrially backward Rajasthan, the Chambal Project means more than what Bhakra-Nangal means to Punjab or Hirakud to Orissa. The irrigation of 14 lakh acres of now absolutely waste land will provide a high level of secure production. Power facilities will naturally initiate a process of industrialisation which will bring in its wake prosperity to the region. The State Governments are already committed to the supply of the Chambal power to heavy industries like zinc smelter at Udaipur, calcium carbide and nylon plants at Kotah and mechanical and electrical workshops at Jaipur. The availability of power will also provide opportunities for the exploitation of mineral resources of the region which till now remained poorly explored. These industrial undertakings combined with the increased agricultural potential will necessarily result in large income-generation and creation of employment opportunities. The Chambal Project therefore, promises to change some desert tracts into a granary and several backward areas into dynamic industrial pockets.

A DELHI DIARY

THE CONGO MENACE

RISING high above the painful routine, almost drudgery, of Parliament — not excluding the Foreign Affairs debate, the dullest ever — came the adjournment motion on Thursday in respect of the attack on Indian army officers in the Congo. Excitement in Parliament is not nearly as passionate as feeling amongst keen observers elsewhere. What on earth has India let herself in for in the Congo? Have we, as Do-Gooders, over-stepped the mark to the point of injuring not merely our prestige and influence, but maiming our own citizens? These questions are being anxiously asked and the view is being expressed that we have made a major error by trying to be so helpful in settling international affairs elsewhere. It is about time, most people think, that we recognised that neither Mr. Rajeshwar Dayal nor Brigadier Rikhye is safe personally in his present assignment. It is pretty feeble asking the United Nations to guarantee their safety because these are the officers who are supposed to guarantee the safety of almost everybody else — incidentally, the prestige of the United Nations as well. The time, it seems, has come to call a spade a spade!

I cannot remember any occasion on which the Government of India, on international affairs, has looked so helpless as in this case. The long debate on the United Nations' resolution and the performance of our delegation there seemed deliberately designed to avoid the head-on challenge from the People's Republic of China. In fact, when the subject for debate was first put down, it was not Foreign Affairs, but Foreign Affairs with particular reference to the United Nations. It is stated that Mr. V. K. Krishna Menon, the Defence Minister, was responsible for the post-script. I do not know whether this is true, and it does not matter any way because Parliament refused absolutely to be distracted. Acharya Kriplani reflected the feeling of the House when in the middle of the Prime Minister's speech he interjected: "Why not come down to China and Pakistan?" He elaborated this by saying that we should devote more attention to the home front instead of meandering in New York and dwelling on the Congo. This is a true reflection of public opinion and, for the first time, I think the Prime Minister is completely at sea in regard to true opinion in the country. When in an angry interchange with Acharya Kriplani, there were some questions about what opinion in the country was on our China policy, the Prime Minister said he knew the public opinion "better". I am ready to wager a hundred rupees on a bet that a poll would show that China is exercising the minds of many people in Acharya Kriplani's direction, and not in that of the Prime Minister. However, at the present time, the question is not what the people think, but what Parliament did.

THE MEASUREMENT OF BOREDOM

I am constantly reminded of Lord Kelvin's great dictum that we know nothing about a subject unless we can contrive to measure something about, preferably, its hard core. A distinguished statistician has been sitting through the Parliament with a visual apparatus wherewith to measure boredom. He tells me that he has never known a debate in which boredom was statistically as high as in the Foreign Affairs debate this week. His unit of measurement is the "yawn". He added together the number of yawns in one particular speech — that of Mr. Krishna Menon. I am told the figure was sixty-three yawns in an hour — an all-time record! I am sorry to say that the Prime Minister encountered many yawns also, though Mr. Krishna Menon holds the record, as I believe he still holds the record for his marathon performance at the United Nations. But let me pass on to a more entertaining subject.

THE GERMAN FILM FESTIVAL

I spoke last week of the arrival of West Germany in the economic field. This week we have been treated in Delhi to the arrival of West Germany in a massive cultural impact described as the Film Festival. There has been a different picture at the Rivoli each day of the week beginning with 'The Royal Game' in a gala premiere on Tuesday. The Minister of Information, Dr. B. V. Keskar, introduced three of the German filmstars present—two actresses and an actor who appeared in a turban, did an excellent 'Namaste' and one brief salutation in Hindi. Their speeches met with great applause. How do they all speak English so well? Has this been the result of the American impact or the recognition of the new business value of the world's greatest international language? All the films being exhibited have their words spoken in English. One of the great weaknesses of Continental films has thus been removed.

It is doubtful whether a better opening film could have been chosen to show the liberal trend in German culture than "The Royal Game." It is the story of an Austrian lawyer, Dr. Werner Von Basil—had he a real counterpart? — fighting the Nazis in occupation of Austria. The hero's part is splendidly played by Curd Jurgens. He is driven half insane by isolation in the Hotel Metropol, but manages to retain a portion of his sanity by imaginary chess games which he has never previously played. By the manner in which the German occupation is derided in a German film, shows how deliberately West Germany is putting Nazism in its lowly historical place. Apart from the splendid acting of the entire cast in this film, one had the feeling that choice of the film was happy in that it showed Germany willing to admit one of her major errors, still inscribed deep in living memory. Perhaps we in India will learn also to show ourselves as we are or were. We are too anxious to show India only at its best. One hopes, with Dr. William Melchers, the German Ambassador, "that the German Film Weeks in India shall, in their turn, contribute to enliven collaboration in the field of film-making, promote an exchange of films between our respective countries and help in bringing about a fruitful exchange of ideas between the peoples of India and Germany."

GENTLEMEN: THE QUEEN
