Strange Ushers

THE New Year's eve festivities one witnesses in Bombay, Calcutta and other cities are not really a very cheering sight except for the more ardent of the merry-makers. It is not so much the *ersatz* quality about it which is depressing, though the decorated Christmas trees and the cotton wool snow in some of the restaurants and shop-windows may look a little out of place. But the dacron suits, terylene shirts, paper caps, confetti, and the deathly pale lipstick, the latest fashion all over the 'free' world, on the faces of Indian women—fashions travel fast and easily, across the foreign exchange barrier—these one comes to accept like the Spanish or Mexican bandits' garments affected by Indian film-stars, or the twist, or the jazz discs which have invaded our more expensive eating places. There are, of course, some local variations. More of *salwar-kamiz*, styled a tighter fit than the tightest of ski-slacks, more variations in men's dresses and a sprinkling of sherwanis in the North, more of dacron suits in Bombay than woollens, but the same pin-pointed Italian style shoes, gaudy bush-shirts or jerkins. Added zest is imported into the merry-making by prohibition in Bombay, which is never failed to be noticed by the habitues of wet Calcutta's night haunts. What is faintly depressing about all this is the image one gets from it of the New India in the making. What does it reflect of the pattern of society that we are building up?

Not that a socialist society has always to be grim and austere. There are times when men and women should allow themselves respite from the monotony of the days' routine. There is renewal of life in such moments of gay abandon, but the renewal of what sort of life?

Such reflections are unfortunately forced upon one by the hangover from the old year—the spate of learned conferences in which the thought-leaders of the country deliver their orations, and which bring together some of our best minds and the young hopefuls of the coming generation. Of the many conferences the ones that obtrude are those of agricultural economists which met in Vallabh Vidyanagar and the Economic Conference as also the Conference of Labour Economics which met in Baroda. Asoka Mehta delivering the presidential address at the Agricultural Economics Conference chose as his theme 'Agricultural Revolution'. Professor V K R V Rao, who presided over the Labour Economics Conference, took up the 'Role of Industrial Labour in a Socialist Economy' as the subject of his address. The President of the Economics Conference, Dr Lakdawala, however, confined himself modestly to "Aspects of Trade Policy". Even in this limited sphere he had some caustic observations to make on the poor results of import substitution which has been one of the key-notes of our industrial policy. In food, agricultural products and producers goods, our imports had increased more than domestic production over the years 1953-61 and import substitution had played a negative role in the increase in manufacturing output (excluding metal products and other capital goods) which could be entirely attributed to the increases in domestic demand. These may be matters of great import to the economy, but they would not capture public imagination. What would, of course, were the prospects of an agricultural revolution. Asoka Mehta for the first time in his life perhaps spoke in the vein of a technician admini-

strator for a change, as if agricultural revolution was only a matter of the appropriate inputs in adequate quantities, and that all that needed to be done was to make the results of scientific research available at every nook and corner of the countryside by an administrative machinery which was equal to the task. "The real problem is to translate technological feasibility into an administrative certainty". Who says that agriculture cannot be administered? It is all a matter of technical expertise and administration. Of course, it would also call for "reorientation of the human factor in agriculture" but that could be done through continuous education, administration and training as well as through the provision of essential inputs and services to the farmers". Nothing very exciting in all this to bring cheer in the New Year.

Professor Rao, however, is still for hitching his wagon to the stars. Industrial peace is not enough. That even capitalist societies have. But for the construction of a socialist society, the industrial worker has to play a more positive and a more purposive role. He must have the sense of partnership and participation in the process of industrial development, and must not remain only a wage-earner. This has been achieved through the abolition of private ownership of industry in some countries. But Professor Rao suggests a short-cut to making the worker a co-partner. This is the result of a little arithmetical exercise in the proportion which provident funds would form of the industrial capital in the country. To that extent, the worker can be made a shareholder in industry. But for workers' participation in management, there is a snag. The worker has first to acquire skills in management, and how is he going to do it when in the leading sectors of organised industry, more than 72 per cent of the workers are illiterate and the Board of Workers' Education, which does not even concern itself with literacy but only training in trade unionism, does not take care of more than 5 per cent of the industrial working class. A depressing thought, carried over from the Old Year on the top of food shortage and all that, made more poignant by Dr Rao's warning that wage increases must not absorb all the increase in productivity achieved by the worker, for a margin must be left for capital formation, for growth...

True, it is not every day that life is illuminated by a vision nor can people be perpetually made to respond to the call of this or that, whatever may be considered worthwhile at the moment. But the New Year's day is a beginning, a moment in time which is for looking forward.

1648 21

Tax Support for New Issues

ALTHOUGH professedly intended to revive the capital market and to restore confidence climate in the country, the tax concessions announced in Parliament last week actually form a mixed bag. A subsidy is offered in the form of tax credit certificates to individuals taking up new issues; there is a small reduction in the rate of income-tax to be charged on individual holders of Government securities; and, third, non-residents maintaining deposit accounts with Indian banks will be exempt from Indian taxation on the interest earned on their deposits. The last is a move to attract foreign exchange deposits, while the other two make investments in new issues and Government securities a little more attractive to the individual investor.

All the three, however, have one feature in common, viz, the deliberate play on interest differentials to influence the flow of investments into desired or preferred channels. This is technically an interesting innovation and deserves both serious attention and commendation. The possibility of influencing the pattern of interest rates so as to vary the attractiveness of investment in different sectors of the economy is a field worth wider exploration.

The exemption from Indian income-tax of the interest earned by non-residents on the deposits maintained by them in Indian banks has been long overdue and is welcome. If the repatriation of these funds together with interest is really allowed freely, it may attract sizeable foreign exchange deposits to India. But is the Finance Minister really sure that the withdrawal of these funds is free and untrammelled by dilatory official procedures? Neither the banks handling them nor non-residents maintaining such accounts will agree. Prior approval has to be obtained from the Reserve Bank for any transfer from non-resident accounts. The applications have to go to the Reserve Bank and they lie waiting for days. No one knows what rules and restrictions apply to them. These are contained in a couple of volumes of Directions to Reserve Bank officials which are secret and are not available even to the banks which handle these accounts. To repeat, if non-residents are allowed to operate their accounts freely, sizeable deposits from them can be confidently expected. Needless to say, even if such deposits increase sizeably, their influence on the volume of remittances to India from Indians abroad would only be marginal.

The promise extracted from Lal Bahadur Shastri by the Federation of British Industries in London that Delhi will try to revive the capital market in India and which was repeated by him subsequently at the annual meeting of the Associated Chambers of Commerce in Calcutta, is now going to be redeemed. This is how the Stock Exchanges have interpreted the tax concessions to investments in new issues announced by the Finance Minister in Parliament last week. The concession will apply to new issues of public limited companies in industries specified in the first schedule to the Industries (Development and Regulation) Act 1951 and in other industries as may be notified by the Central Government from time to time, provided that the ordinary equity capital of the company issued for subscription is not less than Rs 20 lakhs and that the ordinary equity capital is issued for the first time after December 23, 1964.

The concession is to be given in the form of tax credit certificates spread over 4 years at 5 per cent for investment up to Rs 15,000, at 3 per cent for the next Rs 10,000 and 2 per cent for the balance, with a ceiling of Rs 35,000 of investment by an individual during a given year. The tax credit certificates may be used to pay income tax and they will be negotiable for non-investors whose tax liability is small or nil, but only after 12 months from the date of their issue. The amount covered by the tax certificates will be treated as an actual receipt and not added back to income for purposes of taxation. The concession however would be available so long as investors hold on to the new issues for 4 years; if the new issues are transferred or sold, it will no longer be available.

The other concession goes in the opposite direction, insofar as it makes Government securities slightly more attractive for individual investors in that interest on them will no longer pay unearned income surcharge. It will however be liable to surcharge as on earned income.

The Finance Minister has been guided by the assumption that "the investment climate is not there", that while arrangements for loan finance are fairly adequate, there is a lacuna in respect of individual investment in equities and it is this particular area of the capital market that he wants to stimulate. Now, the capital market is so complex and so delicately interlinked, that reviving it would normally mean toning up investment activity in general. When the share market becomes more than ordinarily active and the inflow of investment funds tends to lift share values well above the level at which yields on shares cease to be attractive, there is an overflow of these funds into the new issues. It is this sort of investment climate which is favourable for new floatations.

Today the situation is just the opposite. Profitability of industry has not gone down. On the contrary, it is definitely better compared to what it was in the immediate past and profits as a percentage of the net worth of companies range from 10 to 12. Dividends are also better, but the index of share prices has been dropping with the result that the yield earned on investments at current levels is pretty high—it is higher than what it has been in the past and much higher than yields on the stock exchanges abroad. The new issues floated in the past 2 to 3 years however are in the dumps and are currently quoted at an average discount of 25 per cent or so.

The Finance Minister has not given any analysis of the capital market nor enunciated the hypothesis on which he is acting on the present occasion. All that one says is that "it is generally felt—and this feeling is to a large extent true—that the investment climate if he not there." By investment climate if he means the scope for floating new issues, one would still be puzzled. On the basis of what sort of facts is he acting? It is true new floatations continuously rose from year to year from 1958 to 1963, and declined in 1963, for the first time in four years. But far from being a very bad year for new issues, 1964 had an unprecedented record of new capital issues! Perhaps, as implied by the Finance Minister, the unfavourable state of the capital market has to be judged from the large stock of new issues that underwriters have been left with. The new concessions, however, will not help the underwriters to lighten their burden.

Again, what is the behaviour pattern of new investors that the tax concessions assume? Those who go in for new issues which are professedly risk capital, do they do so primarily to hold on to their investments, or is the primary motive one of capital gain? It is true in recent years the capital gains tax has perhaps influenced investors of new issues to hold on longer to their investments than they would do normally. But to the extent that capital appreciation is the major incentive, will not the present concession fall somewhat flat on subscribers to new issues since it will not be available in the event of sale or transfer?

Revival of the capital market, however, is a much wider issue and the case for it, as it is usually presented, is by no means obvious. Even in the loose sort of planning that we have, the basic desideratum is the creation or generation of a certain volume of saving and its allocation between the public and private sectors at pre-determined proportions. If the maintenance of a proper investment climate in the stock exchanges requires the flow of savings to them at a higher rate than is required under the Plan, the case for it cannot be taken for granted as the Finance Minister seems to have done. On the contrary, such statistics as are readily available would seem to suggest that investments allotted to the private sector in the Third Five Year Plan were realised even by the third year of the Plan. How much the Plan figures have to be inflated because of the subsequent rise of prices and how the resulting magnitudes would look like, whether they tend to strike a balance or not—none of these questions the Finance Minister chose to answer on the present occasion. Without answers to some of these questions, to talk of "investment climate not being there" is not very illuminating.

Why are not adequate investible funds flowing into the stock exchanges? The explanation may be that the volume of these funds has declined—this is behind the argument for the reduction of taxes and implicit in it is the demand for the reallocation of resources between the private and public sectors and an inter-sectoral balance different from that in the Plan. Or, the volume of investible funds may still be adequate but they may find more remunerative lodgment elsewhere—in stocks of commodities, in urban real estate or in other uses. The flow could be directed to the stock exchange if the more attractive forms of investments could be curbed by appropriate action. Which course in the present situation would prove more effective, however, is a matter of judgment. It is the more attractive fields of investments in commodities or real estate—with 'on' prices—which are the more glaring at the moment and at this end also vigorous action is clearly indicated.

Weekly Notes

Dialogue?

AT the annual general meeting of the Associated Chambers of Commerce and Industry last month Prime Minister Shastri was at his non-combative best. All of the ACCI's expected criticisms of economic policy failed to provoke him to spirited response. A few of the criticisms he conceded, a few others he parried ever so gently, but the majority he avoided altogether. This may have contributed to a general feeling of goodwill, but it hardly made this particular instance of "dialogue between Government and industry"—the great value of which Shastri emphasised towards the end of his speech —particularly fruitful.

Focussing on the sharp rise in prices, the President of the ACCI traced the malaise to the diversion of Government expenditure to non-productive projects, mainly defence, failure of foodgrains production to expand as planned and shortages of power, imports and so on which had slowed down the rate of industrial advance. These were the basic causes, but there was a secondary phase of inflation which the country was in the danger of entering and which was caused by the fear of rising prices among the consumers of all sorts which led to stock-piling, unnecessary shortages, breakdown of the movement of goods and panic.

The solution was two-fold : to reduce "non-productive" expenditure by the Government and to raise industrial and agricultural output. Increasing production meant, within the framework of the ACCI President's thinking, larger incentives for the private sector. In agriculture it called for less haste with the imposition of ceilings on land holdings; in industry for a whole host of concessions to the industrialist ranging from lower taxes, less insistence by the Government on reasonable wages for industrial labour and turning a blind eye to monopoly and the managing agency system. If these requirements were conceded, the enlightened self-interest of the agriculturist and the industrialist would no doubt do the trick.

And how much was the Government prepared to concede? To this question there was no answer. The scale of operation, Shastri granted, does have a bearing on agricultural production, but at the same time, ceilings were necessary for reducing disparities. And the Bonus Commission and the Monopolies Commission, which he most interestingly clubbed together, were unpleasant necessities because of the lack of a sense of social responsibility in industry. If industry showed a proper sense of responsibility "nothing would make the Government happier" than to concentrate on measures to help industry. All that remained was to close with the peroration that "there are very few problems which cannot be resolved by frank and constructive dialogue, between Government and industry, between management and labour and between producers and consumers" !

Sugar Agreement

Our London Correspondent writes :

THE Commonwealth Sugar Agreement has been extended for a further year and will now run to the end of 1972. Also, two new members have been admitted—India and Rhodesia. On December 18 the instrument of accession was signed on behalf of India and she will now be able to sell 25,000 tons at the negotiated prices for Commonwealth suppliers to the U K Sugar Board. In addition, in the Commonwealth preferential markets of the U K and Canada, India will now have an overall quota of 1,25,000 tons. The Indian Sugar Mills Association has taken the responsibility of arranging necessary supplies.

Nearly 90 per cent of U K's sugar imports come from the Commonwealth. The Sugar Board in Britain buys sugar at the Commonwealth price and sells at the world price. One of the most interesting features of the latest Commonwealth Sugar Agreement is that it takes into account the difficulties caused to the less developed countries by the seriously depressed prices of sugar which are likely to continue throughout 1965. Many of them send over 50 per cent of their sugar to the U K and at a time of falling world prices for sugar, the new arrangement under which they will be paid a special price higher than the basic price will help these countries a great deal. Thus, the only Commonwealth country to be paid the basic price will be Australia (which is not a developing country and is a relatively low-cost producer). Australia ships just one-seventh of her crop to the U K and will receive £42 a ton f o b, compared with around £46 10s in 1964, and approximately £46 11s 6d to be paid to the less developed members of the Commonwealth.

Gaps in Housing

ADDRESSING the Conference of State Housing Ministers in Chandigarh on Tuesday, the Union Minister for Works and Housing, Mehr Chand Khanna, noted with satisfaction that among his audience was M S Thacker, Member in charge of housing in the Planning Commission. The Minister took this as proof of the latter's interest in housing and his support for "a sizeable allocation of national resources for housing in the Fourth Plan". However, neither this remark of his, nor one later on in his speech that in the past housing had been regarded as 'non-productive' and had therefore been given a low place in the scheme of priorities, could have been intended by the Minister to be taken to mean that allocation of insufficient finances in the Plans was responsible for the dismal progress of government-sponsored housing schemes.

That the progress of housing has indeed been dismal is obvious enough; and on present indications the prospects are hardly any better. A recent official press release, pointing out that in urban areas alone the shortage of housing expressed as a percentage of the need was about 35 per cent during the decade 1951-61, estimates that even if shortage is to be maintained at this very high rate, it will require the construction of about 17.5 million urban houses, plus another 1.5 million for replacement, or a total of 19 million urban houses from 1961 to 1976. What are the prospects of so many houses being built during the fifteen years? Says the official press note: "It is very unlikely that even under the most favourable circumstances, the investment of funds in housing during the Third, Fourth and Fifth Plans will produce even a fraction of the 19 million dwellings in the urban areas if the Third Plan which envisages the construction of only 1.5 million dwellings is to serve as an indicator."

Compared to the minimum target of 19 million urban houses for the fifteen year period, 1.5 million houses in the Third Plan is indeed a flea-bite, but even this limited task is likely to remain incomplete at the end of the Plan. Here the statistics of expenditure on government-sponsored housing programmes are certainly interesting. According to the Housing Minister's estimates, only 60 per cent of the allocation for housing in the States sector is likely to be utilised in the Third Plan. Taking the Union territories, where performance has been much better, only 80 per cent of the Plan allocation for housing will be spent.

There is an interesting contrast, however. While the States' expenditure on housing lags behind Plan allocation, the utilisation of funds provided to the States by the Life Insurance Corporation for housing has been quite satisfactory. Out of Rs 60 crores earmarked by the LIC for housing in the Third Plan, Rs 45 crores have been drawn by the States in the first four years and the remaining Rs 15 crores are expected to be spent in the final year. In fact, it is known, the States have been pressing the LIC for more funds. The explanation, no doubt, is that funds from the LIC do not form part of the State plans and are given to the State Governments outside the ceilings fixed by the Planning Commission for their annual plans and are available to be used only for housing. Plan funds for housing are, however, available, to be diverted to other uses and this is just what the States have been doing.

This problem of diversion of funds intended for housing to other uses by the States was one of the principal themes of the Union Housing Minister's address to the State Ministers' Conference. In fact, he had as many as three alternative proposals for curbing such diversion. The first of these envisages the transfer of Plan funds earmarked for housing from the States to the Central sector "in order to avoid the pressure of other competing demands in the States". Under the second proposal, these funds would be entrusted to a Central Housing Board which would in turn disburse them to the State Housing Boards according to their requirements. The third proposal is that the Planning Commission should insist on the State Governments providing each year funds for housing in proportion to their overall Plan outlay and utilising these funds only for housing. All thsee proposals are bound to meet with the resistance of the States who have hitherto preferred to keep the administrative arrangements for executing their housing programmes rather amorphous, a number of them still fighting shy of constituting formal housing boards.

It is, of course, in the bigger cities that the failure of housing programmes is most acutely obvious. Master plans have yet to be prepared for many cities and even such plans as have been drawn up remain very much on paper. Surprisingly, this did not find even a mention in the Housing Minister's speech. The Minister's solution to the problem of sky-rocketting prices of land in and near the big cities—the creation of a revolving fund for bulk acquisition and development of land required for housing—takes little note of the factors behind the rise in land prices. Any comprehensive scheme of urban development has to begin by freezing land prices. One, however, hesitates before recommending such a step since it is a fact that the sharp rise in land values have attracted large amounts of private investment into real estate and construction. As a result, private construction has made an important contribution to the provision of residential accommodation in the cities. Unless the State Governments can, and are willing to, shoulder the responsibility adequately, little good can come out of any action which will cause private investment to taper off.

Left Communists in Jail

ASKED for the reason for the mass arrests of left-wing communist leaders all over the country, which began on Wednesday and are continuing at the time of going to press, Home Minister Nanda is reported to have expressed surprise that this question should have been put to him at all. No doubt he was right. The official explanation for the arrests was predictable and should have been taken for granted. Nevertheless, by timing the arrests within days of the adjournment of Parliament, the Government has laid itself open to the charge that it had sought to avoid having to explain its action in Parliament. The criticism is not answered by the somewhat unusual procedure adopted by the Home Minister of inviting a small group—only four MPs went along in fact—of "non-communist" Members to explain the circumstances which had led the Government to make the arrests.

The proximity of the mid-term elections in Kerala, one of the States where the left communists are at their strongest, also lends significance to the timing of the arrests. Nanda has denied that narrow considerations of party advantage in the elections had anything to do with the arrests. This may be the truth. Yet the elections in Kerala may have influenced the Government's decision. It is known that after the all-India Congress at Calcutta in October-November last year, the left communists were just getting down to the task of consolidating their organisational structure and expanding their mass base. In this task a creditable performance in the Kerala elections would have helped very considerably and must have been part of the party's calculations. The arrests of almost all prominent leaders must naturally upset these calculations. Whether the Government will find it necessary to take other steps to incapacitate the left communists further in the Kerala elections remains to be seen.

It is unlikely, however, that the Government would be anxious to remove the left communists completely from the political scene. When the question of banning the party was raised by the MPs who met him on Thursday, the Home Minister is reported to have remained non-committal. Apart from the undoubted strength of the left communists' following in some of the States, the Congress party has much to gain from keeping the communists in the country permanently divided and fighting among themselves.

Meanwhile, the Government may not be able to avoid giving a fuller explanation of the mass arrests and making public some of the evidence of subversive activities by the arrested leaders which it has claimed is in its possession. However, a pointer to the type of evidence that may be produced is already available in Nanda's statement that the arrests of the left communists had not been precipitated by any special development and what threatened the security of the State was their 'line of thinking' and their 'attitude'.

Japan's New Posture

FOR the past decade Japan's foreign policy has been characterized by what can be frankly called timidity. The new Prime Minister, Sato, has given notice that he is out to change this policy and expand Japanese economic and political influence in Asia. Sato, more a product of the "economic miracle" of the Fifties than of the guilt-ridden period directly following the War, can be expected to pursue more aggressive policies in a number of areas. Now that Japan's financial problems of indemnity to various Asian nations for war damage have, at long last, been settled, a major diplomatic difficulty has been solved. Although still limited by its constitution from large scale military forces, the Japanese "self-

defence" forces are no longer an insignificant factor.

Sato has also given notice that Japan will no longer implicitly follow American foreign policy as she has done since 1945. Particularly in its relation with Asian nations, Japan will attempt to pursue a more independent policy, thereby making her influence felt more strongly. Two economic factors are of overriding importance to the Japanese, however, which may make their independent road somewhat more difficult. The United States is the largest market for Japanese goods, from handmade toys to hydro-electric generators, and American economic influence cannot be discounted. Japan's need to import practically all her raw materials and her dependence on exports for economic survival may also limit her political maneuvering.

Japan's unnatural and strained relationship with China also is a source of political and economic problems. Due primarily to American pressure, Japan does not have diplomatic relations with China and its trade has limited to a trickle. Traditionally Japan's largest customer, China has been cut off from Japanese goods since the advent of the Communist government. The entire Japanese left, plus a substantial segment of the conservative business community (which is hungry for the rich Chinese market), have been clamouring for a more liberal policy toward China. Sato, however, has already indicated that he will limit even the few contacts which now exist between China and Japan.

Japan is trying hard to improve its "image" in Asia. Its recent exhibition of machinery in Bombay was an impressive display of industrial strength. The announcement of a Japanese "Peace Corps" and a greatly increased programme of foreign aid will help Japan in Asia. Japan, as the most industrially advanced nation in Asia, should naturally have an important voice in Asian affairs. Yet, her representatives at the United Nations have been totally silent on every issue except nuclear weapons, which Japan is naturally very much opposed to. Japan's subservience to the United States in foreign policy and her recognition of the Taiwan regime have not been helpful in gaining for her an independent foreign policy.

The new government, however, has indicated that much of Japan's past passivity in the international sphere will disappear. The diplomatic and economic offensive has already begun, and Asia can watch with interest as Japan again takes her place as a leading power.

Letter to Editor

Crisis of Leadership

THE resilience and vitality displayed by the Chinese economy — in recent months after the earlier downturn, is indeed something that needs careful analysis. A comparison has to be made if we are not to be left behind in the race. An opinion is expressed in this letter which it is hoped may stimulate a discussion.

The difference in performance of traditional societies of India and China appear to stem from the difference in the political power structures of the two countries. Rapid socio-economic change requires, besides capital investment, a comparably rapid change in social values, habits, attitudes and mores of the bulk of the population. This change appears to be the most difficult aspect of the process of growth and the resistance to it proportional to its degree of incompatibility with tradition and the pace at which it is sought to be introduced. These stresses, when combined with the resentment against restraints on consumption an underdeveloped economy has to adopt for its requirements of capital formation, constitutes the most formidable force against growth.

A political democracy such as we have in India has its roots and sources of political power embeded inside the broad matrix of a deeply traditional and static society. The body-politic of the ruling party with the active co-operation of constructive elements outside itself should provide the main impulse for social change and the impulse has to be strongest and applied most effectively by the lowest stratum of political power. It is at this level and this level alone that significant results are possible. The heat generated as a reaction to such an impulse soon threatens to burn out the very roots of power supported by it and it is therefore the strength of the political power, its faith in national objectives and courage in implementing its decisions that can ensure rapid transition without recourse to totalitarianism and all its ugly ramifications.

This strength and this leadership is strongly conspicuous by its total absence in our country. The well springs of ideology dry up before having travelled very far down into the desert sands of power politics. A political structure such as would be required to translate broad objectives into action at the lowest level, just does not exist today. The nature of the power struggle at the vital base of political power is such that it precludes the entrance of just the type of men needed to implement policies conducive to rapid change. The political leadership, sheltering under the glib talk of democracy, avoids unpleasant or unpopular decision and actions, which may topple the wobbly pyramid of political power on which they themselves are precariously perched. This lack of inherent strength and conviction in national objectives and loyalty to nothing but the stability of the power pyramid, results in what we see all around us today. Stop-gap solutions, evasion, hedging, smoke screens of verbiage, the chase of the shadow for substance, the striving for an image or a front instead of concrete accomplishment, all this and more to the nauseating accompaniment of an unending torrent of meaningless cliche-ridden platitudinous oratory. These are symptoms of nothing but total political impotence.

Is this a malaise that would by the very nature of the situation, plague every traditional society in its hurry to modernise in a democratic manner? If the answer is yes, would it be more prudent to opt for slower rates of growth in preference to the harshness of totalitarian methods? If slower rates of growth are to be accepted would we have the courage to restrict drastically our rates of population growth to prevent the situation deteriorating further? We do not know the answers.

In the meantime, we are content to drift and wishfully try to believe in the truth of our variant of Marxist dogma that causative factors of pure economics provide in entirety the dynamics for socio-economic transition. We fondly wish to believe that all we need is a little tightening of the belt and brisker workmanship with the begging bowl to step up rates of capital investments, and that this alone would ensure for us the rates of growth, crystal gazing economists project, for attainment of a take-off within the next decade.

However, our past experience with regard to poor rates of growth, below those projected earlier, the higher capital/output ratios, failure in agriculture, inflation, unemployment, distorted income distribution and a comparison with the growing Chinese economy force us to pause and wonder whether we are not seriously wrong somewhere in our understanding of the structure, outline and time-scales of socio-economic progress.

Capital View

Peripheralism

Romesh Thapar

NOTHING is happening, literally nothing. Yes, Gulzarilal Nanda is drafting a so-called resolution on economic policy for the Durgapur Session of the Congress Party, and Swaran Singh is drafting one on foreign policy. Meanwhile, Sanjeeva Reddy and his bureaucratic team handling steel continue deliberately to mislead the country about their betrayal on the designing and engineering of Bokaro. TTK delivers his homilies on the prevailing crisis, always directing his barbs against his 'enemies' in the Cabinet and the party. But these activities are no longer news. The same kind of noises are to be made in 1965. The same kind of apathy is to prevail. And if one is inclined to be impatient, a reference to recent by-election results has a salutary effect; the Congress continues to win.

Intellectuals No Better

Of course, intellectuals can argue that the voting pattern is no pointer to the state of the country. The voter is illiterate. Accustomed to the rule of kings and emperors, and the patient wait for a successor with the semblance of a leader, the illiterate of India keep voting the Congress family to power hoping that it will throw up sons like Gandhi and Nehru. The truth remains that no real alternative to the Congress Party has formed. Why blame the so-called illiterates when the literates are no different although they presumably have the capacity to be.

Nothing stirs the interest of the people. We appear to be able to carry on because over the years we have learned to handle small jobs, small decisions. We seem to be living on this expertise at the moment. Certainly, vitally important files are not moving in the Secretariat. Holidays pile up one on top of the other, paralysing one or the other arm of the GOI. The coffee-drinkers, who boycotted the old coffee house during the price resistance move, jam the new quarters allotted to them by the GOI and succeed in running the most disorganised joint in town. And the shops are full of customers, prices notwithstanding.

When we do act, it is in aid of some rather pointless projects. For example, you would think that the Municipal Corporation of this city had plenty to do what with continuing water contamination, electricity breakdowns, deteriorating roads, slummy development and cold wave deaths. On the contrary, our corporators have turned their attention to the names of roads, streets, markets and colonies—not to naming the hundreds which are unnamed and cause endless confusion, but to changing those of the ones which have names! The Ministry of Works and Housing has joined this pleasant pastime.

Here is a sampling of their foolishness. Jehangir Road and Nurjahan Road are to be renamed after some 'historical persons'. Hauz Khas is to change to Raghubir Nagar, Mori Gate to Nehru Gate, Fountain to Bhai Mati Das Chowk, Esplanade Road to Sehdav Malhotra Marg, Dufferin Bridge to Dr Mukerji Pul and Alipur Road to Dr B R Ambedkar Marg. Streets once named after the professions of the people living in them—Basti Bagrian Bazar, Sang Tarashan, Gali Rui, Gali Matkewali, Gali Kababian, Gali Sakkawali and Gali Kumarahan—are to be named after our Saints and revolutionaries. So it goes—Shankar Road to Buddha Marg, Old Rohtak Road to Bhagat Singh Marg, New Pusa Road to Mahatma Gandhi Road, Hamilton Road to Vivekananda Road and Kingsway Road to Lajpat Rai Marg. Even Indraprastha Marg may be renamed again with something inspired by the central revenue buildings! By the time the capital has been given this new look, we will be well on the way to loosing our bearings.

Disorganisation All Round

Peripheral involvements consume our time and energy. The bomb-makers and those who are opposed to them, even as they mouth their slogans, doggedly refuse to subject their theorising to economic, political and military tests or to search out those who have the know-how to provide the answers to our peculiar problems. The protagonists of Hindi thrill to the idea that their favourite language will now adorn government files, but they are as dull as before about what needs to be done at many levels to make the language alive and effective. Socialists of various hues, demanding that the country's capacity for independent economic development be strengthened, hail the Bokaro agreement with the Soviet Union, but fail to fight the loaded 'turn-key' principle embodied in it which, ironically, opens the doors to massive western private capital penetration into the economy and deals a death-blow to our independent designing and engineering of industrial projects. We are content with fairly expert paper work on plans and perspectives, on targetology, but no one moves to clear the obstacles to implementation.

This peripheralism could be ended by a leadership or a party with a sense of direction. But Cabinet meetings, from all accounts, are a bedlam. Parliament, too, finds it hard to maintain a quorum. And the Congress party seems to have become a plaything in the hands of *dadas* and the like. Yes, the bureaucracy, civil and military, maintains some degree of cohesion, but only to project its own very selfish and retrogressive interests which are in conflict with the declared objectives of national policy. Opposition groups, which could have disciplined the ruling party, are themselves in disarray. Witness the Socialists and Communists, or the Swantantras and Jan Sanghis, unable to mount a single campaign of consequence in a period of crisis.

The Dangers

The dangers inherent in this kind of *apparently normal* situation are to be seen not only in the more obvious confusions in our national and foreign policies, but in developments like the Nepal King's decision to address an RSS rally in India, in the Army Chief's involvement in the recent TELCO strike, in our acceptance of Michael Scott's so-called pacification role among the Nagas, in our ambivalent attitudes to the mischief-making of Abdullah and Bakshi in Kashmir, in our surrender to the demand that retired I C S and military officers be handed critical jobs for which they are most unsuited and in our willingness to keep superannuated politicians in harness. These are only a few examples of the practices which help spread demoralisation and are now breaking even the optimism of the incurably optimistic.

I said earlier that nothing is happening in the Capital. This is an exaggeration. Peripheral activity notwithstand-

ing, I find that those who would like to see a drastic change in the present set-up are becoming more vocal. In fact, speculation is fairly widespread about whether Shastri will be able to carry on for long with the team he has assembled. Many who supported him at the time of his rise to prime ministership are now wondering what persuaded them. The truth is that Shastri is safe so long as a viable alternative does not present itself. And nobody has so far been able to spot this alternative.

Threat to Shastri

But it would be shortsighted to assume that a leaderless country can continue to indulge in peripheralism at a time when the economic situation is certainly out of hand. Shastri must either change radically the composition of his government or risk his own continuance. The consensus which brought him to power exists, as I have said, only in the absence of an alternative—and this is unhealthy, to say the least. A new and more dynamic consensus has to be sought if we are to move forward. Will Shastri do the finding or be content to be thrown aside.

The discussions at Durgapur might yet provide us with pertinent evidence of the mood of the ruling party, although there seems not a ripple on the surface at present. Could it be that the rot has gone so deep that only a series of upheavals can shake the party out of its stupor? Many subscribe to this view, but qualify it with the theory that the people of India are tolerant and patient, that much time will elapse before anything resembling an upheaval occurs. That there *is* such speculation underlines the gravity of the political paralysis.

Needless to say, this state of affairs is likely to be seized upon by those influential and interlocked financial interests within this country and without who imagine that India has only to open her doors to private entrepreneurship to usher in an era of plenty. Our own TTK, although he plays the radical on controlled food distribution to make Subramaniam sound tame, has encouraged this kind of thinking among his political colleagues and those bureaucrats through whom he operates. Indeed, the systematic popularisation of 'turn-key' arrangements with foreign collaborators, beginning with Soviet-aided Bokaro and the western-backed fifth steel plant, prepares the way for the entry of foreign capital. Report already has it that US experts in Delhi are hawking the idea of a 40:40:20 equity holding formula; equal shares to be held by our government and the foreign investor (whether private or public) and (the fly in the ointment!) a crucial minority holding to be reserved for the private investor in India (who is expected to 'play ball' because these shares are to be quoted on foreign stock markets!). The technique of divide and rule is being given a new look.

Time to Speak Out

You would think that there are enough people at ministerial and bureaucratic level in the Government of India to see these moves for what they are, but such an assessment would be wide off the mark. Peripheralism breeds precisely the opportunist pragmatism which is used theoretically to justify compacts of this sort. Those who oppose are dismissed as 'wooden', as 'dogmatists' — as if the experience of other nations has no relevance to us, very special creatures. The critics are on the defensive. Strange, for this is the time to speak out.

Yes, there is little doubt now that 1965 will become significant only if the younger elements in our political parties mobilise to break the hold of the aged, exhausted elite which rules today. Judging from the controversies raging within the political parties, the possibilities for new alignments are unlimited. Today's situation cries out for the forging of a catalyst group to spell out the basic issues and to strengthen the Centre to launch the attack on them. Will this group form? Here's hoping that 1965 will offer an answer—and in the affirmative.

From the Chair

The Associated Cement Companies Limited

Summary Of Chairman's Statement

THE following is a summary of the statement issued to shareholders by Shri Dharamsey M. Khatau, Chairman, The Associated Cement Companies Limited, on the Company's working for the year ended 31st July 1964. The Annual General Meeting of the Company will be held on Friday, the 22nd January 1965 at 4 p.m. at Patkar Hall of S N D T Women's University, 1, Nathibai Thackersey Road, Off Queen's Road, Fort, Bombay.

Hardly had four months elapsed after our last Annual General Meeting when our country was plunged into grief by the death of Pandit Jawaharlal Nehru. At that time your Directors passed the following resolution:

> "The Directors place on record their deepest sense of grief at the sudden passing away on 27th May of India's first Prime Minister — Jawaharlal Nehru. An inexorable fighter for freedom and human dignity everywhere, his unswerving dedication to secularism and democracy consolidated India's freedom, his resolute insistence on planning for rapid development laid the foundation of economic progress, and his passionate advocacy of peace and friendship among nations inspired a new consciousness of civilised international behaviour. Outstanding man of letters with the widest cultural interests, ardent student of nature and powerful supporter of the sciences, loving his people and most beloved of them, Jawaharlal Nehru was the complete civilised man. The death of this, one of the greatest of men, is an irreparable loss to the nation and to men of peace everywhere. The Board extends to Shrimati Indira Gandhi and to other members of his family its sincerest sympathy."

I am sure that you will now desire as shareholders of this Company to associate yourselves with this expression of sorrow.

The destiny of the country is now in the hands of Shri Lal Bahadur Shastri, able and trusted colleague of Jawaharlal, and we must all pledge our fullest support to the Prime Minister.

On our frontiers the stalemate continues. Our rising population and deteriorating food position are also causing great concern. The Government of India is now faced not only with the task of keeping the country prepared to defend itself and protect its frontiers but also of overcoming the food crisis. These problems are receiving the urgent attention of our Prime Minister and his Cabinet and I am sure that each one of us will give his utmost co-operation to Government.

Rise in Costs

Turning to the affairs of your Company, during the year under review, the rise in prices of coal, fuel, gypsum, stores, spares etc, required in the manufacture of cement, has inevitably had its effect on our cost of production. Despite our continuing efforts to peg down costs by improved productivity at every possible stage, the cost of production has gone up as compared with last year, owing to factors entirely beyond the control of your Company.

Although Government announced an increase of Rs 1.25 per tonne in the retention price with effect from 1st July, 1964, this increase, as usual, suffered from the defects of 'too little and too late'. Owing to the delay in granting these meagre reliefs, your Company has in the last three years alone suffered a loss in earnings of nearly Rs 1.50 crores.

The retention price allowed on current levels of cost of production barely allows sufficient earnings of profits to pay a reasonable dividend. There is, therefore, no generation of internal resources, so necessary for expansion and modernisation of factories other than accruing depreciation. Even during the year under review when the net profits are higher than last year, we shall have to draw a small amount from Reserves to be able to maintain the usual modest dividend.

Cement Corporation

The Indian press recently carried news of Government's proposal to form a Cement Corporation whose functions would be to set up several new units in the public sector in an endeavour to achieve the production target set by the 4th Plan.

It is necessary to point out that the private sector in the cement industry has the experience, the know-how and the willingness to increase productive capacity, but it has been handicapped for several years by an uneconomic price which has failed to attract fresh capital for the expansion of the industry. If the incentive of an adequate price, coupled with an expansion allowance and sufficient foreign exchange can be granted to the manufacturers, they can contribute very substantially to the growth of the cement industry.

Suggestions for Improving the Financial Position of the Cement Industry

Although the Finance Act, 1964, contains a few favourable changes, so far as the cement industry is concerned, they do not go far enough. I, therefore, venture to offer the following suggestions for the serious consideration of the Government to improve the financial position of the Indian cement industry and encourage its rapid growth:

(i) an Automatic Escalator clause to meet increases in (a) the pitsmouth price of coal, (b) railway freight and (c) the linking of the dearness allowance to the cost of living indices;

(ii) the inclusion in the price structure of an expansion allowance to be identified and utilised as such;

(iii) the Development Rebate on plant and machinery to be stepped up from 20 to 40 per cent.

Monopolies Enquiry Commission

I must, here, refer briefly to the Monopolies Enquiry Commission which has recently been set up by Government, presumably to allay public apprehension regarding concentration of economic power. There can be no objection to such an enquiry but I do hope that the Commission will go carefully into the criteria to determine what constitutes a monopoly. The fact that an enterprise is relatively large does not in itself constitute a monopoly. One of the main points to determine is whether the enterprise is

acting in the best interests of the country. I make particular mention of this, because your Company has been many times overtly, and sometimes directly, referred to as a monopoly. Both in production and distribution of cement, in which your Company is primarily engaged, you are aware that the price and distribution are rigidly controlled by Government. There can, therefore, be no question of any monopolistic position for anyone in the industry, either big or small.

Coal

Owing to considerable improvement in the transport position, your factories were able to receive their full supplies of coal for the second year in succession. The beneficial effects of such a situation were unfortunately offset by a further deterioration in the quality of the available coal. Due to the introduction by Government of a scheme for the conversion of the units at Dwarka and Madukkarai to oil-firing, it has become possible for your Company to face these difficulties with some measure of success.

Packing

The quarterly packing charge allowed by Government continues to be computed on the basis of utilising second-hand and new bags in the ratio of 1 : 2. As I pointed out last year, this ratio is high and would be more realistic at the level of 1 : 3, if second-hand bags have to be used at all.

Cement Demand and Transport

As the demand for cement in India continues to be in excess of production, the distribution of cement still remains under statutory control in all the States.

The availability of wagons for the transport of cement has shown considerable improvement. Nevertheless, we have continued our efforts for utilising road transport to the maximum extent possible, and have been able to move more than a third of our despatches by road.

Expansion and New Works

Your new plant at Jamul is nearly complete and will soon go into commission. Extension work at Dwarka and construction at Porbandar are also progressing satisfactorily. Letters of Intent have been received from the Government of India in respect of licences which will enable us to establish factories at Wadi in Mysore State and at Durgapur in West Bengal. These schemes are now being pursued.

Other Products

There was an appreciable improvement in the manufacture and sale of Silvicrete, Portland Blast Furnace Cement, Waterproof (Hydrophobic) Cement and Accoproof cement waterproofing additive. The new White Cement Plant at Kymore was completed in August 1964 and is now in production.

Engineering Works, Shahabad

The Machine Shops, Fabrication Shops and Forge Shops at our Engineering Works, Shahabad, have been in production throughout the year. The erection of the Hot-blast Cupola in the Grey Iron Foundry is complete.

Plans are now being made to extend the Machine Shops and Fabrication Shops to cope with anticipated demand for cement-making machinery.

Central Research Station, Thana

I hope the formal opening of the Company' new Central Research Station at Thana will have taken place before our Annual General Meeting Under centrally planned direction, the project will cover all aspects of manufacturing techniques, the evolution of more efficient and economic methods of processing, and also developing diversified products.

There will also be a Technical Service and Development Division of the Institute equipped to carry out comprehensive testing of soils and aggregates for Government, Local Authorities, Architects and private parties, so as to design concrete and soil-cement mixes suitable for various types of constructions. This Division will also keep close liaison with the Indian Standards Institution and allied organisations with a view to help standardization of testing procedures and evolution of new standards for items involving the use of cement and other diversified products of the Company.

Issue of Debentures

In order to finance the construction of our new factories and to meet the costs of expansion of our existing plants, it has been decided to issue First Mortgage Debentures ('D' Series) of Rs 7 crores, redeemable in 1975-79. The issue consists of 70,000 7% Debentures of Rs 1,000 each which will be issued to the general public with preference to shareholders.

Pakistan Factories

The Government of Pakistan have authorised the West Pakistan Industrial Development Corporation to negotiate with us for the purchase of our Pakistan factories. These negotiations are in progress and I hope the deal will go through.

A C C—Vickers—Babcock, limited

Although the turnover of sales and service of ACC - Vickers - Babcock, Limited for the year ended 31st March, 1964, amounted to Rs 5.50 crores, it must be noted that AVB incurred a loss of Rs 15 lakhs on the year's working. From this year onwards, AVB is expected to earn sufficient profits to cover the charge for depreciation.

Bonus Commission's Report

You must be aware that the recommendations of the Bonus Commission have been modified and accepted by the Government. The modification by the Government in the rates of return on capital and reserve was very necessary and should be considered to be fair in the circumstances that prevail today. Nevertheless, the proportion of available surplus which remains to be divided between the industry and the employees, without any deduction for a rehabilitation allowance as a prior charge, and the stipulation of a minimum bonus payable in a profit-sharing bonus scheme even when a company is working at a loss, are, to say the least, unfair to industry.

Lahour-Management Relations

Labour-management relations at our Works were cordial throughout the year. I would like to express on your behalf, the Management's warm appreciation of the loyalty, hard work and whole-hearted co-operation of the Company's employees at the Offices, Works and Collieries.

Bombay, 20th November, 1964.

Note: The above summary is not a document purporting to be a report of the proceedings of the Annual General Meeting.

Non-Receipt of Copies

Complaints can be attended to promptly if subscribers kindly remember to mention their subscription number.

From the London End

Labour's First Two Months

AS Parliament dissolves for the Christmas recess it is perhaps time to take stock of the first two months of Labour Government. The sterling crisis of the past five weeks has dominated the picture and, indeed, many believe that in the past month Britain has passed through its gravest financial crisis since 1949. The Government appears now to have gained a respite, and there are signs of a returning confidence in the country for the prospects of the economy. Ministers believe that this will be sufficient for the Government to hold the economy steady until the new long-term plans for economic rehabilitation are put forward. Present indications give promise of a useful rise in exports in the crucial months of early 1965 and it looks as if the import bill will begin to decline. The rumours of an early spring election, therefore, seem unfounded. Labour Ministers give the impression of having every intention of carrying on with their jobs despite the Party's slender majority. Though the general belief in political circles is that an early election would bring Labour back with a greatly increased majority, it does not look, at the moment, as if Wilson will do this.

Genesis of the Crisis

It is interesting to try and enquire into the root causes of the crisis of confidence in sterling. Everyone is agreed that the basic reason why sterling weakened was the large payments deficit which the Labour Party inherited from the Conservatives. In late summer, estimates of the deficit ranged around £ 500 million or slightly higher at £ 600 million (Roy Harrod's). When the Labour Party took office it found that the deficit was more likely to be in the neighbourhood of £ 700 to £ 800 million.

The depressing balance of payments situation was aggravated by certain tactical errors and misunderstandings. The furious reaction of European countries to the 15 per cent import surcharge on which they had not been consulted was aggravated by the fact that the Labour Party had consulted the Americans. Moreover, many European countries felt, despite reassurances to the contrary from the Labour Government, that these surcharges were a preparation for devaluation. Misgivings were further increased when the Labour Party's first budget was announced. The more conservative European banking circles felt that with Britain borrowing money abroad it was hardly the time for the country to raise social benefits. Callaghan's mistimed half disclosures of the tax reforms he proposed to initiate next year caused panic and confusion. This hit the Government securities market very seriously and necessitated a rescue operation by the Government broker. The large-scale institutional investors were confused about the impact of the proposed tax measures on Government securities and life assurance companies, which made them lose confidence in the Government, and there is little doubt that the sterling crisis was really caused by the loss of confidence in the City. The crisis flight from sterling appears to have been more a flight of British than foreign money. It has been estimated that in the month before November 25, when the crisis really broke, between two-thirds and three-quarters of the sterling sold in the market was of United Kingdom origin. However, as Parliament closes, this particular crisis is now under control.

Devaluation Ruled Out

Certain definite facts are now known to replace the doubts which were in the minds of many people when the Labour Party took office. Perhaps the most important one is that the Labour Government has not the slightest intention of devaluing the pound however great the speculative pressure. The proof of this is in the size of the credit that central banks produced to meet the crisis. These loans are given, not to support Britain, but to support sterling as an international currency Even if the Bank of England were forced to draw on a large scale from the $3,000 million loan, it could obtain further funds by approaching I M F or the U S A.

With the sterling crisis no longer monopolising attention, it is possible to take a more sober look at the Government's long-term constructive measures — the incomes policy and the special measures designed to aid exports, the incentives to technological change, the measures for industrial expansion and greater efficiency are all in the process of formation and are making progress. The hopes for 1965 lie in actions on which preliminary steps have already been taken — regional planning, scrutiny of labour useage, export incentives, civil development contracts and the selective use of Government purchasing.

A start has already been made in regional planning. One of the black spots of the British economy is underused capacity in the less favoured areas and much misused capacity in the favoured areas. In this connection, Labour's plan to spread employment better throughout the country are vital.

Long-Term Measures

Many of the long-term measures contemplated by the Labour Party are those which no Government has hitherto attempted, although in their last phase of Government, the Conservatives were beginning to move in this direction. An incomes policy has long been regarded as a method of dealing with inflation. It is hard to judge how successful George Brown's efforts at getting the Trade Unions and employers to sign a declaration together with the Government on productivity and incomes will in reality prove to be.

On the industrial front, the index of production which had remained stagnant at 127 for the first nine months of the year, rose to 129 in October. The trade figures for November, on the other hand, were disappointing especially as imports again showed a rise despite the imposition of the unpopular import surcharge. Of course, it is a little early for these measures to bite, and experience from Canada suggests that surcharges of this nature usually take effect only about the third month after their imposition.

The crux of Britain's economic problems, however, remains the poor export performance. As Sir Geoffrey Crowther put it, the brutal fact remains that Britain is not paying her way. In this connection, Wilson's speech in the House on the Defence debate did a great deal of good by dispelling the illusions of nuclear grandeur. As a *Times* leader put it: "The sooner everyone sheds illusions and Britain stops aping a false grandeur the better. Britain is not going to live by bombs, but by trade".

It is understood that the Government is to produce a new plan for

exports in the new year. The new packet of measures have been drawn up in consultation with industry, and it is known that leaders of the British National Export Council have had several sessions on these export incentives with Labour ministers, includnig Douglas Jay, President of the Board of Trade. Full details of these measures are not yet known, but it is understood that the package of policies, suggestions and ideas that are being put together by the Treasury and the Ministry of Economic Affairs may include the following:

(a) More Government money to be made available to foreign countries in the form of long-term credit for selected business. The system will be jointly supervised by the Board of Trade and the Export Credits Guarantee Department.

(b) The overdraft limits permitted by the Export Credits Guarantee Department might be made easier to give exporters more flexibility. This would help small exporters.

(c) Government money will be provided for research into markets that are now covered by the various Committees of Export Councils.

(d) Financial help may be given for inward and outward missions of businessmen. Exporters of capital equipment are finding that they derive more benefit from entertaining groups of potential foreign customers in England than by heavy spending abroad.

Another proposal which is being discussed is the suggestion that a two-tier interest rate should be adopted to give exporters a fixed interest rate independent of Bank Rate. The Managing Director of Leyland Motor Corporation is said to have urged the Government to set up a special loan scheme which would provide finance for exports "at fixed and reasonable rates of interest which will not leave us at the mercy of a Bank Rate which we appreciate must be charged from time to time". There is certainly a strong case for this demand. In a small way, this is already being done in respect of the large-scale capital goods transactions covered by the Export Credits Guarantee Department scheme for direct guarantees to financial institutions putting up the money. For example, banks which provide the money for the first years under this scheme, do so at the standard rate of 5½ per cent, while the insurance companies who look after the longer periods also operate at a constant, though somewhat higher rate. This practice could well be extended to other classes of export credit business. GATT can hardly object to such a scheme since other signatories actually operate similar systems.

Although the final form of the measures for export promotion are still not known, one very healthy fact is the serious manner in which the Labour Party is approaching what is one of Britain's gravest economic problems. No one measure, no series of exhortations alone are enough. What is required is a basic concerted and comprehensive programme, and this is certainly what the Government is attempting.

December 23, 1964.

800 YEARS LEIPZIG FAIR

1165 1965

ANNIVERSARY FAIR
28th FEBRUARY-9th MARCH 1965

Leipzig Fair today is the most important commercial event in the German Democratic Republic and the biggest Fair to be held in the socialist countries. More than that, it is the great centre of unhindered world trade, specially valued by the newly developing nations for the role it plays in expanding their international trade ties. A visit will enable you to secure an unequalled picture of modern production on a world scale, and survey all the latest developments in manufacturing techniques.

Information and Fair Cards can be obtained from: LEIPZIG FAIR AGENCY IN INDIA

P. O. Box No. 1993, BOMBAY 1 • D-7 Nizamuddin East, NEW DELHI 13 • 34-A Brabourne Road, CALCUTTA 1 • "Prem Niwas" 14 Besant Avenue, Adyar P. O. MADRAS 20 or at the frontier of the German Democratic Republic.

9,000 EXHIBITORS FROM 70 NATIONS AWAIT YOU!

Book Review

The Many Annie Besants

The Last Four Lives of Annie Besant by Arthur H Nethercot; Rupert Hart-Davis, 1963; pp 483; price 42s.

The art of biography
Is different from geography.
Geography is about maps;
Biography is about chaps.

This is no more than a schoolboy jingle but it is possible, if one is so inclined, to wrest some deeper meanings from it. For instance, biography may be considered as a sort of "map" of a "chap"'s life in which geography, in its widest sense, is of crucial significance. If set in a different clime, would a person's life not have assumed vastly different contours? This imponderable question gains piquancy in the case of persons who, out of choice or necessity, shift the geographic setting of their activities in mid-career.

The second volume of Arthur Nethercot's biography of Annie Besant begins with her arrival in India in 1893 at the age of 46 and ends with her death at Madras in 1933. Even before she set foot on Indian soil Mrs Besant, initiated into the occult mysticism of Theosophy by Madam Blavatsky, had begun to remember India as her motherland and Hinduism as her religion from her past incarnations. In the 40 years spent in India, Mrs Besant's personality made its forceful impact on varied aspects of Indian life. At the same time, international renown and fame came her way mainly because of her work for her adopted motherland.

Biographies of this extraordinary Irish woman are numerous, which fact speaks of the range of her interests and the power of her personality. Nethercot's attempt obviously is to present a definitive work, for which task he is ideally suited for at least one reason — that he never knew Annie Besant and never came within the ambit of her influence. This, which could be a serious handicap, is a necessary precondition for objectivity in the case of a controversial figure like Mrs Besant who generally evoked strongly opposing responses in people, fervid loyalty and admiration or bitter antagonism. As Nethercot says "Where Annie Besant was involved, it was usually possible to get completely contradictory views on almost any subject". Also for this reason, the biographer's task has been far from easy and no one who reads this book can fail to be impressed by the amount of work that has gone into it. Nethercot has deftly pieced together his subject's Indian "lives" from various and diverse sources. He mentions with regret that he did not have access to the Theosophical archives and that no one could tell him anything about the diary which Mrs Besant kept or the clipping service she subscribed to. However, he had interviews and correspondence with scores of persons in four continents whose lives had touched that of Annie Besant at one time or the other. The most interesting portions of this book are those that give the substance of this research, often in foot-notes — the personal impressions, recollections, anecdotes and opinions of individuals from diverse walks of life, ranging from Col Prentice, a lapsed Theosphist in Australia, to Jawaharlal Nehru and Digby Besant, Annie's son. Altogether, this volume compresses in its four hundred odd pages material that could well have spilt over into several more in the hands of one less gifted in marshalling and sifting facts.

Martyr with Many Causes

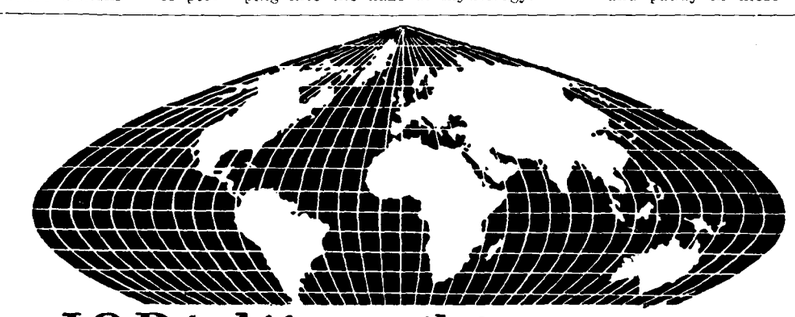
Annie Besant, who meant many things to many people in the course of her long life, moved simultaneously on two vastly different planes. As a Theosophist she was not only a mystic and a spiritual *guru* to a scattered band of believers but an exponent of Hindu philosophy as well. As a fighter for Indian freedom and founder of the Home Rule movement, she stepped into the mundane world of politics. Her original avowed intention was to confine her work to the spiritual plane and steer clear of politics. But her fiery spirit could not resist responding to the challenge of battle. She herself ascribed her entry into politics to the command of the Rishi Agastya, an example of occult preciosity which her biographer rubs in with gleeful relish. But it is a measure of Mrs Besant's versatile genius that she carried the role of leadership in both these worlds easily and simultaneously and also packed in a number of connected activities. She was an inspired educationist and boy scout pioneer; ardent feminist and social reformer; brilliant orator and lawyer; prolific writer and journalist. To each of these varied activities she brought her characteristic energy and intensity, interpreted by some as symptoms of her vanity and dictatorial ruthlessness and by others as humble and selfless service. Altogether, Annie Besant is an enigma. What Nethercot himself considers as the "clue which motivated her mutable career" he selects from her own autobiography which covers the early part of her life. This was her yearning for martyrdom. Nethercot sums up: "She was not to become a martyr without a cause; she was to become a martyr with a whole series of causes". But as with all popular-psychological analyses, this sounds a trifle too pat.

However, Annie Besant was a martyr and the principal concern of this book is the portrayal of her martyrdom in the Theosophical Society and in the Indian Home Rule movement. Mrs Besant's occult experiments, her "discovery" of J Krishnamurthi the long legal battle over his guardianship, his presentation as the New Messiah, his final repudiation of this role and break with the Theosophists have all been recorded more poignantly by others like Lady Emily Lutyens, themselves closely involved in that amazing drama. But here, for the first time, are all the relevant facts presented dispassionately and in perspective. The record is fascinating and Annie Besant clearly emerges as one whose power of influence over others was counterbalanced by her own susceptibility to influence. The story of the Home Rule movement and the rejection of Annie Besant's moderate philosophy for the more radical approach of Gandhi has also been told by others. But here it is presented from the Besant view-point and the drama of her clash with Gandhi — to whom she was the first to apply the title "Mahatma" — the Nehrus and others is one which bears repetition.

Almost throughout the book the personality of the biographer is not allowed to intrude on the narrative. The facts are presented with admirable academic restraint while the documentation is meticulous. It is mainly in the last three chapters that Nethercot gives, by way of summing up, some of his own views on the characters and controversies he has so closely studied. His verdict on Krishnamurthi is worth quoting for its laboured attempt at

fairness: "I should hate to think of him as a charlatan; I prefer to think of him as a sort of schizophrenic or at least as a man of a now permanently divided dual personality". Regarding Mrs Besant's own flamboyant excursions into mysticism, he is rather more generous, on the ground that the nature of the mystical experience is "utterly personal". And as for Annie Besant's contribution to the Indian freedom movement, if only India had followed Mrs Besant's advice in 1929, he says, the country "would probably have attained Dominion Status 17 or so years earlier than it did, it would probably have retained Pakistan and there would have been no Kashmir problem" — a sweeping statement which lightly ignores all the 'ifs' and 'buts' that lie behind the word "probably". And that is not all. Nethercot goes on to analyse the final responsibility for this tragic muddle. "The greatest share", he holds' "must perhaps go to Jawaharlal Nehru through his influence on Gandhi and Motilal Nehru in the 20s, Gandhi being essentially the instrument by which the younger Nehru achieved his ends."

But what of the reasons why Annie Besant failed where Gandhi — or perhaps Nehru, the puppeteer — succeeded? Nehru's own interpretation, as discussed with the author and reported earlier in the book, need to be repeated in this context. For Nehru felt that Mrs Besant's political views soon went out of date and proved too slow for the younger generation; that unlike Gandhi, she failed to get down to the masses and exercised influence only on the educated upper classes. If this is admitted as true — and Nethercot reports that Mrs Besant's "loyal entourage" did so — then Nethercot's brave attempt at historical post-mortem seems utterly pointless.



This, however, does not mar the excellence of this book as a biography of a great woman and one of the most striking figures of the century. To its many virtues must be added that of timeliness also. For though several of her associates and antagonists are still alive, the memory of Annie Besant has begun to fade. That the commemoration stamp issued recently in her honour had to be withdrawn because of a factual error may have been the result of just another unfortunate oversight. But it is also symptomatic of the fact that the name of Annie Besant is slipping into the haze of mythology.

New Uses of Jute

THE progress of research in the new uses of jute undertaken in technological research laboratories and review of other schemes relating to jute production will be among the items for consideration at the meetings of the Governing Body of the Indian Central Jute Committee and its Sub-Committees to be held in Calcutta from January 5 to 8.

The annual report of the Technological Research Laboratories of the Indian Central Jute Committee outlines the progress made in the preparation of rayon-grade pulp from jute stick, wall coverings of jute and manufacture of asphalted roofing material and box board from jute stick. The experiments under way or scheduled are directed, among other things, towards improving the method of determination of fibre fineness and production of furnishing fabrics from light jute cloth and non-woven fabrics for cement or fertilizer bags and light hand bags.

During 1963-64, the Economic Research Section of the Indian Central Jute Committee continued its comprehensive survey of 120 villages in West Bengal, Bihar and Assam to study the estimates of cost of production of jute and paddy in these three States.

I.O.B. is big enough to serve you...

I.O.B. is an international bank with offices throughout India and South-east Asia and correspondents the world over. It offers a wide range of services to suit the needs of varied customers. Indeed, I. O. B. is big enough to serve you.

We asked our customers, thousands of them at random, what they thought of our service. They replied: "We are pleased". They also made several helpful suggestions which we are implementing. Indeed, I.O.B. is small enough to know you.

Range of I.O.B. services: Savings and Current Accounts—Recurring and Fixed Deposits—Personal and Business Loans—Bills Payment Service—Gift Cheques—Travellers Cheques—Safe Deposit Lockers —Trade and Export Information and Advice—and whatever other specialised help you may need.

...and small enough to know you

Dandakaranya: A Survey of Rehabilitation

I—The State of Agriculture

S K Gupta

The development of Dandakaranya was undertaken to solve an almost intractable human problem—the rehabilitation of a large number of refugees who were uprooted from their homeland in East Pakistan, victims of a political decision to divide the country in which they were not consulted. Vast numbers re-established themselves in West Bengal without help. A sizable fraction did so, fully or partially, with such help as the Ministry of Rehabilitation was prepared to give.

Dandakaranya was expected to provide a home for the residuary refugee population in camps or elsewhere for whom there was supposed to be no more room in West Bengal. More than twenty-two crores of rupees have already been spent and further expenditures are in the offing but barely seven thousand families have been given rehabilitation of a sort in the course of five or six years.

What is the end result of all this expenditure of time and money? What are the prospects? It is time that a proper assessment was made and people saw Dandakaranya without any blinkers.

My ten months at Dandakaranya of which four were largely pre-occupied with the new influx at Mana were not sufficient to allow me to know the facts as thoroughly as I would have liked to, because under the peculiar administrative arrangement of the Dandakaranya Development Authority most matters were dealt with at a lower level and hardly reached the Chairman unless they were regarded as matters of high policy or unless the Chairman specially called for information. There were no annual reports nor any collected body of statistical information covering all aspects of the project and its working up to date.

Even so, what I saw myself and learnt on further enquiry caused me profound disquiet. I have decided to share my disquiet with the public, not to cast reflections or start a polemic, but so that if things are what I believe they are, immediate action may be taken to set things right. Human distress on a large scale is much too serious a matter to be passed over in silence either to feed official complacency or to save reputations. 'A willing suspension of disbelief' may be, as Coleridge thought, a necessary precondition of imaginative writing or literary appreciation, but for the administrator nothing could be more fatal. He must not pull the wool over his own eyes nor over those of others.

Rehabilitation in the wider sense embraces all aspects of life. Here the word is used in the narrower sense of economic rehabilitation. The enquiry is confined to the different ways in which such economic rehabilitation has been sought to be effected and whether they are adequate. Of these ways agriculture, industries and employment and trade are the most important.

THAT the emphasis of the Dandakaranya Development Authority has hitherto been largely, if not exclusively, on agriculture admits of no doubt. Prior to the recent influx which began in February 1964 there were approximately 7,500 families of displaced persons within Dandakaranya of which 7,261 were recorded as agriculturists and moved to village sites by the end of June 1964. By the end of the agricultural season of 1963-64 about 6,286 families had been allotted agricultural land at the rate of roughly 6.5 acres per family and half an acre for homestead and kitchen garden in four widely separated zones of Orissa and Madhya Pradesh, viz, Pharasgaon, Umarkot, Paralkot and Malkangiri. Seven acres are not an inconsiderable area for an agricultural holding on East Bengal standards and one would think that the settler would be fairly well-off. But the result of the experience of the last few years belies any such facile optimism.

The fact of the matter is that it is not the quantity of land but its quality which, together with other factors, determines the yield on which rehabilitation depends. Among these factors, the most important are (1) soil texture and topography, (2) climatic conditions, (3) water (or irrigation), (4) a suitable cropping pattern, (5) good farming practice with improved seeds and implements, and (6) the skill and energy of the individual farmer together with the man-power he can mobilise in his support. Almost all these factors are inter-connected. The soil texture may be good but if rainfall is low or of very short duration, seeds will not germinate or will wilt even if they do, unless there is irrigation. If the soil is porous even heavy showers will prove unavailing in retaining the quantity of moisture which the crops require for growth and maturity; and if the land is sloping, fertilisers will be washed away along with the water. As for good farming practice much depends upon how quickly, under new soil and climatic conditions, the age-old habits of the cultivator and his preference for paddy can be changed in favour of a novel cropping pattern which in its turn depends upon a good agricultural extension service designed to bring new knowledge and technique to the notice of the cultivator. The personal factor includes man-power as well as the skill and energy of the individual farmer. One of the contributory factors for the latter is incentive which comes from the prospect of a good yield in return for input as well as ready marketability of the produce at a reasonable price. Manpower shortage in Dandakaranya during the crucial period of cultivation is a by-word. There is no surplus labour waiting to be employed nor any seasonal influx of such labour. The ordinary settler family has usually only one adult male member for whom it is difficult not only to plough and sow all the 6.5 acres within the short period available, but also to eliminate the fast-growing weeds which are a characteristic feature of lands reclaimed out of the virgin forest during the first few years. Women who, in East Bengal, do not work in the fields have sometimes lent their hand in sowing and weeding but their number is small as household

work could not be completely neglected. There are undoubtedly a few slackers, especially among those who were not traditionally agriculturists, but by and large the cultivators are inherently hard-working when there is at all any prospect of wresting a fair yield even out of reluctant soil. But as the soil scientist of the Project observed in February 1962 with regard to Boregaon and Jugani, you can't expect anybody to go on working hard if the predictable result is a poor yield which would not pay for the cost, far less maintain a family.

Poor Quality Land

The low quality of the soil in the areas released for the refugees is not a new complaint, but was noted by Sukumar Sen more than once and commented upon by the Agricultural Expert Team set up by the Food and Agriculture Ministry at his instance. In fact, the settlers have to make do with the worst lands, hitherto regarded as uncultivable. The local adibasis had, as one would expect, occupied all the fertile low-lying areas in the valleys enriched by silt and moisture. They had even cleared many up-land forests to carry on their peculiar 'padu' cultivation in the slopes and burnt the forest undergrowth every year which deprived the soil of the enrichment it might have received from the decaying forest littler in the course of years. What remained was generally virgin forest land with little humus and with soil depth and texture varying from place to place.

In Boregaon and Jugani (Pharasgaon zone) the soil is generally shallow, sandy loam to loam in texture, acidic in reaction, poor to medium in nitrogen and organic content, and poor in phosphate as well as moisture-holding capacity. The Soil Scientist reported that 6 per cent of plots were basically unfit for agriculture, 32 per cent were poor and submarginal, 53 per cent could be of medium quality if their moisture retention capacity could be improved, and only 9 per cent were of good quality. In the Umarkot region (comprising Umarkot and Raigarh Sub-zones) the soils are somewhat shallow in depth and do not show properties of moisture-retentivity adequate enough for paddy cultivation. They would have to be put under cultivation for several seasons—about 4 or 5 years as Dr Govinda Rajan told me verbally—before moisture-retentivity would improve. The texture varied from sandy loam to loam and in some cases clay loam with heavy-textured soil underlying the surface at places. It is generally acidic in reaction with moderate to poor nitrogen and organic content and poor phosphate content. In 23 villages of the Umarkot Subzone whose lands were subjected to a detailed soil analysis, the soil scientist observed on the basis of their topography and soil texture that out of 8,198 acres about 60 per cent was suitable for paddy while another 15 per cent could be added from the highlands by terracing and field bunding, but that the remaining 25 per cent of light textured high land would never be suitable and it would be foolish to persist with paddy cultivation in these lands instead of trying cash crops.

The soil of Paralkot is closely similar to that of Umarkot area and is expected to behave in the same way under cultivation. In fact, soil survey reports indicate that the soils are fairly deep, generally acidic in reaction, medium in nitrogen and organic content and poor in phosphate. The texture varies from sandy loam to clay loam with underlying heavy textured soil in places and moisture retentivity is not very satisfactory. The picture is different in Malkangiri where the soils vary a great deal in their profile, characters and surface textural properties from that of Umarkot zone. In villages on either side of Malkangiri-Motu road the surface texture varies from sand, loamy sand to loam with sub-surface texture becoming heavier. On such land, according to Govinda Rajan, the suitable crop is not paddy but groundnut, tobacco and mesta. On Malkangiri-Balimela road, however, the soil is darker, deeper and heavier and therefore suitable for paddy. All the lands for the tribal quota have been taken from this region and none from the other.

The primary effect of climate is on rainfall which is important because artificial irrigation is as yet non-existent. Apart from its quantity, the period over which rainfall is spread and the occurrence of occasional bright spells in between are important factors in paddy cultivation which is the staple crop on which the settlers' heart is set. Most of the annual rainfall of 50"-60" takes place usually within a limited period of 100 to 110 days from mid-June to the end of September, starting and closing almost abruptly without pre- or post-monsoon showers. Because of this and the hardness of the soil for lack of moisture during the preceding dry months the settlers cannot start preparing the seed-bed and sowing seed till after the monsoons have started, and since these operations take a minimum period of 2 to 3 weeks the effective period of monsoons left for helping plant growth and formation of grain is barely 90 to 100 days. Under these conditions the paddy which can be grown here must be of the broadcast, rain-fed, short-duration variety since impounding of water is not possible on account of the light texture of the soil and its undulating contour, and there is no irrigation to supplement the rainfall and extend the period. But the shorter the duration of growth the less the yield and the more the susceptibility to diseases like 'blast'. Application of fertilisers on a large scale without artificial irrigation will not help much in increasing the yield because the high nutrient content of the soil will increase the period of vegetative growth of paddy plants, deferring the reproduction phase and making the plants more susceptible to damage for want of soil moisture at the most crucial grain-formation period of the plant life. Moreover, in a short-duration paddy suitable for the agro-climatic conditions mentioned above, the heading stage comes towards the end of September or early in October when vagaries of climate like heavy rains or storms or drought often damage the prospect of a good harvest. Broad-cast paddy requires to be weeded at least twice, but if the sowing starts after the commencement of the monsoons the appropriate time for weeding will coincide with that phase of the monsoons when rainfall is heaviest and most continuous. This adversely affects weeding, even apart from man-power shortage in the family and lack of resources to employ hired labour.

II

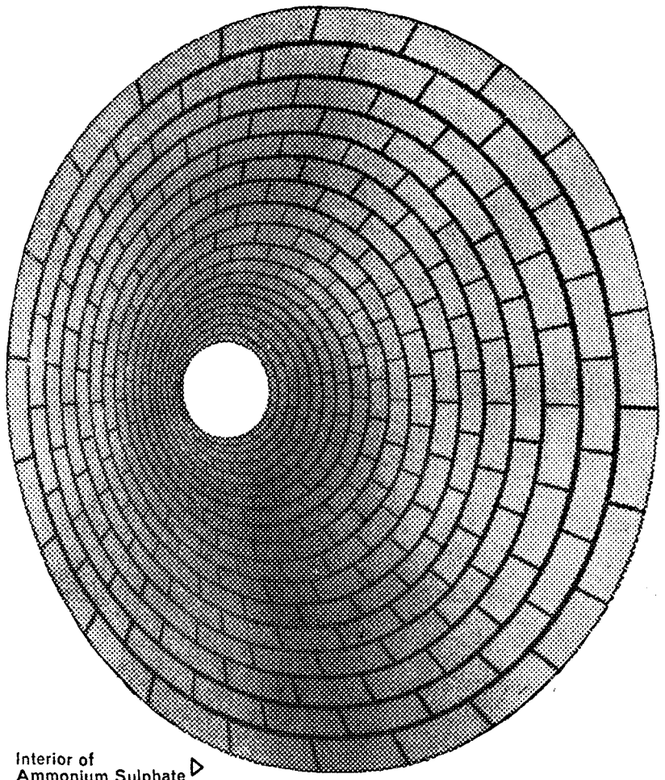
The effect of the soil and the climatic conditions in those parts of Dandakaranya area where refugees have been settled is that the lands are not ideally suitable for the production of a satisfactory paddy crop except where the soil is of a heavy texture and low in situation. According to the Director of Agriculture only about 20 per cent of the holdings have an yield of about 15 maunds per acre while 80 per cent have an average not exceeding 8 mds. The Chief Administrator before me would not believe it and held that the yield must be higher, and an obliging subordinate officer of the Agricultural Department dutifully gave him a note in support, but the Director of Agriculture stuck to his view. To the Chief Administrator's statement that at least 60 per cent of the lands given to displaced persons must be yielding 10 mds of paddy per acre if not more he observed that "the lands would then be very good indeed and there would have been no scope for us to find hundreds of acres in this tract unutilised. My view which I had submitted to the Chief Administrator about the potentialities of paddy production still holds good."

Detailed Analysis

A more detailed analysis of the condition of agricultural settlers and the yield from the lands will, therefore, be attempted for each of the four zones though absence of reliable statistics is a great handicap. Selective crop-cutting experiments on 5 per cent sample survey basis generally exaggerate the yield and are highly unreliable. Whether this is due to a natural desire on the part of the agricultural extension officers to justify their existence or encourage complacency in an easily convinced top-level administration it is difficult to say, but most zonal Administrators have been sceptical of crop-cutting figures and relied more on their own comprehensive estimates made by their sevaks by house to house survey under the guidance of Assistant Administrative Officers after the crop is harvested. The difference in respect of some villages is indeed striking. In one Umarkot village, while crop-cutting showed an average of 8.26 mds per acre, house to house survey showed 3.16 mds. In two others while crop-cutting showed an yield of 15.27 mds and 14.8 mds respectively per acre, house to house survey showed 10 mds. In another prosperous village the house to house survey estimate was 14 mds against the crop-cutting result of 17.14 mds. The Agricultural Development Officer's report for 1963-64 shows that only 439 families in Umarkot zone received 30 mds of paddy or less while the Zonal Administrator gives the number of such families as 768. It was because of these discrepancies and the insistence of some villagers that the actuals were even less than what was recorded on house to house survey that I directed a simultaneous comprehensive verification of the entire stock of paddy in settlers' houses to be completed by the end of December 1963 or the beginning of January 1964. The result was startling and will be referred to later in the course of this discussion. True, this verification shows the position three months after harvesting during which, apart from what was consumed, some paddy must have been sold, but the suggestion of the then Chief Administrator that the settlers concealed their paddy in adibasi houses is too absurd and has only to be stated to be disbelieved. It was a snap verification without notice, and in any case there is not so much mutual confidence between the settler and the adibasi as to league them together in a conspiracy of silence.

The figures should therefore be taken with some caution and in case of conflict the house to house survey figures should be preferred. It should be remembered that for the purpose of assessing the nature of rehabilitation correctly averages are not a safe guide as they mask the condition of the economically weakest group. When the declared intention is to start each individual displaced family on the road to rehabilitation by giving all families identical advantages in the shape of equal quantities of land and equal loans or grants or services, success of rehabilitation must be judged by the condition in the lowest bracket. One should ascertain how many people are unable in spite of honest effort to make both ends meet from their agricultural land and other subsidiary pursuits carried on along with agriculture.

We must also have a clear idea as to how much paddy a family needs in order to make both ends meet. A conservative estimate for a family of 4.5 persons puts it at 36 mds for food, 7 mds for seed, and 18 mds for sale to meet his cash expenses—a total of a little over 60 mds per year. Some supplementary items of food may probably be raised in the kitchen garden provided there is a well for watering the garden. Supplementary cottage or small-scale industries may also meet part of the need if favourable conditions for such employment are created. But if industrial employment is whole time with little respite left for ploughing and sowing as is the case with a substantial portion of people in Boregaon and Jugani, it is obviously a failure of agricultural rehabilitation.



(a) Pharasgaon Zone

Pharasgaon zone comprises three villages: E Boregaon, W Boregaon and Jugani. This is the earliest settlement where 205 agricultural families and 46 non-agricultural small-trader families were moved in 1959. The latest figures suggest that the number of small-trader families has come down to 30 or 34.

In 1961 and the preceding years the yield of paddy was less than 5 mds per acre while the district average was 10. In 1962 an experiment was made on 129 plots to improve the yield by the application of manures and fertilisers (ammonia sulphate, super phosphate, oil cake and green manure) and the conservation of water through proper field bunding. The result, so far as yield was concerned, was encouraging with an average of 11.38 mds per acre, though the Zonal Administrator does not put it higher than 10.5 mds approximately. But the expenditure on manures, fertilisers, seed loan and labour was enormous, and there was no satisfactory supplementary crop. Only 'mesta' and 'til' grew well and 'urid' thrived when it was treated with super-phosphate. Castor, niger, cotton, vegetables and spices did not do well while maize and 'arhar' suffered damage from cattle trespass. In 1963-64 when the experiment of manuring was not repeated and 53 per cent of the area was sown with paddy and 7 per cent with other crops, the yield was again poor, averaging 5.44 mds per acre according to crop-cutting trial and 3.37 mds according to house to house survey. The Zonal Administrator's report shows that out of 1,214 acres as much as 200 acres (32 plots) were unproductive, 131 plots (or families) received upto 30 mds, 16 plots yielded between 31 and 40 mds, 5 plots between 41 and 50 mds, 10 plots between 51 and 60 mds and 11 plots above 60 mds. About 46 persons tried to grow niger but not very successfully. When actual stock verification was made on September 1, 1964, it was found that on that day 193 families had less than 10 mds in their possession and in the remaining 12 families the stock varied from 10 to 19 mds.

What the position will be in 1964-65 I have no means of verifying, but when I left Dandakaranya it was not very encouraging. By the end of July when agricultural operations should have been in full swing, less than a fourth of the agricultural settlers had taken exclusively to cultivation. Thirty settlers of Jugani had not done any cultivation at all, many had sold their bullocks or were thinking of

ACC 1096 R EVEREST

Interior of
Ammonium Sulphate
Saturator

ACCOCID-*ACC*'s acid-proof cement

ACCOCID is an excellent bedding and jointing cement for acid-proof bricks and tiles or acid-resisting natural stone slabs for the construction of acid-storage tanks and reaction-vats, pickling-tanks, acid-towers, fumestacks, acid-resistant industrial floorings etc.

ACCOCID is supplied in two parts— (1) a *powder*, packed in 50 kg. special jute bags with polythene liners, to be mixed with (2) a *liquid*, packed in 16-litre black sheet drums.

doing so, while others who were willing to plough by working night shifts at the Industrial Centre were finding themselves handicapped for want of seed paddy and plough cattle. People relied more on industrial employment in the wood-working centre at Boregaon or on salaried employment. Out of 205 agricultural families 39 had secured regular salaried exployment within or outside this zone, members of 117 familes were working in the industrial centre mostly on daily wages, and 43 were earning their livelihood either by cultivation or by independent trade or business such as grocery, tailoring, sale of fish or milk, plying carts, or by working as masons or petty contractors. Most agricultural families worked night shifts in order to attend to their fields by day, thus cutting down their period of rest; and I have seen a case where husband and wife worked in alternate shifts in the industry and weaving sections at Boregaon in order to take their turn with the baby, the husband driving the plough with the baby on his shoulders. Very little supplementary income could be received from subsidiary cottage industries. In 1963-64, out of 46 persons who received cottage industries loan, only 12 persons earned a moderate income while all the others suffered loss or ate up their capital. But for the Industrial Centre at Boregaon, despite its low rate of wages, most of the agricultural families in these three villages would have starved.

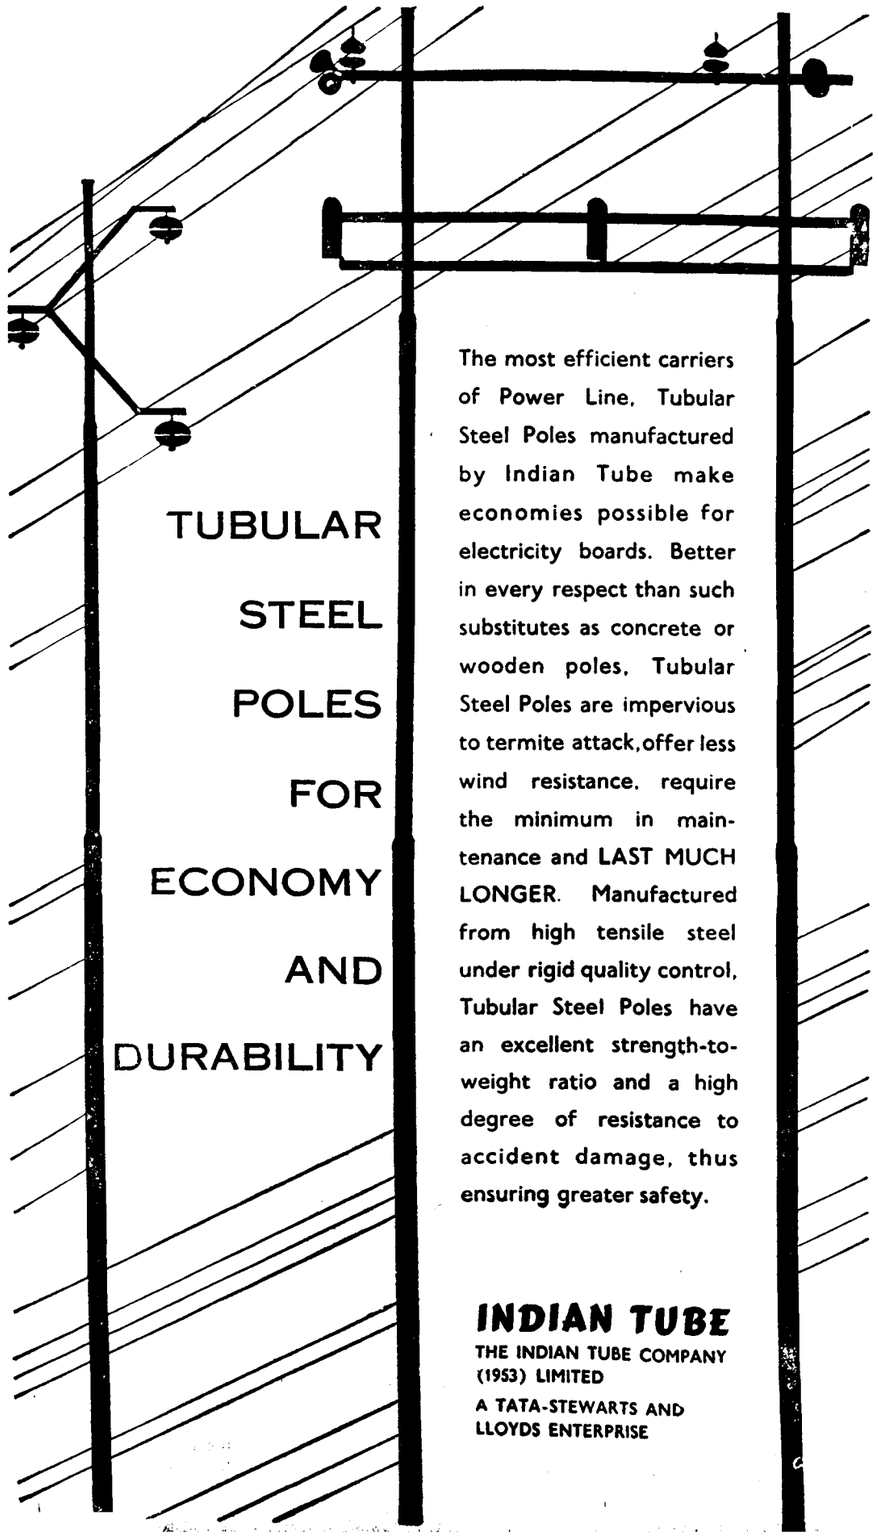
(b) Umarkot Zone

The second area to be taken up for reclamation was Umarkot where there are to-day 48 villages, half in Umarkot sub-zone and half in Raigarh between which there is a broad belt of reserve forest about 20 miles wide.

The uneven distribution of good and bad lands in this zone without regard to whether a family got a reasonable proportion of land on which he could grow paddy is noticeable. The soil scientist found in the course of his survey of Umarkot sub-zone that out of 1,240 families in 23 villages 176 had nothing but high land which was altogether unsuitable for paddy, 51 had only one acre of paddy land each, 107 had 2 acres, 176 had 3 acres, 143 had 4 acres, 117 five acres and 470 six acres or more. Taking the average yield to be 10 mds per acre which is somewhat optimistic, a settler family should have at least 4 acres of paddy land to give him just enough for his food requirements. On this basis more than 41 per cent of the settlers of Umarkot sub-zone are without the required minimum. It is not surprising that for a substantial proportion of the settlers of this zone the minimum needs are not satisfied from the produce of the land.

In 1961-62 when only Umarkot sub-zone was developed and there were 1,265 families in 24 villages, the average yield was 10.55 mds per acre according to crop-cutting experiment. (In the Soil Scientist's report it is given as 10.36 mds). Even so, at least seven villages had a much smaller average varying from 6 to 8 mds per acre and 249 families got less than 35 mds each. The number of families getting between 35 to 70 mds was 807 while the remaining 209 families got more than 70 mds. Two hundred and forty nine families would be about a fifth of the total number and they could not get from the land even their minimum food requirements, not to speak of an extra quantity for satisfying other needs or preserving seed paddy.

In 1962-63 there was a drop in the average yield per acre. The number of villages had by then increased to 47 and the number of families to 2,546. For 24 villages of the Umarkot sub-zone this was the second year of cultivation while for Raigarh sub-zone it was the first year. Paddy was the main crop. The total area under it was 12,134 acres and the total output 115,371 mds yielding an average of 9.50 mds per acre. Out of 2,546 families as many as 1,547 are reported to have got less than 50 mds. But this broad statement does not sufficiently emphasise the distress in some of the worst affected villages. As many as 15 villages had an average yield varying from 3.5 mds to less than 8 mds per acre, 5, 6 or 7 mds being the general rule.



It was in 1963-64 that the accuracy of the figures first came under question. The crop-cutting experiment showed an average yield of 11.35 mds per acre while house to house eye test showed 10.6 mds. The total acreage was 17,397 of which 14,071 or 81 per cent was under paddy and the rest under other crops like niger, urid, mesta, til, mung etc. Sixteen villages, i e, about a third of the total number got less than the zonal average, their yields varying from 3.16 to 9.28 mds per acre. The total number of families reveiving less than 30 mds was 768 and of those getting under 50 mds 1,512.

But actual physical verification of stock carried out between December 27, 1963 and January 4, 1964 showed a very different picture. At that time only 121 families or 4.3 per cent were found to have a stock of 50 mds or above. Then in descending order came 108 families (3.8 per cent) with stock between 40 and 49 mds, 219 families (7.8 per cent) between 30 and 39 mds, 452 families (16.1 per cent) between 20 and 29 mds, 798 families (28.4 per cent) between 10 and 19 mds, and 1119 families (39.7 per cent) less than 10 mds. In the last category there were 121 families who had no stock at all and more than 370 families who had less than 5 mds. Even if allowance is made for the quantity consumed and sold for cash expenses the result of stock verification indicates that crop-cutting experiment figures need drastic modification. To suggest a post harvest spending spree among settlers or concealment of paddy in adibasi houses to account for this wide variation seems to be insufficient.

Supplementary Occupations

It may be said that besides paddy other crops were grown and that besides cultivation other supplementary occupations were available. What is their nature and what effect did they have on the settlers' colony?

Assuming that all the lands were cultivated (about which one cannot be sure) 19 per cent of the allotted lands were sown with other crops, the most important being urid grown on, 1,440 acres, mesta on 526 acres, niger on 760 acres, 'mung' on 224 acres and til on 285 acres. Crops like Arhar, ground nut, ragi and maize were tried on so small a scale that they may be left out of account. Even Mung and til come under this category having regard to the approximate price of the yield. It is only mesta, urid and niger which yielded sizable crops of 4,288 mds, 3,600 mds and 3,040 mds respectively. The settlers' income from these non-paddy crops must however be calculated on the basis of what they would have obtained in the village or in the neighbouring hat and not, as the Agricultural Development Officer had done, of the price obtaining in the distant urban market or at the jute mills. His conclusion that the average income of a settler family in Umarkot was Rs 614 per year in 1963-64 suffers from the fundamental fallacy of taking the ruling price of the distant urban distribution centres as the price which the

farmer obtains in the village. This is obviously not the case, for the middleman must have his cut and the carrier his transport cost. The additional income of Rs 100 supposed to have been received from the kitchen garden is pure guess work and is totally false if supposed to apply universally. Only one man raised a banana orchard and lived on its produce but he did nothing else. Several tried their hand at large-scale kitchen-gardening, but failed because the wells they had dug in their homestead plot collapsed for want of support. By and large kitchen gardens as an additional source of food failed for want of water and no steps have yet been taken, despite a recommendation to that effect, to provide the necessary funds to sink a well. For families whose crops had failed wholly or in part the only means of staving off starvation was casual employment as day labourer either in the Mixed Farm at Umarkot or in earth excavation work at the Bhaskal Dam or in digging head-water tanks in villages under the Agricultural Department, but they could absorb only a fraction of the people affected. The distress in Umarkot last year for a very considerable proportion of families defies description.

What about the prospects of the current agricultural year, 1964-65? The late monsoon and the long gap between the first shower and the next wet spell caused some anxiety but it did not last long. All the settlers have ploughed their lands, including those who had no adult male member in the family. The families who were pauperised by a partial failure of crops in 1963-64 and were supporting themselves by the casual labour mentioned above were maintained by a short-term loan during the three crucial months of the agricultural season. The result is not yet known though the harvesting is over. Some stray reports reaching me from Umarkot about large-scale desertions do not encourage optimism but full facts will be known only if accurate house to house census of stock is taken.

(c) Paralkot Zone

In Paralkot 1960-61 and 1962-63 were years of partial failure of crops, but 1963-64 was supposed to be a good year as there was sufficient rainfall spread over a fairly long period and the settlers of older villages had become acclimatised to the zone. In that year there were 2,239 settlers families spread over 45 villages, but only 2,223 families carried on cultivation as the remaining 16 families were brought to the area too late for taking up agricultural operation. The total area under paddy was over 11,000 acres which meant about 5 acres per family, though all these 5 acres were not wholly suitable for paddy.

From the estimate made by the Zonal Administrator after taking into account the crop-cutting experiment of the Agricultural Department, the sevakas' report, the settler's own statement and the result of the stock verification it appears that the total number of villages in which the average yield per family was less than 40 mds was 18. The number of villages having less than 50 mds per family was as high as 33. Taking the zone as a whole the average yield per family was 43.5 mds but if we break up the number of families into categories having a paddy yield up to 20, 30 or 40 mds the result will be as shown in the Table below.

In other words 1,093 families out of 2,223 or about 50 per cent had received up to 40 mds of paddy which is less than what would be needed for food and other requirements.

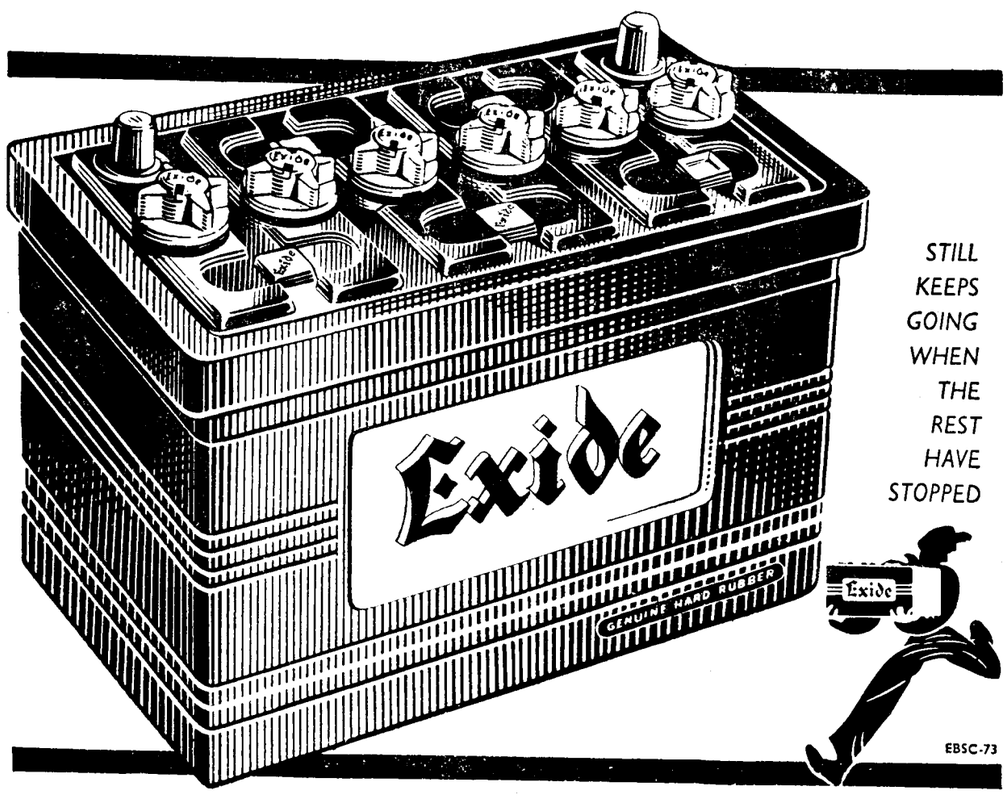
What are the causes of this comparatively low yield in a number of villages and in about 50 per cent of the agricultural holdings even in a year of bumper crop? The Zonal Administrator has listed the causes generally as (1) poorness of the soil, (2) pest attack, (3) poor growth due to late ploughing, (4) negligence on the part of the settler, (5) lack of adult male members in the family, (6) bad selection of seed, long-duration, paddy being sown on land suitable for short-duration variety, (7) bad selection of crop, paddy being sown on land suitable only for mesta, arhar or niger, and (8) inadequate field bunding for the conservation of moisture.

Of these factors he thinks that poor soil or its unsuitability for paddy is more important than is generally admitted. As for negligence he thinks that although sometimes wilful, it is more often forced upon settlers by sickness while bad lands or two successive crop failures acted as deterrents to energetic work. Weed growth was prolific which for a one-worker family was difficult to combat in time both for lack of man-power and of suitable implements. His conclusion is that although many of the settlers had come to Dandakaranya after 10 or 12 years of camp life they had generally overcome their camp sluggishness creditably and were doing their best.

This shows that given land which is not sub-marginal and an Administrator who is knowledgable, sympathetic and hardworking, rehabilitation on agricultural land is possible. Supplementary income for about 100 persons was available towards the end of December 1963 in the Industrial Centre started that month in one of the villages, and the number rose steadily till the end of May 1964 when most workers were disbanded in order to attend to cultivation. Almost 50 per cent of the settler families had also received milch cattle which is another source of supplementary food.

(d) Malkangiri Zone

This was the latest zone to be developed where work is still going on though the present indications are that after the lands whose release has been asked for are obtained the possibilities of further extension of Malkangiri will have been exhausted. At the beginning of the last agricultural season (1963-64) only 23 villages could be opened and 1,023 families allotted agricultural land which they cultivated in groups. Since October 1963 more villages have been opened though somewhat gingerly as tubewells could not be sunk quickly



No of Villages	Total No of Families	Families Getting Up To 20 mds	Families Getting Between 21-30 mds	Families Getting Between 31-40 mds
Group I villages (numbering 15)	669	150	139	144
Group II villages (numbering 19)	979	85	126	204
Group III villages (numbering 11)	575	24	58	163
Total (45 villages)	2,223	259	323	511

enough on account of the underlying rocky strata and the withdrawal of the drilling rigs to Mana after the new influx, but their agricultural potentialities cannot be assessed till the current agricultural season is over. The figures below relate to the agricultural season 1963-64 in these 23 villages.

These families worked in groups during the year. They raised 27,422 mds of paddy on 4,691 acreas, giving an average of 5.85 mds per acre.

The grouping of families according to quantity received works out as follows:

Quantity obtained	Number of families	Percentage
Up to 30 mds	671	*65.6*
Between 31 & 50 mds	180	*17.6*
Between 51 and 60 mds	86	*8.4*
Above 60 mds	86	*8.4*
	1,023	*100.00*

This is sufficiently discouraging but a more detailed break up of the number of families in the lowest brackets shows the position to be worse :

Number of families receiving upto	10 mds of paddy	180
"	from 10 to 15 "	242
"	from 15 to 20 "	209
		631

It is possible that the uneven quantity of the land is responsible for these wide disparities, some receiving only 5 mds while some others received 90 mds, and that the disparities will be partially ironed out when a more discriminating allotment is made at the time of distribution of land to each individual family. Even so, unless the productivity can be increased the maximum that a family could receive on equal distribution out of the yield of 1963-64 could never exceed 27 mds.

The over-all position may be summed up thus on the basis of paddy yield which is a fairly accurate index. In Pharasgaon zone, out of 205 families 26 received above 40 mds of paddy in 1963-64 and 179 below it. In Paralkot, out of 2,223 families 1,130 received above 40 mds and 1,093 below it. In Umarkot, out of 2,834 families 1,993 received above 35 mds and 841 below it. If the dividing line be 50 mds 1,322 families would be above it and 1,512 families below. In Malkangiri zone, out of 1,023 families 352 received above 30 mds and 671 below it. If the dividing line be 50 mds 172 families would be above it and 851 families below. The average yield per acre was 3.37 mds in Pharasgaon, 10.3 mds in Umarkot, 8.35 in Paralkot and 5.85 in Malkangiri. There is no evidence of large scale vegetable gardening which was, in any case, greatly hampered by lack of water and absence of markets. In one zone, agriculture was so poor that people gave it up as a bad business and became workers in the Industrial Centre. Cottage industries started in different zones touched only a fringe of the affected population, and except where the Zonal Administrator was energetic, were either moribund or intermittently active. Where casual labour was available people whose yield was poor eked out a sub-standard living somehow; where it was not, they starved. There is no general policy of giving test relief by providing work where the spectre of famine is in sight, as one finds in the normal administration of a State. Once the full quota of agricultural loan (Rs 850) has been received by the settler for his implements, bullocks, milk cow and seed he has no more claim on the Project Administration for further loans, and whatever further accommodation he may receive is by way of grace which is not always available.

III

Where then do we go from here? Dropping agriculture altogether as a bad business as was once suggested by the Minister would not help. It would mean leaving seven thousand families in the lurch after investing crores of rupees in trying to settle them on land. Apart from the huge waste, no satisfactory alternative for these people can be visualised. Nor would callousness or indifference, such as was shown by an ex-Chief Administrator who, on receipt of a distress signal from a Zonal Administrator, sat over the file for three months and on the eve of transfer recorded a minute 'strongly' objecting to giving any short term loan because it would be "administratively unwise and demoralising". To say that "we should not place any kind of premium on bad husbandry or laziness and should in fact discourage such families by refusing them help and forcing them to stand on their own legs" assumes, wrongly, that poor yield is invariably due to the fault of the settler. And to suggest vaguely that if possible work might be provided overlooks the fact that outside work (assuming it is available) during the crucial three or four months from June to September would leave none to look after cultivation on which the family would have to depend for maintenance for the rest of the year.

Collousness or self delusion of this sort is not the answer. What is needed is a careful and factual analysis of the causes of poor yield in different areas and a determined attempt to remove these causes if possible. Such an analysis was made by the Agricultural Expert Team whose Report, published in the second half of 1963, contains within a short compass a valuable summary of the causes that are retarding agricultural progress in Dandakaranya. For want of space only a brief summary of their findings can be given.

IV

Report of the Agricultural Expert Team

The Team's finding about farm outturn agrees with what has already been stated. An outturn of paddy varying from 2 mds to 7 mds per acre, of mesta about 10 mds, of ground nuts upto 10 mds, of arhar about 5 mds, and of sesamum about 8 mds is a poor enough yield to sustain an agricultural economy even on a minimum level of subsistence. This was not due to 'bad husbandry or laziness' for they found the settler receptive to suggestions and enthusiastic in work though not yet completely adjusted to a new environment and unable to shed the agricultural practices and cropping patterns followed in East Bengal. There should be mixed cropping in Dandakaranya as an insurance against partial failure of either crop and exclusive preference for paddy should be discarded in favour of a new cropping pattern in which the cultivation of maize, arhar, castor, mustard, niger, mesta, tobacco etc all have a place. Leguminous crops like 'dhanicha' could be grown either as a cash crop or as a source of green manure. The Team laid considerable stress on careful selection of seeds suitable to the agro-climatic condition of the locality, and on the need of levelling, terracing and contour-bunding the undulating terrain in which action has 'sadly lagged behind'.

Deficiencies in the physical and chemical properties of the soil are a more formidable obstacle which requires to be tackled by a liberal use of organic and green manure and an adequate

quantity of fertilisers. The growing of manurial and leguminous plants for restoring to the soil the humus which needs frequent replenishment would require setting apart some portion of the land every year for this purpose. For organic manure cow-dung composts are the best and should be available as fuel is no problem in Dandakaranya, but since one pair of bullocks and an occasional milch cow may not yield enough farm yard manure to cover the settler's land in full, a suggestion is made that dairy farms should be started by groups of settlers in as many villages as possible whose incidental by-product will be a sufficiency of cow-dung manure that the villagers will need. Fertilisers are a more difficult problem. For curing acidity about 2 tons of lime per acre are necessary while an application of 100 lbs of ammonium sulphate has been found to double or treble the yield of paddy in Boregaon and Jugani in 1962. "To the extent that these measures are not adopted in practice by all the settlers through lack of conviction or resources the process of rehabilitating displaced persons as farmers will be delayed". Lack of conviction may be overcome by demonstration held in selected, agricultural holdings in villages, but resources can be augumented only by raising the ceiling of loan or subsidising the price. The amount of loan was fixed *ad hoc* and was too small even when it was fixed but with passing years and the rise of prices it has become utterly inadequate.

Greatest Snag

It should be the duty of the Mixed Farms in different zones to investigate scientifically the problems which face the settler. Experiments must not be an inefficient academic exercise in growing exotic varieties as in the Dumriput Horticultural Farm which is situated far away from any zone but directed particularly to solving local problems that are being faced now or are likely to be faced in future. The Mixed Farms should also serve as units for multiplication and testing of seeds and raising livestock and poultry, and as demonstration and training centres where settlers will work for wages and their younger generation will learn with the help of stipends.

But the greatest snag is lack of irrigation. The Team criticise the DDA's preference for big and costly irrigation schemes and its complete indifference to minor irrigation. More than Rs 5 crores were allotted for three schemes, technically called medium, of which only one at Umarkot, viz, Bhaskal Dam (estimated to cost about a crore) was in operation and likely to be completed in 1965 or 1966. Of the other two, actual dam construction of the Rs 2.02-crore Project on the Sattiguda in Malkangiri—pace the statement made in Parliament—is not likely to be undertaken before 1966, and the Rs 2 crore project in Paralkot has only just come out of its chrysalis after having obtained the necessary imprimatur from the CWPC. When it will be undertaken and completed is anybody's guess. Of the benefits of Bhaskal Dam only a tenth will go to displaced persons while the rest will go to others, for out of a total estimated command area of 11,000 acres, only 1,100 acres will be land belonging to displaced persons. It is said that another 400 acres may probably be added by lift irrigation if additional capital is invested and electricity is available at the Dam site what is yet a far cry. Among minor irrigation schemes only one at Pakhanjor estimated to cost about Rs 7.5 lakhs has so far been undertaken but the quantity of displaced persons lands likely to be irrigated by it is small. Twenty-four minor irrigation schemes have been under investigation for a long time, but either because the head of the Irrigation Department is not interested—he confessed he had no experience of minor irrigation and wanted to be relieved of it—or because the investigating engineers are incompetent and lethargic, little tangible progress has been made.

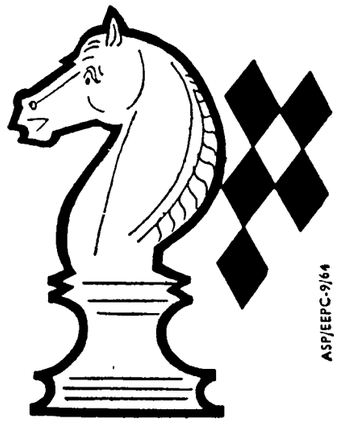
Yet, as the Expert Team say, the DDA would have been better advised if it had concentrated on minor irrigation which have many advantages over bigger and costlier schemes. The time taken in the construction of such schemes would be much less and the benefit would flow immediately, the initial and recurring cost would also be less, the benefit would be solely conferred on the lands reclaimed for displaced persons and adibasis, and the problem of water distribution and utilisation less difficult of solution. But whatever the method adopted irrigation in Dandakaranya is an absolutely imperative necessity without which any expectation of agricultural rehabilitation in the majority of cases will prove a mirage. The settlers will fight a losing battle against uncertain and short-duration rainfall and reap a harvest which will not last them for more than six or eight months in the year. With irrigation they can switch over from rain-fed broadcast paddy to transplanted paddy whose yield is more. They can have a second or rabi crop which now they are unable to do. They can start field bunding or ploughing earlier with the help of water from big storage reservoirs and irrigate the land at the maturing stage if the rains hold off unaccountably early. Agriculture will not be a 'gamble in the rains' as it now is. A small well in the homestead will also help growing of vegetables in the attached kitchen garden in which the women of the family may work.

Organisation for Marketing

But all this will be partly useless without a proper organisation for marketing. If production had been for home consumption alone this would have mattered less, but on the assumption that improved methods would increase output and that crops other than paddy would a have to be grown in larger quantities organisation of sale becomes a matter of urgent necessity. Even the weekly 'hats' spread over the area are not too close to the newly settled villages and settlers who have invested in carts ply a lucrative carrying business; but the bigger urban markets or distribution centres are too far off for these carts to reach. Middlemen are few and there is no competition among them so that settlers are at their mercy. In 1963-64 when the ruling price of 'mesta' at the Mill site was Rs 22 per md many settlers in Umarkot sold it at half the price till by direct negotiation with the Jute Mill owner one of their middlemen was persuaded to lift the balance at prices varying from Rs 15 to Rs 17. Cases have been reported where settlers brought pumpkins all the way from village to 'hat' but finding no demand dropped them by the way side to avoid the burden of carrying a heavy head-load home. In Malkangiri the Zonal Administrator occasionally utilised returning empty trucks to take the produce of the settlers to Jeypour or Jagadalpur which were a hundred or two hundred miles off, but such casual help is too uncertain to be a dependable substitute for disposing of farm produce at a reasonably good price throughout the year.

Should the farming be individualistic or joint? The Expert Team's feeling is that co-operative or joint farming would solve many of the settlers' difficulties if the problem of dealing with the malingerer and of equitable distribution as between small and large families could be properly tackled. But an even greater difficulty is the instinct of

individual ownership which is strong among farmers almost all the world over. The Team want to meet this by suggesting that while the settler will preserve his right over his individual holding, the pooling of land, manpower and other resources will enable the settlers working as a group to derive the maximum benefit. If the settlers can be persuaded to accept this arrangement it will no doubt be a great step forward though preliminary discussions with the settlers have not proved very encouraging.



The latest suggestion of the Ministry is however in favour of Collective Farms run directly by the Project in which displaced persons would be employed as labourers and, if possible, allowed a share of the produce. The suggestion has been made not so much because the Ministry is enamoured of the Collective Farm idea as such as because of a feeling that the new migrants were all land-less labourers of East Bengal who are tempted to cross the border by the lure of land obtainable free. In judging how far this scheme is workable I need only refer to the Project's experience with its Mixed Farms at Umarkot and Paralkot which may serve as fair models of the economics of a Collective Farm of that size run by officials with hired labour.

The pro-forma accounts recently drawn up for these two Farms upto March 31, 1963 show that at Umarkot the excess of expenditure over receipt, as a result of about two years' working, was Rs 2.27 lakhs and in Paralkot it was about Rs 92,000 as a result of a year and a half's working. Even if 40 percent is deducted for the experimental part of these Farms and the frozen assets of the horticultural section which would not bear fruit till four years later, the resultant loss would still be high. In both these cases labour was generally paid at the minimum permissible rate and surplus labour was laid off or discharged when the peak agricultural season was over. Obviously the same method of wage payment cannot be adopted in the proposed Collective Farms, for the refugee families inducted into the Farm cannot be cast adrift after the agricultural season is over. The rate of wages must also be such as would enable the family to live. The wide gap between expenditure and receipt now seen in the Mixed Farms will increase rather than decrease when the Farms are collectivised, and the promised share of the produce in addition to wages will remain a futile dream.

The wise course would be to recognise the tenancy rights of the displaced persons (either as individuals or as members of Co-operative Societies) so that self-interest and the sense of property may be harnessed to increase production. The displaced persons have not yet had their tenancy rights secured by the grant of pattas because the Ministry is as yet unable to decide whether the cost of reclamation and development of agricultural land should be charged to the settler. It would be a cruel joke if people up-rooted from East Bengal who have lost all their assets are made to pay for the development of Orissa and Madhya Pradesh.

Even by putting forth one's best energies and the most liberal capital investment for bunding, levelling, terracing, irrigating, manuring and marketing, etc. a sizeable fraction of the holdings will still be unable to provide a living to their owner. What I have attempted to prove is that the number will be much less than they are now, if the steps suggested by the Expert Team are adopted. For the holdings below the margin some alternative means—either mixed farming with an emphasis on dairying, poultry farming, stock breeding and vegetable growing, or industries or a combination of both—may have to be found. As regards mixed farming a lot of leeway has still to be made, for what has been done upto date has not even scratched the surface. When more than 50 percent of the tanks of settler villages, excavated at an average cost of Rs 20,000 or more dry up in summer, pisciculture becomes out of the question except in big State-owned tanks from which the displaced persons derive no benefit. The supply of milch cows has not escaped criticism either, and the Agricultural Expert Team expresses in somewhat guarded language its fear that the cows and heifers which were supplied free under the stray cattle catching scheme in New Delhi were substituted *en route*. As regards industries, the imbalance in the economy of Dandakaranya with its overwhelming emphasis on agriculture which hardly pays its way and the neglect of industries and other urban pursuits which could provide a living wage has long been notorious, but that is a large question which has to be treated separately.

(To be Continued)

ASP/EEPC-9/64

Win the battle of International trade

There is a rich market for Indian goods abroad. But as an exporter, you cannot sell sub-standard goods. You have to bear the brunt of the battle against powerful western rivals in the world market.

You can win this battle of international trade only on quality, competitive prices and service facilities. The export market can be a source of continuous earning power, provided you exercise strict quality control in the manufacture of goods, adopt modern techniques in production and adhere to high standard of specifications.

Thus you can help the country tide over her foreign exchange crisis and also maintain her prestige in the world.

We are here to guide and assist you in promoting your export.

Unemployment Statistics in India

V R K Tilak

This article refers to the various sources of information regarding unemployment in India and examines the estimates that are available from each of these sources. The figures of unemployment are examined particularly with reference to the period 1951-61, the first decade of economic planning.

HOW many persons are unemployed? The answer to this question depends primarily on the concept used in regard to unemployment. Among the various characteristics of human population, it is perhaps the most difficult of measurement. In developing countries where rapid population growth is accompanied by a large number of new entrants to the labour market, the structural unemployment is growing in size. In most of these countries where agriculture is the predominant economic activity, employment is governed by seasonal fluctuations. Even employment in the manufacturing sector is highly sensitive to seasonal changes as it is mostly confined to the processing of agricultural products. Employment in construction activity is also seasonal in character. The seasonal aspect of the problem adds to the difficulties of measurement of unemployment. Experience shows that it is precisely in countries where unemployment is assuming large dimensions, there is no systematic basis for estimating unemployment, while on the other hand, unemployment is measured with more frequency and greater accuracy in countries where the problem is not so acute. In the latter, there are also several sources to check the estimate of unemployment—unemployment insurance records, trade union returns, labour force surveys, Employment Exchanges, etc.

It is the purpose of this paper to refer to the various sources of information regarding unemployment in India and to examine the estimates that are available from each of these sources. The figures of unemployment are examined here particularly with reference to the period 1951 to 1961 which represented the first decade of our economic planning. The number of persons unemployed in our country is provided by the following sources:

(a) Population census;

(b) National Sample Survey;

(c) Employment Exchanges; and,

(d) Plan estimates.

(a) Population Census

A beginning was made in the 1951 census when the optional question left to the discretion of States was devoted to the problem of unemployment in Mysore, U P and Bombay (now Maharashtra). Information was collected regarding age, sex and educational qualifications of the unemployed besides the duration of unemployment and the type of work sought by them. However, in the 1961 census, a total count of the unemployed was made for the first time throughout the country. Unemployed persons were classified into two groups, new entrants to the labour market seeking employment, and persons who were employed before but were out of employment and seeking work at the time of the census.

According to the 1961 census, the number of unemployed persons was 0.57 millions in rural areas and 0.83 millions in urban areas making a total of 1.4 million in the country as a whole. To what extent there has been an increase in the volume of unemployment between 1951 and 1961 is not known for the country as a whole but there is some indication in regard to the States of Mysore, U P and Maharashtra for which figures are available in the 1951 and 1961 census as shown below:

Table 1: Number of Persons Unemployed in Mysore, UP and Maharashtra

State	1951	1961
Mysore	6,376	44,130
U P	33,155	84,472
Maharashtra	80,460*	1,73,281

*This related to the then Bombay State.

It is obvious that the total figure of unemployment obtained from the 1961 census is on the low side mainly because it is not practical in a massive operation like the census to identify all unemployed persons and partly because of the concept used in the census. For the same reason there is no point in comparing the figures of unemployment between 1951 and 1961 even in the States for which information is available. Although it may be too early to think of the next census, it is a matter for consideration in what manner better results could be obtained in the 1971 census in regard to unemployment.

(b) National Sample Survey

The National Sample Survey has provided the proportion of unemployed persons separately in the rural and the urban population in the country as a whole since its fourth round of enquiry in 1952. The following are the estimates of unemployment on the basis of the National Sample Survey rounds of enquiry as applied to the total population interpolated between the period 1951 and 1961 on the assumption of rural-urban composition as observed in 1961:

Table 2: Estimate of Unemployment on the Basis of N S S Data

Year	N S S Round of Enquiry	Estimated unemployment (in millions)
1951	—	Not available
1952	Fourth	0.36
1953	Sixth	2.71
1954	Seventh	1.56
1955	Ninth	2.33
1956	Tenth	4.26
1957	Eleventh & Twelfth	6.44
1958	—	Not available
1959	Fourteenth	6.82
1960	—	Not available
1961	Sixteenth	6.48

From the above table it may be seen that the figure of unemployment has not moved in one direction, but this could be explained by changes in definitions and concepts used in the various rounds of enquiry. However, the number unemployed went up from 4.26 to 6.48 millions between 1956 and 1961. With the standardisation of concepts and definitions of unemployment, it may be expected that the future rounds of enquiry will provide comparable estimates over a period of time. There is, however, need to examine in what direction these concepts could be improved and better adopted to yield more reliable estimates of unemployment.

(c) Employment Exchanges

Another source is provided by the number of applicants seeking work at

15% of the fare is all you need to deposit with me to become a bona fide passenger! The rest is payable in 20 easy-to-manage monthly instalments! My Pay Later Plan is so simple you can't afford not to fly right now!

employment exchanges. Although there is no difficulty of concepts or definitions here, the estimate of unemployment provided by the exchanges has to take into consideration a number of factors, most important of which are the proportion of unemployed persons registering at exchanges on the one hand and the proportion of employed persons on the live registers on the other. The following table shows the number of applicants on the Live Register of employment exchanges in the country as a whole at the end of March in each year from 1951 to 1964:

Table 3: Applicants for Jobs on the Live Register of Employment Exchanges

Year	No of Exchanges Functioning	No of Persons on the Live Register (in million)
1951	122	0.33
1952	126	0.34
1953	126	0.42
1954	127	0.52
1955	128	0.59
1956	136	0.70
1957	152	0.74
1958	197	0.93
1959	223	1.21
1960	270	1.38
1961	307	1.56
1962	334	1.85
1963	349	2.48
1964	356	2.45

The above figures indicate a continuous increase in the number of persons remaining unemployed at exchanges, but it is not clear to what extent it is due to an actual increase in unemployment and to what extent it is due to the opening of additional exchanges, increasing popularity of exchanges following the Employment Exchanges (Compulsory Notification of Vacancies) Act, 1959 and so on. However, it is known that the proportion of unemployed in urban areas who registered at exchanges increased from 27.0 per cent in 1953 to 33.5 per cent in 1951 as observed by the National Sample Survey. It is also known that nearly one-third of the applicants who are registered at exchanges are already employed and are seeking better avenues of employment as revealed by the survey conducted by the State Statistical Bureaux in a number of States. These proportions however require a constant review and uniform practices are required to be followed by exchanges in all the States to keep the live register uptodate.

(d) Plan Estimates

For any estimate of unemployment, the three sources mentioned above provide the raw material which requires to be processed for use in planning. The estimates of unemployment given in different plans are mentioned below:

Table 4: Estimates of Unemployment

Year	At the Beginning of	No Unemployed (in millions)
1951	First Plan	Not available
1956	Second Plan	5.3
1961	Third Plan	9.0 (original)
		8.0 (revised)
1966	Fourth Plan	12.0 (anticipated)

It will be interesting to examine how the procedures in estimating unemployment have been evolved from Plan to Plan partly based on the results available from the various sources and partly on the basis of the "carry forward" effect of the previous plans. To start with, the First Plan did not make any estimate of unemployment. The Second Plan estimated unemployment at 5.3 millions which comprised 2.8 millions in rural areas and 2.5 millions in urban areas, the former on the basis of the findings of Agricultural Labour Enquiry 1950-51 and the latter on the basis of National Sample Survey in 1953. The latter figure was also corroborated by live register of employment exchanges after making due allowance to the proportion of the total unemployed registered at exchanges. At the time of formulating the Third Plan, however, there was no direct reference to the N S S or employment exchange figures; but the backlog of unemployment from the Second Plan (5.3 millions) was carried forward after adding to it 1.7 millions to make up for the under-estimate previously made of the new entrants to the labour market during the plan period and 2 millions for the short fall in the previous plan achievements. Thus the total unemployment at the beginning of the Third Plan was estimated at 9 millions. This figure has been subsequently revised to 8 millions taking into consideration the results of N S S since available and the earlier over-estimate. It is now anticipated that the Fourth Plan will start with a backlog of 12 million unemployed persons which is again obtained by the "carry forward" of 8 million from the Third Plan to which the short-fall of the Plan achievements in relation to the new entrants to the labour market to the extent of 4 million has been added on.

Educated Unemployed

A brief mention may be made here with regard to unemployment among educated persons, i e, those who have passed High School or higher examinations. The Study Group on Educated Unemployed set up by the Planning Commission in 1955 estimated the educated unemployed at 0.5 million in 1956 which was also the figure referred to in the Second Plan. This estimate was based on employment exchange figures after necessary adjustment for the proportion of unemployed registered at exchanges as revealed by the N S S. Subsequently, the Third Plan put this figure at 1.0 million in 1961 on the same basis as that adopted by the Study Group. In this context, it may be relevant to refer to the number of educated applicants remaining on the Live Registers of exchanges.

Table 5: Number of Applicants on the Live Register of Employment Exchanges

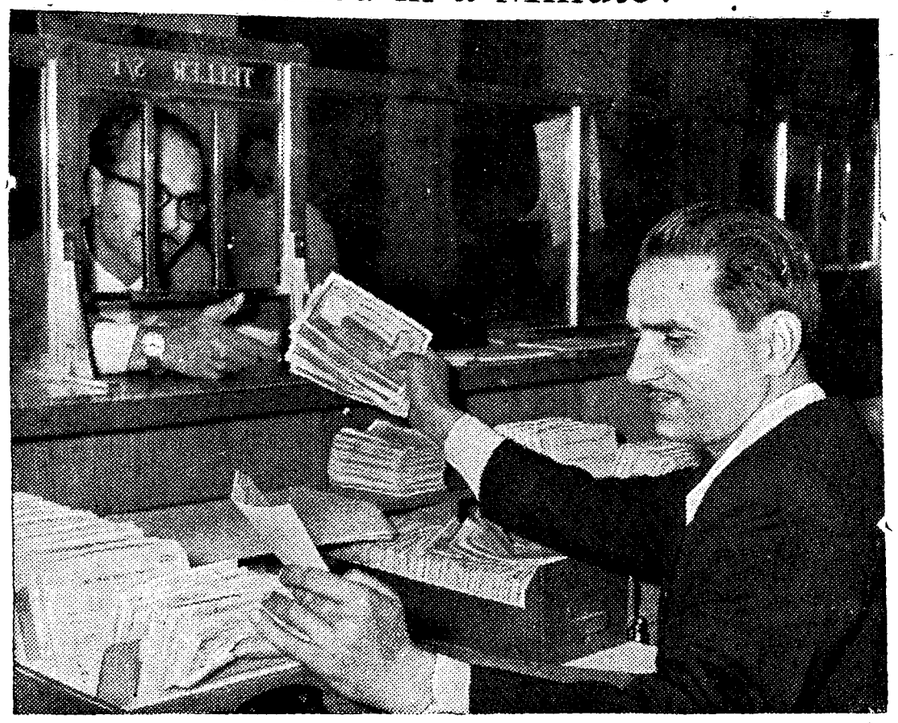
Year	*(in millions)*
June 1956	0.25
June 1961	0.56
June 1964	0.80

As already mentioned, the above figures require to be examined taking into consideration *inter alia* the proportion of the total unemployed registering at exchanges. It is known from the National Sample Survey that the proportion of unemployed matriculates and intermediates registered at exchanges went up from 40 per cent in 1953 to 64 per cent in 1961 and of graduates from 22 per cent to 60 per cent during the same period.

Conclusion

The following are some of the broad conclusions that may follow from the above analysis of the sources of information on unemployment and the figures provided by them:

(i) All the three available sources, viz, the Census, National Sample Survey and Employment Exchanges have yielded valuable information on unemployment, but the activities of these agencies require to be co-related and their results analysed to yield firm estimates of unemployment. For this purpose these sources should be strengthened and properly co-ordinated.



(ii) There is need to make one agency responsible for estimating the figure of unemployment and for reviewing it on a continuous basis at the national level.

(iii) The figures of unemployment now available do not permit a time-series to be developed partly owing to difference in the concepts used by the same agency or by different agencies and partly due to other factors. It is absolutely essential that a series of unemployment estimates is built up as it is one of the most important economic indicators.

(iv) While the plan estimates are based on the best possible judgment of available information at the beginning of each plan, there is need to make more frequent estimates during the course of each plan. This would enable a review of the unemployment situation even before the plan comes to a close in order that remedial action, if any, could be taken in time.

(v) The estimates of unemployment have to be developed not only at the all-India level but also at the State and regional level on a continuing basis.

Cashed in a Minute!

And that is precisely what we mean. It takes no longer than a minute to cash your cheque at any PNB office with the Teller System.

The streamlined Teller System eliminates tokens, queues, all tedious and unnecessary waiting and delay.

PNB was the first bank to have introduced the Teller System as far back as 1954. Today, PNB has 90 branches operating this system and plans to introduce this on-the-spot service in 60 more branches throughout the country.

Substantive Forces in Indian Administration

A Comment

Donald B Rosenthal

WHILE many of the points which C N Bhalerao makes in his article entitled "Substantive Forces in Indian Administration" *(The Economic Weekly,* October 17, 1964) are unexceptionable, the conclusion which he reaches seem to be in sharp contrast to some of his statements a few pages earlier. Space limitations undoubtedly led the author to rely upon excessively simplistic generalisations, but the internal logic of the argument also appears to be wanting.

First, while it may be true that many under-developed countries have to contend with what Bhalerao calls "semi-feudal" bureaucracies (an unfortunate label at best) this does not really seem to be the problem in India. Indeed, if one is to rely upon a Weberian definition of bureaucracy, the Indian system of administration has for a considerable amount of time (going back to the pre-British period) served effectively, if not always imaginatively in performing system-maintenance functions. The current problem, of course, is to reorient the administrative structure toward an activist role in Indian society. The answer, indeed, seems to be to "debureaucratize" the bureaucracy which is precisely the direction in which the system appears to be headed although the author's position is more than a little ambiguous on this vital point.

More Politics, Not Less

The problem, as Bhalerao later suggests, is one of infusing the bureaucracy with certain organizational goals which lie beyond the maintenance of bureaucratic organization as an end in itself. However, one possible answer to this problem is to introduce *more* politics into the administrative system and not less. This is in no sense a "modern" problem as opposed to a traditional one and thinking about Indian administration in those categories is not very helpful.

This leads me to my second point. Bhalerao seems to have relied upon an old image of the nature of the relationship between politics and administration in developed nations. Or, rather, he tends to attribute a value to the ideal of administration set down in Western textbooks without inspecting the conflicting values which are part of the real functioning of administrative systems in Western countries. This is understandable given the self-glorification which has been attached to politically "neutral" administration in many countries. Bhalerao reflects this position where he remarks:

> "The substantive processes of administration in these countries (i e, the new nations) have a character of their own, not comparable to Western administrative processes, and often bypass the neatly formulated civil service laws and constitutional provisions."

While it is probably true that each nation has its own characteristic way of arranging relationships between administrative and political activities, it is certainly not true in the United States that politicians and politics do not play a significant part in the administrative process. As people dig below the surface rhetortic in other countries, the political biases of administrative systems also become apparent. Political control over the prefectures in France and Italy (or at least the conservative biases which are built into these systems) make administration in every country considerably more than a problem in technical expertise. There is nothing unique about India or other new nations in this respect.

Thirdly, I am not quite sure what the logical connection is that the author attempts to establish between the operation of democratic politics and the development of "dynamic administration". If anything, I have suggested, nothing would be so likely to activate administration as the successful infusion of democratic politics into the overly bureaucratized administrative structure. As the Marwaris have demonstrated, nepotism is not the worst thing that might happen to an organization.

As part of the same sentence (p 1682) refering to the need for "dynamic administration" which is hindered by politicians being in power, the author seems to suggest that left to its own devices the administrative system would be able to "tackle issues in a scientific and thorough manner". What real *evidence* is there for the notion that a self-propelling administration would do so or that a more congenial political leadership would really spur administrators to enterprising activity? In practice much depends on the *quality* of political leadership, but certainly the process of selecting Cabinet members on the basis of political criteria is less important than the existence of a relatively coherent party organization or its absence. The difference between Madras and Maharashtra, on the other hand, and Uttar Pradesh, on the other, is a case in point. No one could prove that selection for membership in the Maharashtra Cabinet is less politically motivated than membership in the UP Cabinet.

Falls into Administrator's Trap

Fourthly, that the Congress party has developed an *effective* political organization in its planning mechanism is highly debatable. It is true that political links exist at all levels through the control of party nominations and that local conflicts may stall the work of the administrators and the application of bureaucratic standards, but frequently the administrator is trying to carry out those standards in a manner which Bhalerao elsewhere in the article describes as "rigid". At the same time, few politicians at the local level are really stimulated to make an important contribution to the planning process.

In general, the author falls into the administrator's trap, while seeming to deny that he is doing so. Is it clear from his argument that the politician can really come out ahead in a game where he is not permitted to interfere in day-to-day administration?

I raise this point because of my recent study of Indian local government in Agra and Poona. Obviously, the role of the corporation Chief Executive Officer is the model which Bhalerao seems to prefer, i e, the politicians are around to complain a little and to perform certain ritual duties at budget time, but ultimate power rests with the administrative head. The politicians are to lay down "general" policies, but in practice the more general the policy, the greater discretion is left to the administrator. If administrators become *politicians* under the present system, that is no worse than their becoming *policy-makers* under the suggested

system. Indeed, the former situation is to be preferred since they will be responding to the real demands which exist in the society and not to their own conceptions of what a public interest should be. The author seems to be suggesting that just such a responsiveness is desirable when he says:

> The test of an effective democratic administration is the extent to which is represents the needs and experience of the different sectors of society and serves as an effective instrument of social change.

But somehow he assumes that the administrator left to his own devices can do this better than if he is under the lead of a politician.

In passing, I might also allude to his complaint about the importance of the dominant castes in various states in selecting civil service appointees. It is debatable whether this actually is a narrower pool to draw from than the previous sources of recruitment to the IAS. Few castes are so thoroughly dominant in any state that they do not require other caste allies and a frequent "payoff" may have to be in the form of jobs and services in the administration.

Admittedly this tends to undermine the position of all-India service, as does the recent discussion about allowing applicants for IAS positions to take examinations in the vernacular, but it is no more inherently unfair than the personality test which has formed part of the civil service examination process in both India and England. There is no need to cite here the recurrent complaints in the United Kingdom that public school types wind up in higher civil services positions because they fit into the self-defined bureaucratic image.

Particularism in Administration

Fifthly, I would suggest that one of the roles of the politician is to bring particularism into the administrative process. In the United States, Congressmen and state legislators perform this function, which is often described as "casework". Some members of the United States Congress build their legislative careers on this. The practice also exists in England and elsewhere.

In a sense, as the forces for increased bureaucratization are in operation in nations demanding significant social and political change, democracy is threatened unless particular and individual interests can also be served. Indeed, Bhalerao seems to be suggesting the need for just such activity when he says: "Administrative decisions are based on too much conformity with established practices, rules and procedures which discourage examination and challenge" (1683). What I am suggesting is that politicians are appropriate element for encouraging that examination and challenge.

Next, I wonder what Bhalerao really means by the *public interest*. Why does he seems to imply that the administrators are inherently better able to serve it than the politicians? Isn't it possible that in some circumstances by acting to "please the higher authorities" the bureaucrats are actually serving the public interest?

The reasons for corruption, which is the next subject, brought up by the author for discussion are rather difficult to establish, but certainly the organizations set up to investigate the problem and lead campaigns against it are not likely to inspire much in the way of change. Both politicians and administrators are guilty in this area, but undoubtedly a considerable part of the corruption which occurs in India is due to the cumbersome nature of the administrative system. A few rupees may speed up the process in moving a document through innumerable channels. To a certain extent the continuance of the present system encourages both the politician and the administrator who milk it to their own advantage, but one solution lies in the development of a more competitive party politics which might help to alleviate this situation by challenging the established communications pattern. Of course, the *bases* of corruption in India (as in any society) go much deeper *than the* complexity of the administrative structure.

Ultimately, I would suggest a prime solution to the present weakness in the Indian political structure must depend upon the development of an effective party system in India where the opposition can *profit* from exploiting the mistakes of the present government. Congress has often revealed its own mistakes, but no one has been able to effectively check this and the process simply continues. The falling vote of Congress in elections, suggests that the public is not completely insensitive to these problems.

Finally, the achievement of those worthy qualities which Bhalerao projects for administration — "flexibility, scope for initiative and an atmosphere which encourages scrutiny and change of traditional forms when they are found unsuited" — require a *greater* infusion of political purpose into the administration of India and not a withdrawal into a modernized version of the pre-Independence district officer.

Thus while I find certain statements in the Bhalerao analysis with which it is easy to agree, I have tried to add a few cautionary notes arising from a somewhat different perspective on the appropriate relationship between politics and administration. I have said very little about the problem of developing high quality politicians who are checked in their actions by an interested public. This remains a considerable problem for every developing society.

Export of Raw Goat-Skins

TO promote and encourage the tanning and finishing of raw skins and hides into tanned and finished leather, the Government of India has decided to reduce the raw goat-skins export quota from 55 per cent to 50 per cent of the basic quota. The minimum quota has been reduced from 1,25,000 pieces to 1,10,000 pieces per shipper. This has been done in the expectation that the tanning industry will expand the existing leather tanning and finishing facilities in all the regions of the country and also establish new tanneries and finishing units so that processing of raw skins in the country can be stepped up and consequently the export of tanned skins and finished leather can be increased in preference to their export in the raw stage. Government have also been giving encouragement to the manufacture of more leather goods which can be exported.

The State Governments have undertaken programmes for assisting, promoting and establishing leather tanning and finishing factories in their States. The Central Government have also requested the State Government concerned to give liberal credit assistance and other facilities to the existing tanning and finishing units and for the establishment of new factories. The Government of India have promised all assistance in the form of import of such machineries and equipment as are not yet indigenously made for establishing more such factories.

Over the past decade, there has been a welcome development in the expansion of leather tanning and finishing industries and it is hoped that in the coming years it will be possible to reduce further the export of raw skins and promote the export of tanned skins, finished leather, shoes and leather goods.

From the Chair

Ashok Leyland Limited

Speech of the Chairman, Sir A Ramaswami Mudaliar

THE following is the Speech delivered by Sir A Ramaswami Mudaliar, KCSI, DCL (Oxon), Chairman, Ashok Leyland Limited, to the Shareholders at the Sixteenth Annual General Meeting of the Company held on 17th December 1964 at Ennore, Madras :

Gentlemen,

I have great pleasure in extending to you a cordial welcome to the Sixteenth Annual General Meeting of your Company.

The Directors' Report, audited balance sheet and profit and loss account for the year ending 30th September 1964 have been circulated to you and, with your permission, I shall take them as read.

As the Profit and Loss Account shows, the sales for the year 1963/64 at nearly Rs 17.38 crores were a little over 59% in excess of the corresponding figure for 1962/63. This result was achieved by an increase in the average output of Comet chassis per month from just over 200 in 1962/63 to 315 in 1963/64; and by a substantial increase in the sale of spare parts, arising partly from a larger allotment of foreign exchange providing for the manufacture of more spare parts in your factory. The surplus available after provision for taxation has enabled your Directors to propose a dividend of 9% subject to deduction of tax and to transfer to general reserve a sum a little in excess of Rs 36 lakhs.

Your Factory's ability to increase its output by over 50% in one year must be accepted as unusual, being in excess of what could normally be expected. In January 1964, in my speech at the last Annual General Meeting, I enumerated the reasons which had made the results for the 1962/63 year disappointing. I also advised you that it was possible to anticipate an improvement with some confidence; and I indicated that the re-establishment of a flow of materials adequate to sustain the Factory's output, the more rapid installation of plant and machinery after a period of delay in machine tool deliveries and other steps which your Company had taken to overcome the difficulties faced during 1962/63 would make 1963/64 a more satisfactory year from the financial point of view. By the end of 1963, production had been re-established at a satisfactory level; and it is to the credit of all concerned that throughout the year which ended on the 30th September 1964 there was a steady improvement.

Smooth Progress

A study of the graph of output from 1954 to 1964 included in the Balance Sheet, will show that a smooth upward curve could be drawn, on which the actual output figures would lie approximately, with the exception of actual output figures for 1961/62 and 1962/63, the former being above the smooth curve and the latter below it. This indicates that in the year 1961/62 we produced more chassis than was justified by the foreign exchange available for imported materials, this fact contributing among others which I have previously enumerated to the very serious drop in production in 1962/63. I would not wish to be over-optimistic on the basis of the 1963/64 results, but it is very satisfactory to note that they indicate a reversion to the previous steady increments in yearly output, the actual 1963/64 output being approximately equal to what the curve would indicate. It is interesting to record that your Company anticipates an output in the 1964/65 year of not less than 4500 "Comet" chassis and that this figure is close to the one which would be obtained from the curve to which I have referred, if it were plotted from an equation satisfying the actual outputs from 1954/55 to 1963/64, excluding the figures for 1961/62 and 1962/63. It is to be noted that if the 1964/65 target is achieved, the increase in production will be approximately 20% in comparison with the 1963/64 year.

It is necessary for me, at this point to emphasise that all forecasts of future developments assume the maintenance of good relations between Management and employees. While, on the whole, these relations have remained cordial since your Company started production in 1954/55, there have recently been indications of some restlessness amongst employees, leading to a regrettable tendency for workmen deliberately to reduce output on several occasions, with a view to induce Management to make concessions. The temporary shortage of rice, which has faced employees with domestic worries, has contributed to some deterioration in their readiness to co-operate in achieving full output from the Factory. It is hoped, however, that better counsels will prevail and that the Company's employees will revert to a tempo of work which will maintain the steady increase in output which must be achieved for economic working.

Expansion Programme

I am happy to be able to inform you that the expansion programme initiated in 1960 with a view to increasing the production of Comet chassis to not less than 5000 per annum, with adequate provision for spare parts manufacture is nearing completion. Within a month or two all the plant and machinery, including jigs and special tooling, will have been installed; and steps taken some time ago to train artisans will make it practicable for full utilisation of the installed capacity to become effective. Based on the output achieved during the 1963/64 year, it is possible to hope that actual production will in due course considerably exceed the planned figure. This arises from the fact that, assuming your employees will work with a will, their efficiency will be at a higher figure than was anticipated, so that in future years it will not be at all impossible to achieve outputs considerably in excess of 5000 per annum without further capitalisation. At the same time, it will become increasingly practicable to produce in your factory spare parts adequate to meet the demand.

I have referred to the production of spare parts as one of your Company's important activities. In recent years, the supply of spare parts to your customers has been, for reasons beyond control, far from satisfactory and too many vehicles have been temporarily unserviceable for prolonged periods because essential replacements parts were not available. In common with other Automobile Manufacturers, your

Company faced the difficulty that insufficient foreign exchange could be made available for the import of spare parts, while factory facilities remained inadequate to provide for the level of output necessary to meet the demand not only for current production but for the servicing of the large number of vehicles already in service. Another disability has been that the ancillary industries, manufacturing in India a wide range of components which manufacturers purchase in the finished condition, were unable to meet the demand for spare parts additional to supplies made to manufacturers for inclusion in the chassis and engine. The position has already greatly improved and will continue to do so. More foreign exchange has been made available for importing spare parts not available from Indian factories; and improved output facilities in the factories is enabling manufacturers increasingly to produce components, additional to those required for chassis manufacture, for sale as spare parts. If the present improvement can be maintained, it is anticipated that your Company will soon be in a position to meet all spare parts demands within a reasonable period from the receipt of orders.

I have referred to the general expansion programme which was inaugurated in 1960. More recently, in 1963, with a view to increasing the indigenous content of the Comet chassis, it was decided to add to components being manufactured in your factory differential wheels, pinions and trunnions; engine cam shafts; and engine timing gears. Your Directors decided that it would be undesirable to risk over capitalisation by making a capital issue to cover the expenditure which would have to be incurred on the import of plant and machinery for the manufacture of these new components. Accordingly, a loan of Rs 60 Lakhs was negotiated with the Commonwealth Development & Finance Company, which became available from August 1964. All the plant and machinery required for this expansion of the Factory's manufacturing facilities is currently being ordered and it is hoped that it will be installed so that actual production will commence in 1965. With the inclusion of this additional range of components to be manufactured in your Factory and your Company's ability to purchase additional bought out finished components, for example brake assemblies, from new manufacturing concerns established more recently in India, it is anticipated that it will be possible to increase the indigenous content of the Comet chassis to 90% before the end of 1965, compared with a figure of 82% at the present time.

New Models

In my speech to you in January 1964, I informed you that the Government of India had approved the inclusion of new models in your Company's range of products, based on the Leyland Beaver chassis; and I enumerated the types of vehicles it was proposed to manufacture. You will be pleased to know that during the 11 months which have elapsed since the last Annual General Meeting, considerable progress has been made with planning for the introduction of the heavier duty chassis. The provision of funds for the construction of new buildings for the first phase of the "BEAVER" project has been included in the Company's 1964/65 Capital Budget. Building plans are nearing completion and work will be commenced in the near future. Provisional estimates have been completed with a view to assessing the expenditure which will have to be incurred on plant and machinery for the new project. These estimates indicate that about Rs 330 Lakhs will be required for the purchase of machine tools, jigs, etc which will have to be imported. Additionally, a sum exceeding Rs 200 Lakhs will be required for building and for plant and machinery to be purchased in India. Your Directors are giving their active consideration to the most advantageous manner in which finance can be made available to meet the very high level of expenditure involved. In this connection, it is with pleasure I am able to inform you that the Leyland Motor Corporation has indicated its readiness to provide the amount of Rs 330 Lakhs (approximately £2.5 million) which will be required for imported plant and machinery, subject to satisfactroy arrangements being approved by the Government of India. Your Company is engaged in ascertaining as closely as possible the amount of money in rupees which will become available from internal resources, so that it will be possible to calculate the balance which will have to be provided by a capital issue. As far as work on this problem is concerned, it appears that it will not be necessary to raise capital to cover the total estimated expenditure of approximately Rs 550 Lakhs (the sum of the amount required for imported plant and machinery and that required for buildings and plant and machinery to be purchased in India). It is probable, therefore, that the necessary finance will be raised partly by a capital issue and partly by a loan from the Leyland Motor Corporation, subject to the Government of India approving such a loan and its terms. Certainly, however, some additional capital will have to be raised and an application to the Controller of Capital Issues has been made for a new issue of Rs 221 Lakhs, of which Leyland Motor Corporation will take approximately Rs 133 Lakhs and the balance be subscribed by Indian shareholders.

Until such time as the heavier duty chassis have 100% indigenous content, it will, of course, be necessary for your Company to obtain an allotment of foreign exchange to cover the import of components from the United Kingdom. It is possible that such an allotment will not be made earlier than the 1st April 1965, so that the first of the heavy duty chassis for sale may not be available until after June 1965. Market surveys indicate that there will be a demand for the heavier duty chassis which will justify your Company's decision to include the new models in its range of products. In this connection, it is anticipated that by 1968 when production of the heavier duty chassis will be fully established, with a high indigenous content such restrictions on gross vehicle weights as might at the present time inhibit sales in a number of States will have been amended, so that it will be practicable for road transport users to take full advantage of the greatly increased payload capacities of the new model.

Ennore Foundries

The increase of your Company's demand on Ennore Foundries Ltd and additionally the increase in the demand for iron and aluminium castings by other manufacturers has necessitated steps being taken to ensure that Ennore Foundries can meet this demand. Plans are nearing completion and orders have already been placed for plant and machinery to enable Ennore Foundries to increase its output to 200 tons per week. Looking to the future, provisional plans are already in train, so that when the demand arises the Foundry output can be increased to something over 400 tons per week.

You will be interested to know that your Company recently prepared a Five-Year Plan with a view to forecasting the probable increase of its turnover, the capital expenditure necessary to achieve it and the likely profitability each year. Calculations made in relation to this Five-Year Plan indicate that by 1967/68 the Company's turnover may reach a figure of about Rs 33 Crores, with a reasonably fair profit on capital employed at that time, after taxation. Data utilised for the preparation of this Plan were conservative, revenue being calculated on the low side and the expenditure on the high. However, the figures must necessarily be treated with reserve because the assumptions on which they have been based may prove incorrect with the passage of time. Any unexpected or abnormal increase in material costs, reductions in foreign exchange available for the Automobile Industry, loss of production due to labour disputes, etc would obviously reduce the turnover and at the same time the Company's profitability. The plan will, nevertheless, be useful, as representing reasonable annual targets at which the Company can aim and indicating that subject to reasonably normal conditions being maintained, output of your Company's products may increase steadily with satisfactory profitability.

I have considered it necessary to give you a fairly detailed account of the programme of expansion which the Board has decided upon and which I trust will have your approval.

Changes in Board and Top Management

Let me now refer to the changes in the constitution of the Board itself and to the changes in the Company's top management. It is with deep regret that I have to report the loss that the company has sustained by the sad demise of Sir Henry Spurrier, Chairman of Leyland Motors, and a Director of your Company since the collaboration agreement was arrived at by the Indian Company with Leyland Motors. Sir Henry took the keenest interest in the development of the Indian company and we were fortunate to have more than one visit from Sir Henry, to your factory and offices. It was his vision which enabled us to undertake the expansion of this company, after its formation as Ashok Leyland Ltd. The Directors have placed on record, their deep sense of loss at the passing away of Sir Henry and I am certain that you as shareholders, will join in expressing your great appreciation of his contribution to the success of the Company and your regret at his demise.

Mr W. West, Chairman and Managing Director, West Yorkshire Foundries Ltd and a Director of Leyland Motors, has been co-opted as a Director in the place of Sir Henry.

I referred to changes in the top management of the Company. Mr A E L Collins, who has been Managing Director of the Company since its reconstitution, is shortly leaving us to take a place in Leyland Motors, London. His services to your Company have been invaluable. His devotion to duty, his concern for the growth and prosperity of your Company, his intimate knowledge of Indian conditions, his suave manners and his tact in dealing with the staff, particularly with the workers in the factory, cannot be exaggerated. Mr Collin has set a pattern of conduct as Managing Director which can be paralleled by only a few examples. As this will be the last meeting of the shareholders which Mr Collins will be attending as Managing Director, I am sure you would like to place on record, a Special Resolution of appreciation of his unique services.

To remove any deep feelings of disappointment at his departure which you may feel at this juncture, I should hasten to state that he will still be available to us for advice and consultations in India over a long period. In the projects that we are undertaking, the expansion that we contemplate, it is essential that Mr Collins, who has been associated in the planning and has such intimate knowledge of it, should be available, particularly in the initial stages. I said that Mr Collins will be joining the Leylard Motor Company in London, but he has kindly agreed to visit our Company at least once a quarter to see the progress we are making and give us the benefit of his advice. We are extremely thankful to Mr Collins for this gesture of his deep interest in our Company — a gesture which entails not a little trouble, labour and time on his part. We are also thankful to Leyland Motors for not merely agreeing to this proposal, but actively supporting it. As you will see from the Notice, Mr Collins will be retiring at the end of March from the services of your Company.

From the notice of the Meeting before you, you would have seen that the Board of Directors has decided to appoint Mr J C Watson as Managing Director of the Company for a period of five years from the 1st April 1965. Mr Watson has been the Factory Manager from the 1st October 1963. His work has been quite satisfactory and much of the credit for the improved production in the factory during 63/64 is largely due to him. The Directors have no hesitation in recommending to you, for approval, the resolution which is before you, to appoint him as Managing Director for the period mentioned therein. With your approval, the Company will approach the Government for its sanction.

Thanks

It only remains for me now to thank the Management, Officers, Clerical Staff and the Workers at the Factory for their enthusiastic co-operation which has helped the Company to progress steadily during the years. I trust that this co-operation on the part of the workers, particularly, will continue in the future and even as they are proud of the place that Ashok Leyland occupies in the automobile industry in India now, they will be even more proud in the near future, of its position—a position which will be due in no small measure to the co-operation of Officers, Staff and Workers.

I should like to thank both the Central Government and the State Government for the advice, help and assistance that we have received from them.

Finally, I should like to thank you all — the Shareholders of the Company for the continued support that you have extended to us, which has enabled the Board to go confidently forward with its plans for enlarging the scope of your Factory.

NOTE :— This does not purport to be a record of the proceedings of the Annual General Meeting.

New Companies

DURING November 1964, 99 new companies were registered with an authorised capital of Rs 108 crores. In the preceding month 74 new companies were registered with an authorised capital of Rs 11 crores. During November 1963, 121 companies were registered with an authorised capital of Rs 15 crores.

During November 1964 the largest number of companies was registered in Maharashtra. The Union Territory of Delhi was second with 20 new registrations. In the States of West Bengal and Madras 19 and 11 companies were registered respectively. In the remaining States 23 companies were registered. During the month 18 big companies with an authorised capital of Rs 50 lakhs and above were registered.

Around Bombay Markets

Dalal Street in Good Mood

DALAL STREET has been having a holiday for the past one week and there are still a few more days to go before it reopens for official trading. The market sentiment in kerb dealings holds out the hope of a fairly promising start for the New Year. Equities have staged quite an impressive recovery from their December low levels and several counters are now quoted around the highest levels for many weeks. National Rayon which had been marked down to Rs 326—the lowest for 1964—early in December, have recovered to Rs 374; Century have come up from Rs 549 to Rs 584, Tata Steel from Rs 142.75 to Rs 148, Indian Iron from Rs 25 to Rs 26.20, Standard Mills from Rs 553 to Rs 614, Hindustan Motors from Rs 16.08 to Rs 17 and Tata Locomotive from Rs 258 to Rs 275.

The market had been declining for several weeks without any worthwhile rally even though the corporate news had been fairly encouraging. By about the beginning of December, it had come down to within a striking distance of its 1964 low, with quite a few scrips establishing altogether new low levels for the year. Technical considerations alone could have easily produced a recovery of the order that has now taken place and it could be easily extended farther without indicating any change in the underlying trend. It is too early to say whether the current rally would mark the beginning of a new major upward move. It could and much would depend on the coming February Budget.

There has, however, been an appreciable change in the mood of the market in recent weeks in that it is now inclined to respond to favourable news. The Prime Minister's assurance at the annual meeting of the Associated Chambers of Commerce, Calcutta, that the Government is giving serious attention to measures needed to revive the capital market has been a source of great comfort to the stock market. The tax concessions announced by the Finance Minister recently, though limited in their scope, have strengthened the market's belief that the Government means business. Tax credit ranging from 2 to 5 per cent on new equity investment in specified industries, up to a ceiling of Rs 35,000 tax relief on funds transferred from abroad and the removal of two per cent surcharge on interest on Government securities do not add up to much and they are unlikely to have any important impact on the capital market. But the significance of these measures lies not so much in the amount of actual relief that they provide as in that they serve to indicate more clearly the Government's anxiety to tone up the capital market which has been in an awfully bad shape since long. Several first class issues are at present quoted at a discount. If individual savings are to be mobilised for industrial development, the cult of equity will need to be firmly re-established—re-established because equity prices in India have been declining despite increasing inflationary pressures on the economy with the result that individual savings are now being increasingly employed in commodity markets.

Cotton

Prices Above Ceilings

THERE has been no material change in recent weeks in the situation obtaining in the cotton market. Spot prices remain well above the ceilings though there has been a slight setback from the highest levels recorded about a fortnight ago. Official activity in futures has been at a standstill for several weeks as the hedge contract has been quoted above its operational ceiling of Rs 775 (per 3 quintals); in kerb dealings, the contract has been bid up to around Rs 783 which is only Rs 15 below the statutory ceiling of Rs 798. That business in futures should be allowed to be transacted above the ceiling prescribed for the pre-delivery period shows that the East India Cotton Association has no control over the activities of its members. The Forward Markets Commission has prescribed a margin of Rs 15,000 per 100 bales on all 'long' positions when the hedge contract rises above Rs 775. But since the contract cannot be officially quoted above Rs 775 during the pre-delivery period the bulls are not liable to pay any margin as yet even though the March contract has been quoted (unofficially of course) above Rs 775 for over a month.

If the market authorities had really meant business they should have enforced the margin long ago. There is no

Thursday, Morning

sense in waiting for the commencement of the delivery period. And the technical hitch could be easily overcome by making the margin applicable at any rate below Rs 775. If the bulls had been called upon to deposit the margin without being able to receive any payment at above Rs 775 this would certainly have created an impact on the market and restrained bullish fervour in the future market. It is surprising that the market authorities should not have bothered to take any stern action to check bull manipulation. It may be that the authorities have developed a greater sense of respect for the sanctity of the contract. But it seems more probable that they are unwilling to take any action which might harm the interest of bulls. That certainly is the general market opinion.

Why Inaction

What happens to the fortunes of bulls and bears does not really matter much. It is the spot material which really counts and it is here that the situation is most disturbing. It is some two months ago that spot cotton prices pierced the ceilings thereby reducing cotton control to a farce. All that the Government has done and that too only very recently is to announce the introduction of quality and *vatietal* survey at the point of delivery to the mills and the fixing of the last date for ginning and pressing of cotton in certain States. While survey is intended to prevent transactions in cotton at above the ceiling rates, the last dates for ginning and pressing are being fixed in order to accelerate the movement of cotton. Both these steps are in the right direction but, by themselves, they cannot be expected to achieve much. Survey has its limitations, depending on how honestly and efficiently it is carried out. As for the measure, it is pertinent to ask what the Government is going to do in case the cotton growers and 'kapas' merchants do not take all their 'kapas' to the ginning factories within the prescribed period. It is really amazing that the Government should not have resorted to requisitioning of cotton on a large scale when prices are known to have pierced the ceilings in a big way. Requisitioning is by far most important feature of any scheme of price control; it gains particular significance when prices are believed to have flared up despite a fairly satisfactory supply poistion. If the Government does not have the administrative ability to enforce price control then the control should be done away with, which, of course, would be a counsel of despair.

Much has been heard recently about the controversy that has been provoked by the Indian Cotton Mills' Federation's draft scheme envisaging the purchase of all cotton needed by mills by one single agency. The scheme provides that all existing contracts for cotton purchase made by the individual mills will have to be registered with the Federation. Cotton deliveries to mills under these contracts will be permitted only if the Federation is satisfied that the purchase prices are within the prescribed ceilings. Individual mill's requirements of cotton will have to be registered with the Federation and in no case they shall be for more than 1/12th of the mill's annual cotton quotas. Mills will not be permitted to make purchases through their normal channels, unless on an understanding that the contracts are provisional and are subject to confirmation by the Federation's buying agents. The respective payments will be made through the Federation's buying agents. If the Federation feels that purchases are being made by any mill in violation of the terms laid down in its scheme and at prices above the ceilings, then it will be with the Federation to recommend to the Government to requisition the cotton stocks of the mill concerned and to make them over at controlled prices to the Federation's buying agents. If cotton prices continue to rule above the ceilings, despite these steps, the Federation's buying agents will refrain from buying even if it means closure of mills for some time and payment of lay-off compensation to labour as a sequel.

Futile Controversy

The scheme is plausible and by no means impracticable. And there can be little doubt that, if properly implemented, it would have a significant impact on cotton prices, especially when the supply position is far from being uncomfortable. But the scheme has evoked strong protests from cotton growers and traders which is scarcely surprising because the proposed monopoly purchase of cotton by the Federation will directly affect the interests of traders and growers. And from the manner some of the prominent mills are reported to have effected purchases of cotton after the formulation of the draft scheme one wonders whether the scheme carries the support of all the member mills and whether the Federation is really earnest about implementing the scheme. In his presidential speech at the annual meeting of the Cotton Buyers' Association, Shri Madanmohan R Ruia has expressed the view that "nothing should be done to disturb or, for that matter, eliminate normal trade channels from the marketing of the country's crop in any scheme of things that may be contemplated or actually adopted, either now or in future." And he adds that "this view is shared by the Government and the Indian Cotton Mills' Federation alike with the result that a joint effort is being made to arrive at a solution satisfactory to all the interests concerned." Apparently, the Federation is not very keen on pushing through its scheme of centralised purchase of cotton.

It is really amazing that such a great fuss should be made over cotton when the supply position is known to be reasonably satisfactory. Nobody seriously disputes the view that there is sufficient cotton to take care of the industry's increased requirements. If market arrivals of cotton have continued to be on the low side despite a fairly good crop it is mainly because growers are sitting tight on their stocks in the firm belief that the Government will not take any action which would adversely affect their interests mainly due to political considerations. That cotton prices should continue to remain well above the ceilings clearly indicates that the Government is either unwilling to take proper action to make price control a success or it is unable to administer control. In either case, it reflects poorly on the Government. It is shocking that the situation in the cotton market should have been allowed to deteriorate to its present position when it is easily possible to keep prices within the ceiling only if the Government is willing to take appropriate measures. Compulsory survey and the fixing of the last dates for ginning and pressing must be reinforced by requisitioning on a large scale, increase in margins against cotton and ceilings on bank advances and restriction on holding of stocks in excess of prescribed limits at all levels. The market authorities would be well-advised to impose heavy margin on 'bull' positions when the hedge contract keeps above Rs 760 or so.

Oilseeds

Prices Hit New Highs

OILSEEDS prices continue to soar. On Wednesday, December 30, groundnut ready (Khandesh) in Bombay were quoted around Rs 65, linseed around Rs 70, castorseed at Rs 44 and cottonseed around Rs 33; all these prices are per 50 kilograms. Groundnut oil ready was traded at Rs 24.25 (per 10 kilograms), linseed oil at Rs 29.50 and castor oil at Rs 19. While groundnut ready had recorded a much higher price of about Rs 76 last season, though only towards the fag-end, castor and linseed prices are the highest for about a decade. Very rarely has linseed oil been known to have fetched a price higher than that of groundnut oil which is the situation obtaining in the market at present. The situation is much worse in respect of oilcakes which have been bid up to all-time high levels. Groundnut expeller cake is quoted around Rs 520 as against Rs 380 (per tonne) a year ago. Linseed cake is quoted around Rs 560 against Rs 320, cottonseed cake at Rs 450 against Rs 300 and mustard at Rs 650 against Rs 310. Even at these exorbitant prices current demand remains unsatisfied. It is not that there has been some unexpected increase in demand but the market is bare of supplies.

Current record high prices suggest as if the country is passing through a serious oilseeds famine. But strange as it might appear, the overall supply of edible oils this season promises to be much better than in the previous season. Oilseeds prices have continued to soar despite prospects of a larger supply from domestic sources, anticipated import of 75,000 tons of soyabean oil, ban on export of groundnut oil and ban on the use of edible oils for non-edible purposes. It is really shocking that the Government should find itself unable to do anything to check the runaway boom in oilseeds. It is one thing if measures aimed at keeping prices under check fail to yield the desired results; that is bad enough. But when the authorities deliberately avoid taking proper measures to contain prices, it is a different matter and that is far more disturbing. The price pattern of oilseeds, oils and oilcakes has been greatly distorted by the actions taken by different States and district authorities within States to restrict the movements of oilseeds, oils and oilcakes outside the States and the districts. New Delhi's decision to ban

the exports of groundnut HPS with effect from January 1 within a few weeks of the Commerce Minister's spirited defence of his earlier decision to allow exports about a month ago, is to some extent a reflection of the chaotic condition prevailing in the oilseeds markets in the country. Out of the 15,000-ton export quota that the Government had intended to allow for export upto the end of December not even 50 tons are reported to have been shipped. If the Government has banned the export of groundnut HPS it is not because it has come round to the view that even small exports have a disproportionate effect on pushing up domestic prices which are already standing at extraordinarily high levels. Informed sources feel that New Delhi has been obliged to take this decision because it could not persuade the Government of Gujarat — the main source of supply of groundnut HPS — to permit the movement of groundnut outside the State even for export purposes. If this be true, it is a very disturbing development. The State Governments cannot be allowed to set at naught the Union Government's decision on vital issues.

Futures At Stand Still

Official trading in oilseeds futures has continued to be virtually at a standstill for many weeks. All the outstanding positions in groundnut, castorseed and linseed were squared-up about a fortnight ago at rates which clearly favoured the bulls. Futures have shot up to new high levels and the rise has been really spectacular in the case of linseed March which has moved up form Rs 46 to Rs 55 (per 50 kgs) within a fortnight, the heavy margin at above Rs 50 notwithstanding. All the business that has been put through in castor and linseed futures in recent weeks had been only in kerb as the hedge contracts have been all the time quoted higher than the prescribed weekly limits. Neither the market authorities nor the Forward Markets Commission seem able to do anything to check kerb dealings. If the authorities can do nothing in the matter then why continue all sorts of restrictions on official transactions. The forward market had better be closed down if it is to function only in kerb.

Export activity in recent weeks has been virtually confined to groundnut extractions which have been doing extremely well. Inquiries with the trade indicate that India has sold nearly all its production of groundnut extractions upto February. Business in cottonseed decorticated has been becoming increasingly difficult because of the spurt in domestic prices. Even after allowing for the export incentives, current cottonseed cake prices are out of parity with world prices. Exporters of groundnut HPS have been unable to meet their commitments which run into several thousand tons. The settlement of outstanding contracts is likely to cause serious hardship to the shippers because of the spurt in overseas prices. To a considerable extent exporters of groundnut have been put in an awkward position because of the Gujarat Government's refusal to permit movement of goods outside the State even for export.

Money Market

Thursday morning

DEMAND has been firm in the short-term money market during the past week. The inter-bank call money, which had been wavering between 5.5 per cent and 5 per cent almost throughout December, was perched at 6 per cent on Wednesday, the last working day of the year. Year-closing demands, conventionally described as 'window-dressing' demands, found the market short of supplies with big leaders keeping away. This has partially accounted for the stringency in the market and the hardening of the rate.

That there is an overall shrinkage in the flow of funds into the call loan market is evident from the weekly returns of the scheduled banks. The volume of 'money at call and short notice' which stood at a peak level of Rs 80.10 crores as on November 20, has gradually come down to Rs 61.08 crores on December 18, and it is not unlikely that the flow would have still further diminished by the end of the month.

Apart from the temporary phase of year-end requirements which straightened up the call money rate, the pick up of the busy season has also forced up the demand. Except during the first week, bank credit throughout November last did not move up and was not, therefore, a factor activising the call loan market which was almost dormant with call money available for a major part of the month at 1 per cent. The position turned out to be different in December. During the three weeks ended December 18, bank credit soared up by Rs 79.48 crores (Rs 63.88 crores in the corresponding period last year) accompanied by a net fall of Rs 14.24 crores in aggregate deposits. As a result borrowings from Reserve Bank which stood Rs 1.31 crores on November 27, rose to Rs 22.42 crores on December 18 (scheduled banks' return) and to Rs 35.35 crores on December 25 (Reserve Bank's return). Cash in hand and balances with Reserve Bank shrank by Rs 2.68 crores while investments fell by Rs 72.58 crores. These facts establish that the busy also had its impact on the short-term money market and accentuated demand.

The rise in the call money rate over the Bank Rate does not appear to be an unusual phenomenon, as even last year year-end dealings took place at 5 to 5.5 per cent against the then Bank Rate of 4.5 per cent. The current rate of 6 per cent being one per cent above the Bank Rate, is hardly surprising, viewed in the context of the revised restricted loan policy of the Reserve Bank.

Latest scheduled bank's statement as on December 18, reflects the more or less steady and comfortable conditions that featured the short-term money market during that week, call money being easily available at 5 or 5.5 per cent. Bank credit expanded by Rs 12.85 crores, but at the same time aggregate deposits were higher by Rs 11.57 crores which must have helped to relieve the pressure on the market with the result that borrowings from Reserve Bank were hardly Rs 43 lakhs and investments were not affected beyond Rs 82 lakhs, although cash and balances contracted by Rs 6.04 crores which became inevitable as market supplies of funds were less by about Rs 5.09 crores.

Reserve Bank's statement for the week ended December 25, reveals a contraction in active notes by Rs 1.97 crores. The contraction during the past two weeks hardly amounted Rs 5.04 crores against an expansion of Rs 88.07 crores that occurred during the preceding two weeks ending December 11. To this extent, the rising phase in the demand for funds is evident and reflects the growing impact of the busy season. The small additional note issue of Rs 61 lakhs and the return of Rs 1.97 crores of notes from active circulation have swelled the notes in the Banking Department by Rs 2.57 crores. Foreign securities have continued at the previous level of Rs 85.46 crores but foreign balances have declined by Rs 13 lakhs. Government deposits, both of the Centre and the States, are slightly lower by Rs 1.85 crores while their loans have marginally increased by Rs 1.31 crores. The only significant change is the increased borrowings of scheduled banks, aggregating Rs 12.54 crores thereby raising the total borrowings till December 25 to Rs 35.35 crores compared with Rs 8.08 crores as on December 27, 1963.

Business Notes

Associated Cement

ASSOCIATED Cement's working results during the year ended July 31, 1964 have showed a satisfactory improvement. The profit after meeting all expenses of operation and management and after providing for depreciation Rs 281 lakhs, (Rs 243 lakhs), for development rebate reserve Rs 36 lakhs (Rs 21.57 lakhs), and for taxation Rs 249 lakhs (Rs 298 lakhs), has risen from Rs 180.28 lakhs to Rs 213.83 lakhs, i e, by about 18 per cent. A sum of Rs 1.62 lakhs (Rs 1.63 lakhs), has been transferred to Amortisation Reserve to provide for the amortisation of quarry and factory lands, and another sum of Rs 212 lakhs (Rs 179 lakhs) to General Reserve. The Company has no sur-tax liability. The Directors have recommended the payment of a dividend at the rate of Rs 12 per share of Rs 100 (same as in the previous year) amounting to Rs 228.90 lakhs to be paid out of the General Reserve. This would mean that the General Reserve will be drawn this year to the extent of Rs 16.90 lakhs (Rs 49.90 lakhs drawn last year) for maintaining the dividend.

There has been an improvement in production both in India and Pakistan —the output amounted to 38.1 lakh tonnes (37.6 lakh tonnes) in India and 3.9 lakh tonnes (3.8 lakh tonnes) in Pakistan. Despatches from Indian factories improved by 1.1 lakh tonnes at 38.7 lakh tonnes, but those from factories in Pakistan dropped by 0.4 lakh tonnes at 3.9 lakh tonnes. On the whole, production and despatches were slightly higher than in the previous year, being 95.2 per cent and 96.6 per cent respectively of rated capacity as against 94.4 per cent and 95.4 per cent last year. These small increases do not mean much, as the Company admits, in the context of an acute shortage of cement in the country, particularly when large allotments are made for State purposes and priority projects, and supply to the general public is greatly reduced. What is required is additional productive capacity.

Sales turnover was also higher, the overall realisations from cement and other sources being Rs 39.21 crores as against Rs 37.45 crores representing a rise of about 4.7 per cent. Apart from the improvement in the turnover of grey cement including Portland and Blast Furnace cement, there was an appreciable increase in the turnover of other products such as special cements, refractories and waterproofing compounds. Sale of coal to outside parties also increased. The net profit margin has improved from 4.9 per cent to 5.5 per cent though the gross profit margin has shown a slight fall from 21.5 per cent to 21.0 per cent.

This has been achieved through continuous efforts to improve utilisation of men, materials and money with a view to check rising costs of production. The Company, however, complains that cost of production has risen due to higher coal prices and railway freight rates, enhanced electricity duty, higher dearness allowances to employees, increase in the prices of stones, spares, etc. The increase of Rs 1.25 per tonne in the retention price granted by Government effective July 1, 1964, did not fully cover the increase in the cost and was, according to the Chairman, "too little and too late".

ACC's Progress, 1961-64

	1961-62	1962-63	1963-64
Production (in lakh tonnes)	40.5	41.5	42.0
Rated capacity utilised (p c)	*93.1*	*94.4*	*95.2*
Turnover excluding excise duty (in lakhs of Rs)	34.37	36.67	38.49
Taxes, duties, etc (in lakhs of Rs)	372	432	385
Balance profit (in lakhs of Rs)	193	180	214
Net profit margin (p c)	*5.6*	*4.9*	*5.5*
Payments to Provision for employees (in lakhs of Rs)	574	654	686
Dividends (in lakhs of Rs)	229	229	229
Rate of Dividend (p c)	*12*	*12*	*12*

Owing to the delay in granting even this meagre relief, the Company suffered a loss of nearly Rs 1.50 crores during the last 3 years. The Chairman states that the retention price allowed to the industry on current levels of production barely allows sufficient earnings to pay a reasonable dividend. No internal resources are generated for expansion and modernisation of factories. The Chairman is of the view that the stringent controls on price and distribution accentuated by procedural delays in release of foreign exchange and licensing, the raising of Bank Rate and the consequential check on credit facilities have all acted as disincentives in the matter of attracting fresh capital to the cement industry.

As regards expansion and new works, the new plant at Jamul will soon be commissioned. Extnesion of the works at Dwarka and construction at Porbunder are also progressing satisfactorily. Letters of intent in respect of licences to establish factories at Wadi in Mysore and Durgapur in West Bengal have been received. The white cement plant at Kymore has now started production. The engineering works at Shahabad manufactured 2,500 tonnes of cement machinery, a major portion of which was supplied to Panyam Cements and Mineral Industries. ACC is giving technical and consultative services to parties interested in establishing cement factories. Its services are now being made available as an older and well-established manufacturer to newcomers like Assam Cement, the proposed Maharashtra Cement Industries, Chettinad Cement Corporation, Panyam Cement, etc.

Central India Spg

IN his statement circulated to the shareholders, Naval Tata, Chairman of the Central India Spg Wvg & Mfg, referring to the prevailing inflationary trend in the country, has stressed the need for well-planned concerted action to step up the agricultural yield in order to hold the price line in foodgrains and to avoid the perennial dependence on large-scale imports of food a part of which costs foreign exchange.

Tata is critical about the present wage policy of the Government of India vis-a-vis their efforts to combat the raging inflation inasmuch as wages are chasing prices conspicuously. Speaking about his own Mill, he points out that the increase of Rs 8 per month granted to a textile worker in

Nagpur by the Wage Board, the grant of Rs 6 per month by way of dearness allowance, the raising of the employer's contribution to Provident Fund from 6.25 per cent to 8 per cent from December, 1963, the doubling of employer's contribution to the State Insurance Fund from 1.25 per cent to 2.5 per cent, have all added to the annual wage bill by about Rs 16 lakhs. During the year 1963-64 the increase in dearness allowance has added another Rs 8.60 lakhs approximately. The recommendation of the Bonus Commission will cost the Company a further Rs 7.50 lakhs. The average monthly earnings of a cotton mill worker is thus raised from Rs 149 in 1960 to Rs 190 in the current year without taking into account the impending impost of minimum bonus. A higher wage bill, unless accompanied by higher productivity, only adds fuel to the fire of inflation, contends Tata.

In sharp contrast with the laxity in the control of wages, prices of cloth manufactured by the organised mill sector are severely controlled, leaving outside control power loom and handloom cloth. Control of cloth prices should be accompanied by a simultaneous control of the prices of important raw materials that go to make up the price of cloth. Government's policy in respect of cotton prices, he states, is directed by political considerations of appeasing the agriculturists.

The taxation policy of Government is another conspicuous instance which accounts for a steep rise in prices. For instance incidence of taxation in the price of cloth is 15 to 36 p c, kerosene 45 p c, sugar 23 p c, vanaspati 11 p c, electricity 30 p c, cigarettes 50 p c. In cloth he has quoted the instance of Empress Mills which has paid in 1963-64 by way of cotton cess, sales tax on cotton, stores, coal, etc, electricity duty, excise duty on cloth and yarn, import duty, octroi and Municipal taxes, water tax, vehicle tax an amount of Rs 125.63 lakhs which works out to 19 per cent of the ex-mill value of cloth produced by the Mill.

Referring to the price control on about 50 per cent of the output of mills from October 20, 1964, Tata does not find such rigorous control necessary when there is no shortage of cloth in the country. The output of cloth from the three sectors has been steadily growing from 7,615 million yards in 1962 to 7,981 yards in 1963 and to 8,256 million yards in 1964. Why should mill cloth alone be regulated? he asks. He pinpoints the need for more production and continuous flow of cloth to the consumer to prevent any attempt on the part of the trade to exploit shortages. He stresses the importance of utilising to the utmost our existing textile plants in terms of production and employment potential. But this is possible only if the output of cotton is increased to bridge the existing gap.

Mysore Sugar

MYSORE Sugar has earned during the year ended June 30, 1964 a pre-tax profit of Rs 12.68 lakhs as against Rs 1.57 lakhs in the previous year. This higher profit has accrued in spite of a drop of Rs 61.79 lakhs in the sales of sugar at Rs 3.04 crores countered by a small improvement in the realisations from distillery products by Rs 2.19 lakhs at Rs 13.15 lakhs. Net surplus from both the sugar and distillery trading accounts, however, turned out to be better at Rs 34.64 lakhs (Rs 29.58 lakhs).

Fall in the sales of sugar is a sequel to lower production. 201,103 tonnes of cane were crushed yielding a production of 22,091 tonnes of sugar as against 259,654 tonnes of cane crushed in the preceding year yielding 27,390 tonnes of sugar. The recovery obtained was, however, slightly higher at 10.98 per cent compared with 10.57 per cent in the previous season. The distillery also functioned for a shorter period owing to the shortage of molasses. Even so, the Company's profit turned out to be higher and the result would have been still better had the crushing season been normal. A sum of Rs 6.6 lakhs paid to workers during the year on account of 1962-63 also diminished the profits.

Out of the profits taxation absorbed Rs 7.37 lakhs (Rs 70,000) and Reserve for development rebate Rs 2.70 lakhs (Rs 81,000) leaving barely Rs 2.61 lakhs. The Directors have withdrawn Rs 5.04 lakhs from Dividend Equalisation Reserve and other Reserves to propose a dividend at 15 per cent on the increased capital of Rs 43.16 lakhs as against 30 per cent in the previous year on Rs 21.79 lakhs. Total dividend will amount to Rs 6.47 lakhs (Rs 6.54 lakhs). The expansion programme for increasing the capacity of the sugar factory and doubling that of the distillery factory is under way. A licence for manufacture of Acetic Acid has been obtained; foreign credit of Rs 23 lakhs has been finalised and plant and machinery have been ordered for.

Cotton Agents' Sugar Group

THE four sugar mills managed by the Cotton Agents have all recorded satisfactory progress during the year ended June 30, 1964. Upper Ganges Sugar Mills, the biggest of the group has made a pre-tax profit of Rs 53.79 lakhs compared with Rs 39.44 lakhs in the previous year, a rise of 36 per cent over the year, though sales realisations were slightly lower at Rs 442.75 lakhs (Rs 454.22 lakhs). Crushing season was slightly shorter for the Mills but nevertheless cane crushed was more at 367,030 tonnes (285,383 tonnes) and recovery also was higher at 9.84 per cent (9.76 per cent). After transferring a larger amount of Rs 15.12 lakhs (Rs 5.75 lakhs) to miscellaneous reserves, the Company has maintained the equity dividend.

New India Sugar Mills earned a pre-tax profit of Rs 29.79 lakhs (Rs 10.75 lakhs) showing a rise of about 177 per cent following a higher sales turnover of Rs 195.75 lakhs (Rs 175.20 lakhs). Unlike Upper Ganges, crushing season in the case of this mill was longer, but cane crushed was lower at 112,971 tonnes (124,343 tonnes). The recovery, however, was the highest in the group at 10.47 per cent (9.92 per cent). Higher profit attracted a larger taxation provision at Rs 19.50 lakhs (Rs 6.00 lakhs), and at the same time transfers to miscellaneous reserves also were raised to Rs 6.82 lakhs (Rs 1.23 lakhs). Dividend on equity shares was maintained at Rs 3.65 per share of Rs 10.

The per cent increase in Gobind Sugar Mills' pre-tax profit has by far exceeded those of other mills. Profit amounted to Rs 31.00 lakhs during the year as against Rs 5.87 lakhs in the previous year, the increase being 428 per cent. There was a sharp rise in sales from Rs 155.11 lakhs to Rs 255.53 lakhs. Cane crushed exceeded that of the previous year by 27,799 tonnes at 144,379 tonnes in a longer crushing season, though the recovery was less at 9.87 per cent (10.38 per cent). Even with a larger provision for taxation at Rs 20.00 lakhs (Rs 3.70 lakhs) and an increased allocation of Rs 2.77 lakhs (Rs 0.83 lakh) to miscellaneous reserves the Company has stepped up the dividend from Rs 2.00 to Rs 2.25 per share.

Bharat Sugar Mills, a comparatively small unit in the group, also made higher profit at Rs 10.82 lakhs (Rs 5.98 lakhs), a rise of about 80 per cent, despite a slight setback in sales turnover at Rs 101.21 lakhs (Rs 109.52 lakhs). Crushing season in this case also was longer and cane crushed amounted to 68,621 tonnes (57,608 tonnes). Even after transferring to miscellaneous reserves a larger amount of Rs 42,815 (Rs 19,768) it was possible for the Company to raise the dividend from Rs 1.50 per share to Rs 2.00 per share of Rs 10.

The Directors state that the rebate of 50 per cent on the basic excise duty which was allowed on additional production during October-November 1964 as compared with the corresponding months of 1962, should have been allowed to production during the entire season as that would have been greater incentive for efforts to achieve maximum production in the sugar industry. The production of sugar industry for the season amounted to only 25.71 lakh tonnes as against the target of 33 lakh tonnes of sugar fixed by the Government.

Goodyear India

AS previously proposed by the Directors, shareholders of Goodyear India have now authorised the Directors to offer 640,000 new shares to the existing shareholders at the rate of 8 new shares to every 5 existing shares held, at a premium of Rs 7 per share. The additional finance that will be raised by the issue will be used to expand the production capacity of the Company's factory at Ballabgarh (New Delhi) from 210,000 to 310,000 tyres per year (i e from 750 tyres to 1,000 tyres per day), i e, by about 50 per cent. The additional capacity is expected to be achieved before end of 1965. The Company has got its overall industrial licence extended upto 1968 to manufacture 510,000 tyres and tubes a year. In the new issue the parent Company, namely, Goodyear Tire and Rubber Co of Akron (U S A) is not participating but will provide foreign exchange in dollars to the value of Rs 80 lakhs as a long-term loan to purchase abroad the specialised plant and machinery needed for the proposed expansion.

Trading results for the eleven months ending November 1964 available now show encouraging progress. Gross sales aggregated Rs 10.6 crores compared with Rs 8.4 crores during the corresponding period last year. Net profit is of the order of Rs 30 lakhs as against a loss of Rs 53 lakhs in the same period in 1963. At this rate the year's profit is expected to exceed Rs 40 lakhs.

IIM CALCUTTA

INDIAN INSTITUTE
OF MANAGEMENT, CALCUTTA

Established by
The Government of India
in co-operation with The Government of West Bengal
as a National Institute for management
education and research

Collaborators:
The Alfred P. Sloan School of Management,
Massachusetts Institute of Technology, U.S.A.

The Institute has pleasure in announcing its programme of

POST-GRADUATE STUDY
IN MANAGEMENT

A comprehensive two-year residential programme expressly designed for mature young people who seek executive careers in industry and Government.

Objective: The course seeks to give the student with a demonstrated interest in management a grasp of its basic concepts and a breadth of view, which will provide a foundation for development toward general management responsibility.

Curriculum: The course will draw on the best patterns of graduate management education in the U.S.A. and will emphasise the fundamentals which underlie sound management decisions. The programme of study will cover existing practices in the conduct of economic affairs, the environment of the enterprise, human factors in an industrial setting and the analytical tools available to management including operational research. The Institute will award a Post-Graduate Diploma in Management to those who successfully complete the two-year programme. However, it has requested powers to award degrees and expects that these powers will be granted.

Qualifying Education: Applicants should hold at least a Bachelor's degree in any subject or any professional qualification considered equivalent to a degree. The medium of instruction is English and a good command over the language is required.

Qualifying Test: An appropriate test for post-graduate study in Management will be administered at different centres in India. There will also be a qualifying interview.

Academic Year: The first year of the two-year programme will run from August 9, 1965 to May 6, 1966.

Fees: Fees for board, room and tuition will be Rs. 1,700/- per academic year.

Location: The programme will be residential, conducted at the Institute campus in Calcutta.

Applications and enquiries: Last date for application is February 1, 1965. Applications and information may be requested from:

The Programme Director
Post-Graduate Programme
Indian Institute of Management, Calcutta

Regd. No. B-5489

While paying a tribute to the hands that are busy constructing a bigger, better Tata Chemicals, Mr. J. R. D. Tata said "...there is youth, there is an enthusiasm, there is a zest about the people here, there is morale, a belief in themselves—a confidence in themselves...".

THE HANDS THAT CREATE AND CONSTRUCT

Yes, it is this zest, morale and confidence which has transformed Mithapur, a township which owes its existence and prosperity to Tata Chemicals. Today it is a living example of what our young, enterprising men can do on their own, if given a chance.

As India's Five Year Plans strive to raise our standard of living, Tata Chemicals make their contribution through comprehensive expansion. Yesterday's planning results in today's progress and in tomorrow's chemicals.

Diversions at Durgapur

FROM past experience one has come to accept an open session of the Congress as something between a jamboree and a command performance. At the end of it whatever resolutions the High Command may put before it are passed intact without amendment. True, there are grumblings, some airing of views and sometimes, but not often, a little horse trading behind the scenes to meet the views of dissenters when they are lucky enough to catch the ear of or find supporters among the influential members of the Working Committee. At Durgapur some correspondents seem to have noticed a difference. With the coming of collective leadership, it is reported, there is a much greater assertion of individual views and also a change of attitudes. Members no longer accept without question whatever is put before them. They ask embarrassing questions, they argue and press their respective points of view with an insistence which was unthinkable in the earlier days.

Whether the actual proceedings justify this interpretation, it is difficult to judge from a distance. The dominating figure at the Durgapur session, Atulya Ghosh, did not accept a single amendment to his key resolution on the task before the Congress. On the contrary, he brushed aside all timorous questioners and flayed the critics of the Congress within the party. He accused them of being frustrated in not realising their ambition to hold office. The resolution stated that the youth of the country had to be infused with a sense of purpose and participation in the development of the country, that Congressmen should undertake the responsibility in mobilising agricultural labour in the constructive tasks of development, etc. It also called for a well-co-ordinated youth programme. But it did not say who was to mobilise agricultural labour and for what purpose and how it was to be yoked to the task of developing the economy. Neither unemployed youth nor agricultural labour would decline any opportunities of useful activity, squeezed as they are between diminishing employment on the land and rising food prices.

On two specific points criticism was loudest, viz, that there was no reference to corruption among Congressmen and farmers holding back foodgrains from the market. The first received no mention at all, Atulya Ghosh dismissing as loose talk all allegations within the party that the Congress had degenerated after taking over the country's administration. The second point about farmers holding foodgrains was slurred over with the pious injunction that "it should be possible for Congress workers to impress upon the farmers individually that it is essential in the national interest to make available the entire marketable surplus of foodgrains to the community". There was nothing of Socialism at all in the resolution; it called upon the party to be united, to make the party organisation more broad-based, to come in close contact with the people and asked for greater co-operation between the party and the Government.

The very sane and sensible resolution on foreign policy, reaffirming the country's resolve not to depart from peaceful use of atomic energy and hold steadfast to non-alignment and peaceful co-existence does not seem to have encountered much opposition except from a handful of members from Bihar

and U P who wanted the country to plump for the atom bomb. In fact, there was no reference in the resolution to the dispute with China at all, for as the mover of the resolution explained, the general formula of non-aggression and peaceful co-existence covered the case of Chinese aggression.

The Working Committee discussed what further measures had to be taken to curb the activities of the Left Communists though no evidence was produced to give any substance to the scare that was being worked up. Press reports end on the cryptic note that the question whether the Left Communist Party should be made illegal would be examined by the Home Ministry.

The raids for unearthing black money and unaccounted assets received honourable mention in the resolution on Economic Policy. While the drive against black money should help to rehabilitate the Congress in the public eye if it is fearlessly pursued and not slackened under pressure and also followed up by bold, realistic measures to win over the stragglers among the business community, except perhaps the hardened, incorrigible ones, to honest business practices, what can be the design and purpose behind the deliberate scare of Left conspiracy? Does the Cabinet seriously believe that with some raids on black money, as a sop, the danger of a possible threat to the country will divert the attention of the people from the hardships of spiralling prices and food shortage or at least make the attendant misery less unbearable?

This worked up suspicion of danger in the air considerably enfeebled the spirit of Bhubaneshwar which had revived the demand for a definite socialistic orientation to Congress policies. That spirit was hardly evident in Durgapur at all. This became clear when the demand that a definite assessment be made of the steps taken by the Congress to implement the Bhubaneshwar resolution failed to gain support. Even such a pointed question as that about the nationalisation of rice mills, which had been accepted at Bhubaneshwar and not acted upon subsequently, did not have to be answered in the Economic Policy resolution. The latter, while reaffirming its faith in the basic concepts and programmes accepted at Bhubaneshwar pleads that "during the months which have lapsed since then, the nation has been grappling with serious difficulties and tasks relating to the current situation."

On two points, however, the resolution is specific. One is the definite commitment that the land reforms should be completed before the end of the Third Plan. The other is the stress on the role of 'technological self-reliance' in the field of industry and the clear statement that Indian science and technology should be given the greatest possible support in the programmes for national reconstruction.

The resolution, however, loses itself in platitudes when it should come to brass tacks:

> "Advance towards socialism based on the principles of democracy must necessarily involve millions in the country as well as popular institutions in processes and activities which are designed to achieve rapid economic progress and social justice."

But how is this to be achieved? What are the operational steps and the changes in organisation and institutions that they call for? On all these questions, the Congress is as delightfully vague as ever.

Pakistan: Change Nevertheless

AYUB KHAN's election to a second term as President of Pakistan was predictable, it now seems in retrospect. Yet the highly enthusiastic response that the opposition candidate, Miss Fatima Jinnah, drew during the election campaign did hold out the prospect of a very close fight, if not an upset. Miss Jinnah and the opposition parties have now alleged that the election was rigged and that there was, besides, official intimidation of Basic Democrats intending to vote against Ayub Khan. Whatever the element of truth in this allegation, it cannot be denied that there were many factors which tended to exaggerate the apparent support for Miss Jinnah. The most important of these was that her support came largely from the highly vocal intelligentsia in the cities. In these areas she did indeed do well in the election. The rural votes, on the other hand, went to Ayub Khan, overwhelmingly in West Pakistan and only slightly less so in the eastern wing of the country.

This urban-rural split of the vote is explained mainly by Miss Jinnah's election manifesto. Almost the only positive programme on which the five parties backing her could apparently agree was the revocation of the 1962 Constitution promulgated by Ayub Khan and the introduction of popular democracy with universal adult franchise. Tagged on to this was the general promise of more democratic freedom of all types. Understandably the appeal of all this was far more to the urban intelligentsia, which had borne the brunt of the restrictions imposed by Ayub Khan, than the rural voters who, consequently, remained apathetic to the opposition parties' campaign. In any case, the promise of democracy must have had less than the expected attractiveness in a country whose experience of democracy has been as unhappy as Pakistan's has been.

The absence of any programme in Miss Jinnah's manifesto was inevitable considering the distances separating the parties supporting her. These ranged all the way from the progressive leftist Awami National Party to the fundamentalist Islamic Jamaat-i-Islami and Nizame Islam. Even the idea of a woman aspiring to the presidentship of the country was repugnant to the latter two parties to begin with. Ultimately they extracted their pound of flesh by getting a commitment to whittle down the Muslim Family Laws Ordinance, promulgated in 1961, written into Miss Jinnah's programme. This progressive law discourages polygamy, makes divorce less easy and in the event of divorce provides for the maintenance of the wife and children, makes registration of all marriages obligatory and fixes the minimum age of marriage for men and women.

Miss Jinnah's defeat may be no great loss, not even for the cause of democracy. For, considering the heterogeneous character of her support, her victory would have scarcely guaranteed an orderly transition to democracy. More likely, the combined opposition would have splintered, taking the country back to the chaos of pre-Ayub years. The Combined Opposition and Miss Jinnah, it would appear, have done what they could for democracy in Pakistan. They could have hardly added to their contribution if they had won, and might well have reduced it. The candidature of an esteemed personality like Miss Jinnah, the vigorous election campaign conducted by the Combined Opposition, the relative relaxation of restrictions and the re-emergence of the intelligentsia in active politics have given a new turn to Pakistan's politics which Ayub, even though he has been elected by a handsome margin, will not find it easy to reverse.

Capital View

The Hunt for 'Left' Communists

Romesh Thapar

WHO persuaded the Home Minister, Gulzarilal Nanda, to launch his new-year's-eve police action against the 'left' communists? The moody Central Intelligence Bureau? The ambitious R S S chief, Golwalkar? The uncertain Lal Bahadur Shastri? The so-called collective that is the Cabinet? Or the astrologers and soothsayers who are fast becoming the advisers to the 'sons of the nation' on future political prospects? These questions are being raised everywhere in the Capital. There is embarrassment at all levels, even among normally conformist editors and pressmen, although there are those specimens who would like to see the total illegalisation of communist activity.

We are obviously developing a democratic conscience, for there is a marked reluctance to accept Nanda's assurance that the GOI possesses considerable evidence to prove that the 'left' communists planned subversion on a national scale and in the interests of China. These elements are, after all, insignificant in their influence. And if such evidence is available, why is it not made public? A proper trial is demanded. Only then can such elements be isolated and fought. Nanda's incompetent approach only helps them emerge as fearless opponents of the Congress juggernaut. Hence, the very pertinent attempt to link the arrests with the forthcoming Kerala mid-term elections.

The representatives of friendly countries, including the communist countries, have been assured privately that the arrests do not in any way mark a shift in India's internal and external political alignments. The assurance is fatuous. If a proper trial is not held, and if Nanda's ministry continues to sit tight on the evidence it is supposed to possess, it will not be long before the 'right' communists are compelled sharply to radicalise their recently-adopted programme in order to prove to their close supporters that they are not the 'collaborators' and 'revisionists' that they have been made out to be. Then, an attack on the entire communist movement will be on Nanda's agenda, particularly if the present economic crisis continues to mount. This kind of development would certainly influence India's general political posture.

The reaction abroad is revealing. The opinion is widespread that the round-up of the 'left' communists under emergency powers reflects the casual interest Jawaharlal Nehru's heirs have in democratic procedure. Some point knowingly to the attempt being made to entice foreign capital into India. Others show concern about the interest Shastri and Nanda appear to be showing in winning over the Hindu elements organised under the banner of the R S S. In other words, there is little doubt that India's democratic image is now being tarnished.

An open trial, or the publication of conclusive and documented evidence could be tolerated. A 'white paper' is 'promised', but this has not been released yet. Meanwhile, to maintain that emergency powers give the GOI the right to take this kind of action, is to make a mockery of our Parliamentary Government. There are laws to deal with the sort of threat that the Home Minister has said exists. Proper legal procedures would help isolate the real culprits and break the alleged conspiracy. Anything less will defeat the purposes which Nanda is presumably supposed to have in mind.

The very general accusations against the 'left' communists which Nanda tried to spell out in the course of a talk over the AIR are similar to those mentioned against a section of the CPI at the time of the Chinese attack in NEFA. Much of this evidence is apparently based upon the demented polemics of individual adventurers who imagine that they can establish 'liberated', Yenan-like bases contiguous to Chinese territory along the Himalayas. Can such lunatic outpourings be used against the entire communist 'left'? No court would uphold such a case. Nanda must, therefore, produce more plausible evidence of conspiracy and subversion —and place it before the nation.

When even psychopathic anti-communists in the West are beginning to take note of the far-reaching changes taking place within the international communist movement, changes which are bound ultimately to compel each communist party to think for itself, it would be the height of folly for political leadership in India to assume attitudes which are antiquated and reminiscent of that brand of thinking of which we believed we had purged ourselves. Whatever the aberrations communists in India still suffer from, it can no longer be denied that now in many ways they lead the battle within the communist movement for independent expression. These significant developments need to be more fully understood by non-communists.

Democratic functioning is integral to the unity and viability of a sub-continental, multi-communal, federal State like India which embraces many apparently conflicting interests and culture patterns. A damaging compromise here or there could certainly create those authoritarian tendencies which generate regional revolts and pose a challenge to the unity of the State. Nehru understood this though he allowed himself to be pushed into extremist actions on occasions. But today the flouting of legal procedures is becoming a habit. There is grave danger in this for the Centre.

For the moment, the swoop on the communist 'left' is linked with next month's elections in Kerala. Tomorrow, the conviction will spread that when Congress power is threatened, free and fair elections are not possible. The day after, a whole region will become responsive to slogans rooted in determined opposition to the Centre, to slogans of revolt. The ouster of the communists from power in Kerala in 1959 almost wrecked the democratic system in India. Then, fortunately, good sense prevailed. But a repetition, with variations, could prove to be the last straw.

There seems to be no logic in the attitudes of the GOI. Opportunistically, the intrigues of Abdullah and company in Kashmir are tolerated even to the extent of tying the hands of Sadiq. In the East, among the Nagas, we are officially involved in a debate with secessionists on the degree of independence to be granted. Yet, on what appears to be the flimsiest of evidence, Nanda is permitted to lock up a whole section of the Indian Left on the plea that it is 'anti-national'. These are the antics of a Government which does not quite know what it is doing—unless, of course, the astrologers and soothsayers have taken over the reins.

Our unhealthy political state is underlined by the heavy silence of the so-called leftists in the Congress Party, the inhibitions of the communists who do not approve of their erstwhile comrades and the quiet retreat of those accustomed to chattering about freedom and liberty. Only a few enlightened voices are heard demanding that no one be condemned until proved guilty. The militants of the Jan Sangh and the RSS approve of Nanda's action. So do the Swatantra bigwigs. If there had been genuine institutions in support of democratic processes, in defence of dissent, it would not have been possible to lock up people without trial.

It remains to be seen whether the Durgapur Session of the Congress Party (for which the entire resources of the West Bengal Government have been mobilised full time for the past several weeks!) will face these issues squarely or rest content with rubber-stamping the meanderings of the GOI. Congressmen should have enough time to face these issues—for, Gulzarilal Nanda has even cancelled the scheduled meeting of the Congress Socialist Forum. But, alas, who will lead them in the debate? Peripheralism breeds political pipsqueaks.

Weekly Notes

Official Farewell

THE Government of India has adopted the right and fair procedure in appointing a Committee to inquire into the desirability of abolishing the managing agency system. This is the procedure laid down under Section 324 read with Rule 11 of the Companies Act. Earlier, the Government's apparent intention was to act under Section 326, under which the Government can reject applications for approval of managing agency agreements on the ground that the proposed managing agent is not a fit and proper person. The use of Section 326, which was meant to deal with individual cases of delinquency, to abolish a system of management in certain established industries would have been a clear abuse of statutory and administrative powers.

The five-member committee headed by I G Patel consists wholly of officials; in fact, three of the five are from the Finance Ministry. Considering the views which the Finance Minister has already expressed, it can be taken for granted that the Committee will recommend abolition of the managing agency system in certain industries and businesses. The question then is which industries and businesses will be closed to managing agents—and when. A large number of managing agency agreements, it is known, are due to come up for approval this year but the exact number is not disclosed. The first appointments of managing agents under the Companies Act 1956 took place in 1960 but how many of them were for five years is not known; the Company Law Administration has never published the "maturity pattern" of approved agreements even though their number does not exceed 1,500 and all the necessary data are in its possession.

Under Rule 11, the Committee that may be appointed to report on the enforcement of Section 324 can have the powers of a commission of inquiry. It can "examine such representatives of the management, investors and other interests concerned with the working of the units engaged in the industry or business concerned as the Committee may in its discretion select for the purpose". The Rule requires the Committee to make specific inquiries in regard to

(a) the importance of the industry or business to the national economy;

(b) the number of companies engaged in the industry or business and their financial and managerial performance;

(c) the capital structure and form of management of such companies;

(d) the capital structure of the managing agencies and the extent of their interest in managerial companies;

(e) the total remuneration received by managing agents acting as such or in other capacities;

(f) the extent to which managing agents have been responsible for the promotion, development and finance of managed companies; and

(g) whether in the light of various considerations, other forms of management could be of greater advantage to the shareholders and the general public.

The report of the committee may or may not be published. Data on all these matters, except (g) which is after all a matter of conjecture, are already available with Government. The test of the Government's earnestness, therefore, is the speed with which the Committee reports back. No useful purpose would be served by asking for memoranda and oral evidence. The question has been debated so long (with so little facts, though) that nothing new can be uncovered now to support the indefinite continuance of the managing agency system. The so-called substitute of management, by secretaries and treasurers is and should be deemed as no different from managing agents.

There is one problem which though only procedural requires immediate attention. That is the question of the guarantees which banks and most financial institutions require from managing agents (or failing them, one or two directors) for loans to managed companies even when the loans are fully secured (by_mortgage, pledge or hypothecation) against good and conventional collateral. In concrete terms, these guarantees are meaningless for they can never be honoured in event of default. ICICI has never insisted on such guarantees while the Industrial Finance Corporation announced its intention to give up the insistence only in 1964; SFC's and banks are still slaves of the old tradition. Severe transitional difficulties would be created in the industrial credit structure with the phased abolition of the managing agency system if adequate arrangements are not worked out in advance. Banks must be directed in the near future not to insist on such guarantees and the state-owned banking system (i e, the State Bank of India and its subsidiaries) must set the example on its own.

As for other transitional problems, private managements will have to do some fresh thinking on the creation of a rational and efficient system of management. In fact as distinct from law, the abolition of managing agents will not make a drastic change in the system of top management but it would imply fixation and assignation of individual responsibility and more work by less prestigious and younger boards of directors.

Confrontation: Another Step

IT seems to have gone relatively unnoticed that Indonesia had a full year's warning of Malaysia's election to the UN Security Council. It was last year that Czechoslovakia and Malaysia agreed to split the usual two-year term of non-permanent members to end a voting stalemate. Clearly, therefore, President Sukarno is not leaving the UN in a huff, suddenly angered by Indonesia's enemy's elevation. The withdrawal is the latest step in Confrontation which is now the sheet anchor of Sukarno's external and internal policies.

What does Sukarno expect to achieve by his dramatic act? Indonesia has set a precedent which other disgruntled countries could follow to express their dissatisfaction with the world organisation. Speculative reports have already appeared that Pakistan may follow suit if the UN does not act according to her dictates on the Kashmir question. In principle, therefore, Indonesia's exit detracts from the UN's prestige and authority. In actual fact, however, it is unlikely to have much impact.

Nor will Sukarno's withdrawal in any way make Malaysia more vulnerable to his threats. Formally, Malaysia's defences are well taken care of by her treaty with the United Kingdom. Besides, it is known, the US too has offered military assistance. On the other hand, Sukarno's internal and foreign policies have firmly put him out of favour with the western bloc. This by itself is sufficient to ensure that he can launch no large-scale military offensive against Malaysia with any hope of success. His principal allies today, People's China and the Soviet Union, are divided and are competing for influence over him. The Soviet Union, while verbally sharing Sukarno's views on the colonialist character of Malaysia, has discreetly refused to get too involved in Confrontation; she has been equally cautious in her response to Sukarno's withdrawal from the UN. Only People's China and Albania have seemed to go the whole hog with Indonesia on Malaysia, while Sukarno sought to impose an economic blockade of Malaysia, China sold her 250 million Malayan dollars worth of goods in the first ten months of 1964 and in the process built up a thumping trade surplus which must have come in very handy for financing her growing imports from the non-communist world. As for the non-aligned countries, few, if any, have supported confrontation even on paper, though Sukarno continues to be one of the pillars of non-alignment.

The theory that Indonesia's withdrawal from the UN is the precursor to a large-scale armed attack on Malaysia or even a marked intensification of the military aspects of Confrontation, therefore, has to be discounted. Yet it is part of Confrontation. To expect it to be followed by any serious action is to misunderstand Sukarno's policy. The Indonesian President has talked freely of "crushing" Malaysia and had even set a deadline for the achievement which has come and gone. But from the way he has actually implemented Confrontation it should be clear that what he expects to achieve is far less spectacular than the immediate military destruction of Malaysia. For the most part, he has been content to keep the Malaysia issue alive. The world-wide attention which his withdrawal from the UN has commanded subserves this objective admirably. More concretely, there has been a sharp step up of the British military build-up in Malaysia. British troops in and around Malaysia have been vastly strengthened, reinforcements have been rushed to the naval base in Singapore and a new air command has been formed. Malaysia herself had earlier ordered conscription. If heightening of tension was Sukarno's objective, the British and Tunku Abdul Rehman have co-operated admirably; they had no choice in the matter.

On Malaysia itself Confrontation has begun to leave not a few scars. There have been the inevitable fissures created by the large presence of foreign troops and military advisers. On the economic front, Malaysia's trade declined by one-sixth in 1964 and the Budget for 1965 presented by Finance Minister Tan Siew Sin in November last showed a deficit of M$853 million, double that in 1964—the result of burgeoning defence spending. The Indonesians may be too poor to be hurt by Confrontation, but Malaysia's prosperous business, mainly Chinese, and her comfortably-off middle classes are not likely to bear the burden as stoically.

More important, after the successful struggle against the Dutch for West Irian, Confrontation has become the principal prop of Sukarno's popularity at home. The prop has apparently served well so far. While the Indonesian Communist Party as well as forces opposed to it, mainly the army, have grown vastly in influence under his rule, they still vie with ea to win his favour. Recently w right-wing elements were alarn the inclusion of the Communist Chairman and two other comm leaders in Sukarno's Cabinet sought to close their ranks, the or nisation that they set up was calle the "Body for Supporting Sukarnoism". The fact that inspite of keeping his country in a continuous state of economic ruin for years, Sukarno can still confidently stay away from the country for long periods is evidence enough that, from Sukarno's point of view at least, the success of Confrontation is not to be judged by the very, very unfortunate fate of the few dozen guerillas he has sent forth to 'liberate' Malaysia.

Not Enough Fish

INDIA ranked tenth among the countries of the world in its output of fish in 1963 with a catch of 1.05 million tonnes, according to figures recently published by the *Bulletin of Fishery Statistics* from New York. This was an improvement over the previous year's catch of 0.97 million tonnes but that is by no means the whole story. If we consider the length of our coastline, our inland water resources, and the number of fishermen and fishing craft involved, the achievement is immediately cut down to size. Actually, our average fish production in the sixties has been below the level attained in 1959 and even in 1963 it was much less than the Second Plan target of 1.45 million tonnes. Between 1957 and 1962 world production went up from 31.14 million tonnes to 44.72 million tonnes; Japan increased hers from 5.4 million tonnes to 6.9 million tonnes and Peru hers from 0.48 million tonnes to 6.82 million tonnes. In contrast India's production during the same period decreased substantially.

It was pointed out in the Third Plan that a large increase in fish production was necessary so as to make available a minimum protein diet to the people. The Third Plan programme for fisheries was framed with this objective in view. Current consumption of fish in India is as low as 2 kgs per capita per year compared to 52 kgs in Norway, 50 kgs in Iceland and 45 kgs in Portugal. According to an F A O expert, if we could increase our per capita consumption of fish to half of the per capita consumption in Portugal, it would mean an eight per cent increase in our total food consumption. Our annual requirements of fish have been estimated at four million tonnes. And yet the fin-

location for fisheries in the [illegible]ns taken together has been 42 crores.

[illegible]'s neglect explains our failure. [illegible], though she has been excluded [illegible] some of the richest fishing areas [illegible] the war, now produces nearly 7 [illegible]n tons compared to half that quantity in the mid-fifties; Peru's production has shot up from 0.48 million tonnes in 1957 to 6.9 million tons in 1963, making her the number one fishing nation in the world. This achievement was made possible mainly by mechanisation of fishing craft and modernisation of nets. Between 1957 and 1962 Peru's tonnage of mechanised boats increased seven fold. Japan has 190,000 machanised craft with a tonnage of 1.6 million. In contrast India has only about 3,000 boats mechanised out of a total of 80,000. Of the mechanised crafts most are concentrated in Maharashtra. Similarly, our fishermen still use cotton or flax fibre nets; even though in the tropics the fibre rots quickly and so maintenance is quite costly. The wider use of nylon nets would bring many advantages. They are stronger, finer, almost invisible, require less maintenance and generally last three times as long as cotton nets. One of the obstacles to their wider use is that the synthetic fibre for nets has to be imported. Foreign exchange is the obstacle in the way of mechanisation also.

As a result most of our boats operate within 20 miles of the shore and fishing is suspended between June and September. With mechanisation we could exploit the deep sea potential as well as eliminate the seasonal character of the fishing industry.

North vs South in Nigeria

BECAUSE of its large population and important resources, Nigeria is one of Africa's key nations. Its position as the leading exponent of parliamentary democracy in Africa makes it doubly important. Thus, when Nigeria is faced with a major political crisis which threatens to destroy the nation, it is a matter of concern internationally. Although the crisis caused by the recent election seems to have been settled, at least for the time being, by a coalition of all of the major parties, the roots of the crisis remain.

Like many of the new states of Africa, Nigeria is a creation of its former colonial rulers. Nigeria is a confederation of major tribal groups linked by a British-imposed federal constitution. When Nigeria gained its independence in 1960, a delicate balance of power between the three main tribal groups managed to cement national unity. During the past five years, however, political tensions have mounted until they reached a breaking point just prior to the recent election. Indeed, one of the major political parties boycotted the elections, claiming that the ruling party had manipulated the electoral machinery.

With only token opposition, the dominant Nigerian National Alliance, consisting almost entirely of northerners, won an overwhelming victory. The opposition United Progressive Grand Alliance (acually a coalition of the southern tribes of Ibo and Yoruba) did not contest that election, although it is clear that it has the support of the majority of people in the South. Thus an impasse was reached when the southerners refused to accept the results of the election and threatened to secede from the Nigerian union. For the time being at least, a political settlement has been reached which has preserved Nigeria as a national entity without solving any of the basic problems.

The roots of the problems are all too familiar to many nations of Asia and Africa. Nigeria is roughly divided between north and south. The North is controlled by feudal Muslim emigrates, and remains essentially autocratic in everything but name. Education and "modernization" generally are at a relatively low level, and the whole region was virtually ignored by the British, who were content to leave the traditional social structure intact. The South, which is itself divided, is predominantly Christian or pagan and has taken to industry and trade vigorously. Education is at a high level, and most of the Nigerian civil service and virtually all of the employees of European firms are Southerners. The North, however, contains more than half of Nigeria's population, and therefore is in a position of political domination. Furthermore, it is easier to control the North because of its high illiteracy rate and still strong traditional social structure. Language problems further muddy the waters, and English has been officially adopted as Nigeria's national language. Thus, religious, tribal, and linguistic animosity has provided a powerful barrier to national unity in Nigeria.

It remains to be seen what the solution of Nigeria's problems will be. The North realizes that it would be the greatest loser in any split of the nation. Not only would it be cut off from the sea, but the Southern regions are wealthier and more advanced and could therefore speed Northern development. The Southern groups, on the other hand, are adamant in their demands for fuller regional autonomy and are opposed to Northern domination of any kind. The compromise patched together by the popular president Dr Azikiwe should be sufficient to "hold the line" for the present. Nigeria's future as a nation is, however, in doubt.

Agricultural Price Policy, at Last?

IT is heartening to be able to say that for once the Government has appointed a committee with the right terms of reference. The recently announced Agricultural Prices Commission will be concerned with the prices of not just (the superior and inferior) foodgrains but also those of sugarcane, oilseeds, cotton and jute. It had been argued on the basis of some revealing empirical data by agricultural experts (particularly by Professor M L Dantwala whose appointment as Chairman of the Commission, though yet to be announced, is taken for granted) that agricultural price incentives which are confined to only *some* of the agricultural products (e g foodgrains) do not have the desired impact on yields per acre because such partial price support creates the incentive for farmers to switch crops. Of course, the price mechanism needs to be used for achieving planned changes in the crop pattern, but this presupposes a planned price structure covering all agricultural products which has not so far existed.

Though an increase in output of foodgrains is important for obvious reasons, commercial crops are no less important both for meeting the increasing domestic demand and for earning greater foreign exchange. The rather obvious need, not to confine agricultural price support to a narrow range of products seemed to have been overlooked in the earlier discussions on the subject and in the advice given to the Central Government by some foreign experts. It is to the credit of those who were opposed to this short-sighted approach that they argued the case for a co-ordinated price support policy for most agricultural products with sufficient force for it to have been adopted before the other policy has had time to do too much damage.

The terms of reference of the Agricultural Prices Commission are sufficiently broad. While determining the relative price structure for agricultural commodities, it has to keep in view its effects on such things as the cost of living, level of wages and the industrial cost structure, etc. However, its precise relationship with the Food Corporation of India has not been clarified yet. There is obvious need for defining that relationship carefully in advance if the two bodies are not to find themselves working at cross-purposes. Again, it has not yet become clear that the minimum prices which will be offered to the cultivators will be guaranteed for something like five years; there is every reason to believe that unless some such guarantee is published, the incentive effects of minimum prices will be too weak to have an impact on yields.

Further, though an integrated system of price support for the major agricultural projects is in all probability a necessary condition for increasing yields per acre, nobody has ever seriously argued that in the Indian conditions it is likely also to prove a sufficient condition; the need to augment the supplies of inputs like irrigation (through minor projects), fertilizers and pesticides, etc, will remain as great as ever.

Lastly, the declared aims of Government regarding agricultural products include not only price support of the farmers but also a price ceiling for the consumer. Unfortunately, regarding this latter aim, there is no evidence yet of meaningful action by the Government. Without the power to force the surplus States to make their surpluses available to the deficit States, without rationing in the cities and without a crash programme to build the warehouses to stock about six million tons of foodgrains, it is still difficult to see how the Food Corporation can ensure a ceiling on foodgrain prices for the consumer.

Non-Receipt of Copies

Letter from South

Election Tactics in Kerala

THE sudden swoop on the Left Communists has further tangled the already extraordinarily complicated electoral scene in Kerala. The arrests have enthused not any section of public opinion in the State and, if anything, they have further downgraded the political standing of the Congress. No evidence has been presented to prove the charge that some kind of armed insurrection was immediately on the agenda of the Left Communists. In Kerala at any rate the entire Left Communist organisation was being geared up for the elections which are a bare six weeks away; the battle for which it was preparing was of the ballot and nobody was bothering about bullets. The ease with which the entire Left Communist leadership was arrested and the refusal of any of those arrested later to go underground hardly substantiate the accusation that they were preparing to challenge the Indian State in any ultra-revolutionary way.

The arrests will not prevent the Left Communists from going ahead with their election campaign. If anything, it will only provide further impetus to their campaign and give some of their candidates, who have been arrested, additional glamour and prestige.

Coming to the Kerala elections, it is strange then that so experienced a politician as Namboodiripad should try one ingenious formula after another to keep alive the chance of some sort of understanding with the Muslim League. The latest one is that independents sponsored by the Muslim League should be supported by the Left Front as the price for the Left Communists joining it. This is rather baffling, to say the least. The League is not going to give up its official candidates in its strongholds, even if it agrees to sponsor "independents" in some marginal constituencies. And in those strongholds in Malabar there pockets of Communist influence. What is to be the directive to these Communists and their supporters? For whom are they to vote? Above all, what happens to the struggle against communalism, which everybody agrees, has spread like a cancer in Kerala's body politic?

What the Left Communists seem to be overlooking is that a very big section of those who had formerly voted for the Congress are now looking for an alternative. One of the main reasons for their disgust with the Congress is precisely the opportunism with which it allied with the forces of Nair, Catholic, and Muslim communalism, until it reduced itself to a gathering of communal chieftains. This section will certainly not regard the Left Front as a reasonable alternative if it also goes in for the same sort of game as the Congress. The electorate might have been prepared to condone opportunism for some time as far as the Congress was concerned, out of a sense of past loyalty and from reverence to its idols, but certainly no transference of support can be expected if the Left Front also treads this primrose path.

Besides, there is the question of stability. Except for the brief 28 months when the Namboodiripad Ministry was in control, Kerala's experience has been that any compromise with the forces of communalism inevitably generates squabbles and internecine strife that bring alliances and Ministries crashing to the ground. What hope, then, can there be of stability when the Left Front, already heterogeneous enough, goes in for alliance or adjustment with the League?

In addition, there is another danger of which the more enlightened sections of the Kerala electorate cannot but be aware. The State has known the existence of a minority Ministry—the RSP government had only some quarter of the seats in the Assembly. Now the League is allied or is very likely to ally with the dissident Congress, which is an alliance of the more powerful segments of Catholic and Nair communalists. If, with the help of the Left Communists or Left Front, the League and its partners are able to emerge as a powerful minority force, or even as the largest single force, there is no reason to doubt that it will make a bid at Ministry-making. The contingency could even arise that it would emerge as the alternative which both the Congress and the Left Front would be asked to support as otherwise Kerala would have no Ministry at all, since neither the Congress nor the Left Front would tolerate each other's minority Ministry. The prospect opens up of endless confusion and instability. Principles apart, sheer expediency would seem to dictate utmost to prevent such an outcome.

At the time of writing, however, it does not appear as if the Left Communists are going to abandon adjustments with the Muslim League. In addition, they may come to some sort of understanding with a section of the SSP. What the reaction of the other constituents of the Left Front is going to be is not clear. It is possible that the Right Communists may try to build an alliance with the RSP and prominent independents and then decide whether or not to support individual Left Communists or SSP candidates in certain constituencies and leave it to the Left Communists and the SSP to do likewise.

From the London End

New Look for Aid Programme

THE forthcoming visit of Mrs Barbara Castle to India and Pakistan prompts reflections on the new Ministry for Overseas Development set up by the Labour Party. The merging of the various Government Departments which, in the past, were concerned with technical and financial aid was something which should have been done a long time ago. Before the new Ministry was created, responsibility for the aid programme was divided among several Government Departments—the Treasury, the Department of Technical Co-operation, the Board of Trade, the Colonial Office, the Commonwealth Relations Office, the Central Africa Office and the Foreign Office. No single Minister was responsible for all aid. In view of the generally recognised importance of aid to developing countries, it was essential that a single department with a Cabinet Minister in charge of the administration of British aid should be set up if any system and coherence was to be given to this all important subject. It is interesting to note that, apart from Holland, no other European country has a Cabinet Minister for aid, and there is no doubt that Mrs Barbara Castle certainly takes her job very seriously indeed.

Shortly after taking office, Mrs Castle promised a full review of the aid programme, the main object of which would be to see that the UK gives value for the money and technical assistance she pumps out in aid. Hitherto British aid to developing countries has not accounted for a large proportion of her gross national product. The latest figures indicate that the percentage is only 0.7 per cent as compared with 1.7 per cent for France. The drastic overhaul of the Department and the weight that is being given to the provision of technical assistance as well as financial aid, are moves in the right direction. The new Ministry is hoping to recruit 30 economists under the direction of Dudley Seers, and four of the eight main administrative divisions are directly concerned with technical assistance. Many of the recipients of British aid in future will be given greater help in planning their economic development, and Sir Andrew Cohen's appointment as Permanent Secretary will ensure that technical assistance is given due weight. Sir Andrew was Director of the now-defunct Department of Technical Co-operation.

The recent sterling crisis in Britain has prompted thoughts in the minds of some people as to whether Britain, with her unhappy balance of payments position, was not spending too much on aid to developing countries, and whether in this field, as in that of defence, Britain was not trying to do too much. Indeed, Enoch Powell recently claimed that current policies of aid to under-developed or newly developing countries were both "futile" and "harmful" to the receiving nations.

Impact of Payments Deficit

There is, of course, no doubt that what Britain is able to do in the field of aid will depend largely upon the state of Britain's balance of payments. This highlights the need for a really critical examination of the whole problem of international liquidity. With sufficient reserves to fall back upon, donor countries would no longer jeopardise their balance of payments position by providing aid in their national currencies (which are, in the main, convertible) to the developing countries. One lesson that has emerged quite clearly from the recent sterling crisis is that the new central bankers' collaboration techniques have not provided the complete answer to the problem and that a more reliable solution must be sought. In recent years, there has been no dearth of suggestions on how to improve international liquidity. So far, these schemes have invariably been turned down, mainly as a result of pressure from the more orthodox European countries who believe that there is really no need, at present, to increase international liquidity.

In view of the prevailing international climate and Britain's own balance of payments difficulties, the new Ministry will have to cut its coat according to its cloth. This means that in the near future there is little likelihood of British aid increasing above the level of approximately £150 million a year; it also means that Britain will have to continue to provide "tied" loans, ie, loans which have to be spent by the recipient countries in the donor country. This system causes the minimum of strain on the donor country's balance of payments. It is to be hoped, however, that the new Ministry will take a fresh look at it with a view to making the tying of loans less onerous for the recipient country. To begin with, more of this tied aid should be for maintenance imports instead of being tied to specific projects. Again, if the aid is to be really effective, some provision must be made to cover local costs. In many cases the provision of the foreign exchange cost alone is not sufficient to get the project moving. While it is understandable that loans are tied to prevent the money from being spent on purchase of equipment from third countries, there is no valid reason for failing to provide local costs.

Much can also be done to improve the terms on which a country like Britain provides loans to the developing world. In its aid programme to independent countries in the Commonwealth, the bulk of the aid is in the form of loans under Section 3 of the Export Guarantees Act formally tied to the purchase of British goods. They are normally long-term loans with grace periods for repayment at rates of interest (in recent years between 5¼ and 6¾ per cent tied to the British Government's borrowing rate or very nearly equivalent to conventional banking terms. This has meant that loans of this nature cannot be used for those projects which do not produce revenue quickly, and is particularly inappropriate in view of the already heavy burden of debt service on many developing countries. Britain has recently introduced longer grace periods and a waiver of interest on loans for a period of seven years, and some lengthening of the terms of repayment.

More could be done in this field. The World Bank Mission at present in India is looking into the possibility of postponing debt repayment in view of India's balance of payments difficulties, and it is hoped that during her visit to India Mrs Castle will understand more fully the problems faced by a developing country like India. It is not surprising that the first foreign tour by the new Minister for Overseas Development should take her to India and Pakistan, two of the major recipients of British aid among independent Commonwealth countries. Figures on British bilateral aid for 1945-6 to 1962-3 showed that the independent Commonwealth countries received a total of £230 million (19 per cent of total bilateral aid), almost entirely after 1957. Three-quarters were in loans as opposed to grants. India received over half the total (£122 mililon of which all but £3 million was in loans). Pakistan received £30 million.

Mrs Castle's visit to India will acquaint her at first hand not only with India's development problems, but with a knowledge of how Britain's share of consortium aid to India is being used. It looks as if Mrs Castle's tour will mark the beginning of a new and more efficient era for the British aid programme. What is required here is fresh thinking and more efficiency as well as a greater on-the-spot appreciation of problems of developing countries. All this will help the new Ministry to reach conclusions on major aspects of aid policy. This will necessarily take time, but there is no doubt about the dynamism and enthusiasm that the new Minister brings to her task.

Book Reviews

Subsistence, Its Economics

N K Thingalaya

The Economics of Subsistence Agriculture by Colin Clark and Margaret Haswell, Macmillan & Co Ltd, London, 1964; pages 218, price 30s.

THE features of subsistence agriculture are not unknown: the attitude to farming as a way of life rather than as a business, the preponderance of the human energy and labour among inputs applied to agriculture, low land yields, high rents and, of course, hunger, squalour, illiteracy, unhygienic living conditions and inertia. The price insensitiveness of farmers is a part of subsistence agriculture with its corollary of the backward-sloping supply curve for farm products (and also for farm labour). In sum, the subsistence farmer emerges as a non-profit-maximising entrepreneur, caught in a vicious circle of low income — low productivity — still lower income. All this has been said before and is fairly well known. In delineating the features of subsistence farming, therefore, this book does not add much that is new. Its purpose here seems to be to document the different symptoms of subsistence agriculture as diagnosed by various "thorities" in various parts of the world at different times. The book presents a picture of the nature of subsistence in which the various parts have been brought together and then proceeds to evolve indicators to measure "the degree of subsistence".

Clark and Haswell begin by claiming that the extent of hunger and malnutrition prevalent in the world has been exaggerated. The common belief, aided and abeted by the FAO's publications and campaigns, is that "a lifetime of malnutrition and actual hunger is the lot of at least two-thirds of mankind". The truth, according to the authors, is that the world is not as miserable as all that. It is the standards used for estimating food requirements which are questionable. After much "intellectual detective work" the authors bring down the extent of hunger to 10 to 15 per cent of mankind.

Different Stages

Just as the growth of the whole economy is analysed in different stages, the development of agriculture can be studied in various stages. Recently some writers, like Winter and Daniel Thorner, have used elaborate classifications of peasant economies in an historical context. To trace the growth of agriculture in three stages, Clark and Haswell take us back to the prehistorical period to meet the "preagricultural man" amidst his primitive life. When hunting and fishing were the sources of food, the primitive man required an area varying from 17 to 90 square kilometres to obtain his food. With the introduction of agriculture the area required per person merely to subsist declined sharply. This happened even when cultivation was primitive with the rotation of fields rather than crops, clearing of forests by means of fire and use of labour as almost the only input. But when cultivation became sedentary, space requirements fell to 1 to 5 sq km per person and with the domestication of animals it further declined to half a sq km per person.

Measuring or comparing agricultural progress on an international plane is admittedly difficult, the more so because in the backward agricultural countries the greater part of the output is grown for subsistence consumption with only a negligible portion being traded for money. The authors use an unit of grain-equivalent for the purpose, fixing some 250-300 kg per person per year as the subsistence minimum. In a subsistence economy, as De Vries who has evolved many interesting empirical propositions regarding the role of agriculture in economic development has rightly observed, it is almost a law of nature that agricultural production will increase approximately at the same rate as the population. The large number of case studies and pioneering efforts made to estimate productivity in agriculture, which are cited in this book, bring out the nature of labour-earnings in agriculture. A bold generalisation is made by de Farey that "three kilograms of cereals is the usual reward for a day's work in a subsistence economy, whether it be India now, Russia at the beginning of the present century, or France in the 18th century". Clarke and Haswell present a wealth of empirical data to verify de Farey's proposition including such fascinating bits as that the average wage per man per day in Madras district in 1954 was 3.35 kg of rough rice.

Rent in poor peasant economies has been the subject of attention of

political economists since Ricardo, not the least because it accounts for roughly a half of the gross produce of land. It is not the fertility of the soil but the pressure of population on land that creates rent. A long table provides data on rents and prices of agricultural land in different parts of the world, giving the percentage share of rent in gross output and in total factor income in the developed and the backward economies. Surprisingly, the relevant data for India are not given, though the book abounds in references to the Farm Management Studies. Except in commenting on the rising land values and high rent, the authors make no reference to tenurial policies and tenancy legislations seeking to alter man-land relations which most developing countries have enacted, successfully or otherwise.

Leisure Preference

The leisure preference of subsistence farmers is an economic dogma which has come down from William Petty in the 17th century and it naturally makes its appearance in this book also. Case studies are cited to show that when the land held by families exceeds three hectares in fertile tracts, they tend to leaseout a part of it. But it is no less true that most of the farm families do not have sufficient land to keep them fully occupied, though the size of holding that provides full employment to a family may vary widely as may the intensity of labour-use on farms, making it difficult to measure the extent of rural over-population in subsistence economies.

The high income elasticity of demand for food is an accepted feature of the consumption pattern in peasant economies. At the lower income levels, expenditure on food articles forms the predominant item in family budgets. It tends to decline with rise in income. An impressive array of family budget data is presented to corroborate even this least controversial of all the characteristics of a subsistence economy.

However, after reading the book it is difficult to make out whether the authors intended to write a handbook on subsistence agriculture or a treatise on the economics of subsistence. Since there is no preface or introduction to the book we have nowhere an authoritative statement of the purpose of the book. But the mass of empirical information on subsistence presented by the authors is very useful and their success in providing some indicators for international comparison is commendable.

What to Do with Agriculture

N S Shetty

Agricultural Planning in India by S C Jain, Metropolitan Book Company, 1964; pages 125, price Rs 6.50.

AT present agricultural planning in this country takes the line of least resistance, argues the author of this brief book with the ambitious objective of pointing the way to a "revolution" in Indian agriculture. This approach to farm planning involves introducing technological changes into farm production while its structure and organisation remain unadjusted to these changes. The frequent failures of "schemes of improvement" is proof of the validity of this criticism. Despite huge investments made in three Five-Year Plans, we are now almost at the point from where we had started. The warning follows that "time is now ripe to give serious thought as to whether to stay for some years more with the existing techniques of agricultural planning or to introduce new methodology capable of eradicating the various lacunae in our efforts to solve agricultural problems and raising farm productivity within the shortest possible period."

What Is Wrong?

That something is wrong with our agricultural planning needs no special emphasis. Jain's book falls logically into three parts. In part one he examines the existing techniques of agricultural planning. The basic causes of the slow rate of increase in agricultural production and productivity are described in part two. Part three brings together the author's proposals to bring about the "revolution" in agriculture.

The main components of agricultural planning in the Five-Year Plans are described by Jain as :

(i) provision of material inputs which include manures and fertilisers, improved seeds, irrigation facilities and insecticides and fungicides;

(ii) measures for improving efficiency of agriculture which involve introduction of improved cultural practices and changes in methods of production;

(iii) provision of economic incentives through price support, subsidies; and

(iv) institutional reforms, including land reforms, provision of institutional credit and reform of the marketing system.

The achievements of agricultural planning, according to the author, have been "spectacular" in creating pockets of increased knowledge and experience in agricultural development, in getting the Government deeply involved in the problem of agricultural development and in increasing awareness of agricultural problems among governments, politicians and the public. While there is no doubt that by and large "substantial progress — better progress than in any other ten or twelve year-period of India history" has been achieved, the break through to high productivity is far from being in sight yet.

Not Original

Jain's proposals for bringing about the agricultural 'revolution' are :

(1) Complete mechanisation of agriculture in two districts in each State;

(2) Seven agricultural machinery producing plants and a plant for manufacturing multi-purpose machinery capable of doing all jobs on the fields and farms;

(3) Three insecticide, weedicide and pesticide plants along with power sprayers, dusters and aerial spraying equipment plants;

(4) Chemical fertiliser plants;

(5) Irrigation and electricity on all farms; and

(6) Centralised agro-biological and agro-service stations, with a large number of laboratories equipped with modern appliances.

As a blueprint for the agricultural 'revolution' this is as grandiose as it is perhaps lacking in originality. The question is why the far more elaborate blueprints contained in the Five-Year Plans so far have failed to deliver the goods. Though Jain is highly critical of the Government's efforts, no systematic answer to the above question emerges from his book.

Some Patterns of Tribal Leadership

A Aiyappan

Before undertaking any action programme, the agent of change should have some idea not only of the theory but also of the general morphology of tribal leadership in its relatively static phase in the past and in the present fluid situation of rapid change under the powerful impact of modernism. A great deal is known of charismatic and religious leaders of tribal groups, but not of other types of leaders of the past and the present.

An attempt is made here to describe briefly a few typical situations and the history of group or individual leadership emerging in these situations in order to suggest the kind of problems which the researcher is likely to meet with in tribal societies.

THERE is a pressing need in India now for research information on problems of tribal leadership. Administrators of welfare programmes on a nation-wide scale are confronted with the task of locating genuine leadership and enlisting it in the service of tribal and rural reconstruction. The wide-spread failure to do this has been partly responsible for the malaise in our community development schemes. On-the-spot studies and active involvement in welfare work are necessary before the anthropologists can help the administrator in his difficult job. Anthropologists in India are getting sensitised to the new field of leadership studies as applied to our rural and tribal communities. (The Seminar on Leadership held in Ranchi in November 1962 discussed various aspects on the subject with particular reference to rural and tribal India. The report of the Seminar when published is bound to be of great interest.)

Before undertaking any action programme, the agent of change should have some idea not only of the theory of leadership but also the general morphology of tribal leadership in its relatively static phase in the past and in the present fluid situation of rapid change under the powerful impact of modernism. History would give us insights into the nature of leadership which different situations threw up, the relation between leaders and followers, the instrumentalities of leadership, the personal and group goals sought to be achieved, and so forth. In the following pages, a few typical situations and the history of group or individual leadership emerging in those situations are briefly described—no detailed analysis is given—in order to suggest the kind of problems which the researcher is likely to meet with in tribal societies of India. A great deal is known of charismatic and religious leaders of tribal groups, but not of other types of leaders of the past and present.

Leadership that Got Pushed Out

The Kisans are a Dravidian-speaking tribe living mainly in the Districts of Sundergarh and Sambalpur of Orissa, their largest concentration being in Gangpur, Bonai and Bamanda. The Kisan language is allied to the Oraon language and the tribe itself is believed to be an off-shoot of the Oraons. The Bariha was the traditional leader of the Kisans. The word Bariha, it is surmised, means "king". The Bariha was a minor 'Raja', over-lord, above the village-heads (Gountia). The Raja of Gangpur recognised two Barihas, and Raja of Bamanda recognised four who are still surviving and functioning to some extent. Copper-plate charters appointing them as chieftains over the Kisan were also granted. The Barihas' functions were mostly social and involved very little administrative or revenue or judicial work. Fines and the various fees collected by them were the chief source of income for the Barihas. The Bariha had the special function of arranging the marriages of widows and divorced women and the readmission of illicitly pregnant women into the Kisan society. The bride prices of all these types of marriages went to the Bariha. At the last phase of Barihahood in the lowland villages, the widows and divorcees were almost sold away. This kind of 'revenue' collection led ultimately to the decline of the office of the Bariha.

The office of the Bariha got stabilised because it helped to weld several Kisan villages together and provided a machinery for social control at an inter-village level over areas which included about 100 or more villages. Disputes which could not be settled at the village level or by a small group of nearby villagers were referred to the Bariha who could fine or excommunicate or readmit guilty persons. The position of the Bariha was strengthened by the use the Rajas made of the office as their channel of communication and as their "executive". After the Rajas lost power and the British came in, the Rajas and Barihas lost their roles. The new emerging tribal elite did not like many of the things done by the Bariha, e g the admission of aberrant women into Kisan society. The "sale" or similar disposal of widows and divorced women was also repugnant to the emerging tribal elite. The support for the office from the popular side also gradually waned. People stopped going to the Bariha to deal with the various categories of disputes described above. Inter-village disputes also ceased to be referred to the Bariha.

About 25 years ago, the authority of a Bariha to impose some rather cruel sanctions was questioned in a criminal complaint. There was a custom by which, in cases of seduction, the Bariha allowed the brother of a seduced woman to kidnap the sister of the accused man (seducer). Educated Kisans thought this was unjust and exploitative and filed a complaint. My information in this case is, unfortunately, incomplete, but it shows that forces to undermine traditional authority were being generated by an emergent and new type of leadership.

By 1945, a new movement was taking shape. This was the organisation of the tribes on the model of the caste associations of the Gonds, Telis and other castes. Social reform was its aim and one of the first resolutions of the Kisan Jati Sabha was for the abolition of the Bariha's office. The Panchu Palli (five villages)—a council of leaders—representative of a few villages came now into existence to settle matters involving more than one village. For this there was precedent in the council which could, in the past, be summoned by an aggreived villager to settle a matter which a Bariha refused to adjudicate. Several Barihas and village leaders would attend such a council. But the Panchu Palli referred to here had limited coverage over a few villages. Informal councils with the jurisdiction over four or five villages functioned in the past also. A resolu-

tion of the Kisan Jati Sabha only formalised this small council's role.

The Ritual Leader

Another type of leader, exercising social control, is the Panigiri (Panigrahi) or Ghata Bariha. He helps in the maintenance of the existing structure at the inter-village level and also the ongoing sanskritisation process, to which some of the Bariha's activities ran counter (e g readmission of aberrant women). In a Barihas' territory there may be two or three Ganga Ghats (ghats for purificatory baths) each in charge of a Panigiri. The Panigiri's influence is declining, but not so much as the Bariha's. The Panigiri is the person who ritually readmits deviants by sprinkling water on them, formerly on the orders of the Bariha or local leader. The Panigiri hears disputes regarding readmission and cases which could not be decided at the village or inter-village level. With the emergence of the Panchu Palli and Kisan Jati Mahasabha the Panigiri's influence is going down as cases now get settled quickly at the village level.

Persons capable of "talking", with good economic status based on landownership, with literary, or puranic scholarship, with medical and other traditional knowledge, or with contacts with courts and the world outside, are the kind of men who get into the new leadership positions. Gram Panchayat members also are invited to sit with these leaders in tribal meetings. Government servants are only outwardly respected by the Kisans. Land and bullocks give real status, for the Kisan is business-minded, worldly wise, and calculating, and values real property. Active politicians of the Congress party (most of them formerly members of the Praja Mandal) and some of the Ganatantra Parishad party are found among the Kisans. Most of the new leaders are of the Congress party, but there are many among the people belonging to Ganatantra Parishad. The Jharkhand party has little appeal to the Kisans. These new leaders are genuinely interested in the future of the tribe and are all reformers. The all-India parties are attempting to draw these leaders into their own groups. Thus the Kisans are moving from the state into national parties.

Annan Pittan was an outstanding personality among the Kurichiyas of Wynaad, one of the predominantly tribal areas of Malabar. The Kurichiyas are still one of the most conservative of South Indian tribes. Unlike the Nayars, they retain their matrilineal family system, and many other old world customs, little affected by modern trends. My acquaintance with the tribe began about 1934 and I have been in touch with them for the last 18 years. Annan Pittan was one of the four or five literate men of the tribe who number about 12,000. Apart from literary he had several other qualifications, the capacity to "speak law" being one of them. His skill in handling disputes, skill as a hunter and marksman with both the shot gun and bow and arrows, his stature and bearing were among his additional qualifications. Some time about 1937 Annan Pittan was nominated as a Panchayat member to represent the Depressed Classes, for at that time the Kurichiyas were wrongly included in the list of Depressed Classes. The elders of the tribe were opposed to his accepting the membership of the Panchayat, so the gods were consulted in the usual formal manner. The *shaman* as the mouthpiece of gods told them that the gods were opposed to a member of the tribe accepting the membership of the Panchayat Board. Now the Kurichiyas are an extremely religious people with an exaggerated development of religious institutions which has been the undoing of the tribe as in the case of the Saoras of Orissa. Anan Pittan disobeyed the commands of the gods and accepted the nomination and attended the first meeting of the Panchayat Board. Within a few days he had an attack of cholera and he died within a few hours after the attack. I had the sad privilege of attending his funeral ceremony. The tribal elders with whom I discussed the subject of his death told me that the gods had taken their revenge on the disobedient Kurichiya.

Responsive, but Ascribed Leadership

Few tribes there are in India who can equal the Kurichiyas in their religiousness. Yet occasionally we come across tribesmen who have courage to go against tradition. Annan Pittan was one such, but his unfortunate death at a critical time gave the elders a good excuse to hold up social change. Had he survived, wider contacts of the Panchayats would have enabled him to attempt modernisation of his tribe.

Among the Koyas (of Malkangiri), one of the most backward tribes of Orissa (according to the list of the Dhebar Commission), the Pedda, the hereditary headman of the village, is in most cases the *de facto* as well as *de jure* leader of his village. He enjoyed this position in the past because the disposal of the village land was in his power and he was the agent of the Muttadars. But now he no longer enjoys this power and so his importance is much less, but he still controls social, political and religious activities, the Perma or priest acting under his direction. Some Peddas have now become Panchayat members.

The qualities which the Koya villager wants in his leader are—

(1) he should be frank and fearless in dealing with outsiders, particularly Government officials;

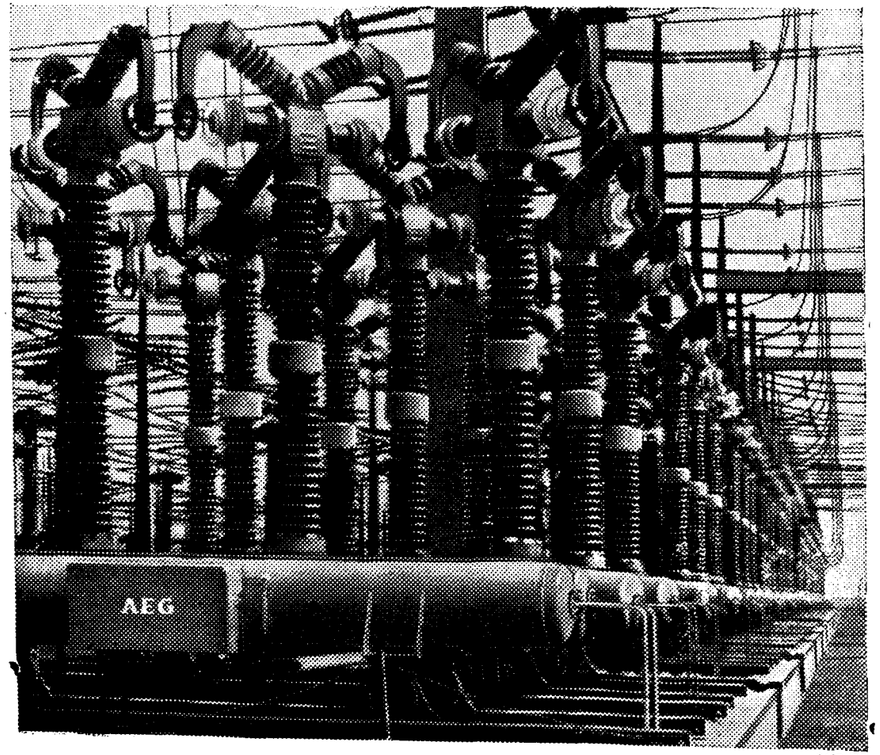
(2) he should be truthful;
(3) he should be impartial; and,
(4) he should be somewhat rich.

Prasanta Kumar Choudhury tells me that in each Koya village an annual meeting is held of all the villagers, at which they review the Pedda's work for the past year; the Pedda sits along with the other members of the assembly and listens but does not challenge any statement or express anger. The object of this annual meeting is to make him aware of his lapses and make him do better in the future.

The Koyas are a tribe of Dravidian speakers. Among several ancient Dravidian communities, the democratic, responsive leader of the type referred to here is mentioned in classical works in Tamil. The persistence of the institution among the Koyas is a matter of some interest.

The traditional pattern of tribal leadership which after stabilising its economic and political status sanskritises and leads itself up and partially out was well brought out in a dispute concerning an election from a double member parliamentary constituency in which the tribal member got elected as the member for the general seat by getting more votes than his non-tribal rival. In the award of the election tribunal, the situation which I have referred to is discussed in detail. Candidate D in his nomination paper described himself as a member of a scheduled tribe, and the returning officer accepted his claim. The rival candidate who filed the election petition produced documentary evidence to show that in his school record and several registered documents he had described himself as a Kshatriya, that he had marriage relations only with zamindar families who also described themselves as Kshatriyas, that he was wearing the sacred thread and was maintaining a great deal of social distance between himself and the members of the tribe

to which he claimed to belong. The election tribunal held the view that D should be regarded as a non-tribal and on this and other grounds declared his election void.



I need not go here into the sequel ot this dispute. There is no doubt that D's ancestors were tribals who managed to raise themselves to pseudo-Kshatriya rank through devices with which we are familiar. The procedure is about the same as in the Rajputisation described by Surjit Sinha in his presidential address to the section of Anthropology of the Indian Science Congress Session in 1962. D sanskritised himself and his leadership of the people after this was from outside. Under the traditional social systems, for both the tribal and the non-tribal ruralites, there were gains to be acquired by the assumption of Kshatriyahood. But, under the new constitution, the political gains were tempting enough for the provisional renunciation of Kshatriyahood. Under the trdaditional social system, the particular tribal society did not provide a satisfying role within it for a highly sanskritised elite. Under modern conditions, westernisation provides such roles without the individual having to create any myth for the status change.

AEG SPELLS POWER

AEG spells power—power generation, power transmission, power conversion, power distribution. Incepted in Germany 80 years ago, AEG has won International recognition as one of the world's largest and oldest established electrical equipment companies. Today, AEG has 25 factories. Their total output covers every branch of electrical engineering, from the minutest trade and household appliances to complete electrical installations for all branches of industry.

Dandakaranya: A Survey of Rehabilitation
II - Industries

S K Gupta

Judging by the two categories into which the Ministry classified the displaced persons it seems that its imagination did not at first go beyond agriculture and small trade, as the two alternative means for their economic rehabilitation. No sound economy can, however, be built upon agriculture alone, even under the best of conditions, and in Dandakaranya conditions were far from ideal. Trade, too, in the narrower sense, was not a sufficient alternative, for it could not play a significant role in a rural economy where thirty to fifty families in a village earned a precarious living from land while the nearest village was sometimes miles apart. Even in urban and semi-urban areas its scope was limited because of strong competition from old, established rivals.

The pattern of non-agricultural rehabilitation which was limited to providing a loan for starting a trade and another loan for building a house with three months' grace within which to make good and be independent of aid was, therefore, foredoomed to failure. Here and there some one with an instinct for business set up a shop, another opened a barber's saloon close to a staff colony, a third started a confectionery or a bakery or an eating house near some urban concentration; but their number was small and the shop rooms built by the Project were mostly vacant because of high rent and unsuitability of site. The majority failed in their venture, ate up the business loan and looked about for jobs.

Many non-agriculturists had only their skill as carpenter or weaver to offer and could find employment only if there was an entrepreneur to organise work, provide capital and take charge of marketing. The Project authorities were thus gradually forced to start industries on their own with the twin objects of finding supplementary work for agricultural families and self-sufficient means of living for the non-agriculturist.

For the second purpose the tests of efficiency of an industry are whether it will be economically viable when the artificial prop of the Dandakaranya Development Authority is withdrawn, whether it can offer a living wage to the workers, and whether the volume and scope of employment bears a reasonable relation to the capiatl invested. Unfortunately, no commercial accounts have been kept and the figures supplied by the industries department are sometimes slightly discrepant. There are, however, three other sources from which helpful data are available.

A profit and loss account for most of these industries was drawn up from the start of the industries up to the end of March 1963 in a specially devised proforma at the instance and under the supervision of the Deputy Financial Adviser and Chief Accounts Officer of the DDA.

An Economic Investigation Team set up at my request by the Development Commissioner, Small Scale Industries, New Delhi, to explore the possibilities of Small Scale Industries incidentally deals in its Report with the present state of some of the major industries run by the DDA and their working in March 1964.

Lastly, the Rehabilitation Industries Corporation lent me the services of its Chief Cost Accountant who made a detailed scrutiny of the working of the industries during the three months from April to June 1964 and submitted a report in August which is quite illuminating.

All these materials have been made use of in the following survey of the industries of the Dandakaranya Project.

BETWEEN 1959 and 1964 the following Industrial Centres were set up by the Project Administration, the figures in brackets showing the year of starting.

(I) Centres directly controlled by the Industries Department:
- (a) Industrial Centre at Boregaon (1959)
- (b) Industrial Centre at Jagdalpur (1962)
- (c) Wood Working Centre at Umarkot (1962)
- (d) Oil Extraction Centre at Ambaguda (1962)
- (e) Carpentry Unit at Govindapalli (1963)

(II) Cottage industries directly controlled by the Zonal Administrators:
- (a) Weaving Centre at Boregaon and Jugani (1960)
- (b) Cottage Industries Centre at Umarkot (1962)
- (c) Cottage Industries Centre at Paralkot (December 1963)
- (d) Cottage Industries Centre at Malkangiri (March 1964)

Except at Ambaguda all others concentrate on one or more of four stereotyped industries like carpentry, weaving, blacksmithy or sheet metal work.

(a) Industrial Centre at Boregaon

This is the biggest Industrial Centre of the DDA primarily concerned with timber products of a general or a special kind. Its different sections are (1) a saw mill (with log stacking as an ancillary operation), (2) a general carpentry unit, (3) a blacksmithy unit, (4) an Ascu treatment plant, and (5) an ammunition box manufacturing unit. The first two were started in 1959, the third in 1962 and the fourth and fifth towards the latter part of 1963. A wood seasoning unit with a boiler has also been installed recently, but it had not started functioning by August for lack of specialist staff. Of these the saw mill, the blacksmithy and the wood seasoning plant are only feeders to the carpentry and ammunition box sections, and the Ascu treatment is also likely to be so as soon as the present contract with the Post and Telegraphs Department to treat its telegraph poles at a certain agreed rate is over.

The proforma accounts, condensed in Table 1 show a loss of Rs 3.25 lakhs upto the end of March 1963.

The latest attempt made with the concurrence of the Chief Financial Adviser to reduce the gap between expenditure and income by excluding the charge of superior direction from the left hand side and adding a fictitious sum of Rs 30,000 on the right hand side to represent the national value of waste timber which was unutilised is disingenuous and I disallowed it when it came to my notice on the eve of my leaving Dandakaranya. I am not sure whether the attempt will not be revived. Even if it be conceded that superior direction is part of normal administration and its cost should be excluded there is no justification for adding a fictitious sum over and above the actual sum received by sale of waste timber. If operational inefficiency led to large wastage when logs were converted to timber and this waste timber, as the foreman admitted, had no demand and was not sold nor turned to any profitable use, it is not permissible to argue that this waste is really an asset and to inflate the figure of income by another thirty thousand as it snational value.

Investigation Team's Report

I pass over the Economic Investigation Team's estimate of loss for the months of March 1964 at Rs 30,721 in respect of four of the units (excluding blacksmithy) and come to the report of the Cost Accountant who has gone more deeply into the matter. It is not necessary to set forth the details of his calculations and the manner in which he has distributed the fixed cost and overheads over the different units of manufacture, but the net results of his findings are briefly as follows.

The saw mill works 46 per cent below capacity and recovers only 50 per cent of sawn sections from logs against 65 or 70 per cent of a normally efficient mill. The resultant high cost of production is reflected in the high price charged for sawn timber from the carpentry and ammunition box sections. The latter comes in for very severe strictures for the extremely unwise terms on which the Project agreed to supply 10,000 ammunition boxes of a particular type to the Defence Department at Rs 29 per box including delivery and loading at the railway station although the actual cost is more than double the amount. The cost of timber (teak) per box is Rs 20, and that for fittings Rs 17.30, while the cost of conversion (including proportionate costs of power, salaries of establishment, depreciation and repairs of buildings, machinery and plants, and the actual wages paid to labour) comes to Rs 22. If Rs 1.25 is added for transport and delivery at the railway station, the production cost per box amounts to Rs 60.50. The Economic Investigation Team calculated the cost of timber at Rs 16 and of fittings at Rs 12 (though they did not show how they worked out these figures), but even on that assumption the production cost per box comes to Rs 51 which far exceeds the contract price of Rs 29.

The fact is that when the contract was entered into in May 1963 the Project Administration, pleased with being able to pull off a large supply order from the Defence Department, showed a surprising lack of cost consciousness and did not stop to think what they were letting themselves in for. Hardly anything was done to retrieve the position even when the large recurring loss became apparent. Three steps could have been taken to reduce the loss, viz, increasing the efficiency of the saw mill so as to reduce the cost of timber, utilising the full capacity of the plant so as to make 100 to 150 boxes per day instead of a bare 15 so as to reduce the overhead, and substituting costly teak by the cheaper variety of timber which the Defence Department was quite willing to accept provided it was properly seasoned. The second step could have been taken easily for the output of the saw mill, even after working fifty per cent below capacity, was quite sufficient to feed both the carpentry and ammunition box sections at this increased tempo of production. As for the third, teak was used instead of inferior timber because the latter was not available at short notice and the seasoning plant had not started functioning.

As things are, the loss per box is Rs 31.50 which means that in eleven months from August 1963 to June 1964 during which 4,656 boxes were manufactured a total loss of rupees one and a half lakhs (approximate) was incurred on the assumption that all the boxes will be approved without objection. Actually, out of 4,566 boxes 3,000 were approved, 1,156 were passed after rectification of minor defects, and 500 boxes still awaited rectification and final inspection which would necessarily mean some additional cost. The cost Accountant cannot be blamed for concluding that "the agreement to supply ammunition boxes has been an extremely unfavourable deal".

The general carpentry section for the production of furniture, doors, and windows, etc, works partly on piece rate basis and partly under the foreman directly. It appears that during the three months from April to June 1964 the value of the articles manufactured was Rs 35,000 while cost incurred in materials, wages and overhead was Rs 32,000. The two remaining sections, viz the Ascu treatment plant and the blacksmithy are insignificant because they never employed more than 5 or 6 workers each. The Ascu plant was completely idle from June and the output of the blacksmithy during these three months was valued at Rs 1,600 while the cost amounted to Rs 2,200.

Considerable Loss

Most of the manufacturing units were, therefore, run at a considerable loss and the saw mill escapes the stigma only by being able to unload its costly products on sister units which have to take them willynilly. Only the carpentry section shows a small profit, due largely to the suddenly increased demand for furniture at Mana Camp where a completely new office had to be fitted up at short notice. No jugglery of figures can reduce this loss nor is the argument available that the loss is due to its being a training centre as well. The training aspect of the scheme is only a small part of it and most trainees should earn their keep after three months, if training is properly organised. No account having been kept of how much wastage of materials was due to training and what remuneration was paid during the exclusively training period it is not permissible to make them the scapegoats for all the loss sustained.

Table 1: Proforma Accounts of Industrial Centre at Boregaon

Expenditure	*Rs*	*Income*	*Rs*
(A) Raw Materials	4,27,019	(a) Saw Sections	3,72,988
Labour Wages	76,766	(b) Furniture	86,838
Electricity	98,000	(c) Blacksmithy Products	4,114
(B) Establishment (Overhead)	68,316	(d) Sale of Waste Timber	719
(C) Depreciation	79,235		4,64,659
Interest on Capital	24,048	Excess of Expenditure over Income	3,25,725
Superior direction	27,000		
Total	8,00,384	Total	8,00,384

Even the consolation—a large volume of employment at living wages, is not available. The average employment in 1963 was 170 per day. Between January and July 1964 the number employed in different sections will be seen from Table 2.

Taking the month of June as typical, there were 107 displaced persons in the saw mill and log stacking section, 82 in the ammunition box section, 28 in the carpentry section and 7 in the blacksmithy section. The Ascu plant which had flickered into life in April and May was closed in subsequent months.

For a capital investment which has been variously estimated from Rs 3.3 lakhs to Rs 4.7 lakhs the volume of employment is only moderately good, but it is not possible to be enthusiastic about this employment figure when it is remembered that all these are not new employment for an additional set of displaced persons, as out of 224 desplaced persons employed in this centre in June as many as 155 had already been settled on land or offered business loans and had found land unproductive and business unprofitable and that only 69 new employments had been created for people who had not previously received any kind of accommodation.

Even worse is the standard of wages which in most cases was below subsistence level. Excluding piece rate workers, the employees are usually graded according to their skill and responsibility as chargemen, operators, helpers and trainees and paid usually at the daily rate of Rs 6, Rs 4, Rs. 2.50 and Rs 1.50 (now raised to Rs 1.75) respectively. The low rate of wages for the vast majority of workers will appear from Tables 3 and 4 for the three months from May to July, 1964.

Trainees constituted 71 per cent in May, and 62 per cent in June and 56 per cent in July, the improvement in the latter months being due to the periodical selection for promotion started of late. There were, in July, 37 trainees who were in this category for over a year and a half, 11 for over a year and 10 for over 6 months.

With such a large proportion working at the lowest rate and with a maximum of 24 or 25 working days in a month (unless reduced by illness or other causes) it is not surprising that the total income of a worker is in most cases far below the subsistence level (see Table 4).

Comment is needless. An industrial employee who does eight hours of manual labour and walks a long distance to come to his place of work gets much less than the lowest paid menial employee of the DDA. Out of 271, 225 and 280 workers at Boregaon in May, June and July as many as 178, 173 and 178 did not reach an income level of Rs 50.

Only the piece rate worker fared reasonably well. In June 1964 the average earning of 17 piece rate workers was Rs 138 and the income of one of them was as high as Rs 471. July figures were somewhat disappointing and the average was low probably because some of the workers were only partially employed, but even so, 4 earned more than Rs 200 each, 9 between Rs 100 to Rs 200 and 4 between Rs 80 to Rs 100. The total number of piece rate workers in this month was twenty.

(b) Industrial Centre at Jagdalpur

There are four units run under an Organiser of Industries, viz (1) weaving and spinning, (2) carpentry, (3) sheet metal work, and (4) blacksmithy. The Organiser is independent of the Industries Officer and directly controlled by the Chief Administrator.

The proforma account upto the end of March, 1964 drawn up by the Deputy financial Adviser shows a net loss of Rs 1,600 (approximate), the carpentry section being run at a slight profit and others at a loss. For the next three months the Cost Accountant calculates the net operating loss at Rs 12,600. The Economic Investigation Team's analysis tallies with this for it finds the excess of expenditure over income in March 1964 to be Rs 4,000, but it thinks that if Rs 3,000 be regarded as the cost of training the net loss of Rs 1,000 may not be regarded as too high.

This flattering conclusion about training is not borne out by facts. The number employed is small and it shows a progressive decline. There is a great

Rs 70 to Rs 80	7	8	18
Rs 80 to Rs 90	—	1	5
Rs 90 to Rs 100	4	6	3
Above Rs 100	11	9	—

deal of absenteeism among the workers within a month and desertions in subsequent months. The organiser's invariable comment against most displaced workers in the monthly progress report is that they are wilful or negligent which seems to be an excuse, prepared in advance, for his failure to attract them or win their loyalty. Obviously, the centre has not been able to attract the displaced persons and make them work continuously so that desertions and irregular attendance detract from its utility as a training centre.

The capital invested, excluding office furniture, is Rs 22,000 for tools and equipment, and Rs 91,551 for buildings etc, excluding land for which no payment had to be made. In May, June and July the total number of workers were 96, 74 and 79 respectively of whom about 11 were not refugees. Of the 96 workers of May, 43 ceased to attend in June while 17 new workers joined, and something similar to this also happened in July. Irregular attendance was very high in June, about a dozen workers being absent for more than twenty days, and in July there were four cases where the attendance was much less than ten days. The primary reason must be that either the centre has failed to develop the requisite skill among the refugees to enable them to earn more or, what is more probable, it has not been able to win their confidence so that they prefer working under other masters who offer them better conditions of work and better wages.

The low rate of daily wages and poor attendance were reflected in the income earned by workers at daily rate and piece rate. Twenty-one persons in May, 19 in June and 4 in July earned less than Rs 10 which probably shows that they found other jobs more attractive. The number in the different income brackets will appear from Table 5.

Table 5: Number of Employees in Different Income Brackets

	May	June	July
Up to Rs 30	58	24	21
Rs 30— 40	24	30	27
Rs 40— 50	2	6	20
Rs 50—100	8	8	7
Above Rs 100	4	6	4

In the highest category there is one chargeman—a widow, who is not a refugee and whose qualifications for the responsible job she holds are very doubtful. The rest are piece rate workers of the locality who are not refugees.

(c) Wood-Working Centre at Umarkot

The Wood-Working Centre was started in March 1962 and gradually expanded to comprise four units—a saw mill, a carpentry section, a blacksmithy and a tubular furniture factory. The total capital invested is about Rs 1.30 lakhs in machinery and tools and Rs 50,000 in buildings.

The proforma accounts up to March 31, 1963 show a net loss of nearly Rs 22,000 even without taking into account interest on capital outlay and the proportionate share of the cost of H Q establishment. As in the case of Boregaon Industrial Centre the saw mill, inspite of inefficient working, saves itself from loss by issuing sawn sections to the carpentry unit at a slight profit, but the latter together with the blacksmithy section suffered a loss of Rs 4,000 between May and July as per Cost Accountant's Report, while the tubular furniture factory ceased working in January and was never resumed later. The saw mill was not working in December 1963 for want of power.

Employment figures show remarkably sharp fluctuations from month to month. Prior to December 1963 there were, according to the Industries Officer, 4 operators, 5 helpers, 28 trainees and 30 piece rate workers, but the figures submitted on the spot by the foreman in December (63 showed 3 operators, 4 helpers, 5 trainees and 10 piece rate workers working on that date.) The information given to the Cost Accountant was that while there were 6 operators, 12 helpers, 61 trainees and 6 independent carpenters working at piece rate in April, there was a sharp fall in June when only 5 operators, 4 helpers, 33 trainees and 7 independent carpenters were employed. The drop from 85 workers in April to 49 in June is a deplorable anti-climax to the ambitious programmes outlined in the Industrial Sub-Committee meeting held in April 1964 and a poor return on an investment of nearly Rs. 2 lakhs.

The wages paid are also low. The average monthly earning of operators was Rs 90, of helpers Rs 55, and of trainees Rs 30. Promotion from the lowest category to the next was slow, at least seven persons being in that category for over a year, some even for two years. The average monthly pay roll of the wage earners is Rs 2,800 compared to which the salaried supervisory establishment, drawing Rs 1,700 per month, seems abnormally large.

(d) Oil Extraction Centre at Ambaguda

This is one of the craziest schemes whose operation has been so unbusiness-like that after a year's working which showed a loss of Rs 2.33 lakhs up to 31st March, 1963, the Financial Adviser seriously asked whether a scheme which showed no redeeming feature at all should be continued. The leisurely manner in which the scheme was pursued is obvious from the fact that while the Chief Administrator sanctioned the scheme as early as March 1960 and the factory building was ready by the end of the year, oil seeds began to be purchased from February 1961 onwards and it was not till May 1962 that crushing operations could be started. Undaunted by the loss new machinery was purchased and set up in November 1963 for crushing 'mohua' seeds, but they have not gone into operation yet. In July 1964 the Oil Extraction Centre ceased to work for want of seeds and will remain idle till February, 1965. There has throughout been a hiatus between purchase of machinery and the starting of production with resultant loss of operating time and interest on capital. If half the enthusiasm shown for the former was available for the latter things would not have been in such a bad way. Unfortunately, the zeal for purchasing machinery has often out-run discretion for, as the Cost Accountant says, already machinery worth Rs 41,000 purchased for this Centre had to be condemned and scrapped.

The factors responsible for this heavy loss are many. Seeds were purchased at high rates in the off season and they were of inferior quality so that the percentage of oil extraction was below par. This, together with under-utilisation of the plant and its prolonged idle period, payment of excessive electric charges, engagement of staff far in advance of need and the purchase of costly, but not very efficient, machinery etc led to high production cost with the result that the oil was later sold at much below the cost of production to the same firm from which the seeds had been procured at higher rates. The excuse that the cost of seeds was high because the formal purchase procedure had to be observed should cut no ice because in a commercial undertaking it is the result that matters and not the formal correctness of the procedure adopted. On account of an agreement with the Orissa Electricity Board, more is paid for electricity than would be justified by the units actually consumed while the surplus units which could have been utilised by the Central Work-Shop situated next door was not utilised because it produces its own electricity through generators inspite of the State Electricity Board's power being available at its door step. Nothing could be more inept or extravagant. The Cost Accountant has shown that if strict control is exercised at all stages, the Oil Extraction Centre may be made to yield a profit of 13 per cent whereas, between April 1963 to 9th July 1964, the net loss was Rs 2.8 lakhs.

What are the economic consequences of this scheme so far as the displaced persons are concerned? The salaried establishment consists of three employees—none of them a displaced person—of whom the foreman is an ex-Accountant of Andhra State Service without any business experience or any technical knowledge of oil extraction. Throughout the second half of 1963 only 12 displaced persons and 2 Adivasis found employment in this centre, 6 as operators, 5 as helpers and 3 as trainees. By June 1964 the total rose to 14 displaced persons and 4 outsiders of whom 2 were chargemen, 6 worked as operators, 9 as helpers and one as trainee. The redeeming feature of the scheme was the large proportion of workers in the higher category and the smaller number of trainees. This naturally resulted in higher average wages so that in June 1964 only three employees earned less than Rs 50, thirteen earned between Rs 50 to Rs 100 and two had an income of over Rs 100. This was however only a flash in the pan for with the closing down of work on July 9 most of these employees have again been reduced to the position of trainees, forced to try their hand in some other trade or craft such as carpentry or weaving. A capital investment of more than Rs 2 lakhs which cannot employ more than a dozen displaced persons, incurs heavy losses from year to year and suddenly closes its door in the midst of the working season stands self-condemned, the condemnation applying less to the scheme itself than to the manner in which it has been run.

(e) Industrial Unit at Govindapalli

This is a small affair started in July 1963 more to give employment to a number of refugees in a neighbouring transit camp than because of any inherent advantage of this site. It now consists only of a carpentry unit as the proposed saw mill has been transferred to Boregaon and the blacksmithy was closed down for want of raw materials. In December 1963 there were 2 operators—both non-displaced persons—and 20 trainees of whom 17 were displaced persons who came from a transit camp some three miles off. When the Economic Investigation Team visited the place they found 2 operators and 39 trainees of whom one operator and 32 trainees were refugees. Figures for June 1964 show a further increase in employment though the increase was partly due to recruitment of a large number of non-displaced personnel. The earnings in June 1964 of different categories of workers were as follows:

	(Persons)
Up to Rs 30	12
Rs 30— 50	38
Rs 50— 60	10
Rs 90—100	1
Above Rs 100	1
	62

(f) Cottage Industries

Only the briefest mention will be made of the four cottage or small scale industries organisations run under the direct control of the Zonal Administrators since their purpose is not to provide a self-sufficient means of living to the employees, but to supplement the meagre earnings from agricultural land. A large number of employees in the weaving section are women.

The earliest to start was the weaving centres at villages Boregaon and Jugani which, in June 1964, had 62 workers, mostly women, whose average earning per month at a daily rate of Re 1 never rose above Rs 25 and sometimes fell as low as Rs 3 or Rs 4. Piece rate workers, numbering eight, fared better and some of them earned as much as Rs 96 in June though in the preceding two months their earnings did not exceed Rs 60. Even on paying such low rates the net loss during April—June, 1964 was Rs 1,500. Inspite of this deficit this is a useful institution as it offers a sorely needed additional income to people of Boregaon and Jugani who are hard hit by the poor quality of their land and its meagre yield. With better organisation and a little more clerical assistance in costing and keeping accounts this section has plenty of scope for expansion with the help of the expert weavers among the new migrants who are concentrated in Narayanpur Transit Centre where a third unit may be started.

Unfortunately, the same remark does not apply to the cottage industries set up in different villages in Umarkot Zone which have languished for long periods and where the wages are both meagre and very irregularly paid. The weaving units in villages Murtama and Gobri were idle during January and February 1964, and even after they were revived they were run at a loss although the daily rate was first reduced to 75 P per day and then to 50 P. The carpentry unit at Umarkot which earned a small profit was merged with the mechanised wood-works centre. The small blacksmithy unit in village Sonabeda just managed to keep its head above water, the tin-smithy at village Karagaon had to be closed down, and the tailoring unit at village Barakumari did not get going at all. The total volume of employment was low. In May there was practically no worker in the weaving section on account of the reduction of the wage rate to 75 P or 50 P per day. In June when the rate was temporarily raised to Re 1 per day there were 50 workers of which carpentry accounted for 31, weaving for 11 and blacksmithy for 8. All the workers in the carpentry section and over half the workers in the weaving section preferred working at piece rate.

The Small Industries Centre in Paralkot Zone was a sturdy child under the fostering care of its energetic Zonal Administrator and showed greater vitality and promise of survival. Started towards the middle of December 1963 it had in its three sections (carpentry, blacksmithy and weaving) 99 workers by the first week of January of whom 6 were skilled workers at Rs 4 per day, 13 worked at piece rate in the carpentry section and 80 worked as trainees, either directly under the Administrator or as helpers to the piece rate workers. In March, the Economic Investigation Team found that the number of workers had gone up to 120, but with the onset of the monsoons and the beginning of agricultural operations most of the workers had to be sent back to their land.

The Cottage Industries Section in two villages in Malkangiri started in March 1964 are too recent to justify any comment, but refugees of a few villages have shown considerable initiative without waiting for the starting of industrial units by the DDA.

III

I am not concerned in this article with laying down a blueprint for what should be done in future, but only with an analysis of the existing state of things. It is obvious that industries run by the DDA have been extremely amateurish, uneconomical, reckless about wastage of time and raw materials, and unconcerned about costs, with losses mounting up annually, with employments at a low level and sporadic because of occasional closing down of units, and with wages scandalously low for the large majority of employees they satisfy none of the three tests laid down in the beginning of this article. There should be a complete reorganisation of the Industries Department with a Director at the top who has both technical and managerial ability of a high order and whose control over all the widely scattered units run by the DDA should be complete and unquestioned. The present system of accounting should be replaced by commercial accounting so that there may be a continuous checking of the value of the product with its cost of production. Some suggestions have been made by the Economic Investigation Team and also by the Cost Accountant of the RIC as to what shape this organisational machinery should take and they should be considered even if they cannot be accepted in *toto*. What is important is that the present system of control by different independent officers with hardly any supervision from the top should be replaced by tighter control by one who has experience of industrial management as well as imagination, energy, knowledge and drive to make his authority felt all along the line. If the right type of officer is found he may also have overall control of the Central Workshop and the Motor Vehicle Repair Sections whose potentialities for providing technical training to displaced persons and giving them employment are now completely unutilised.

Several other questions remain to which no final answer can be given without further study. What are the industries to be started? Where are they to be located? Are they to be in the public sector or the private sector? If the former, is the DDA the most appropriate agency for the purpose? These are questions to which no completely satisfactory answer can be given till adequate data are available. It appears from press reports that large-scale comprehensive surveys about the economic and industrial possibilities of Dandakaranya are now in contemplation which at least shows a belated dawning of wisdom, which Sukumar Sen tried to drill into the minds of the Ministry without much success, that industry and not agriculture is the solution if refugees are to be rehabilitated on a large scale. But the risk is that these surveys, if they are to be of any use for preparing industrial projects, take a long time and in the long run, as Keynes said, "We are all dead". What is important, is that on the basis of data already available some immediate action should be taken for starting industries for which there is scope, while preliminary spade work for bigger projects are under way. These data can be collected from surveys that have been already undertaken and completed—viz the Techno-Economic Survey Report of the National Council of Applied Economic Research, the Report of the Economic Investigation Team appointed by the Development Commissioner, Small Scale Industries, and an earlier report prepared by two officers of the West Bengal Industries Directorate.

One has to admit that for development of industries on a large scale Dandakaranya is not yet an ideal area. Of the various factors which determine the locations of industries, viz raw materials, labour (skilled and unskilled), power (fuel or electricity), transport and communication, water resources, markets, banks and other financial organisations, etc, it can boast of very few. Transport is rudimentary because roads are still being built or improved and the only railway line under construction will reach Bailadila by the end of 1965 or the beginning of 1966, while the other half of the scheme connecting Bailadila with Bhilai or Raipur to the north or Bhadravati to the south is still in the thinking stage. Coal is not available and electric power is available, with occasional breakdowns, only in a very few places. The contemplated hydel project at Chitrakut will take years to start and function and the alignment of the electric lines in Bastar has not yet been decided upon. Water resources in Dandakaranya where most rivers are seasonal and water table low pose a problem which has to be solved probably by building reservoirs for storage during the rains. There is or should be an abundance of raw and unskilled manpower from among the refugees in need of gainful employment but facilities for training are exiguous. As regards markets there has hitherto been little demand for a wide variety of additional consumer goods in this under-developed region though several big projects already under way, such as the Mining industry at Bailadila, the MIG Factory at Sonabeda, the Railway Project connecting Vishakhapatnam with Bailadila may stimulate demand for many commodities of a stereotyped as well as of a novel kind of which advantage can be taken if industries are properly planned. But, as the Techno-Economic Survey Report says "any such scheme has to take cognisance not only of the regional or national demand for the product but also of the alternative sources of supply, existing or proposed, in other regions". Over-production with too many people competing for the same market may be disastrous.

Choice of Industries

The choice of industries for development by the DDA or with its collaboration depends not merely on the above factors but also on the purpose in view. Since that purpose is to provide employment to as many refugees as possible the industries should be labour-intensive and not capital-intensive. Since immediate employment is desirable to shorten idle camp life or unproductive life in villages, industries which give results in the short run should be preferred to industries which require a long period of waiting before underground resources are developed, processed and become ready for use as raw material. This does not mean that the latter should be neglected, but only that exclusive concentration on such long run projects should not lead to the neglect of projects which have a larger employment potential in the shortrun. The Techno-Economic Survey has suggested that a few resource-based industries have great possibilities of which the most important is an integrated iron and steel plant at Bailadila which may start functioning by 1970-71. The other possible big or medium industries suggested are a pig iron factory in Umarkot, two cement factories in Koraput and Bastar districts, a calcium carbide factory, a clay-washing plant, and a plant for manufacture of silicon carbide. The snag about these industries is that, apart from the huge initial capital investment required, all of them require further study of data of all sorts before a project can be launched and that in the case of the iron and steel plant, national and political considerations decide the choice of location more than its economic advantage or technical feasibility.

Considering all this, the Economic Investigation Team has taken the view that in the short period only those lines of manufacturing should be set up which are predominantly market-oriented or of ancillary type. The Team has made a fairly detailed study of the commodities for which there is an existing or potential demand both in the interior markets—at Jeypur and Jagdalpur—and in the bigger markets beyond the border. It has also ascertained from the Hindustan Shipyard, the Vishakhapatnam Port Trust, and the DBK Railway Project what their annual consumption of various kinds of commodities is. Such studies may be extended to the Bailadila Mining Project, the MIG Factory Project, the Hindustan Steel Project at Bhilai, etc, to ascertain their requirements and also to the Defence Departments which are large consumers of a wide variety of goods. When the Central Government directly or through its public sector corporations is such a large consumer it should not be difficult for the different Ministries to come to a working arrangement with the Ministry of Rehabilitation or the DDA, so that a fair proportion of the supply could come from the industries run by the DDA. When the market is assured, it should not be difficult either for an energetic and experienced Director of Industries to plan and organise his production in the most effective and economical way possible so as to be able to compete with the market both in quality and price. The Techno-Economic Survey Report suggests that the bigger industries and large-scale factories should be started first to stimulate growth, so that sufficient purchasing power is pumped into the hands of the people of Dandakaranya in order to generate demand for products of many small-scale or cottage industries to be started later. This ignores the long gap that must intervene between the first step taken for starting large-scale industries after necessary survey and the production of raw materials and the stage of production when employment on an adequate scale becomes possible. The best thing is to exploit the demand that is already there while not neglecting the steps needed for future large-scale industrial development.

The agency for setting up and running these industries is a difficult question to answer. The Techno-Economic Survey Report suggests that 90 per cent of the total investment will be in the public sector because the steel industry and the mining of iron ore will be under it. The large-scale industries suggested for the private sector are cement, calcium carbide, wood distillation and pig iron production. It also thinks that small scale industries should be in the private sector though a large share of the initial expenditure by way of providing industrial estates should be incurred by the DDA. The difficulty is that the private sector has not yet shown any enthusiasm for coming over to Dandakaranya and the record of the DDA, if my foregoing analysis is correct, has also been quite dismal. Representatives of the Indian Chamber of Commerce, Calcutta, whom I met in a conference early in May wanted a tax-holiday for some years, adequate finance to be provided at a cheap rate, exclusive licences for certain lines of production, and the creation of an infra-structure in advance which would remove all their headaches about road and railway transport for the movements of raw materials and finished products, and provision of their requirements of power, water and land in convenient areas of their choice. They frankly stated that profit, not philanthropy, would guide their choice. Members of the Bengal National Chamber of Commerce were more helpful in their attitude but they wanted to have an on the spot study of the situation before coming to a decision. The DDA thought of an industrial estate at Ambaguda in 1959 but even by the end of 1964 nothing has been done besides occasional notings in the file after very long intervals. It is probable that small scale industries except the very few which can be run independently by the refugee artisans or artisans' co-operatives will have to be run partly by the private sector and partly by the DDA, but the private sector will have to moderate its demand for incentives and the DDA will have to show much greater efficiency than it has hitherto done. The technical education of the refugee boys which has been sadly neglected must be taken up in earnest.

Unless the entire machinery of the Industries Department is drastically overhauled with control vested in a competent Industries Officer or Director of Industries helped by adequate staff, it is futile to expect these industries to be a source of employment with reasonable wages for a considerable number of refugees waiting in the camps or languishing in the villages.

(To be Continued)

Busy Year for IMF

THE International Monetary Fund provided twenty-two members with $1.9 billion in twelve currencies during 1964 — its second largest year of financial activity thus far. As in 1961, when drawings totalled £2.5 billion, this year's Fund operations included large-scale drawings on the part of the United Kingdom, but 1964 also saw the first use of Fund resources by Italy and the United States.

The U K and U S maintained stand-by arrangements respectively for $1 billion and £500 million at the beginning of 1964, and new arrangements in the same amounts were disclosed during the summer. The first U S drawing, equivalent to £125 million in European currencies, was made during February, and subsequent drawings occurred in June ($125 million), September ($150 million) and December ($125 million). Currencies drawn by the U S were sold for dollars to countries wishing to make repayments to the Fund. Although more than $4 billion were drawn from the Fund in U S dollars in earlier years, a return flow restored the Fund's holdings to a point at which its rules require repayments in other currencies, or in gold.

The Fund's holdings of some of its European currencies had been considerably reduced when, early in December, the U K effected a drawing of eleven currencies equivalent to $1 billion. In order to meet the U K request, the Fund sold $250 million of its gold holdings to acquire needed currencies, and borrowed the equivalent of $405 million more under the terms of its General Arrangements to Borrow.

These arrangements, which were used for the first time, authorize the Fund to borrow up to $6 billion in the currencies of ten of its industrial members, and must be reviewed in 1965 if they are to be extended beyond a four-year term which ends in 1966. Since the coming year will also require decisions in connection with quota increases, it is expected to bring developments importantly affecting the Fund's future financial capacity to strengthen and support the international monetary system.

Economic Conference

R K Hazari

THE 47th annual conference of the Indian Economic Association was held in Baroda from December 29 to 31 on the impressive campus of the Maharaja Sayajirao University. About 250 members and delegates attended. D T Lakdawala of Bombay University presided. The subjects for discussion were: (1) the Theory of Capital; (2) International Liquidity; and (3) the Basis of Taxation in the Context of the Developing Indian Economy. The respective rapporteurs were Gautam Mathur (Osmania), S L N Simha (Reserve Bank) and R J Chelliah (Rajasthan). The current topic was "Fourth Plan: Size and Priorities". Discussion of the Theory of Capital is being reviewed separately.

International Liquidity

There were 22 papers on this subject, of which 12 were published in full and the rest in the form of short summaries. This innovation represents a compromise between the acceptance of all papers submitted by contributors and rejecting the substandard outright. The rapporteur's report was more of a contribution in its own right than a critical summing up of the papers. Most contributors agreed on the definition of international liquidity and the need to prevent its shortage in the future. Several of them advocated a bold or revolutionary approach on the basis of the Triffin proposals for a world central bank, but displayed insufficient understanding of the problems involved in setting up and working it. Two contributors favoured an evolutionary approach, encompassing recent liberalisation measures and the developments (e g, swap arrangements between central banks) allied to I M F working, and also suggested greater automatic flexibility in its credit policy.

Regarding the composition of liquidity, the rapporteur suggested the replacement of gold by gold certificates, abandonment of gold reserves against currency and a revision of the gold price with arrangements for equitable distribution of the benefits of revaluation. As for the particular interests of developing countries, movements of hot money did impinge upon their balance of payments, directly and indirectly. Besides the recent facility of an additional drawing of 25 per cent of the quota, D Bhattacharya (Toledo) revived the suggestion for the creation of an Export Receipts Stabilisation Fund. The rapporteur felt that all reform proposals, not merely Triffin's, required international collaboration and surveillance. A variety of arrangements, he believed, could provide suitable checks and balances.

In the group discussion, it was unanimously felt that the present system of reserve creation through a few key currencies was unsatisfactory. There was general support for the establishment of a system providing for genuine creation of reserves on an adequate scale, for which IMF with suitable adaptations was well-fitted. Much interest was shown in Bernstein's scheme for the creation of a new composite reserve unit, at least as a transitional arrangement, provided the obligation to maintain a partial gold reserve ratio was removed. According to the rapporteur, the discussion helped to focus attention on the fundamentals of the subject and provided an opportunity to familiarise the audience with the working of the international monetary system and recent plans for reform.

The open session brought out a number of useful points. P J J Pinto (Reserve Bank) made the point that while the Triffin proposals were based upon trade, recent heavy drawals from IMF were matters of confidence. No single institution could by itself handle movements of hot monies. The veto of the Ten over IMF would have to be sorted out slowly. AG Chandavarkar (Reserve Bank) suggested that instead of subsidising interest on loans to developing countries, it would be better to recognise their bonds as trustee securities in leading capital markets. Dr I G Patel (now back as Chief Economic Adviser) emphasised that our kind of short term difficulties could not be solved by short credits. Since there is no easy way now to raise long term untied cash, it is necessary to enter international capital markets for getting elbow-room accommodation. Professor V K R V Rao agreed with the proposal for reviving capital markets to provide long-term cash facilities to developing countries but considered it dangerous to get long term loans for short term requirements. He favoured matching short credits against short requirements and believed that the policy of getting maintenance loans was wrong because it tended to cut into capital formation. He also called for differentiation in the IMF between developed and developing countries as had been achieved at the Geneva trade talks.

Replying to the debate, S L N Simha maintained that raising the price of gold was not a subsidy to producers, only paying a fair price for it. He was cautiously optimistic about tapping international capital markets and wanted IMF to lengthen the maximum repurchase periods (3 to 5 years at present) in favour of developing countries. Summing up, Professor Lakdawala wondered whether a world central bank would have the power to withdraw liquidity besides creating it and how a super central bank could operate in the absence of an international fiscal system.

Basis of Taxation

The discussion of the basis of taxation was rather discursive, mainly because of the sweeping breadth of the subject. Most of the 10 papers (there were also 16 summary papers) were concerned with the objectives and functions of taxation, the role of direct and indirect taxes, the most satisfactory base for direct taxation and agricultural and land taxation. There was one paper each on taxation of foreign investment income and company taxation; the latter alone essayed the testing of a hypothesis.

Most writers agreed that maximum resources should flow into the public exchequer but not at the expense of private saving and investment. They assumed, without adequate empirical justification, that incremental public revenues would be used for public investment rather than consumption though they could have argued that some part of the additional public consumption constituted investment in human capital and provision of social overheads necessary for subsequent investment. The need for a broad-based tax structure with a harmonious combination of direct and indirect taxes was accepted but not a single paper gave any evidence of serious effort to translate this unexceptionable principle into a reasonably logical and feasible scheme.

As regards the basis of taxation, nearly all contributors agreed that income should be the primary base. None, however, seemed to recognise the place of capital gains. On the contrary, one contributor, R L Sharma (Jodhpur) played around with surplus income (income minus essential consumption and priority investments) and another R L Sabarwal (Ludhiana) placed his faith in a mass expenditure tax on a progressive scale to such growing consumption. These ideas failed to carry conviction because they were just thrown up but no attempt was made to relate them to the existing tax scheme: would they replace the super tax and/or the confusing surcharges? At what levels would they apply? What are their revenue implications? Would they affect the federal devolution of revenues? The expenditure tax in one form or other fascinates many who have been converted to appreciation of private savings (as such or as a source of finance for public investment) but it still remains an appendage, fascination is not backed with genuine conviction or understanding of the entire structure of direct taxation. The rapporteur for instance pointed out that after income and wealth tax at present rates practically no assessee would be able to spend more than Rs 36,000 except out of past wealth, on which expenditure tax could be levied. Dr Nanjundappa (Dharwar) emphasised that both income and expenditure cannot be taxed simultaneously at high rates.

Degree of Progression

The desirable degree of progression again left the contributors — and participants in the discussion—groping for facts. Several recent empirical studies have shown that highly progressive rates have neither curbed incentives nor dried up the sources of capital. M Sinha Ray (Viswa Bharti) warned against uncritical acceptance of these findings and the rapporteur emphasised that where evasion and avoidance sustain incentives, steep progression cannot last because it does not exist. Dr M P Bhat (Gujarat) made the point that tax rates are hardly meaningful when the tax base is narrow. There was no reference in the discussion to the fact that corporate investment which accounts for a large and increasing part of private investment requires equity capital more as yeast for fermentation than as the main source of finance for investment and that equity capital itself is being raised increasingly from institutional sources. Nor was formal progression related to the actual number of assessees, e g, in the assessment year 1961-62 (the latest for which data are available) the number of individual and HUF assessees with an income of over Rs 2 lakhs was only 543 and 97 respectively.

In indirect taxes, the consensus was in favour of (a) selective exercises as allocative measures, (b) stiff taxation of luxuries and (c) taxation of non-essentials having a high income elasticity of demand. Bright Singh (Madras) feared that indiscriminate excise duties might hamper exports. The rapporteur drew attention to the taxation of a wide range of intermediate products and expressed strong doubts about fulfilment of the intentions underlying them, and disapproved of the large number of duties, most of which fetched little revenue.

Taxation of Agriculture

Taxation of agriculture called forth a number of suggestions to raise the rural tax burdens, particularly on higher income groups, among other reasons, to increase the marketed surplus. E T Mathew (Kerala) suggested that "the potential income from each holding" calculated as the average potential output per acre for the region should form the basis of taxation. Amiya Gupta (Viswa Bharati) proposed the amalgamation of Union income tax and agricultural income tax but neglected the question of the appropriate exemption limit. Chelliah said that policy recommendations based purely on calculations of formal evidence can be accepted only with great reservations owing to the possibility of backward shifting and, further, that indirect taxation might prove an adequate instrument for taxing the rural masses. Sadhu Singh (Ludhiana) strongly refuted the suggestion that land taxation had not gone up. He referred to various local taxes and surcharges and said that in Punjab at any rate land taxation had tripled or quadrupled. Greater risk in agriculture and inconsistency with price supports and other incentives were also arguments against raising the tax burden.

Regarding the taxation of foreign investors, P C Chatterjee (North Bengal) dished out the usual arguments about relatively high taxation in India without attempting to explain the growth of foreign collaborations. V D Lall (Bombay) examined Turvey's proposal for replacing the corporation tax by taxes on shareholders and rejected it firmly, after a somewhat detailed analysis, on grounds of loss of revenue. He also circulated a supplementary note to refute the rapporteur's suggestion that Turvey's scheme could perhaps be applied to private companies. This reviewer stressed that while taxation had not so far affected corporate investment, it had tended to encourage high costs; it was, therefore, worthwhile to investigate the possibilities of a tax system which offered incentives for cost reduction. Dutia (Ministry of Agriculture) argued for taxation to make traditional cultivation methods costlier and to discourage acquiring of further land.

Social Objectives

In the open session which followed group discussion, R N Bhargava (Benares) said that socialist objectives could not be superimposed on the traditional objectives of taxation and that recent socialistic taxation was responsible for slowing down the rate of growth. A good tax structure, he said, could bear a heavier tax load. He called for stability of the rates and schedules over plan periods and suggested that direct taxes rates should be applicable to the financial year after the Budget. M V Mathur (Education Commission) regretted that the Panchayat Raj structure had not mobilised much resources so far. Chelliah suggested in this connection that States and panchayats could levy duplicate taxes and then allow a 70-85 per cent tax credit. V S Shukla (Baroda) said that raising of the marginal saving income ratio was the basic objective of taxation but the expenditure tax as imposed or envisaged could not cut down middle class consumption. The only way to curb consumption was to shut off the supply of certain goods. On a similar vein, P N Mathur (Poona) emphasised that taxation of the rich will not cut down consumption if defence expenditure is tending to push it up at the same time. On a different level, M P Bhat felt that since the share of property owners in national income was relatively high, there was scope for heavier taxation of property incomes.

The rest of the discussion was practically confined to agricultural taxation. In the random cross fire over higher taxes against tax incentives (ultimately answered by Professor Chelliah's statement that the farmer should be better fed, better clothed and better taxed), S C Gupta (Delhi) made some useful points. Agricultural taxation, he said, could not be viewed merely as a method of mobilising resources for the public sector. Diversification was necessary in this field, especially by

taxing income from money-lending, trade and rent on a discriminatory basis and by levying a tax on unsown productive land. The simultaneous need for cheaper inputs and more taxes had to be reconciled and one of the ways of doing so was to raise taxes (especially betterment levies) only when the benefits of increased productivity were realised. Horizontal equity between urban and rural taxes, he emphasised, could never be established since the levels of productivity and capital formation, etc, differed so much. K S Krishnaswamy (Planning Commission) explained that since agricultural taxation was not so responsive as urban taxation to increases in national income, the easier source had to be exploited first for the sake of convenience.

In his summing up, Lakdawala said that the search for equity could not be carried too far. Criteria other than the capacity to pay would be necessary even if the direct tax coverage were 100 per cent. There need not be any limit on the rates of commodity taxation, the idea that they should be restricted within a range of say 25 to 70 per cent was misplaced.

Current Topic:
The Fourth Plan

Discussion of the current topic left one in doubt as to how much interested economists are in the Fourth Plan. As for its size and priorities, it was obvious that none of those present, eminent or not, had not been able to spare the time for going through the various draft Plan papers. One senior participant explained the accounting mechanism of deficit financing at the Reserve Bank (only insiders can be in the know after all) and another, from his exalted place, waxed eloquent on steady moral degeneration without essaying a quantification of rate of growth. N D Sovani (Poona) initiated the audience into the metaphysics of reality with observations on the increasing unreality of successive plans. He said that past under-fulfilment of targets had not been taken into account in postulating the rate of growth, that two years of booming exports did not justify excessive optimism about the future and that the muddle in price policy showed no signs of ending. Taking these observations at their face value, K S Krishnaswamy listed the considerations in the light of which the realism of the Plan had to be assessed :

(1) Since the bulk of consumer goods came from agriculture, is agricultural growth commensurate with the growth of demand?

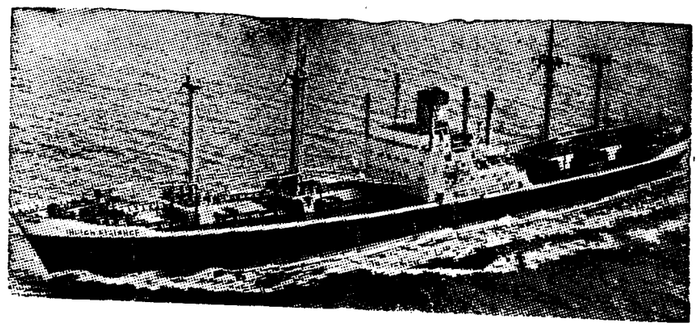
(2) Though institutional changes are necessary, the production problem is overwhelming and this boils down to greater productivity i e, larger industrial inputs per acre and the creation of an adequate infra-structure.

(3) Each plan has to be an instalment of a longer perspective which implies that problems cannot be solved by throwing them forward.

(4) Plans can no longer be enlarged merely to get more foreign aid. The domestic price problem cannot be solved in an enduring manner by changing the structure of imports which will continue to consist largely of food, petroleum and metals.

(5) A change in the occupation pattern has to be brought about by providing wider opportunities of non-agricultural gainful employment, which in turn requires manpower budgeting.

M B Desai (Baroda) pleaded for demarcation of the areas of rehabilitation from areas of response and suggested that best results could not be obtained by distributing effort all over. A G Chandavarkar pointed out the practical



On towards progress . . .

India Steamship Co., Ltd., has a steady record of progress . . . Since Independence, its tonnage has increased from about 85,000 D.W. tons to over 200,000 D.W. tons—more tonnage being still on order.

Its services are also extending to various trade routes. After initial consolidation in the India-U.K.-Continent trade—the Company entered the Indo-Soviet service to the Russian Black Sea ports in 1956 and later to Rumanian ports. In 1959 the Company forged still another link in the overseas with South America, and in 1960 it extended its service to Poland.

Their experience and reputation for fast, efficient and dependable service built on the personal care given by their experienced officers and crew to the cargo entrusted to them, have earned them the goodwill of their customers.

absence of income and price policies and of manpower budgeting and said that the financial aspect of the Plan was based upon the quantity theory of money while the real aspect was Keynesian, without there being an adequate link between the two. He regretted that no Plan so far had referred to the role of interest rates and monetary policy. Dutia contended that price policy was a necessary but not sufficient condition for technological revolution. Gautam Mathur asked for calculation of the self-reproduction rate of heavy industries and the ratio of heavy quick yielding investment; he wanted deficit financing to be related to the latter.

Prof V K R V Rao said that the Planning Commission had turned to constant self-introspection and that there was a greater awareness of realities now. The excessive optimism at the time of the Chinese invasion that defence and development could go together was no longer there. More specifically, (1) industrialisation is being geared to agricultural development for the first time, (2) selectivity is being accepted but there are political difficulties, (3) it is realised that development cannot be neglected, (4) a sharp increase in social service expenditure is being provided for, partly for welfare and partly for production, education being oriented towards production, and (5) politicians are displaying a greater degree of understanding and acceptance of economic criteria.

The next session of the conference will be held in Benares at the invitation of the Benares Hindu University. N V Sovani of the Gokhale Institute, Poona, will preside. The topics for discussion are (1) Theory of Demand, (2) Population: Economic Analysis of the 1961 Census and, (3) Investment in Human Resources.

The Theory of Capital

A Correspondent writes:

THE Rapporteur introduced, at the outset, a welcome procedural change; he suggested that the discussions be on the theory of capital, in general, rather than revolve around the ten papers contributed on the subject. Accordingly, the discussions ran in rather general terms and touched upon some 'fundamental' issues in capital theory. Of course, the papers were referred to by the discussants, *albeit* in a cursory manner, at appropriate places. The subject was divided into six broad categories: (1) Measurement of capital; (2) the nature of capital; (3) technical progress; (4) production function; (5) treatment of capital in growth models; and (6) unbalanced growth in relation to capital formation. Even though, for want of time, the last two topics were not taken up for detailed discussion the participants did touch upon these aspects as well; thanks to the inter-related nature of problems in capital theory.

The much debated issue of measuring a heterogeneous bundle of long-living assets somehow failed to evoke any controversy. Brahmananda who led the discussion explained how one could measure economic magnitudes unambiguously in a Sraffa system in terms of the standard commodity. Gautam Mathur drew attention to the similarity between Sraffa pricing and the Robinsonian golden age situation. He further indicated that the Robinsonian system gives an unambiguous measure of capital only in a steady growth state where uncertainty is ruled out and the rate of profit remains constant.

Leading the discussion on the nature of capital, R Bharadwaj pointed out that a satisfactory capital model should consider a number of quite complicated issues, such as, measuring capital selecting production processes, determining process intensities and so forth, simultaneously. It was pointed out by him that the earliest model to give explicit recognition to all the above aspects including also the heterogeneous character of capital goods was the model due to Von Neumann. He added further that this remains even now the most rigorous and complete capital model. The Sraffa model was compared to that of Von Neumann. In the discussions, there appeared to be a broad agreement regarding the immense difficulties encountered in the treatment of the dynamics of relative price movements under non-steady states. The success in measuring capital in Von Neumann—Sraffa models, Ray observed, was primarily due to avoiding the real issues of growth where structural changes are prominent. At this point the Turnpike Theorem, which attempts at linking Von Neumann's results with the real world issues of development, came up with Nath raising questions regarding the operational meaningfulness of the Theorem. However, the difficulties of formulating a preference function in the form required by the Theorem, among others, were considered to render the Theorem somewhat unattractive in practical plan formulation.

A good deal of time was taken up in discussion of technical progress. Chakrabarty who opened the discussions proposed that technical change be defined mainly in terms of engineering data. Mehta interpreted the growth of technical knowledge in itself as technical progress. This point was further elaborated by Lokanathan who maintained that, in a modern economy, a large share of investment goes into knowledge-increasing activities.

It was generally agreed that technical progress should be discussed in terms of engineering data. However, it was pointed out by G Mathur that the conventional definitions of neutral technical progress, used in the theories of growth, have been generally formulated in economic terms. Mathur further suggested the possibility of devising a definition of neutral technical progress in terms of simple process matrices.

Turning to the utility of the notions of neurality and non-neutrality, I G Patel expressed scepticism and further suggested that the superiority of a technique may be determined entirely by looking at the productivity per man in the consumption sector. However, G Mathur felt that this may not always be an unambiguous indicator. Continuing the discussion, V K R V Rao criticised the engineering definition as being inadequate for purposes of giving any answer to the question of neutrality when the resources employed in the two situations were the same but the technical knowledge was at an improved level in one of them. The difficulty of identifying constancy of resources in such situations was raised by Mathur.

Discussions relating to the Production Function were initiated by P N Mathur who discussed the neo-classical production function, particularly of the Cobb-Douglas variety. He attributed its popularity to its simplicity and cautioned against its indiscriminate applications. Discussing the production functions of the neo-Keynesian types, Jain referred to the central importance of the Wicksell effect in the formulation of a production function. G Mathur, elaborating upon this indicated the difference between the neo-classical and the neo-Keynesian production function as one intimately linked up with the notion of the Wicksell effect.

Is It Later than We Think ?

A B C

Some weeks ago Mrs Joan Robinson delivered a tirade at us telling us to wake up and catch up with the Chinese who, she certified, had not the slightest interest in invading India, and who, she said, had gone far ahead of us in all forms of economic development.

The Chinese Government must be duly grateful for her testimonial but it behoves us to enquire whether her views on Bharat's progress are justified.

[The author was a student of Mrs Robinson a quarter of a century ago and confesses to have been taken in by her heresies and fallacies at that time and even to have enthusiastically admired them. He has, however, repented and recanted since and is grateful to Time for giving him an opportunity to don sack-cloth in public.]

THERE is no doubt Mrs Robinson saw everything in our country with a jaundiced eye. She admires the industrial revolution in China, the agricultural progress, the mental alertness, the eager vision of the people. She forgot that China has suffered from half a century of violence from warlords, famine and invasion, and her people are now prepared to sell their souls for peace and order. Liberty had become anarchy and that had been replaced by the law of the jungle in the years since the last Manchu had been hoofed out of the country, and the Japanese and the war-lords and Chiang Kai-Shek and the Communists came into their own. Today little things like forced labour or compulsory sterilisation or getting hanged for deviating from the Party line worries nobody—at least whole provinces are not being devastated in senseless rivalry among marauding dacoit gangs, nor towns and villages being plundered to satisfy the rapacity of some small-time thug.

India in similar case a couple of centuries ago had welcomed Mrs Robinson's ancestors, though it is doubtful whether any Chinese bandit could match in cruelty, rapacity or greed, the early servants of the Hon E I Co. However, that was a long time ago. The years passed and while these Western marauders who despoiled our country evolved into the Nabobs who financed the Industrial revolution in their own, peace and order came back to us, as well as the slow torpor that hangs on all subject peoples.

The years of British domination did not serve us well, it sopped the natural evolution of our political genius and imposed an artificial and superficial unity upon a fragmented people. And after all, why not? Our kinsmen the Red Indians of North America were divided into dozens of "nations"; why should the Brown Indians of S E Asia not have a similar number? True, the ramshackle political structure of Hindu India collapsed in front of a couple of hundred horsemen of Mahumud of Gazni. But we can draw comfort from T S Eliot's assurance:

> *"Men learn little from others' experience*
> *But in the life of one man,*
> *Never the same Time returns".*

In the life of one Nation also, never the same time returns, so quite clearly, Unity is not the need of the hour—the continued dominance of the Congress Party is far more important. In any case, the rivalry between the "Free World" and the "Socialist Democracies" will be deep enough to ensure a hope that neither side is permitted by the other to dominate India, at least in our time.

For Midnapurians!

The British imposed unity by importing a foreign language, English, in which educated people from Peshawar to Rangoon, from Colombo to Srinagar, could converse, carry on the daily business of life, commerce, industry, administration. But the masses could not be appealed to in English and to prevent the rise of an educated ruling caste, we have tried to call "Bharat that is Hindia" into being. "Genii of the Lamp", as Alladin found to his cost, are not always obedient servants and Hindia has been split up into Tamilnad and Punjabi Suba, Telugu-land and Maha-Gujarat, and there is a faintly audible cry of "Midnapur for the Midnapurians" in S-E West Bengal. That will really be splendid! Should each District in the country become a State, there should be enough of Ministerships to satisfy every seedy politicians and enough of even Chief Ministerships to satisfy most of them. Since political institutions exist but to subserve human needs, again one asks, why not?

We shall then have about 300 States in the country, each with its own language, its own people running its own administration — indeed if we went a little further and established 300 different countries, we might be able to swamp the rest of the World in the U N !

And then there are the castes and communities. The British, apt pupils of the Romans in the art of Divide and Rule, have left to us their legacy, until today when a Congress candidate wins the election at Jind, on a whispering campaign of Hindu vs Sikh, while caste and sub-caste dominate parties and politics from the State to the village. But these are the realities of life—we console ourselves that even in educated and advanced Europe, there are Catholic and anti-Clerical parties. We, Hindu, Muslim, Sikh or Christian by whatever label we might go, are a religious and God-fearing people and if we do occasionally "kill each other for the love of God", at least we are purer and holier than the Godless Chinese. One who criticises rather than admires this aspect of our contemporary life, betrays a complete lack of understanding of the beauty and depth of our culture, the harmony and synthesis we have established between the old world and the new.

In laying the foundations of Democracy firmly we have laboured for the freedom of the human spirit. Perhaps we have not bothered sufficiently about feeding the human stomach but material wants, thank heaven, have never been very compulsive in Bharat. Such sly, snide sneering remarks about our caste-based elections, about the sources of Party funds, we can ignore, secure in the knowledge that later if not sooner, as in Sardar Kairon's Punjab, justice will catch up with the malefactor, at least those who will not even attempt to white-wash themselves.

No we have nothing to be ashamed of in our record. Think of the hundreds of crores of rupees which are spent annually in the name of Agricultural Development. Is it the fault of the Government or of the People that so many individuals at so many levels have sticky fingers, which the cash simply refuses to trickle through? Any way even if the village bund is not repaired, or the Japanese (foreign again!) method of cultivation is not introduced, at least the Party organisation at the village level is being strengthened and rendered safe for the next election or two!

Sleeping in the Sun

Naturally the Government is not a Fascist nor a Communist dictatorship and cannot compel unwilling people to obey its orders. In the bad old days the balance of trade between agriculture and industry was so adverse to the former and the cash imposts (like rent or land revenue) so heavy, that the poor villager had to sell most of his produce, to pay for whatever he needed to purchase and for his rent. All that is changed now; rent and land revenue have become a fraction of what they were in real terms, and the farmer need sell only a small proportion of his produce to satisfy his monetary requirements. Nor has he been so corrupted by the greed for money as to give up the ideal of the contemplative life, so attractive a feature of Hindu culture. No, by no means. Four months' labour in the year still suffices to bring in one harvest; the remaining eight, he spends in philosophical discussion, contemplation, or merely sleeping in the sun. Incidentally, we are able to save the USA of part of the heavy costs of warehousing her excess wheat and thus display our spirit of international co-operation.

We also rejoice that the moral superiority of our people is being upheld and our virtue is being preserved untarnished through all the vicissitudes of these troubled times. Neither beef nor pork, nor veal nor ham nor spirits nor wines are available in our (somewhat seedy) Railway Refreshment Rooms or in the I A C, at least above the counter. If the prayers of bootleggers move the All Highest at all, most of our political *netas* will surely have seats near Him, when they are finally gathered into Abraham's Bosom.

To say nothing of the Sadachar Samities. If it is saddening to think that this wonderful instrument for maintenance of purity is being laughed at, it is tragic that the sport of rooting out corruption is being turned against the very *netas* themselves. Any way the black-mailing slanderers, one hopes, will soon be rooted out and all our energies get diverted once again towards purifying our administrative machinery. If in the process of insuring themselves against decisions which Time shows to have been erroneous, officials develop the art of "passing on the buck" to someone else, we rejoice —better a halt to progress, than an administrative error.

In the meantime we are developing our vast public sector industries. In coal for instance the public sector will be raising some 60 million tonnes by the end of the Fourth Plan and will have a capital of about Rs 450 crores, in deep mines, washeries, LTC plants and the like. Today the private sector raises almost the same quantity in backward, inefficient workings, which barely employ Rs 60 or at best Rs 70 crores. Instead they use some 400,000 human beings, of whom nearly 90 per cent could be replaced by machines, thereby proving how hopelessly old fashioned they were and how very much in need of modernisation.

Our labour legislation is among the most modern in the world, so that our labour is about the most costly, at least for those industrial units which really obey the regulations. (Unfortunately many don't). Unlike other industrial countries which sweated their labour in the early transition years, our industrial labour forms an aristocracy, an elite amongst the starving ill-clad working class of our country. This provides another example, if this were needed, of our social conscience for this is all at the cost of our balance of trade.

Enough has been said to show what a great advance has been made by this country, and on what a wide front. Not only has democracy been maintained but the old virtues, the old values have been re-established. With all the peaceful atoms we are developing at Trombay and the Yoga Health Centres in New Delhi, with the Hindi revival in Arya Varta, we can afford to laugh at carping critics. Perhaps the population is exploding right in our ears, perhaps there is a shortage of foodgrains, perhaps there's not quite enough cloth to clothe the naked, perhaps there's even a slight shortfall in our targets. But we shall go on, from Third Plan to Fourth and from the Fourth to the Fifth and even if there is a slight waning in enthusiasm, much will have been accomplished.

Will that be enough to stave off the wrath of the "People" who come behind? They may be hungry and tired but their caste and creed rivalries, their tribal jealousies would seem to make any faster rate of material progress unnecessary. If greater haste is not desired by any one except a small intellectual elite, would it not be a sin for the political leadership to attempt it?

Business Note

Ashok Leyland

THE results of the working of Ashok Leyland for the year ending September 30, 1964, have fulfilled the optimistic hopes held out by the Chairman, A Ramaswami Mudaliar, at the Annual General Meeting of the Company held in January 1964. As against the disappointing results of 1962-63, the Company has produced vastly improved results for 1963-64. The pre-tax profit after providing a depreciation of Rs 53.17 lakhs (Rs 41.63 lakhs) amounted to Rs 188.44 lakhs as against Rs 67.47 lakhs representing a rise of nearly 180 per cent. Taxation provision had to be raised more than four times at Rs 86.40 lakhs (Rs 21.45 lakhs). Even so, the net profit after tax at Rs 102.04 lakhs was more than double the preceding year's figure of Rs 46.02 lakhs. This enabled the Directors to plough back about Rs 36.09 lakhs (nil) to General Reserve after earmarking Rs 18.50 lakhs (Rs 14.00 lakhs) to development rebate reserve and to step up the dividend from 7 per cent to 9 per cent for the year which will absorb Rs 47.31 lakhs (Rs 32.07 lakhs).

The improved results have followed a sharp rise in sales by about 60 per cent during the year from Rs 10.92 crores to Rs 17.38 crores. This was achieved partly by an increase in the output of Comet chassis from about 200 per month in 1962-63 to about 315 in 1963-64 and partly by a substantial rise in the sales of spare parts which could be manufactured in larger quantities helped by an enhanced allotment of foreign exchange. The increase output by over 50 per cent in one year is "unusual" for the Company, but this, according to the Chairman, was attained by re-establishing production at a satisfactory level after its dip in 1962-63. An output of over 4,500 Comet Chassis is anticipated in 1964-

65 which would mean the maintenance of the rate of progress achieved over a period of 10 years with the exception of 1961-62 and 1962-63 and the stepping up of production by about 20 per cent over the year 1963-64.

The expansion programme initiated in 1960 to manufacture about 5,000 Comet chassis per annum and also adequate spare parts is now near completion. Within a month or two all plants and machineries will have been installed and the installed capacity will be fully utilised. Based on the output achieved in 1963-64, actual production may in due course be expected to exceed the planned figure.

With regard to the programme initiated in 1963 for increasing the indigenous content of Comet chassis by manufacturing components within the factory, a loan of Rs 60 lakhs was secured by the Company in August last from the Commonwealth Development and Finance Company. Now plant and machinery have been ordered and production is likely to commence in the current year. After the plan goes through, the indigenous content of the Comet Chassis which is 82 per cent now is expected to reach about 90 per cent.

The Company is also going ahead with a scheme of increasing the output in its Ennore Foundries to 200 tonnes per week immediately and eventually to 400 tonnes per week in order to meet its own additional requirements and the additional demands of other manufacturers for iron and aluminium castings.

Around Bombay Markets

Sharp Break in Equities

DALAL STREET's distinctly firm appearance throughout the Christmas holdings had raised hopes of a promising start for the New Year. The start was not really unpromising; in Monday's early dealings, many popular counters were marked up beyond their December highs. But the initial strength proved to be extremely deceptive. Equities soon began to drift lower and the market developed near-panic conditions on Tuesday (January 5). Within just two days, Century fell from Rs 588 to Rs 560, Standard Mills from Rs 608 to Rs 568, Indian Iron from Rs 26.30 to Rs 25.60, Tata Steel from Rs 148 to Rs 144, Tata Locomotive from Rs 276 to Rs 264.50, Hindustan Motors from Rs 16.96 to Rs 16.32, National Rayon from Rs 371 to Rs 354.50 and Shivrajpur from Rs 22.60 to Rs 18. The market as a whole lost nearly 70 per cent of the ground it had gained from its December bottom. Lower levels, however, attracted considerable short covering and some replacement buying and the market staged a moderate recovery by Wednesday.

In view of the impressive recovery from the December low point, some setback in equity prices was not unexpected on technical considerations. But the break that occurred on Monday and Tuesday seemed more than a correction of the preceding rise. The sudden turn in market sentiment was attributed to the growing anxiety among business men over the aggresive hunt for unaccounted money and the Government's decision to seize unaccounted assets discovered from searches for recovering tax dues. Trading sentiment was also unsettled by rumours about disquieting development on the Sino-Indian border.

Dalal Street is once again in an uneasy mood. With the market unable to maintain a firm appearance despite encouraging corporate news, the outside public is in no mood to take any lively interest in the stock market. The Finance Minister Krishnamachari's recent tax concession in respect of investment in equity shares of new companies in specified industries is interpreted as a more positive indication of the Government's concern about the capital market. But confidence is unlikely to revive unless the Government takes more concrete measures to encourage the flow of savings to the investment market. This might not be possible unless the Government takes stern measures to check the speculative employment of funds in commodity markets and in real estate.

Cotton

Needed Firm Action

YET another week has gone by and the situation obtaining in the cotton market continues to be about the same with almost all the varieties quoted well above the ceilings. The situation has, if anything, worsened in that several mills in the upcountry are reported to be faced with closure due to inadequate supplies of cotton and prices have hardened a little following some unseasonal rains in Gujarat, though the impact of the recent rains can be easily exaggerated. With the Government of India in no mood to own the responsibility of making cotton available to the industry at ceiling prices (that is what price control really implies) and at the same time unwilling to revise prices of controlled varieties of cloth in order to accommodate the rise in cotton prices, the industry is

Thursday Morning

naturally becoming increasingly worried over its prospects. The Indian Cotton Mills' Federation has been busy for some time working out a scheme which would enable it to secure cotton at or below the ceiling prices. The original proposal regarding monoply buying has been shelved for the time being and it will be resorted to only when all other measures fail. The Federation has now finalised an 8-point plan of rigorous self-discipline through strict supervision of the purchases made by the member mills. Under the latest scheme, no mill in Bombay and Ahmedabad shall hold more than two months' stocks of Indian cotton, the limit for mills in other areas being 4 months' stocks. Each mill will be required to declare to the Federation its presnt stocks of cotton and 'kapas', its stocks with merchants as well as forward purchases. The Federation will give to each mill purchase-delivery certificate for a quantity which will enable it to conform to the prescribed limit of stocks. No mill will purchase cotton or 'kapas', ready or forward, in excess of the purchase-delivery certificates and no mill shall buy cotton at above the ceiling prices. The Federation has declared that it will be prepared to buy throughout the season any cotton offered at prices 5 per cent below the appropriate ceilings. A permanent high power subcommittee has been appointed to implement the scheme with immediate effect.

The scheme is laudable in that purchase of cotton above the ceilings is to be avoided through strict self-discipline. It goes without saying that the success of the scheme will depend on the willing co-operation of all the mills

in observing strictly the code of discipline laid down by the Federation. The growing agitation among traders and growers against the Federation's scheme is not ununderstandable because it will restrict the scope of their operations. But that is precisely what is needed in the prevailing market conditions; price control over cotton has been reduced to a complete farce. If the Government is at all serious about enforcing cotton control, it would be well-advised to resort to requisitioning on a large scale which alone can induce growers and merchants to part with their stocks thereby accelerating the movement of the crop. At a time when the industry has devised a scheme of self-restraint, Government action will produce a salutary effect on the market. It is to be hoped that the Government will not miss the opportunity provided by the industry plan of self-discipline.

The Forward Markets Commission too can do its bit. Since the hedge contract cannot be officially quoted at above Rs 775 during the pre-delivery period, the margin of Rs 15,000 per 100 bales which the Commission has prescribed should be made applicable at some operational level—Rs 774 or lower. The hedge contract has been quoted above Rs 775 since December 9 — the latest quotation is Rs 782 — but it has failed to attract any margin. There is no sense in waiting for the commencement of the delivery period for the enforcement of margin. Whether the margin will have any significant impact on the market is a different matter.

There has been a marked revival of overseas demand, mostly from Japan, for Bengal Deshi despite the steep rise in prices here. Fairly good business is reported to have been put through recently. Sales registered to-date have exceeded 1.16 lakh bales.

Oilseeds

Prices Recede

OILSEEDS prices registered an all-round sizable setback last week and the fall was particularly pronounced in linseed which had recored the most spectacular rise in the preceding fortnight or so. The decline in prices made possible the official resumption of future trading in castor and linseed. Linseed March which had been bid up to Rs 55 in the previous week were sold down to Rs 49.50 (per 50 kgs) on January 7 and castor March moved down from Rs 212 to Rs 201.25 (per 250 kgs). In ready, linseed declined from Rs 71 to Rs 66, linseed oil from Rs 30.50 to Rs 28 (per 10 kgs), groundnut (Khandesh) from Rs 64.50 to Rs 61 and groundnut oil from Rs 24.25 to Rs 22.80. Oilcake prices also eased by Rs 10 to Rs 30 per tonne.

In view of the fantastic rise that had taken place over the past few weeks, technical considerations alone could have produced a sizable setback. But the sudden turn in market sentiment last week was due largely to reports of highly beneficial rains in the Punjab, Uttar Pradesh and Madhya Pradesh which have raised hopes of bumper crops of mustardseed and rapeseed and linseed. Most market men are now inclined to the view that if the weather continues to oblige, the mustardseed and rapeseed crop might set a new record around 15/16 lakh tons and linseed output would be around 4 lakh tons. The supply position of oilseeds last season had been seriously affected by the partial failure of the mustardseed crop which yielded no more than 6.5 lakh tons.

The suply position of vegetable oils this season promises to be distinctly comfortable. Apart from the anticipated record harvests of mustardseed and groundnut, the country will be importing 75,000 tons of soyabean oil for the vanaspati industry and a minimum 50,000 tons of mutton tallow for the soap manufacturers which will naturally ease the pressure on the demand for various edible oils. If oil prices continue to be high despite improved supply, the authorities, whether Central or State, will have only themselves to blame for their failure to enforce a measure of discipline on the market.

Export activity has been virtually confined to groundnut extractions which have been in keen demand recently. Poland was reported to have purchased substantial quantities last week. Business in cottonseed cake was limited by the poor availability of goods; internal prices too have been on the high side. Hardly any business was reported in castor oil.

Money Market

Thursday morning

THE inter-bank call money rate opened for the week at 5.5 per cent on Monday and eased in stages to 4.75 per cent in late transactions on that day which was the first working day of the New Year. The climb down from the peak of 6 per cent, reached in the previous week due to year-closing and other concurrent factors, reflected the return-flow of funds to lenders and the consequent return of the market to more comfortable and realistic conditions once the window-dressing was over. Since then the rate hovered between 5 per cent and 4.75 per cent till the close of Wednesday.

Strange as it may seem, the Calcutta market which used to be generally tignter than Bombay displayed an even easier trend, the call money rate coming down by and by from 6.5 per cent to as low as 2.5 per cent on Wednesday. In Madras, however, stringent conditions continued to persist not, however, due to local demand but reportedly arising out of substantial transfer of funds to other centres. The call rate as a result remained steady and firm between 4.75 per cent and 5 per cent.

The intensity of demand for funds that set in during the last week is reflected in the Reserve Bank's statement for the week ended January 1, 1965. Scheduled banks' borrowings during the last week of December 1964 rose sharply by Rs 26.75 crores to Rs 62.10 crores. This compares with the rise of Rs 18.71 crores during the week ended January 3, 1964 to Rs 26.79 crores. Thus, set against the position a year ago, scheduled banks' borrowings from the Reserve Bank by the end of December, i e, in two months of the busy season, are higher by Rs 35.31 crores. The restrictions imposed on borrowing have not, therefore, deterred so far the scheduled banks from resorting to borrowings from the Reserve Bank, and obviously there is still room enough for banks to step up their borrowings.

Notes in Circulation have risen during the week ended January 1, 1965, by Rs 11.31 corres to Rs 2516.80 crores as against Rs 2369.18 crores about a year ago on January 3, 1964, showing an increase of Rs 147.62 crores over the year. Rs 29.68 crores worth of additional Notes were issued during the week, probably in anticipation of heavy demand, but of this Rs 18.37 crores remained with the Banking Department.

Foreign assets during the week have fallen by Rs 2 crores as a sequel to a decline in balances held abroad. Central Government's deposits with Reserve Bank are lower by only Rs 75 lakhs and those of scheduled banks have receded by Rs 3.38 crores while advances to governments are also more by Rs 75 lakhs. As against scheduled banks' borrowings of Rs 26.75 crores, their deposits are higher by Rs 7.45 crores.

Kamaraj's Siren Voice

THE resolution on economic and social policy adopted at the Durgapur Session of the Congress states, *inter alia*, that "the rate of economic growth must be stepped up *substantially*" and that "more far-reaching social and economic policies must now be forged for implementing a *bolder* Fourth Plan" (italics ours). There is much else about advance towards socialism, social justice and reduction of disparities, etc, but the above are the specific and pointed references to the Fourth Plan. This resolution has produced no impact yet on the Government.

What has is Kamaraj's Presidential address, asking for scaling down the size of the Fourth Plan because of the dangers of inflationary pressures arising out of large investment. It is the impact of "such pressures on the poor and weaker sections of society" which has turned him against a Plan of the size of Rs 21,500 crores to Rs 22,500 crores which has been provisionally accepted by the Planning Commission. Kamaraj points out that Rs 21,500 crores is more than what has been spent in the first three Plans put together, ignoring that in view of the rise in prices the comparable investment in real terms in the Fourth Plan is appreciably less ambitious than the financial figure of Rs 21,500 crores suggests. That the burden of raising nearly Rs 3,000 crores by the Centre and the States to implement such a Plan would be too heavy is Kamaraj's other objection.

There is thus a sharp rift between the Congress President and the Congress Party to the extent that the views of the latter find expression in the economic and social policy resolution. This is certainly striking, but even more striking is the alertness with which the Finance Minister has come to the support of Kamaraj and the speed with which the latter's views have initiated re-thinking at the top. Shastriji has called a meeting of the Planning Commission on Monday to reconsider the size of the Fourth Plan and a meeting of the National Development Council is likely to be summoned soon to recast the Fourth Plan outline in the light of the high level discussions held over the last few days.

In an inflationary situation such as the present one, it is clearly unnecessary to be overmuch concerned with the problem of financial resources. However, that apart, let us consider the plight of the poorer and weaker sections of society for whose benefit the Congress President wants the Planning Commission to recast the Fourth Plan and cut down its size. True, the economic situation today is bad enough. Prices have been rising, especially of the essential commodities needed by everybody, rich or poor. Nor is there any doubt that with determined action at an earlier stage some of the difficulties currently facing us could have been avoided. It is not today that we have become aware that agricultural production fluctuates from year to year or that food production has been sluggish or stagnant. It did not need much intelligence to anticipate that from year to year the community would be spending more and more with population increase, rise in incomes and larger employment. On top of this there has been the incubus of a vastly inflated defence budget in the last two years. And it would be idle to deny that the earlier assumption, based more on patriotic fervour than reason or conviction, that defence and development could reinforce

each other and go ahead with a sort of chain reaction has not been borne out in actual experience.

Things today are not so very different from what they were six months ago. It is no pleasure, however, to find that the worst fears then expressed in these columns ("Is Growth Expendable?", Special Number, July 1964) should have today a prophetic ring. It was pointed out then that

> "A situation such as this is ideal for the so-called pragmatists who live in the present to take over. Politically, it is good to be concerned about prices; that would be an earnest of one's identification with the masses, whose interest is not being safeguarded here and now because the Government is callous, big business is exploitative and so forth. All this makes a fine facade for the pragmatist behind which things of value to the vulnerable classes themselves can be jettisoned. For such a purpose, what is better than a crisis of confidence in the future?"

It is sad to find Congress President Kamaraj appear in the pathetic role of such a pragmatist. The country had expected much from this son of the soil. He has done much to tone up the Congress organisation and the political life of the country. Will he think again? The dangers of short-sighted pragmatism spelt out in the editorial referred to above have become so real in the light of Kamaraj's views and their apparent impact on the Government that no apology is necessary for quoting at length from it in what follows.

There are enough lessons from the immediate past which one can draw upon to realise that some short-term remedies can be worse than the disease; at a minimum, they end up by being no remedies at all for society as a whole, though they may benefit an advantageously placed section of it. It was the frantic "re-appraisal" of the Second Plan that reappeared in the initial years of the current Plan in the shape of transport, power and other bottlenecks. And the foreign exchange crisis of the Second Plan itself was the fruit of the "realists'" solution for the unemployment scare of the First Plan period. But nobody, least of all the men in a hurry to solve the price problem, cares to ponder a moment on these mistakes of the past!

Fascinating games can be played on how to reduce demand and influence prices in two weeks. But in real life, which the pragmatists often do not believe in seeing in the round, things do not happen that way, especially when one is dealing with prices of consumer goods essential for plain, daily requirements. It is at that point that one has to strike if a dent is to be made on current demand. What is more important, this reduction in spendable income has really to be made at the lower income levels, if the maximum impact is to be felt on the demand for rice, edible oils, textiles and such necessities of life.

It takes no great perceptiveness to see that cutting the demand for essential consumer articles cannot be achieved without reducing employment at the lower income ranges. A variant of this is, of course, to reduce the rates of remuneration to the workers. In all the agitation against rising prices, the point is ignored that in a considerable range of incomes, the excess demand that exists is the counterpart of the employment and income increases that have occurred over the years. If we can organise our affairs more rigorously, it is true that a good bit of fat at higher income ranges and in the distributive trades can be cut, without detriment to the quality or quantity of goods produced. But it is a safe bet that padded incomes are likely to be the last to be cut or tampered with. Those that have these are too privileged or too powerful politically to be effectively dealt with under existing conditions, unless drastic measures are taken. But drastic measures are not taken because the cry can be raised that democracy is in danger or that there will be no incentives for the already better-off sections of the community. What then is easier than achieve price stability through denying employment to those who have little or no income to spend?

This is not perverted thinking. The incomes that are most expendable are those that do not yet exist. But they would come into existence if the Third and Fourth Plan outlays are carried out as scheduled. Should these come about — and even without any really effective redistributive policies being adopted — there would be a further increase in employment and spendable incomes with the people. For those who concentrate on the present price problem, nothing would be more unhelpful than the additions to these incomes that are yet to come.

One should not, of course, close one's eyes to the immediate problem or to inflation. But in seeking the easy way out of the present situation or shortages, must we perpetuate them? Pragmatism is only a part of economic statesmanship. The other, and more important, part of it is a vision of the future to be striven for. It is time that the latter is rescued from the stampede that is threatening. This is however not to say that there were no gaps in the built-in scheme of things. There were and still are. Both the Congress President's address and the economic and social policy resolution have pin-pointed some of them. Despite exercises on the significance of projects being phased over time and the relationship of such phasing to the rate of growth of income and output, the Planning Commission has never been quite aware of the relevance of the issue. The pattern of investment — in addition to, as much as together with, the size of the investment — is an element to be taken into account. The larger the size of the investment programme, the greater is the necessity of certain types of marginal adjustments in the pattern of investment for dampening the inflationary pressure of the bigger outlays. Of this, the Planning Commission is even less aware. The size of the development programme is, after all, only one dimension of the process which makes rapid long-run growth feasible. What the investment programme yields in the short period in terms of increased availability of goods and services is the other dimension of the process, namely, that of political feasibility. In order to win the war of 'magnitude', it may on occasion be good tactics to concede minor variations in the 'pattern'.

What was also not built into the Plan was any scheme for effective insulation against fluctuations in food production, and ironically we have been badly caught up in it, in a fairly good year with an all-time record high rice production and at a time when imports are freely available. This is now being remedied and a hopeful beginning has been made by setting up the Food Corporation.

Granted these and other gaps and short-comings, which must be overcome, the fact remains that the guarantee of a minimum income by the end of the Fifth Plan to which the Congress has committed itself, the progressive reduction of the backlog of unemployment, not to speak of the other social objectives reaffirmed at Durgapur — the siren voice of Kamaraj, the pragmatist, will take the country and the Congress to none of these.

Drug Prices: Case for Enquiry

THE disclosure that the same drug is being imported into this country at Rs 5,500 per kg and at Rs 300 per kg could not have come at a more uncomfortable moment for that section of our drug industry which has been fighting tooth and nail to ward off the long-awaited amendment of the Patents Act. 'Librium', a tranquiliser, is imported from Switzerland at Rs 5,500 per kg by a Swiss firm which holds the patent rights to the drug in India; it is also imported at Rs 500 per kg by another firm from Italy which does not recognise patent rights to drugs. As an instance of a patent monopoly being exploited by the patentee to charge exorbitant prices, this is by no means unique. There have been numerous instances of vital drugs being imported into this country at excessive prices when they could be had from Italy or the Eastern European countries for a fraction of these prices. Thanks to the Patents Act, import from the cheaper sources is shut off; those who undertake imports lay themselves open to prosecution by the patentees.

Those who have been aware of the damage done by patents to the development of the pharmaceutical industry on lines which would ensure supply of the vital life-saving drugs at prices which the mass of the people can afford to pay will, no doubt, be heartened by the Industry Minister's statement that the Government will after all introduce the bill to amend the Patents Act in the next session of Parliament. The enthusiasm will remain qualified, however, since all reports indicate that the Patents Act as it is today. The enthusiasm will remain qualified, however, since all reports indicate that the amendments proposed by the Government will fall far short of what are called for in the interests both of speedy development of an indigenous drug industry, and cheap supply of medicines to consumers. While detailed comment on this matter must await the publication of the Bill, the Government's attention needs to be drawn to another, and complementary, course of action which, if pursued, could have signal effect on drug prices in the country.

It is a fact established by investigations in countries like the U S and the U K that the prices of drugs manufactured by a patent-holding monopoly bears little or no relation to their cost of production. The manufacturer gets his profits where he can as quickly as he can. Invariably he charges what the consumer can bear, which in the case of life-saving drugs can be very high indeed even in a poor country. Only two factors could compel reasonable prices: competition from other manufacturers and pressure from the Government. Since the patents system protects the manufacturer from competition, the consumer's only protection is Government intervention. In both the U K and the U S A Governmental pressure has been successfully applied to bring down drug prices.

The Government of India has enough powers to regulate prices of commodities under the Defence of India Rules as well as the Essential Commodities Act. Following the declaration of Emergency, prices of drugs were frozen at the then prevailing levels. But since these levels were high enough manufacturers have not demurred and consumers have not benefitted. What is necessary is more discriminating regulation aimed at progressively reducing prices. This calls for a thorough enquiry into costs of production. A competent enquiry will produce many startling facts as well as many pointers for action.

Weekly Notes

Slow-footed Refineries

TO speak of the "inauguration" of the Barauni refinery by the Minister for Petroleum on Friday, as official announcements and advertisements released by the Indian Oil Corporation have done, is somewhat misleading. The first mn ton unit of the two mn ton refinery was commissioned in July last year and is at present in operation. The second mn ton unit is still under construction and is not expected to be ready for commissioning till the middle of this year. It is not clear, then, what the occasion for the "inauguration" is.

What the publicity attendant on the event has achieved, however, is to remind one of the unconscionable delay in the execution of the Barauni refinery. The agreement with the Soviet Union for setting up the refinery was signed in September 1959 and, even after making allowance for the slow progress of prelimanary work, the refinery was scheduled to go on stream in February 1963. But in all the official write-ups released by the Indian Oil Corporation, there is no mention at all of the reasons why the refinery has ended up so much behind schedule.

The first two public sector refineries at Nunmati and Barauni are rather poor advertisement indeed of the public sector's ability to expand refinery capacity in pace with the growth of demand for petroleum products. Nor is the third one at Koyali doing too well. The first stage of the three mn ton project was to be commissioned early this year. This, it is now certain, will not be possible though the extent of the delay is yet to be known. Work on the refinery at Cochin, however, is reported to be progressing apace and the deadline of end-1965 for commissioning may be more or less honoured.

The Petroleum Ministry's estimate of demand for petroleum products at 25 mn tons by the end of the Fourth Plan has been challenged as an underestimate. It is known that the Indian Institute of Petroleum had recommended, on the basis of a detailed study, that the Fourth Plan should aim at establishing additional refinery capacity of 12 mn tons which would take total capacity by the end of the Plan to 29 mn tons. An inter-Ministerial committee which subsequently went into these estimates recommended additional capacity of 11 mn tons and total capacity of 28 mn tons by Fourth Plan end. As against these recommendations, the Petroleum Ministry has settled for the lower figure of 25 mn tons — on what basis, it has never been adequately explained.

But what are the prospects of refinery capacity being set up to meet even the Ministry's lower estimate of demand? The tentative programme for the Fourth Plan has been drawn up on the assumption that the capacity of the existing refineries plus those already under way will be 17 mn tons so that new refineries would have to be planned with a capacity of 8 mn tons. Three new refineries are on the anvil. Two of these will be at Madras and Haldia while the site for the third remains to be selected.

though it has been decided that it will be in north-west India. The refineries at Madras and Haldia will have a capacity of 2.5 mn tons each and are expected to be completed in 1967 and 1968, respectively. The refinery in the north-west also will have a capacity of 2.5 mn tons and will be completed in 1970. To make up the deficit of 0.5 mn tons, the Madras refinery is to be expanded.

Of these, some progress has been made so far only on the Madras refinery. An agreement has been signed with the National Iranian Oil Company and the American International Oil Company on what are believed to be very favourable terms, specially in regard to the price of crude oil. In Haldia, on the other hand, the problems are truly formidable. Ignoring everything else for the moment and judging only by the progress made in creating port facilities, it appears extremely unlikely that a refinery will go on stream there in 1968. The position is even more indefinite in regard to the proposed refinery in the north-west. What makes it particularly so is that the setting up of this refinery is contingent on oil being produced in Cutch, Jaisalmer and Punjab.

ICICI's Ten years

WHEN, ten years ago, the learned gathered to cast its horoscope, they predicted for the Industrial Credit and Investment Corporation an existence prominent in public affairs and declared that it would "provide finance, particularly by way of underwriting of, and direct subscription to, share capital of companies". The first part of the prophesy has been amply fulfilled and the satisfaction and pride with which the ICICI looks back on its first ten years are not unjustified. But, like that of all mortals, the ICICI's progress has been no unswerving march along the linear path charted for it in advance.

The Rs 100 crores or so of assistance which the ICICI has provided so far to private companies has been a significant contribution to industrial development in the private sector; but it has not taken the form, principally and unvaryingly, of "underwriting of, and direct subscription to, share capital of companies". Foreign currency loans have accounted for almost 50 per cent of all assistance. On the rupee side, direct subscription to capital has constituted the smallest part of assistance (11 per cent) while loans have constituted the biggest (48 per cent).

Starting in 1955 with initial resources of Rs 17.25 crores — Rs 12.50 crores in rupees, comprising Rs 5 crores of privately-owned share capital and a Rs 7.50 crore interest-free loan from the Government and $ 10 million in foreign currencies loaned by the World Bank — the ICICI first found few takers for its offers of foreign loans, so easy was it to get import licences until the mid-years of the Second Plan. During this period the demand was for rupee loans to purchase foreign exchange from the Government to finance imports.

Soon came the foreign exchange crisis, and the ICICI became the private sector's principal institutional source of foreign currency resources — thanks to the munificence of the World Bank. The foreign exchange problem has persisted ever since, as has the role of the ICICI as purveyor of foreign exchange, so that over the ten years its foreign currency loans are barely lower than its total rupee assistance in all forms.

By far the largest part of the ICICI's foreign currency resources has come from the World Bank. In five lines of credit the World Bank has advanced $ 90 million; DM 40 million have come from the West German Kreditanstalt fur Wiederaufbau and $ 5 million from the US Agency for International Development. While the majority of the foreign exchange loans have financed purchase of capital goods and equipment for new projects, not a few have gone to established concerns for replacement and modernisation. In particular, a large part of the W German credits has been used for the latter purpose.

As in foreign currency loans, in underwriting again it is possible to see the shifts induced by general economic trends. When the ICICI came into being the capital market boom of 1959-61 was still a thing of the future and so its first few years were marked by active underwriting. Then in 1959 the tide turned and the boom set in; the public which had held back so far swooped down on most of the issues that hit the market; some of these issues, it is interesting to recall, were subscribed 100 times over! Promoters, confident of public response, did not feel the need now to approach the ICICI for underwriting. The kind of issues that did come to the ICICI were of units in industries like paper and electricity in which, because of price control, profit rates were pegged.

The capital market boom tapered off in 1962; in the stagnation that followed, and which still persists, the ICICI was again much sought after to underwrite capital issues. In the two years and nine months up to September 1964 it underwrote issues for Rs 7.11 crores or about 43 per cent of its total completed underwriting in ten years.

The ICICI's rupee resources, except for the share capital which was subscribed to by private parties, have come entirely from Government loans. Its function has thus been to channel funds from the Government to the private sector, its own contribution consisting principally of evaluation of projects and deciding which deserve assistance. As for the larger impact of its operations, these have been a major counter-vailing factor. To say that they have had a significant corrective effect on trends in the capital market would be to claim too much; but, then, this is a criticism which must extend far beyond the ICICI.

Finance, Private and Public

HOW much business is done by private sector financial and investment companies? A Reserve Bank survey of the finances of 177 public and private companies in 1962-63, which account for 84 per cent of the share capital of all non-Government financial and investment companies other than banks and insurance, gives some interesting results. Their resources are Rs 67 crores of owned funds (share capital and reserves) and nearly Rs 55 crores of borrowings, mainly from 'others', at the end of March 1963. Their investments in private securities amount to Rs 65 crores, including Rs 10 crores held as inventory, and loans aggregate Rs 51 crores. During the year 1962-63, they raised a gross total of Rs 9 crores, almost wholly from borrowings; of this amount Rs 2 crores went into private securities and the remaining Rs 6 crores was loaned out. While shares continue to form the bulk of investments, debentures have begun to attract.

Out of the main income of Rs 9 crores, dividends contributed nearly Rs 5 crores, and the balance was shared equally between interest and net earnings from hire purchase financing. The companies earned 4 per cent on net worth against 5.3 per cent in 1961-62; the decline was not due entirely to higher tax liability for the volume of profits before tax also declined thanks to lower income

and higher interest charges. Most of the profit after tax was distributed as in the previous year (nearly all such companies are classified under section 104, formerly 23A, and are required to distribute most of the profit) but with an almost constant distribution, retention became nominal.

Though the inclusion of hire purchase financiers confuses the picture, it is obvious that private sector financial and investment companies are now only minor constituents of the capital market and that too mainly for loans rather than investments. Their income compares favourably with that of the 16 public sector financial corporations taken together but their resources and operations are much smaller. The statutory corporations earned only Rs 6 crores in 1962-63 but their profit on net worth was higher at 5 per cent. They raised a gross total of Rs 27 crores (of which Rs 10 crores was from bonds, Rs 5 crores from Government, and Rs 2 crores in foreign exchange), and put Rs 6 crores in investments (mainly debentures) and Rs 19 crores in loans. The total resources of statutory corporations have yet to catch up, owned funds of Rs 26 crores and borrowings of Rs 84 crores, aggregating Rs 110 crores against Rs 122 crores in their private counterparts.

Italy's Shaky Government

IN countries with an established parliamentary system and a strong ruling party, the election of a largely ceremonial president usually involves little dissention. In Italy, where the president of the Republic often holds the balance of power in selecting a prime minister, and where a presidential election means a test of party strength, the recent election of President Saragat almost paralyzed the body politic. It is clear that the presidential election left Italy's fledgling parliamentary democracy weaker and that the ruling centre-left coalition has lost face. It is even possible that the Christian Democratic party, which has ruled Italy since 1948, may split as a result of the tensions created by the election.

The election itself, which was almost a comedy of errors, took 21 ballots and lasted a fortnight. When the two Houses of Parliament, which together constitute the electoral body, finally elected Signor Giuseppe Saragat, they were exhausted by the effort. Saragat's choice was obvious from the beginning, though the political parties were divided among themselves, and could not agree on a single candidate. Indeed, Saragat's candidacy shows some of the inherent problems in Italian politics as it has developed since the war.

Saragat is both a non-Catholic and a Socialist. As a non-Catholic, he was unacceptable to the strongly Catholic wing of the ruling coalition as well as to the clerical parties outside of the Government. In a nation which is nominally 98 per cent Roman Catholic, but in which an estimated 40 per cent of the population never enters a church, the religious issue is a controversial one. As a Socialist, *albeit* not a Marxist, he aroused the animosity of the right and some sections of the centre. His clear record of opposition to the Communists did not win popularity among members of the far-left political groups.

The ruling Centre-Left coalition, which consists of the dominant Christian Democratic party, and the Nenni Socialists combined with Saragat's own Social Democratic group, is in deep trouble. In the recent municipal elections, the ruling parties suffered a slight setback, primarily to the parties of extreme right and left — the communists and left-Socialists on the one hand, and the Republicans on the other. Not only is the coalition threatened by its parliamentary opposition, but it is also ridden with internal dissentions. The left wing of Nenni's Socialist party is anxious to continue its long standing co-operation with the Communists (broken off when the Socialists joined the coalition government), and in fact the Socialist party was split at the time of the coalition, and faces the possibility of further factionalism. The Christian Democrats are in deeper trouble. Since it was founded in 1948 by the late A DeGasperi as an opposition to the popular front of the period (with the strong support of the Catholic Church), the party has been without strong popular leaders. It has become an alliance of regional political leaders with a vague political ideology but without a concrete programme. The Christian Democratic right wing, which is strongly Roman Catholic, could not accept

even a moderate Socialist and non-Catholic like Saragat. Faced with electoral losses, and a seeming increase in leftist influence in the Government, a large number of Christian Democrats want to scrap the coalition. One of those most interested in ending the present Government is former Premier Fanfani, architect of the coalition in the first place. Thus, it remains to be seen if the centre-left government in Italy can last. It is also doubtful that two of Italy's most important political parties, the Christian Democrats and the Nenni Socialists, will continue as political entitites.

It is possible that Italy may see another "popular front" government in the foreseeable future. The Communists, who have been left in the political wilderness for almost two decades, are anxious to take part in the government. As Italy's second largest party, they are a potent force. If the present coalition does break up, it is possible that such a popular front will be formed. Certainly the present situation is not helping Italy's democratic system. Many people feel that parliamentarianism does not work well, and the proliferation of parties has not helped matters. The coming period is an extremely important one for Italy, and particularly for its present governmental set-up.

Economics: Socialistic, Courtly

A Correspondent writes:

MAY I supplement the very admirable reviews of R K Hazari and 'Correspondent' on the Economic Conference in your issue of January 12 with a brief "marginalia"?

This Conference, like its recent predecessors, has amply justified the changes in the conduct of proceedings introduced since the Nagpur session. The meetings had a certain brisk pace about them and the wafflers—who like the poor shall always remain with us—did not have much more than a sporting chance of getting a word in edgewise! Old Conference hands even recalled the memorable 1944 (Dr Hyder's) session in Delhi. Even more pleasing was the rapport between Age and the Angry Young Men, a gracious coming to terms with a new dispensation. The Elders did say their sage piece, to the point, and to give just that added leavening of mellowness to the mass of virtuosity. We have now a very impressive body of highly competent young Indian economists steeped in the latest lore and with impeccable credentials. With this generation, the gap between the two cultures of Economic Science, the 'Literate' and the 'Numerate', appears to have been bridged. One could discern too the beginnings of a growing and effective dialogue between the 'Advisers' and the 'Academics'. The one showed an agreeable willingness not to be wholly on the side of the angels even as the other took in the occupational hazards and difficulties of the economist in the Backrooms of Power. Yes, it was all very prim and precise. One even missed the now-vanished species of the lone wolf with the *idee fixe!*

There is something to be said for holding an academic conference in the capital of a former Princely State. In Baroda there was just the right touch and flavour of a vanished age. Was it not Oscar Lange, who told an incredulous Galbraith in the midst of the near mediaeval pageantry of the convocation of the University of Cracow, "we like our economy to be socialist but our manners to be feudal"? So was it here—splendid logistics plus courtliness!

Anand and Baroda

Another Correspondent writes:

THE agricultural economists' conference at Anand and the economists' conference at Baroda offered some interesting similarities and contrasts. The hospitality at Anand was enveloping; one was looked after right from half past five in the morning when children came to pour hot tea and inform one that bath water was ready, till supper was served by endless files of volunteers. The same facilities were there in Baroda as well, but there was less spoon-feeding. Tea was served but one missed it if one was silly enough to bolt the door; boiling water was available but one had to find a bucket if one wanted it; excellent and abundant food was provided but one was free to give it the go-by and retire to a chair.

The discussion at Anand, on the whole, kept more to the point and was better informed. This is somewhat surprising and difficult to explain. One reason might be that the proportion of teachers was lower and of research workers higher at Anand than at Baroda, and teachers seem to keep up with things less well. Another might be that mathematics and statistics have made greater inroads into economics than into agricultural economics in India so the proportion of mathematics-based statements that could go over the heads of "lay" economists or be misunderstood by them was less in Anand. There were howlers in both Conferences on this account. In a paper submitted to the agricultural economists' conference, what was evidently a supply function went under the name of production function; in Baroda there was some fanciful speech-making about the turnpike theorem. Nevertheless, the approach of the agricultural economists was more workman-like. Their level of ambition was lower, and their achievement measured up correspondingly better.

Letters to Editor

North vs South in Nigeria

MAY I offer a few brief comments on your informative Weekly Note, 'North *vs* South in Nigeria', in your issue of January 9?

It is said that "religious, tribal and linguistic animosity has provided a forceful barrier to National Unity in Nigeria". But it would be nearer to the truth to talk of regional differences rather than religious, tribal or linguistic barriers as an operative influence in Nigeria. Undoubtedly, the North is overwhelmingly Moslem whereas the West and South are predominantly Christian and pagan. There is also a sizeable proportion of Yoruba Moslems in the West. From this, however, it would be misleading to infer that religious differences have any part to play in the recent political distemper in Nigeria or at any time in the past in Nigerian public life. Fortunately in Nigeria, as elsewhere in tropical Africa, religion has not yet been imported into politics on the scale and in the manner familiar to inhabitants of the Indo-Pakistan sub-continent. Religion sits lightly on African shoulders. There is piety and even orthodoxy but seldom fanaticism, whether among Christian or Moslem Africans. It is not unusual to come across African families whose members profess different religions, including a flexible agnosticism!

Likewise the adjective 'tribal' has to be used with due caution in Nigeria. The Moslem North has two distinct tribes, viz, the Hausas and the Fulanis and there are also speakers of a third language, Kanuri. In the East, apart from the Ibos there are the Ibibios of Calaban. In any case, in Nigeria tribe and religion are subsidiary to region.

The survival of the feudal Emirates in the North is explained by the adoption of 'indirect rule' in this region under the influence of Lugard's philosophy. The presence of the powerful Fulani Emirs in the North — comparable to the Indian ruling princes in many respects, down to a rather violent addiction to polo! — gave the ruling British power a ready-to-hand instrument of control not available in the South or West. In these regions the tribal chief did not quite fill the bill. Today the British presence in the North is not wholly a thing of the past. Witness the number of Balliol ties at cocktails!

In conclusion, it should also be pointed out that the latest census in Nigeria has been an inconclusive and controversial affair. One therefore does not know the precise numerical preponderance of the dominant North.

Bombay, 'AFRICANUS'
January 12.

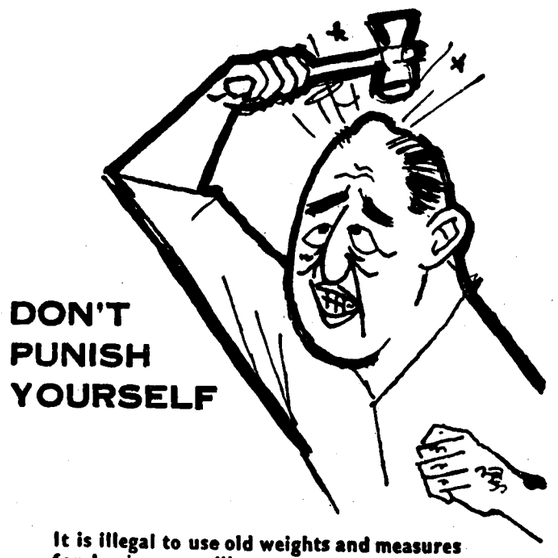
Annie Besant

THE unsigned book review of Nethercot's book on Annie Besant and her associates needs a little comment. It so happens that the lady is my paternal grandfather's first cousin. For your reviewer to describe Nethercot's review as objective is, frankly, ludicrous. There is a history behind this which would probably not interest you. It has long ceased to interest me.

As for the quotation which your reviewer excerpts from Nethercot's book "objectivizing" J Krishnamurthi, would it not be a good idea if your reviewer were to consult both the N E D and Webster for current definitions of the scholarly use of the word "objective" and its derivatives? It also happens, that J Krishnamurti is a close personal friend of mine. This is natural since we are of precisely the same vintage; and he has been a great deal in Bombay. It also happens that I have some close acquaintance with a number of psychiatrists, of whom perhaps the most objective, and certainly the most widely experienced, is the founder and first director of the World Federation of Mental Health, Dr J R Rees. Your reviewer might do well to refresh his knowledge of the term "schizophrenic". He might also consult three works of Karl Jung, upon the concept of dual personality.

Even with these precautions, however, I doubt if your reviewer, and I am quite certain Nethercot, could be said to be objective in the defined sense of that term.

Mrs Besant committed the error of living too long; nevertheless, she did a great deal to form the present Bharat, and her influence, both good and bad, is still felt far outside the faithful at Adyar. J Krishnamurthi also wields a certain influence.



I myself do not regard him, despite his schism from the Theosophical Society, as a major prophet, nor a guide to spiritual philosophy; but as a gentleman, which seems to be a rarity nowadays. This impression of rarity is reinforced upon reading the review in question.

EVELYN WOOD

Bombay,
January 7.

Our reviewer writes: I am quite willing to undertake all the heavy reading prescribed for me by Evelyn Wood but, in return, I would request him merely to re-read my review. He could find that far from considering Nethercot's summing up of J Krishnamurthi as "objective", I have clearly implied that it is less than fair. The point is not elaborated further since the subject of the biography is not Krishnamurthi but Annie Besant.

All that the review says is that Nethercot fulfils a pre-condition necessary for objectivity in undertaking the definitive biography of a controversial figure like Annie Besant in that he never knew her and never came within the ambit of her influence. To this I now feel inclined to add that he is not related to Mrs Besant either.

It is illegal to use old weights and measures for buying or selling; even quoting prices in terms of old units is punishable.

Besides, you punish yourself every time you indulge in transactions based on Seer or Maund; you get less than your money's worth !

It is not enough for the trader to use metric weights.

From the London End

France Asks for Gold

THE recent hectic activity in the London and Paris gold market has brought into prominence once more the unstable nature of the present international monetary system, based on the gold exchange standard, which relies on the deficits of the reserve currency countries (the U S A and the U K) for any growth in world reserves over and above what comes from new gold production.

At the end of last week, after a period of frantic activity touched off by the decision of the French to convert a proportion of their dollar holdings into gold, the dollar price of gold finally closed between $35.17 and $35.20 an ounce. During this period, dealings in gold were heavier than at any time since the Cuba crisis. During the week there was steadily rising speculation, and gold prices rose 6½ cents an ounce in four days.

The Bank of England's decision to allow the price of gold to rise above $35.13, where it had previously been held, heightened rather than lessened speculative pressure. The Bank of England also allowed the £ to fall below $ 2.79. These recent operations in gold, illustrate quite clearly the interdependence of sterling and the dollar. The general distrust for reserve currencies is at the back of the desire to hold gold. There is no doubt that the two reserve currencies, the £ and the dollar, must stand or fall together.

There is no doubt that before Europe can be convinced that the key currencies can be trusted at their present gold parities, more will have to be done to show that there has been a real change for the better in the British position. One of the factors which leads to a distrust of the dollar in European minds is the fear that a collapse of sterling would transfer the whole pressure to the dollar and make it too costly to hold the present gold price for long.

As the present system stands, any rumour no matter how unfounded, can produce a raid on one currency or another, or a move out of currencies into gold. The speculative pressures were calmed by the warning from the U S Treasury that those expecting a rise in the basic price of gold will "inevitably end on the losing side". The U S Treasury also made it quite clear that it regards the present gold price as "immutable", and that if it came to a pinch and the U S had to choose between controlling all capital movements and agreeing to a change in the price of gold, it would be the first line of action that the U S Government would pursue. It reaffirmed what the late President Kennedy had said three years ago, that the whole of the U S gold stock was available to support the dollar in the international markets "at the immutable price of $35 an ounce".

In addition, the American Administration is considering passing a law to free a part of the fixed gold cover for U S notes and reserve bank deposits. At present, much of American gold stocks are tied up as backing for notes and deposits as a result of the 25 per cent gold cover requirement for Federal reserve banks on deposits by commercial banks.

Mistrust of Present System

What is behind the latest French move to assert the independent position of France? The sums which the Bank of France has asked the U S to change from dollars into gold are not very large; they amount to approximately $ 300 million over the next three months. What is more important is that France has indicated that she would like that in the future any additional dollars flowing into the account should be converted into gold. There lies the rub.

Although the French move can be described as the move of a prudent banker who is not entirely confident about the strength of either the sterling or the dollar, there is no doubt that one of the aims behind the French move is to highlight in a very practical manner, the French distrust of the present international monetary system, and the demand for a thorough reform of it. The dissatisfaction of France with the present system is no secret, although the remedies proposed by the French are not all of the same sort. There is the orthodox school in France which would like to see the old gold standard restored to its pristine splendour, while there are other groups with a more nationalistic outlook who would like to see the franc take its proper place in the world monetary system.

The French plan favouring a change in the present system is based on the "Bernstein" plan for monetary reform which would create a new "composite reserve unit" with the major difference that these new reserve units would eventually replace dollar and sterling holdings, not merely supplement them. It is for this reason that the French are anxious that special care should be taken in the creation and volume of any new reserve currency units, and any recourse to them should be concerted and limited. They also believe that they should be supervised, not by the I M F where the French feel they have not got enough influence, but by the "Group of 10" where their own position is more influential.

The French position was described very clearly at the Tokyo meeting of the International Monetary Fund in September and there is no doubt of the French disapproval of the system. They have repeatedly pointed out that the system as it exists to-day, allows British and the U S A to finance large deficits using their own currencies, and so weakens more orthodox methods of balance of payments discipline. The French have also pointed out that while the U S A has been running a heavy deficit, the outflow of investment capital has continued.

While the French move by itself presents no great threat, particularly if a change in U S legislation on gold backing is introduced, if other European countries, especially West Germany and Italy, were to follow France's example, this could have a very serious effect on the whole international monetary position. Both Germany and Italy at present maintain the lowest gold covers of any member of the European Economic Community. A showdown over the world monetary system cannot now be postponed indefinitely, it appears.

Non-Receipt of Copies

A Calcutta Diary

No Eleventh Arm for Durga

AT Durgapur, where the Indian National Congress recently concluded its 69th annual session, several wordy resolutions were adopted solemnly and ceremonially. The power of the word is not to be underestimated even in this age of its incredible profusion; but, with a variety of motives, there were Congressmen to complain that the party only passed pious resolutions and then did nothing or little about them. The failure of the Third Plan was not denied; extolled was the promise of the Fourth. Caterers provided excellent meals; most delegates yet remembered that there was a severe food crisis in the country. Oddly enough, the debate that generated the greatest interest and animation was on the question whether India will or will not make an atom bomb. It was decided at session's end that, at least for the present, the ten-armed Durga will have to do without an eleventh, nuclear, arm.

What seemed obvious from beginning to end was that few knew what they were talking about; the many included the Prime Minister, Lal Bahadur Shastri. The Congress President, like a minor spokesman of the External Affairs Ministry referred to the Colombo proposals and China's sinister intentions towards this country but made no direct reference to the bomb. It was *Shastriji* who did not try at all to conceal his pride over the decision not to make a bomb—for the present. Only a few heard the horse-laugh of which the epicentre was believed to be Peking, although there is evidence to suggest that some other captains may also have been equally amused.

The Jamboree

Nobody was left in any doubt that the online begetter of the Durgapur session of the Congress was Atulya Ghosh, although the nominal President of the State Congress had to be made the Chairman of the Reception Committee. Ghosh bestrode the scene like a colossus, as he was, at least physically, fully qualified to do. Few cared to notice that Ghosh had reduced the whole show to a farce by announcing at a Press conference two weeks earlier what the Congress was going to decide, on the bomb and other questions. In the event Ghosh proved absolutely right to the last detail; the Congress decided exactly as Ghosh had said it would. Nobody expected a surprise from Durgapur; but Ghosh's prescient statement imparted to the millions of words uttered there a greater hollowness than was necessary.

Yet the session was held. Those who said that Nehru was the star attraction of Congress sessions without whom few would care to attend them have been proved wrong. Atulya Ghosh showed that the traditional pilgrims to the annual *mela* could do without their diety; the shrine was important enough. *Pandas*, he successfully demonstrated, had taken over from the Pandit; and the loss may be more marginal than electoral. Kerala got incidental mention; but, after Nanda's massive arrests of the left C P I, if anybody was nervous he did not show it. The Congress Party in its long career has successfully faced and withstood so many crises that it no longer quivers when another crisis is around. Confident talk replaces concern. Atulya Ghosh said it in Bengali, drawing cheers; Prafulla Sen said it in Hindi, drawing cheers. When party talk exceeds the permissible percentage of nonsense, it does not much matter what language one uses; at Durgapur linguistic clashes were few and never really unpleasant. The West Bengal Chief Minister went to the extent of saying that, having been born in Bihar, for him Hindi and Bengali were the same. The little he had to say could, indeed, be said even in Hindi. He too was agin' the bomb—for the present.

The Other Explosion

No matter what has been happening elsewhere in the country for the general reason of a sudden and fantastic increase in defence expenditure, in West Bengal prices have behaved in the most extraordinary manner in the last few weeks. Statutory rationing came into being last week; and dal disappeared altogether from the market, as other things had done earlier. Atulya Ghosh has denied any connection between the upward movement of prices and the levy on trade and commerce to meet the cost of the Durgapur Congress. He has said that the cost of the Congress came from small donors, people who paid a rupee or two. Well, Ghosh himself advised us not to pay much attention to gossip.

It has been said that in any city except New York a presence like the U N's would have created an unbearable pressure on prices and everything else like accommodation. It is suggested that a Congress session has, given the obvious difference in scale, similar effects on the market, especially in a State as deficit and overpopulated as West Bengal. Whether or not there have been levies on particular trades, the very expenditure on Durgapur was enough to have upsetting effects on supplies and prices; and upset many things were. Children in Calcutta went without milk so that Kamaraj could have his coffee at Durgapur. It is not pleasant to have to present problems in such personal terms; but there it is.

After Pro Forma

If this be the *pro forma* account of the Durgapur Congress, it must be somebody's business to demand a final balance sheet of what comes in, from where, and what goes out in the name of a Congress session. At a private function a hero of the Bhubaneshwar Congress had been asked, with a bluntness that took one's breath away, how much he had made out of Bhubaneshwar; with a blandness unknown since Clive's "I am amazed at my moderation", the politico referred the questioner to sponsors of the Durgapur session for more up to date information. Like everything else the Congress sessions are growing annually more expensive; and again at Durgapur no attempt was made to relate the outlay to the return.

Against this background, the mushroom of the bomb debate wore an ominous look. The whole thing seemed unbelievably unreal and yet fantastically farcical — and cruel. A foreigner was some years ago *justly castigated* for suggesting that what India needs is not blast furnaces for making steel but gas chambers for wiping out a part of the population. Perhaps, after all. India should have the bomb, for judicious use within. It cannot be said that Durga's existing ten arms have so far been used very effectively against enemies within — or without.

— Flibbertigibbet

Book Reviews

The Vietnamese Tragedy

Vietnam Divided by B S N Murti, published by Asia Publishing House, 1964; pages 227, price Rs 16.
The Last Confucian by Denis Warner, published by Penguin Books, 1964; pages 385, price 5s.

IT is often possible to tell the extent of a world crisis by looking at the number of books published about a given area or situation in a specific year. Judged by this criterion, the situation in Viet Nam ranks as a major crisis. Indeed, the amount of material which has been published on Viet-Nam has been particularly striking in view of her almost total isolation prior to 1954. Scholarship, both East and West, was almost ignorant of this area of the world prior to its attainment of a spotlight in the Cold War. The amount of homework which had to be done by scholars and journalists alike is indicated by the large number and often low quality of the material which has been published since 1954.

These two recently published books provide some insights into the situation in Viet-Nam, and also offer some interesting contrasts of style and quality. Because of Viet-Nam's crucial importance at present, they are particularly relevant. They are indicative of the kind of material which has crowded libraries and diplomat's bookshelves in recent years.

Diem and the U S

Both books have similar aims. They wish to shed light on an exceedingly complex political, social and economic situation which is entering a crucial phase. Both trace recent Vietnamese history in order to provide essential background to present developments. Murti's analysis concentrates mostly on the period since the Geneva Conference (1954) ended French hegemony in Indo-China and provided a backdrop to the present crisis. As a former Deputy Secretary General of the International Control Commission for Indo-China, he had a unique opportunity to see developments during the crucial period from 1954 to 1957 at first hand. His account relies mostly on the reports of the Commission, or press reports, and is clearly favourable to the North Vietnamese Government.

Murti discusses the unco-operative attitude of the Diem regime in South Vietnam, and its attempts to lure the large Roman Catholic population of the North southwards by means fair and foul after the Geneva agreements were reached. His discussion of the rise of the Diem regime, and the key role of the United States in securing and maintaining Diem's power in South Vietnam, and particularly Diem's campaign to destroy all opposition, whether Communist or non-Communist is elucidating. Furthermore, it provides an understanding for part of South Vietnam's present dilemma, for there is no sophisticated and experienced leadership to take-over from the military rulers due to Diem's (and by implication, American) ruthless destruction of all legitimate opposition.

N Vietnam's Role

In his discussion of the Vietnamese situation, Murti almost entirely ignores North Vietnam. This omission is particularly unfortunate, as it is impossible to understand the situation in Vietnam without looking at the country as a whole. His bias toward the North Vietnamese government is evident in his discussion of the role of the Viet Cong (Communist National Liberation Front in the south). He contends that little or no arms came from either China or North Vietnam, despite overwhelming evidence to the contrary from both the International Control Commission (an independent body consisting of India, Canada and Poland) which he has dismissed in one sentence, and from Western press sources, which he has totally ignored. Further, he does not discuss in any detail the political and military influence of the North Vietnamese government on the Viet Cong. Most independent observers seem to agree that Viet Cong obtains substantial material and ideological help and direction from the North, and from Communist China.

Where Murti's book is valuable is in its overview of the recent history of Vietnam, and particularly the development of South Vietnamese policy under the direction of the United States. The description of the French withdrawal from Vietnam, and their ambivilant attitude toward Southeast Asia generally is important when one recalls that French influence in Vietnam is still quite strong, particularly in the fields of finance and education.

An experienced journalist, Denis Warner spent a good deal of time in Vietnam, and succeeded in talking at length with leaders of both North and South Vietnam. His discussion of the government and personalities of North Vietnam is particularly cogent, and unusually useful in the light of the few facts available about this area. While highly critical of U S policy in Viet Nam, Warner maintains an admirable objectivity, and freely criticized both sides when necessary.

The Context

"The Last Confucian" places the Vietnamese struggle in the context of the Cold War and analyzes the situation from this point of view. It is because of this broader frame of analysis that he is able to cogently discuss both the background and the present situation in that troubled land. His discussion of Diem's personal character, and the mark he left on the face of South Vietnam is as devastating as it is convincing. And, as always, the stamp of American influence is heavy on the Diem regime. Warner discusses the little known fact that Diem was able to bully the Americans into supporting various schemes which were not considered practical, and that after he removed all possible democratic opposition, the U S had no alternative to him. While Murti does not discuss the recent series of military juntas in South Vietnam, Warner's analysis is fairly up to date, and tries to deal with some of the causes for the rash of coups and counter-coups.

Though Warner is basically sympathetic to Ho Chih Minh's Communist government in North Vietnam he is not unmindful of Communist Chinese influence in the area, and in fact shows that North Vietnam might be willing to accept some kind of solution which would rid Vietnam of both Chinese and American domination. Warner recognises the substantial Northern aid to the Viet Cong, although he accepts that the popularity of the rebels in South Vietnam comes from a rapport with the peasants combined with the total bankruptcy of the Saigon Government. Under the present circumstances, no victory for the American-backed Saigon regime is envisioned, and Warner is quite impressed with the morale and intelligence of the Viet Cong, as he is with the savagery with which the struggle has been carried on by both sides.

Warner's book is a conscientious job of reporting and analysis, written with a good deal of perception. He holds no brief for American "anti-Communism" while at the same time maintaining a highly critical attitude toward the Communist-backed Viet Cong. By placing Vietnam clearly within the context of the Cold War, with the impact of outside influences from various sources, he is able to clearly see the picture, as clearly as possible under the circumstances.

While both books provide some very useful background material to a country surrounded by myths and preconceived notions, neither writer has any solution for the difficult situation in Vietnam. Both agree that the Saigon regime will have to radically change if it is to have any chance of holding the loyalties of the people. Warner particularly points out that a government which provides essentially no services to the peasants, has not carried out a meaningful land reform, and exists only through outside support is politically bankrupt. Indeed, the Saigon Government has in the past year engaged in its "strategic hamlet" programme which has essentially provided concentration camps for a section of the population and has increasingly taxed the poorer sections of the peasantry. With such a legacy of corruption and misgovernment, it is difficult to see how the Saigon government, even with direct U S military support and the commitment of American troops, can succeed.

Warner observes that any solution of the situation in Vietnam will have to be in the context of the Cold War, and will have to be a political solution. Merely abandoning the country to the Viet Cong and the Communist North would be unacceptable to the United States, while a return to the 1954 *status quo* would negate the gains made by the Viet Cong, and therefore be unacceptable to them. Thus, some kind of negotiated solution is called for, though both writers seem to be unable to make any concrete suggestions.

China : Some Portents

P Misra

The recently concluded session of the Chinese National People's Congress, (the Chinese parliament) was in the nature of a victory parade for Mao Tse-tung.

After years of internal disarray and external disenchantment, China had exploded its first nuclear device; Khrushchev, her bete noire, *was no longer the head of the Soviet Government; her influence in Asia and Africa was in the ascendant; and industrial and agricultural production, after years of stagnation, had taken an upward turn.*

BEFORE the Congress met, observers in Peking were busy scrutinizing the list of the 2,836 Deputies attending it. *Le Mond's* correspondent in Peking described the Chinese Parliament as not only the largest, but also "the most familial" in the world, as wives of almost all the members of Chinese Politbureau were found to be members of Parliament, along with their spouses. More important were the names missing from the list. Gone were those of Dalai and Panchen Lama, along with those of other top delegates from Tibet, and in their place were included 12 representatives, "the erstwhile serfs and slaves recently emancipated". From Sinkiang, 12 delegates representing minority communities were found missing and from Manchuria, 10 Manchurian delegates out of 29 had been dropped. It is interesting to note that most of the delegates dropped represented the minority races bordering on the Soviet Union. Missing was also the name of Marshal Ping teh-Huai, relieved earlier of Defence Ministership for his alleged pro-Soviet activities.

Optimism and Confidence

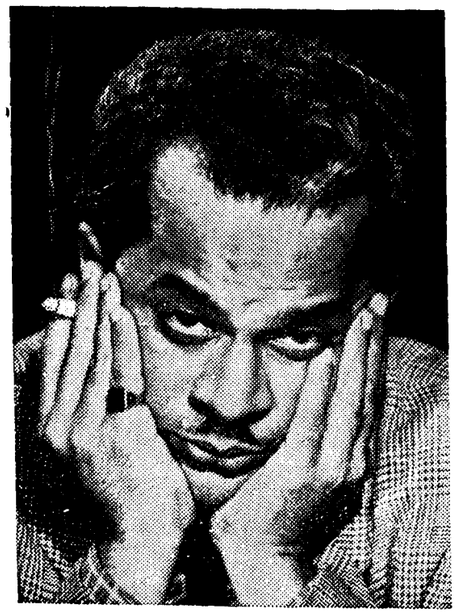
Chou En-lai's report, issued by Hsinhua, is remarkable for its tone of confidence and optimism. The report said that China experienced a large upsurge of industrial and agricultural production during 1964. "After three successive years of natural disaster from 1958 to 1961 and despite withdrawal of Soviet aid, Communist China managed to readjust its economy." Chou accused Khrushchev of "abruptly and perfidiously tearing several hundred agreements and contracts and withdrawing Soviet experts working in China and cutting the supply of important items of equipment". While conceding that this added greatly to China's difficulties, he nevertheless declared that China had not been cowed. Shortcomings and mistakes in work had been corrected and the arduous task of readjusting the national economy had been accomplished.

The entire national economy, Chou En-lai claimed, had taken a turn for the better with industrial output 15 per cent higher than in 1963. And the production of cereals, cotton, tobacco and sugarcane touched 1957 levels and production of petrol, cement, motor vehicles, chemicals and cigarettes marked a rise of 20 per cent over last year. Chou En-lai claimed that the consumer goods were in relatively abundant supply and that one could see signs of prosperity everywhere. "Prices have remained stable, revenue and expenditure were in balance and confidence in the currency was greater and there has been considerable expansion of foreign trade." Chou En-lai stressed the fact that the great achievements of the last few years had been the result of the resolute policy of self-reliance, specially after the betrayal of Soviet Union, and as a result an army of first-rate scientists and engineers was ever growing. He proudly declared that China had produced its atomic bomb, largely on its own initiative and even the foreign atomic scientists had to admit that it has surpassed those initially built by the United States, Britain and France. Turning to 1965, Chou En-lai said both revenue and expenditure were likely to be 10 per cent higher. The draft plan for 1965 provided for an increase of about 5 per cent in total value of agricultural output as compared with 1964.

Opposition Admitted

The report also revealed that the period following the Blooming of the Hundred Flowers and Great Leap Forward witnessed a massive spurt of revisionist trends, which were ruthlessly suppressed. Chou-En-lai confessed that the Government experienced much internal opposition after the failure of the Leap Forward policy and the rise of revisionism, advocating abandonement of the fight against imperialism and assistance to revolutionary struggles of other countries.

This was a serious problem and consequently the Party had to launch a counter-attack in September 1962 against such reactionary manifestation. He paid homage to Mao Tse-tung "for guarding against under-estimating the peril of restoration of capitalism." Obviously, it is in this context that nearly 295 delegates, about one-fourth of the previous Congress were dropped from the present Congress.



The report on foreign relations, not only assured continuity but stepping-up of China's aggressive policies against the background of her expanding economy. Chou En-lai emphasised that Asia, Africa and South America were the nerve centres of the revolution and pointed out the growing contradictions in the imperialist camp, the latest symptom of which was Franco-U S conflict. He also predicted an imminent economic crisis in America. China's unwillingness to withdraw the seven posts from Ladakh, as a pre-condition to negotiations, laid down by the Colombo proposals is a sign of her growing truculence and her support to Sukarno on Indonesia's withdrawal from the U N are significant in this context.

Though no direct attacks were made on the Soviet Union for its alleged revisionism, Safudin, President of the autonomous region of Sinkiang, warned the Congress against subversion and sabotage from across the border. He was obviously aiming at the Soviet Union. Lin Leng-yi, the President of the Federation of Chinese Workers also had a dig at Russia while emphasising that China did not envisage any re-conciliation with imperialism or limitation of her aid to the oppressed people of the world.

Fears of Revisionism

The Congress thus marked a great triumph for Mao's policies. The expanding self-reliant economy, the prospects of a successful harvest and the creation of a parallel international communist movement, will naturally embolden China to take aggressive postures in world affairs. Yet, Mao is hounded by fears of a revisionist revolt in China. To guard against this catastrophe the Chinese Communist Party has launched a mass campaign to create "millions of revolutionaries after the image of Mao". The Old Guard of the Chinese Communist Party is aging fast. Its average age is 65 and observers of the Chinese scene had expected that some younger blood might be introduced into highest echelons of the party during this Congress. It was widely rumoured in Peking on the eve of the Congress, that Mao will step down to honorary Chairmanship of the Party and that Chou En-lai, who has been carrying the enormous burden of Premiership since 1949 and has lately looked very tired, may be elevated to the ceremonial post of the Presidentship. But to everybody's surprise, no change in the top leadership has been made. It appears that the Chinese leadership is still reluctant to entrust power to the younger cadre who are essentially technocrats. The ranks of devout Maoists who were participants in the historic Long March is thinning fast. On the other hand, the recent experience has shown that even the smallest relaxation produces strong revisionist forces in the Chinese society, which can be suppressed only with great difficulty. Mao may be prepared to pay any price to prevent the "restoration of capitalism in China through the back-door of revisionism" but to the younger technocrats of the Chinese revolution such an endless crusade appears very barren and dreary indeed.

The proceedings of the Congress indicate that China's economic progress is assured in the near future, unless she jumps into adventurist operations across her frontiers. It is also evident that once China's international personality is recognised and her foreign policy placed on an even keel, her obsession with the world revolution may be a thing of the past. It is now largely up to the diplomacy of the Western powers to help the evolution of this prospect.

what is the problem, sir?

If it has anything to do with banking services— and particularly if it relates to help and guidance for developing INDUSTRIES or developing IMPORT-EXPORT BUSINESS- we would cordially suggest a reference to us.

THE BANK OF INDIA LTD., has had over 50 years' experience of trade, finance and industry—it is at the disposal of our customers.

THE BANK OF INDIA LTD.

Dandakaranya: A Survey of Rehabilitation

III—Other Urban and Semi-Urban Employment

S K Gupta

A few odds and ends should now be dealt with to tie up loose ends and bring the discussion to a close.

Apart from industries the other possible means of earning a living in urban and semi-urban areas are private or co-operative trade, transport, contract work of all sorts, public service, and independent professional or consulting work. Of these, the last may be ruled out at once for displaced persons moved to Dandakaranya lacked the necessary qualifications to set up as lawyers, doctors or consulting engineers.

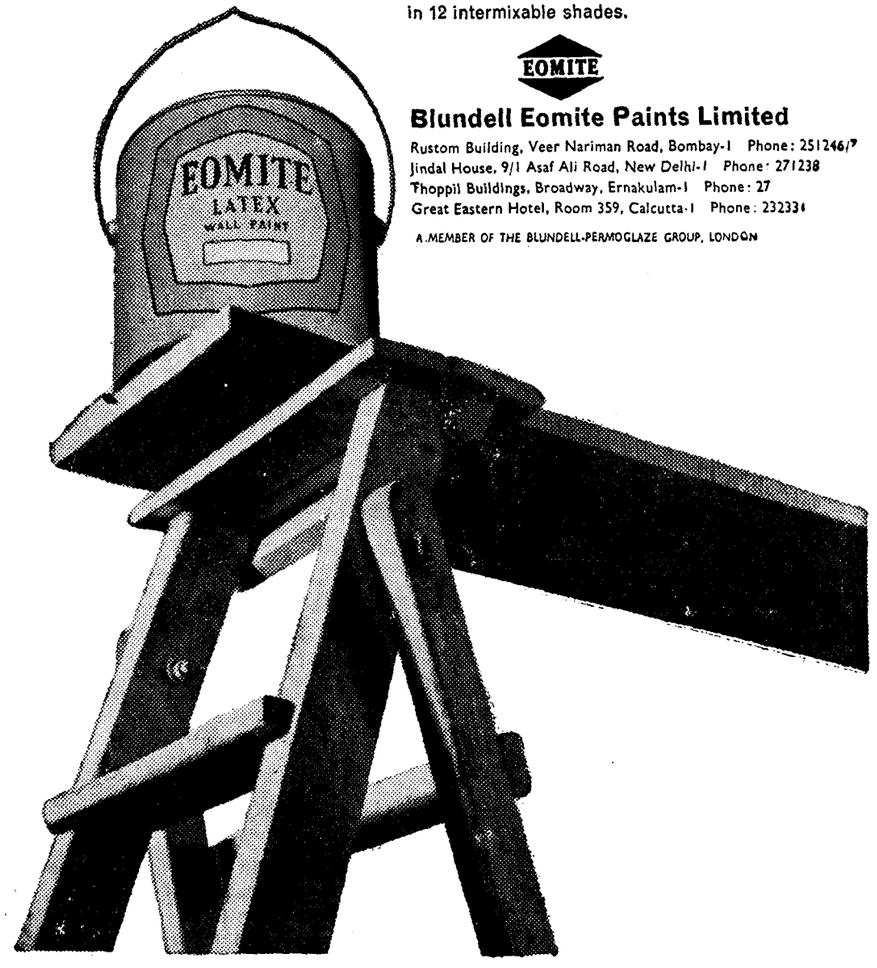
What scope did the displaced persons have in the rest and what opportunities were created?

PRIVATE trade or business is not an expanding source of employment in backward areas where people's purchasing power is small. Displaced persons seeking employment under old established business houses in the four or five urban centres within Dandakaranya were likely to get snort shrift because the latter would prefer their own kin who knew the locality and spoke the local language. In any case no attempt was made to give displaced boys a training in salesmanship and induce private businessmen to take them in as apprentices. Those who wanted to set up as independent traders or shopkeepers faced an uphill task. They were offered a business loan of Rs 1000 and a house-building loan of Rs 2000 and a maximum of three months' dole apparently under the belief that within that period they would be able to earn enough from their meagre capital investment to maintain their family and repay the loan. Since, as will be shown later, no homestead plot had yet been allotted, the income would also have to be large enough to pay the rent of the shop room that would have to be hired. Even if a homestead plot had been available, it would presumably have been away from the hub of the urban area and therefore unsuitable as a shopping site.

Unrealistic Scheme

The scheme was, therefore, not very realistic and the rigidity with which it was applied made its harshness all too plain. One glaring example was the case of 23 non-camp displaced families sent from West Bengal towards the latter part of 1963 who were not offered any homestead plot and did not on that account take the business loan because there was no place where they could ply their trade, but whose dole was stopped after three months reducing them literally to starvation till private charity and occasional casual work came to their rescue. Their case evoked no response from the Ministry even when a reference was made.

How many people have been given such business loans and how many have made good? I have no exact information about the first but a press note of the Ministry published in a vernacular daily of Calcutta on December 15, 1964 gives the number on September 30, 1964 to be 170 which presumably includes the 100 families who had formed themselves into a co-operative society to run a transport service under the name of Navjiban Transport Co-operation Society. It also perhaps includes another ten persons who had formed a co-operative soap-manufacturing society at Boregaon. Of the rest only about 10 or 15 persons are maintaining themselves fairly well by running canteens, or grocery and carpentry shops in places like Koraput, Ambaguda, Jagdalpur, Umarkot, Paralkot and Boregaon. One even did a thriving grocery business in the isolated village of Dabugaon whose one big weekly 'hat' compensated for all the remaining lean days of the week. But such cases are rare. It should also be said that shops and canteens which depend largely on DDA staff for sale of their goods have a somewhat uncertain future because their market will shrink as soon as the DDA is wound up or work shifted from one zone to another. Offices and officers are much more mobile than shop-keepers and the shifting of the main Transport garage from Boregaon to Ambaguda spelt disaster to a number of people who previously lived by catering to their needs. It is only the growth of a sizable local population with enough purchasing power which can assure a stable custom to grocers and hoteliers.



The co-operative soap factory mentioned earlier is in the doldrums. If it has not already closed its doors it will have to do it soon. With poor technical skill and crude methods of manufacture nothing better should have been expected, particularly when materials had to be obtained from a distance and local markets were not fully exploited. Even the hospitals of the DDA did not patronise its products in the way they should have done. Whether with a more attractive wrapping and active canvassing sales would improve is more than one can guess, but the society seems to be nobody's baby and hardly receives more than spasmodic attention from the Special Officer (Co-operatives) of the DDA.

Transport

The only transport service run exclusively for the employment of displaced persons is that of the Navajiban Co-operative Transport Society. It started promisingly and did well in the initial stages but it began to face heavy weather as soon as the fostering care of Sukumar Sen and J K Roy was withdrawn by death or transfer. Its 100 members contributed as their share the maximum loan they were entitled to and raised a capital of Rupees one lakh. The Rehabilitation Industries Corporation advanced Rs 5 lakhs as loan and a fleet of trucks were purchased for running a carrying service in which thirty or thirty-three of the subscribing members found employment as clerks, accountants, drivers, cleaners or mechanics. For a time the earnings and emoluments were reasonably good and part of the loan was paid off. The root of the trouble which started after the death of Sukumar Sen lay in the fact that in order to ensure security for the loan it had advanced, the RIC had reserved the right to appoint the members of the Managing Committee, and after the transfer of J K Roy, had appointed as Chairman, the DDA's Conservator of Forests between whom and the Society's Secretary (who was also an officer of the DDA) there soon developed irreconcilable differences. The latter blamed the Chairman for favouring private carrying contractors in pre-

BLUNDELL EOMITE ARE ONE STEP AHEAD WITH THEIR NEW LATEX WALL PAINT

Blundell Eomite's new 'Eomite' Latex wall paint adheres to new, surface-dry plaster and cuts unnecessary delay. Here is the paint, interior decorators in India have been waiting for so long. Supplied in an economical paste form this mild and alkali-resistant wall paint is diluted with water and applied with brush, roller or spray. It 'takes' to cement and lime plaster, concrete, brick-work, asbestos sheeting and building board. Quick-drying, opaque and spongeable, 'Eomite' Latex wall paint is ideal for your interior walls and ceilings. Available in 12 intermixable shades.

A MEMBER OF THE BLUNDELL-PERMOGLAZE GROUP, LONDON

ference to the NCTS which, as a DDA sponsored society designed to help refugee rehabilitation, deserved special consideration. The complaint was that the more hazardous jobs under difficult road conditions which the Conservator of Forests gave to the NCTS led to frequent breakdowns and damages to parts, with consequent increase in the cost of repair, the number of idle hours, and considerable loss of income. The Secretary, too, acted arbitrarily and in defiance of the decision of the majority of members. He had to be pulled up and has, I think, left the DDA for good. These internicine squabbles among two officers of the DDA who were foisted upon the NCTS to occupy two key positions in the Managing Committee did much damage to a society which had started so well and whose potentialities for good are by no means exhausted, provided the RIC replaces these two office-bearers by others likely to give a better account of themselves. The original idea of Sukumar Sen was, it seems, to transfer the entire transport business of the DDA and its petrol pumps to one or more transport co-operatives formed by the displaced persons so as to give greater scope for rehabilitation of displaced persons by opening up new opportunities of gainful employment as drivers, mechanics, cleaners, clerks, accountants, petrol pump men, chaukidars, etc, whereas the employment of displaced persons at present in the vast transport organisation of the DDA is minimal. The NCTS has not yet justified the expectations it created but it is probably not yet too late to pull it out of the rut.

Contract Labour

Another avenue of employment initiated by DDA's first engineer-member S Bandopadhyaya was the execution of petty contracts through a body of men called group leaders—contracts relating to a wide variety of works such as construction of buildings and link roads as well as water-bound macadam high-ways, making of culverts and small bridges, excavation of tanks, earthwork for dams, and miscellaneous construction, repair and maintenance works of all kinds. These group-leaders were recruited either from among refugee settlers or from registered displaced persons who had migrated from East Pakistan but were not fully rehabilitated in West Bengal. Local tribals were also entitled to be enrolled as such, as were a few co-operative societies of displaced persons and tribals. They were expected to collect a group of displaced persons for both skilled and unskilled work and not employ outsiders except when no displaced person was available for that type of work. As a *quid pro quo* for guaranteeing employment of displaced persons the group leaders were given liberal concessions. Works upto Rs 50,000 (if distributed by the Chief or Superintending Engineer) or Rs 25,000 (if distributed by an Executive Engineer) could be allotted to them without calling for tenders, and in the case of co-operative societies the limit could be doubled. The earnest money was minimal and the security deposit which was not required in advance could be built up out of small deductions from bills which were expected to be paid at scheduled rates and at frequent intervals during the progress of the work. Even advance payments in between two bills could be made for unmeasured work at the discretion of the Executive Engineer if the Assistant Engineer so recommended.

The scheme so promising in intention did not work as well as its sponsors thought it would. Out of the 426 East Pakistan displaced persons originally registered only a fraction survives. There were complaints of unfair distribution of work which may be exaggerated because anybody who fails to secure a contract in the absence of open tender is likely to ascribe motives as to why his rival was favoured, but the point on which all group leaders were unanimous was the undue delay in the payment of bills and the refund of security deposits which was a severe strain on their exiguous resources and drove them into the clutches of big contractors who used them as their *de facto* agents so that these contractors got the concessions they were not entitled to while the DDA was denied the benefit of lower rates which competition might have brought about. There were also cases where outside contractors, not registered as group leaders, were directly allowed all the concessions a group was entitled to on the flimsy excuse that no group leader was competent to do the job, and this favour was repeated even after the DDA had condemned the practice. The Superintending Engineer's latest suggestion, which I could not accept, was to throw the door wide open to all and sundry regardless of whether they were refugees or tribals, which would have knocked the bottom out of the group leader system and deprived it of whatever justification there was of dispensing with the time-honoured practice of calling for competitive tenders.

But the expectation that the group leader system would lead to large employment of displaced labour has been belied. Whatever may have happened in the beginning almost the entire labour force now employed by group leaders and other contractors consists of tribal men and women. Where the work site is far removed from a settler village or transit centre this is understandable but where it is not the failure to enforce a condition which was the *raison d'etre* of the group leader system will take some explanation. Responsible officers have told me that the reason why contractors (including group leaders) prefer tribal labour to displaced persons is not that the latter are unwilling to work or put in hard labour but that they will insist on the minimum legal wage being paid to them while the former may be cheated into accepting less. True, casual labour under group leaders is not a permanent means of rehabilitation but it may yield a useful addition to agricultural income which has been shown in the majority of cases to be very much below subsistence level. The group leaders themselves could have found in this system a means of permanent rehabilitation if it was worked in the spirit in which it was introduced. The near breakdown of the system has choked up a promising line of employment and hampered the rehabilitation of a sizable number of refugees.

Public Service

Lastly comes public service which in this context means service under the DDA because both Orissa and M P have their work cut out for them to provide employment to their own indigenous population and may not unreasonably expect a share of the employment provided by the DDA which other States, not in any way connected with the refugee problem, are taking full advantage of. The DDA had on July 31, 1964 as many as 5,199 officers and employees of all grades in its regular establishment and about 1,312 employees (this is the figure in January 1964 but the number must have remained approximately the same) in its work-charged establishment—together making up a total of over 6,500 which is not far below the total number said to have been rehabilitated

upto date. Disregarding for the moment the nagging question whether such a large establishment was necessary for such a small measure of rehabilitation and looking at it only from its employment potential the conclusion is obvious that if a fair proportion of these employments could be reserved for displaced persons much of the problem of urban rehabilitation could have been solved and even the fertility status of much sub-marginal land improved with the help of resources augmented by the income of members working in different departments of the DDA, part of which was bound to flow back to the main branch of the settler family.

Employment : For Whom?

The figures collected by the departments which I shall analyse in subsequent paragraphs are, however, a misleading index of the measure of rehabilitation through employment under the DDA for the simple reason that the word displaced person is ambiguous and has been applied indiscriminately to three classes of persons each comprising a narrower circle than its predecessor. There were, first, those who had lost their homeland in East Bengal in consequence of the partition of India whether they were in need of assistance or not. Secondly, there were displaced persons in need of assistance and registered as such but who did not live in camps nor depend on doles. Thirdly, came those who were not only registered but were for a long time dependent on doles and mostly lived in camps in different parts of West Bengal. In connection with rehabilitation in Dandakaranya the word was restricted to the third category who alone were sponsored by the Government of West Bengal under instructions from the Ministry for movement to Dandakaranya and for whose rehabilitation the DDA was directed to accept responsibility. Even tagged members were excluded from consideration, that is, members who were parts of the family in a very real sense (adult sons, brothers, parents, uncles, etc) and who were allowed to accompany the 'sponsored family' in order that a family was not split up, though, on account of the fact that they were not living in camps at the time of departure, none of the rehabilitation benefits either by way of doles or separate allotment of agricultural land or payment of agricultural or business loans was extended to them.

In the figures of employment of displaced persons collected by the office and given below no distinction was made between these different categories. Anybody hailing originally from East Bengal and now a permanent resident in India was called a displaced person when totalling up the classified list of personnel in different categories of employment. Obviously, the extent of rehabilitation through jobs under the DDA is very much less than the figures would suggest if the word is restricted, as it should be if the Ministry's directive is to be observed, to sponsored displaced persons. The Ministry's policy may be wrong. Personally I think that it is. All displaced persons who have found their way into Dandakaranya either as sponsored displaced persons, or as tagged members or as employees should be sought to be permanently rehabilitated without rigidly adhering to the formula that 90 per cent camp displaced persons and 10 per cent non-camp displaced persons are alone entitled to consideration. But as long as the formula is not discarded it is not possible to take credit for substantial rehabilitation through jobs by inclusion of those who do not come under the accepted definition.

Recruitment to the upper echelons of service where higher qualifications are needed provide little scope for employment of displaced persons though they are important for one reason which I shall explain later. It is in the lower echelons—the Class III and Class IV posts—where the employment potential is large and the standard less exacting where considerable scope exists. Out of about 6,500 jobs no information is available to me about the composition of 1,300 odd work-charged personnel but from general observation I do not think that more than five per cent of them would be displaced persons. As regards the regular establishment of 5,199 officers and employees about which more definite data are available there are three departments—medical, education and zonal administration and resettlement—in which the number of displaced employees (in the broader sense) had to be large because in their case a knowledge of Bengali was essential. Doctors, nurses and compounders must understand what the patients say, teachers must teach through the medium of the mother tongue, and *sevaks* and Assistant Administrative Officers must establish direct contact with displaced persons in order to understand their problems and explain DDA's policies and schemes. It is not, therefore, surprising as figures in Table 1 show that in these departments the proportion of displaced persons in Class III posts and to a smaller extent in Class IV jobs was fairly high.

Directives Disregarded

By contrast, the proportion of displaced persons in similar categories in other departments was very low and in some cases so absurdly small that the only possible explanation one can think of is either an inherent allergy to employment of displaced persons or an anxiety to favour the claims of particular candidates for one reason or other.

Obviously the directive issued by Sukumar Sen in 1961 with the imprimatur of the DDA and subsequently repeated by the present writer in January 1964 that in all Class III and Class IV appointments sponsored displaced persons, tagged members, tribals, unsponsored displaced persons and local inhabitants should get preference in the order stated went unheeded. The opportunities of rehabilitation through employment under the DDA were systematically neglected through indifference if not something worse. Three States— Kerala, Andhra and Punjab—seem to have had a disproportionately large share in filling up the vacancies and this not because candidates with requisite skill and qualifications were not available from among displaced persons or the indigenous population of Orissa and M.P. One obvious instance is the Central Workshop where displaced boys who had passed the one and a half year's training course in the Industrial Training Institutes at Bhilai or Koni were not considered fit even for in-plant training for six months on the ground that they could not be 'trusted to handle delicate machinery', though the Hindustan Steel Works at Bhilai absorbed them soon after without any such misgiving. All that the Manager of the Central Workshop would agree to was to give such training (which would have to be for two years) if a completely new wing was opened with additional plants so that access to 'delicate machinery' would be barred. The Chief Administrator not only endorsed this view but suggested a reduction of the stipend recommended so that, instead of two years which is the normal period of training, both theoretical and practical, a displaced boy would have to spend three and a half years on an inadequate stipend of Rs 35 before the Manager of the DDA Central Workshop would consider him properly qualified for appointment. He did not have such qualms when recruiting raw hands from other sources.

This apathy to employment of displaced persons, most notorious in the case of the Central Workshop is also seen in Transport, Engineering (construction and irrigation), Reclamation, Agriculture and in jobs in Headquarters or branch offices, whether in clerical or menial jobs. The emphasis here laid on the need of employment of displaced persons is not inspired by any narrow parochial view. If the DDA had been an ordinary Central Government undertaking where opportunities for employment should be *overte anx talents* no such question would have arisen. But the DDA was set up for a specific purpose, viz, the rehabilitation of displaced persons from East Pakistan, and since permanent or quasi-permanent employment in public service is one important means of such rehabilitation the opportunities offered by the large employment potential of the DDA should have been more fully utilised.

Table 1: Employment of Displaced Persons in the Medical, Education and Zonal Administration Departments of the D D A

	Total Number of Employees		Total Number of Employees Displaced	
	Class III	Class IV	Class III	Class IV
Medical	280	270	209	101
Education	366	2	347	2
Zonal Administration (including resettlement)	273	173	206	83

Table 2: Employment of Displaced Persons in other Departments of D D A

	Total Number of Employees		Total Number of Displaced Employees	
	Class III	Class IV	Class III	Class IV
Central workshop	83	46	5	10
Transport	380	234	56	52
Reclamation	564	127	160	6
Engineering (Const)	287	242	93	67
Engineering (Irrgn)	305	80	34	20
Agriculture	211	131	24	27
Head Quarters	151	106	11	5

Method of Recruitment to Blame

Why this was not done might lead to subjective speculations from which I shall refrain but there is no doubt that the method and the machinery of recruitment was partly to blame. In the higher echelons officers are either taken on loan from the Central or State Governments for a stated period or recruited through the UPSC. The proportion of displaced persons in these categories is negligible, being nil in Class I out of total of 43, and 24 in Class II out of a total of 129 and these latter consisted wholly of medical men and a few assistant engineers. In the general non-technical establishment in the Headquarters which constitutes the hard core of the administrative machinery, the predominant element came *en bloc* from the Settlement Department of the Ministry at New Delhi, when it was about to be closed down or drastically reduced. The significance of this in the context of rehabilitation lies in the fact that in recruitment of personnel for the unfilled vacancies their sympathies naturally went to people they knew or were interested in, rather than to displaced persons whose rehabilitation should have been their special concern. Even peons and other Class IV staff were allowed to come on deputation and draw the project and deputation allowances.

In the selection of candidates for appointment to any class of posts the Chairman did not originally have any say and had no means of checking whether his directives were ignored. The Employment Exchange regulations were applied in a way which was definitely calculated to debar employment of displaced persons. The statute merely required notification of vacancies. The rules promulgated by the Ministry (Home or Labour, I am not sure which) went much further and suggested that no appointment of outsiders should be made before the candidates sponsored by the Employment Exchanges were first interviewed and found unfit and a certificate obtained from the Director General at New Delhi that he too was unable to suggest any suitable candidate. For displaced persons this works very prejudicially because settler villages and transit camps were usually situated very far from the two or three Employment Exchanges within the Dandakaranya area. Lack of knowledge that registration in the Employment Exchanges and periodical renewal of such enrollment were a condition precedent to employment under a Central Government organisation, and lack of resources to pay the exorbitant bus fares to and from their village for registration and interview were the two major obstacles to their being considered for appointment. For the floating new migrants who were being transferred from one transit camp to another till their final destination was reached there was the additional handicap that they had no knowledge in which Exchange to register and no guarantee that intimation would reach them in their changed address in remote villages or camps where postal service was very irregular. In all clerical and other appointments the case of displaced persons therefore goes by default while candidates from other States who receive prior intimations from their relatives already in service that some vacancies are in the offing have the whip hand. They hurry to Dandakaranya, get themselves registered and bide their time till the hour comes for presenting themselves before the selection committee. In the only selection committee over which I presided the great preponderance of candidates from one particular State who had no obvious reason to come so far away from their home state excited my curiosity and enquiries revealed the modus operandi above outlined which enabled them to swamp the selection committee because candidates from among displaced persons and other States did not know the trick.

The rule that nobody should be appointed without being sponsored by an Employment Exchange has little valid reason behind it and the way it is being abused justifies its abrogation or drastic modification. If it was intended to ensure fair deal for candidates from all over India competing on equal level it has obviously failed of its purpose. But in this case where fair deal for all competitors is not the objective but the appointment and rehabilitation of as many displaced persons as possible, provided they have the requisite qualification, the Employment Exchanges are a clumsy and time-wasting obstacle in the way. The Employment Exchange officer is

not the best judge of who is a fit candidate for any particular post, nor does he pretend to be so for he only acts as a post office, forwarding the names that are recorded in the Exchange. I suggested to the Ministry that for the purpose of employment of displaced persons the existing rule should be modified so that while all displaced persons should try to get themselves registered in any one of the local Employment Exchanges or in Calcutta, the DDA should not be debarred from considering their case at the time of selection even if their name is not sent up for want of timely intimation, along with that of those whose names are sent up. If the displaced candidate is selected an intimation could be given to the Employment Exchange to keep its records in order. Like many other proposals emanating from the DDA in connection with refugee settlement this too did not receive any reply and presumably the matter is still under consideration.

Education and Training

Superficially education may seem to have little connection with economic rehabilitation but this is a mistake. It has a vital though indirect bearing on such rehabilitation which has so long been lost sight of because of the excessive faith of the Ministry in agriculture and small scale cottage industry. Except agriculture where traditional methods may be followed without much book knowledge and handicrafts where manual dexterity is all-important all other occupations require a minimum educational background which is the passport to any kind of training or to any job under the public or the private sector. Even a chaukidar must know his three R's, an aspirant for *dai*-training must have education upto Class V together with a knowledge of the local language, and a literate peon has to prove that he has read upto Class VIII. Similar qualifications are necessary for training as a nurse (unless the still higher standard of Matriculation is insisted on), an auxiliary nurse, a mid-wife or a *gram sevika.* No Industrial Training Institute would admit a student unless he is a matriculate (or, in special cases, has at least passed the Class VIII standard) and an L D C must, in addition, have knowledge of typing. Since agricultural land does not expand *pari passu* with the expansion of the family, new avenues of all kinds must be explored even for the existing refugee population in Dandakaranya, and this need will increase as the number increases. The keenness of the refugees for the education of their children has also been quite well-known and has been admitted more than once in the pamphlets issued from time to time by the Ministry when credit is taken for the arrangements made by the Project in this behalf. Unfortunately what passes for education in Dandakaranya is a mere make-believe — a facade without depth of content.

It cannot be denied that education is the Cinderalla of the Project and has the smallest budget. With a teacher-student ratio much in excess of the usual norm and without books, maps, black-boards and other aids to education, teaching imparted by untrained teachers becomes a meaningless mumbling of things learnt by rote which is not even an apology for ordinary bookish education, far less of education with an agricultural or a practical bias. The Education Officer is too timid even to ask for the minimum allotment of funds necessary for books and other requisites and when he takes courage in both hands and does, administrative bungling or apathy holds up sanction. Books supposed to be supplied free are either not supplied at all or so rigidly rationed that one book may have to be shared by ten, fifteen or twenty boys or girls. One teacher takes three or four classes simultaneously and can pay attention to none. There is very little supervision so that barring the few cases where the teacher is genuinely interested in teaching the student scarcely receives any individual attention. While the lowest classes in primary schools are overfull the sharply diminishing roll strength in the higher classes indicates the huge proportion of failures or desertions which are a measure of the waste of educational effort. This is further exemplified by the fact that five middle schools in widely separated villages in four zones and one high school at Umarkot are enough to take in the products of about 150 primary schools of settler villages for further education. Stipends for students compelled to live in hostels attached to middle schools or the high school are niggardly and rendered still more so by cheese-paring deductions. The teachers are mostly untrained with a consolidated salary plus dearness allowance but without any increment so that the desire for transfer to the normal administrative hierarchy salaried on a time-scale basis becomes difficult to resist. The drift from teacher to sevak, from sevak to L D C, and from L D C to U D C is a regular feature of the DDA administration. The products of such schools cannot provide very promising material for further education in high schools or training in technical institutions. What is worse is that the few who show promise and are sent to Industrial Training Institutes in the neighbouring States feel frustrated and sometimes have to desert because stipends on which they have to depend for their expenses are not regularly paid through administrative bottlenecks.

A Retrograde Step

Yet it is obvious that unless education is more vigorously pursued and proper training imparted several avenues of employment would be a closed door to the existing and the rising generation. The training courses should be open to girls as well for in these days their earnings are also necessary to supplement the family budget, and there are several occupations (eg, teaching, nursing midwifery, service as *gram sevikas,* etc) in which girls fit in better than boys. They have also better prospects of employment in the State service as for these jobs the States have to go far afield to recruit their personnel. A nurse's training scheme was started in a small way at Kondagaon and has already proved a great success. A *dai* training scheme was also under way when I left. What is sought to be emphasised here is that with agriculture proving a broken reed and with prospects of more agricultural land receding into the background greater reliance will have to be placed on industrial jobs and jobs in all kinds of services, crafts and trades where admission as well as success will depend upon the acquisition of special skills based upon sound academic knowledge upto a prescribed standard. This has been woefully neglected in the past and may be even more neglected in the future if the reported step of reducing teaching strength by combining the function of *sevaks* and teachers and dropping the teachers' training scheme is given effect to. *Sevaks* in the DDA who have received no special training and who have their work cut out for them in doing their multifarious liaison work will have added responsibility when agricultural extension work is also made part of their duty. If to that is added education the latter is bound to get short shrift.

Urban Rehabilitation

A permanent home is part of economic rehabilitation. The natural instinct of an uprooted individual is to get some land of his own where he can build his home and grow his roots. This has been done quite satisfactorily in agriculturally settled villages though rights and titles are still to be perfected by documents guaranteed by the States and the lands are to be mortgaged to the Government of India for house building and other loans. What about urban settlers? What progress has been made in securing lands for them and giving them a permanent home?

The position, it must be confessed, is still very nebulous and unsatisfactory. A rural non-agricultural settler gets, besides his business loan, half an acre of homestead-cum-kitchen garden plot and 2 acres of agricultural land. By a parity of reasoning Sukumar Sen had suggested that an urban settler should get, free of cost, four to eight hundred square yards of homestead land and an extra loan for building his business premises in lieu of two acres of agricultural land. The Ministry did not recognise any parity and refused the extra loan, but in a letter written as late as March 28, 1963 they said that a maximum of 800 sq yards could be allotted per family provided the cost of acquisition, if any, and the cost of development did not together exceed Rs 500 which would have to be treated as a loan, not as a grant. There seems to have been no follow up of the efforts which Sukumar Sen had initiated so that even by the beginning of January 1964 the position was almost static. The little push that could make things move was missing, till discussion with State Governments was resumed in January or February 1964.

Right in the beginning of the Project the State Governments had allowed temporary possession of several plots of lands on either side of major highways for setting up transit centres where displaced persons could stay (and, if possible, work) while steps for their permanent rehabilitation were under way. Lands were also obtained for a longer duration for offices and staff colonies and industrial units. When Sukumar Sen realised that exclusive dependence on agriculture was futile and industrial and other resources must be explored he started discussion with the State Governments for permanent transfer of some of these plots and a few others which were or could be made suitable as industrial and residential sites so that displaced persons could earn their living from industries situated within a reasonable distance from their home. In this way, in Koraput four large plots on the National Highway measuring 273 acres in all were acquired from the Orissa Government while negotiations were started for acquisition of about 78 acres in four other plots in Umarkot-Raigarh zone though it has not made much progress yet on account of local resistance.

But the final result upto date is disappointing. Of the four plots acquired one was meant for an industrial estate, another for DDA's own industries and the remaining two for permanent homesteads of displaced persons working in those industries. The industrial estate has not seen the light of day even in five years and over the site intended for it now stand the Central Workshop, the main Transport Garage, and the Ambaguda Oil Crushing Unit. Obviously nobody remembered when these buildings were erected that an industrial estate was projected on this site. In the adjoining land meant for refugee homesteads, the staff of the DDA working in the Workshop and Garage have found a footing and pushed the displaced persons to the wall. No step has been taken for demarcation and allotment of any homestead plot out these parcels of land. The remaining two plots must still be there but they could not be traced and demarcated by the departmental officers on the date of my visit.

Similar indifference was noticeable in respect of lands offered by the Madhya Pradesh Government. Nineteen acres of land in Jagdalpur town itself are no doubt being used as an industrial unit but 59 acres in village Kangoli, about four miles from Jagdalpur, lay covered with jungles and undemarcated in June 1964 and could be traced only with considerable difficulty. Till very recently no attempt was made to see if water was available underground, for without water and without power its suitability for industrial or residential use would be more than doubtful. There were much better potentialities in the 50 acre plot in Dharampura close to the staff colony and now temporarily in the possession of the DDA for accommodation of lower grade staff and a transit camp but till I talked matter over with the Chief Secretary of Madhya Pradesh towards the end of August 1964 its possibilities for permanent residence of displaced persons do not seem to have been considered. Nor, for the matter of that, were the potentialities of Narayanpur — a fast growing township — remembered when large areas once in the possession of the DDA were proposed to be surrendered to the State Government.

In fact, there has been a surprising lack of foresight in picking up and acquiring suitable areas for urban residence of displaced persons and a surprising indifference to their interest when areas transferred by the State Governments for resettlement of displaced persons were converted to the purpose of the DDA organisation. One example has already been cited — the occupation by the DDA staff of land acquired for homesteads for displaced persons opposite the Ambaguda Workshop. Another glaring example occurs at Farashgaon where 10.40 acres of land permanently transferred in January 1964 to the DDA for the resettlement of displaced persons were occupied by the Reclamation Department as their central tractor depot. About half of the 22 acre plot which the M P Government has agreed to transfer permanently to the DDA for allotment of homestead plots to the members of the N C T S is occupied by the Project's poultry farm which it would be difficult to dislodge when the deal with the M P Government is finalised.

Urban resettlement by the allotment of homestead plots has thus been completely neglected. There were probably a few allotments in Boregaon but they were technically speaking for rural small traders, not urban small traders. One reason for this neglect was obviously lack of vigilance, an absence of a constant and spontaneous urge to see that no aspects of rehabilitation in urban areas are ever lost sight of. Another reason may be some uncertainty as to where the displaced persons should be resettled, for the dismal failure of the industrial ventures undertaken upto date may well raise a doubt as to whether the existing industrial centres are the most suitable locations. Urban rehabilitation and successful industrialisation should go side by side except when employment in public service or trade is assured.

Conclusion

I must bring this discussion to a close though much more might have been said. I have scrupulously avoided matters administrative — the illogical distribution of powers and functions at the top level, the inflated staff and

the large establishment bill, the inefficiency of some technical staff, the enormous TA bills and the excessive amount of unnecessary travelling, and other cognate matters — because I wanted to focus attention on what really matters most, viz, the economic condition of the refugees who were taken to and are still living in Dandakaranya. I have tried to be as factual as possible, not mincing matters but not going beyond the data I have in my possession. True, some of these data are slightly descrepant — evidence, no doubt, of some slipshod work in the offices where they were compiled. Given time, the discrepancies could have been reconciled after proper verification but that time was not available. The Minister had at one stage agreed to my original suggestion that unless he wanted me to quit earlier I might be relieved on September, 30 which would give him about a month's time to choose my successor. Apparently he changed his mind shortly after for on September 8, when I was in Calcutta, he sent me a telegram an extract from which is worth quoting: "In view of your offer Government consider that *in the interest of the Project* you should relinquish charge *immediately on your return* from Calcutta *on the 10th September* and hand over custody of *all papers* to the Chief Administrator even before the appointment of your successor." I had barely time to return and pack and quit. Reconciling of small discrepancies by fresh verification was out of the question in the circumstances. Skeptics will doubt whether so much hustling was really necessary or was in the interest of the Project. People with a malicious turn of mind might think that it was more in the interest of persons who feared exposure and wanted to prevent it by reducing the margin of time between my return to Koraput and relinquishment of charge 'with all papers' so that the 'skeletons in the cupboard' I had referred to in my letter of resignation might remain safely buried. I had, however, kept from the beginning a manuscript note book in which all important statistical information contained in files passing through my hands were recorded for ready reference, because I found DDA's statistical service to be non-existent and disorganised. The information contained in these articles which are based on these notes and other papers is not, I presume, likely to be faulted on the ground of large inaccuracies though some small discrepancies may continue to exist. The general picture is not distorted.

I admit that the picture is a gloomy one and constitutes an indictment of the Dandakaranya Project as it has worked up till now. Partly the indictment recoils on me too for I was for ten months the Chairman of the DDA. I have explained elsewhere (see *Financial Express*, December 13, 1964) why the Chairman's role was comparatively ineffective. All I can say is that by the time I had obtained a clear picture of the affairs of Dandakaranya by on-the-spot studies, by questioning officers, by calling for reports and returns, and by appointing investigating teams to probe into different aspects of development, the Minister decided that the Chairman should only advise but not act. Not being able to imagine myself in that role I have quit. That is a matter of very small importance. It is the refugees who matter most, for what happens in Dandakaranya is a matter of life and death to them. If my reading of the situation is wrong none would be happier than I. If I am right, a heavy responsibility rests on the Ministry, the DDA, the West Bengal Government and the general public to change the shape of things. A report from Jagdalpur published in the *Hindustan Standard* on December 28, 1964 says that 282 agricultural settler families have recently deserted from Umarkot-Raigarh area on account of famine conditions which, if true, is a severe indictment of the past and a serious portent for the future.

Agricultural Economics Conference

C H Shah

WINDS of theory blew low over the deliberations of the 47th Indian Economic Conference held at Baroda last month. In contrast, the discussions at the 24th Indian Agricultural Economics Conference held at Vallabh Vidyanagar (Anand) basked in hot sun of empiricism. If not all, most of the participants who attended both the Conferences carried an impression that each of the two would have maximised the total benefit if they had shared the climate of each other.

The Indian Agricultural Economics Conference which preceded the Indian Economic Conference got started on a note of realism. Both the Inaugural and Presidential Addresses dealt with the problems that currently afflict agriculture. The discussion groups and open sessions approached the subjects selected for discussion mainly from the side of empiricism.

The rough edges of reality often leave deep bruises. Pleasant vagueness of generalised theory gives way to uncomfortable conflicts of facts, views and approach when subjects are tackled on mainly empirical grounds. Solution of the problem as faced in the real world becomes equally elusive in both cases. The choice is not between perfect and imperfect but between less imperfect and more imperfect conclusions and inferences.

The Inaugural Address of the Chief Minister of Gujarat implicitly suggested the hypothesis that the performance on the production front was commendable, but the distribution of the product which is fettered is likely to curb further progress through improved efficiency that can be induced by regional specialization. The Presidential Address, in contrast, admitted the failure on the production front but laid the blame on the lag in the fulfilment of production targets of feeder industries like fertilizer. What emerged coould be termed as the 'agro-industrial integration hypothesis'. Both Addresses covered a wide variety of data, one relating to Gujarat, the other relating to India but both drew different conclusions, one emphasising regionwise production specialization the other emphasising production integration at inter-industry level.

Three subjects were selected for discussion by participants. In all 47 papers were contributed. All the three subjects had relevance to current problems of agriculture. Against a backdrop of the current rise in farm produce prices, the widespread shortages of food, cotton and oil seeds, and the recent deliberations of Jha Committee, and with the Prices Commission in the offing, one cannot over emphasize the relevance of 'Relative Prices and Production and Supply of Farm Products'. 'Capital Formation in Agriculture' is of direct help to agricultural production. Rising national income leading to pressures on supply of cattle products has revived interest in 'Economics of Cattle and Dairy Products'.

Since one cannot simultaneously attend discussions of all the three groups, one has to rely on discussions in open sessions for making observations on the subjects where group discussions one has not attended. The observations are offered below with this limitation.

Relative Prices

Though the problem of relative prices was attacked from three angles, no central theme seemed to emerge. It was argued on the one hand that the relative prices are important, but they are not enough. Costs are of equal importance. Relative profits and marginal shifts in them provide, therefore, a better criterion to judge and to evoke production responses. The second major argument was: In a developing economy, the major problem is that of raising the level of total production, the change in composition of the product-mix is of secondary importance, if not unimportant. Third, on the basis of an empirical study, it was argued that there are circumstances when changes in relative prices bring forth results contrary to expectation. This referred to diverse movement in relative prices of sugarcane and paddy and area under the two crops. Technological conditions which undergo a change with developmental activities were held to be responsible for the 'perverse' behaviour of prices and area. Decline in importance of groundnut in Andhra and its steep rise in Saurashtra under comparable price changes in both the areas was suggested as an other illustration.

Of the three topics, discussion on 'relative prices' came closer to the core of the problem though it did not quite reach it. Of the text-book functions of the prices two that are most important relate to optimum allocation of resources on one hand and optimization of satisfaction through product distribution for consumption. Of all the economic theories, this one relating to prices is considered neat and almost unfailing. But the discussion of the theory of product prices proceeds on the basis of a major assumption 'other things remaining unchanged' (Marshall's famous phrase of ceteris paribus) and these other things include either prices or quantities of inputs and techniques of production. But in an empirical world, 'other things' cannot be ordered to behave as postulated in theory. It is in this context that the general equilibrium analysis assumes vital importance. Partial analysis is mainly an analytical tool to comprehend functioning of the economy. While discussing relative prices, a wider context thus becomes inevitable, not only the prices of farm products but also the prices of other products and inputs of all kinds together with the level of technique and foreign trade are to be taken account of. With this the problem would assume incomprehensible magnitudes. The mathematician's solution to this is to set up a model consisting of several equations. How many equations there will be in such a model will depend on experience and understanding of the economy. Only those commodities will enter the model which would have a vital role to play in determining the supply and demand for products being considered—an arbitrary but a useful procedure to make the problem comprehensible. Is the allocative role of relative prices relevant in an economy where overall scarcity of all commodities prevail? One can argue here on the basis of the theory that even when all commodities are scarce, there are some which are scarcer than others; while developing the economy therefore the increased inputs may have to be allocated between commodities according to relative scarcities of the latter.

When techniques are constant, resources are given and demand is unchanged, parity between prices of farm and non-farm products is assumed to indicate parity of incomes between the two sectors. A powerful plea was, therefore, made by some participants

to consider the problem of parity prices in the context of relative prices. It lacked support, however; the things assumed constant, change and they do not necessarily change in equal proportion for the two sectors making application of parity idea unworkable.

Discussion on 'Capital Formation in Agriculture' did not reach the pitch attained by the discussion on 'relative prices'. What would capital consist of? Should working capital be considered a part of 'capital'? Why not include investment in human beings? Shall we measure capital through commodity flows, inventory counting or expenditure accounts? These questions seized the participants' minds for a disproportionate time. In pure theory one can hardly distinguish between production and consumption goods, their labels would depend on the use to which they are put. Even here the condition is not comfortable, production and consumption activities overlap to an extent greater than one would like to admit. Robinson Crusoe laying by his surplus catch of fish may use it next day to enjoy leisure, to weave a net or to catch fish for the third day; the wording of the label to be attached to the fish laid by will have to depend on Crusoe's *intentions* today about the use he is going to put it to tomorrow. Necessarily, therefore, any classification of capital will be arbitrary. No doubt each classification will have a useful purpose. It can be argued, therefore, that clear mention of categories, the process of their aggregation and building up of their relationship would matter more.

How can capital be measured? Theory will have a different answer. In any empirical system, the alternatives would be weighed on the bases of relative merits and demerits, since none of the alternatives would satisfy the theoretically ideal standard. The relative merits of measurement would depend on sources of data used and the objective of the study. For net capital formation, for instance, the expenditure would confront almost an unsurmountable problem of separating replacement from maintenance and repairs, and the two from net additions. The commodity flow approach would be guided by the label attached to each flow as to its intended use. The most interesting question—viz, 'what brings about additions to the stock of capital?'—was almost by-passed. Discussion of it should have had all the interest commanded by the discussion on prices. Agricultural economists being closer to farms, conditions of farms almost engaged their exclusive attention while discussing investment.

In various suggestions on capital formation institutional reforms loomed large. Land reforms and credit reconstitution came in handy. Dissenting voices were heard: What about absorption capacity of the farmer? What about the misdirection of easy credit? These could have been enlarged but they were not. Do we have a wide enough spectrum of techniques to permit a steep raising of capital per working person? An analysis of past trends almost suggested an equal pace of capital and labour as shown in one of the papers submitted to the Conference. The contributor has also suggested a hypothesis to explain this in the form of close complementarity between labour and capital. This thesis did not come up for comment or commendation. Nor was its usefulness discussed for future policy guidance. A useful line of attack on the problem at the macro level was thus missed.

Cattle and Dairy Products

Discussion on "Economics of Cattle and Dairy Products" posed three problems: What do we do with our surplus cattle? How to increase supply of dairy products which are scarce and are likely to become scarcer? What guidance do we get from technicians in regard to cattle policy? The papers that were contributed approached the subject from a different angle. Study of costs indicated that on an average engaging in dairy production is not a paying proposition; it becomes paying to some mostly in monsoon. The size of the herd is a factor to be reckoned with in this context. Small-sized herds are uneconomical; the small farmer is therefore at a disadvantage. Another common theme was: Standards of feeding under Indian conditions are not known, and the relation of fodder and feed to output is still less known. Broadly it was maintained that the present supply of feed and fodder is scarce and with a shift away from inferior grains like jowar and bajra that have larger per acre yield of cattle nutrition, and growing demand for milk, fodder shortage is likely to be more severe. The themes of the papers were nearer to the core of the problem.

The relevant questions for economics of cattle are: Why does the producer maintain surplus cattle? Can we explain this fully in terms of religious sentiment? It is relevant to have facts like these further analysed: that there is slow but sure trend in favour of the buffalo which goes against the explanation, in terms of religious sentiment; that the male/female ratio in buffaloes is very low compared to that in cows which further discounts the same explanation. Religious sentiment, if at all, is only a part explanation. Not far from the place of the Conference—in Ahmedabad—the Municipal Corporation finds hard to sell milk despite the service of home delivery, and has therefore decided to go into icecream production next season, a venture which the Delhi Milk Scheme gave up after burning its fingers. The demand for milk is high but not high enough and certainly not high enough at the producers' level. At their level, of all animal products, demand for draught power, organic manure and fuel is high. The producer adjusts his cattle economy to these demands. The observation of the Ford Foundation Team on "Food Crisis in India" that even for manure a smaller herd would be more economical has probably still to gain support from technicians; they did not bring this up during discussion at the Conference at any stage. A non-technician would still nurse a doubt: Why does farmer not find out this simple phenomenon, if it is so simple as it seems?

Towards the end one pertinent question was raised by one of the prominent participants: After all, what concrete suggestions emerge from our deliberations? The hot sun of empiricism made facts look very bright but it made their shadows darker too. The only concrete suggestion, if one wants to note it, was the one relating to relative prices. It was that one cannot consider the price of any one commodity or a group of commodities —food—in isolation from other related commodities even when prices are to be fixed, unless it is a very short-term measure.

Two hundred and odd participants in the Indian Agricultural Economics Conference is an index of the growing interest in the subject. It is also an index of the growing importance of the subject and the increased complexity of the agricultural situation. The emphasis on empiricism in agricultural economics has a place inasmuch as agriculture is earthbound, but it can be overdone as in any other field of applied economics. In fact, the growing complexity requires closer acquaintance with the theory to grasp better the generality underlying the diversity of facts.

Labour Economists' Conference

S D Punekar

THE Eighth Session of the All-India Economics Conference was held at Baroda from December 29 to 31 under the auspices of the Maharaja Sayajirao University. V K R V Rao, Member of the Planning Commission, presided.

With the Fourth Five Year Plan on the anvil it was but natural that the President should discuss the role of organised labour vis-a-vis planning. The topic selected by Rao for his address was "the Role of Industrial Labour in a Socialist Economy". He regretted that organisations of industrial workers were not showing much interest in the Plans, with the result that labour in India was not having any noticeable impact on the objectives of the Plan, its strategy, the mobilisation of resources, the organisational and motivational aspects of expansion of industrial activity and reduction of costs of production. To get organised labour involved intimately in the formulation of the plans, it is proposed to set up a Labour Panel to advise the Planning Commission on the Fourth Plan.

New Role for Labour

What are the ways in which the industrial worker can play an effective role in our socialist economic development? In answering this question, Rao observed that the traditional role assigned to the worker is improvement of industrial relations. However, if economic development is to take the form of the construction of a socialist society, the industrial worker has to play a more positive and a more purposeful role. What is this role? According to Dr Rao what distinguishes the worker's role in a socialist economy from that in a capitalist society are : worker identification, worker participation, worker education and worker co-operation.

In regards to the sense of identification with the enterprise, the worker should not feel that he is only a wage-earner, who has to do his allotted work and take interest only in the remuneration that he receives for it. He should have the feeling that he also owns the concern and that he shares in the excitement of its growth, its fortunes and misfortunes, its successes and its failures; he would also like to see that the concern works efficiently, maximises its output and minimises its cost. For this purpose, the worker should have a sense of participation or identification. This sense is lacking even in industrial enterprises in the public sector, let alone the private sector. The scheme of joint management councils, more loosely described as worker participation in management, has not been successful. Only 80 undertakings, from both private and public sectors, have participated in the scheme. According to a Government evaluation, there has been practically no impact and no difference in working in respect of 40 per cent of the concerns, which have instituted joint management councils; even in those that have shown some success, the results have been more in the nature of better industrial relations than of increase in productivity traceable to worker initiative or the stimulation of a sense of participation in and identification with the concern by the workers.

To remedy the situation, Rao suggests :

(a) extension of co-partnership in management to co-partnership in ownership; and

(b) acquisition by workers and their leaders of skills in management and its problems.

Partnership in Management

For co-ownership, workers can buy shares in their companies with their provident fund accumulations. By the end of the Third Plan period, the workers' provident fund is likely to have an accumulation of about Rs 700 crores. Thereafter, on the assumption that about 80 per cent of industrial workers would be contributing at the rate of 8 per cent and the rest at 6¼ per cent, additional accruals in the Fourth Plan are likely to be of the order of Rs 600 crores. Allowing for an expected withdrawal of Rs 300 crores during the Fourth Plan period, an amount of Rs 1,000 crores is available to workers to buy shares in industrial capital. The worker would then get the right of ownership in the concern to that extent. Instead of getting the usual interest of 4 per cent, he becomes entitled to a share in the profits of the concern in which he is working; his interests get identified with the efficiency and profitability of the concern and he becomes a partner with his employer in the fortunes of the concern and industry. Rao suggests in effect the establishment of a workers' industrial ownership bank that will mobilise workers' savings and enable co-partnership of the industrial worker with his employer.

Workers' education would provide to workers skills in management and associated problems. The scheme of the Central Board of Workers' Education has a limited scope; it provides only trade union and labour education and citizenship training. These provisions should be supplemented by literacy programmes, as well as technical or professional or higher educational programmes for the working classes. Trade unions and Universities can make a useful contribution in this field with Government support. Part-time courses, correspondence courses, workers' colleges, night schools, week-end schools, Sunday schools and the like may be geared to the requirements of industrial workers and aimed at giving them cultural, technical, professional and managerial skills.

In a country which has accepted the principle of co-operation as the basis of planning for democratic socialism, industrial co-operatives have an important role to play. The principle of co-operation can be extended to organised industry, not to giant concerns and industries requiring vast and complicated technical and financial talent, but to the small and medium concerns. The experiment is worth making, because if it succeeds it may strengthen our economic democracy.

The Conference had three subjects for discussion :

(a) wage-price relationship;
(b) economics of social security; and
(c) role of trade unions in mixed and socialist economies.

Nineteen papers on these three subjects were discussed.

Wage-Price Relationship

The six papers received in this section discussed the various aspects of the field, often going beyond the scope of the subject. For example, one of the papers discussed the relationship between wage-price and full employment, dealing with technological and disguised unemployment, normally prevalent in developing economies. Another paper concluded that our

wage-price policies were not conducive to economic development. A third paper confines itself to the theoretical concept of wages, while another deals with "an open economy", "fluctuations in prices and employment" and "a stable monetary policy". Two of the six papers related to empirical verification of theory — one studying the movement of wages and cost of living of jute and sugar workers on the basis of data from Census of Manufacturers for the years 1950-1958 and the other making an attempt to draw some hypotheses about the relationship between foodgrain price behaviour and changes in money wages. The general impression about the papers in this section was that they failed to restrict themselves to the given field and hence not much light was thrown on the wage-price relationship.

Social Security

This section also had six papers — two dealing in very general terms with economics of social security, one with old age assistance in India, two with some aspects of the Employees' State Insurance Scheme and one with social security schemes in India. The last paper written by a high official in the new Ministry of Social Security, gave up-to-date and authoritative details about the Employees' State Insurance and Provident Fund Schemes. One of the six papers was an interesting case study of the attitude of workers to the E S I Scheme in two factories in U P; it showed all-round dissatisfaction. The session discussed in detail the few social security schemes at present in operation in India but could not get an over-all view of the economics of social security; nor could it obtain a perspective of social security for the future.

Trade Unions

This section, which dealt with the role of trade unions in mixed and socialist economies, had seven papers for discussion. The definitions of trade union, socialism and mixed economy demanded clarification. One view advocated was that the workers' organisations in communist countries should not be called trade unions in the strict sense of the term. This view, pressed by the Rapporteur of the Section, was not acceptable to all.

Two other areas, which attracted attention were labour research and voluntary labour arbitration. V K R V Rao stressed the importance of labour research in a developing economy, with an emphasis on rapid industrialisation and suggested that the Indian Society of Labour Economics, representing labour economists in India, should take the lead in organising labour research on proper lines. It was generally agreed that the Society, with the assistance of the Planning Commission, should explore the possibilities of conducting some labour research surveys. The Indian Academy of Labour Arbitrators, started in Delhi in 1964, has already done some preliminary work in finalising the constitution, enrolling members and publicising the cause of voluntary labour arbitration. The work is to be extended on an all-India basis during the current year.

Asoka Mehta, Deputy Chairman of the Planning Commission, has been elected next year's President and the following subjects were approved for discussion in the next session :

(a) methods of wage determination (including wage boards);

(b) role of workers' education and training in economic development; and

(c) consumer price index numbers.

Around Bombay Markets

Equities Recover

Thursday, Morning

DALAL STREET which had been completely shaken by the panicky sell-off on Tuesday, January 5, has staged a fairly quick recovery and it is back again very near the highest point reached in the New Year's opening session on January 4. And the market's overall performance, though far from being impressive, holds out the hope that it might not take long to make a new mark in the upward move which has been in progress since about the second week of December. The market sentiment had deteriorated all too suddenly in the preceding week mainly due to rumours about disquieting developments on the northern borders. The turn came when the bears found that these rumours were baseless and they rushed for a cover. Recovery was aided by the deliberations at the Congress session at Durgapur. There was virtually nothing in the economic policy resolution to make the stock market feel uneasy. Not only that. The market seemed much pleased with Shri Kamaraj's presidential address wherein the Congress President had advised the Planning Commission and the Central Government to be prudent and realistic in fixing the size of the Fourth Plan in view of the restricted scope for raising additional resources and the inflationary impact of a large development outlay.

The corporate news too has been distinctly encouraging. The preliminary reports indicate that banks have had a fairly prosperous time in 1964. The Tata group of electric companies has raised the interim dividends. The December output of saleable steel by the Tata Iron and Steel Company is a new record. The Indian Cotton Mills' Federation's scheme holds out the promise of securing cotton at or below the ceiling prices. There have been persistent reports about quite a few companies seriously considering the issue of bonus shares. The story will not perhaps be complete without a mention about the end of the two-month-old strike at National Rayon which accounts for nearly a third of the total output of rayon yarn in the country.

With turnover extremely restricted and activity almost entirely professional, the stock market's behaviour is likely to remain quite irregular. The market is, however, inclined upward in the hope that the forthcoming Budget will contain some fiscal relief for reviving the capital market. Whether the market's expectations in this regard will be realised or not, it is extremely difficult to say. The recovery in equity prices will need to be sustained for long in order to attract outside public participation.

Cotton

Prices Recede

THE situation in the cotton market is beginning to ease. Though still well above the ceilings, spot cotton prices registered a decline of Rs 20 to Rs 40 per candy last week. And there was also a mild revival of official trading in futures which had been at a standstill since December 9 as the hedge contract had all the time been quoted above the operational limit of Rs 775. Of course, only official dealings had been suspended; business was freely conducted in kerb at rates higher than the operational ceiling of Rs 775. On January 11, the March hedge contract was sold down to Rs 770.75 but it again rose above Rs 775 the next day, bringing official trading to a standstill.

The easier tendency in cotton prices is not due to any upward revision of crop ideas; crop estimates are, in fact, being gradually revised downward. Some of the leading spot houses feel that the crop might not exceed 57/58 lakh bales. The pattern of marketing having undergone a significant change it is no longer easily possible to estimate the size of the crop from the flow of arrivals.

Nor is the recent setback in prices due to Government's determination to enforce strictly the price control order. The way the authorities have continued to remain idle spectators of the open violation of the price control order is really amazing. Cotton prices have eased because the Indian Cotton Mills' Federation has made it abundantly clear that it is determined to implement its 8-point plan of securing cotton at or below the ceiling prices through rigorous self-discipline. The high power sub-committee of the Federation has warned the mills that if they do not excercise self-discipline in accordance with the code of conduct already laid down, it would not hesitate to seek the Government's permission to requisition cotton either from the mill or from the trade. The Textile Commissioner has constituted, at the instance of the Federation, a joint committee of representatives of trade and industry, which will be asked to recommend, whenever necessary, requisitioning of cotton stocks from mills as well as from the trade to maintain prices within the ceilings.

Latest reports indicate that some sixty mills have been asked to surrender their excess cotton to the tune of over 1 lakh bales to the Federation for redistribution among needy spinners. If the mills fail to submit variety-wise break-up of the surplus cotton within a week, the Textile Commissioner is likely to order the requisitioning of the same. The Federation's scheme has made it easier for the Government to enforce the price control order. It would be most unfortunate if the Government were to miss the opportunity and not take positive measures on its own to facilitate the supply of cotton to mills at or below the ceiling prices. With the Federation undertaking to purchase all the cotton offered to it during the season at 5 per cent below the ceiling prices, the growers are assured of a price which is about they can hope to secure if the price control is not to be reduced to a farce. It is an ideal situation where the producer does not have to lock up his funds in order to be able to get the maximum permissible price for his product. If the growers are not satisfied with the ceiling prices of cotton, they had better fight out their case with the Government.

Contrary to the easier tendency in the rest of the market, Bengal Deshi prices have continued to show a hardening tendency. This is partly due to a smaller crop and partly due to keen buying by both mills and exporters. Japan is reported to have made sizable purchases in recent weeks. The increase in the export price of Deshi cotton is welcome in that it helps to augment the country's foreign exchange earnings. But there is a danger that if prices continue to rise, the overseas buyers might be obliged to switch over to synthetics or seek alternative markets.

Oilseeds

Prices Ease Further

PROSPECTS of a bumper crop of mustardseed and rapeseed, which is varyingly estimated between 15 and 18 lakh tonnes, have brought about a significant change in the general sentiment in the oilseeds market. Oilseeds prices have developed an easier tendency under the lead of mustardseed and linseed; linseed have, in fact, been merely following mustardseed. Spot mustardseed which had been quoted around Rs 2,150 per tonne about a week ago has declined to Rs 1,560 and the quotation for March position is much lower around Rs 1,375. Mustard oil ready has come down from Rs 4,600 to Rs 3,900 per tonne and the March position is quoted around Rs 2,800. Within a fortnight or so, linseed ready has declined from Rs 71 to Rs 61 (per 50 kilograms) and linseed oil has come down from Rs 30.50 to Rs 23.75 (per 10 kgs).

The sharp decline in mustardseed and linseed prices has imparted an easier tendency to other oilseeds. The fall in groundnut and groundnut oil has, however, been much less pronounced; spot groundnut (Khandesh) has moved down from around Rs 64.50 to Rs 59 and groundnut oil from Rs 24.25 to Rs 21.80. This is mainly because, both mustardseed and linseed had been pushed to ridiculously high levels and they have slumped with improved prospects of supply.

Oilseeds future have eased in sympathy with the weakness in the spot material. Castorseed March which had declined from Rs 212 to Rs 201.25 in the preceding fortnight were further marked down to Rs 194.37 on persistent bear pressure and nervous bull liquidation. The week-end quotation was a little better around Rs 197 because of short covering induced mainly by technical considerations. Linseed March which had been marked down from Rs 55 to Rs 49.50 in the preceding week or so eased further to Rs 46.62 on persistent north Indian selling. Later, the contract rallied to around Rs 48 on bear covering and some replacement buying. Cottonseed futures were neglected around Rs 117.25.

Oilseeds prices can be expected to ease further because of the distinct improvement in the overall supply position due to record domestic production, sizable imports of soyabean oil and mutton tallow and the continued ban on the export of groundnut oil. How far the current decline might go, it is difficult to say. A great deal will depend on the Government's export policy for groundnut oil and groundnut HPS. Informed sources say that the current ban on the export of these commodities is likely to be lifted in February or early March when the movement of the mustardseed crop will be in full swing and the country would have received a sizable quantity of soyabean oil from the U S. The need for earning foreign exchange can scarcely be over-emphasised. But there is a distinct danger that export of groundnut oil might cause an unduly large excitement in the market and push up prices of edible oils to undesirably high levels. New Delhi will be well-advised to bear in mind carefully the possible impact of export of groundnut oil on internal prices of edible oils which are already standing at very high levels.

Money Market

THE money market displayed very steady conditions during the week with hardly any notable movements. The inter-bank call money rate continued to be quoted at 5 per cent though dealings were reported occasionally at

4.75 per cent on Monday and Tuesday after clearing hours. By Wednesday slight stringency was noticeable with lenders not so easy to locate as before. Scheduled bank's statement on January 1 last showed that "Money at Call & Short Notice" has contracted to Rs 58.48 crores from Rs 66.42 crores in the previous week, indicating that the flow of funds to the call loan market has been reduced and banks had to rely more on the Reserve Bank by borrowing Rs 29.48 crores during that week. This tendency has continued during the week ended January 8, when according to the Reserve Bank's statement, loans to scheduled banks jumped up by Rs 28.06 crores to Rs 90.16 crores. In the last three weeks scheduled banks' borrowings have continuously increased, the total increase being Rs 67.35 crores. That seasonal pressure is mainly responsible for this rapid increase in borrowings can be taken for granted considering the equally substantial expansion in bank credit which during the four weeks ended January 1, amounted to Rs 87.15 crores. The rise a year ago was even sharper. Between November 1, 1963 and January 3, 1964 total bank credit swelled by Rs 152.39 crores while in the current season it has risen by Rs 136.36 crores only. It can be expected, therefore, that the rise in bank credit will be more rapid in the coming weeks. The deposit resources of scheduled banks have no doubt increased in absolute figures from Rs 2245.01 crores on January 3, 1964 to Rs 2536.67 crores on January 1, 1965, i e, by Rs 291.62 crores, but the rise during the current busy season alone is about Rs 5.45 crores and compares with Rs 2.33 crores during the same period last busy season.

As the overall flow of funds into the call loan market continues to be limited, the scheduled banks rely more on the Reserve Bank for their needs, and the extent of their reliance will also depend upon the changes in their deposit resources. In any case, the call loan market may continue to rule steady and more or less on a par with Reserve Bank's lending rate to the Banks.

Reserve Bank's statement during the week ended January 8, is a reflection of the enlarged demand for funds. Notes in Circulation sharply rose by Rs 55.72 crores of which Rs 18.71 crores came out of the Banking Department thus involving an additional Note Issue of Rs 37.01 crores. Foreign securities went down by Rs 4.99 crores. Rupee securities had to be inflated by the addition of Rs 40.34 crores to cover the additional Note Issue and fall in foreign securities taking into account the inflow of Rupee coins. Foreign balances, however, improved by Rs 2.03 crores with the result that Reserve Bank's foreign assets declined by only Rs 2.96 crores.

Central Government's deposits receded by Rs 1.48 crores and those of State Government improved by Rs 71 lakhs. Borrowings of Governments increased by Rs 2.69 crores. While scheduled banks' borrowings increased by Rs 28.06 crores, their deposits fell by Rs 3.04 crores reflecting their overall needs during the week.

Business Notes

Kesar Sugar

THE working of Kesar Sugar Works for the year ended July 31, 1964 shows a marked improvement. Net profit after providing Rs 5.65 lakhs (Rs 4.38 lakhs) for depreciation, Rs 1.85 lakhs (Rs 14,000) for development rebate and Rs 9.00 lakhs (Rs 6.00 lakhs) for taxation, has more than doubled at Rs 8.65 lakhs as against Rs 4.17 lakhs in 1962-63. The increased profit has followed larger sale at Rs 3.02 crores compared with Rs 2.91 crores in the previous year. Sugar production during the year was higher at 211,953 quintals compared with 176,950 quintals in the previous season. The various incentive measures such as grant of higher prices for sugar cane and sugar, and rebate on excise duty on excess production helped to achieve larger production and sales though the target of production, namely 33 lakh tons, has not been reached. After taking into account other items of receipts and payments, a sum of Rs 8.00 lakhs has been transferred to General Reserve leaving Rs 34,532 (Rs 13,039) to be carried to the next account. Out of the General Reserve a dividend at Rs 10 per share, equivalent to 20 per cent, has been proposed which will absorb about Rs 5.43 lakhs.

The factory is stated to have attained a crushing capacity of 1,500 tons of cane per day, though the anticipated capacity of 1,700 tons per day is yet to be achieved due to delay in the arrival of machinery.

With a larger cane crop for the current season, the Directors expect still higher production. The Company's distillery suffered a setback during the year for want of molasses, but during the current year the position is expected to improve. The chemical factory's sales were maintained due to diversification of production.

Belapur

BELAPUR production of sugar fell to 2.54 lakh quintals with a recovery of 12.43 per cent during the year ended September 30, 1964, from 3.00 lakh quintals in 1962-63. Sales also dropped from Rs 365.83 lakhs to Rs 301.54 lakhs. However, the pre-tax profit was substantially higher at Rs 74.87 lakhs compared with Rs 59.98 lakhs. Taxation provision absorbed a much larger amount at Rs 41.65 lakhs (Rs 33.71 lakhs). Even then net profit stood higher at Rs 33.22 lakhs as against Rs 26.27 lakhs. The Directors have stepped up the dividend from Rs 18 to Rs 20 per share of Rs 50. The higher profit has enabled the Directors to set aside Rs 2 lakhs (nil) to General Reserve and Rs 31.70 lakhs (Rs 24 lakhs) to Dividend Equalisation Reserve from which the dividend amounting to Rs 28.20 lakhs (Rs 25.38 lakhs) will be paid. Besides, the shareholders will be entitled to relief under Sec 235 of the Income Tax Act in respect of the advance agricultural income-tax of Rs 25 lakhs paid by the Company to the Maharashtra State Government for the assessment years 1962-65.

The Directors state that during the current year recovery is lower due to shortage of rainfall and water supply; but they expect improvement as the season advances. Last year, the Company's factory crushed about 2.05 lakh tons of cane of which 50,330 tons were purchased from outside. The Company, this year, seeks to secure about 50,000 tons of cane from its own areas by making advances to cultivators and cultivating cane more intensively. The Company has set up three lift irrigation schemes on its drains from which it is proposed to supply water to the cultivators who will repay the cost to the Company over a period of years. On the whole the Directors consider the past year as successful one and, but for the heavy taxation, it would have been a very profitable one also.

The Company's subsidiary, Gangapur Sugar Mills, recorded a net loss of Rs 11.39 lakhs for the year ended June 30, 1964. The setback in its working is attributed to shortage of cane supplies. During the current year the cane supply is expected to improve to some extent, but even that will be insufficient for economic operation of the factory.

Bhopal Sugar

BHOPAL Sugar Industries has fared better during the year ended September 30, 1964 as compared with the previous year. Gross profit earned is higher at Rs 6.85 lakhs (Rs 4.12 lakhs). Net profit after making the usual provisions including Rs 37,500 (Rs 95,000) for taxes amounted to Rs 1.92 lakhs (Rs 13,222). This being insufficient even to clear arrears of preference dividend and to meet the year's dues, dividend has been skipped as in the previous year. The last dividend was 3 per cent for 1961-62; in 1958-59 the Company paid 25 per cent.

Kirloskar Brothers

DESPITE a rise in sales from Rs 4.78 crores to Rs 5.33 crores, gross profit of Kirloskar Brothers for the year ended July 31, 1964 has turned out to be lower at Rs 56.49 lakhs compared to 59.63 lakhs in 1962-63. The lower profit is attributed to increased production costs without a corresponding rise in the selling prices.

Taxation provision absorbed less at Rs 17.25 lakhs (Rs 18.13 lakhs). Allocation to depreciation was more at Rs 15.64 lakhs (Rs 13.96 lakhs), but other allocations were pruned down. The Directors have however maintained the equity dividend on the increased capital at 9 per cent which will absorb Rs 6.80 lakhs (Rs 6.10 lakhs). Preference dividend also takes away more at Rs 1.35 lakhs (Rs 36,246).

The Company's branch at Dewas is stated to be working satisfactorily, production having reached its rated capacity. Government has approved the phased manufacturing programme of compressors in collaboration with Tecumsch Products, Michigan, U S A, and steps are being taken to arrange for foreign exchange for the import of machinery. The Company's sealed compressors are expected to come in the market in the next financial year. A financial arrangement has also been entered into with Butler Machine Tool, U K, for the manufacture of planing, cleaning and shaping machines of which planing machines might begin to come on the market by the end of the current financial year.

Indian Oxygen

THE operations of Indian Oxygen have turned out to be more profitable during the year ended September 30, 1964. Sales have risen by Rs 1.89 crores to Rs 12.10 crores and the net profit also is slightly better at Rs 73.38 lakhs (Rs 71.06 lakhs). The equity dividend has been maintained at 12 per cent and will absorb 43.68 lakhs. Out of the profits Rs 63 lakhs (Rs 69 lakhs) have been transferred to General Reserve from which the dividend will be distributed. Allocations have absorbed more during the year. Depreciation gets Rs 67.78 lakhs (Rs 59.66 lakhs) and taxation Rs 86 lakhs (Rs 69.34 lakhs).

The Company spent about Rs 73.75 lakhs by way of capital expenditure on capital projects in connection with its oxygen and acetylene factory at Hyderabad, loxite factory at Ranchi, electrode factory at Madras and a new equipment factory at Calcutta. Products from all factories have contributed to the larger turnover. The Company's capital expenditure is expected to increase further in the next three years as a result of the major projects which have been undertaken under the Company's Rs 6-crores expansion programme spread over four years ending September 1967. The necessary financial arrangements for the programme are stated to be almost complete.

Structural Engineering Works

STRUCTURAL Engineering Works Limited has earned a pre-tax profit of Rs 10.98 lakhs (Rs 6.81 lakhs) during the year ended June 30, 1964. Sales went up to Rs 156.52 lakhs from Rs 129.73 lakhs during the previous year. Out of the profit the major deductions are taxation, Rs 5.75 lakhs and managing agent's remuneration, Rs 1.14 lakhs — thus leaving a balance of Rs 6.97 lakhs, available for distribution.

The Directors have recommended a dividend of Rs 6.00 per share on 45,000 ordinary shares, Rs 4.50 per share on 45,000 partly paid-up shares, Rs 7.14 per share on 5,000 cumulative preference shares and Rs 9.28 per share on 20,000 redeemable cumulative preference shares — all totalling Rs 6.94 lakhs.

The directors' report states that the results for the year would have been more satisfactory if only the pipe plant did not remain idle during the first half of the year and also work at the Dhamangaon establishment had not come to a standstill during the latter half of the year owing to raw material shortage.

The proposed new factory at Mulund to manufacture Cochran boilers is nearing completion and will go into production soon, the report states. Orders worth well over Rs 5 crores are on hand to keep the company's establishments fully engaged during the current year.

The company has received a long term loan of Rs 60 lakhs from the ICICI which is fully withdrawn to meet the capital outlay on the Cochran boiler and other projects.

Bank of America

BANK of America registered record earnings in 1964 with net operating earnings increasing to $99 million compared to $90 million during the previous year. Loans outstanding stood at $9.2 billion as against $8.3 billion a year ago and the deposits rose to $14 billion with an increase of $757 million during the current year.

At year-end the bank operated 871 branches throughout California. With 5 new foreign branches opened during 1964, the bank's international network now includes 27 overseas branches, 12 representative offices and interests in banks and other financial institutions in 22 countries.

The Indian Iron &Steel Company Ltd
Notice

THE Register and Transfer Books for Ordinary shares in the Company will be closed from Monday, the 15th February, 1965 to Saturday, the 27th February, 1965 both days inclusive for the purpose of payment in due course of an interim dividend on Ordinary shares in respect of the year ending 31st March, 1965. The interim dividend when declared will be paid to those shareholders whose names appear on the Company's Register of Members for Ordinary shares on the 27th February, 1965 or to their mandatees.

BY ORDER OF THE BOARD
MARTIN BURN LIMITED
Sd/- F. G. Liversedge,
Managing Director,
Managing Agents.

Gold Support

SOME one high up in the British Treasury who had an occasion in the recent past to interest himself in Indian balance of payments asked a visitor the other day, who it was in the Indian set up who lost his sleep over the weekly returns of the Reserve Bank. He frankly confessed that he could not himself bear to look at these statements without nervousness and trepidation. One does not know who in the Government loses his sleep over it but last week's papers, the financial press not excluded, suggest that no one looks at the weekly returns any more. Or else, how is it that an increase for the first time in many many years in the gold holdings of the Reserve Bank went unnoticed and was not commented upon by the Indian papers? The single exception was the Gujerati *Vyapar*. It did not escape the vigilant eye of the *Financial Times*, London, either.

The Reserve Bank, of course, would not bother to explain its gold operations even though this was the first operation of its kind to come out in its weekly returns. There had been an earlier transaction in gold some years ago, when the Reserve Bank paid to the I M F India's share in gold for the raised quota. It did not feature in the weekly returns. While it is useless to expect the Reserve Bank to explain or even put in a footnote, it is not necessary either. For the Government has some little stock of gold which is drawn from various miscellaneous sources—the subscriptions to the Gold Bonds amounting to some Rs 8.61 crores, the output of the Kolar gold fields averaging Rs 2 to 2½ crores annually which has been moving since August 1958 straight to Government stocks and there is also some smuggled gold which is confiscated from time to time, averaging, about Rs 1.5 crores annually, judging from the figure given out once to the Estimates Committee. Gold stocks with the Government from all these sources are estimated at Rs 31 crores. (All the figures are at the official price of gold).

That no explanation has been offered for the modest increase in the gold reserves of the Reserve Bank is not surprising. But it is surprising that no explanation has been forthcoming yet as to how the foreign exchange reserves suddenly sank so dangerously low that in order to avoid seeking Government permission for allowing reserves to fall below the minimum, a transfer from Government stocks of gold had to be effected at the last moment. It is this which calls for an explanation, not the modest transfer to the gold reserves which is, after all, only a matter of internal book keeping. The decline in foreign balances is altogether a different and much more serious matter.

That things should have been allowed to come to such a pass raises doubts whether the Reserve Bank or the Finance Ministry tries to keep any track at all of the anticipated foreign exchange incomings and outgoings in the coming weeks or months and attempts to synchronise them in some sort of way. Exports have been good, in fact unusually good, and it is not true that all the exports are going to the rupee payment countries and are thus not bringing in any foreign exchange. There is no reason either to assume that aid payments have been lagging behind. On the contrary, all evidence suggests that aid utilisation has been activised and that procedural delays and hold ups which had precipitated a situation like this in the past have

now been straightened out to a great extent. After the unpleasant experience of bunching of imports in the past leading to a near crisis in the payment situation, track was being kept of the licenses likely to mature in a given period. There has been no relaxation of import and no reason to suppose relaxation of vigilance on the same. Surely, the Reserve Bank or the Finance Ministry would not have invited a situation like this of its own accord; something, therefore, must have gone wrong elsewhere. What could it be?

The scope for speculation about an explanation remains free until the authorities choose to take the public into their confidence. It may be that the deferred payment arrangements which were actively sponsored after the foreign exchange crisis of 1957 have now come to roost, for the credits then sought to be encouraged were for 5 to 7 years. It is possible, though highly improbable, that this was not anticipated or that foreign exchange payment on debt servicing which has now come up to a sizeable figure had not been anticipated well in advance. There is, besides, the fact of emergency food imports or drafts for defence, either of which can cause a sudden drain and, though anticipated, could not have been provided for in advance.

No Room for Product Patents

ONE of the principal issues on which the controversy over patents law in India has come to be centred is whether in the field of chemical products, food articles and drugs and pharmaceutical products should be made unpatentable and patents should be restricted to processes. The justification for such a change in law is that whereas a product patent gives the patentee the monopoly of that product, under a system of process patents the same product could be manufactured by different patentees using different processes. In his "Report on the Revision of the Patents Law" submitted to the Government of India in 1959 Justice N Rajagopala Ayyangar recorded that: "the denial of product claims is necessary in order that such important articles of daily use as medicine or food which are vital to the health of the community should be made available to every one at reasonable prices and that no monopoly should be granted in respect of such articles. It is considered that the refusal of product patents would enlarge the area of competition and thus result in the production of these articles in sufficient quantity and at the lowest possible cost to the public."

In the current controversy those who want the patents law to be left as it is, mainly the international drug companies and their Indian spokesmen, have made an attempt to confuse the issue by contending that under the existing patent system in the country patent claims for chemical products, including drugs and pharmaceuticals, can be sustained only when these products are manufactured by the process described in the patent specification. Following from this, it has been argued, any number of manufacturers can make the same product using different processes. This seemingly convincing claim is, in fact, highly misleading and needs to be refuted.

There is nothing in the Indian Patents and Designs Act to bar the grant of patents to chemical products. But the practice in this respect has come to be based on Section 38 A(1) of the U K Patents Act of 1907 as amended in 1932. This section lays down that "in the case of inventions relating to substances prepared or produced by chemical processes the specification shall not include claims for the substance itself, except when prepared or produced by the methods or processes of manufacture particularly described and ascertained or by their obvious chemical equivalents." In the U K the provisions of this clause were so exploited by the patentees as to render their monopoly of the products concerned as impregnable as if they were covered by straight product patents. The artifice adopted was to draft the specification as regards the process in such a way as to cover all the possible processes. The Committee appointed by the U K Government to advise on amendment of the U K Patents and Designs Act, the Swan Committee, concluded that patents granted according to the provisions of Section 38A(1) were, in effect, no different from patents for products *per se*. This was one of the reasons which led the Committee to recommend that Section 38 A(1) should be abrogated and products patents allowed—a recommendation which the U K Government accepted.

The operation of the so-called product-by-process patent system in India has been no different. The protection granted to the patentees under it has been scarcely less than what it would have been under a system of product patents. This has been achieved, as mentioned above, by drafting the specifications of the process in such a manner as to cover all possible processes. This becomes clear from an examination of any of the patent specifications relating to chemicals.

The patent in India for Tolbutamide, an anti-diabetic drug, is a case in point. Tolbutamide belongs to a group of compounds known as sulphonyl-ureas. The patent in question —taken out, not surprisingly, by one of the international drug companies—covers sulphonyl-ureas of a general formula and describes all the possible processes for preparing sulphonyl-ureas—no less than 13 in all. Of course, the patentee uses only one of the processes; the others have been included in the patent to keep out competitors. When the Haffkine Institute developed a process for making Tolbutamide different from that *used* by the foreign patentee and sought to manufacture the drug through an Indian pharmaceutical company, it was promptly challenged by the foreign patentee claiming that the process was covered by its original patent. Pending judicial disposal of the matter, production of Tolbutamide by the process developed by the Haffkine Institute has languished. The foreign patentee's monopoly in the production of the drug thus remains virtually unaffected and will continue to be so considering how long-drawn-out patent litigation invariably tends to be in this country as elsewhere.

Indeed, the instance of Tolbutamide shows that the protection afforded to the patentee by the present system extends even beyond keeping out rival manufacturers trying to make the drug by a different process. For, it is reported that when another manufacturer, this time one of the international companies, developed Chloropropomide, another anti-diabetic drug belonging to the sulphonyl-urea group, the Tolbutamide patentee claimed that this too was covered by its patent which was in respect of sulphonyl-ureas of a given general formula. Ultimately, it is learnt, the company which developed Chloropropomide agreed to manufacture the drug under licence from the other company, thus accepting the latter's patent claim. It is, of course, fairly common for the big international drug companies to accept one another's patent claims even when they could be challenged as part of *quid pro quo* arrangements designed to preserve their monopolies in their respective fields, keep out other manufacturers and prevent competition among themselves.

In any case, there is enough evidence to show that the present patent system in this country has worked no better, from the point of view of encouraging competitive research and manufacture, than a product patent system. The need to amend the law is, therefore, incontestable. According to reports, the amendments to the Patents Act which the Government is expected to move in the coming session of Parliament will seek to reduce the term of patents, put a ceiling on royalty rates and make the provision for compulsory licensing more effective. While these changes are necessary and have been long overdue, they will lose much of their impact unless the award of patents in the field of chemical products, food articles and drugs and pharmaceuticals is restricted to processes. If the objective of reducing the monopolistic consequences of patents is to be achieved, it should be explicitly laid down that the patentee's exclusive claim will be limited to the process that he actually *uses*, leaving others free to manufacture the product by other processes.

Annual Number 1965

THE 16th Annual Number of the Economic Weekly will be out on February 6, 1964. It will be a 180-page issue, bound in art cover, and will be priced at Rs 3 per copy. Registration and postage charges will be Rs 1.25.

The Annual will be supplied free to subscribers. Agents are requested to place their orders in advance.

In view of the Annual Number, there will be no weekly issues on January 30 and February 13.

A FERNANDES
Business Manager

Weekly Notes

. . . (India) Ltd Blessed

GOVERNMENT has decided not to insist any more on issuing Letters of Intent (ie, pre-licenses under the Industries Development and Regulation Act) only to resident individuals or companies registered in India. Such preliminary approvals for starting an industrial undertaking can now be granted directly to a prospective foreign investor without requiring him to find an Indian partner. To this extent, the initiative for industrial venture in India can rest with the foreigner, and not with the Indian collaborators, at least in the initial stage. Indeed Indian collaborators can be eliminated altogether, as an extreme case, with the assistance of the Industrial Development Bank.

This appears, at first sight, a major policy change, though what precisely has been the policy so far has never been very clear. The Foreign Capital Policy Statement of 1949 which still continues to broadly regulate foreign investment lays down that the major interest in ownership and effective control should, save in exceptional cases, always be in Indian hands. But at the same time, the statement held out the assurance that no discrimination would be made between foreign and Indian undertakings in the application of the general industrial policy. Of the total of about 2,000 new collaborations approved from 1956 to 1963, some 1,750 were purely technical collaborations in the sense that they involved no foreign equity participation. Most, though not all, of the remaining 250 or so which had such participation were in the manufacture of metals and chemicals, generally accepted as technologically intensive industries. In more than one-half of these 250, however, foreign collaborators held effective control, ie, more than 40 per cent of equity. In other words, foreign control has accompanied the inflow of new technology. Since this is the field covered by "exceptional cases", the doors were open already. By opening the door wider, the **zamindari** tenure that was conferred upon Indian industrialists by their exclusive right to obtain industrial licenses has now been virtually terminated.

The privilege hitherto enjoyed by the Indian licensee strengthened his capacity to bargain with foreign investors who had already more or less decided to come to India. But it also created several difficulties. It did not altogether prevent effective foreign control, as the facts mentioned above testify; neither did it keep down the liability on account of remittances and repatriation. The choice of foreign partner, however, remained with the Indian licensee, meaning in most cases the influential business houses, which had been successful in getting the licenses at the right time. Many potential foreign investors in new industries turned away because they did not want the particular licensees as partners. The one-sided right of choice implied discrimination against the foreigner. This element of discrimination, however, was not covered by the assurance given in the 1949 Statement which concerned only the application of general industrial policy.

Will Speed Implementation

APART from these matters of protocol, a more substantive issue has assumed importance over the last two years. Many high priority projects for which Indian parties had received licenses and negotiated or had almost completed the negotiations for foreign collaborations made no progress because the Indian collaborators were either over-committed elsewhere or unable to raise the rupee finance. Since the mobilisation of local resources is primarily the responsibility of the Indian party, cases of such failures tended to discourage or put off prospective foreign private investors.

No tears need be shed over this loss of the privileges of industrial **zamindars**. The procedural change in licensing would speed up the implementation of approved projects and would also help to break up the practical monopoly of large projects held by big Indian business houses. The extent of foreign control will certainly increase in terms of absolute magnitudes but even in the past seven years, there has been no dearth of "exceptional cases" of effective foreign control, particularly in the industries which are considered the most impor-

tant and which will assume increasing importance in the future. The measure in which the Development Bank and other financial institutions come forward to participate in the foreign-initiated ventures would give the public sector a share in the private sector of industry. So long as foreign initiative does not go into chocolates, cosmetics and the like, the change is all to the good, at least for the immediate future, particularly since it should reassure the World Bank and IMF about India's willingness to achieve international viability.

The long-term, especially balance of payments, implications of the recent moves to attract more foreign private investment, however, remain obscure. For at least the last three years, the World Bank has been extremely sceptical of India's capacity to service external debts and has consistently prodded the Government of India into liberalising the conditions of entry for foreign equity capital, as distinct from purely technical collaborations. Technical collaborations create an immediate and recurring liability and are proving expensive — payments on account of royalties, fees, etc., amounted to Rs 45 crores in 1963-64 — while equity investments allow some breathing time. Granted all this, the World Bank, with all its experts, has yet to establish whether equity investment as compared with official aid is preferable for developing countries or not, taking into account its ultimate cost in terms of the burden on balance of payments and all the benefits, e g, import substitution, organisational and technical skills, etc, that are supposed to flow from it.

Teja Tops Shipping Target

SHIPPING has already over-fulfilled its target for the Third Plan. This is not anything much to make a dance and song about but with so much dismal failure all around in keeping to the schedules leading on to the targets in the different fields, this achievement in shipping certainly deserves honourable mention. According to the latest survey by the Ministry of Transport, over 5,83,000 GRT have been acquired by the Indian shipping companies in the public and private sectors, as against the Third Plan target of 3,75,000 GRT new shipping and 93,000 GRT delivered against Second Plan orders. Net acquisition, however, would be naturally smaller for scrapping of old ships so far amounts to 1.46 lakh GRT, bringing down the net acquisition to 4.37 lakh GRT. This is, of course, not the whole story for a lot more shipping is on order—about 6,90,000 GRT and another 40,000 GRT are expected to be ordered before the Third Plan end.

In this splendid performance, the role of Jayanti Shipping has been spectacular indeed, for this new-comer in the field has already acquired tonnage of about 5,00,000 which is the largest in India for any shipping company. A remarkable performance, indeed, whatever may be the economics of it or the financial outcome of the company's operation. (It should be pointed out that though Dr Teja does not say so specifically this figure presumably is that of D W T and is not, therefore, directly comparable with the G R T figures mentioned above.)

On the financing of shipping companies Dr Dharma Teja has made a definite, albeit, startling contribution, in his statement made at the last Annual General Meeting of the shareholders of the Jayanti Shipping Company and shaken up the ship-owners who, having had their financing experience in other industries, bring into shipping their old concepts which tend to inhibit their activities. The point about financing is that you must always have enough cash to meet your commitments, enough, but not much more. If you have too much cash, you are under-trading. If you have too little, you are over-trading. No one could accuse the other Indian shipping companies of the latter, and most definitely the charge of under-trading cannot be levelled against Jayanti Shipping.

Dr Teja has seen the potential of credit availability that Indian shipping has. The credit comes from two sources, one of which is general to all shipping and the other is specific to Indian shipping. The general part is credits given by ship-building yards for building new ships. Any reputed ship-owner with suitable security can get from almost all the major ship-building yards of the world 80 per cent credit over a period of 8 years. Indian ship-owners can also get 90 per cent loans in rupees over 18 years at the low rate of 3 per cent. What Dr Teja has done is to use Indian Government credit to secure the ship-building yard and use his ships to secure the Indian Government, a method which has enabled him to manage with only marginal internal finance.

Not that other ship-owners were unaware of this method of financing, but it needed Jayanti to crystallise the whole scheme, and where Dr Teja stole a march on the others is in the scale of his operation. Other ship-owners thought twice about expansion; Dr Teja had the courage to plunge in a big way. He realised that the greater his commitment, the larger his orders, the more willing would shipyards and Government be to extend him credits.

Bold Financing, Poor Accounting

WHILE Dr Teja has undoubtedly been bold and imaginative in shipping finance and perhaps blazed a trail, which even the faint-hearted may follow, one cannot say the same about the accounting methodology he presented in his Statement to the shareholders. The terms he uses for comparing with other shipping companies are unfamiliar and therefore are difficult to understand; the arguments with which he supports his contentions do not follow recognised accounting principles.

To put the Jayanti accounts in more familiar terms, while the gross revenue of the company has jumped from Rs 99 lakhs to Rs 497 lakhs and gross profits are over Rs 1 crore, there is an unstated net loss, if account is taken of depreciation. And this, after capitalising the interest paid abroad on purchase of new vessels—a feature which is totally novel in Indian shipping, though it is in accordance with a recent Government of India ruling. To put Jayanti's accounts on par with that of other Indian shipping companies, however, one would have to deduct from the gross profits the interest charges and this would go to increase the net loss.

Dr Teja has invited discussion on another novel argument of his, about what he calls double depreciation. He claims, if one understands him correctly, that there is no need for a company to account for depreciation so long as its financing is done from borrowings. It is difficult to understand the logic of this argument. True, if a company is financing its investment from borrowing, then there is no need to earmark these funds as a separate entity. But this cannot alter the requirement that a company has to earn depreciation in order to meet its liabilities for loan purposes, as well as recording the fact that the asset has depreciated in value to the extent provided.

As it is, Indian shipping companies do not provide enough against depreciation. They provide depreciation of a ship on a straight-line basis of 5 per cent over 20 years, although it is increasingly recognised that a ship becomes obsolescent much earlier and, indeed, requires major renewals of hull and machinery after 12 years. Some Indian companies, therefore, do face and will face the alternative of either taking a loss on capital account (almost unheard of in factory machinery) or renewing an obsolescent vessel. Clearly, if a ship actually depreciates by about 7 to 8 per cent a year, it would be only prudent to provide a minimum depreciation of 7 per cent per year. The more rational system would be to permit as much depreciation as profits will allow; this will give the shipping companies a much greater competitive edge in the lean years when they are not able to provide for depreciation in their rate quotations.

Jayanti's total commitment to Indian shipping has led to the latter's major expansion. It is to be hoped that Dr Teja's courage will not go unrewarded. He has at least shown that Indian shipping is as competitive as any in the world. What is now required is an organisation which can maximise his profits and men who are capable of raising Jayanti's operating performance over the pedestrian levels at which it is slogging at the moment.

Fund Raising at Durgapur

A Correspondent writes:

IN an afternoon session of the Subjects Committee meeting during the Congress session at Durgapur, Atulya Ghosh, West Bengal's Congress boss moved about on the dais, wearing an expensive 'punjabi' made from Cashmere *tush*. He did not perhaps know that it cost the fantastic amount of Rs 1,000. He did not pay for it; sometime ago, an affluent Congressman had taken note of Ghosh's regret that he did not have warm clothes to wear in Darjeeling, and promptly telephoned an order to a famous Calcutta tailor to take his measurement for a 'punjabi' made from the best material.

Lots of people and firms must have likewise taken note of the needs of the Durgapur Congress session and supplied financial help to it. Casual suggestions and dropped hints must have brought out donations running to lakhs to finance the enormous expenditure on food, lodging and transport of the delegates to the session. The West Bengal Provincial Congress Committee, the host of the Durgapur meet, claimed that Rs 14 lakhs were raised from donations, most of which, it further claimed, came from common folks. To bring home the point that the Congress session is being financed by common people, the West Bengal Congress had arranged the publication in newspapers of a picture of Atulya Ghosh receiving a cheque from a District Congressman for Rs 25,000; this amount, the caption read, was the first instalment of collection from ordinary people in the district. Still earlier, West Bengal's Chief Minister had declared in the Assembly that he, like others, had donated Rs 25 to the Congress fund for the Durgapur session.

All this propaganda could not hide some obvious fund-raising gimmicks at Durgapur at public expense. A quick check at the exhibition grounds showed that the Congress must have raised not less than Rs 10 lakhs from the rent of the stalls and pavilions in the industrial exhibition alone. There were also two other exhibitions, on agriculture and on khadi and cottage industries, into which money from Government agencies had been poured in equal measure.

The land on which the exhibitions were held belongs to the Durgapur Projects Ltd, a Government undertaking. It was lent to the Congress at a rent which has not been decided yet. An official of Durgapur Projects told this correspondent that the rent would be nominal. Possibly, it would not cross a couple of thousands of rupees. And, yet, look at the profit the Congress made on the land owned by a Government company. Here are some instances.

The pavilions of Hindustan Steel and the Heavy Engineering Corporation must have fetched not less than a lakh of rupees to the Congress. The rent for the Railway or Orissa Government pavilion must have been of the order of Rs 50,000. The West Bengal State's pavilion was the largest, costing not less than a lakh of rupees in rent. The cost of building the pavilions was, of course, much more; but it is unlikely that the Congress made any profit out of the fabrication of the pavilions and stalls and the display materials inside unless, in the case of some favourite contractors, the Congress bosses did quietly suggest a cut on the total bill.

There were lots of stalls outside the exhibition precincts, serving food or selling things or presenting shows as in a *mela*. The rent for any such stall measuring about 50' x 50' was Rs 1,000 to Rs 1,200. Rents of bigger stalls were proportionately higher. If the stall was a little way back from the main road facing the exhibition, the rent was halved. There were over fifty such stalls outside the exhibition ground and you can guess the money the Congress collected from the land outside the exhibition grounds.

Case for Sadachar Samiti

THERE were other ways the Congress made profit at the expense of the public exchequer. Take, for instance, the flats that were given to the press correspondents or other people who could not stay in the delegates' huts. The two-room flats owned by Durgapur Projects were kept vacant, we were told, since July for use during the Durgapur Congress. The official rent of the flats is less than Rs 20 each, but the Congress charged Rs 200 for each flat for the short duration of a little over a week, making a clean profit of Rs 180 per flat. Many pressmen, living in the press camp installed in these flats, complained that the Congress organisers did not even care to put up planks over ditches that lay across the route they used to take from the back of their flats to the Subjects Committee pandal, and some press reporters are known to have sprained their ankles or otherwise hurt themselves while rushing back to their quarters to file reports. The two wire-service agencies, PTI and UNI, chose not to pay such high rents for flats and built up little tinsheds of their own at the back of the big pavilion housing a restaurant, operated by a well-known Park Street caterer, where a fish-dal-rice lunch cost Rs 4.50.

The Congress exploitation of Government agencies and the public sector for party purposes is also evident in the building of a small station, named after Dr Roy, only a stone's throw from the bigger Durgapur station. The utility of this station after the Durgapur Congress is questionable; its only utility, namely its nearness to the Congress session site, died with the end of the session. And yet, at least Rs 8 lakhs must have been spent on this rail station which the Railway Minister opened a week before the Congress meeting.

There were other expenditures from Government funds which otherwise could not normally have been made, such as Rs 10 lakhs sanctioned by the State Government for improving roads leading to the Congress site and Rs 6 lakhs spent by the Post and Telegraph authorities for telegraph, telephone and allied communication facilities. Electricity was supplied to the Congress session and its paraphernalia at the cheap rate charged from small-scale industries. The cost on police arrangement by West Bengal which a Calcutta newspaper calculated at Rs 2 lakhs was, however, unexceptionable in view of the congregation of so many VIPs on the occasion of the meeting.

Equally unexceptionable is perhaps the traditional practice of fund-raising through the publication of a souvenir. Charitable organizations do this as do political parties, here and abroad. But it is interesting to note that the Congress party must have collected at least Rs 80,000 by way of advertising revenue from the English edition of the souvenir alone. It had forty pages of advertisements at the official rate of Rs 2,000 per page for one edition, Rs 3,000 for two. Special position rates are not included in this calculation. Quite possibly, many of the advertisers must have paid more as space charges to parry pressure for additional donations to party fund directly.

The exact amount of direct donation to party fund is a matter that deserves to be enquired by a private detective agency or, better still, by the Sadachar Samiti.

Johnson Begins

PRESIDENT Johnson, formally inaugurated on January 20, is clearly one of the most skilful politicians in recent American history. His political ability, combined with a huge majority in an often difficult Congress, promise to make his first term in office a significant one. To understand President Johnson's popularity it is necessary to look at his political roots. Unlike President Kennedy, who was clearly aristocratic in both background and style, Johnson is a "man of the people". He was born in the heartland of American populism, a powerful movement which caught the imagination of farmers and workers in the Midwest during the early part of this century and was aimed against the bankers and aristocrats of the Eastern seaboard. Johnson also served his political apprenticeship under President Roosevelt at a time when economic liberalism (and occasionally radicalism) was the order of the day.

Lyndon Johnson is also one of the most skilful legislators that the United States Congress has produced in this century. Having served in both the House of Representatives and the Senate for more than two decades, he has developed an almost unsurpassed understanding of the intricacies of the legislative process, a factor which has caused many Presidents serious problems. Not only is Johnson a master of twisting the arms of recalcitrant legislators, but he has a deep feeling for the process of legislation itself. This knowledge, combined with long personal and political contact with most key Senators and Representatives, will mean that he will have an easier time with his programmes than did President Eisenhower or even John F Kennedy.

President Johnson seems to pose a dilemma to most foreign observers. His style is neither polished, nor for the most part sophisticated. This fact is often taken as a sign of *naivete;* or perhaps ignorance. While it is true that Johnson does not have the breadth of wisdom of President Kennedy, he is clearly an intelligent individual, and keeps very well informed on current issues. Furthermore, a number of his advisers have an excellent understanding of world problems, and are particularly well informed and imaginative concerning domestic issues. Thus, while Johnson's style is not inspiring to the intellectual, he does combine keen political sense with a mass appeal.

Johnson starts out his term of office in a stronger position than President Kennedy ever had. He has more popularity, a larger (and, what is more significant, more liberal) majority in both Houses of Congress. Moreover, it seems as if the President will try to implement a substantial proportion of his electoral programme. His State of the Union address to the Congress, significantly delivered in the evening when there are maximum television audiences, stressed a strong programme, and left no doubt that he is firmly committed to increased aid to education (a very controversial issue since traditionally American education has been in the hands of the States), medical care financed by public agencies, a large mass transportation programme, and other costly, and politically controversial proposals. Administration of the newly passed civil rights law has been actively pursued by the federal government, under prodding from the executive branch. Thus, Johnson's popularity with Negro voters in the large cities is increasing and promises to be an important aspect of his strength.

Lyndon Johnson has surprised many liberal analysts in the United States with his far reaching domestic programme. Prior to his election, most intellectuals regarded him with suspicion at best, and supported him only as a lesser evil than Goldwater. Many now seem to be grudgingly accepting Johnson as both an effective politician and a national leader with some vision. Naturally, it remains to be seen if the promise of Johnson's initial speeches and statements is realised in practical legislation. But his odds are a good deal better than even, and certainly much more favourable than those of President Kennedy, who was faced with a hostile Congress, and a style often unsuited to the rough-and-tumble of U S politics.

President Johnson has one area of weakness which has become graphically evident in recent weeks. He has little experience with foreign affairs, and clearly prefers the more down to earth domestic issues over which he has strong control. Thus, the situation in Vietnam continues to stagnate with little initiative in any direction from the White House. American policy toward Europe also seems to have been enveloped by an embarrassing silence. While the United States was pushing hard for the multi-lateral nuclear force up to a few weeks ago, there is now stony silence from Washington, and growing dissention from the NATO allies.

Thus, present prospects from Washington are mixed. On the domestic side, Johnson seems to have emerged as a leader of both vision and effectiveness. But in matters of foreign policy, the new Administration has yet to prove itself. It is clear that, from whatever point of view, inaction in matters of international importance will be disastrous. Lyndon Johnson has his work cut out, and his recent performance shows that he has the ability to get the job done. While not of the intellectual stature of a Kennedy, he may yet prove to be more effective in implementing the programmes largely chalked out by the late President.

Letter from South

The State of the Congress

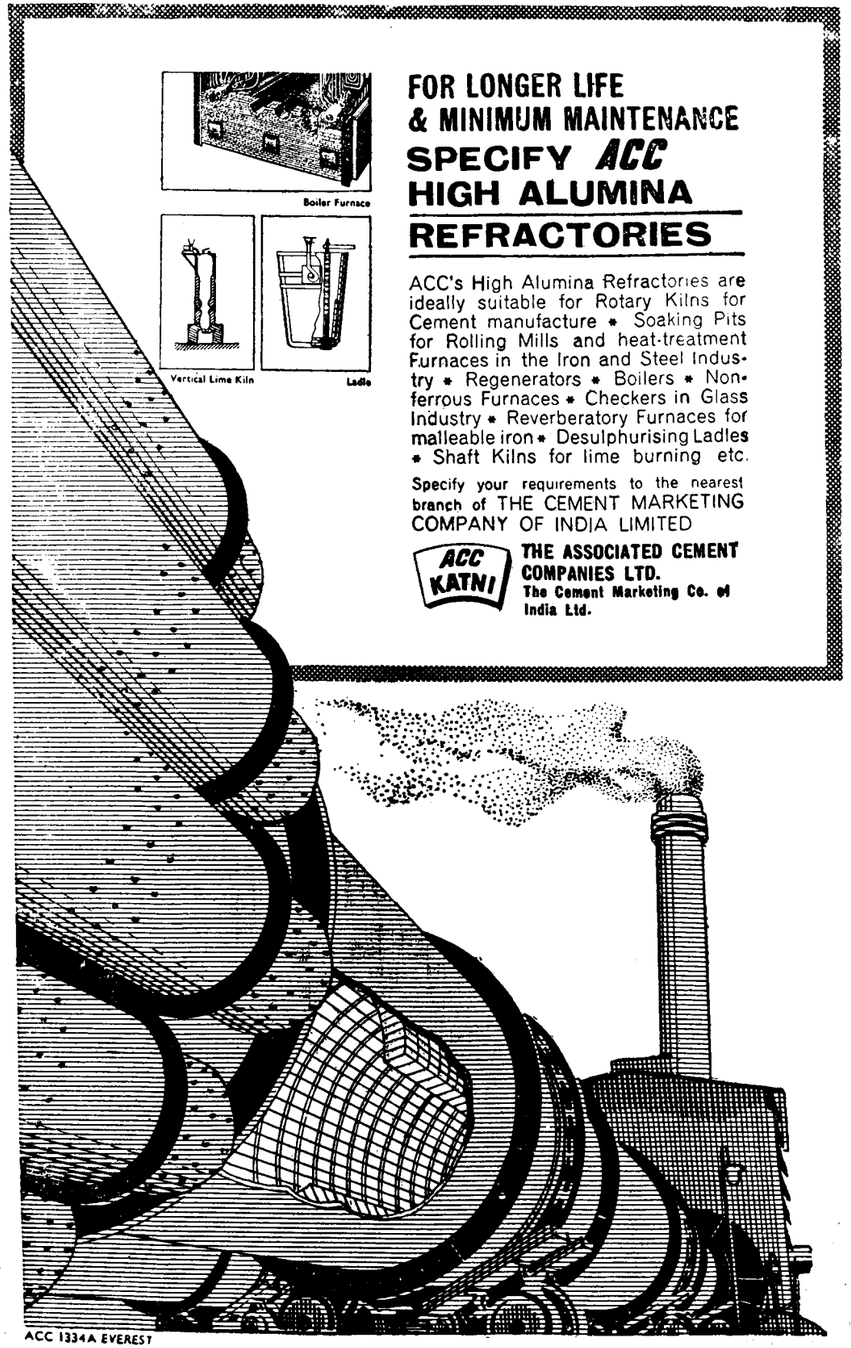
DURGAPUR has not caused even a ripple to stir in the stagnant Congress waters in the South. And this precisely is cause for concern. The "new economic policy" of "pragmatic" retreat even from the policy pronouncements of Nehru fits in with the mood of the leading Congress cliques here, who were never really bothered too much about the chailenging assumptions and assertions of the late Prime Minister, whom they never genuinely tried to understand or to know. Shastri, Kamaraj and Atulya Ghosh are far closer to, more familiar with, indeed, indistinguishable from, one another. How to make politics pay, how to keep things steady and how to let capitalist spontaneity work, these were and remain their main concern.

Absent Leaders

While Tamilnad was quite prominent in the proceedings and most of the Ministers knew that both good form as well as self-interest required attendance—after all, Kamaraj would miss their absence and wonder—, Kerala was unrepresented. So was Andhra—the Chief Minister is said to have rushed back as his wife had had a fall. Mysore was somewhat unseen and, in any event, Nijalingappa was far more attentive to the no-confidence motion he was going to face, where the opposition would rely heavily on the charge-sheet brought forward by a section of his own partymen. In the reported ruckus over the resolutions processed by the Working Committee, these satraps would not know where exactly to put themselves. If Sanjeeva Reddy and Kamaraj were united they could easily take up the appropriate postures. But rumour had it that the Andhra strongman was trying for his own place in the sun, was emerging rapidly from the position of Kamaraj's protege and hewing closer to Atulya babu. While Sanjeeva Reddy was all for the new course, where exactly Kamaraj stood was anybody's guess. Hence, the indecision or, even better, the safer absence and the quick departure.

In Kerala we hear of strange goings-on. While the opposition parties are in a state of confusion, the Congress has declared that it would go it alone. Yet ex-Chief Minister Sankar has already made his pilgrimage to Mannath Padmanabhan's home, reportedly to assure the Nair chieftain that the official Congress would be at least as fit a vehicle for his organisation's interests as the dissidents. It is further reported that Sankar made the additional point that the Nairs need not fear the Ezhavas while the Catholics would always be their rivals. (The dissident Congress is said to be controlled by the Catholics while the ex-Chief Minister is an Ezhava.) That this visit was not a single swallow is underlined by the published reports of the forthcoming trips by Lakshmi Menon and A M Thomas to some celebration that the Nair Service Society is organising. Simultaneously, some Catholic bishops are gathering soon in a secret conclave to decide what they could do to heal the breach between the two Congress factions.

These facts emphasise the conclusion that even after a split and separate functioning, the two Congress bodies cannot find a single principle to justify their wranglings. Communal separatism is clearly at the root of the break up and if the influential communal bosses so decide, some semblance of cohesion could again be restored. This does not look likely at the moment and may not even come about prior to the elections. After all, a great deal of personal bitterness has also developed and there is a desire for some trial of strenth, to demonstrate who is more powerful and who should be top dog should a single Congress organisation again become possible.



A Model of Pragmatism

The split in Kerala could become a model for the other parts of India in this age of "pragmatism" when the petty politics of the opportunist manoeuvre and the shady deal are at a premium. It is significant that despite strenuous efforts, including quite a prolonged trip by Krishna Menon, there are no signs of even a Congress Socialist Forum coming into being in any of the Southern States. Avadi, Bhubaneswar, Durgapur — nothing has made much of an impression on the Congress groups here.

The seeming serenity of Kamaraj and others at the prospect of the Congress failing to get a majority in the Kerala polls is based on the calculation that nobody else will either. The expected breakdown of the Left Unity Front means that no viable alternative to the Congress will be presented to the electorate. It is also unlikely that the Left Front and the Left Communists will separately win enough seats to give a joint majority after the elections. The prospect is real enough that President's Rule will have to continue even after the polls. And, Kamaraj and others feel, what is the difference since this, too, would mean that the Congress monopoly of power remains intact throughout India, even if the democratic system itself gets discredited in the process? *Parkalum* — let us see!

Sanjeeva Reddy Displeased

Nor is Kerala alone. The degree of the crisis is highest there but the quality of the Congress is much the same, say, in Andhra. If Sanjeeva Reddy is anxious to emerge from the status of Kamaraj's protege, the present Andhra Chief Minister, Brahmananda Reddy, is no less eager to be known as a person in his own right and not dependent for his status on the mercurial grace of the Union Steel Minister. It is widely believed that the appointment of V B Raju to the key and lucrative job of Chairman of the State Road Transport Corporation is an indication of the latter's desire to assert himself. This ex-Minister and defeated Congress candidate was said to have socialist inclinations once upon a time. But a trip to West Germany and the dim prospect of socialist convictions leading to any pedestal of power in the foreseeable future has wrought a degree of metamorphosis of belief. Still, Sanjeeva Reddy has not forgotten V B Raju's adherence to Sanjeevaiah and so counselled against any swift promotion. After a total eclipse for some years, Raju himself would be much more amenable and humble. Despite his objections the appointment has gone through. What is worse is the way in which the present Chief Minister is clipping the wings of Balaiami Reddy, the present Food Minister and a very loyal follower of Sanjeeva Reddy. The appointment of a senior civilian to handle the question of food supplies, directly responsible

to the Chief Minister, is also not without significance.

It is now rumoured that a new alignment is taking shape in the Andhra Congress power elite. A C Subba Reddy from Nellore and a strong man in his own right seems to be emerging as the direct plenipotentiary of Andhra's man in the all-India Syndicate. Against this powerful combination, Brahmananda Reddy is forming an axis with APCC President Thimma Reddy and Finance Minister Chenna Reddy. These positions have not crystallised as yet and each is rather warily feeling out the other. They are all conscious that any open attack on Sanjeeva Reddy's citadels would be inopportune at the moment. Thus, for example, there was no overt opposition to his son-in-law being the official Congress candidate to fill the Assembly vacancy created by his elevation to the Centre. What will be tried though, are small acts of defiance, which if pushed through, could build confidence, rally the cohorts and lead to bigger things.

But what is all the quarrel about? Perhaps, Sanjeeva Reddy is all for the Durgapur line while Brahmananda Reddy insists on loyalty to the Bhubaneswar approach? Even to pose the conflict in this context causes Homeric mirth. To their credit it must be said that the protagonists do not even take the trouble to put on any ideological togas. Their quarrel is strictly pragmatic — over the spoils of office and on the question of personality assertion. If in the process there is an amount of political instability and if the bureaucrat is simultaneously harassed and pleased, since many minor decisions will now be his alone while simultaneously factional considerations will dictate petty favours, nobody seems to be particularly bothered. And the opposition is still weak enough to be treated as irrelevant.

All this is creating a vacuum both inside the Congress and in the South as a whole. It is a peculiar problem since the vacuum seems pretty full of noises, scramblings, posturings and the like. Moreover, if nature is said to abhore vacuum the Congress politicians seem to thrive within one. The danger is that the people may well begin to despair and abhore politics and politicians of all kinds. This would prepare the ground for someone or some collective or some alignment of collectives to think in terms of partyless politics, with the army and the civilians playing a far more important role than parliamentary democracy now allows them.

From the London End

The Bloated Aircraft Industry

THE aircraft workers protest march to London (precipitated by rumours of large-scale cuts in the industry) and Harold Wilson's Chequers dinner invitation to representatives of Britain's aircraft industry, bring into prominence once more the future of this large and expensive industry which currently employs some 250,000 people.

No final decision on this important subject can be taken, however, before the Plowden Committee (which has been set up to enquire into this industry) publishes its report. In the meantime, it is worth taking a look at the present shape of the industry.

It has been obvious for quite a long time that Britain's aircraft industry is too large for Britain's needs. Six years ago the Conservatives attempted a half-hearted plan to reduce the size of the industry, and under Mr Duncan Sandys, the large number of private companies in the aircraft industry were merged into a few large groups. At present, the British aircraft industry consists of a few aircraft building concerns and two aero-engine manufacturers.

The British Aircraft Corporation was formed out of the merger of Bristol, Vickers Armstrong and English Electric. They produce the VC-10, the BAC One Eleven and the controversial TSR2 whose future is still undecided. This company is also engaged in the Concord project and, in the military field, it produces the Lightning, the Jet Provost and the following missiles: Thunderbird, Bloodhound, Vigilant, ET316 and Swingfire. It employs a total of 40,000 workers.

The next large group is the Hawker Siddeley Aviation Group employing 39,000 workers. It is made up of Hawker Blackburn, Avro Whitworth and De Havilland. It produces the HS748, the HS681, the Argosy, the Trident and the Comet, and, in the military sphere, the HS125, the Sea Vixen, the Buccaneer, the HS Kestrel, the HS P1154 and the rockets, Firestreak. Redtop, Bluestreak, Sea Dart, Seaslug and AS 37.

Handley Page still remains an independent organisation. It produces, among others, the Dart Herald aeroplane. Short Brothers and Harland of Belfast produce the Turbo Skyvan and the Belfast.

The two main aeroengine companies are the Rolls-Royce Aero Engine Division, employing 34,500 workers and producing the Dart, used in Convair 240, HS 748, HS Argosy, Handley Page Herald, the Japanese aircraft NAMC YS 11, the Dutch Fokker Friendship, and the U S Grumman Gulfstream. It also produces the Conway engine used in the VC-10, the Avon engine used in the Caravelle, the Comet, the Lightning, and the Seavixen; the Tyne used in the French Breguet Atlantic, the German Transall C160 and the Short Belfast plane; the Spey used in the Trident, the One Eleven and the Fokker Friendship; the military Dart used in the HS 748; the Medway used in HS 681; and the military Spey used in Buccaneer, McDonnell Phantom, and a number of other engines.

The other large engine group, the Bristol Siddeley engine group produces the Olympus used in the Concord and also in TSR2 and the Vulcan Bomber; the Viper used in the Indian Hindustan fighter; the Jet Provost, HS 125 and a number of engines used in helicopters.

While no definite decisions have yet been made by the Government, there is no doubt at all that it is firmly resolved to reduce the size of the British aircraft industry by 1970 to approximately 1½ times the size of the French aircraft industry which employs between 100,000 and 150,000 men. The object of Wilson's dinner was to canvass the views of the industry about the most economic set-up for itself. But plans of this sort must naturally be long-term. It begins to appear as if the main brunt of rationalisation will fall on the British Aircraft Corporation, which is involved both in the Concord and the TSR2. If both

the Concord and the TSR2 are cancelled, BAC will be in real trouble, and it would then be left entirely dependent on the declining production of the VC-10s and the BAC One Eleven and some missile work. The main criticism of the TSR2 is not only that it is too expensive (it is likely to cost about £3m a piece against the previous limit of £2.5m), but that it is too sophisticated for the defence requirements of the U K. Cuts on this plane would make a major contribution towards the estimated £950m saving on defence expenditure over the next 10 years. It is likely that a compromise on this subject will be reached, as well as a compromise on Hawker Siddeley's planes. Here, the very expensive P1154 supersonic VTOL project might be abandoned, and the earlier vertical take-off plane, the P1127, developed. The last moment invitation to Short Brothers and Harland of Belfast probably implies a reprieve for the company's big Belfast Freighter which is due for completion very shortly. The efficiency of Britain's aero engine manufacturers is not in doubt since British aero engines power half the world's civil jet airliners and turboprops. So the British engine firms will probably emerge unscathed.

Dependence on Defence Orders

Many would like the aircraft industry to be devoted solely to the production of civil aircraft—Mr Cousins has said that he would rather build freight-carriers than bomb-carriers—, but in the present state of the industry unless many more orders for exports are received (which in face of intense competition from other aircraft manufacturers seems unlikely) the industry will be heavily dependent on military orders.

In the post-war period, the British aircraft industry grew because of export orders from a number of countries who were anxious to re-equip with new jets their air forces which had been shattered during the war. Now many of these countries not only have a sufficient number of jets, but are also manufacturing them themselves.

In any reorganisation of the aircraft industry, the Government has a duty to see that sub-contracting contracts are spread out over as wide a field as possible. The French, for example, make it a practice to sub-contract to unsuccessful companies, and thus share out the work.

There is no doubt at all that the aircraft industry needs overhaul. Since the war thousands of millions of pounds have been sunk into it; abandoned aviation projects have cost the U K more than £300 m since 1951. According to a recent estimate made by the *Economist*, it costs an average of £2,000 per man to maintain the aircraft industry, or something rather more than £500m a year at its present size or £5,000m in the decade that it takes to design and deliver a new aircraft. The current cost of developing new engines alone ranges from £20m to £100m depending on their complexity.

Low Productivity

Compared with the aircraft industry in other countries, productivity in the British industry is not high. The Americans are said to obtain three times the production per man that the British do, and they use a larger proportion of unskilled workers. It is interesting to note that 10 per cent of British qualified manpower works in the aircraft industry. Foreign currency earned by the industry last year was a little under £100m; the French earned almost the same amount although they use one-third of the manpower, mainly through the sales of their successful Caravelle.

Wilson's concern with the state of the aircraft industry is understandable. That streamlining is essential nobody doubts, and indeed it will not mean the end of the industry, but the creation of more efficient and economic organisation. Hawker Siddeley are already embarking on many branches of advanced industry outside aeroplanes. The Canadian aircraft industry, which had grown on defence contracts, some years ago went through a similar crisis, from which it has emerged by drastic cutting down in men and design teams. It is now a smaller and more efficient industry earning more money than it has ever done.

A great deal of rethinking will have to be done about Britain's aircraft industry. Indeed, if Duncan Sandys' famous "rationalisation" project for the industry had been more carefully thought out and planned, much of the present crisis could have been avoided. The U S aircraft industry is already planning for necessary contraction, and all the leading American companies are attempting to adjust themselves to severe over-capacity and a declining market. The American consultants, Arthur D Little Incorporated, have recently published a detailed assessment of these efforts. This report discusses some of the plans which will help the U S industry to survive. One approach is diversification, with aeroframe makers diversifying into missiles for instance. Another solution is to apply the industry's research to other areas such as urban mass transportation and the exploitation of ocean resources. This, however, is a very long-term project. The report also comments on the failure to diversify into commercial markets. American companies seem unable to exploit their experience outside the industry. The best American companies have, however, transformed their aeroframe makers into "centres of invention, research, development and custom production".

Better Use of Skills

Much on these lines could also be done for the British aircraft industry. Some of the suggestions that are being mooted are that the Government could speed the building of a new airbus for which there is an immediate market, or that Britain should manufacture American aircraft under licence, but with British aero engines. A significant part of the British aircraft industry could be more effectively employed elsewhere. Most of the 250,000 aircraft workers are not specifically aircraft engineers, but skilled men who happen to be employed in the aircraft industry. With the crying shortage of skilled labour in other industries, which has now reached crisis proportion, transfers could, with proper planning, be made to the benefit of all. There is a growing demand for electronic skills and about onethird of the investment in modern military aircraft is in electronics. Some of this skill could be used to produce more efficient electronic aids in civil aviation or to meet the need for electronic instruments in medicine and in industry. The machine tool and other precision manufacturing industries could be enriched by talent which is now taken up by the aircraft industry. The Government itself could encourage various industries like "aircushion craft", monorails, hospital equipment, special-purpose building systems, to name but a few.

To support the British aircraft industry at its present size and cost is an uneconomic proposition, and it is necessary that the Government should take firm action to reduce the industry's size, particularly in the military field, at the same time making adequate plans to absorb the redundant skilled labour which is urgently required in other industries.

Capital View

The Passing Scene

Romesh Thapar

AS another Republic Day approaches, we have been doodling about the Congress confabulations at Durgapur. None of us seem to be able to make any sense out of the proceedings. Has Atulya Ghosh managed to grab the organisation? If there is a compact between Shastri and Kamaraj, why the implied criticisms of each other in their public speeches? Does Morarji Desai plan to change his tactics and emerge as a neo-Nehruist? Will Indira Gandhi accept the pincer movement of the Right to seize the ruling party or will she prepare for battle? Where does Nanda stand? A sorry spectacle, these permutations and combinations of personalities in the party, but this is the miserable state of the Congress today.

This kind of political doodling could range over many areas of enquiry. How come the party's official stand on the nuclear deterrent did not reflect the jingoism in the Working Committee? Is the free entry given to foreign capital an attempt to discipline indigenous tycoons who have been flirting with opponents? Has it been decided, at caucus level, to order a skilful retreat from 'socialistic' objectives? How will this smothering of past pledges be done in a party which has lived on a balance of power between the Right and Left? The questions certainly pile up.

Chaos at Film Festival

We must wait and watch for the developments. To say the same things all over again about the muddle and confusion is a rather futile exercise, even for journalists living in the incredibly prolonged twilight of Congress rule. So even as we exercise patience, let us turn to those subjects which absorb the time and energy of the comfortable middle class in the Capital.

At the best of times, in our mixed economy, organisers are few and far between, but the Information and Broadcasting Ministry must be absolutely bereft of such talent—at least, so it appears, from the extraordinary mounting of the first genuine international film festival. The chaos had to be 'sampled' to be believed.

Delhi's citizens got the first taste when, within an hour of booking offices opening, there were no tickets to be had. Even as Nanda launched the hunt for evidence against 'left' communists, the culture-climbers were searching for festival tickets in the Capital. It was a desperate, unrewarding search—blunted by the over-polite double-talk of the disorganisers in the scattered offices of the I & B Ministry —until the more enterprising discovered that stacks of these tickets were lying hoarded with the Vips and Spivs. The hoards were unearthed with money and influence, but the damage had been done.

Incensed pressmen, reduced to a single ticket a day, decided that they were not going to enjoy this festival at all. Everything appeared wrong: the speeches at a thinly-attended inauguration; the vulgar display of food at the formal buffet banquet; the amateur level of the symposia presided over by men with no knowledge of films; the feudal pomp at the Rashtrapati Bhavan reception; and the quality of the films entered. Then more fuel was added to their simmering anger. They found allies among the delegates, Indian and foreign, who also were reduced to chasing those elusive tickets and cursing the arrangements.

At this stage, something happened. Embassies took a hand in getting tickets for those who they thought deserved to see their films. Even the Press Information Bureau became generous. And, believe it or not, the theatres took down the 'house full' signs. Don't ask me what happened. Maybe, Indira Gandhi took a hand. Or, maybe, the Vips decided that they just could not have their families and intimates view uncensored films!

Yes, for the first time in what appeared to be living memory, the middle class of the Capital was exposed to uncensored stuff—and some were so lost in the prevalent mood that they were even titillated by the mock heroics of one of our offerings on the 1962 events in Ladakh! The word, 'uncensored', drew the crowds—and the blackmarketeers. Love in a tumble, bare buttocks and bosoms, dialogues loaded with sexful meaning, and a variety of tensions, kept our supposedly lusty audiences laughing nervously, coughting in embarrassment and fidgeting. Oh, to have been able to record this middle class sickness on film, with hidden cameras and tape recorders.

The fact is that there was little in the films to censor, but over the years our moral-keepers have made such morons out of us that even the slightest reference to the real relationship between man and woman causes a flutter—even a blackmarket in tickets. And, to think of it, the same story will be repeated in Calcutta, Madras and Bombay where the festival is due. We have certainly been 'integrated' on this plane of the unconscious.

I only hope the organisers will be more organised as the festival moves out of Delhi. A single theatre for invitees, please. Some block bookings through recognised societies, please. More theatres for more frequent showings, please. Sterner action against those who blackmarket tickets, please. Sorry to sound so basic. Our bureaucrats do not seem to understand any other language.

R S S and King Mahendra

Surprisingly enough, or perhaps, appropriately, the local elite was so engrossed in 'uncensored' film fare that it took little notice of other developments. Reports are current about Nepal's involvements with the RSS, involvements which are coming to light since King Mahendra announced his intention to address a rally organised by these Hindu militants. Equally interesting is the 'growing respectability' of V K Krishna Menon who is now slated as a member of our delegation to the Afro-Asian conference at Algiers — obviously an attempt to build the defences against a Chinese-inspired assault on India's policies.

Of course, the RSS story gets more play. It is a strange story. Apparently, for some time now the Nepalese have been sticking their fingers in the Hindu politics of the sub-continent. Tulsi Giri, alleged to be a former member of the RSS during his student days in Banaras, has been masterminding the idea of a Hindu consolidation under a monarch like Mahendra. This sounds the craziest of fantasies, but then the doyens of Hinduism have an extraordinary appetite for such intoxicating ideas.

There is indignation in palace circles in little Kathmandu over Delhi's

supposed *volte face* on Mahendra's plan to address an RSS rally in Nagpur. Tulsi Giri and his supporters imply that the G O I approved of the visit. And no one in Delhi is prepared categorically to deny this. Perhaps, our pragmatists were hoping to end Pakistan's flirtation with Nepal by playing on Mahendra's RSS sympathies. Now, these frolics are public and enterprising investigation should uncover many facets of an hitherto unpublished story.

Leaving melodrama behind, the debate on the Bokaro steel project continues. We are told that 'unexpected' hitches have developed and are being ironed out. The truth is very different. Despite the unexplicable secrecy which surrounds the negotiations with the Soviet delegation, a few revealing facts have been gathered. First, we are being asked to surrender our right to participate in and to judge the Soviet project report which will be submitted in October. Second, the foreign exchange component for the first phase of the project, estimated at some Rs 160 crores, has been scaled down to Rs 100 crores without any valid explanation. Third, there has been a complete departure from the specifications laid down in the Dasturco report, specifications which were to ensure us the most modern continuous strip rolling plant.

The hon'ble Steel Minister and his hon'ble ICS advisers talk of unexpected hitches, but the betting in the Secretariat is that they have every intention of accepting the Soviet turn-key terms, not because of their interest in ensuring the rapid implementation of the Bokaro project, but because Sanjeeva Reddy is anxious to push the fifth steel plant into Andhra through a turn-key arrangement with an Anglo-US consortium whose influential 'fixers' have been visiting the Capital rather frequently. These manoeuvres could have been neutralised by an independent Indian firm of consultants, but now, with the destruction of Dasturco on the Steel Minister's agenda, there's little chance of preventing our steel programme becoming the preserve of foreigners and their agents.

Tortuous Ways

Dastur's offer to become a public sector agency has been so distorted that demands are now being made to reduce the consultancy to a truncated body designed to rubber-stamp bureaucratic decisions. The hon'ble Steel Minister and his hon'ble ICS advisers have made clear that they do not want to understand what role a firm of consultants is supposed to play. And, significantly, in the course of the debate, Soviet spokesmen are beginning to reveal that their stand on 'full control' was in fact dictated by the Steel Ministry. Tortuous, very tortuous, are the ways of the G O I.

These problems notwithstanding, the talk will soon turn to the marked contradiction between the views of Kamaraj and Shastri on the resources position of the Fourth Plan. It is old mutton, this business of the scale of the plan, but it is decided that the targets must be reviewed all over again. This means that the extra Rs 3000 crores sought is considered too heavy a strain. And this in turn means that TTK has been warned to produce a softer budget. No wonder the stock markets are beginning to stir.

I don't want to imply that there is anything wrong in encouraging a revival in the investment climate. A mixed economy needs this. But those who want to restore incentives on the economic front must also implement reforms in the economic structure to satisfy the political aspirations of the radicals in the ruling party. Such an equation has yet to be worked out. In its absence, the Congress will suffer from polarising tensions. Do Kamaraj and Shastri represent the two ends of the economic-political equation?

Maybe, the ruling party will emerge from its dazed existence by restoring the incentives necessary in a mixed economy while at the same time proving its socialist dedication by a take-over on the banking and foreign trade front (for, every section seems to be dragging its feet on land reforms). These inter-connected matters are being discussed, but so far nothing tangible has emerged. Whatever the outcome, a reshuffle at Cabinet level is bound to be ordered to reflect the balance of forces which will finally prevail under the Shastri-Kamaraj alliance.

Religious Composition of Punjab's Population

Changes, 1951-61

Gurdev Singh Gosal

The religious composition of Punjab's population has undergone significant changes during 1951-61.

The excessive migration of the Sikhs to other States in India and to foreign countries has reduced their proportion in the total population in their own home State.

The Hindu population on the other hand, has slightly improved its relative strength because of excess of in-migration over out-migration.

Within Punjab, too, contrasting patterns of mobility of the two communities have been witnessed during the decade.

In the Sikh majority districts the population of the Sikhs increased very little or decreased while the rate of growth of the Hindu population was very high—higher than the rate of natural increase in many districts.

In the Hindu majority districts, by contrast, the numbers of the Sikhs increased phenomenally in certain areas while the Hindu population increased at about the rate of natural growth.

The Sikhs have shown greater mobility, both within and out of Punjab, in pursuit of economic opportunities than their Hindu brethren.

While the movement of the Sikhs is to a large extent from rural areas to rural areas, that of the Hindus is to urban places. In this movement religious and linguistic considerations have been generally disregarded.

These inter-regional shifts have set afoot a process of inter-mixing of Hindus and Sikhs. This is a healthy trend towards national integration and is a matter of great political, social and economic significance.

MOST human geographers will concede today that few among the phenomena causing or reflecting regional differences in cultures are as potent and sensitive as religion. A study of the changes in religious composition in Punjab where several economic, social and political matters are directly or indirectly associated with religion assumes a special significance. Particularly in post-Independence Punjab, religion, language and politics have been so intricately mixed up as to create difficult problems both for the administrator and the planner. Hence, an investigation into the regional variations in the growth rate of major religious groups, their inter-regional shifts and changes in the relative proportion of population of each within various areas is desirable on both academic and practical grounds.

The recent demographic dynamism of Punjab would be evident not only from its unusually high rate of population growth, but also from the substantial migration of its peoples to other States of India, and at the same time a considerable amount of redistribution of population within the State, causing significant regional and intra-regional changes in the religious composition of the population.

Our attention would be focussed primarily on the Hindus and the Sikhs, who according to 1961 Census, form 97 per cent of the State's total population. During 1951-61, the Hindus increased by about 30 per cent; while the State's estimated rate of natural increase was about 28 per cent. The Sikhs, on the other hand, increased only by 19 per cent.[1] Thus, assuming[2] similar rates of natural increase for both the communities, the slightly higher than the natural rate of increase in the case of Hindu population is obviously due to an excess of in-migrants over out-migrants. The considerably lower rate of increase of the Sikhs is attributable to the excess of Sikh out-migrants over the Sikh in-migrants. In India as a whole, their population increased by about 23 per cent. Indeed there has been a considerable migration of the Sikhs to other States of India and abroad. The numbers of such migrants from Punjab to foreign lands and other States of India are estimated at 240,000 and 220,000 respectively.

1 If allowance is made for the burnt slips on a proportionate basis, Punjab's Sikh population in 1951 should have been larger by about 150,000 and its rate of increase during 1951-61 should be about 19 per cent (as against 21.8 per cent as given in Census of India Paper No 1 of 1963, page v). Similarly the corresponding growth rate of the Hindu population should be about 30 per cent.

2 Many people believe, however, that the rate of natural increase of the Sikhs is somewhat higher than that of the Hindus.

Sikhs

A comparison of the figures in Table 1 indicates that outside Punjab there has been some amount of inter-State redistribution of the Sikhs during the decade, leading to differentials in their rates of growth. However, the actual numbers involved in this re-distribution are very small. The spectacular increases in the Sikh population of a few States may directly be attributed to migrations from Punjab which, consequently, reduced the proportion of the Sikhs in the State's total population.

Although the Sikhs moving out of Punjab have spread over most parts of India in their search for economic opportunities, a very large majority of them have gone to the adjoining States of Uttar Pradesh, Rajasthan and the Union Territory of Delhi, where their population has shown tremendous increases during the ten years (Tab 1).

The Terai region in Uttar Pradesh has witnessed unparalleled increase in the Sikh population. The explanation is not far to seek. Despite its agricultural potentialities, the region had been lying practically waste. The abolition of the landlord system of tenure soon after Independence threw this virtual wasteland open for development and attracted streams of Sikh peasants from the densely populated areas of Punjab.

Similarly, the extension of canal irrigation in the Ganga Nagar District of Rajasthan has encouraged a rush of Sikh farmers from their home State, increasing the district's Sikh population by 95.19 per cent—from 110.095 in 1951 to 214,905 in 1961. The actual number of in-migrants can, however, be determined only after making allowance for the natural increase. In the Alwar District where there were 23,028 Sikhs in 1961, the decennial increase was no less than 76 per cent, mostly in rural areas. Although in a number of other districts the percentage increase was startling, the increase in actual numbers was only small. In Rajasthan as a whole, the Sikh population increased by 84.98 per cent—from 148,229 in 1951 to 274,198 in 1961.

There was also a trickle of Sikh farmers to the newly reclaimed areas in Madhya Pradesh, where in 1961, in a total population of 66,715 Sikhs, 19,755 were in rural areas. The over-all increase in Sikh population in the State was 64.6 per cent.

In several of the remaining Indian States the Sikh population increased appreciably, but in urban areas and in pursuance of non-agricultural activities, Delhi and Greater Bombay experienced particularly impressive increases. Only Bihar and West Bengal, where the Sikhs were already in large numbers, registered small increases.

This movement of the Sikhs from Punjab to near as well as far off Indian areas during 1951-61, as also earlier, demonstrates their keenness to avail themselves of economic opportunities, whether in rural areas or in towns, whether in the field of agriculture or in other sectors, against all linguistic and religious considerations. It also shows unmistakably their tendency toward dispersal to areas of economic potentialities anywhere in the country, rather than concentration in the Punjabi-speaking zone of Punjab. It is no doubt a very healthy trend toward national integration, and a matter of great political import.

Among the Hindus too, there has been considerable out-migration from Punjab to other Indian States, but the number of Hindu in-migrants to Punjab has exceeded the number of out-migrants. These in-coming people are mostly labourers who engage themselves in construction work, or ply as rickshaw-pullers. However, notwithstanding this small excess of in-migration, the proportion of the Hindus to the State's total population has remained practically the same.

Changes in Religious Composition

The reverse pattern of imbalance between out-migrants and in-migrants of the two religious groups is not the only factor that has caused regional differences in the rate of growth of Hindus and Sikhs in Punjab. The considerable amount of redistribution of persons belonging to the two communities within the State has produced not only great contrasts in their rate of change within areas but also impressive inter-regional disparities in the growth of their populations. Of the two communities, the Sikhs have shown greater mobility within as well as out of Punjab. The resultant differentials in their rates of actual population growth have significantly modified the share of each community in the State's total population, as also in the total population of each area.

Whereas the proportion of the Hindus has increased from 62.2 per cent in 1951 to 63.6 per cent in 1961, that of the Sikhs has declined from 35 per cent in 1951 to 33.3 per cent in 1961.

Within Punjab, very contrasting areal patterns have emerged in the growth of population of the two communities during the decade. The contrasts were particularly accentuated in the case of the Sikhs whose population decreased or increased very little in a number of districts, but increased spectacularly in others. The population of the Hindus, on the other hand, increased practically everywhere at rates not far above or below the rate of natural growth. The inter-district disparities in the rate of population growth of each community give a measure of its mobility within the State, and also

*If allowance is made for the 1951-Census slips which were burnt in the Jullundur fire, the percentage increase comes to about 19.

the difference in the degree of mobility of the two communities.

In nearly all those districts where the Sikhs were either in a majority or formed a large proportion of the total population, their numbers either decreased or increased by rates far lower than the rate of natural increase. Tnis was due mostly to considerable out-migration from the rural areas. By contrast, the Hindu population in all of these districts increased by much higher rates which were above the rate of natural increase in most cases. The figures in Table 3 suggest some amount of in-migration of Hindus, most of which is to urban areas.

Table 3 reveals that in all the trans-Sutlej Sikh majority districts, the Sikh population increased very little during the decade. These are the districts where density of rural population is high, per capita cultivated land is small, and in some parts of which the menace of water-logging has been increasing alarmingly. The gradual deterioration of farm economy under the pressure of increasing population is inducing the peasants to seek economic opportunities elsewhere in the State as well as in other States of India or abroad. A sizeable proportion of the out-migrants have gone to those areas in Punjab where extensive wastelands have been reclaimed and brought under cultivation with the introduction of canal or tube-well irrigation, as in the Sirsa and Fatehabad tahsils of the Hissar district, Patiala and Rajpura tahsils of the Patiala district, Thanesar, Karnal and Kaithal tahsils of the Karnal district, and Jagadhari tahsil of the Ambala district. In most of these areas into which the Sikh peasants have moved the Hindus are in overwhelming majority. There has been considerable migration of Sikh farmers from the trans-Sutlej region also to the agricultural frontiers of the Terai in Uttar Pradesh and the Ganga Nagar district in Rajasthan. In addition, a large number of Sikhs have moved out for employment in the army, transport, industry and several other types of activities.

Large scale out-migration has practically neutralised the effect of high rate of natural increase in the population of the Sikhs in the Amritsar, Gurdaspur and Kapurthala districts; it has caused a 9 per cent decrease in their population in the Jullundur district from which there has been tremendous emigration to the U K during the decade.

The Hindu population in nearly all the districts listed in Table 3, on the other hand, increased by very high rates — higher than the rate of natural increase, reflecting some in-migration. This increase took place mostly in urban places, the most spectacular increase being in the Bhatinda district where, during the decade, numerous towns sprang up as agricultural markets and centres of processing industries, based mostly on cotton and oilseeds, located along rail routes converging on Bhatinda. Most of the industrial and commercial activities here, as elsewhere in the state, are handled by members of the Hindu community.

The great differences in the rates of population growth of the two religious groups in the predominantly Sikh districts have caused significant changes in their relative strength, the most meaningful changes being in the Jullundur, Gurdaspur and Sangrur districts where the patterns of religious composition have been reversed (Table 4). With the exception of Patiala and Ludhiana districts where the relative position of the Sikhs in the total population has somewhat improved, the proportion of the Sikhs declined in all the Sikh majority districts, whereas that of the Hindus has slightly improved (Table 4).

However, any progress in diversification of rural economy by a quick process of rural industrialisation in the densely populated trans-Sutlej plain will slacken this exodus. As the agricultural frontiers in the Terai and Ganga Nagar areas are fast closing, the rush of out-migration for farming is likely to peter out very soon. In future the out-migration of Sikhs will therefore be more and more for non-agricultural pursuits.

By contrast, in many of the Hindu majority districts the Sikh population has experienced a phenomenal increase while the number of Hindus has increased only at about the rate of natural growth (Table 5).

In the Hissar, Karnal and Ambala districts the increase in Sikh population, both percentage-wise and in actual numbers, was particularly impressive. In the Hissar district the increase was 89.9 per cent—from 80,394 in 1951 to 152,719 in 1961; in the Karnal district, 84.7 per cent—from 96,458 in 1951 to 177,602 in 1961. In both the cases the rapid rise in Sikh population took place in those areas where the development of new irrigational means has made the reclamation of waste lands possible. The inmigrants to these areas have invariably come from the densely populated regions where hunger for cultivable land is great. Also, among these inmigrants are a fairly large number of former displaced persons who come from the canal colonies of West Pakistan.

It may be noted that this process of redistribution of population, from areas approaching some kind of a saturation level under the existing economy and technology to thinly settled areas of considerable agricultural potentialities, has greatly slackened, if is is not already over. The future does not seem to hold a bright promise for further reshuffling on this account.

In the Hindu majority areas the Hindu population, on the other hand, increased appreciably only in the Hissar district where the last decade witnessed economic development at a quick pace. In the Kangra, Simla and Hoshiarpur districts their increase was far below the rate of natural growth, implying considerable out-migration. In the Simla district the main reason for the small increase in Hindu population and actual decrease in Sikh population was the shifting of the state Capital from Simla to Chandigarh. In the Kangra district, poverty of resources continues to push out the local inhabitants irrespective of their religion. In the Hoshiarpur district also where the disastrous action of the chos and the gradual increase of population over the last four decades have reduced the per capita cultivated land to less than half an acre, the process of out-migration has been continuous, particularly from the overwhelmingly Hindu-majority Una tahsil where poverty is more acute than elsewhere in the district.

In view of the considerably large differential in the rates of population growth of the two communities in nearly all the Hindu majority districts

the share of each in the total population has been modified during the decade. Whereas the proportion of Sikhs has improved in the Hissar, Karnal, Ambala and Hoshiarpur districts, that of the Hindus has increased in the Simla and Kangra districts. The religious composition of the Rohtak, Gurgaon and Mahendragarh districts remains practically unchanged. (Table 6).

Muslims

With a population of 393,314, which is only 1.94 per cent of Punjab's total population, the Muslims are the third religious group in the State. Their number increased by 38 per cent during the decade. However, within the State there are marked regional contrasts in their rate of growth. In the border districts of Gurdaspur, Amritsar and Ferozepur their population decreased by 40.6,43.3 and 0.8 per cent respectively.

In all the eastern districts of Punjab adjoining Uttar Pradesh, on the other hand, there has been tremendous increase in Muslim population, partly due presumably to in-migration from that State (Table 7). These in-migrants work mainly as agricultural labourers and truck farmers.

In the Gurgaon district where 16.91 per cent of the total population was Muslim in 1951—the highest percentage in Punjab—there was further concentration of this community, raising their number from 163,663 in 1951 to 216,767 in 1961; and their proportion to total population to 17.47 per cent. Part of this increase is attributable to in-migration from the adjoining areas of UP.

By contrast, there has been considerable dispersal of Muslims from Malerkotla, which was another area of Muslim concentration in 1951, to the adjoining districts. This dispersal has been encouraged by the stability in the law and order situation. As a result, there was absolute decrease in the Muslim population of the Malerkotla tahsil, and tremendous increase in the adjoining districts of Patiala, Bhatinda and Ludhiana during the decade. In most cases the increase has taken place in the rural areas where the Muslims work as agricultural labourers.

In the Lahaul and Spiti district the Muslim population has increased from 2 in 1951 to 1210 in 1961. It is an exclusively male population. It should be interesting to find out in what economic activity these people are engaged.

Some migration of Muslims has also taken place from the Kashmir Valley to the large towns and cities of Punjab during the decade. But the actual numbers involved in this movement are rather small.

Christians

With a population of 149,834, which is 0.74 per cent of the state's total, the Christians are a very small minority in Punjab. Their population experienced an increase of 51.56 per cent during the decade, mostly in the rural areas. About half of the increase seems to be due to conversions from among members of some of the backward classes. However, the numbers involved are so small that they have made no material difference in the pattern of religious composition of Punjab (Table 8).

The Buddhists, Jains and others represent only 0.32 per cent of Punjab's population. The population of the Buddhists increased from 1,660 in 1951 to 14,857 in 1961; that of the Jains from 45,096 to 48,754; and of the remaining religious groups decreased from 984 to 879. It will be clear from the above figures that the pattern of growth of these minorities is hardly significant to the religious composition of Punjab's population.

Summary

The religious composition of Punjab's population has undergone significant changes during 1951-61. The excessive migration of the Sikhs to other Indian states and foreign lands has reduced their proportion in the total population of their home state. The Hindu population, on the other hand, has slightly improved its relative strength because of excess of inmigration over out-migration.

Within Punjab also, contrasting patterns of growth of the two communities have been witnessed during the decade. In the Sikh-majority districts, the population of the Sikhs increased very little or decreased, while the rate of growth of the Hindu population was very high—higher than the rate of natural increase in many districts. This trend has resulted in a reduction of the proportion of the Sikhs, and an increase in that of the

Hindus in nearly all the trans-Sutlej areas. It has reversed the pattern of religious composition in the Gurdaspur, Jullundur and Sangrur districts.

In the Hindu-majority districts, by contrast, the numbers of the Sikhs increased phenomenally in some of the areas, while the Hindu population increased at about the rate of natural growth.

Both within and out of Punjab the Sikhs have shown greater mobility in pursuit of economic opportunities than their Hindu brethren. While the movement of the Sikhs is, to a large degree, from rural areas to rural areas, that of the Hindus is to urban places. In this movement, religious and linguistic considerations have generally been disregarded. The inter-regional shifts discussed above have set in a process of inter-mixing of people belonging to the two communities. It is a healthy trend toward national integration, and is a matter of great political, social and economic significance.

A NEW DIMENSION TO INVESTMENT

Over 1,30,000 Investors have subscribed more than Rs. 18 crores in Units and applications continue to flow in for 'Units' at premium.

.... the premium includes an element of income accrued to the Trust which will be returned to unitholders as part of the Trust's income distribution.

Among various advantages are the following tax concessions

(1) In case of individual unitholders, income up to Rs. 1,000 distributed by the Trust is exempt from income-tax.

(2) It will also be excluded in computing total income for purposes of assessment.

(3) Individual unitholders will receive their dividend without any deduction of income-tax at source.

Unit Certificates in respect of 1,24,000 applications received during the initial sale period (July 1 to August 14, 1964) have already been despatched to unitholders. Those who have not received them may kindly contact or write to the head office of the Unit Trust at Bombay.

The World Bank in Search of a Policy

Ashok V Desai

Statistics of the World Bank's operations in 1964, just released, bear out the suggestion that the demand for the Bank's credit is lagging behind supply. The Bank has been highly liquid since 1962 and has been retiring its funded debt. Given its present assets position it could certainly afford to lend more.

The forces behind this development invite some detailed consideration.

THERE was general concern when the 1962-63 annual report of the World Bank showed a decline in the value of new loans to $449 million from the previous year's total of $882 million. Since the need of underdeveloped countries for external finance had by no means diminished, questions were asked whether the Bank's conditions of lending were not too onerous and whether loan finance as such was reaching the limits of its usefulness as a form of external development aid. Attention was diverted from these questions by the Geneva Conference on Trade and Development; if the opportunities of export to industrialised countries were extended, the need for loans would be less pressing.

Decline in Assistance

By now, however, it has become apparent that the Geneva Conference was pretty fruitless. It brought out the strong sense of disappointment of developing countries over the performance of the GATT, which is likely to make it even less effective than it has been in the past. But the Conference created nothing that could succeed where the GATT failed. It failed even to obtain an undertaking from industrial countries to reduce tariffs. Since then, we have been waiting for the progress of the Kennedy Round and coming to realise that its results will be neither quick nor substantial; eyes are turning again towards possibilities of getting more loan finance. Meanwhile, the outflow of loans from the World Bank shows signs of slowing down again; loans in the calendar year 1964 amounted to $728 million and were $60 million less than in 1963.* At the same time, loans from the International Development Association, which gives softer loans than the World Bank, have risen by leaps and bounds: the 1964 total of $418 million was more than double the 1963 figure. There has evidently been a shift from finance from the Bank to finance from the IDA. Since the Bank and the IDA follow a unified policy, this shift reflects, besides the natural preference of borrowers for soft loans, their growing inability to borrow on the Bank's terms. The forces behind the shift have a long-term significance and invite some detailed consideration.

* The World Bank and its associates publish annual accounts for financial years running from June to June as well as annual loan statistics for calendar years. The last available figures are for the year 1964.

Lending for Development

Formally, the Bank is free to choose the projects and decide the terms on which it will lend money. It has, however, developed certain clearly defined conventions.

The lending rate of the Bank is governed by, and is generally somewhat above the rate on first class securities in the capital markets of the United States and Western Europe; for the last seven years it has been between 5 and 6 per cent. This adherence to the market rates is not formal; for while the Bank lends out of its capital subscribed by member countries on which it has to pay no dividends, a large part of its loans (50 per cent at the end of June 1964) is financed out of funds raised in the capital markets. Not only does the Bank borrow in its own name; it is also active in finding customers for loans it has given to particular borrowers. Thus its primary business is the lending of its reputation. It acts as an intermediary between investors in industrial countries and borrowers in underdeveloped countries, as a device to remedy the low investment status of underdeveloped countries in the eyes of private investors.

The importance of this role must not be underestimated, for in the postwar world, there have been powerful obstacles to the international flow of private capital which made mediation indispensable. The first obstacle is the greatly improved opportunities of investment in industrial countries: the momentum of postwar reconstruction and full employment policies has maintained rates of investment much higher than before the War, and raised the rates of profit. Second, as a consequence of widespread decolonization, political uncertainties have been added to the usual economic ones associated with investment abroad. This has not only to do with the possibilities of nationalisation; obstacles to the repatriation of capital and profits, generally on grounds of payments difficulties, have also become more common.

The World Bank has been able to overcome these difficulties. For one thing, it is not entirely dependent on market borrowings, and can to a substantial extent make its loans independently of the state of the capital markets by lending out of its capital. Further, it has a wide choice of capital markets in its borrowings. And insofar as borrowing countries value continual access to it for funds, the risks attaching to its loans are greatly reduced. Thus the World Bank is largely free of the disabilities of private investors; and only an organisation of its status and scale could have overcome them.

Decline in Demand

It appears, however, that the demand for the Bank's credit is lagging behind supply. The Bank has been highly liquid since 1962 and has been retiring its funded debt. Given its present assets position it could certainly afford to lend more.

One reason for this slackening in demand is the growth of direct contacts between investors and borrowers. Some of the Bank's borrowers—notably Japan—have improved their credit enough to be able to float loans in European and American markets. The liberalization of capital movements in the last decade has undoubtedly contributed to this development.

The Bank has made great efforts to promote such direct borrowing, and can only be pleased by it. It has repeatedly urged on its clients the need for such fiscal and monetary policies as would reassure private investors; and more recently it has concerned itself with more specific proposals, including a code of guarantees to foreign investors to be accepted by borrowing countries and facilities for arbitration in disputes between investors and borrowers. Ideally from the Bank's point of view, therefore, all countries

how did CHARMINAR become

one of the world's

top selling cigarettes?

because of VAZIR SULTAN

Ask any Charminar smoker this question and he'll say, "Because of the flavour!" Who put the rich flavour and unique taste into Charminar? Dedicated experts at The Vazir Sultan Tobacco Company Limited.

At their factory—the largest in South-East Asia—traditional secrets combine with modern tobacco know-how. Charminar's unique taste starts with the very finest tobaccos, developed by experts for Charminar. Other experts carefully blend the select *triple-matured* tobaccos. Then an extra process exclusive to Charminar gives you its rich flavour and unique taste. No wonder nearly 900 million Charminar cigarettes are bought every month...making Charminar one of the world's top selling cigarettes.

There's nothing like Charminar—India's greatest cigarette!

THE VAZIR SULTAN TOBACCO COMPANY LIMITED

MAKERS OF INDIA'S GREATEST CIGARETTE!

CAS/VS-3

in need of foreign capital would give such guarantees and gradually begin to borrow directly on the world market.

Underlying Problems

Even if they eventually did so, however, the Bank would not be able to wind up in contentment. For the view that unhindered movements of private capital would be sufficient for the needs of underdeveloped countries, if it was ever held, has undergone much modification. In particular, the Bank sees two problems which private investment would not be able to solve. First, there are services which are essential to development, but which do not yield a monetary return on investment, at any rate in the short run. The most important among them are schools and roads. Second, there are investments which yield a monetary return, but the balances of payments of some countries are too adverse to permit the transmission of profits abroad. Private capital would be very reluctant to help in these cases, and it is incumbent upon the Bank to step in.

The Bank's answer to these problems is the International Development Association. The IDA, which was founded in 1960, shares its administrative machinery with the Bank. The difference between them is that there are no conventional rules governing the lending of the IDA, regarding interest, terms of repayment or the currency in which capital and interest are to be repaid. In practice, the IDA has been giving interest-free loans repayable over fifty years.

In its first fourteen months, the IDA gave loans worth $101 million; in the three years that followed, the amounts were $134 million, $260 million and $283 million respectively. It is evident that the demand for its loans has risen rapidly. And it does not just reflect demand diverted to a cheap source of funds, for all the IDA loans can be identified as either loans for services that are not priced or loans to countries in payments difficulties. And the relative magnitudes of the two kinds of loans are significant. The International Monetary Fund publishes an annual report on exchange control in member countries. If we judge the gravity of the payments positions of countries on the basis of the stringency of their exchange control, it appears that over 80 per cent of the IDA loans in the last two years have been to countries in payments difficulties, and less than 20 per cent to countries in comfortable payments circumstances for investment in unpriced services.

Thus, the IDA meets real needs, and its efforts can only be commended. Its prospects of success are, however, a matter of concern. Hitherto, the World Bank has sold off over a fifth of the loans given by it, and borrowed to cover more than a third; repayments amount to 9 per cent of the loans given. These sources of funds are, however, virtually closed to the IDA. Since it has no income, it cannot borrow; nor can it sell its loans. Its repayments are going to come in much more slowly than the Bank's, and will not necessarily be in convertible currencies.

Thus, the IDA will have to depend almost entirely on members' subscriptions and interest-free loans from the Bank. Members' initial subscriptions, amounting to $782 million, were fully committed by mid-1964, and precipitate action had to be taken to raise the resources. The total subscriptions promised at present are $1540 million. IDA loans exceeded $1000 million at the end of 1964, so even the raised subscriptions might be fully committed by the end of 1965. Further increases in subscriptions will depend on the inclinations of member countries and might well suffer from their preference for national control of nationally given credits.

So the IDA seems likely to depend on the Bank for regular additions to its resources. This year the Bank gave the IDA $50 million and stopped putting the revenue from the 1 per cent commission on disbursed loans into the Special Reserve which had to be held in liquid form. However, the commission revenue and the annual profits together are the upper limit of what the Bank can give the IDA every year. They came to $131 million in the financial year 1963-64 and will decline in the future if the Bank's lending falls. Considering that the IDA lent $418 million in 1964, no practicable contribution from the Bank's earnings will be adequate. Hence it is probable that the IDA's loans will fall short of demand for them, and arrangements are called for either to supplement IDA's resources regularly or to reduce the demand for loans. Hitherto all efforts has gone in the first direction; here we shall explore the possibilities in the second.

The problems which led to the inception of the IDA, can, however, be tackled more directly. Let us take the first one, viz, that investment is necessary in services which do not bring a monetary return. Two possibilities immediately come to mind here: one might either change the conventions about pricing and charge for services that are normally free; or one might make some other charges to pay interest on investment in free services.

It is perfectly possible to make charges for the use of roads, education, water supply, etc, and many of these services are often sold at a price, or their use entails the payment of a tax which may or may not vary with their consumption. It is, however, common to underprice them or make them free goods because some objective of policy—e g equity, literacy, hygiene—is served by the encouragement of their use.

This does not, however, preclude the raising of prices or taxes in other sectors. Such a policy was implicit in the loans given by the Bank earlier for roads, irrigation projects, etc, and no arguments for its abandonment have emerged. If, however, loans for the provision of free services become widespread, the tax structure in underdeveloped countries will have to be adapted for their servicing. In fact, it is evident that for loans spent on primarily home produced goods, like roads and schools, tax revenue and external loans are alternative sources of finance; and the better the fiscal organisation the lower the need for external finance.

Tax System

The design of the system of taxation, therefore, invites more attention than the World Bank has devoted to it. Hitherto the Bank has concerned itself only with overall fiscal policies, and often urged the limitation of deficit budgeting, insofar as it worsens the balance of payments and makes the servicing of the Bank's loans difficult. Since budget deficits are generally incurred in response to powerful domestic forces, its advice goes unheeded. However palpable the connection between budget deficits, inflation and the balance of payments might be, the plea for fiscal discipline is bound to sound weak in the face of the growing needs of public investment and administration in underdeveloped countries. A much more effective and lasting contribution to fiscal discipline would be made, however, if they were helped to develop tax systems which would enable their revenues to keep pace with their needs.

Most underdeveloped countries rely heavily on taxes on commodities which can be taxed at a small number of points—goods entering international

trade or manufacture goods. Such a tax regime has its virtues: its cost is extremely low and the scope for evasion limited. But its base is narrow, and it is ill adapted to the aims of growth and equity. If we take these objectives into account, we must look for tax systems which restrain consumption, which are progressive and particularly hard on non-functional incomes, and which are difficult to evade.

Restraint of consumption generally calls for an effective land revenue. Not only is the land-based population the largest group of consumers, it also produces goods on which a large proportion of incomes is spent. Hence the commodity pattern of goods released by their taxation corresponds closely to the needs of the growing urban populations. The initial problems of setting up a land revenue system are formidable, and might often require changes in land revenue and ownership; but once it gets going, the problems of assessment, ascription and collection are comparatively simple.

It is difficult to devise taxes that are progressive and difficult to evade, since a high proportion of the taxable persons in underdeveloped countries are self-employed. But there are certain status-symbols or familiar forms of wealth display in all societies—buildings in some, marriage ceremonies in others—and their taxation can be progressive and effective. There is some scope for progression in land revenue as well.

Payments Problem and Integration

A more detailed analysis of fiscal policies would unduly stretch the limits of this paper; the above remarks make it evident, however, that some radical improvements in the tax structure of underdeveloped countries are possible. This list of improvements is by no means exhaustive; more detailed suggestions, however, can only be made on the basis of the particular institutional characteristics of the countries. Their rural character and the importance of small enterprises raise problems of efficiency and economy of taxation for which no general treatment is available, and where solution must depend on the study of local conditions. The Bank is in a very favourable position to initiate such studies, and in view of their bearing on the servicing of loans, its interest in them is manifest.

Payments difficulties have beset a very large number of countries, and their resolution has absorbed much administrative effort. The devices of import substitution and export promotion are familiar and widely used. There is often much scope for the use of information about long-term prospects of demand for products and about substitution possibilities in policy making; but given their state of information, countries know the rules of trade policy, and their practice cannot be greatly improved. But compared to marginal improvements in the techniques of antarky, the potential gains from planned international specialisation are considerable. While it is not possible to set limits to the range of industries particular countries can run with advantage, there are, in every region, countries which have a definite superiority in the production of particular goods by virtue of their mineral or agricultural resources; and however contestable the general argument for free trade might be, it is least equivocal in respect of free trade in these goods.

Such commodities are often the subject of bilateral trade agreements today. On balance, the bilateral agreements probably result in mutually advantageous trade which would not take place in their absence. Owing to their restricted international scope, however, they are liable to divert trade from less advantageous channels; and since they are shortlived, they do not result in enduring patterns of specialization. Hence it is advisable to move in the direction of more permanent multilateral arrangements.

Such arrangements could take many shapes; the following is suggested only as an illustration. A group of neighbouring countries might select a set of commodities including some in whose production each individual country has an absolute advantage, and agree to allow free trade in these commodities and their derivatives within the region. This would prevent inefficient import substitution in these commodities, and at the same time obviate the necessity for import substitution by providing for the growth of exports. The river Parana, the Caribbean and the Indian Ocean are convenient nucleii for such trade regions.

Of the problems associated with trade groups, many can be anticipated and tackled in advance. First, an attempt must be made to ensure that the regional exports and imports of each country balance and grow *pari passu*; thus, the selection of commodities to be freely traded will have to be preceded by a detailed study of the prospects of growth of their demand in individual countries. Second, a clearing house would be required for the exchange transactions arising from regional trade; and the stability of the agreement would be safeguarded if the clearing house were accompanied by the provision of credit to finance the short-term swings in countries' regional balances of payments. Such a fund could also be replaced by a free market in the currencies of the region. Third, it would be difficult to choose commodities in such a way that no two countries compete in their production. Hence it would be necessary to choose a large enough number of commodities for each country to ensure that a fall in the exports of one of them would not cause a serious imbalance in the country's trade with the region. Further, it would be advisable to diversify steadily the production of exportable goods and the set of freely traded goods exported by each country, so that its dependence on individual commodities is reduced.

Regional Trade Groups

Regional trade groups can solve the problem posed by the weak payments circumstances of the World Bank's clients. For the problem arises because the Bank's loans are spent largely on capital goods produced by a few industrial countries, and the clients' balances of payments with these countries are weak, so that they cannot repay loans in currencies that other borrowers can use. Now, if these capital goods are included in the set of goods to be freely traded in regions, the countries in that region can use loans in the currency of the regional producer of capital goods. Thus, the number of currencies in which the World Bank can give loans and accept repayment will increase, and the growth of regional trade will ameliorate the problem of their scarcity and inconvertibility.

The rationale of regional trade groups is simple. The practical problems of research and organisation are, however, formidable. So are the problems of political co-ordination and of the planning and finance of investment. But they are problems that the World Bank could tackle most effectively. Not only is the Bank capable of organising co-operative effort of this magnitude, it can also, by the provision of finance, help in the realisation of plans and create sanctions against their failure. The characteristics of the Bank which have minimised the risk of default can be used to ensure the success of trade groups. They point the direction in which the Bank's activities could most fruitfully move.

The National Council's Strategy for the Fourth Plan

T N Srinivasan

In April 1964, the Perspective Planning Division (PPD) of the Planning Commission circulated its Notes on Perspective of Development, India 1960-61 to 1975-76.

These notes provided a wealth of information on input norms, capital co-efficients, demand projections, etc. In fact the notes can be described as a "do it yourself planning kit". All you have to do to produce your own Fourth Plan on the back of an envelope is to change the PPD numbers here and there to suit your prejudices, biases, and tastes.

This is a critique of one such attempt.

(The author, and not the organisation he is associated with, is responsible for the views expressed in this article.)

UNDER the "direct supervision and guidance" of its Director General, the National Council has come out with its own strategy for the Fourth Plan. The preliminary version of this strategy was in circulation in September 1964. The final version was published in November 1964. There are some interesting omissions in the final version as compared to the preliminary. More about this later on.

The Council starts with the premise that the provision by 1975-76 of a minimum consumption expenditure of Rs 27 per capita per month for the poorest 5 per cent of the population will involve a drastic redistribution of consumption expenditure if national income were to grow at 6.8 per cent per annum during 1965-66—1975-76. Lorenz concentration coefficient will have to fall from 0.33 to 0.034.[1] On the other hand if redistribution is not feasible, the attainment of the minimum consumption objective will involve a very high and unattainable rate of growth of income. The Council then argues that since redistribution of total consumer expenditure to the required extent is not feasible in one stroke, one might attempt to achieve it in stages. First redistribute the main item of consumer expenditure, namely, cereals and pulses. The other items could then be taken up successively in decreasing order of their share in consumption expenditure. Thus the Fourth Plan is the "cereal redistribution plan", to be followed up presumably by a "cloth plan", a "house plan", and a "fuel and light plan", a "durables plan", etc, in successive quiquennia!

How is the redistribution going to be achieved? In urban areas it will be through rationing and in rural areas through a programme of part-time employment in rural works (with wages paid in cereals) of the poorer sections of the population.

This redistribution scheme and the associated rural works form the core of NCAER strategy. One must keep in mind the following facts while examining this scheme. First, the data from 15th round of NSS show that expenditure on cereals and their substitutes constitute nearly 42 per cent and 24 per cent of total consumer expenditure in rural and urban areas respectively. Thus redistribution of cereals implies redistribution of sizable chunks of consumer expenditure. Second, the distribution of cereals among different expenditure groups in both rural and urbans was markedly more even than total consumption expenditure. The Lorenz concentration ratios for *quantity of cereals* consumed were 0.14 and 0.08 in rural and urban areas respectively while the corresponding figures for total consumer expenditure were 0.30 and 0.35. Thus inequalities are very pronounced in other items of expenditure such as on health, education, etc. These inequalities will be reduced as free compulsory primary education, scholarships for higher education, extension of health services, etc, become available in increasing amounts. The NCAER strategy involves a reduction of concentration ratio in consumption of cereals to roughly one-ninth of the above already low values in *five years*. This is to be considered in light of the NCAER view mentioned earlier that reduction of concentration ratio in total consumption by the same extent in a *decade* is not possible[2]. Third, NCAER seems to be implicitly assuming that a substantial portion of any levy imposed on rich farmers to finance the rural works cum redistribution programme will cut into their consumption (of cereals in particular) rather than into their savings. It may in fact happen that these farmers might prefer to maintain their consumption of cereals at the expense of a reduction in other items of consumption or savings. A levy in kind will not solve this problem. It may only result in a reduction in marketed surplus thus jeopardising the urban "minimum consumption for all through rationing" scheme of the Council.

The Council does some computations on the burden of the levy by imagining an average village and applying to it the cropping pattern and yield rates prevailing in three states. It is not at all clear what these computations are supposed to illustrate. Be that as it may, different sections of the paper relating to this levy are not even consistent with each other.[3] For instance, according to Table 17 of the paper, rural works will create 1,933 million man days of employment in 1970-71. Assuming that the number of villages remains the same as in 1961, this amounts to an employment of over 3400 man days in 1970-71 for the hypothetical average village, requiring 10.2 tonnes of cereals as wages. The "illustrative" computations are based on 2,500 man days of employment! Besides, the gross cropped area assumed for the computations corresponds to 1953-54 rather than to the figure for 1970-71 given in Table 13 of the paper! Yield rates assumed are those of 1960-61. One could at the very least have worked consistently with figures relating to 1970-71 for production and areas given in Tables 10 and 13 to derive the implied yields.

One can in principle separate the problem of redistribution of consumption from that of capital formation through rural works. In fact, as the Council itself points out, our plans did make provisions for rural works. If one wishes, one can separate out a rural works component in the total invest-

ment proposed by PPD for agriculture. In this sense the rural works aspect, as such in the NCAER strategy, is nothing new. However, as the Council points out, the rural works programme of the Plans have not been a great success. When it comes to devising a concrete scheme for identifying and making rural works a success, the Council's contribution is rather meagre. It amounts to just two recommendations: (1) put all rural works programme under a Central Ministry and (2) employ retired NCO's of the Army to supervise the works.

The NCAER strategy relating to Industries, Minerals, Transport, etc, could have been passed over without comment except for the interesting omissions in the published version as compared to the draft. In the draft the section on industry stated "No material balances for the industrial sector were prepared by the Council. Those prepared by the PPD have, therefore, been relied upon". The section on Minerals said "The target for mineral production are broadly based on PPD material balances,...". In the published version, the Council has omitted all references to PPD. The targets in the published version, almost in all cases, are identical with those in the draft. Are we to assume that the Council did its own material balancing in the time-span between the two versions to check the internal consistency of various targets thus confirming the PPD exercise and therefore no reference to PPD need be made?

One is tempted to ask the following question as well. If a redistribution and rationing scheme for cereals and one or two other essential consumer goods of the order envisaged by the Council could in fact be carried out, one can also carry out much bolder programme of capital formation in basic industries than the Council recommends. After all the rationing scheme will suppress the deleterious consequences of a wage-goods price inflation that might otherwise take place. Why did the Council refrain from applying its resources to identifying (and suggesting remedial action on) the factors that inhibit faster growth in sectors of our economy other than agriculture? Surely the Council cannot hold problems of mobilisation of financial resources to be the limiting factor.

Notes

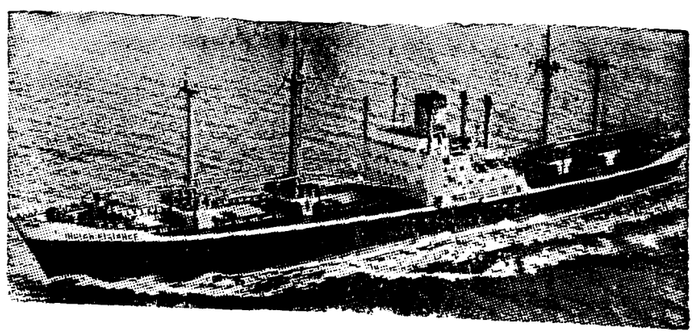
[1] I have not verified this computation of NCAER.

[2] The above discussion assumes that the data from NSS 15th round (1959-60) could be taken to represent the consumption distribution even in 1965-66. The comparison of initial and target concentration ratios does not necessarily indicate the magnitude of the task involved in going from one to the other.

[3] The Council does not indicate how the cereal consumption of the upper income groups in rural areas are to be kept down to the levels indicated by it. True, the levy is to be progressive. But this progression with respect to size of land holdings cannot be easily converted to progression among different per capita expenditure groups other than those covered by the rural works programme. Besides, as we mentioned earlier, a levy can redistribute income but not necessarily consumption.

On towards progress . . .

India Steamship Co., Ltd., has a steady record of progress... Since Independence, its tonnage has increased from about 85,000 D.W. tons to over 200,000 D.W. tons—more tonnage being still on order.



Its services are also extending to various trade routes. After initial consolidation in the India-U.K.-Continent trade—the Company entered the Indo-Soviet service to the Russian Black Sea ports in 1956 and later to Rumanian ports. In 1959 the Company forged still another link in the overseas with South America, and in 1960 it extended its service to Poland.

Their experience and reputation for fast, efficient and dependable service built on the personal care given by their experienced officers and crew to the cargo entrusted to them, have earned them the goodwill of their customers.

GOI's Decision-Making Apparatus

Through the Foreign Investor's Eyes

Anant R Negandhi

This article examines the foreign investor's reaction to the Government of India's "pragmatic" policy on foreign investment in India and to the official procedures for approval of such investment.

The necessary data were collected through a questionnaire survey in the United States of American companies which had invested in India or were contemplating such investment and personal interviews in the United States and India with executives of U S, British and Indian companies.

(Most of the data used in this article were collected for the author's Ph D thesis on "An Evaluation of the Private Foreign Investment Climate in India" at the Graduate School of Business Administration, Michigan State University, Michigan, U S A. The author wishes to express his thanks to Dr Claude McMillan Jr, Dr Dalton E McFarland, Dr Richard F Gonzales and Dr Edward W Smykay, all of Michigan State University.)

LIKE most of the developing countries, India's economic development heavily depends on the availability of managerial and technical know-how and foreign exchange. One of the ways to solve the problem of shortages of foreign exchange and managerial and technical know-how is to invite foreign private investors to India. Indian planners seem to have realized the potential of this media for promoting economic development in India. Recently the Finance Minister, Shri T T Krishnamachari, said: "I think the stage has come when we would be justified in opening the doors even wider to private foreign investment."

Not Enough Investment

However, in spite of our need and desire to increase the inflow of foreign private investment, such investment has remained quite inadequate. To carry out successfully envisaged economic plans we need some 300 million dollars investment a year from abroad, while the rate of investment from such sources has been approximately 100 to 120 million dollars a year. Moreover, the need of foreign private investment is likely to increase greatly in the Fourth and Fifth Five-Year Plans. For example, the preliminary figures released by the Government suggest that the total investments of the Fourth Plan will be Rs 21,500 crores to Rs 22,800 crores. The Plan envisages an over-all growth rate of about 6.5 per cent per year. Now if the Fourth Plan is to reach its targets, over-all private investment will have to be about Rs 7,000 crores, and private foreign investment will have to rise to four to five fold over the present rate.

The large gap between the supply and demand of foreign private investment in India has prompted researchers to undertake a comprehensive study of the Indian foreign investment climate.[1] In this research the following factors were investigated:

(a) Indian socio-economic and political environments and the foreign executives' evaluation of these conditions.

(b) Factors or Indian policies influencing investment decision of foreign investors in India, and their evaluation of these policies.

(c) Market potential and profitability of foreign ventures in India.

To collect the necessary data for this study a questionnaire survey in the United States and personal interviews in the United States and India were conducted. The questionnaire was distributed to some 188 American companies either having investment or contemplating such investment in India. Personal interviews were conducted among 82 top ranking executives of American, British and Indian companies. The entire field research was undertaken during the period between October 1963 and April 1964. Prior to this, extensive library work was done to collect factual data concerning Indian socio-economic and political environments and specific Indian policies affecting foreign private investment decisions.

The findings of this research seem to suggest that the Indian socio-economic and political environments, market potential, profitability of foreign ventures, and the Indian Government's attitude towards such investment are quite favourable in India. And these were regarded as such by the foreign executives investing in India. However, the research discovered that the excessive red tape and bureaucracy in the government, indecisive foreign investment policy and high tax rates were the main factors retarding the inflow of foreign private investment into India.

The favourable factors in Indian investment climate has been discussed and analysed elsewhere by the author.[2] Such unfavourable factors as red tape, and indecisive foreign private investment policy of the Indian Government will be discussed and analyzed in this paper. The Indian taxation policy has been examined by many authorities, and readers interested in this subject should examine the excellent research work of the National Council of Applied Economic Research.[3]

Red Tape and Bureaucracy

As said above, one of the main obstacles to securing foreign private investment or collaboration is the slow and cumbersome working of the Government control apparatus. The formidable array of forms to be executed and officials to be consulted greatly discourages both the domestic investor and the foreign investor or collaborator. One can easily visualize this difficulty of the foreign investor by merely looking at the procedural formalities he has to go through to obtain approval of the Indian Government. Under present procedural formalities, he must obtain:[4]

(a) An industrial licence under the Industries Development and Regulation Act of 1951.

(b) Approval from the capital goods and foreign agreements committees.

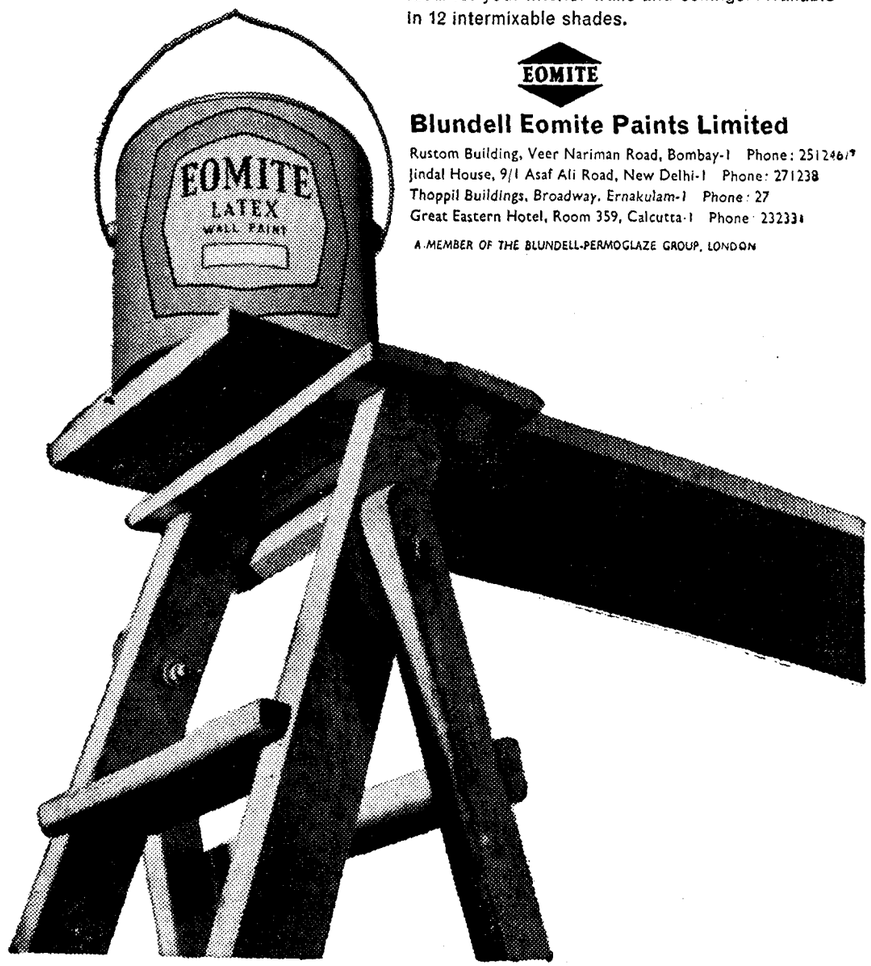
(c) A consent for the issue of any capital stock under the Capital Issue Act of 1947.

(d) A license to import capital equipment and machinery under the Imports and Exports Act of 1947.

(e) An approval from the Reserve Bank under the Foreign Exchange Regulation Act of 1947.

(f) A certificate of incorporation under the Indian Companies Act of 1956.

The net result of these excessive control measures is the creation of unnecessary red tape at all levels. And this irritates both the domestic and foreign investor. The latter, however, is more sensitive in that he always has the opportunity of going elsewhere to obtain quick approval for his investment.



A majority of the foreign executives interviewed, approximately 87 per cent of the total, in the United States and India and responding to a questionnaire survey in the United States mentioned that red tape and slow decisions on the part of Indian Government officials were the main obstacles to investment in India. Their indictment of red tape and excessive controls can easily be seen from the following statements.

An American executive in the United States said:

> They [Indian government officials] are as slow as molasses in January ... we are in many countries, and India tops them all in red tape and

BLUNDELL EOMITE ARE ONE STEP AHEAD WITH THEIR NEW LATEX WALL PAINT

Blundell Eomite's new 'Eomite' Latex wall paint adheres to new, surface-dry plaster and cuts unnecessary delay. Here is the paint, interior decorators in India have been waiting for so long. Supplied in an economical paste form this mild and alkali-resistant wall paint is diluted with water and applied with brush, roller or spray. It 'takes' to cement and lime plaster, concrete, brick-work, asbestos sheeting and building board. Quick-drying, opaque and spongeable, 'Eomite' Latex wall paint is ideal for your interior walls and ceilings. Available in 12 intermixable shades.

> time consumption. You cannot move without innumerable trips to New Delhi.

An American executive in India said:

> ... bureaucratic red tape and delays are particularly irritating, to the point that in certain cases we have foregone opportunities rather than fight through the procedural battle.

Yet another American executive said:

> Red tape has been fantastic ... we budget ten times the usual required executive time ... It is difficult to do business with the Indian Government at least insofar as starting a corporation is concerned. We find the Indian officials very hard working, very well informed and very gracious, but because so many are or seem to be involved in most decisions, a decision is difficult to obtain.

Red tape and excessive Governmental bureaucracy also were considered the main problems faced by businessmen operating in India. For example, of the 54 U S and British executives interviewed in the United States and India, some 44 executives (81.4 per cent) mentioned red tape as the main operational problem.

Many of the American and British executives interviewed in the U S and India showed much concern about the conflicts that exist among different agencies of the Indian government. Conflicting objectives from agency to agency with no means to coordinate them and to resolve the conflicts result in additional delays.

Investment Policy

There is no single formal document that can be cited as laying down Indian private foreign investment policy. The Indian Government's attitude toward private investment is mainly reflected in the Indutsrial Policy Resolution of 1956 and various high-level pronouncements made from time to time. The industrial policy statement of 1948 set the early pattern for foreign private investment in India. In this statement it was said that foreign industrial know-how should be sought, but effective controls of new enterprise should be in Indian hands except in unusual cases calculated to serve the national interest.

The Indian Industrial Policy Resolution of 1956 thus prohibits establishment of majority-owned subsidiaries by foreign investors. However, in recent years this rule of minority participation has been disregarded. For example, English Electric Company, Consolidation Pneumatic Tools Company, Asahi Glass of Japan, W W Sprague of the United Kingdom, Parke Davis of the United States, Atlas Copco of Sweden, Johnson and Johnson of the United States, Hoffman-LaRoche of Sweden, Italian Ceat Croma, and Merck, Sharp and Dohme Company of the United States were allowed to own a majority in their Indian operations.

Thus, there is little about Indian private foreign investment policy that is rigid. The Indian Government is guided by pragmatism. The Government does not wish to establish rigid approval patterns that cannot be changed should the times or the specific case so demand. It wishes to avoid any form of rigidity and to keep a flexible position so that it can say yes to a wholly foreign-owned venture if the "merits" of the case demand such approval.

However, this pragmatism in policy both helps the foreign investor and adds to his problems. He has no clear-cut answer as to what will be approved and what will not be approved by the Indian government.

A majority of the executives responding to the questionnaire survey and interviewed showed much concern about the flexible attitude of the Indian Government in this regard. They considered this fexibility as a sign of "unbalanced mind" of the Indian Government. This can easily be seen from the following statements of Indian, British and American executives.

An Oxford-educated Indian executive said:

> Changing our investment policy from time to time hurts us more and creates suspicion in the eyes of foreign investors. We should be very clear from the beginning about our policies.

An American executive said:

> [Indian] policies may be fair but the Government of India cannot make up its mind ... and frequent changes in the policies create uncertainties in our mind and do not give us confidence to expand or grow ... changing policies also create frustration.

A British executive in India said:

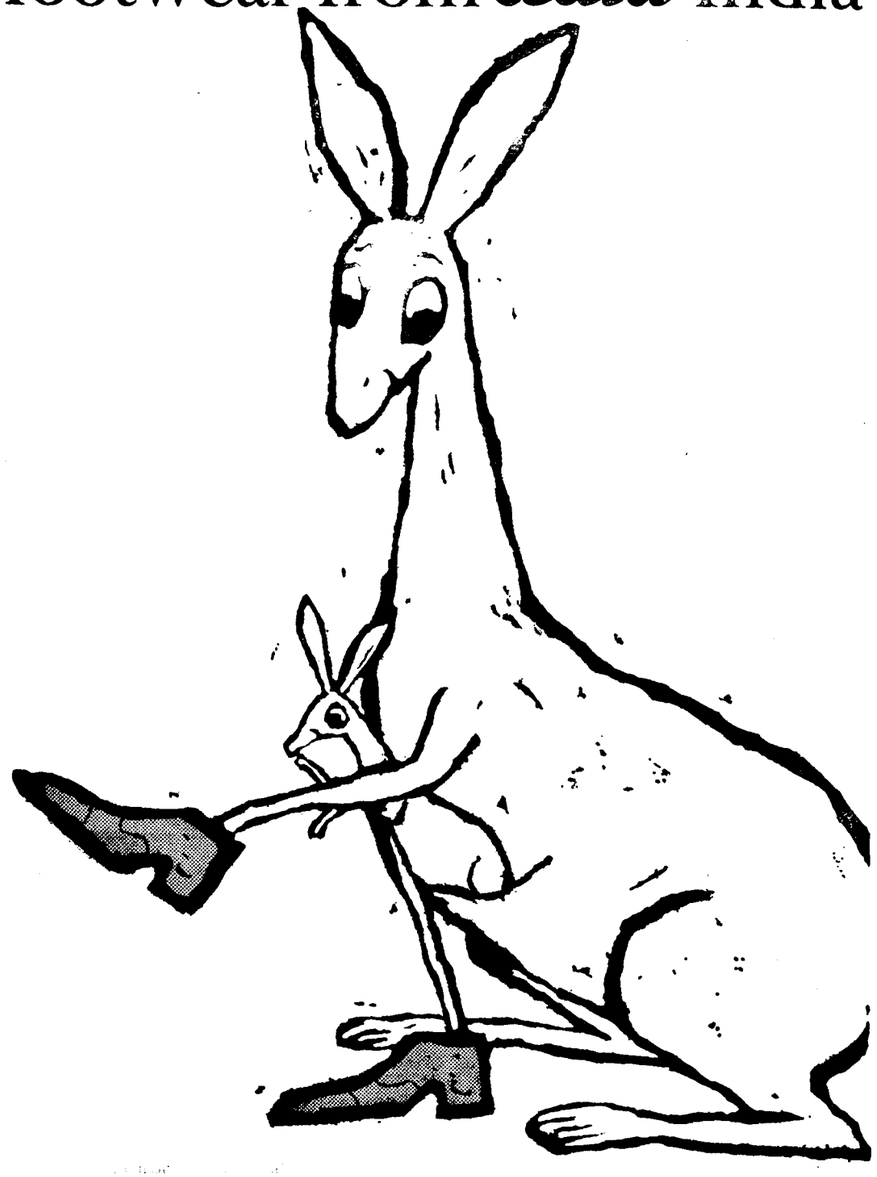
> No general guidelines for what will be approved and what won't ... even Pakistan has general guidelines ... it is very frustrating for the foreign investor.

Conclusions and Recommendations

We have seen that excessive red tape and bureaucracy in the Indian Government and indecisive foreign investment policy are the two most important factors retarding greater inflow of foreign private investment in India. The third important factor retarding such investment is the high taxation in India. The relative importance of these factors in retarding investment in India was also confirmed by yet another finding of this research. To pinpoint the specific factors retarding foreign private investment in India, some 54 executives of American and British companies in India were asked to mention factors or policies which must be changed to increase their investment in India. Their responses to this question are as follow:

Of the 54 executives, 36 executives (66.7 per cent) said that, in order to attract investment, the Indian Government must improve its administration machinery and should get rid of excessive red tape. Some 34 executives (62.9 per cent) suggested that the Indian government should not oscillate in its policies, while 21 executives (38.9 per cent) suggested some changes in tax structure. Other changes suggested by these executives were:

Changes in Policy	*Per cent of Total 54 Responses*
Foreign exchange should be liberalized	*14.8*
More consideration be given to economic size	*1.8*
Repatriation policy should be liberalized	*1.8*
Excessive controls should be removed	*3.7*
Availability of raw materials and technical personnel should be improved	*5.5*



Of the three most important factors retarding foreign private investment in India, namely, excessive red tape and bureaucracy, indecisive foreign investment policy, and taxation policy, the first two factors were investigated in this paper. The third factor, Indian taxation policy, has been discussed and analyzed extensively by the author elsewhere and also investigated by such authorities as the National Council of Applied Economic Research.

Other factors such as Indian socio-economic and political environment, market potential and profitability of foreign venture in India have been termed as favourable by foreign investors investing in India.

The findings of this research seem to suggest that extensive red tape and bureaucracy in the Indian Govern-

COUNTRIES WE EXPORT TO (6)

Australia has purchased in 1964, 125,000 pairs of footwear from Bata India

ment and indecisive foreign investment policy of the Government are hurting India as far as investment from abroad is concerned. What can India do to remove these two serious obstacles and impediments to foreign private investment? An attempt has been made to provide an answer to this question below.

It is indeed true that in recent years, the Indian Government has made several attempts to introduce expeditious procedures. For example, last year the Government appointed a committee known as the Industries Development Procedures Committee headed by T Swaminathan, Secretary of the Department of Supply and Technical Development to review the operation of controls applicable to the establishment of additional industrial capacity in the country, the import of capital goods, and the issue of capital and foreign investment and collaboration. The committee in its interim report recommended the issue of a "letter of intent" within a month from the date of receipt of an application to start an enterprise. This new procedure is intended to give the applicant the earliest opportunity for finalizing other parts of his projects like the terms of foreign collaboration, import of capital equipment, issue of capital and other related matters and would broadly indicate the conditions on which the Government would be prepared to consider the grant of a license.

This may alleviate some of the problems and difficulties of foreign investors in India, but much more needs to be done yet in the direction of procedural reforms. To decrease red tape and bureaucracy in decision-making, we should identify therefore the main sources of red tape.

One of the most potent sources of delay is in the issue of import licenses.[5] The procedure known as "screening for indigenous availability" is adopted for issue of an import license. This procedure requires applicants for import licenses to obtain a number of "refusal letters" from indigenous suppliers before they can be given the license. This procedure is very circuitous and time consuming, and it is doubtful whether the resultant saving in foreign exchange is worth the loss to the nation through delays in implementing new projects.

Another source of delay in obtaining foreign collaboration approval is in securing an industrial license, necessary under the Industries Development and Regulation Act of 1951. It is believed that the implementation of this act has created serious obstacles to industrial progress. For example, the Indian Engineering Association's research suggests that the present system of industrial licensing control has led to indecision or to arbitrary decisions and has provided unnecessary scope for the misuse of power. To alleviate this problem the Association has suggested a change in the method of issuing the industrial license. Under the new system, the purpose of industrial licensing would be simply to register or record the intentions of the various parties proposing to set up new projects or to expand existing ones. The advantages of this procedure according to Engineering Association are:

(1) Industrial projects would be implemented more speedily through the elimination of a major source of procedural delay.
(2) An industry would become more efficient through the removal of artificial restrictions on competition and through the establishment of units of an economic size, resulting in lower prices, improved quality, and increased capacity to compete in export markets.
(3) Unnecessary duplication of controls and multiplication of government decisions would be avoided, thus enabling both the administration and applicants for licenses to attend to other more important work.
(4) The full potential demand of industry for raw materials, electric power, fuel, transport, etc., would be duly registered with the authorities concerned, thus enabling more realistic planning ahead for the vital sector of the economy.
(5) Industrial licenses would cease to be a marketable commodity, and current speculation on trafficking in licenses would be eliminated.

The Engineering Association's suggestions merit the serious thought and consideration on the part of Indian planners.

Yet another source of delay in obtaining the Government's approval is the division of responsibility among various Government authorities for approving new projects. This involves the foreign businessman in several trips from one Ministry to another or between the Central and State Governments. It is therefore desirable to concentrate the various discussions and decisions relating to each project at one particular point as far as possible. One possibility here would be to give a greater measure of responsibility to the State Government to approve and promote industrial projects within their borders.

As we have seen above, there is no single clear-cut policy which reflects the attitude of Indian Government toward foreign private investment. So far, the Government has been pragmatic in implementing this policy. However, the pragmatism itself has become an inhibiting factor and is looked upon by the foreign executives as a sign of "unbalanced mind" of the Indian Government.

Indian planners, however, always have taken pride in being flexible in their policy measures. But if the flexibility creates suspicion and uncertainties in the minds of private investors, then indeed it is time for the Indian Government to make up its mind about what they want. In particular, as pointed out by one of the foreign advisers to the Indian Investment Centre, there is an urgent need for general guidelines concerning what will and what will not be approved by the Indian Government.

There is also a need to spell out clearly policies concerning the following:

(1) Rules on equity;
(2) Royalty payments; and,
(3) Payment for such intangible assets as research and development.

Quality tools from quality steel

In 1923, a new Indian industry was born when the manufacture of improved agricultural implements of steel was started at Jamshedpur. In 1925, The Tata Iron and Steel Company took over the Agrico factory, and, for the first time in India, diversified production to include essential implements, such as hammers, shovels, picks, beaters and crowbars.

For the past 40 years, Agrico has helped to provide the farmers on the field and workers engaged in the construction and maintenance of roads and railway tracks, bridges and dams with improved varieties of tools.

Agrico now produces annually 4 million pieces of implements, scientifically designed, and forged in one piece from high-grade Tata carbon steel. Strict supervision at every stage of manufacture ensures the high quality and durability that have made Agrico implements the first choice of users throughout the country.

Poverty, Automation and Civil Rights in the US

Philip G Altbach

Since the end of the Second World War a profound change has taken place in the American economy. So much of the industrial process has been mechanised that a large segment of the industrial work force is threatened with permanent unemployment. Automation, or as it is more technically known, cybrenation, has been the primary cause of this second "Industrial Revolution".

Combined with America's growing civil rights movement, automation and its related effects present an unprecedented challenge to the established social order. A social consciousness among American Negroes and a tightening job market spell social discontent if the problems are not adequately tackled.

IN recent months, a good deal of national concern in the VS has been expressed about the plight of workers affected by automation and about the "depressed areas," large pockets of poverty caused by technological change or the exhaustion of natural resources. The coal mining regions of Appalachia on the East Coast are a prime example. Economically destroyed by a shift to oil as a primary fuel, miners are without work and without the prospect of employment. Schools, hospitals, and other social services are inadequate and often non-existent. In short, the area presents a real challenge to the world's richest nation.

Johnson's War on Poverty

President Johnson's War on Poverty is the most graphic indication of the growing national concern about technological change and the poor. It remains to be seen whether this "war" will succeed in effectively dealing with tremendous problems, but it is an example of governmental interest. This article will focus on the issues crucial to understanding America's "second revolution," and the possible solutions which have been put forth in recent months.

Poverty has always been difficult to define in America's affluent society. Many Americans, including sophisticated economists and analysts, have preferred to ignore it. The United States Government states that any family with an income of less than $3,000 annually is poverty stricken. There were 9.3 million such families in the United States in 1964. Many of them receive governmental assistance from any number of local, state, or federal agencies. Some receive surplus food from government stockpiles. Most are under-educated and often lack adequate educational facilities. Minority groups are strongly represented among the poor, particularly Negroes, Puerto Ricans, and Mexicans. The infant mortality rate is higher as is the death rate, and there are more cases of tuberculosis and other diseases.

Coupled with automation and poverty, other factors have made the situation even more difficult. Massive movements of people from rural areas to the cities, and particularly of Negroes from the rural slums of the South to the urban slums of the North, has caused much social dislocation. The revolution of rising expectations has manifested itself among American Negroes and demands for equal employment opportunity, education, and legal status are being pressed vigorously.

A number of statistics show the dimensions of the situation. In the economic sector, the industrial work force in the United States has decreased by 300,000 from its 1957 levels despite impressive gains in productivity and output. Agricultural employment declined from 14 per cent to 7 per cent of total employment. Despite a 17 per cent increase in construction activity since 1956, there has been virtually no increase in jobs. Taking all of the goods producing industries together (agriculture included), this sector shows a loss of three million jobs since 1960. Wage and salary employment went up by 40 per cent between 1957 and 1963. This development took place despite a pronounced deceleration in the rate of gain for white collar workers. More than half of the increase in jobs occurred in the public and personal service sectors of the economy. Thus, in six years, the private, profit making, non-farm sector of the economy generated only 300,000 jobs—or the equivalent of one year's growth in public employment.

It is in this context that the President's Council of Economic Advisers has revised its original prediction that the 1964 tax-cut would quickly reduce unemployment to 4 per cent (a figure still higher than many European nations). In its 1964 Report, the Council said of the unemployment rate, "By the end of the year, it is expected to fall to approximately 5 per cent...but the attainment of the interim goal of 4 per cent lies beyond 1964." All of the above are present trends. They make it clear that:

semi-skilled and unskilled jobs are declining and will continue to do so;

the already mechanised private manufacturing and farming sectors will, through automation, increasingly produce more goods with fewer workers;

the growth sector of the economy, as far as new jobs are concerned, is the "human care," or personal service industry which cannot be cybrenated; and that new markets for housing, schools and social services for thirty-five million impoverished Americans is increasingly important.

Position of Negroes

Negroes constitute about one-fifth of those families below the poverty levels. Furthermore, they have been traditionally the last hired and first fired in American industry. Now, with jobs at a premium and much of the Negro community without adequate educational facilities, their plight is desparate. The civil rights movement, which is acting with so much militancy in both North and South, is beginning to see the relationship of the struggle for equality and the economic situation. Indeed, Negroes have picketed against segregated labour unions in New York City, have demanded pledges of non-discriminatory employment from employers, and have always stressed the need for improved schools.

The depth of these issues has recently been discussed by a number of American commentators. Michael Harrington, a socialist intellectual, described poverty in both human and economic terms in his book "The Other America". This book has spurred the Johnson Administration to step up its efforts in this area and the newly appointed director of the war on poverty,

Quite the most satisfying filter cigarette you have ever smoked—try it and you'll agree.

Rs.2.50 for 20
Rs.1.25 for 10

Peace Corps head Sargeant Shriver, has obtained many of his ideas from Harrington's work. An economist, Robert Theobald, has discussed the economic implications of automation in his book "Free Men and Free Markets". In addition to outlining the scope of the changes taking place, Theobald makes several radical assertions. He states that full employment is no longer possible in the United States and advocates the concept of the guaranteed income, which would assure everyone of an income, regardless of employment status. The guaranteed income scheme would necessitate a redefinition of work and of the "Protestant ethic", which teaches the centrality of work to man's life. Traditionally unprofitable undertakings, such as small farms, skilled handicrafts, and such, would have to be subsidised by the government to insure everyone both adequate income and a satisfying life career. This scheme is somewhat similar to India's village industries programmes. Massive educational programmes would have to be initiated, both to retrain individuals with obsolete skills and also to prepare young people for a radically different economic situation.

Growing National Concern

Harrington and Theobald are still on the radical fringe of American economic and social thinking. But their work has been influential. Men such as Walter Heller of the Council of Economic Advisers and J K Galbraith of Harvard University have urged more radical steps to deal with economic change. Influential journals have featured articles on poverty and automation. *Time* and *Newsweek* as well as more liberal magazines like the *Nation* and *New Republic* have dealt with these issues. *Business Week* and *Fortune*, magazines highly influential in the business community, have taken more notice of economic change. Several conferences have been convened concerning poverty. American students have begun to take an active interest through such organisations as the Students for a Democratic Society, a fairly large left-liberal student movement.

One small group of radical intellectuals has recently issued a manifesto which addresses itself to many of the issues central to America's social dilemma. This group, which calls itself the Ad Hoc Committee on the Triple Revolution, connects the revolutions in automation (economic), human relations (civil rights and equality), and weapons (disarmament) and postulates that far reaching social change is necessary if the United States is to effectively meet the challenges which it faces. It links the Negro struggle with the problems of automation and states that there is no real solution to the Negro problem without substantial economic readjustment. The Committee advocates a substantial reduction in American military spending so that funds can become available for needed projects. It indicates that the immensity of military expenditures in and of itself creates economic problems because many areas have become dependent on arms production and that there is a problem in converting these large sums of money, totalling more than 50 billion dollars annually, to peace-time purposes. It attacks conventional military strategists for continuing to rely on "overkill capacity" and states that the United States could cut its military budget substantially without interfering with its defence position. Finally, the Committee on the Triple Revolution urges that the idea of the guaranteed income be seriously considered and that American intellectuals, economists, and political leaders think seriously about the three-pronged challenge of automation, human rights, and weapons.

Small Beginning Only

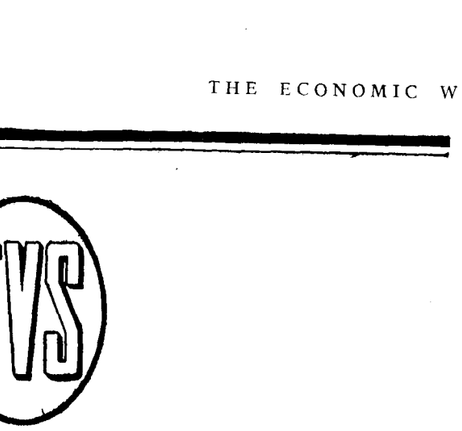
The reaction to the Committee's statement has been remarkable. While most radical intellectuals are ignored by the broader society, the Committee has received widespread publicity and serious attention. Newspapers have printed editorials on the statement which, though usually sharply critical, do admit the importance of the issues presented. Magazines with large circulations have commented extensively on Committee's ideas. Academic figures have devoted more attention to the poverty issue and economists have turned their attention increasingly to this and related issues.

The most important aspect of concern thus far has, however, been President Johnson's "War on Poverty". While the bill authorising this "war" is not even out of its Congressional committee, a number of drawbacks can be seen in the programme. Several economists have stated that the war is not really a war at all, but merely a small forward step where substantial change and massive funds are needed. The total funds suggested for the "war" constitute less than the annual amount spent on unemployment relief payments alone. The programme of area redevelopment, which is intended to revitalise depressed areas such as the exhausted Iron range in Minnesota and the Appalachia area, is both sorely deficient in funds and provides insufficient emphasis on education. Thus, while the "war on poverty" is an important first step and an indication that both government and big business are aware of the problems that exist, it is only a small beginning.

The Triple Revolution in the United States, and particularly the cybrenetic revolution in the production and distribution of goods is causing massive social change in the United States. This article has indicated some of the problems that face an advanced industrial society in a period of technological transformation. It has also discussed a few of the suggestions for meeting the problem that have been postulated. An understanding of these issues is a necessity if America in the 1960's is to be comprehended adequately, for they are vital not only to America's poor and Negroes, but on the international scene as well.

I D A's Billion

THE credits extended to Mauritania ($ 6.7 million) and to Kenya ($4.5 million) in the last week of 1964 brought total lending by the International Development Association (IDA) over the one billion dollar mark. In four years of operation, IDA has extended 70 development credits totaling $ 1,002,240,000 to 27 countries. The largest share, $ 435.9 million, has been for transportation — railways, highways, ports and inland waterways. The largest amount, $ 777,590,000, has been made available to countries in Asia and the Middle East.



Its 42 credits in Asia and the Middle East totaling $ 777,590,000 have been made to Afghanistan, the Republic of China, India, Jordan, Korea, Pakistan and Syria. Nine African countries — Bechaunaland, Ethiopia, Kenya, Mauritania, Niger, Sudan, Swaziland, Tanzania and Tunisia — have borrowed $ 72,000,000 under 11 credits. Twelve credits totaling $ 96,950,000 have been made in Latin America to Bolivia, Chile, Colombo, Costa Rica, Ecuador, El Salvador, Haiti, Honduras, Nicaragua and Paraguay. In addition, five credits totaling $ 55,700,000 have been extended to Turkey.

From the Chair

Indian Oxygen Limited

Statement of the Chairman Mr N Dandekar

THE following is the Statement circulated by Mr. N. Dandekar, Chairman, Indian Oxygen Limited to the Members of the Company with the Annual Report for the year 1964.

Since our last annual general meeting the nation has suffered an irreparable loss in the death of Jawaharlal Nehru. As a freedom fighter and later as Prime Minister, his contribution to the nation's stature and welfare has been outstanding. More than any other individual he emphasised the need for technological progress in all fields, including agriculture, and the urgency of industrial development in India. The best homage we could pay to his memory would be to work sincerely for the furtherance of these aims.

Your Company will complete thirty years of its existence on 24th January, 1965. Looking back I think we can be satisfied with the significant services we have rendered to Indian industry and I hope that with the wider opportunities which will flow from the growing activities of your Company our contribution to the country's development will be even more extensive in the coming years.

The year under review has witnessed a further rise in the general price level. A state of acute monetary inflation came prominently to the surface in the Indian economy, with an impact which was unforeseen by the authorities in resorting so extensively to deficit financing. We have done our best to tackle the problems posed by steadily rising costs induced by continuing inflation. It is in this context of the country's economic situation that we have to assess the year's results.

Sales

You will see from the accounts that sales for the year totalled Rs. 12.10 crores. This was higher than the previous year's sales by nearly Rs. 1.90 crores, which I am sure you will agree is very satisfactory; nearly all products contributed towards this rise, particularly electrodes, dissolved acetylene and arc welding equipment.

Due to the continuing rises in the cost of production of oxygen, mainly caused by increases in the cost of power and labour, we were reluctantly compelled to increase the Company's selling prices from 1st January, 1964. It is, however, interesting to note that, despite these increases, the Company's average realised selling price of oxygen today is lower than that obtaining more than twenty years ago; this is an achievement which arises directly out of the economies resulting from the increasing scale of our operations.

It also became necessary to increase the selling prices of mild steel electrodes from 1st September, 1964 as a result of the discontinuance of supplies of core wire from foreign sources and an increase in the price of indigenous electrode-steel which came into effect in April 1964 after decontrol.

Profit, Taxation and Dividend

The profit for the year, after providing depreciation of Rs 67,77,754 (previous year Rs 59,66,478), amounted to Rs 1,59,38,213 as against Rs 1,40,40,263 last year. The increased profit was earned on a sales advance from Rs. 10.21 crores to Rs 12.10 crores and reflects largely the improved trading results on electrodes, the production of which increased during the year with better availability of core wire. Our requirement of electrode-quality billets are at present being obtained from Bhilai Steel Plant where rolling of this special quality steel has recently been started; and if continuity of supply is maintained by them a great deal of uncertainty in the timely procurement of this essential raw material will have been removed. The price of electrode-quality mild steel registered a sharp rise during the year and this, together with increases in the prices of other raw materials and in the dearness allowance paid to the staff due to the higher cost of living, reduced slightly the overall profit margin.

The tax provision for the year amounts to Rs 86,00,000, as against Rs 69,33,996 in the previous year. This large increase was due not merely to higher profits but also to the new Dividend Tax coupled with a smaller relief from Development Rebate this year and the absence of the credit of Rs 5,66,000 taken last year by transfer of the remaining balance in Tax Allowance Equalisation Reserve.

Net profit after taxation amounted to Rs 73,38,213 (previous year Rs 71,06,267), out of which Rs 10,00,000 (previous year Rs 19,00,000) has been transferred to the Development Rebate Reserve. After adding Rs 35,587 brought forward from the previous year and transferring Rs 57,170 to Fixed Assets Replacement Reserve, nearly the whole of the balance amounting to Rs 63,00,000 has been transferred to General Reserve leaving a sum of Rs 16,630 to be carried forward to next year.

After careful consideration of the Company's present and future resources position and all other relevant circumstances, your Directors have decided to recommend that the rate of dividend (subject to deduction of tax) should be maintained at 12 per cent. If this recommendation is accepted the dividend will be paid out of General Reserve.

Finance

Capital expenditure incurred during the year amounted to Rs 73,75,060. With the progress of the major projects covered by the Company's Rs 6 crore expansion programme spread over the four years ending 30th September, 1967, to which I referred in my Statement last year, the tempo of capital expenditure will increase during the next three years.

I am glad to say that the financial arrangements for the expansion programme, about which mention was made last year, are nearing completion. The agreement with The British Oxygen Company Limited for a sterling loan of £500,000 was formally executed during the year and the Company has already commenced drawing on this loan. Considerable progress has also been made with regard to the medium term loan of Rs 2 crores which The Punjab National Bank Limited has agreed to provide against pledge of debenture stock; and the necessary formalities for making withdrawals against the loan are expected to be completed shortly. I may add that even when the Company will have drawn fully on these various resources, our Debt/Equity ratio will remain well within the accepted limits of prudent industri-

al financing of growth and development.

Development and Expansion

In my Statement last year I mentioned that the construction of the new factory at Hyderabad was well advanced: I am now pleased to report that the dissolved acetylene plant went into production in March 1964 and the oxygen plant in November 1964.

The Loxite factory at Ranchi was completed on schedule and production commenced there in March 1964.

Erection of the new factory for the manufacture of welding and cutting equipment has begun at Taratala Road, Calcutta, and it is hoped that the project will be completed by the end of 1966.

In the field of electrodes, construction work of the new factory at Madras is proceeding satisfactorily and production is expected to commence there by about the middle of 1965. Expansion of the Khardah factory is expected to be completed early in 1966.

Orders have been placed with overseas suppliers for the argon purification plant to be installed at Bombay.

I am glad to report that we have now received 'letters of intent' from Government for substantial expansion of oxygen capacity at our Calcutta and Visakhapatnam factories and we hope shortly to receive 'letters of intent' for substantial expansion in our oxygen capacity at Madras and Kanpur and dissolved acetylene capacity at Kanpur. We have also received an industrial licence for the manufacture of nitrous oxide at Madras. Your Company's application for an industrial licence for the manufacture of air separation plants and associated cryogenic equipment is still under the consideration of the Government.

Management and Personnel

Since the last annual general meeting, two new directors have joined your Board, Mr S N Ray and Mr K Gopalakrishna; and I am sure you would like me to welcome them on your behalf.

During the year, agreements for wage revision were reached with the Unions of your Company's employees at Head Office and different branches. I am pleased to report that a new feature of these agreements is that they are also linked with agreements relating, inter alia, to productivity, interchangeability and re-deployment of staff. I am confident that this new understanding between your Company and the staff will set the tone for greater efficiency by a better awareness of the responsibility acknowledged to the organisation by the staff.

With the continuing growth of your Company, the need for management training assumes increasing importance. During the year under review two rapid management training courses covering seventeen officers were successfully conducted within the Company. Two officers attended the administrative Staff College at Hyderabad and two others attended residential courses conducted by the Calcutta Management Association. Twenty officers also attended short courses and seminars on various subjects organised by productivity Councils, Indian Standards Institution, All-India Management Association, Calcutta Management Association, Bombay Management Association and Indian Institute of Personnel Management. Nine members of the staff received specialised training in U. K. with The British Oxygen Company Limited; and in this connection, I would like to place on record our special appreciation of the technical assistance extended to us by British Oxygen, whether in training our staff, or in supplying technical 'know-how' and the benefits of development and research, or in making available to us the advice and assistance of their experts who visit India when necessary.

Prospects

It will be evident that we are now well poised for the major developmental effort which lies ahead of us. Almost all the industrial licences we applied for or appropriate 'letters of intent' have been received or will soon be in our hands. All necessary financial resources have been arranged. And technically, whether from the point of view of trained officers and staff or as regards the requisite 'know-how', we are well equipped. With these preparations, we have now entered upon a period of fairly large expansion, involving considerable capital expenditure. While we do so with faith and confidence in the economic future of our country, we should, at the same time, bear in mind the storms and stresses through which we have been passing recently and which are also likely to be encountered in the coming months. In this context, I entertain a feeling of restrained optimism about the prospects for your Company in terms of profits and growth.

Note: This does not purport to be a record of the proceedings of the Annual General Meeting.

SP/EEPC-10/64

"Uneasy lies the head that wears a crown"

No wonder! A crown is the symbol of responsibility. But as an exporter of engineering goods your responsibilities are no less than the wearer of the crown. You are competing with industrially advanced countries in a field where precision and quality are in the greatest demand. The nation is anxious to see that the reputation earned by her products abroad is maintained, if not improved upon, and the flow of foreign exchange to the country is consistently increased.

The nation's anxiety and uneasiness on this score can be overcome only if every manufacturer endeavours to introduce quality control in production and raw material selection, conforms to high standards and specifications, employs modern techniques of manufacture, adheres to promised schedules of delivery and offers after-sales service

This Council is equipped to render engineering goods manufacturers every help and assistance in promoting their export.

Around Bombay Markets

Steadier Sentiments

Thursday, Morning

DALAL STREET last week presented a distinctly steadier appearance, though the volume of business continued to be on a restricted scale and interest was almost entirely professional and extremely selected. Activity was virtually confined to half a dozen scrips in the forward list. The market as a whole has yet to move beyond the highest mark made in the New Year's opening session on January 4. But certain scrips, namely, National Rayon, Century, Premier Construction and Hindustan Motor did manage to hoist new peaks in the upward move which has been in progress since about the beginning of December. National Rayon have continued to be in the limelight mainly because of strong bull manipulation.

While neither the total turnover nor the nature of trading activity in the market indicates anything like a revival of confidence—outside participation remains conspicuous by its absence—trading sentiment is gradually veering round to the constructive side. This is based on the growing belief that the Government is now deeply concerned over the state of the capital market and it is eager to take measures to revive confidence in the investment market. The concessions recently allowed for attracting foreign capital and the decision to expedite processing of new applications for industrial projects have strengthened the stock market's belief regarding helpful change in the Government's attitude. The stock market is also pleased with Mrs Barbara Castle's assurance that the U K would be willing to step up the quantum of untied aid to India.

The mood has no doubt undergone a change. And if nothing untoward happens on the political front—the market is extremely allergic to political news, particularly relating to the northern border—the market can be expected to put on a firm appearance in coming weeks. Whether the current recovery will mark the beginning of an important upward trend will depend entirely on the February Budget. Will the market's optimism about fiscal relief materialise? Who can tell?

Cotton

Radical Change

A SIX-MEMBER delegation of cotton traders from the central zone, comprising the Vidarbha, Khandesh, Marathwada and Madhya Pradesh, accounting for nearly one-third of India's total production of cotton, is reported to have offered to sell the mill industry 3.5 lakh bales of cotton, including the much-sought-after 197/3 variety, at the basic ceiling prices. The delegation has expressed its readiness to the authorities to deliver all the cotton stocks with the trade at the appropriate ceilings, leaving the fixation of varieties to the regional committees set up for conducting varietal survey. It is meeting the Chief Minister of Maharashtra to apprise him with the present 'serious' situation and its possible repercussions on the trade and cotton farmers.

All this is in striking contrast to the situation obtaining in the cotton market some three weeks ago when mills were finding it difficult to secure their requirements of cotton even by paying fancy premiums above the ceiling prices (unofficially of course). For over two months ready cotton had been commanding premiums ranging from Rs 25 to Rs 125 per candy; neither growers nor traders seemed the least concerned about the price control order in the firm belief that the Government had neither the will nor the ability to administer the price control scheme.

Cotton farmers, cooperative societies and traders have, however, been shaken by the Indian Cotton Mills' Federation's firm determination to secure cotton at or below the ceiling prices through self-discipline. The Federation's 8-point plan has yet to be fully implemented. Even so, the situation obtaining in the cotton market has undergone a redical change, which supports the view repeatedly expressed in these columns that the fantastic rise in cotton prices was not due to any real shortage of goods; the shortage had emerged simply due to the withholding of supplies from the market, mostly by growers and cooperative societies. Holding of stocks had been encouraged by the policy of drift and inaction adopted by the Government. How else can one explain the price control order being reduced to a farce?

The joint committee of the representatives of the cotton mill industry and the cotton trade which held its first meeting on July 14 had recommended that all cotton ruling above the basic ceiling price should be requisitioned from the trade as well as from the mills having excess stocks. Action is proposed to be taken against the mills—they are said to number 51—which have failed to declare their stocks as desired by the Federation. Arrangements are also to be made for the redistribution of excess stocks amounting to 1.85 lakh bales lying with 117 mills.

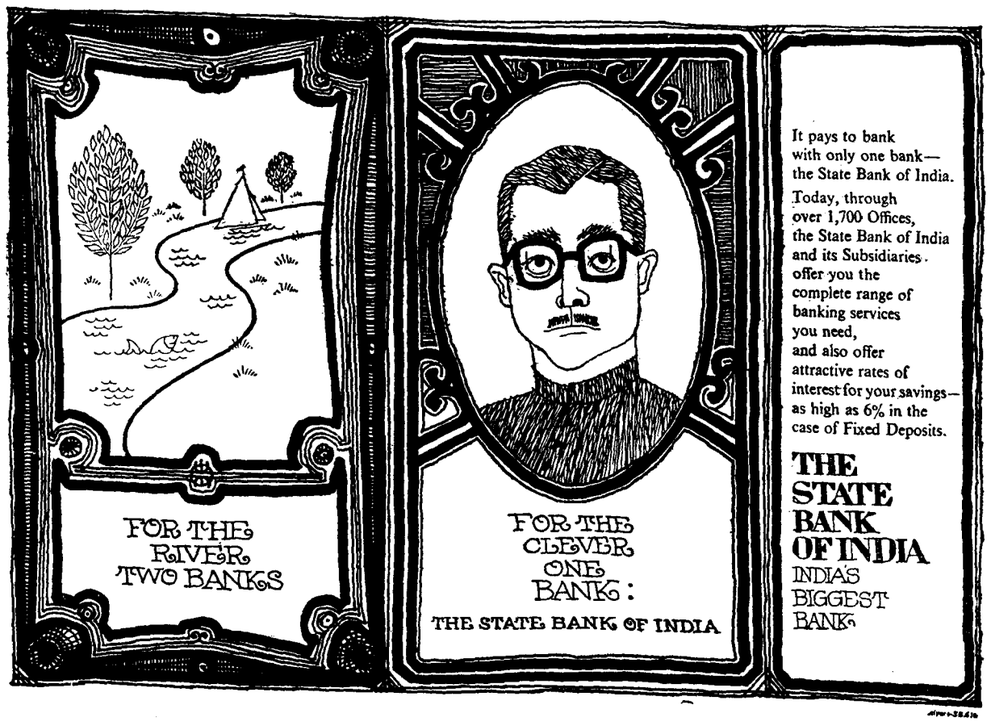
Decline is Welcome

Not a single bale of cotton is known to have been requisitioned so far. It is difficult to say what sanctions will be invoked against the defaulting mills. But the Federation's scheme of self-discipline, the Textile Commissioner's directive asking licensed cotton dealers to declare their stocks and the prospect of requisitioning should it be deemed necessary at any time, have produced a significant impact on the market. Cotton prices have suffered a sharp decline over the past fortnight or so and nearly all the varieties are now quoted below the basic ceilings. And what is more, stockholders are anxious to dispose of their goods at the appropriate ceiling prices.

Far from being a matter of serious concern as has been made out by the delegation from the central zone, the decline in cotton prices is to be welcomed. The growers and traders need the stern reminder that the ceiling prices are the maximum that they can hope to obtain even under conditions of acute scarcity. The Government will be well-advised to bear in mind that it is only when prices decline to somewhere near the floor—a situation which is not expected to arise in the foreseeable future—that it need entertain any representation from the growers. There is nothing to bother about the market when prices keep within the lower and upper limits fixed by the Government.

It is not unlikely that though the current crop estimates have recently been revised down to around 57/58 lakh bales, the actual crop might not be less than 59/60 lakh bales. The crop movement is likely to gather momentum in coming week, particularly because there has been a change in the general market psychology. Cotton prices are likely to ease further. The growers should thank themselves if the Indian Cotton Mills' Federation does not change its mind about purchasing all the cotton offered to it during the season at 5 per cent below the basic ceiling prices. Whether the Federation will be able to absorb all the cotton offered to it at 5 per cent below the ceiling, it is difficult to say.

Oilseeds



Drifting Lower

OILSEEDS prices continue to drift lower under the lead of mustard and rapeseed and linseed. Mustard oil ready lost another Rs 400 per tonne over the week, with the quotation moving down from Rs 3,900 to Rs 3,500. Linseed oil which had eased from Rs 30.50 to Rs 23.75 over the preceding fortnight or so declined further to around Rs 22.50 per 10 kilograms last week. The spot quotation for linseed was marked down to Rs 57 (per 50 kgs); not many weeks ago, linseed ready had been quoted as high as Rs 70. Groundnut oil ready was sold down to Rs 20.60 as against Rs 21.80 at the previous week-end. Prices were lower everywhere; castor futures provided the only exception to the general trend. Castor March which had been marked down to Rs 194.37 (per 250 kgs) in the preceding week recovered sharply to Rs 205.25 by the end of last week. The recovery in castor futures is essentially speculative. There has been no fresh exciting development in regard to export of castor oil; bulls seem to have been encouraged by the slower pace of arrivals in the upcountry centres. The up and down movements in castor futures do not really deserve any serious attention because they are guided mainly by the changing moods of a few powerful speculators and the trend in castor does not have any significant bearing on the price trend in the other important oilseeds.

The remarkable change that has come about in the oilseeds market in recent weeks is due primarily to forecasts of a record crop of mustardseed and rapeseed. Groundnut crop is already known to be an excellent one and the prospects for linseed and other crops are also considered to be encouraging. Reports from Gujarat indicate that while the pressure of the groundnut crop continues to be heavy, there has been a significant decline in the demand for groundnut oil, particularly from north India. Ready groundnut oil in Saurashtra has declined from Rs 23 to Rs 19.50 per 10 kgs.

The decline in oilseeds and oil prices is to be greatly welcomed. Prices had beeen pushed to fantastic levels and despite the recent fall, edible oil prices are still on the very high side. How oilseeds prices will move the flow of arrivals of soyabean oil in coming weeks will depend mainly on the flow of arrivals of soyabean oil from the U S and the Government's export policy for groundnut oil. The arrival of soyabean oil has been delayed by some weeks due to the dock workers strike in the U S and informed sources do not expect the first consignment to reach India before the end of February. Rumours that India will not be getting all the 75,000 tonnes of soyabean oil are baseless. When exactly all the oil will be shipped to India is of course rather uncertain.

Oilcake prices have also been showing an easier tendency in sympathy with the general trend in oilseeds. Groundnut expellers have come down

by about Rs 50 per tonne over the past few weeks. There has been a similar decline in groundnut extractions and other oilcakes. The export business in groundnut extractions, however, continues at normal pace, though overseas prices have been slightly subdued recently. Export activity in oils has been virtually at a standstill for some time. Cottonseed cake also have been inactive due largely to scarcity of supplies.

Money Market

Thursday morning

THE short-term money market was fairly comfortable during the week. Though the demand for funds continued, the pressure was not so excessive as in the preceding few weeks. Borrowers were able to obtain their requirements easily. The inter-Bank call money rate was ruling at 5 per cent but by Wednesday it was inclined to be slightly easier at 4.75 per cent with some stray dealings even at 4.50 per cent. Scheduled banks' borrowings from the Reserve Bank which reached on January 8 a maximum of Rs 90.16 crores in the current busy season declined by Rs 11.18 crores to Rs 78.98 crores on January 15. This might be a reflection of a temporary halt in the rising trend of the seasonal demand.

Scheduled banks' returns as on January 8 showed a further rise of Rs 16.90 crores in bank credit which in the current busy season so far has expanded by Rs 155.26 crores to Rs 1,862.56 crores. Though deposit resources fell by Rs 2.38 crores during that week, time deposits actually increased by Rs 15.36 crores, while demand deposits went down by Rs 17.74 crores. This might indicate that depositors' current requirements have gone less. Obviously, increased time deposits would be more helpful to banks in their lending operations and make them rely less on outside loan resources. However, during that week scheduled banks stepped up their borrowings from the Reserve Bank by Rs 22.31 crores and withdrew their balances also by Rs 14.03 crores. Such increased resources with scheduled banks in the absence of a correspondingly heavy demand might have resulted in a relatively comfortable position in the money market and also repayment of a part of the borrowings from the Reserve Bank.

Reserve Bank's statement as on January 15 shows that Notes in Circulation have gone up by Rs 4.18 crores though the rise is less in comparison with the previous weeks. The additional requirements have been fully met by the Banking Department. Besides, the Banking Department has shifted some Rs 20 lakhs of notes back to the Issue Department which has resulted in a fall in the Note Issue by a like amount. There being an outflow of rupee coins amounting to Rs 19 lakhs, the rupee securities in the Issue Department have diminished by only about Rs 1 lakh.

Deposits of Central Government have receded by Rs 49 lakhs but State Governments' deposits have moved up by Rs 11.85 crores. Governments' borrowings have fallen by Rs 12.98 crores.

Scheduled banks' deposits have moved down by Rs 7.39 crores, but at the same time their borrowings have been brought down by Rs 11.18 crores.

Foreign assets of the Reserve Bank have declined by Rs 1.90 crores, due to a fall in balances held abroad by a like amount.

Business Notes

Indian Rayon

INDIAN Rayon Corporation has earned a profit of Rs 3.67 lakhs during the year ended June 30, 1964 as against a loss of Rs 1.93 lakhs in 1962-63. The profit is, however, subject to provision for depreciation and development rebate. The carryforward of depreciation and development rebate is now Rs 76.78 lakhs and preference dividend (gross) is in arrears to the tune of Rs 19 lakhs. After adjusting the profit against the previous loss and other items, a loss of Rs 41,169 is carried forward.

Commercial production of the factory started from October 1963 and the Company produced during the year 7.02 lakh kg of viscose rayon yarn and sold about 4.58 lakh kg. The additional excise duty imposed from March 1, 1963 is stated to have affected the sales of the Company and the reduction of special duty on rayon filament yarn from October 1964 helped to clear off a large part of accumulated stock even at some advantageous rates.

The Company's plant is stated to have attained a daily average production of 4 tons from February 1964. A plant to expand the capacity to reach the licensed capacity of 10 tons of rayon yarn per day is in progress. Arrangement for a foreign exchange loan of 4.7 million dollars has been completed with Exim Bank. The Company hopes to raise the production capacity of the existing plant itself from 5.2 tons to 6.5 tons by improved processes without the addition of new plant and machinery through the cooperation of Von Kohorn Eastern Corporation.

India's production of rayon filament yarn is about 78.3 million lbs representing 2.8 per cent of the world production in 1963. Production of non-cellulose man-made fibres such as nylon is about 1.6 million lbs or 2 per cent of the total production of all man-made fibres in the country. The total licensed capacity for production of viscose filament yarn at present is about 40.5 million kgs and the actual production last year was 32.5 million kg as against a target of 60 million kg per annum indicated by the Planning Commission. The fears, if any, of excess production of viscose yarn in the country are unwarranted, states M J Vaidya, Chairman of the Company, in his statement. He anticipates good prospects for exports of rayon fabrics which have already increased from Rs 46.1 lakhs in 1957 to Rs 818.11 lakhs in 1963.

EID — Parry Group

THE EID-Parry group increased its sales of fertilisers by over 33 per cent in 1963-64 over the previous year, according to preliminary results just released. During the year the group sold over 2.5 lakh tons of fertilisers, mainly in the States of Madras, Mysore, Andhra, Kerala, Maharashtra and Gujarat.

The EID-Parry group is the foremost producer of fertilisers in the private sector and was the first to manufacture bone super, superphosphate and complex fertilisers. In addition to its ammonium phosphate plant at Ennore, which is now in full production, the group operates superphosphate factories at Tadepalli in Andhra and Ranipet. Fertiliser mixing centres are operated throughout the four southern states and in Maharashtra and Gujarat. The group's manufacturing operations are backed up by intensive propaganda and selling through a net work of over 2,000

The first choice of public utility concerns and industrial undertakings all over India, MEI Switchboards have become a by-word for their superb quality and sustained performance.

distributors and hundreds of salesmen. Believing that the most convincing propaganda for fertilisers is their use on the farms, the group operates numerous demonstration plots.

The EID-Parry group has on the anvil several schemes for expanding its output of fertilisers. It expects that its output will increase from about 2.5 lakh tons at present to over 5 lakh tons in another three years. Principal among the expansion schemes is, of course, the vast Vizagapatnam project of Coromandel Fertilisers in which EID-Parry is collaborating with International Minerals and Chemical Corporation and California Chemical Co, both of United States. The Vizagapatnam plant will be by far the largest fertiliser plant in the private sector and is expected to go on stream in 1966.

Voltas

VOLTAS has produced impressive financial results from its operations during the year ended August 31, 1964. Total proceeds from sales and services for the year aggregated Rs 37.31 crores as against Rs 32.42 crores in the previous year. Pre-tax profit has jumped up from Rs 178.87 lakhs to Rs 219.13 lakhs, i e, by Rs 40.26 lakhs.

Taxation provision including surtax and dividend tax has absorbed Rs 141 lakhs which is Rs 21 lakhs more than in the previous year. Even so, the balance available was more by Rs 19.26 lakhs at Rs 78.13 lakhs, and this enabled the Directors to make larger appropriations to different Reserves. Development rebate reserve got Rs 1.87 lakhs (Rs 1.56 lakhs); reserve for staff gratuities was stepped up substantially from Rs 3 lakhs to Rs 10 lakhs. General reserve was inflated from Rs 18.31 lakhs to Rs 28.26 lakhs. Dividend reserve also was raised from Rs 36 lakhs to Rs 38 lakhs from which the Directors propose to pay an enhanced dividend at 15 per cent including 1 per cent bonus (14 per cent in 1962-63).

Premier Automobiles

PREMIER Automobiles' turnover is stated to have improved during the first six months of the current year, July-December 1964, to Rs 15.5 crores. This compares with Rs 11.15 crores in the corresponding period of last year. Production is steadily going up as a result of the production-incentive scheme. The Company now produces about 500 cars a month and will be able to step up production to 600 cars a month in about two or three months. The lower production of cars in the earlier months was attributed to the introduction of a new model which affected normal production for about 2 months. Output of commercial vehicles will be increased to 8,000 to 9,000 units year in the near future. The trucks will be fitted with more powerful engines and are likely to prove more popular. The indigenous contents of cars and trucks are about 78 and 88 per cent, respectively.

Dharamsi Chemical

A NEW project involving a capital outlay of Rs 2 crores with an initial equity capital of Rs 94 lakhs will be shortly set up by Dharamsi Morarji Chemical for the manufacture of phosphoric acid, sodium tripolyphosphate and sodium hexametaphosphate. The project is deemed important as it would help the growth of synthetic detergents and phosphatic fertiliser industries. Albright and Wilson, U K, will be the main collaborators and will provide the technical know-how besides participating in the equity capital to the extent of 45 per cent for meeting the foreign exchange requirements. Dharamsi Morarji Chemical will invest about Rs 25.38 lakhs in the project.

The factory is proposed to be located at Ambernath, Maharashtra. The sulphuric acid requirements of this project, which will amount to 70 tonnes a day for 5 years and 140 tonnes a day later, will be met by Dharamsi Chemical for a period of 10 years by special arrangement. The new project will put up a phosphoric acid plant of 50 tonnes a day capacity.

Bombay Dyeing

BOMBAY Dyeing and Manufacturing is easily the largest exporters of cotton textiles from this country and has been holding this pre-eminent position since long. Its exports in 1963 amounted to 12.5 per cent of the country's total exports for the year. Its products find a ready market throughout Europe, America, West Asia, Africa and Asia. Australia and New Zealand are, however, the biggest customers. The Company has earned about Rs 27 crores in the export market during the past 5 years.

Due to the Company's far-sighted and aggressive export policy, it has been able to procure licences for the import of the best machinery which has helped it to modernise the spinning, weaving and finishing plants of the Company. Such modernisation helped to increase the turnover of the Company by over 50 per cent. The spinning mills of the Company have now about 136,040 spindles and 2,160 automatic looms, and the textile mills have 84,428 spindles and 2,328 waste plant spindles, 54 automatic looms for towels, etc, 1,514 ordinary power looms and 56 blanket looms. The Company's bleaching works also has a wide range of equipments. The Company has its own ginning and pressing factories at Nanded and Umri.

Started with a modest capital of Rs 1 lakh in 1879, the Company has now an issued capital of Rs 251 lakhs with about 7,129 shareholders.

The Company has now plans to make a public issue of Rs 250 lakhs 7 per cent First Mortgage Debenture Stock, 1973-75. The proceeds of this issue will be utilised for the company's modernisation, renovation and expansion programme.

The subscription list will open at the commencement of banking hours on February 5 and will close at the close of banking hours on February 15 or earlier at the discretion of the Directors, but not earlier than the close of banking hours on February 8.

The entire issue has been underwritten by Life Insurance Corporation of India, The Industrial Credit and Investment Corporation of India, Unit Trust of India, National and Grindlays Bank, Indian Guarantee and General Ins., Oriental Fire and General Ins., New India Assurance and Merwanjee Bomanjee Dalal jointly with Dhirajlal Maganlal Purshotamdas.

Central Chlorine

CENTRAL Chlorine and Chemicals, a new Company set up in Ballarpur in Chanda District, Maharashtra, for manufacturing heavy chemicals and their by-products has received industrial licences for 5,000 tonnes of caustic soda, 4,200 tons of chlorine and 720 tons of hydrochloric acid per annum. The plant and machinery will be imported from Japan under the second yen credit from that country.

The estimated capital requirements of Rs 112.45 lakhs for the project are to be obtained by the issue of shares of the value of Rs 65 lakhs, by taking a loan of Rs 40 lakhs from I F C and by borrowing from Banks Rs 6 lakhs. Loan and subsidy from the State Government are also expected to be received to the extent of Rs 1.45 lakhs.

On Viability

IT does not seem to be possible to get anything done in this country unless a crisis situation arises or is created. No one is yet losing his sleep over the weekly returns of the Reserve Bank, but for the past few weeks, those in high places have obviously been reading them. There is Voltaic reaction, as the foreign exchange reserve moves down to the danger point where transfer of gold from hidden reserves can no longer suffice and an approach to Parliament or a Presidential Ordinance may become necessary to condone the infringement of the reserve requirements, if not to do away with them altogether. That eventuality the authorities are desperately eager to avoid. Hence the SOS to the IMF for stand-by credit and the traditional motions of setting our house in order while the IMF Emergency Mission is on the spot for questioning and we have been put on the mat — jerking up the Bank Rate from 5 to 6 per cent, and imposing the 10 per cent levy on imports. All this exhibition of remorse and self-flagellation, the set motions in a puppet play in response to long distance pulls from the puppet-players could be amusing, had it not been so pathetic. And all the routine motions, one apprehends, would be gone through — tight money, balanced budget, stabilisation programmes, cut not in bloated administrative expenditure but in the vital sectors where it is easiest to operate, for its consequences do not appear here and now.

What is the crisis that has brought on these drastic emergency measures? About the balance of payments problem of any developing economy, the only emergency that may arise is from a sudden decline in export earnings. This is not a problem which has assailed India. On the contrary, India's export earnings have been going up, and going up in a manner which makes the export sector stand out as the most promising and hopeful sector in the Indian economy. The problem of dwindling reserves which has created the emergency situation today is not the work of factors involved in the basic strategy of planning or the growth of the economy. It is of much smaller dimensions, being primarily concerned with the technicalities of foreign exchange budgeting. That budgeting has gone wrong, according to the Finance Minister, because there were emergency imports of food and fertilisers, payments on account of defence imports (unanticipated?), larger repayment obligations (also unanticipated?). All these happened, if the Finance Minister is to be believed, only after July last year, for that was when our stand-by credit with the IMF came up for renewal and was not renewed, as it could have been done without embarrassing questions. The fresh investigation by an IMF Mission, which we are having today and for which, demonstrably, our house is being put in order with this package of unsavoury measures for tighter money and a levy on imports could have been avoided.

In July last year, it would be fair to infer from the non-renewal of the stand-by credit, the Government felt reasonably sure of balancing the foreign exchange budget for the next few months or a year — so sure, in fact, that it did not consider it worthwhile to pay the small commitment charge which such credit arrangements cost. It would be flippant to see in this the working of the accountancy mind; a decision like this must have meant a consensus of the financial authorities of the country, including the expert advisers.

With the wisdom and hindsight of which the editorial desk is supposed to be the repository, one may go on to ask a number of questions. What view could the Government have taken of the food situation in July last with all

the facts in its hand at a time when the Chief Ministers were called to Delhi to consider the food crisis? Could it have been anything but grim and dismal and could the Government possibly have missed the implications in regard to food imports and the considerable drain on foreign exchange? It is not pleasant to pretend to be all-wise or to claim the gift of hindsight, but one may still be pardoned if one asks, how could the alert Finance Ministry slip over repayments due on credit arrangements, not the least to the Fund itself, or misjudge the foreign exchange requirements of defence imports which had presumably been planned well in advance? Defence has obviously been plugged in, to make the Government case look more respectable, though the admission of larger repayment obligations, if not a slip, gives away how loose the foreign exchange bedgeting is.

What has happened on the foreign exchange front presents no worse than a technical problem brought about by the sharp rise in the Bank of England rate last October which is keeping out foreign exchange funds which normally should have come to the coffers of the Reserve Bank. This has to be handled at the expert level by operating on forward and spot rates for sterling. The drain on reserves, anticipated or not, has been aggravated by the prevailing high rates in the London money market. This can be seen in the comparatively larger forward sales of sterling to the Reserve Bank and the decline in spot sales, in sharp contrast to the normal seasonal pattern.

To repeat, the present exchange crisis is just a temporary snag and despite the urgent necessity it imposes for some stop gap arrangement, it is not a matter of great importance in itself. What is, is the need to keep up the tempo of the economy and add to and not undermine the strength it has been building up. All the economic indicators undoubtedly point to the economy gathering momentum. Food production has set up a record; the other indicators are not unfavourable. The monetary situation hardly calls for restraint—and how does the higher Bank Rate and stiffer credit help the balance of payments, any way? Neither would exports be stimulated by tighter credit nor imports hit by it or by the 10 per cent levy. There is a case for taxing imports and at a much higher rate—selectively, not indiscriminately at a flat rate.

That our foreign exchange situation is grave is a fact. That we have to obtain temporary succour from the Fund is also to be admitted. But did we have to present our economy with the formidable bill of fare that consituted the monetary measures this week, even if, as one suspects, this was done with a view to placating the Fund rather than addressing ourselves to the problems of our economy?

A cardinal point in the Fund theology is the inseparability of a domestic inflation and a balance of payment deficit. In an aggregative and *ex post* sense, this is a near-tautology but clearly we would have expected our policy makers and advisers to know that in an *ex ante* sense the emergence of domestic inflation and an external deficit as reflected in the foreign exchange reserve position is not the near-identity crude monetary theorists would have us believe. That this needs to be stated at this stage of the game in India is a sad reflection on the economic expertise that makes our decisions.

There is little point, however, in bemoaning our acts of omission then. There is, one feels, greater point in objecting to our acts of commission now. For what we have done, viz, to approach the Fund for a fresh stand-by credit "to the maximum possible extent" carries with it the bitter pill of a stabilisation programme. A stabilisation programme to cure domestic inflation so as to correct a payments deficit makes sense in a free economy without import regulations. In the Indian context, it is a surrender to the opponents of planned economic growth. It is the wrong medicine for a wrongly diagnosed malady. The cure may sound right to the monetary pundits but the patient will get worse. No, the state of our exchanges does not warrant the severe internal measures.

If the state of the exchanges does not warrant the internal levies, does the internal situation? That there has been a rise in prices last year is an undeniable fact. The monetary expansion was clearly in excess of the economy's absorption capacity, and the gap was reflected in the price increase. The expansion in real output this year may be nearer 7 per cent and what is the order of monetary expansion we are planning for? The rate of monetary expansion should clearly match the needs of the economy. To suggest that because the expansion last year was higher than real output, it should be lower than real income this year is to ignore the time dimension in economic activity. The price increase last year has already occurred. Are we trying this year to bring about a sharp and sudden price reduction through deflation or hold the level of prices with a gradual easing with the pick up in production ahead? There are indications that the much needed respite in prices is appearing. Much is made of the failure of post-harvest prices to decline. What we are witnessing is possibly a delayed reaction to the overcoming of the scarcity psychology. What was required was an alert and watchful response rather than ham handed intervention. There is danger that the credit measures would bring about a real squeeze and hamper production. Credit demand in several important sectors is yet to pick up; credit expansion so far, *pace* the Reserve Bank, is still much smaller than last year. Why this scare then? Are the authorities really convinced that credit levels are higher than they should be? If so, they should have taken the public into confidence as they did in September last.

The monetary measures would be meaningless, without fiscal controls. How do we achieve this — through a budget surplus? And how will TTK ride the Fund horse of a budget surplus along with the private sector horse of tax relief to revive the capital market and yet be loyal to the objective of growth? Are we going to cut defence expenditure — or is it possible to touch administrative costs? One fears the politically easy way out will be taken and investment expenditure will suffer a deceleration in its rate of growth. Already we are seeing in the emergence of a surplus in railway capacity, in the lower levels of coal output and demand the failures of the past in meeting our investment targets. A budgetary surplus at the cost of investment may reduce monetary expansion today but it will make the ascent of the economy to higher levels later more difficult. Let there be no mistake about it. A stabilisation programme at the behest of the Fund is the antithesis of our growth policy; it is the flagrant violation of our resolve not to accept aid with strings. A government dedicated to the interests of the Indian people should have been able to convince the Fund that internal inflation was *not* at the root of our external problem — that it was the investment plan for growth that put our payments under pressure. To cut our investment to achieve balance is more than shortsightedness. It would be betrayal of a solemn commitment.

Railway Budget

THE "inflationary pressures" of which the Finance Minister spoke in such grave terms on Wednesday are one aspect of the performance of the economy; the other, and more important aspect perhaps, is the slackness, even stagnation, in important sectors of industry. T T Krishnamachari was exercised over the need for fiscal and monetary discipline to check the rise in prices, but it was the Railway Budget presented on Thursday which drew pointed attention to the other problem. Goods traffic on the railways was expected to increase by 17 million tonnes in 1964-65. In the event, the actual increase is likely to be no more than 3 million tonnes.

The slackening of the demand for coal in the beginning of 1964 persisted and coal traffic in the first nine months of 1964-65 was actually 2.5 million tonnes lower than in the corresponding period of the previous year. Movement of raw materials to the steel plants has also dropped. Nor has the anticipated increase of a million tonnes in carriage of mineral ores for export materialsed; the actual increase was just about one-fourth of this figure. Other revenue earning traffic also increased much less than the anticipated 5 million tonnes; in the first nine months of the year it was higher than in the previous year by one and a half million tonnes. Clearly, the shortfall in freight traffic is the result of development programmes lagging behind schedule in such vital sectors as steel, cement, fertilisers, mineral ores, etc.

Even allowing for the "signs of revival of traffic", the best estimate of increase in goods draffic during 1964-65 is 3 million tonnes. And in 1965-66, the last year of the Third Plan, the Railway Minister expects that goods traffic will rise by 10 million tonnes. Even if this estimate proves correct, the total goods traffic in the last year of the Plan will be only about 205 million tonnes — far lower than the revised target of 245 million tonnes, not to mention the original Plan target of 260 million tonnes.

The smaller-than-expected increase in goods traffic has been reflected in freight earnings turning out to be Rs 24.5 crores lower than the Budget estimate. The shortfall, however, has been to an extent made up by a higher-than-expected increase in passenger traffic. The 1964-65 Budget had expected passenger traffic to increase by about 4 per cent. Actually, suburban traffic has increased by 8.6 per cent and non-suburban traffic by 5.8 per cent and earnings from passenger traffic are likely to be Rs 16 crores higher than expected. The overall shortfall in gross traffic receipts will thus be about Rs 8 crores.

This deficit in earnings is magnified into a Rs 17 crores shortfall in net revenue as a result of an increase of Rs 18 crores in working expenses — the lower-than-expected goods traffic notwithstanding. The rise in working expenses is attributed by the Railway Minister almost entirely to a higher wage bill owing principally to two revisions of dearness allowance of railway employees. There have been increases in the price of coal and electric power for traction, but these have been

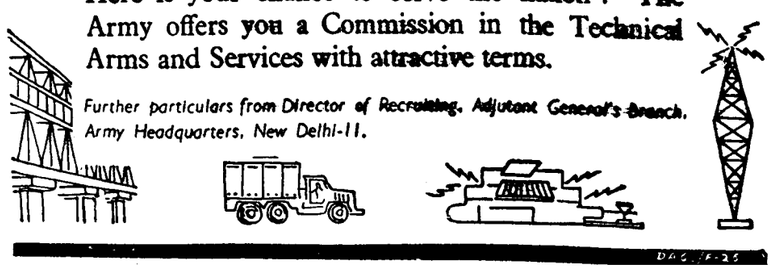
to an extent offset by what the Railway Minister describes as "economy measures" and by the level of traffic being below anticipation, to give a net increase of Rs 18 crores in working expenses.

After paying Rs 104.5 crores to General Reserves, which is about Rs 1 crore higher than the Budget estimate, the surplus in 1964-65 is estimated at Rs 12.5 crores compared with the Budget estimate of Rs 30.9 crores and the 1963-64 actual figure of Rs 49.2 crores. At existing levels of freight rates and passenger fares and given the estimated increase in goods traffic by 10 million tonnes and in passenger traffic by 4 per cent, the surplus in 1965-66 would dwindle further to about Rs 8.8 crores. It is this dismal prospect which the Railway Minister adduces to justify increase in freight rates and fares.

Passenger traffic will contribute Rs 13.5 crores of the increase while higher freight rates will fetch Rs 6.9 crores. The impact of the fare increases has been to make fares slightly more telescopic over distances longer than 800 kilometers for third and second class travel and over 1,000 kilometers and 1,200 kilometers for first class and air conditioned travel. The Railway Minister has been at pains to point out that the increase in fares has been well spread out and that it will be only marginal for all individual journeys. Yet the fact remains that the travelling public as a whole will be paying some Rs 14 crores more on account of the higher fares and it is only to be expected that in view of the general rise in prices this burden will hardly be accepted without demur. The Railway Minister has shrewdly let the highly vocal suburban commuter traffic get off relatively lightly, though it is well known that while passenger traffic as a whole does not pay its way, suburban traffic does so even less. Indeed the rise in the proportion of suburban traffic in total passenger traffic in recent years has been one of the developments with disconcerting implications for railway finances.

The other development is the growth of the so-called low-rated goods traffic as a proportion of total goods traffic. In 1964-65, it is possible, the trend may have been halted or even reversed as a result of the large shortfall in traffic in such commodities as coal and mineral ores, but this is almost certain to prove a temporary aberration from the trend which has been clear. Between 1956-57 and 1961-62 the proportion of low-rated traffic to total traffic increased from 63 per cent to 73 per cent with a corresponding fall in that of high-rated traffic.

The railway administration has been acutely aware of this trend and recent changes in freight rates have been in the direction of narrowing the difference between the low and high rates. Only last year the rates for coal moving over distances longer than 500 kilometers were raised and this was accompanied by a downward adjustment in the classification of certain high-rated goods. The freight increases this year follow the same pattern. Rates have been raised on heavy merchandise like iron and steel, cement, stone, limestone, ores, petroleum products, etc. The conspicuous exceptions are coal, on the ground that the rates for coal have been raised more than once in recent years, foodgrains, kerosene and iron ore for export. Like last year, higher rates for low-rated commodities are accompanied by a reduction in rates for certain high-rated goods — mainly manufactured goods including cotton piecegoods.



These changes reflect the need to preserve the financial viability of the railways in the face of the continuous rise in the proportion of low-rated traffic and fall in that of high-rated traffic — some of it as a result of competition from road transport. Without statistics of the average unit cost of carrying different commodity groups, however, it is not possible to say which pay their way and which do not. For instance, it is certainly not true that low-rated traffic is necessarily unremunerative. Haulage of low-rated materials to steel plants over short to medium distances is not uneconomic as is seen from the financial results of the Eastern and South-Eastern railways which rely on these commodities for a good proportion of their revenue, but are able to make intensive use of available facilities. In fact these two railways are more profitable than most other zonal railways. Even low-rated traffic comprising bulky and heavy materials like coal, ores, etc, may pay if movement is organised in full train loads and at fast speeds.

Reliable estimates of average unit costs are necessary, for only then will it be possible to identify commodities which are subsidised and those which are charged in excess of costs. With such information a more rational freight structure can be evolved, on the basis of deliberate decisions about which commodities to subsidise and how much.

Weekly Notes

Corporate Taxes as Incentives

ON the need for rationalising the various concessions in corporate taxation and making them more selective, in order to encourage investment in some directions and not in others, R K Hazari writes:

The Finance Minister has already announced his intention of modifying the coverage of development rebate after March 1966. The purpose of the development rebate (originally 25 per cent, now 20 per cent, except 40 per cent for shipping and 35 per cent for coal mining) was to compensate selected industries for the inadequate depreciation permitted on the historical cost of fixed assets and to give an incentive for fresh investment. The grant of an extra depreciation allowance last year (after its lapse in April 1959) has partially met some of the complaints on this account. To allow development rebate uniformly to all industries, as has been done so far, is to lose sight of priorities in investment and negative the useful function which this delicate instrument can perform in the allocation of private investment — a function which can never be performed adequately by licensing policy. Development rebate may be abolished altogether in those industries where growth is either not material or does not need tax incentives, and graded from 10 to 40 per cent of the value of new equipment installed in other industries, depending upon their relative priority. Income-tax revenue statistics do not indicate the amount of deduction permitted for development rebate. There is little doubt that this concession is widely availed of and that the amount involved must be substantial.

The tax holiday (up to six per cent of capital employed in a new undertaking for five years after commissioning of plant) also needs looking into. It is far too indiscriminate because almost every industry is entitled to it but, at the same time, it is hardly a meaningful incentive for most units, particularly those with long gestation periods, because depreciation, development rebate and losses are prior charges on profits. In 1961-62, 1,131 assessees (against a total of nearly 11,500 companies assessed) got this concession on an income of Rs 11 crores and saved only Rs 4 crores, an amount which equalled the tax exempted in super tax on inter-corporate dividends. As in the case of development rebate, the tax holiday must be selective and for those who get it, it should be meaningful. It should be *nil* for those industries which would be denied development rebate, for 7 years up to 6 per cent of the capital employed for a few others, and for 10 years up to 8 per cent of the capital employed for high priority industries.

Taxation of narrowly held companies also needs revision. The application of section 104 (formerly 23A) of the Income Tax Act requires modifications particularly in the light of a recent decision of the Income Tax Appellate Tribunal that companies which are listed on the stock exchange but have large foreign holdings are to be treated as narrowly held companies. In the 1964 Budget, section 104 companies engaged in industrial production were exempted from compulsory distribution of most or all of their profits but were subjected to 60 per cent tax against the standard 50 per cent. They do not have to pay the 7½ per cent tax on equity dividends but are liable to surtax. The application of section 104 has created numerous complications in the case of narrowly owned public companies (private companies are covered automatically) and it should, therefore, be clearly laid down that no public company shall come within the mischief of section 104 so long as its shares are listed at a recognised stock exchange and at least 33 per cent of its share capital has been offered to and subscribed by the public.

Abolish Surtax

IF development rebate and tax holiday are changed as suggested above, there would be no justification for continuing the 10 per cent extra tax on section 104 companies and surtax on all companies. These two imposts have affected business sentiment far beyond their revenue potential. The principle underlying them has been neither clear nor logical. A narrowly owned company can, with some justification, be compelled to distribute its current profits on the reasonable suspicion that otherwise the shareholders would be avoiding high personal tax but there is no justification for discriminating, through a higher tax rate, against relatively smaller and up-and-coming businessmen. The surtax was a hangover from Morarji's ill-conceived super profits tax, applying a wrong principle of progressive taxation to companies, and thereby encouraging wasteful expenditure. The revenue loss would be about Rs 20-25 crores — Rs 8 crores under surtax and Rs 14 crores for section 104 companies (see *The Economic Weekly*, March 7, 1964, p 488). But this loss would be recovered by partial withdrawal of development rebate and tax holiday, and removal of the extra incentive to boost costs when corporate profits are taxed at 65 to 75 per cent.

The 7½ per cent tax on equity dividends has attracted a lot of criticism as an incentive to retain profits and raise capital in forms other than ordinary shares. Judging by the overall performance of leading companies in 1963-64, this tax has done practically no damage, notwithstanding the fancies of stock exchange operators to the contrary.

NOTICE

WITH effect from March 1, 1965 the price of *The Economic Weekly* will be raised to 75 paise. Correspondingly the annual subscription will be Rs 36 in India, Pakistan and Ceylon, and the half-yearly subscription Rs 20. Foreign annual subscription rates will be £3 10s or $10.

For the last 16 years, the price of *The Economic Weekly* has been maintained unchanged in spite of heavy increases in costs. Circumstances beyond our control now force us to take this step and we hope readers will continue to extend to us the same patronage as in the past.

A FERNANDES
Business Manager

There is a case for concessions in two other directions. The rebate allowed for profits from increased exports is too meagre to be effective and deserves to be doubled. As for the taxation of inter-corporate dividends (on which super tax was entirely removed last year), foreign investors are taxed at a concessional rate of 15 per cent if they invest in a basic industry, against the standard rate of 25 per cent. Indian companies should be placed on par with foreign investors in this respect.

The tax on royalties and technical fees received by non-residents was reduced last year from 63 to 50 per cent. The position about technical fees, however, remains very confused because it is taxed at 50 per cent if deemed to be delivered in India and is entirely free of tax, if deemed to be delivered abroad. The deeming provision creates a lot of uncertainty, to avoid which foreign collaborators take good care to see that all drawings, etc, are delivered abroad, and avoid getting technical work done locally; besides, they are encouraged to cash in on technical fee rather than royalties. This is a rather complicated question but given the ingenuity of the Finance Minister, it is not beyond solution.

THE SOWING

Life Insurance corporation sows the seeds—seeds that will yield a new and wonderful harvest. Every day LIC plants nearly three million rupees in agriculture, industry, national development. These investments give rise to more food, more clothes, more jobs. In short, they create a richer life for all.

These were some of the LIC Investments during January 1962—March 1963	
Engineering	Rs 16,11,00,000
Cotton Textiles	Rs 12.16,00,000
Electricity	Rs 9,85,00,000
Cement	Rs 6,28,00,000
Jute	Rs 4,37,00,000
Coal	Rs 3,16,00,000
Plantations	Rs 2,40,00,000
Shipping & Transport	Rs 82,00,000
Railways	Rs 66,00,000
Co-op. Housing Societies	Rs 24,00,000

GATT's New Chapter

THE new chapter of G A T T, accepted on November 26 and now signed by almost all the countries on February 8, is a new chapter in more than one sense. For, it marks the end of the era when there was no official recognition in GATT of the special trading needs of the developing countries. The lack of such recognition had forced developing nations to insist, at the last year's UN Trade and Development Conference, that the time had come to dissolve GATT; their demand was withdrawn only on the understanding that the Agreement would soon be modified.

The new chapter has the following main features: The developed countries are asked to give high priority to reducing the tariff and other barriers against present *and potential* imports from developing countries. Thus there is now official recognition of the need for developing countries to find markets for their new manufactured products. Further, the developed countries are asked to refrain from imposing any new tariffs or other disabilities on present or potential imports from developing countries. But what constitutes the most important change is the provision that the developing countries need not reciprocate the concessions the developed countries grant them. This abandonment of the principle of reciprocity is the most important concession to the developing countries. A new Committee on Trade Promotion has also been appointed. Its main purpose will be to ensure the implementation of the new provisions by thinking up helpful measures. One important task it has already been assigned is that of examining the feasibility of drawing up a scheme of preferences for the trade of developing countries.

However, how soon and how far the developed countries will want to implement the new provisions is a different question. Already a qualification is provided in the new chapter: the developed countries need not observe the new provisions "when compelling reasons, which may include legal reasons, make it impossible" for them to do so. For, it does seem that in making the stipulated concessions, for the manufactured products particularly, the developed countries will have to pay the cost — in the short-run at least — of increasing unemployment at home and of disturbing some vested interests. Hence it is too soon to be very optimistic about the final results of the new provisions. They have certainly created a favourable climate of world opinion for the kind of concessions the developing countries demand. To that extent we can be more hopeful now about the Kennedy Round of tariff talks. But the French refusal to sign the new chapter (on the ground that it is not generous enough to the developing countries) and the progress made so far in the Kennedy Round, emphasize the need for the developing countries to continue to press their case for more liberal trade policies on the part of the developed countries.

US and Vietnam Crisis

PRESIDENT Johnson has reiterated once again that the U S does not seek to expand the war in Vietnam while maintaining, at the same time, that she will honour her 'commitment' in South Vietnam. Now, if the course of the tragic war in Vietnam has proved anything it is that this is a contradictory position, since it has been established beyond doubt that the U S cannot defeat the Vietcong in S Vietnam without escalating the conflict.

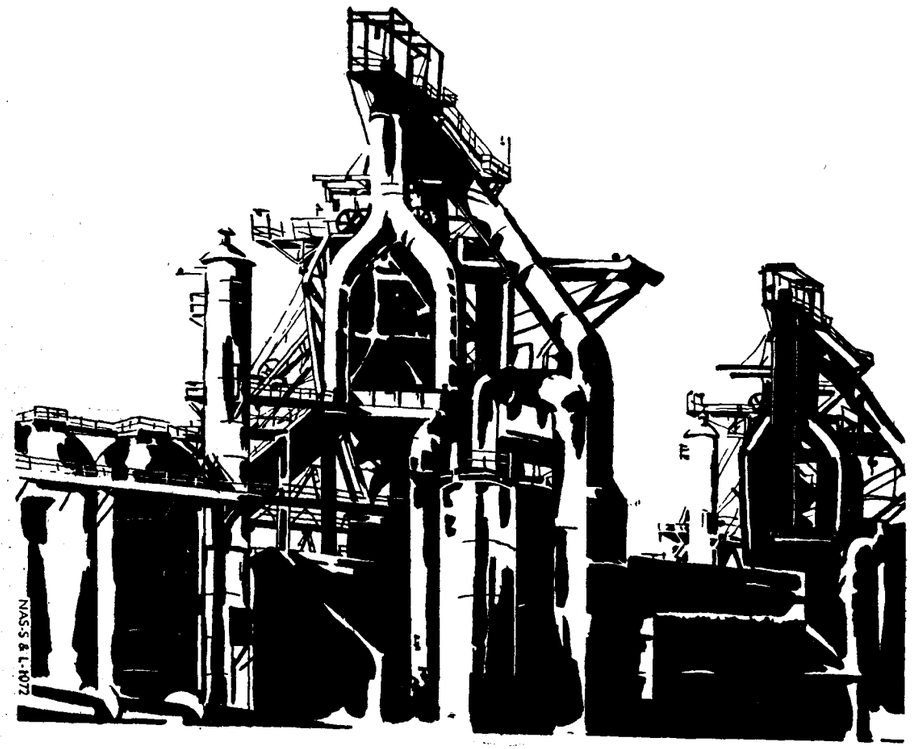
The recent U S air strikes at North Vietnam are proof of this. The pretext that the attacks were aimed at army establishments which had actively assisted the successful Vietcong attack on the U S military base at Pleiku was so patently untenable that even the State Department has not pushed it too hard. Pleiku was another in the chain of defeats which the Vietcong have been handing out to the Americans and the decrepit Government and army of South Vietnam. There was little the Americans could do about it, for though far superior in weaponry they lack the one factor which accounts for the Vietcong's unbelievable success — the support of the people, particularly the peasants.

To their Pleiku defeat the U S retaliated in the only way open to them — by striking at North Vietnam from the air. In the swamps of South Vietnam they have no answer to the Vietcong. Similarly a land war extending beyond S Vietnam's borders will lead them nowhere. But in air and naval power they are clearly superior to any force in the region.

Unfortunately for the U S, superior air power is no answer to the military problem in S Vietnam. It can only extend the war and at best perpetuate a stalemate at heavy cost in human and material terms. Far from helping to honour the American 'commitment' in S Vietnam without extending the war, tactics such as those which guided the air attacks against North Vietnam will most likely extend the war without achieving the objective of defeating the Vietcong.

The U S is not unaware of this, yet so deeply is she committed to hopelessly unrealistic policies in south-east Asia that the only way out of the tragic stalemate — a political settlement with China — still appears unthinkable to her. Nor is it the U S alone who would settle the Vietnam problem without reference to China. In his latest well-meaning pronouncement, Lal Bahadur Shastri has repeated his appeal for U S—Soviet talks on Vietnam. To imagine that the U S and the Soviet Union can settle the Vietnam issue is to ignore the lessons of the failure of the 1954 Geneva agreement which the U S refused to sign.

The fact is that the principal parties involved in Vietnam are China and the U S and no agreement which is unacceptable to either can be effective. Yet the U S would continue to behave as if China did not exist at all! There can be no end to the war in Vietnam and no abatement of tensions in south-east Asia till the U S decides to normalise her relations with China and to give up policies aimed at surrounding China with hostile regimes.



S. & L. AND STEEL PLANTS

S. & L's experience over many years at the great steel plants at Jamshedpur, Burnpur, Durgapur and Bhadravati place them in a unique position to serve the growing Steel Industry.

Recognised as the leading manufacturers in India of fabricated pipework, S. & L. offer a complete service from design to commissioning, with all materials and workmanship of the traditional high standards associated with S. & L.

Capital View

The Revolt of the Angry South

Romesh Thapar

WHERE does one begin to tell the story of the last few days which almost witnessed the wrecking of the unity of this sub-continent? I have been asking myself this question for some hours now — and am none the wiser.

Should I highlight the ease with which an aggressive lobby in the Capital persuaded Shastri and Nanda to tom-tom the 'arrival' of Hindi as the official language? Or would it be more to the point to underline the extraordinary insensitivity of the present Congress leadership to the feelings of the non-Hindi speaking peoples of the South and the East, an insensitivity which persuaded it to dismiss the slogans of the DMK as 'exaggerated', 'inconsequential'?

Maybe, I need to go back several years, to the discussions in the Constituent Assembly, to cover the rift as it developed and how Nehru healed the wounds. I should then discuss the deep fears generated widely by the chauvinistic Hindi-ists who imagined that they alone could cement the unity of a sprawling and varied sub-continent.

Perhaps, the incompetent, puerile handling of this explosive question will be best understood if I record the background against which the crucial Cabinet meetings were held on the evening of February 11 and the morning of February 12.

Warnings Ignored

Reports had been pouring into Nanda's Home Ministry suggesting that the anti-Hindi stir in the South was not confined to the usual DMK circles, that the demonstrating students, drawn from all sections, reflected the general sentiment of the towns in the South. Economic and other frustrations were seen as feeding the anger of the demonstrators. Independent observers claimed that the Bhaktavatsalam ministry was isolated and that Kamaraj was being compelled to disassociate himself from the Hindi policies of the Centre.

These very accurate assessments were, however, dismissed by Nanda and his experts, even described as an attempt to panic the G O I. Shastri, unwilling to take a position contrary to the powerful Hindi lobby, accepted the Home Ministry's view that a detailed explanation of the language policy would be enough to isolate the 'mischief-makers'.

No one at the Centre insisted on visiting the 'affected areas' in Tamilnad. The fact that Chief Minister Bhaktavatsalam was busy discouraging Shastri's plan to send Nanda to explain the Centre's policy was not interpreted as proof that the Congress writ was no longer valid in Madras. Cowardice dictated that only South Indian leaders visit South India. And T T Krishnamachari, in the midst of budgeting, was ordered to ferret out the facts even as the army moved in to prevent a total collapse of law and order.

Crisis In Cabinet

In this atmosphere, the Cabinet met to approve the text of the broadcast which Shastri was to deliver that evening. Despite the clarifications and the belated resort to the 'Nehru Formula', Subramaniam, Chagla and Sanjivayya attempted to persuade their colleagues that the situation had moved beyond clarifications and assurances, that in the absence of Nehru there was a lack of trust in the declarations of the G O I, that some kind of statutory guarantee should be promised to assuage feelings in the non-Hindi speaking regions and to prepare the way for serious rethinking. This intelligent and rational plea was not only scoffed at but the irresponsible Mahavir Tyagi was permitted to make a near-hysterical counter-attack.

Shastri and Nanda, it is reported, sat in stupefied silence as Tyagi, declaiming in *Shudh* Hindi, demanded that for a change the interests of the Hindi-speaking peoples should be considered, that the rebels in the South should be shot down, and that if the Southerners wanted to go they could go (interpreted by some to mean that they could secede!) This performance, coming as it did after the victory calls outside of Deputy Education Minister Bhakt Darshan and Shastri's earlier 'assurance' that Hindi's imposition would be speeded up, created a critical situation within the Cabinet which adjourned without any censure of Tyagi and his henchmen.

Subramaniam, in a highly distressed state, decided within half an hour of the Cabinet meeting to send in his resignation — that is, before Shastri's scheduled broadcast. Unfortunately, the news leaked out even as Shastri spoke over AIR and the impression was created in local political circles that Subramaniam, joined by Alagesan, was acting in a thoroughly opportunist manner, almost giving a head to the revolt in the South. Within hours the report was circulating that the South Indian ministers were resigning in a bloc, that Shastri was about to resign too.

By the morning of February 12, the situation in Madras had deteriorated further and the violent agitation threatened to spread to the adjoining States. Krishnamachari had spoken over Madras radio, but to no effect. The demand for statutory guarantees, was gathering force — even in the Cabinet. The Cabinet meeting in the morning was interrupted by Indira Gandhi, back from a tour abroad, who declared that she was flying to Madras to investigate the situation — a decision taken in the teeth of opposition. At last, someone from the North was getting to grips with the problem; an observer, perhaps not incorrectly, described her as the only man in the Cabinet!

Shastri's Retreat

By now, that is within 12 hours of his broadcast, Shastri was in retreat. He, however, maintained that a change, in the official language policy, even an amendment of the Official Language Act, should be handled by the Chief Ministers. A meeting to consider the question was fixed for February 23. Mahavir Tyagi visited Subramaniam, presumably to explain his conduct. Chavan made clear that his sympathies were with Subramaniam. Indira Gandhi declared emphatically in Madras that Hindi could not be pushed at the risk of disintegrating India, for the original motivation behind the policy was only to strengthen the integration of the sub-continent. How completely this ob-

vious truth had been lost sight of was only too apparent.

Even as the Students' Action Committee called off its agitation, the specialists in double-think got to work. Encouraged by the TTK report that the situation in the South had been exploited by disruptive and subversionist groups, that it was merely a law-and-order problem, the myth was spread that the left communists were behind the violence. This ludicrous attempt to play politics made no impact, not even in Congress circles, for it is well-known that this section of the communists is weak in Tamilnad. Indeed, had there been active participation by the left communists, the disturbances would have spread rapidly to adjoining Kerala and Andhra Pradesh.

Soon, the Hindi lobby was at work, pointing to the dire consequences of a 'surrender' to the South, collecting signatures to a petition which insisted on the carrying through of 'approved' Hindi policies, and implying that a law-and-order situation could be created in Uttar Pradesh and Bihar. Coupled with this campaign was the demand that Subramaniam's resignation be accepted, Subramaniam who is now the ruling party's most effective link with the angry South.

President's Wise Lead

The so-called Congress leftists remained surprisingly quiet in the Capital, even those who are now described as 'atom bomb leftists'. The C P I under Dange, true to form, was conducting an anti-US demonstration on Viet-Nam developments as the revolt sharpened in the South. The PSP, too, was nowhere on the scene. Only Lohia and his lieutenants clapped, convinced that these troubles would help end Congress rule. What does it matter if anarchy prevails, if India ceases to exist as a single unit — so long as the cry of death is in *shudh* Hindi?

The wise words of President Radhakrishnan during the crisis, with which he highlighted the failure of political leadership and warned against attempts to rule without a consensus, were drowned in the headlines of the daily newspapers which were content to emphasise the obvious — his denunciation of violence. And to top it off, the demonstration of solidarity by various Congress chieftains around the fasting Vinoba Bhave added the macabre touch. India, it seemed, was back to normal. Far from it. The fiery passion of the South had made a profound impact on the North.

True, the militant Jan Sangh and the rabid R S S refuse to face the facts and have now raised the bogey of English being imposed on the North. True, the DMK-ists have scored heavily and at the expense of Kamaraj and his friends. True, fears are being generally expressed about the possibility of secessionist movements between now and the next General Election in 1966-67. But this does not detract from that other truth: the angry revolt in the South has given us the shock-treatment we needed. We must now see that our political leadership moves with feet firmly on the ground.

The Crucial Issues

Despite the nonsense being talked about bi-linguism, multi-linguism and uni-linguism, several crucial issues are involved in this business of forging a language to cover the country.

First, English, or whatever truncated form of it remains in India, can at best be a link language until some other 'link' so necessary for communication is accepted by all the regions.

Second, primary and creative expression for many generations will continue in the various mother tongues of the sub-continent, including Hindi, but Hindi will not be accepted as a link language.

Third, the consensus on a language for the sub-continent will increasingly be described as a consensus on a *link* language rather than a *national* language, and to begin with the link language will possess little else than a basic vocabulary.

Fourth, in a situation in which the various mother tongues of the sub-continent assert their development, a new consensus for a stronger Centre will have to be secured to prevent disintegration.

And, fifth, the central leadership will have to apply its mind to evolving a Roman script for the link language. This is the reality of a continental State which embraces many developed communities and groups who are zealous in safeguarding their rights.

The demand for statutory guarantees is a democratic demand. It is possible that in the implementation of the language policy unthinking elements from the Indo-Gangetic plain may succeed in creating a constitutional paralysis, but there are other safeguards which could be effectively employed. A permanent, high-powered control commission, with powers to prevent the violation of the assurances given, could be established. Referandum procedures could be worked out to ensure that no qualitative change in language policy will take place without a reference to the peoples' wishes. The North and South have to learn to give and take on the language issue and the handicaps must be equalised as far as possible in the interests of a developing unity.

Who will draw the correct lessons from the tragic happenings of the past few days? New political alignments are bound to crystalise. To survive, increasingly the ruling party will have to rally behind those who rise above parochial, narrow interests. This applies to language as to all other issues. It is the crux of the political challenge facing India — and the Congress Party.

THE INDIAN IRON & STEEL COMPANY LTD

Notice

The Board of Directors in Meeting held today have declared an Interim Dividend on the Ordinary Share Capital in respect of the year ending 31st March, 1965 of 75 Paise per share subject to deduction of tax.

As already notified the Register and Transfer Books for Ordinary Shares will remain closed from the 15th to 27th February, 1965 and the Interim Dividend will be paid on or after the 8th March, 1965 to those shareholders whose names appear on the Company's Register of Members on the 27th February, 1965 or to their mandatees.

The Directors wish to stress that this distribution represents merely an interim payment of Dividend to shareholders to alleviate their current income position and must not be taken as in any way indicative of the trend of profits for the current year or the final Dividend that will in due course be recommended for declaration at the Annual General Meeting.

By order of the Board,
Martin Burn Limited,
F. G. Liversedge
Managing Director,
Managing Agents.

Registered Office:
12, Mission Row,
Calcutta—1.
9th February, 1965.

From the London end

European Suspicions of Foreign Capital

ONE of the more interesting features of General De Gaulle's attack on the Gold Exchange Standard is that it brings out more sharply than anything else the fundamental difference in the approach of industrialised and developing countries to the subject of foreign private investment. For no one really believes that the General is advocating a return to the pre-war, pristine gold standard; and indeed, world foreign exchange and bullion markets have remained undisturbed by De Gaulle's attack. There is, however, no doubt that his attack on Gold standard is intended to emphasize France's (and other Common Market countries') objection to the working of the present international gold exchange standard system where dollars and sterling act as reserve currencies, and dollar balances which the U S would prefer not to be converted into gold, provide an indirect means of increasing American private capital investments in France. And, it is the fear of the growing spread of such investment and the resulting control of French industry by American capital that lies at the back of France's violent antipathy to the present system of international monetary payments.

Fear of US Domination

The developing countries, whose balance of payments position is so desperate, and who urgently require foreign exchange to go ahead with their projects for industrial development, are now prepared to change their attitude to foreign private investment. And indeed, they are going out of their way to encourage such investment so that they can meet the gap not only in their foreign exchange requirements, but also that in scientific and technical know-how. Industrial countries like France, with a healthy balance of payments, on the other hand, are becoming increasingly suspicious of the control over their own industries passing into foreign hands through the investment of foreign private capital.

In his statement, General De Gaulle pointed out that under the present monetary system, countries holding dollars and sterling in lieu of gold are persuaded not to convert all their dollar holdings into gold. The excess of dollars thus held leads to increasing control of industrial enterprises by American companies because the dollar balances held somewhat unwillingly by European central banks finance a high proportion of U S direct investment abroad. It is common knowledge that America's balance of payments deficit is in large part due to the outflow of private capital for, for many years now, the U S A has been running a large surplus on current account.

In the circumstances, it would be interesting to examine how far American capital has penetrated into the European countries. In recent years both industry and Governments of Western Europe have become increasingly concerned at the growing importance, in certain key sectors of their economy, of America-based companies. The key industries include chemicals and pharmaceuticals, electronics, oil refining and cars.

Rising American Investment

Of the $40,000 millions of American investments placed abroad by the beginning of 1964, only 25 per cent, went to Europe but in 1964 alone, no less than 60 per cent of American capital invested abroad went to Europe. These investments earn an average rate of profit of as much as 11 per cent. As compared with pre-war American investment in Europe which was concentrated in banking and the petroleum industry, it is electronics, food-processing, engineering, metal trades, chemicals and petrochemicals, and car production that attract the greatest interest. In a recent study conducted by Booz, Allen and Hamilton — a management consultancy concern — on American investments abroad over the years 1960-64, it was shown that 20 per cent of American firms' new foreign operations have been devoted to the non-manufacturing sector with special emphasis on the establishment of company-oriented wholesale and retail trading activities. During this period, 4,644 new foreign activities were undertaken by a total of 1,897 U S companies. About one-half of the total went into Western Europe — the U K topping the list by providing locations for 13 per cent of all new operations started abroad.

In France it is understood that U S investment is around $2,500 million, but it should be noted that new industrial investment doubled from $632 million in 1959 to $1,250 million in August 1964. What is causing particular alarm in France is the American takeover of whole factories and the deep penetration into technologically advanced industries. It appears that a major move by the French authorities to cut down further United States investment in French industry — particularly the acquisition of French companies, is now under way. While investment creating new activities may be looked at with a fairly friendly eye, outright takeovers of French firms will be frowned on.

Smaller Companies Enter Europe

There is no doubt about the recent enthusiasm of American companies to invest in France. Following the post-war wave of big company investment, medium and smaller size companies are now seeking to mark out their stake in Common Market prosperity. Equity participations are far more popular than licensing agreements, and according to the Chase Manhattan Bank, the trend now seems to be to exchange the right to a new product for the right to a new market. Thus, although in the immediate post-war period America was able to supply much needed capital and technical know-how to a war-ravaged Europe, the situation is now completely changed. A formula which is now being discussed is one in which Americans and Europeans would invest on a 50—50 basis as this might help to curb American excesses while at the same time helping European industry. Indeed, it is very similar to the joint collaboration ventures which now have the blessings of the Government of India.

The fear of American industrial invasion is beginning to spread to other Common Market countries and the President of E E C, Professor Hallstein said in Amsterdam on February 4th that while Europe "welcomes a certain amount of American investment, excessive concentration in any single branch" should be avoided. The German attitude is perhaps a little less strong than that of France, but it is also beginning to change. The German business community feels

that the reluctance of the German Government to exchange part of German dollar holdings into gold, as France has done, has helped US competitors to buy their way into German industry. Total United States investment in Germany was estimated at $1,700 million at the end of 1963, representing some 4 per cent of total industrial investment in Germany. While German industry admits that American investment is a stimulus to modernize and a compliment to the profitability of the German economy, competition from powerful American groups create dangers for medium and small-scale companies in Germany. In a recent speech Dr Herman Abs of the Deutsche Bank proposed the setting up of an organisation which would collect and maintain up-to-date information on foreign investment in Germany.

Investigation by E C E

It is also understood that in view of the growing concern, the Economic Commission for Europe is to undertake a new investigation into the whole question of foreign investment. In the past, the Commission had contended that foreign investment did not present any global problems for the Community, though sectoral difficulties might arise. Since existing information on the subject is inadequate, a new study is to be made. The experts will now try to discover the extent of foreign penetration into all sectors of the Common Market economy. The results of the new survey should be available in about three months time.

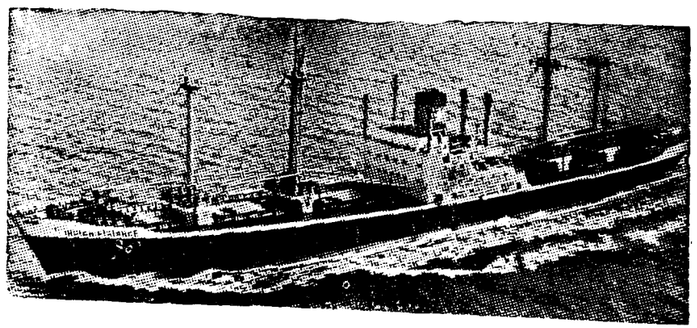
There are a number of steps which European Governments can now take to control foreign investment by exercising stricter control over foreign direct investment projects. Recently, for example, an American plan for buying a $1 million French company was rejected. Far from being an isolated instance, this is believed to be one of a series of refusals of requests to buy. Again, if Continental capital markets could be better organised, American bidders would lose the competitive advantage they now possess by being able to provide immediately large sums of money, and the European companies would be able to do the same. Another positive measure might be to lower tariff barriers and thus reduce the temptation of the foreign investor to invest within the market itself in order to jump the tariff barriers.

British Exports Rise

BRITISH exports continue on a rising trend, imports have been reduced, and the trade deficit is now lower than in recent months. These are the main points to emerge from the provisional overseas trade figures for January issued by the Board of Trade.

Exports in January were valued at £ 368 million (seasonally adjusted). They show a fall from the high December total of £396 million but the average of £378 million for the three months November-January (which brings out the trend) was 2 per cent more than in the previous three months. It now seems clear that a moderate growth in exports has occurred in recent months following the slightly falling trend in the summer of 1964.

On towards progress . . .



India Steamship Co., Ltd., has a steady record of progress . . . Since Independence, its tonnage has increased from about 85,000 D.W. tons to over 200,000 D.W. tons—more tonnage being still on order.

Its services are also extending to various trade routes. After initial consolidation in the India-U.K.-Continent trade—the Company entered the Indo-Soviet service to the Russian Black Sea ports in 1956 and later to Rumanian ports. In 1959 the Company forged still another link in the overseas with South America, and in 1960 it extended its service to Poland.

Their experience and reputation for fast, efficient and dependable service built on the personal care given by their experienced officers and crew to the cargo entrusted to them, have earned them the goodwill of their customers.

Village Politics in Kerala—I

Kathleen Gough

The arrest of 800 Leftist Communists at the end of 1964, 150 of them from Kerala, raises such questions as who supports the Leftists, why, and how political parties operate in Kerala's villages.

I shall discuss these questions with reference to a village in central Kerala, using comparative data from a second village in the northern part of the State. My first acquaintance with these villages was in 1948 and 1949. I returned to restudy them between April and September 1964.

It is not suggested that these villages are typical of Kerala communities. Both, for example, contain a majority of Leftist Communist supporters, and both form wards within Leftist-dominated panchayats. (I do not know what proportion of Kerala's 922 panchayats are dominated by the Leftists, but probably rather less than a third, judging by estimates received from district party offices).

In both villages only one other party, the Congress, has an active organization. In both, the S S P and the Rightist Communists each, in 1964, had only one or two supporters; in the northern village, some half dozen Muslim families supported the Muslim League. Kerala's smaller parties, such as the Revolutionary Socialist Party and the Christian Karshaka Thozhilali Party, are more locally based and in these villages had no supporters at all.

Situated in the midland farming areas, the two villages can also afford no insight into politics on the large tea and rubber estates to the east, the coastal fishing or coir or cashew-nut processing communities, or the bigger ports.

Finally, this paper offers no analysis of political parties as state-wide institutions, but only of some of their operations at the level of village and panchayat.

What is hoped, however, is that the study may provide general insights into how and why villagers of different castes and classes, in the farming and suburban areas, support the Congress or the Communist Parties; how the inter-party conflict is pursued through local institutions, and what factors hold it in check.

[The Congress and Communist Parties polled respectively 34.5 per cent and 36.7 per cent of the vote in 1960 (K P Bhagat: "The Kerala Mid-term Election of 1960," p 147). Both are now split. The Leftist Communists appear to lead a much larger proportion of rural supporters than the Rightists. The Kerala Congress Party had not yet seceded from the Congress Party at the time of my study.]

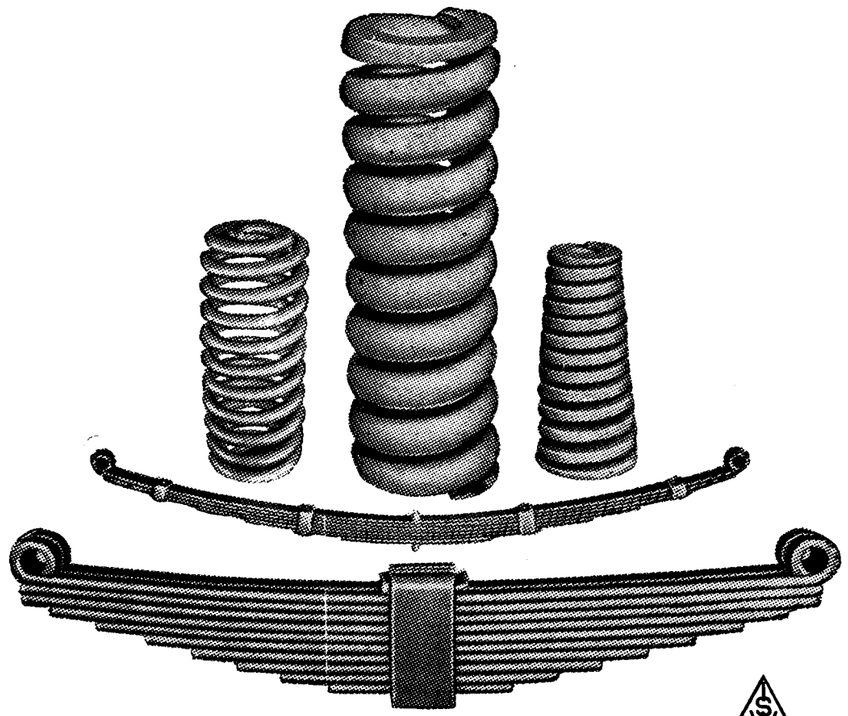
PALAKKARA lies four miles from Ambalapuram, a town and district capital in central Kerala.* Its population has increased from 1289 to 1932 between 1949 and 1964, largely through natural increase, but partly as a result of the construction, in 1958, of a block of government offices in an adjacent village. This event brought several new families of government servants and uprooted landless labourers to live in Palakkara. The increase has made the village very crowded, while the entry of a few rather wealthy families has raised the price of land. About 60 per cent of men in Palakkara work in Ambalapuram or neighbouring towns; less than half did so in 1949. Their work ranges through a great variety of wage or salary occupations.

Parambur, the second village, lies in a rural area in the foothills of the Western Ghats in North Malabar, sixteen miles east of a coastal town which is also the district capital. There is wet paddy farming in the valleys, as in Palakkara, but the bulk of cultivation is of hillside gardens of cashewnuts, coconuts, arecanuts and pepper. About 63 per cent of the men are landless agricultural labourers, in contrast to Palakkara's 24 per cent. About 88 per cent of the men have more or less traditional rural occupations. Parambur's population has increased less than Palakkara's in the past fifteen years — namely, from 1,320 to 1,510. Its economy has also changed less, although there has been expansion of cashewnut farming on formerly waste lands.

* I have used pseudonyms for all proper nouns except the names of famous leaders, to protect the identity of my informants.

"As Bad as Ever"

When I asked middle-aged people in both villages, "Do you feel better or worse off now than when I saw you in 1949?" the most characterstic answer was a laugh and "As bad as ever." There were, in fact, modest improvements in both villages' public property and services. Palakkara has electric street lights, better country roads, a radio house, reading room, children's playground, and some minor irrigation developments. Parambur has several new roads, replacing mountain footpaths — one of the first things I was told is that it is now possible to get a jeep from the main road to the largest paddy-flat, and that two have been down there, one, the Block Development Officer's, and the other, a Congress Party speaker's. Parambur also has a small reading room and a large co-operative society building. Both villages have more frequent bus services to the town. In both, more of the children are in school.



Regarding private wealth, the real wages of landless day labourers — the poorest stratum of the employed — have no doubt somewhat increased. Yet there is if anything more insecurity of employment than formerly in this class. Many families still suffer acutely for two to three months during the monsoon, and some of the less fortunate are almost destitute most of the time. Demands and expectations in this group have risen enormously, and there are perpetual complaints against employers.

At the opposite end of the scale, Palakkara's "upper class" consists of some 26 families of small landlords, of owner-cultivators possessing more than five acres of land, of higher ranking government clerks, and of small businessmen (a spinning-mill owner, a jewel-cutting shop owner, and a lorry-owner) — employing more than a dozen workers. Seventeen of these families are indigenous to the village. Most of them have improved their wealth since 1949 through a fortunate combination of farming with white-collar jobs. Palakkara's only indigenous landlord is a Namboodiri Brahman whose forebears were village headmen. The family contains no educated urban workers, and has been

obliged to sell some gardens since 1949. Its members still own about 60 acres. In spite of lower rents and higher labour costs, the head has been able to hold on to a modest affluence by personally farming a portion of the estate.

Increased Wealth

Among the half dozen bigger landlords of neighbouring villages, the impression I received was one of increased rather than of decreased wealth. In 1949, for example, a wealthy Namboodiri family of an adjacent village owned 600 acres of coconut gardens and wet paddy land. They were obliged by the Communist Agrarian Relations Bill of 1959 to sell 150 acres to tenants. The rest has been parcelled out among relatives and brings a rich livelihood, most it is now being farmed with hired labour rather than through tenants. The family's wealth has been further increased by professional employment, and by investment in shop buildings and rental houses in the town.

Similarly, Parambur's one very wealthy landowning joint family, of Nayar caste, has retained or increased its wealth through a combination of subdivision of the property to maximize holdings under the land laws, of personal farming of large acreages, of professional employment, and of intensive cultivation of plantation crops such as cashewnuts, which are exempt from land-ceilings. The net effect in both areas is that while landlords are deeply concerned about threats to their estates from future land laws, few have suffered so far from the ceilings imposed either by the Communist Agrarian Relations Act or by the subsequent, and much more moderate, Land Reform Act of the Congress government of April 1964.

It is in the middle ranks in both villages that economic deprivation is most bitterly lamented. These ranks include small owner-cultivators having less than five acres, tenant farmers, village craftsmen and other village servants, petty brokers of cash crops or livestock, and individual keepers of small grocery stores or of tea shops. Palakkara's "middle class" also includes lower ranking clerical workers, "peons", and workers in restaurants or in industries. While there is minor variation, in only a few special cases has the livelihood of these families substantially improved since 1949. Among the latter are, for example, a half dozen enterprising carpenters and masons who have gained wealth from the new government building, and a half dozen workers in a metal parts factory whose Communist union has secured substantial wage increases. The rest complain of low wages, high prices, loss or subdivision of land plots, unemployment of some members, heavy indebtedness, poor food and frequent illness, and inability to maintain the most modest middle class standing in spite of hard work and thrift. For such people, the picture is further darkened by a sense of loss of morale and of local co-operation, of growth of corruption and of cut-throat competition for land, jobs, influence and education. They feel that they have been left behind by the few fortunate rich, yet are threatened by the unskilled manual labourers, who, under Communist influence, grow ever bolder in their demands. An elementary school teacher summed up the position when he said. "Seventeen years ago we had troubles but we told you it was a transition period. At least we had hope. Now we do not know what lies ahead — we are looking into darkness."

Castes and Religious Groups

The two villages encompass the main ethnic groups of Kerala. We may divide these into five broad categories. Among Hindus, the Nayars and their congeners (including the small castes of Namboodiri Brahmans and Temple Servants) have traditionally been a landed aristocracy of government servants and religious specialists, about 19 per cent of the people. Below them come the Iravas and a number of allied castes (25 per cent), occupied as tenant farmers, landless labourers, artisans, or in the coir and cashewnut industries. With the mobility of wealth that market relations have brought to Kerala, some Iravas have become merchants, landlords or small industrialists, while many Nayars are now wage earners. At the bottom of the caste scale fall the Harijans, some 9 per cent of the people. They are landless labourers in villages or on the tea and rubber plantations.

Muslims, concentrated in North Kerala or Malabar, form 20 per cent of the people. They have progressed less rapidly than Hindus or Christians in education, and include, as well as rich merchants, many poor and preliterate labouring families in the ports and inland bazaars.

Christians form 24 per cent of the people. They are divided into Roman Catholics (about 90 per cent) and several sects of Syrian Christians and Protestants. Much of the modern capitalist enterprise of Southern Kerala has been carried out by Christians, but Christians span the class structure and include almost every occupation.

Palakkara contains 94 households of Nayars and allied high castes. In traditional parlance they are the "good" or "clean" castes, and the Nayars proper have been the dominant caste in this village. The bulk of Nayars descend from seven ancient matrilineages, whose ancestors owned some land and leased more from the Namboodiri Brahman landlord and head of the village. Today, only about a dozen Nayar families retain paddy fields or more than a single garden, the majority being clerks, mill-hands or urban service workers. Correspondingly, more than three-quarters of Palakkara's wet land and almost half its dry land is now owned by absentee landlords, chiefly Christian merchants or Nayar or Brahman professional men of the town.

Palakkara's 51 Christian households rank socially, and in some contexts ritually, between the Nayars and the Iravas. Their ancestors moved to Palakkara from a nearby Christian village eighty years ago, and they were never fully integrated into its traditional social life. Unlike the aristocratic Syrian Christians and the older Catholic families of Ambalapuram, Palakkara's Christians are believed to have once been Harijans and Iravas who were converted to Catholicism within the past two hundred years. Only three of Palakkara's present day Christians have wealth and high school education, and they have arrived since the government offices were built in 1958. The rest are tenant farmers, brokers, or semi-skilled manual workers in the town.

Irava and Harijan Groups

The 115 households of the "Irava group" were once tenant cultivators and village servants under the Brahmans and Nayars. I have included among them the small service castes who rank close to the Iravas, such as Smiths, Astrologers, Masons, Barbers and Washermen. Some retain their traditional occupations; others trade, or fill town jobs of the same type as the Christians. Some half dozen have completed high school and now hold clerical posts.

The Harijans of Palakkara, finally, comprise 33 households of the Vettuvan and Parayan castes. Once agricultural serfs, hereditarily bound to

Nayar and Brahman households, they are today mainly coolies or landless labourers. Most of the younger children are in elementary school, but none has attended high school.

The Irava and Harijan groups traditionally comprised the polluting castes. There was wide social distance between all of them and the Nayars. Within this category, however, the Iravas and their congeners were sharply separated from the Harijans — a fact today reflected in the government classification of the Irava group as "Backward Classes" but not as Harijans. In Palakkara the social distance between Iravas and Christians has always been much less than between either of them and, on the one hand, the Nayars, or on the other hand, the Harijans.

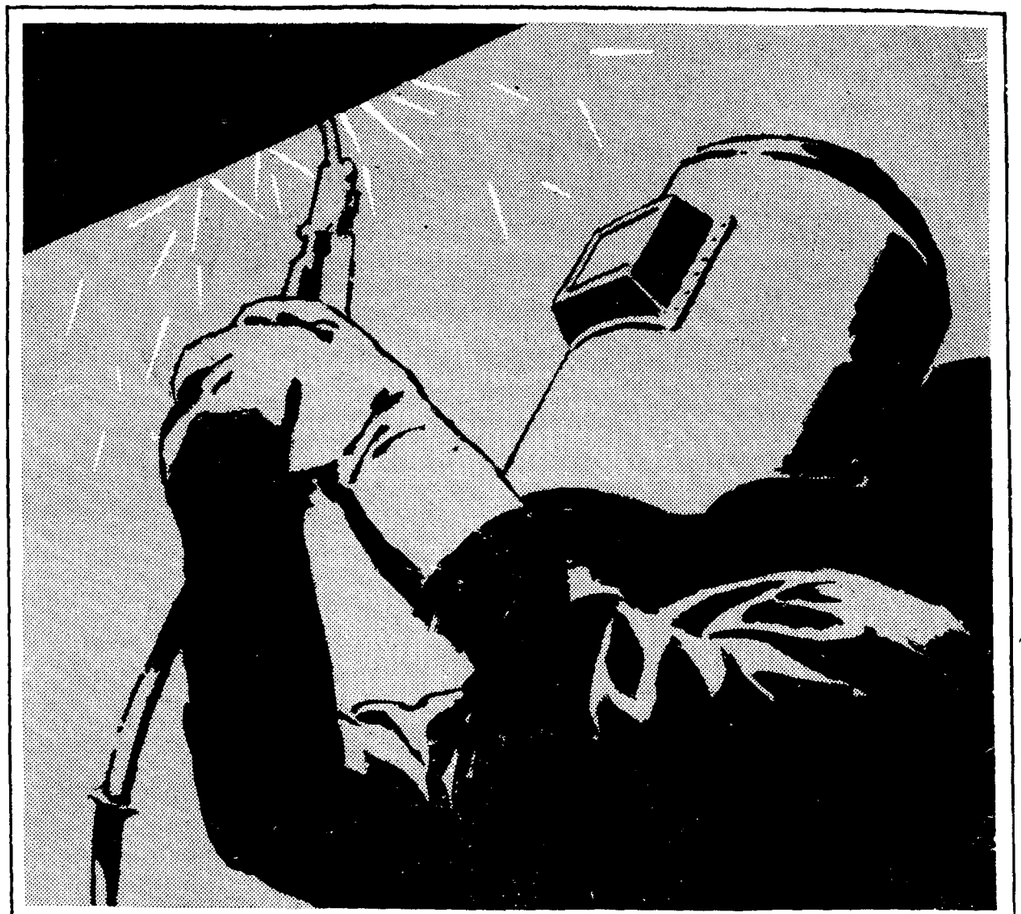
Simpler Caste Structure

Parambur's caste structure is simpler. There are no Christians, and only one house of Harijans. The vast bulk of the village falls into either the Nayar group (53 houses) or the Irava group with 132. As in Palakkara, the Nayars have been the dominant caste of small landowners and tenant cultivators, leasing some lands from a leading family. A hundred years ago, the leading Nayars were a Parambur matrilineage, formerly village headmen under the local Rajas. With the mobility of wealth brought about by export crop farming in the late nineteenth century, the local headman's lineage lost most of its land to a bigger landlord lineage of a village five miles away. This lineage made wealth in the timber trade and "ate up" the surrounding villages. Today one of its branches occupies a large house on a hill-top overlooking Parambur, and the lineage as a whole owns much of the village land. The local Nayar households, of lower social status, own small plots or lease gardens from the landlords, or in some cases work as coolies. The majority of the Iravas are landless agricultural coolies or very small tenant farmers. In both Nayar and Irava castes, a few men are cash crop merchants, shop-keepers, school teachers, hand-loom weavers, bus-drivers, postmen or constables.

Finally, on the eastern boundary of the village, near the river bank, live 25 households of Muslim, culturally and economically affiliated to the small Muslim bazaar town across the river. Sixteen years ago Parambur's Muslims were 'timber coolies" for Muslim merchants. They swam downstream with logs to the port, returning with trade goods. In the past five years timber transport has been taken over by lorries. Parambur's Muslims are therefore very poor and insecurely employed. They pick up day jobs as coolies for Nayar farmers or Muslim merchants across the river, or peddle dried fish between coast and interior.

How the Parties Came

When I came to Palakkara in 1948, there was only limited franchise and political parties had not galvanized social life. Cochin and Travancore, as native states, had played less part in the Independence struggle than had Malabar, and its excitement had scarcely penetrated the village. A few Nayars belonged to the Cochin Praja Mandal, or States Congress Party, but most were cold to the Congress Party because it had recently opened temples to the lower castes. In these latter castes four youth, the only ones to have passed through Primary School, supported the Indian Socialist Party. They were a Carpenter, two Astrologers and a Washerman. Starting out as Congressmen after Independence, they had become disgusted with what they regarded as Congress corruption, its favouring of wealthy and high caste supporters, and its failure to control the prices of food.



About six youths, Nayars and Iravas, supported the Communists. They worked in a textile mill and belonged to the AITUC union, were rebellious against caste restrictions, and in town demonstrations, marched proudly behind the flag. They set in low caste teashops, played cards in the road, and tested the Temple Entry Act by bathing together in the village temple tank. Most Nayars, especially women, condemned them as crazy and sinful, shaking their heads over the supernatural dangers to the village of youth who transgressed religious laws. When a slimy, noxious weed appeared in the tank in the dry season, Nayar women stayed away and blamed it on the deity's wrath against the Communists.

Most of the Iravas were accepting of the Communists, but disinterested. For the past ten years, Palakkara Iravas had belonged to the Sri Narayana Guru movement (S N D P), a famous caste association based on the creed "One God, one caste, one religion." The S N D P required monogamy of Iravas, Sanskritization of their religious rites, repudiation of caste inequalities, and a kind of Protestant (and indeed capitalist) ethic of thrift and independent enterprise. Under SNDP influence the Iravas paid monthly dues to their statewide association, attended its temple in a nearby village, and employed its Irava priest to perform Sanskrit life-crisis rites. They had ceased to take part in animal sacrifice or other "low caste" ceremonies at the village temple festival. The Iravas had, in fact, partly abstracted themselves from Palakkara's traditional caste system — both economically, through wage work, and also morally through the S N D P. They did not, however, attack Nayar dominance head on, but lived in a kind of quiet, back-to-back relationship with the Nayars, fulfilling their tasks and keeping social contacts to a minimum. While few could vote, Iravas tacitly supported Irava candidates who were recommended by the S N D P and who ran as Congressmen or Independents. The Christians, similarly, were deeply involved in their parish church in the next village and supported only church-approved Christian candidates, who at that date ran chiefly as Independents.

Party Tactics

In 1948, Palakkara's Harijans had no interest in political parties. All were pre-literate and worked only within the village. Engaged in relations with small owner-cultivators, they had never been contracted by the Communist peasant unions which, on the larger estates, were in this turbulent period attacking the privileges — and the granaries — of wealthy landlords.

Just beyond the southern boundary of Palakkara lived a strange young man called "Communist Namboodiripad". Aged 25, he was the younger son of a landlord house in a neighbouring village. As a boy he had served as priest in one of Palakkara's temples. At 13 he ran away because his father would not allow him to attend high school and learn English. Visvanathan joined and worked for the Congress youth movement, lived in the Congress Party office, ate in the houses of Christian, Muslim or Hindu party workers, and somehow pulled himself through high school. At 19 he quarreled with the Congress Party because, he said, local leaders were absconding with its funds. He was inspired by a speech by A K Gopalan, the Communist peasant-organizer, followed him on a demonstration, was arrested, and soon joined the Communist Party. "I came to know that

FERRON 5

THE LOW HYDROGEN ELECTRODE FOR WELDING MILD, MEDIUM AND HIGH TENSILE STEELS.

Ferron 5 is a low hydrogen electrode. It is pre-eminently suitable for welding mild steel and medium and high tensile steels having a relatively high carbon content. Excellent results can be achieved with Ferron 5 for welding heavy sections. Ferron 5 is specially recommended for restrained joints.

- Ferron 5 permits the use of low open circuit voltage with a minimum of 45 Volts, D.C. and 60 Volts, A.C.
- Ferron 5 conforms to B.S. 639 : 1952, B.S. 2549 : 1954 and ISI : 814 : 1963.
- Ferron 5 is certified by the Lloyd's Register of Shipping.

only thus could we stop the inequalities." He was instructed in Marxism by a local Namboodiri leader, who seems to have stood to him as a *guru*. Following party policy, Visvanathan later joined the British army and fought in the Burma campaign, but was court-marshalled and imprisoned for organizing strikes in protest against British officers' superior conditions. Returning to Kerala, he formed trades unions among factory and plantation workers. In 1948 he married (within the caste but without dowry), obtained a share of family property, and settled on the edge of Palakkara. I saw him only twice, for he was usually underground or in prison. He had almost no contact with Palakkara people. Most thought him mad, and he thought them hopelessly backward.

When I returned to Palakkara in 1964, I found more than half the village supporting the Leftist Communists. Visvanathan is now President of the local panchayat board. In his party he is prominent on the district committee. Palakkara is now considered a hot-bed of Communist influence in the mainly working class neighbourhoods which surround Ambalapuram.

Political Consciousness

The change to widespread political consciousness came in Palakkara with the introduction of universal franchise and the entry to the village of units of the Congress and Communist parties at the end of 1951. Political interest much increased when, in 1953, Palakkara became one of seven wards in a newly organized panchayat, whose board members were for the first time elected through universal franchise. Four of the wards elected Communists; three of them, Congressmen. Palakkara elected as ward member Gopalan, a young Nayar ex-constable who was by that time one of three Communist Party members in Palakkara. Panchayat elections were not held again until December 1963; the elected board was suspended during the Chinese Emergency and its functions carried out by a government Panchayat Inspector. In 1963 the panchayat elected a new board of eight members, six of them Communists or Independents with C P support. Two additional nominated members, representing women and Harijans, were Leftist Communist supporters. Palakkara's Gopalan was re-elected, and Visvanathan for the first time became panchayat president in his role as ward-member from the next village. The Communists have steadily increased their support; by 1963, only 337 Palakkara people voted for the Congress candidate, and 513, for the Communist.

The parties came to Parambur in a different way. There, as in Palakkara, half a dozen educated and prosperous Nayars (teachers, landlords and owner-cultivators) joined the Congress Party during the Independence movement on nationalist ideological grounds. The difference from Palakkara was that Parambur lay in a region dominated by very large landowners. Its tenants were swept up in the peasant unions of the mid-1930's. These unions were led by A K Gopalan and other eminent mass leaders, then of the Congress Left. They agitated against the landlords for lower rents, fixity of tenure, and the abolition of feudal levies. They also attacked the landlords' right to administer village justice and to impose beatings and fines.

The unions were extremely active until World War II, and in Parambur mobilized 200 Nayar and Irava tenants. Their activism seems to have been related to the growth of export crop farming, the consequent monetization of tenancy and labour relations, the increasing gap in wealth between the great landlords and their masses of impoverished tenants and labourers, and, therefore, the labourers' increasing resentment against the old-style levies in kind and against the landlord's paternalistic "justice". Village members of the *karshaka sangams* almost all became Communist supporters when their organizers left the Congress and joined the C P I in 1939. From about 1942-6, *sangam* activism subsided, partly because the war-boom brought gains to the cultivators, and partly because the C P I ceased its most militant forms of agitation while collaborating with the Allied war effort. The sangams were revived in 1946 and reached the peak of their militancy in 1948. Following C P I national policy, they harvested crops for the benefit of the tenants, ransacked granaries, and waylaid grain lorries to distribute food to the landless. Parambur itself actually had rather little violent "trouble". The local landlord, an Independent M L A of understanding and high character, adopted the enlightened policy of freely distributing stocks of grain to his tenants. But in some neighbouring villages there were bloody encounters between tenants and police, arrests, and two famous cases of martyrdom of Communist leaders. The period became burned into the memories of villagers as one of bitter class struggle between the landlords and the Communist-led tenantry.

When I reached Parambur in mid-1948 the main battles were over. Most Communist Party members were in jail or underground. I was, however, well aware that most tenants secretly supported the C P I. Parambur, like Palakkara, had its budding Communist leader, Parameswaran, a Nayar youth of 27. But whereas Visvanathan looked for his following to urban factory workers and rubber plantation workers of several miles away, Parameswaran's was already established in his village.

After 1951, party units developed in Parambur much as in Palakkara. In 1953 the village became a ward of a larger panchayat, first of three and later of eight villages. From the first, the panchayat elected a Communist dominated board. In December 1963, the Communists further increased their vote, securing seven seats out of eight. Parameswaran has been the ward-member for Parambur since 1953. In 1963, 490 people voted for him, and 227 for the Congress candidate.

Party Units in the Villages

The structure and activities of village units of the Congress and Communist parties in some ways resemble each other. This is natural, as both participate in the electoral system. In each party, village units are responsible to higher committees of the party which tend to parallel the main administrative divisions of the state and nation. Thus, Congress Party members of a ward, which is usually coterminous with a village, elect delegates to a committee of the *mandal*, which is usually coterminous with the panchayat. Mandal committee members elect delegates to committees of the district, state and nation. The Communist Party is similarly constituted, except that the C P seldom has an independent unit at the level of the village or panchayat-ward. Its smallest unit is a branch, which (as in the case of Palakkara and Parambur) is often drawn from a whole panchayat. Branch members elect delegates to committees of the district, state and nation.

When we look into matters, important differences emerge. An obvious one is that in each village, the Congress Party has a large number of enrolled members — 76 in Palakkara and 99 in Parambur — but a relatively small number of firm supporters. The C P I, by contrast, has only two or

three party members in each village, but a large number of followers. There are several reasons for this. One is that the CPI has apparently, in most periods, restricted its membership to a small organization of trained and proven Marxists, appropriate to a revolutionary party with secret activities. Party members told me that this was necessary because most ordinary men, engaged in everyday relationships, could not be trusted to be loyal to the party if they got into difficulties. Party members must be ready to suffer hardships and observe strict codes of conduct which tend to set them apart from others. Even in the past decade of parliamentary participation, demonstrations against Congress policies have often landed them in prison. Many were there for brief periods during my stay, after organizing demonstrations during the food crisis. Party members who drink heavily, steal, gamble or otherwise create public trouble, or who criticize party leaders or policies to outsiders, are subject to temporary or permanent suspension. There are similar rules of conduct for Congress members, but my impression was that they are less strictly observed. The risks and discipline required of CP members cause some men to abstain from joining who would readily be accepted. A Nayar factory worker who had supported the CPI for 17 years told me, for example, that Gopalan often urged him to join it. He refused because, he said, "The party takes the whole man." He was also afraid of endangering the educational chances of his younger brother, who held a government scholarship.

Party Membership

From 1957-9, during the period of Communist rule, efforts were made to widen the party membership and to create a "popular" democratic party. CPI membership in Kerala is said to have reached 60,000. After 1959 it dropped again to about 25,000 — people say, because "bogus members" who merely wanted favours from the government changed sides when it fell, and because the party grew weaker as a result of the ever-widening Right/Left division. When the split finally came, in April 1964, the Leftists appear to have carried off a large majority of Kerala CP members, although they had only a minority in the leadership. In both Palakkara and Parambur two or three members had tacitly left the party during the Left/Right dispute. Because the leadership was too busy arguing to maintain close contact with the villages, they simply stopped paying dues. All were, however, Leftist supporters after the split had occurred, and said that they would probably try to rejoin after its policy became clarified.

As a party permanently devoted to parliamentary democracy, the Congress has enrolled as many members as possible. It was said to have about 15 lakhs in Kerala. In both villages almost all were primary or "Four-anna" members. Only the ward-presidents and one or two others were "active members" who had fulfilled the criterion of paying Rs 10 to the party or of enrolling 50 primary members.

In fact, primary members in the Congress Party are in some respects comparable to a category of villagers called "Communist *anubhavis*" (supporters), a phrase heard on everyone's lips. A Communist *anubhavi* is one who is not afraid to publicize his Communist allegiance. He is close to the local party unit, canvasses in elections, and takes part in public demonstrations. If suitably qualified, an *anubhavi* may run for office in the panchayat with CPI backing — three or four had done so, and won, in both the panchayats where I worked. I had the impression that Communist *anubhavis* work harder for the party than do Congress primary members. Many of the latter pay their 4 annas and then remain in a kind of sleeping partnership, attending party meetings only when required to vote for the active members who enrolled them. The fact that locally prominent men wish to have a large number of personal supporters who will vote them on to the *mandal* or some higher Congress committee seems, indeed, to be the main reason why so many primary members are enrolled. Several Congress district secretaries with whom I talked admitted this openly, and I noticed that two automatically referred to primary members as "bogus members". It will be interesting to see whether the new ruling of June, 1964, which forbids primary members to vote for Congress office-bearers above the level of the Community Development Block, will affect enrollment in villages. Perhaps not, for village primary membership seems to be already mainly relevant to the election of "small big men" at the panchayat level, rather than to elections to the district or state committees.

Communist *anubhavis* are also often members of Communist labour unions. In Parambur about 100 *anubhavis*—small tenant farmers—belong to the peasant union which dates back to the 1930's. They pay dues to the union, elect their own officers, and attend meetings at which they evaluate and criticize the achievements of Communist Party members of the panchayat board. Palakkara formed a similar peasant union of 40 members for the first time in 1963, during the *panchayat* election drive. In both villages, however, the events surrounding the Left/Right split had so absorbed the energies of party members that they allowed their *sangam* work to lapse, and the peasant unions were temporarily inactive. When I left in September, Leftist party members were beginning to reorganize the tenants to demand their legal rights under the new Congress Land Reform Act, and to prepare them to argue for these rights before the government constituted land tribunals.

Peasant Unions

Peasant unions are naturally the most prominent kinds in villages. In Palakkara, however, about thirty men belong to one or another AITUC industrial union. By contrast, villagers' support for Congress unions was very weak. The Congress Party does have its kisan unions, but I was told they are insignificant in Kerala and that, after the CPI, only the PSP has any strength in peasant organizations. The Congress Party also, of course, runs unions in almost all industries and on the tea and rubber plantations. In Palakkara, about six men and an equal number of women belonged to recently organized Congress unions, in a local undershirt factory for women and in a newly started spinning mill. Both of these factories refused admission to known CPI supporters, so that to date the CPI had been unable to establish unions there. Unionism was in general, however, a much more lively interest of Communists than of Congress members.

Within each village, the two parties tend to carry out the same range of formal and informal activities, but with different emphases and goals. Most of these differences spring from the contrast between the Congress as a democratic party which has tried to "absorb" the traditional power structure and gain maximum consensus while only gradually changing the status quo, and the CPI whose village members (in spite of a decade of parliamentarism) have retained the

outlook of Marxist revolutionaries.

In each village both party units of course carry on the political tasks of fund-raising and propaganda through public speeches and door-to-door canvassing. These activities are intensified just before an election, and tend to lapse in between. On the whole, C P canvassing appeals to the class interests of the propertyless and the desire for radical changes leading to greater economic and social equality; Congress canvassing, to self interest and to the desire for public welfare of a more traditional kind. C P I canvassers rely much more on rousing public speeches, demonstrations of protest, organization for militant struggles, and solidarity with charismatic leaders who have conducted such struggles. Congress workers rely more on quiet appeals to the vested interests of those who own property, however little, and for the rest, on personal influence and friendship and on favours, monetary or otherwise, to potential party supporters. It is true, however, that this contrast has to do not only with ideology but with whether or not the Congress is already in power, for the 1960 "liberation struggle" against the Communists did involve large and vociferous demonstrations of an unusual kind.

Political Favours

Moreover I do not mean merely to echo the Communist allegation that the Congress gains its supporters through bribery, corruption and general appeals to self interest, while the Communists gain theirs through idealistic dedication to the working classes. It is more complicated than that. C P supporters, like Congress, do gain personal favours from party members and did so especially during the period of C P rule. Occasionally such favours involve acts which are, strictly speaking, illegal. Most often they are a matter of favouritism in the use of personal influence and the distribution of scarce resources which party members control. An example of the former would be the fact that in Palakkara, with the recent overcrowding many landless families have encroached on government wasteland by the roadside and built small huts there. Leaders in both parties have provided legal aid, and tried to influence employees of the village land-office and the district revenue department, to make such claims "stick" on behalf of their own followers, but to have followers of what each calls the "anti-party" evicted. Examples of mere favouritism are the fact that in Parambur, in the C P period, the panchayat board saw to it that Communist supporting landless labourers were the first to receive gifts of free housing from the government. Similarly, in both villages co-operative societies have given jobs as clerks and fair-price shop managers to supporters of the party whose members happen to dominate the co-operative society's board. The Communist panchayat boards have in both villages also given contracts to build roads and irrigation works to Communist-supporting contractors and labourers.

The difference is that in the case of the Congress Party, my evidence suggests that only propertied persons are likely to join and support it for the sake of either class interests or ideological conviction, whereas propertyless people (as well as many of the propertied) join or support the party *in the first place* to gain good personal relations with, or favours from, party leaders. Communist supporters usually become so because they believe in the party's policies and in the benefit it may bring to their *class*, whereas personal favours come to them as secondary rewards. Instances to the contrary are, of course, available. Thus the managers of two large firms in Ambalapuram—a textile store and a transport company—are said to have switched to the C P I during 1957-59 to gain contracts from municipal and state governments, and then to have reverted to the Congress after 1959. In general, however, in the neighbourhood of these villages, it is assumed that property-owners, and those who have special relations with them, will support the Congress, and the rest of the propertyless, the Communists.

Other activities of the parties show the same kinds of surface similarities, with underlying differences which stem from their different ideologies and class-bases. Both parties stress that in addition to political canvassing it is their members' duty unselfishly to "serve" the public. But Congressmen tend to see their duty in terms of voluntary philanthropy or bringing "help and benefits" to the village: Communists, in terms of "conducting struggles" against the wealthy, or of forcing benefits out of the government on behalf of the poor. Thus in Palakkara, Congressmen were proud that wealthy, urban members of their party had recently built a clinic within the boundaries of the panchayat: and that after the death of Pandit Nehru, the Palakkara Congress party unit gave a mourning feast, prepared in the Congress office, to the villagers as a whole. The Communists, by contrast, are proud that in both villages, their agitations have wrug higher wages and fixity of tenure out of the landlords, and have lowered the house-taxes of people of low incomes, and raised those of middle incomes.

Benefits for the Poorest

By virtue of their control of the panchayat board, the Communists have, of course, brought certain "benefits" to each village with the aid of government funds. But these again have tended to be heavily biased in favour of the poorest sections of the villagers. Examples would be a new road in the Harijan quarter, or a new tank for the low caste washerwomen, while the high caste tanks went unrenovated—benefits which in themselves made it necessary to "conduct struggles" against the privileged before they could be achieved.

Similarly, when communist members do undertake private philanthropy they tend to do it for the lowest and poorest (their own followers), whereas the philanthropies of Congressmen usually end by benefiting the upper and middle ranks of the villagers. The clinic, for example, must charge fees to cover its expenses. These, although small, are prohibitive for the poorer people. Congress members in the village raised funds to build a reading room in the Nayar area, which is — quite naturally—attended only by literate people, mainly from that area. By contrast, the Communist ward member runs a drama club which is located in a mixed street of Iravas and Christians, and is patronized by mainly preliterate Iravas, Harijans, and a few Communist-supporting Christians and Nayars.

Economic Growth and Rural-Urban Income Distribution

1950-51 — 1960-61

V K R V Rao

A significant relationship between economic growth and income distribution is the change that takes place in the proportions of urban and rural income to total income.

The more developed an economy the higher is the proportion of urban income, and the lower that of rural income.

The increase in the proportion of urban income is largely due to the increase in the proportion of the urban labour force to the total labour force, though to some extent it is also a result of the smaller proportion of rural per capita income to urban per capita income.

It must be added however that an index of the degree of development is not only the growth of the urban share in the national income but also a reduction in the disparity between urban and rural per capita incomes.

It would be interesting therefore to consider the effect of Indian economic development during the first two Five Year Plan periods on the growth of urban and rural income as also the change, if any, in their relationship.

[This article is based on the author's forthcoming book : "Distributional Aspects of Economic Growth in India: 1950-51 — 1960-64".]

IT is not easy to allocate India's national income between the urban and rural sectors nor the change in their respective magnitudes over the ten year period. Fortunately, the two terminal points of our period coincide with the decennial Census and it is possible to make a somewhat rough estimate of the relevant magnitudes. There are however differences in definition of the urban area between the two Census of 1951 and 1961 that prevents a straight comparison of the urban population in the two years. The 1951 Census had included in the urban sector all places with a population of 5000 and over as also some places with a smaller population but possessing definite urban characteristics. In the 1961 Census, while all places like municipalities, cantonements and other areas possessing recognised local administrations continued to be treated as urban, for other places the criteria for inclusion were made stricter. Thus, in order to count as urban, they had to have a population of not less than 5000, have a density of not less than 1000 per square mile, and have at least 75 p c of their working populations engaged in pursuits other than agriculture. On this definition, urban population in 1961 was only 17.8 p c as compared with 17.0 p c in 1951. On a reclassification of the data for 1951 in terms of the definition of 1961, however, it is found that the increase during the decennium is higher, being 17.8 p c in 1961 as against only 15.6 p c in 1951. It was therefore possible to identify the increase in urban population on a uniform basis.

Proportion of Workers

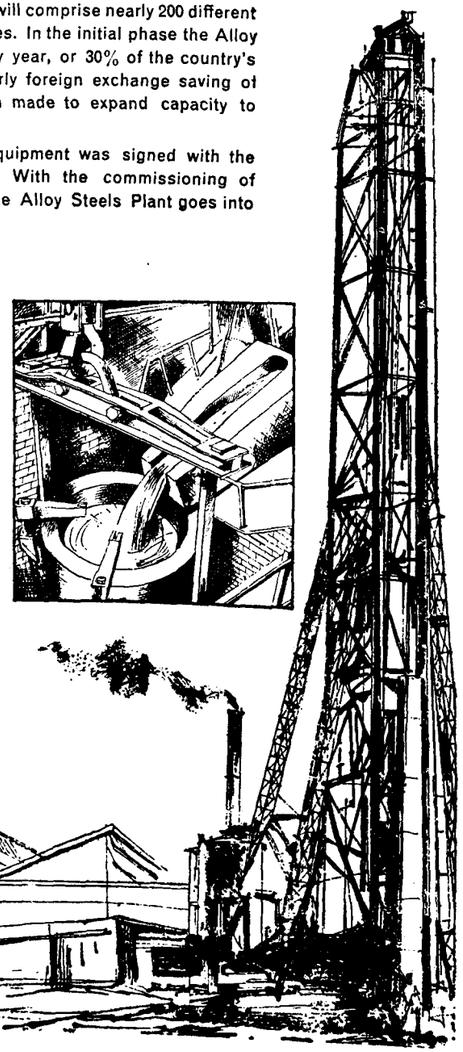
When it came to the number of workers, it was more difficult to bring about comparability. The 1951 Census had classified the population under three categories, namely, 'self-supporting', 'earning dependent' and 'non-earning dependent'. A 'self-supporting' person was defined as one who earned enough at least to maintain himself, the 'earning dependent' as one who had some income, while the 'non-earning dependent' had none. The 1961 Census abandoned this classification and instead introduced only two categories, namely, 'working' and 'non-working'. The principal means of livelihood was no longer linked with the proportion of the income earned but to the activity to which the respondent devoted the major part of his working time. This resulted in a large increase in the number of workers in the 1961 Census, mainly under female workers in agriculture, the index number of female cultivators which stood at 109.9 in 1951 with 100 as base in 1900 now jumping to 194.7 in 1961. It must be added that, as the bulk of the abnormal increase was accounted thus under agriculture, the definitional difference is not likely to have affected to any significant extent either the comparability of workers in other sectors or their distribution between urban and rural areas.

In any case, for calculating urban and rural incomes, we have used the proportion of workers and their income differentials in each individual industrial sector and not the actual number of workers in the urban and rural areas. The proportion of workers has been based on the paper (mimeographed) by B R Kalra on "1961 Census and its implications in terms of labour force, growth and employment" along with the official 1961 Census paper No. 1, and the official country statement for India presented before the Asian Population Conference in 1963.

Net Output in Sectors

For determining the distribution of net output in individual sectors, our figures are based on the estimated income per worker. In the more organised sectors like mining, factories, railways, communication and government administration, where income does not depend upon location, no wage differentials are assumed to exist. For agriculture and allied activities, the net value of output has been taken, while for the remaining sectors like small industries, construction, trade, unorganised transport, professions and liberal arts, data on income differentials have been gleaned from a number of miscellaneous and scattered sources for 1951 and from individual reports of the National Sample Survey for 1961. These data are admittedly rough, are not strictly comparable, and do not always pertain to the specific years 1951 and 1961. Nevertheless, we have been compelled to use them for want of more reliable

HINDUSTAN STEEL'S



ALLOY STEELS PLANT

goes into production

Inaugurated by Shri N. Sanjeeva Reddy, Union Minister for Steel and Mines on January 23, 1965.

The Rs. 70 crores integrated Alloy Steels Plant at Durgapur is India's first, and one of the largest of its kind in Asia. Designed by Indian Engineers and equipped to manufacture all the important and critical grades of carbon, alloy, tools and engineering special quality steels, it will help meet the needs of India's ordnance, machine tools, chemical, aviation and automobile industries, etc. Ultimately its range of manufacture will comprise nearly 200 different types of alloy and special steels of various sizes. In the initial phase the Alloy Steels Plant will produce 100,000 tonnes every year, or 30% of the country's present requirements. This will mean an yearly foreign exchange saving of Rs. 20 crores. And provision has also been made to expand capacity to 300,000 tonnes in the future.

The contract for supply of main Plant & Equipment was signed with the Japanese Consortium in September 1963. With the commissioning of one of the units of the steel melting shop, the Alloy Steels Plant goes into production.

data and also because, in our judgement, they do broadly represent the relevant orders of magnitude.

For such sectors where no income differentials are used, income originating in urban and rural areas have been obtained on the basis of the ratio of workers in the two areas as given by the Population Census results. For those sectors where income differential is assumed to exist, the method adopted is to work out the ratio of rural sample earnings to the coresponding urban figure in each such sector, and the ratio of rural workers to total workers in each sector, and combining the two ratios determine the share of rural income in each sector.

The urban income in each sector is then derived as a residual. Table (1) gives the result of our calculations for urban and rural income in 1950-51 and 1960-61.

Disparity Widened

It will be seen that while urban income has increased from Rs 2,790 crores to Rs 4,803 crores or by 72.15 p c, the increase in rural income is only 39.0 p c, being Rs 9,396 crores in 1960-61 as against Rs 6,760 crores in 1950-51. The share of urban income in the national product has increased from 30.3 p c to 33.8 p c over this period. In per capita terms, the urbanites have fared even better, the increase being 43.2 p c, as compared to only 12.6 p c in the case of rural residents. In spite of a slight fall in the proportion of rural to total population and an increase of nearly 19 p c in the national per capita income, rural per capita income which was 0.843 of the all India per capita income in 1950-51 declined to 0.805 by 1960-61. During the same period, the ratio of urban per capita income to the rural counter-part increased from 1.83 to 2.33.

These figures are of course qualified by the extent to which the size of the net transfer of income from urban to rural areas increased over its 1950-51 level, but this does not appear to have been of a significant magnitude. It is also true that the comparison is between two terminal points, but as 1960-61 was not a bad agricultural year — indeed it was particularly good year for foodgrains — this should not lead to any underestimation of the comparative position of rural income. The conclusion emerges therefore that in spite of ten years of economic planning, the disparity between the urban and rural sectors has widened significantly with urban per capita domestic product standing at Rs 607 in 1960-61 as against Rs 261 of its rural counterpart or more than 2.3 times the rural per capita domestic product as against 1.8 in 1950-51.

In order to get clearer understanding of how this has come about, it is necessary to examine the changes in the net domestic product of the two sectors by their industrial origin. Relevant data are presented in Tables (2) and (3).

Fall in Rural Industries

It is seen from these tables that as far as the rural sector is concerned, its highest increase has been in its income from government services, being as much as 290 p c, indicating clearly the extent to which the bureaucracy has been enlarged and expanded in the rural areas for promotion of development. Increase in the income

from agriculture has been substantial but not in per capita terms in view of the big increase in population during the period and the insignificant fall in the ratio of rural to total population. It is significant that there has been an actual fall in the income arising from small industries, construction, commerce and transport, while the negligible rise in the income from house property indicates the want of progress in rural housing. The increase in the income from domestic service is substantial being as much as 135 p c, but this is probably due to the fall in employment in commerce, rural industries and even rural transport of the traditional variety, as also to the opportunities opened out by the emergence of a comparatively well-off, though not numerically very large rural middle class.

In striking contrast, the urban sector shows a significant rise in the income originating from organised industry. It seems clear that faster progress in the modern sectors of the economy and their larger presence in the urban areas has contributed significantly to the comparatively higher rate of economic growth in the urban sector.

Urban Share of Gain

The larger share that the urban areas have obtained of the gains from development during the first ten years of planning is seen even more clearly from Table (4) that sets out the share of the urban and rural areas in the overall national increase in the net domestic product during the period.

It will be seen that except for agriculture, domestic service and government service, the rural areas have had roughly only about a fourth of the national aggregate of the increased income in the different sectors of economic activity. There has been a significant fall in its share in the income from small industries and construction, the increase in the urban share being 124 p c of the difference between the two years in the national aggregates of the income from this sector. The rural sector does not also appear to have had any share of the aggregate increase in the income accruing from commerce and transport other than railways. It is also remarkable that if we leave out the increase in the income from agriculture, as much as 41.8 p c of the increase in its income from all the other sectors comes from government service. Evidently, planning has led to a large increase in the number of government employees and their income in the rural areas, but this does not seem to have a sufficiently stimulating effect on the growth of income in other sectors in the rural economy.

The case for more effective attention being paid to rural development, both in the agricultural and non-agricultural sectors, seems clear from this analysis. The analysis also shows that urbanisation is attended with a faster rate of growth of per capita income for the urbanites, but this alone cannot be a remedy for the Indian situation, as it will take many Five Year Plans to increase the proportion of

urban to total population in India to the level reached even in the latest among the developed countries while meanwhile disparities will widen between the urban and rural areas and threaten the whole process of economic development with political and social instability.

Our study of the incidence of economic planning on rural and urban areas makes it abundantly clear that India from placing prime emphasis on rural development in order to have there is no escape for a country like economic growth with stability.

Quality tools from quality steel

In 1923, a new Indian industry was born when the manufacture of improved agricultural implements of steel was started at Jamshedpur. In 1925, The Tata Iron and Steel Company took over the Agrico factory, and, for the first time in India, diversified production to include essential implements, such as hammers, shovels, picks, beaters and crowbars.

For the past 40 years, Agrico has helped to provide the farmers on the field and workers engaged in the construction and maintenance of roads and railway tracks, bridges and dams with improved varieties of tools.

Agrico now produces annually 4 million pieces of implements, scientifically designed, and forged in one piece from high-grade Tata carbon steel. Strict supervision at every stage of manufacture ensures the high quality and durability that have made Agrico implements the first choice of users throughout the country.

Official Paper

Synthetics vs Natural Materials

Ashok V Desai

The State of Food and Agriculture 1964, Food and Agricultural Organisation of the United Nations, Rome, 1964, Pages IX+240; $ 6. 30 s.

BESIDES the usual survey of world agricultural conditions, this issue of "The State of Food and Agriculture" carries special studies on the world's needs and prospects of protein nutrients and the effect of synthetics on agricultural trade.

In the study of protein requirements, a tentative departure has been made from the method of averages used hitherto. Averages are utterly uninformative and misleading in the estimation of population requirements, for comparing the average requirements with average supplies gives a gross underestimate of the shortfall. The water consumption per head in Bombay is over 50 gallons a day, or more than enough for ten baths. It would be absurd to conclude from this that the people of Bombay have too many baths, or even enough baths. Yet this is the way in which estimates of dietetic shortfalls have been made.

The appropriate method is not to assume away all deviations from the average, but to assume that these deviations will take a particular shape and estimate the minimum supplies necessary to ensure an adequate supply of protein to those with the lowest consumption. The FAO study gives some information about deviations. It gives average protein requirements at different ages as well as figures 20 per cent above and below the norms to cover individual variations. Information regarding protein consumption in households at different income levels has also been collected for 13 countries.

However, this information is too scrappy to be used to estimate world protein requirements, which have been calculated from averages. As a result, "it appears that the available supplies exceed average requirements on a per caput basis in all of the countries for which there are data except Ceylon...". Just how misleading this conclusion might be can be judged from Sukhatme's finding, also cited in the survey, that "on the basis of the distribution of households in Maharashtra according to protein intake in relation to requirements, it has been estimated that between a quarter and a third of the households do not receive enough protein. The proportion of persons with inadequate protein supplies would be slightly higher, since the distribution of protein within households is not likely to be in accordance with requirements." The average protein intake in Maharashtra exceeds average requirements.

Growth of Synthetics

The study of synthetics deals with rubber, apparel fibres, fats and oils and hides and skins, and analyses the competition between natural and synthetic materials by countries and markets. The country pattern is uniform: synthetics have advanced most in the markets of North America, next in Western Europe and least in centrally planned and developing economies. The availability of natural materials, e g, cotton and hides in the United States, makes no difference; nor does the size of the market. Behind the differences in the rate at which synthetics capture national markets must lie differences in the growth rates of their output.

What determines the growth rate of output of synthetics? And how much of the market would they ultimately capture? The survey gives only stray indications of the answer. It is interesting to note the pricing policy of synthetics: their prices are set close to the average price of their natural competitors, but are kept unchanged for many years at a time. Thus, the price of SBR in New York has remained the same since 1953 at a level below the lowest price of natural rubber; the British price of rayon has been close to and below that of cotton, and prices of other synthetic fibres to that of wool.

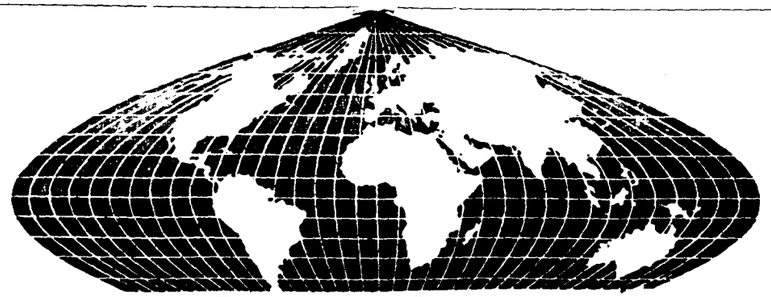
It thus seems that producers of synthetics charge the highest prices at which the markets for natural materials are open to them — prices which allow them the highest profit margins consistent with unimpaired possibilities of underselling. Prices are then reduced as demand bottlenecks are encountered.

If this is the price policy of synthetic producers everywhere, the relative profitability of production of synthetics cannot be higher in the United States and cannot, therefore, explain the higher growth rates of output there. Nor can there be systematic differences in investment-output ratios. The rapidity of expansion of synthetic production in the United States must, therefore, be explained by a higher response of investment to profits. This cannot be fully substantiated either out of the FAO survey or otherwise because comparable statistics are not available for different countries; but the share of profits in value added in manufacturing in 1950-60 was 40.1, 31.9 and 23.5 per cent in West Germany, the United Kingdom and the United States, whereas the proportion of investment in mining, manufacturing and construction to GNP was roughly 9.6, 5.4 and 7 per cent espectively.* Since manufacturing production forms a smaller part of the American GNP, it is certain that the average investment-profit ratio in the United States is far higher than in Britain or West Germany. Our guess is, therefore, that innovations make more rapid headway in the States because American industrialists invest more and consume less out of their profits. To this we should add a number of side-conditions, *viz*, that the design and manufacture of new machinery poses no problems, and that there are no holds barred in competition and no statutory support to declining industries.

As regards the share of the market likely to be captured by synthetics, the FAO survey shows that they have more restricted uses than their natural competitors, and compete with them only in a part of their market. Thus, SBR is a close and winning competitor of natural rubber in the production of tyres for passenger cars, but not for goods vehicles, rayon has an edge over

* Calculated from A Maddison, "Economic Growth in the West", New York, 1964, Tables II-5, and III-4, pp 53, 74 and 79.

cotton in tyre cords, nylon in fishing nets; detergents have encroached rapidly on the market for washing soap but have left toilet soap untouched. Within the sectors where it competes directly, the synthetic product is capable of capturing the entire market; its entry into other sectors, however, depends on the development of competitive variants. A competitive price is generally not enough for the total victory of synthetics: superior quality is also necessary. For this reason, the more successful synthetics come from firms with strong research organisations which can tailor products to suit uses.



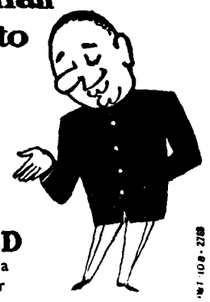
Many consumer goods have a hierarchy of qualities sold to different income groups; one would expect that owing to their policy of maximum profit rates, synthetics producers would enter markets for such goods at the top end. This seems to be true where the synthetic product has been designed as a substitute for the natural one. Thus, all the artificial fibres have entered the textile market at high prices and only rayon has yet become as cheap as cotton. But synthetics often find new uses, as it were accidentally; in such uses they are not necessarily higher priced. Synthetic rubber, whose main demand is in tyres, is quite cheap as a soling material for shoes. Perhaps such accidental uses of synthetics are more important than designed ones: firms develop products and then find uses for them rather than the other way round.

The demand prospects for natural materials depend on the expected expansion of the total market, possibilities of substitution between natural and synthetic materials and rate of investment in synthetics. FAO's projections of total demand make it optimistic about the demand prospects of natural rubber, cotton, wool, oils and fats; it is also optimistic about exports of rubber, cotton and wool from developing countries. It would like to be cheerful about hides and United States is likely to slaughter more animals and thus have more hides to export; and Dupont have introduced, with much fanfare, Corfam, a new synthetic which is supposed to be an excellent substitute for leather in shoe uppers—in fact, a more versatile one in respect of shape and colour. For the present, however, Dupont have decided to go in only for expensive shoes. So the peculiar people who go about Bombay in Impala cars might soon be seen stepping out of them in red-and-yellow Corfam shoes: whether its impact will extend further is, however, uncertain.

Petroleum Complex

THE foundation stone for Polyolefins Industries Limited (PIL) was laid recently by Arvind N Mafatlal, Chairman of the Mafatlal Group of Companies. PIL is a part of the integrated Mafatlal Petrochemical complex and is formed by NOCIL (National Organic Chemical Industries Limited) and Farbwerke Meechot AG. of West Germany with an issued capital of Rs 3.6 crores in which the Indian public will participate upto one-third of the capital.

PIL will manufacture 20,000 tonnes of High Density Polyethylene per annum when completed. Aluminium Organic Compounds widely used as catalysts in polymers formation are also to be manufactured. Engineering for PIL will be done by Friedrich Uhdo of West Germany.



I.O.B. is big enough to serve you...

I.O.B. is an international bank with offices throughout India and South-east Asia and correspondents the world over. It offers a wide range of services to suit the needs of varied customers. Indeed, I. O. B. is big enough to serve you.

We asked our customers, thousands of them at random, what they thought of our service. They replied: "We are pleased". They also made several helpful suggestions which we are implementing. Indeed, I.O.B. is small enough to know you.

Range of I.O.B. services: Savings and Current Accounts—Recurring and Fixed Deposits—Personal and Business Loans—Bills Payment Service—Gift Cheques—Travellers Cheques—Safe Deposit Lockers —Trade and Export Information and Advice—and whatever other specialised help you may need.

...and small enough to know you

The Family, Equity and Income-Tax

'Rustic'

Equity cannot abstract from individuals, and equity in taxation requires that the tax rate should be related to the personal circumstances of taxpayers.

The characteristic we have come to regard as important for equity in taxation is the actual or potential standard of living; the quantum of consumption indicates the level of material well-being, and equity, it is believed, lies in equalising it to a greater or less extent.

Efforts to equalise consumption will fail if a tax fails to affect consumption.

Hence taxes ideally designed for equity must take some indicator of consumption as their yardstick, and they must be incapable of being shifted.

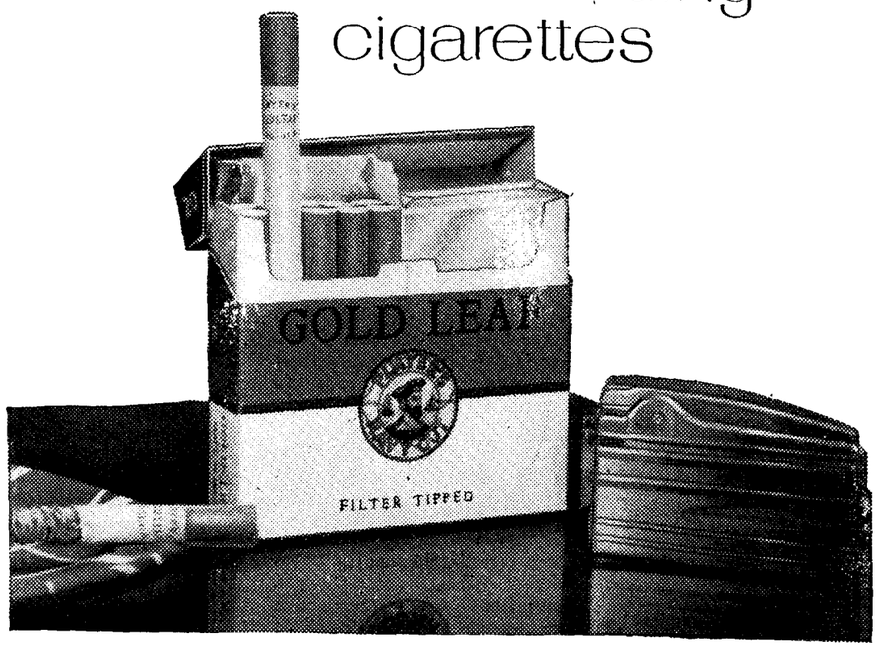
THE only important Indian tax from the point of view of equity is the income tax; while the equity bearing of taxes on expenditure, gifts, wealth and inheritance is indisputable, they are all insignificant in the larger picture. A reading of the Income-tax Act also makes it clear that equity considerations are paramount in its framing and are given a higher priority than comprehensibility or administrative simplicity. And yet, the income tax is not a tax on consumers only; it also covers business institutions very remote from consumption.

One would think *prima facie* that the most appropriate subject of income tax was the family; it would be, in most cases, the unit for which consumption decisions are taken. Even if we were to take individuals as the proper subject of taxation, family taxation would be a good approximation to the taxation of persons since inter-family differences in consumption standards are far greater than differences within families.

Yet, the family is not directly taxed under the Income-tax Act. The primary subject of taxation is the individual, and each member of a family can have himself taxed separately if he wishes. This might well be justified on the grounds that the family as a consumption unit (and not as a collection of kins) is more difficult to define than individuals are. But there is a reasonable presumption that a husband and wife living together form a single consumption unit, and they should not be able to pay tax as individuals unless they are separated or divorced. It might be argued that if the freedom of the husband and the wife to be taxed separately is taken away, the incentive to divorce and separate will be strengthened. However, since marriage entitles men to a tax-free slab of income, joint taxation of husband and wife will increase tax rates in the higher income brackets only, and will affect a relatively small number of people. Besides, the husband and wife are taxed on their joint income in Britain, but divorces on tax grounds are unknown. Indian marriages, being a less flexible institution than British ones, would stand the burden of taxation better.

Hindu Undivided Family

One would imagine that what the Income-tax Act calls the Hindu undivided family would be an excellent subject of taxation. It is not, however, both because it is defined as a collection of close kins rather than as a consumer unit, and because the membership of a Hindu undivided family does not preclude a person from being taxed as an individual on income purported to accrue to him alone. Close kins are, if they so wish, treated as a Hindu undivided family even if they maintain separate residence; and they are afforded an incentive to be so treated because they can thereby extend their tax exemption limit to the sum of their individual exemption limits plus the limit allowed to the Hindu undivided family. The extension is not automatic, but it is not difficult either; all it requires is a suitable distribution of income-earning assets between family members. I S Gulati and Kuldip S Gulati have estimated that as a result of such devices, tax-paying Hindu undivided families paid less than 43 per cent of the tax they would have paid in 1958 if duplication of exemption limits were not allowed; the tax avoided by families with incomes below the (extended) exemption limit could not be estimated*. This is a drain for which there is no justification in equity.



Taxes on firms and companies *per se* can have only a remote bearing on equity. The reason for assuming that they have any is that business incomes generally accrue to people who are relatively well off; there is some rough justice in their taxation, it is believed. But this belief is correct only insofar as taxes are not shifted; and firms that earn their income by selling goods have the opportunity of passing on tax increases to their customers by raising prices. The opportunity may not always be utilised; whether it is or not depends on whether the firm sees it, as well as on its market position — whether it is operating in a competitive or an oligopolistic market, in a seller's market or a buyer's market etc. But the possibility that business taxes are shifted cannot be ignored, especially when tax rates go as high as 70 per cent of profits. In fact, business taxes are so distant from personal income tax and close to commodity taxes that it would be better to have flat-rate corporation or profit taxes divorced from considerations of equity.

The power to shift the tax belongs to any seller in a stronger position than his buyer, and it is quite possible that the income-tax is shifted by individual sellers such as panwallas and accountants. In so far as it is, its equity objective is defeated. Unfortunately, we have no information about how far the income tax gets shifted.

What would we do if we found that the shifting was appreciable? I think equity would lead us then to the taxation of personal consumption or such parts of it as cannot be shifted. Here it would help to presume, as we could without much risk of error, that buyers are generally in a weak position *vis-a-vis* sellers, and that purchase taxes are paid by buyers. Hence we would think in terms of purchase taxes varying according to which income class tends to buy the goods, and of periodic taxes on the use of consumer durables such as cars and houses, also graduated according to the probable income of consumers.

Rediscovering Kaldor?

I S Gulati

The Pundits who had rejected outright his recommendations for a comprehensive tax reform now seem to be re-discovering Kaldor. They now seem to find considerable virtue in what Kaldor had said nine years ago, although at the time they saw nothing but mischief in it.

One cannot quarrel with those who have had a real change of heart, i e, those who now genuinely believe that Kaldor's recommendations for tax reform will do the country good. It is those who drag him in disingenously, and quote him out of context to reinforce their own point of view that need to be exposed.

Support for the case for lowering the existing rates of individual and corporate taxation is sought by referring to Kaldor's proposal that the maximum rate of tax on income should not exceed 45 per cent. The Financial Editor of a well known daily takes this proposal of Kaldor to mean that direct tax burden be restricted to about 45 per cent. Does it really?

KALDOR suggested a ceiling of 45 per cent for income taxation not because he thought that a marginal rate higher than 45 per cent would militate against economic growth, granting that he attached great importance to maintaining economic incentives, but because he strongly believed that "instead of placing the main weight of progressive taxation on a single tax—the income tax—(it is proposed that) progressive taxation should be levied on a number of 'yardsticks' of taxable capacity like total wealth, income, expenditure, etc". The adoption of a comprehensive tax base would, he had argued, "inaugurate a more truly equitable and progressive tax system, as well as bring in a great deal of additional revenue." In fact, it can be demonstrated fairly easily that at the level where a tax-payer is liable to the highest rates of taxes on income, wealth and expenditure, the marginal rate of total direct tax liability would be around 90 per cent.

The point is not that therefore there is no case for lowering the present high rates of tax on income but that the case loses its appeal if it is built on false and irrational premises.

To argue, for instance, that the Kennedy Tax Cuts in the USA demonstrate the fallacy of the 'old fashioned' fiscal theory that income tax rates must be increased to provide larger revenues ignores that the basic premise of the Kennedy Tax Cuts was that the unemployment rate in the USA was persistently high since mid-1957 because the rate of growth in aggregate final demand had been lagging behind the rate of growth in potential supply made possible by increases in capital stock, labour force and productivity. The main objective of tax cuts in America has been to stimulate demand so that the full output potential of the economy is realised.

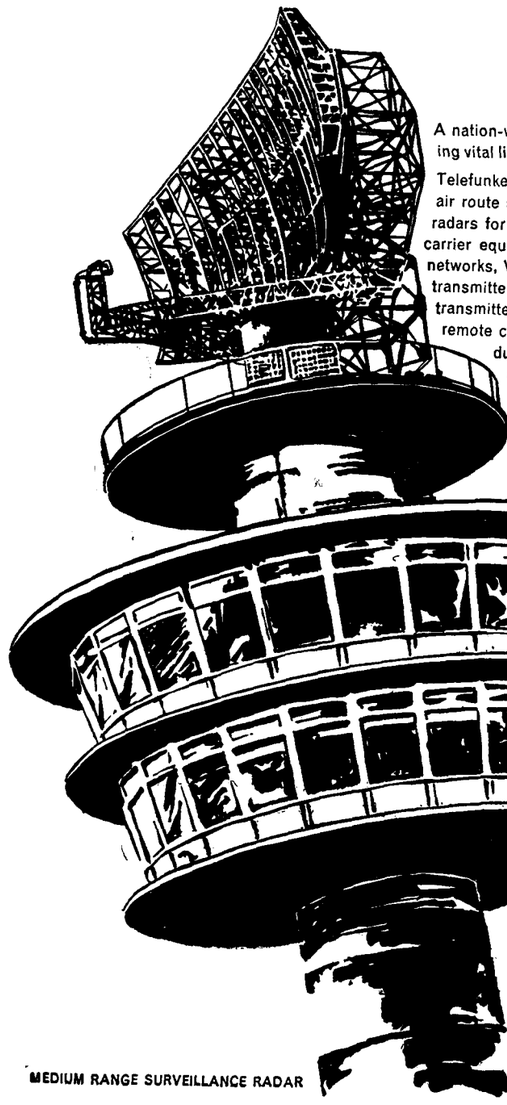
The position in India is precisely opposite to that in America. What is old fashioned in America might therefore be quite the thing to do in the Indian situation. The problem here is to create larger and larger supply potential, agricultural as well as industrial, with a view to meeting expanding final demand.

And then why do these Pundits not refer to the additional tax cuts that President Johnson now wants to make? He has given firm notice that he intends cutting down excise duties. Why? Because his economic advisers have told him that a dollar restored to the tax-payer through reduction of excise duty stimulates final demand much more strongly than a dollar restored through a cut in the rate of income tax.

Case for Tax Cut

All this should not be taken to mean that there is no case at all for reducing the existing rates of income-tax on individuals and even companies. And Kaldor's support can genuinely be invoked. Kaldor regarded it as a major consideration of tax policy "to prevent the tax system from becoming too much of a disincentive on effort, initiative or enterprise." He said in no uncertain terms that he regarded high marginal rates of 80 to 90 per cent to the "wholly pernicious" in their disincentive effects on work, saving and enterprise. That is why he suggested a combination of a moderately progressive income tax with the highest marginal rate of 45 per cent, with an expenditure tax whose highest rate would be 300 per cent and a wealth tax whose highest rate should be 1.5 per cent.

As things stand today the highest marginal rate of the expenditure tax will be 20 per cent (it is 15 per cent until the end of the current expenditure-year) but the highest wealth tax-rate is 2.5 per cent. On the basis of the same assumptions that yielded the total marginal direct tax burden of 90 per cent for Kaldor's package of three direct taxes, it does appear that to keep the total direct tax burden at the same level the highest marginal rate of income tax should not exceed 54 to 55 per cent. Let us straightaway concede however that under a different set of assumptions, particularly with regard to the typical rate of return on capital earned by income groups to whom the highest marginal rate of wealth tax applies, a higher rate of income tax might be justified. May be, one could argue, for a celling rate of 65 per cent. But on the same assumptions Kaldor's own proposals would impose a total direct tax burden lower than 90 per cent.



In any case, it is clear that the existing high marginal rates of income tax on individuals ought to be scaled down. And the very first measure (which ought to have been taken alongside the imposition of the wealth tax) is the complete abolition of the surcharge on unearned income. There is absolutely no justification for its continuation. This step should itself bring down the marginal rate of tax from the present 88 per cent to 82.5 per cent. And if alongside, the surcharge of 10 per cent on earned income in excess of Rs 1 lakh is also abolished, the highest marginal rate would settle at 75 per cent. This is the minimum that we would urge the Finance Minister to do in the Budget due next week.

As regards the rate of tax applying to companies, while there is a case for reducing it to 45 per cent for all companies, there is a much, much stronger case for reducing it to a distinctly lower level for small companies from the existing 42.5 per cent, which, to say the least, is ridiculously high for a company whose income is Rs 25,000 a year or below. In com-

parison, a US corporation with income of $ 25,000 or below pays just 14 per cent by way of income tax. We feel that the lower rate should apply to all companies, public or private, with suitable safeguards against abuse in the case of private companies.

New and small companies deserve to be treated differentially from both the social and economic points of view. Right now, the position of new concerns is that they can avail themselves of either tax holiday or developmental rebates since both run concurrently. While there is a very weak economic case for giving developmental rebate in an economy short of capital or suffering from largescale unemployment, there is a strong case for a more liberal tax holiday. The present ceiling of 6 per cent on tax exempt profit is rather low compared to what other under-developed countries are offering. Also, following Kaldor, one could argue against a tax on dividend. If, on the other hand, one subscribes to the view that some tax differential in favour of corporate retention is necessary to have, the appropriate thing to do would be to revert to the old practice of giving rebate on the standard rate.

Details are important. But more important is the fundamental issue: the reconciliation of the objectives of growth and equality in such a way that growth is not sacrificed for equality that cannot be effectively enforced. The Budget this time provides the Finance Minister an opportunity which very seldom comes by. Let us hope he will take it with both hands.

Around Bombay Markets

Dalal Street Marking Time

Thursday, Morning.

DALAL STREET has had to struggle hard for nearly four weeks simply to regain the ground it had lost in the first two opening sessions of the year on January 4 and 5. It had not fully recovered the lost ground when it slipped badly without any serious provocation and within four working days it was back again almost from where it had started. For the past week or so, the market has simply been idling away its time in the hope — fond hope perhaps — that the Finance Minister Krishnamachari will anyhow provide adequate tax concessions in the coming Budget in order to restore confidence in the investment market. It is mainly because of this optimism that the market has been able to present a remarkably steady appearance recently in face of the violent disturbances over the language issue and has reacted very mildly to Wednesday's surprise announcement about the one per cent increase in the Bank Rate and the 10 per cent rise in the customs levy on all articles except foodgrains, fertilisers, pesticides, books and accessories for family planning.

It can be argued that with the regulatory customs duty of 10 per cent estimated to yield between Rs 65 crores and Rs 80 crores over a full year, the Finance Minister will be in a better position to give tax relief. But the tenor of Shri Krishnamachari's statement suggests that the increase in the Bank Rate and in the customs levy are only the beginnings of the counter-inflationary drive and that further measures for enforcing stricter fiscal and monetary discipline might be woven into the Budget to be presented on February 27. Whether or not the stock market's expectations in regard to tax relief will be realised, it is anybody's guess. But it appears that in its mood of optimism, the stock market has not assessed the impact of the higher Bank Rate and the enhanced import levy which are bound to affect adversely industry's profit margin by pushing up costs of production. Besides, the increase in the Bank Rate to six per cent will bring into sharp focus the average yield of 7 per cent available on equity shares which is far from being attractive in the context of the present interest rates structure. It is difficult to visualise possible changes in fiscal policy which alone can bring about a revival of confidence in the capital market. The question is not merely of offering inducements to invest in equities. The main problem is how to restrict the scope for the employment of funds in commodities, real estate and other less desirable lines of activity.

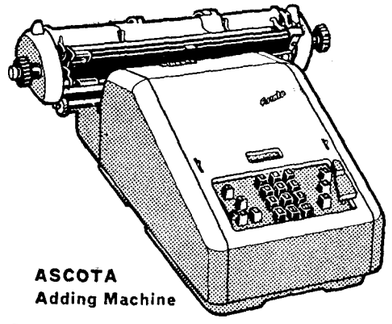
Cotton

Prices Above Ceiling

COTTON continues to make news. The setback in prices which occured about the middle of last month following the formulation of the Indian Cotton Mills' Federation's 8-point plan aimed at securing cotton at or below the ceiling through strict self-discipline has proved to be a short-lived affair. Prices have again risen beyond the statutory ceilings and the unofficial premiums range between Rs 25 and Rs 50 per candy. It is true that the Federation's scheme has not been fully implemented and quite a number of mills are known to have failed to abide by the rules laid down by the Federation. But this is not because the Federation has not been earnest about enforcing the code of self-discipline on its members; the blame rests entirely with the Textile Commissioner. The Federation's scheme had no legal sanction behind it and this shortcoming was sought to be overcome through the Textile Commissioner's intervention. The Federation is known to have kept the Textile Commissioner informed about the names of mills which failed to submit their returns and/or did not surrender their surplus stocks for redistribution among the needy mills. But the Textile Commissioner is not reported to have taken any action against the erring mills. Since the responsibility for administering price control over cotton rests entirely with the Textile Commissioner it is shocking that he should have failed to discharge his duty even when he had been assured of the fullest co-operation from the Indian Cotton Mills' Federation. It is difficult to imagine a situation when price control could have been enforced more easily than this season as the industry had on its own decided to observe self-restraint in regard to the buying of cotton and holding of stocks. Even so, the authorities have allowed price control to be reduced to a sham.

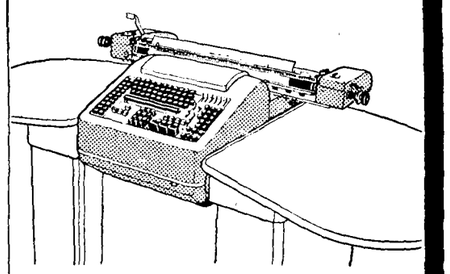
No less disquieting than the failure on the part of the authorities to administer price control is the manner in which the Governments of Gujarat and Maharashtra have been entertaining representations from the growers and traders for helping them secure proper prices for their produce. Cotton merchants of the Central Zone kept off the market for as many as 21 days—business has been resumed only very recently. The Gujarat Agriculture Minister is reported to have drawn the Central Government's attention to the accumulation of stocks in Gujarat. It is difficult to understand how growers can have any cause to complain about the marketing of their crop when the industry is willing to take up the entire produce at the appropriate ceilings or at 5 per cent below the ceiling at the worst. Nor is it easy to appreciate how stocks of even desirable qualities get accumulated when the supply position does not appear to be quite comfortable; it is pertient to ask why the prices of varieties whose stocks are reported to be piling up are quoted above the ceilings.

Whatever be the supply position of cotton—it is not as desperate as is generally made out—there is no reason why prices should be allowed to rule above the ceilings. Will the Textile Commissioner explain why he has not resorted to requisitioning of cotton when prices have been quoted above the ceiling prices since about the beginning of November? The only comforting news about cotton is the excellent export performance despite high domestic prices. Exports of Bengal Deshi total around 1.65 lakh bales.



Oilseeds

Mixed Pattern



THE oilseeds market has been displaying a mixed price pattern recently. Castor futures have been keeping remarkably firm while linseed have been distinctly easy. Groundnut have been quietly steady whereas mustardseed have been rather subdued. The strength in castor futures which took the March contract to Rs 206 on February 17—the contract had

been quoted around Rs 200 about a week earlier—was attributed to strong bull manipulation induced mainly by the idea that the bears would be unable to tender goods against the maturing contract because of the higher spot prices in the producing centres. The spot material has been keeping firm despite the virtual absence of any export business in castor oil for a long while. Market reports are that castor oil is being increasingly used for mixing with other vegetable oils—edible oils included. Exporters seem very pessimistic about selling castor oil abroad except to the Communist countries, Indian castor oil being uncompetitive in other free markets.

Linseed prices have been gradually drifting lower—the March contract was sold down to Rs 44.62 (per 50 kgs on Wednesday)—because of the steady improvement in the flow of mustardseed; arrivals of mustardseed will be in full swing after about a month or so. Mustard oil which had touched a high of Rs 4,800 per tonne not long ago was marked down to Rs 2,650 about a fortnight ago but it has recently recovered to around Rs 2,950. Prospects of any further significant rise in mustard oil prices are generally discounted.

carry the identical assurance of quality and shrinkage control anywhere in the world

All fabrics bearing the label 'SANFORIZED', in India and the world over, carry the same assurance of a reliable, uniform standard of shrinkage control recognised and trusted by millions wherever cottons are sold.

Last year, many of the 56 registered users of the trademark in India recorded an impressive rise in exports—five, seven, eight and even nine times above their 1963 figures. Even more significant, India's exports for the first nine months of 1964 of cloth labelled 'SANFORIZED' exceeded the total of similar exports for the whole year of 1963 by over 30%! A positive indication that use of the trademark helps our fabrics to earn more and more foreign exchange.

Such a spectacular increase in exports is proof enough that Indian fabrics labelled 'SANFORIZED' can compete successfully in world markets. They are in demand because they conform to the same shrinkage standard as cloth bearing this trademark anywhere in the world.

Issued by Cluett, Peabody & Co., Inc. (Incorporated in the U.S.A., with limited liability) proprietor of the registered trademark 'SANFORIZED'. The proprietor uses this trademark or permits its use by registered users, only for tested fabric which meets its strict residual shrinkage requirements.

On the Eve

BY the time this issue gets into the hands of most readers, the Budget proposals would have been out. There is, therefore, little point in speculating on the eve of the Budget on what would no longer remain a matter of speculation by then. At the moment, however, what one should look forward to is not the changes in particular taxes or duties which usually excite the most speculation on such occasions but what view the Budget takes of the general and much more important question of guiding the country's economy in the direction of development and growth. Politically it is not a good year for imposing burdens as can be seen from the trend of the State Budgets which have been presented. This is not to suggest, however, that the Centre can afford to be as cynical and as irresponsible as many of the States have been.

But there are commitments of two sorts. First, commitments for continued development and strengthening the base of the Plan from which point of view this happens to be a crucial year. For the present Budget will decide whether the Fourth Plan starts off from a sound base or is left to take care, as best as it can, of today's omissions and commissions. The need for a proper phasing is implied in any plan of development. This is, of course, a truism. But the jerks and jolts to which the government, not knowing its own mind, is continuously subjected makes it difficult to keep to the right track. But time moves only one way. The Finance Minister has another type of commitment, such as the revival of the capital market, which may not be of his own choice but which he has taken upon himself. This will mean some concessions or revision of tax incentives.

About the pressures on the economy there is no room for doubt; they are being felt by everybody and every day. But where do they arise from and how are they to be eased? Of that, despite the advance publication of the Economic Survey one cannot be so sure. From some recent Planning Commission papers, released by the favoured ones who get hold of them, it appears that far from there being a shortfall in private sector investment, calling for incentives and all that, there has been an excess and this has been an important factor—though not the only one — in accentuating the inflationary pressures. The relative shortage of resources is, therefore, in the other sector which has been sought to be made good so far by continuous drafts on the banking system and though such drafts over the last nine months have been lower than those in the comparable period in the previous year, they are too large to be ignored. So even if the Finance Minister would like to give fiscal incentives, his primary pre-occupation should still be to ensure at the same time an adequate surplus to contain inflation.

The need for additional taxation, however, does not dismiss the case for fiscal incentives—incentives to producers and investors, perhaps also to taxpayers to pay their taxes, to complement the steps that are now being taken for more energetic collection and detection of evasion of taxes. It is a matter of judgment and of one's own experience which must necessarily be limited. But the time has now come to put it to the test whether dis-incentives to non-payment cannot be made more effective by some incentive to voluntary payment. To repeat, the question is one of judgment but it is difficult to be persuaded that barring really hard cases at one end and regular payers—by

choice or necessity—on the other, there is not a sizable intermediate range where a judicious combination of both may not be worth a trial.

And whatever be the case for personal taxation, that for saving calls for a stronger incentive than there is today, say, for company savings. Companies generally have a higher propensity to save than individuals but even here, the marginal propensity to consume visibly increases beyond a point and this applies very strongly to the sur-tax on company profits which must inevitably—phony arguments about equity notwithstanding—weaken the incentive to control costs.

Any relief in corporate taxation to promote greater retention of profits must necessarily safeguard against the use of these augmented resources in low Plan priority or non-Plan investments. The solution may be to restrict investments to an approved list which could be varied according to the needs of the day. It may be coal and heavy industries today, chemicals tomorrow so that a fair measure of support may be forthcoming for the particular industries which are considered essential. There is no reason why public sector units should not be included in the approved list. This would be in effect a move in the direction initiated in a token manner by the differential rates of taxation for private companies introduced in the last budget. To make the scheme effective, the investments made by the companies to take advantage of the tax remission on retained profits will have necessarily to be held for a minimum period of years.

Although a scheme like this would help to increase the flow of funds into the capital market, there is also the need to rectify the present discrimination against profits from industries in that they are taxed twice, once in the hands of the company and again in the hands of the shareholders as dividends, while urban property for instance, held by individuals directly, is taxed only once. The Finance Minister has to return to the old established principle of grossing up which was abandoned by his predecessor.

There is thus undoubtedly scope for some play with direct taxes without loss of revenue because by far the bulk of the revenue earners are today the indirect taxes and a small percentage increase in the latter can more than compensate for some relief in the former and they need not fall on the poor. There is actually a case for substantial increases on items which go largely to sustain luxury consumption. In fact, the conventional notion that indirect taxes are necessarily regressive needs reconsideration. By a judicious choice of items the impact of indirect taxes can be made to fall on selective sectors of consumption. But as a measure for restricting consumption, indirect taxes are nearly played out and the time has come when not only food but a lot of other things will have to be brought under controlled distribution.

The present Budget, to repeat, is the jump off for the Fourth Plan and the Finance Minister must necessarily look before and not after.

More on Viability

THE latest statements of the scheduled banks provide further evidence of the slackening of the pace of credit expansion in the current busy season compared to the last. Thus up to February 12, 1965 the seasonal credit expansion amounted to Rs 208 crores as against Rs 260 crores in the same period last year—a rise of 12 per cent over the pre-seasonal level as against 18 per cent. True, comparison with last year which witnessed an abnormal expansion is not appropriate, but neither is it relevant that credit expansion so far has been higher than in the whole of the 1962-63 season. The economy has been functioning at a higher level of activity than in the 1962-63 season—industrial output, though growing at a slower rate, is still growing at roughly 6 per cent, agricultural output is distinctly larger and we are operating at a price level which on an average is some 15 per cent higher. In the face of these factors, a slower expansion of credit (both absolutely and much more so relatively) than last year would have seemed adequate even without the necessity of further measures. Monetary expansion should be in keeping with the needs of the economy and it certainly does not follow that since monetary expansion exceeded the rise in output last year, it has to be smaller than the increase in output this year.

Despite slower credit expansion, there has been a larger recourse to the Reserve Bank by the commercial banking system; on February 12, 1965 this had amounted to Rs 95 crores as against Rs 62 crores at this time last year. It is known, however, that the State Bank has been primarily responsible for this larger borrowing because of its larger commitments (as indicated in the Chairman's Annual Address to the Shareholders of the Bank) to public sector enterprises and to State Governments and others for financing procurement of foodgrains—activities which it is not the intention of credit policy to discourage.

The slower pace of credit expansion has its corollary in a slower growth of money supply this season. Until the first week of February money supply had risen by a little over Rs 200 crores as against over Rs 260 crores last year. There is reason to believe, on the basis of what the Economic Survey has to say, that the operations of the Government have had a smaller expansionary effect this year; the external deficit itself would have had a contractionary effect this year as against a moderate expansionist effect last year. The pace of monetary expansion would thus appear to be restrained even before the monetary screw was given another twist. Prices too since the first week of January have begun to recede, the fall in the month up to the first week of February being roughly 4 per cent; the fall in food articles being, significantly, slightly greater at over 5 per cent. This may be a delayed reaction to the bumper harvest and though in the present situation, new monetary measures might accelerate the process to the point of causing a sharp break in prices, a watchful response was more in order than sledge hammer methods. The danger that the credit measures may bring about a real squeeze and hamper production cannot be ruled out, particularly as credit demand in certain very important sectors is yet to pick up.

The crisis is, as was pointed out last week, temporary, technical and in the sphere of international reserves. The response to that should have also been to tide over a temporary technical difficulty by obtaining short term funds without disturbing the process of the economy reverting to more normal price relationships. Far more important is the need to maintain and step up the tempo of economic activity and add to the strength that has been built up.

Time for Tax Reform

I S Gulati writes:

THE Union Finance Minister, T T Krishnamachari, deserves to be congratulated on his decision to present the 'Economic Survey' to the Parliament a week ahead of the Budget. The public as well as the Parliament will thus be in a position to appreciate whatever Budget proposals the Minister chooses to put forth next week.

As is pointed out in the Survey, the Third Plan period has witnessed a considerable tax mobilisation in that the ratio of taxation to the national income has increased from a little below 10 per cent at the end of the Second Plan to between 13 and 14 per cent now. At the same time, Government current expenditure on goods and services has risen from 7 per cent to 10 per cent of national income with the result that the Government sector's own contribution to the flow of saving has, at best, remained at the same level as at the end of the Second Plan.

While one might not join issue with the observation that "with a rate of saving of 10 to 11 per cent of the national income at present, the potential for raising resources further in the future cannot certainly be considered exhausted", it will, no doubt, raise considerable debate and controversy whether at the current levels of taxation, especially in the urban sector where, on informed calculations, the proportion of total income taken away in taxes certainly exceeds 20 per cent, there exists much potential for raising resources through the medium of additional taxation.

In fact, while emphasising that strenuous efforts have to be made to contain the pressure of demand on the economy, the survey acknowledges that "in a situation where rapidly growing demands have been pressing against inadequate improvement in production, even traditionally non-inflationary modes of finance such as taxation tend to exert an upward pressure on prices".

In his statement to the Lok Sabha on the opening day of the current Budget session, the Finance Minister argued for "the strictest fiscal and monetary discipline" and indicated that the financial operations of the Government as well as of private and public enterprises "will necessarily have to be guided by the overriding consideration of avoiding inflation".

Now, if taxation, in the Government's own reckoning, tends to exert an upward pressure on prices in the present state of the Indian economy, why, it may well be asked, did Krishnamachari have to impose a 10 per cent regulatory customs duty on imports? Does he seriously believe himself that the duty will slow down imports?

No serious observer of the Indian economic scene will take Krishnamachari seriously even if he were to say categorically that the regulatory customs duty is a temporary measure and that he will withdraw it as soon as the foreign exchange reserves improve. The regulatory customs duty is regulatory in name only. It is, to all intents and purposes, a revenue duty, a duty which with one stroke, as it were, will yield an additional revenue of between Rs 100 and Rs 125 crores next year. Viewed as a purely revenue impost, according to the Finance Minister's own assessment of the current state of the economy, the measure is difficult to justify. The new duty coupled with the increase in railway passenger and freight tariffs is bound "to exert an upward pressure on prices" and thereby defeat the very objectives of imediate economic policy underlined by the Finance Minister.

The Budget for 1964-65 had to provide for an increase of Rs 200 crores in curent expenditure. Of this increase, Rs 120 crores were accounted for by extraordinary claims which are not likely to recur. Defence and developments together accounted for less than Rs 50 crores. At the same time, total Plan outlay for the curent year was to be stepped up by Rs 284 crores over the figure of Rs 1,700 crores for 1963-64. Even allowing for the customary over-estimation of Plan outlay in the Budget, the Plan outlay for 1965-66 would not have to be stepped up by more than Rs 50 crores, may be less, to reach the revised target of Rs 8,000 crores for the public sector.

It apears more or less certain that the additional demands on the Budget for the next year will be very modest compared to those arising last year. If this reading of ours is reasonably correct, the additional revenue already raised through the regulatory customs duty should be more than enough.

The real question which ought to have been exercising the Finance Minister's mind over the past one week is not what aditional taxes he should raise but what changes he could effect in the existing tax structure to provide maximum incentives for effort in the right directions, even though such changes might involve foregoing a part of this additional revenue.

The 'Economic Survey' underlines, for instance, "the need for rigorous export promotion". Now the existing tax concessions on exports are, firstly, a 10 per cent rebate on income and super tax on profits derived from exports and, secondly, a rebate to only specified goods of income and super tax. The first concession is obviously available to *all* exports. But not the second. But even the second is not related directly to additional export earnings. In several countries tax concessions to exporters have been so devised as to relate them directly to *additional* export earnings and this has enabled the Governments concerned to give sizeable larger remissions in income tax.

In the case of small or new companies, too, the Finance Minister could afford to be a little more generous if he really means to help them. The present tax concession of 2.5 per cent to public companies with total income not exceeding Rs 25,000 a year is frivolous. Also, it might be worthwhile examining if the taxation of foreign companies could not be so patterned as to offer maximum encouragement to retention and ploughback in India. The overall rate of tax on foreign companies stands now at 65 per cent. If instead the foreign companies, like Indian companies, were required to pay tax at the rate of 50 per cent only and in addition a withholding tax of 20 per cent were levied on their distributions, they might find it to their advantage to retain in India as much of their profits as they can.

As regards taxation of individual incomes the step that Krishnamachari must not postpone is the abolition of surcharges on unearned income. It has absolutely no justification to exist alongside a wealth tax with such high rates as obtain in India. At the same time, he could take this occasion to plug the important loopholes in the tax treatment of the Hindu Undivided Families.

Weekly Notes

Companies Amendment Bill

THE Select Committee on the Companies Amendment Bill has not made any major changes in the Bill which would shortly be taken up for consideration again by Parliament. As expected, the Swatantra and Communist members have appended separate minutes of dissent attacking the objectives of the Bill from opposite extremes. As originally presented, the Bill had sought to relax many irksome procedural formalities but at the same time to tighten up the provisions relating to the 'objects' clause in company memoranda, blank transfers and nominee holdings, audit, cost audit and investigation, appointment of superannuated directors, inter-company loans and take-over bids.

To avoid inconvenience to existing companies, the Select Committee has suggested that the division of the 'objects' clause into the main and other objectives (with a special resolution required for taking up the latter) should apply only to new and not existing companies. The purpose of this amendment was to prevent certain odd kinds of diversification, sometimes at the expense of shareholders. It is true that any major project requires an industrial license and once that is obtained, it is an approved project. That does not invalidate the proposition that shareholders have a right to be consulted before a major activity, basically different from the one pursued so far, is taken up. An existing company finances new projects mainly from sources other than fresh share capital (which require shareholders' approval), i e, mainly reserves, depreciation and loans. Shareholders have no control over the disposition of reserves and depreciation and can regulate loans only to the extent of laying down the maximum borrowing powers of the company. The once-for-all procedural formality notwithstanding, there is no reason why existing companies should be exempt from a necessary check on company managements.

The Bill had also originally provided that every public company must maintain a separate register for the shareholdings of (besides directors and managing agents, etc) every person who is a beneficial owner of 5 per cent or more of the equity share capital. This provision was taken from a U K report; its purpose was to enable the company and its shareholders to know the identity of large shareholders and the nominees acting on their behalf. The Select Committee in its wisdom has deleted this clause instead of expanding its overage to include private companies as well.

No Choice in Kerala

THERE is a farcical quality about next week's elections in Kerala. Sixteen political parties and 556 candidates are contesting the 133 Assembly seats. Yet the Kerala electorate has no real choice; in effect the choice it is being offered is between a Congress government after the elections and continuance of President's rule.

Among the major parties the Congress is the only one fighting the elections on its own. It has no alliances, but has set up candidates for all the 133 seats. The Right Communists have an understanding with the Revolutionary Socialist Party; they have set up 76 candidates while the RSP has put up 14. In addition, the Right CPI-RSP alliance is suporting a few independents. The Left CPI has 74 candidates and has an understanding with the Samyukta Socialist Party which has 29 candidates of its own. The Left CPI and the SSP are also suporting a number of independent candidates, including those set up by the Karshaka Tozhilali Party and the Malnad Karshaka Union, two peasant-based parties. The Left CPI is also backing a few independent condidates whose principal support comes from the Muslim League. This is, in fact, the extent of Muslim League-Left CPI understanding in the elections. All the 16 official Muslim League candidates are being opposed by the Left CPI. The Muslim League's election alliance is with the Kerala Congress which has set up 60 candidates.

The major parties or groups are thus the Congress (133 candidates), Left CPI-SSP (105 candidates), Right-CPI-RSP (90 candidates) and Kerala Congress-Muslim League (76 candidates). The chances of the Congress winning a majority of the seats to enable it to form a Government are understandably rated very law even by Congressmen themselves. With an administrative record which is no small liability, the Congress has focussed its appeal on the theme that it alone can offer Kerala the prospect of political stability. There is, it must be admitted, an element of truth in this claim, for none of the three major opposition groups can reasonably hope to win a majority. The Left CPI-SSP alliance will probably win more seats than Right CPI-RSP, but with 30 of its candidates in jail under the DIR its role after the elections remains highly uncertain. In fact, Home Minister Nanda has hinted more than once that the Left Communists would be prevented from forming or participating in any Government in Kerala even if the election results make this possible. The prospects of the Right CPI-RSP alliance forming a Government with the support of the Left CPI are very remote as will be clear to anyone who knows anything of the bitterness and viciousness of the Communist faction fight in Kerala which is partly reflected in the fact that the two factions are opposing each other in no less than 61 of the constituencies. That leaves the Kerala Congress-Muslim League alliance; but its chances of being able to form a Government are the slightest among the three major opposition groups.

Yet it is possible that after the elections the Kerala Congress may find itself in a position to play a crucial role. This could happen if the official Congress party wins a large enough number of seats to be able to form the Ministry with the support of the Kerala Congress. In such a situation the pressures on the Congress leadership would be very severe to make concessions to the rebels. It will be interesting to see how the Congress leaders will then reconcile their present lofty attitude towards the Muslim League with the Kerala Congress's deep involvement with the League and also how the Kerala Congress and the Muslim League sort things out among themselves. These problems need not, of course, rule out a post-election coming together of the official Congress and the Congress rebels. In any case, the Kerala Congress has no independent long-term role in Kerala politics and if it doesn't return to the Congress, it must in course time disintegrate and disappear.

State Bank and Rural Credit

WHILE recommending a public majority holding in the Imperial Bank, the authors of the Rural Credit Survey had contemplated the creation of a strong, integrated, State-sponsored commercial banking institution with branches spread over the whole country to take over cash work from non-banking treasuries, to provide extended remittance facilities to co-operative and other banks—and to funnel urban funds into rural development. These expectations have been broadly fulfilled by the State Bank since its inception in July 1955, though the last objective is hardly mentioned now.

From July 1955 till 1964 the Bank opened 651 new offices, bringing the total number of its offices to 1,147. Of these, as many as 217 offices are at places with a population of less than 10,000. In 1964 itself, 30 branches were opened under the second branch expansion programme, as compared with 20 in the previous year. Out of 145 branches proposed to be opened during the period July 1960 to June 1965 under this programme, 100 have already been opened. To extend further banking facilities to rural and semi-urban areas, the Bank has embarked on its third programme of opening 319 branches at non-banking treasury and sub-treasury centres over five years beginning January 1964.

The Bank's progress in 1964 has, indeed, been phenomenal. Total advances increased from Rs 290 crores to Rs 393 crroes in 1964 and the credit deposit ratio rose steeply from 49 to 60 per cent. Deposits expanded by Rs 64 crores to Rs 659 crores. Its operations have been especially prominent during the current busy season; it has accounted for 45 per cent of the total bank credit expansion and two-thirds of outstanding borrowings from the Reserve Bank.

Commercial operations of the State Bank have no doubt been spectacular during all these years but developmental assistance, especially to co-operatives, agriculture and smallscale industries, is still relatively insignificant. The amount outstanding from co-operative institutions was only 2.5 per cent of total advances at the end of September 1964, in absolute terms Rs 10 crores against Rs 5 crores in 1960. For small industries, the amount outstanding was Rs 31 crores. The limits for rural and small industry finance are, of course, much higher: at the end of 1964 Rs 62 crores to co-operative institutions and Rs 130 crores to small industries. Whereas the Bank has been able to mobilise savings in rural and semi-urban areas by its intensive programme of branch expansion, the credit extended in these areas has thus not been commensurate. On the other hand, the State Bank has been lending very heavily to industries in the private and public sector, supplementing and competing with other commercial banks. During 1964 the Bank's advances to industry increased from Rs 211 crores to Rs 286 crores and their proportion to total advances rose to 76 per cent.

This represents to some extent a diversion of funds from the rural to the urban sector, contrary to one of the objectives laid down in 1955. However, realising that the bottleneck lies in the cooperative movement itself, the Bank has decided to go directly into rural credit with Pilot Centres, which will be set up in areas where existing rural credit institutions are weak or lagging behind. Together with the Bank's decentralisation programme, this measure should help to step up the flow of institutional credit to less developed areas.

Nagaland: First Gains

THIS is a suitable time to reflect on the progress that has so far been achieved in the Nagaland peace talks. The ceasefire is in force until March 6, and will most probably be extended. A parliamentary delegation has visited Nagaland—to assure the Nagas that New Delhi is interested in them and their State. The Peace Mission has come out in favour of Nagaland remaining within the Indian Union, thus scotching the accusation that it is nothing but a meddlesome, anti-Indian, and trouble-seeking body. Most important of all, the reply by the Naga leaders to the Peace Mission's proposal has been encouraging. The phrase "the Nagas are prepared to enter into any kind of relationship with India" suggests that the Naga leaders are willing to consider something less than independence for Nagaland.

None of these factors can give hope that the problem will be solved immediately, without further protracted negotiations. But things are moving, if not as rapidly as could be desired, at least slowly and steadily in the right direction. The most tangible asset so far is the continuance of the ceasefire. Peace in Nagaland gives the Government the opportunity to carry out much-needed development, which the years of warfare have completely prevented. Roads can be built, schools and hospitals provided, and freedom of travel for Nagas and other Indians can open Nagaland's windows onto the world, instead of isolating it from all outside influence. Once the population and this includes members of the guerilla force too, has felt the benefits of peace, it is likely to view with disfavour any further efforts at warfare.

The efforts of the Peace Mission have brought Naga affairs to the talking point, instead of the fighting point. It is vital that nothing should occur to disrupt this state of affairs and negative the progress of the last few months. In this context, the concern of some MPs over the handling of Naga affairs by the External Affairs Ministry is somewhat misplaced. At this juncture, the situation is very delicate, and the government should do nothing which might anta-

NOTICE

WITH effect from March 1, 1965 the price of *The Economic Weekly* will be raised to 75 paise. Correspondingly the annual subscription will be Rs 36 in India, Pakistan and Ceylon, and the half-yearly subscription Rs 20. Foreign annual subscription rates will be £ 3 10s or $ 10.

For the last 16 years, the price of *The Economic Weekly* has been maintained unchanged in spite of heavy increases in costs. Circumstances beyond our control now force us to take this step and we hope readers will continue to extend to us the same patronage as in the past.

A FERNANDES
Business Manager

gonise the Nagas again. Those who hold that India should take a 'strong line' have apparently learnt nothing from the years of frustrating warfare. Another important point that has received relatively little notice is the tentative attempts being made at unity among the Nagas themselves. The December meeting between the rebels and other Nagas did not end in complete agreement — no one expected it to — but it indicated their concern to end their quarrels.

The outlook for the future is hopeful, as long as the talking continues. Talks should go on, likewise the ceasefire. Each side has been ready to enter the talks without reservations so far. No pressure should be put on the Government of India to try and force the pace of progress, or worse still to try and issue any ultimatums. India's best hope of achieving what she wants is by showing the Nagas the real benefits of association with India. As this is only possible while the ceasefire lasts, it should be a matter of concern to all that it does last indefinitely, thus enabling the Nagas and India to arrive at the best solution of a complex, but by no means insoluble problem.

Story of a Railway Project

IN 1956 the Railway Board decided to set up a Loco Component Works at Varanasi to manufacture components for steam locomotives. The following history of this project is taken from the Comptroller and Auditor General's latest report on the Railways, released this week:

April 1956: Engineer-in-Chief appointed and the nucleus of the organisation set up.

March 1957: Project reviewed by the Railway Board in the background of the policy of progressive dieselisation and decision taken to go ahead with the project on grounds of operational necessity although the Ministry of Finance did not regard it as of sufficiently high priority for release of foreign exchange.

September 1957: Work relating to construction of building commenced.

April 1958: Project estimate for Rs 4.79 crores approved fixing March 31, 1961 as the date for the completion of the project.

Work temporarily suspended from February 1959 to June 1960 due to difficulties in arranging adequate power supply.

Work suspended again from May 1961 to February 1962 due to difficulties in settling the design of some shops.

Meanwhile, an expenditure of Rs 28.01 lakhs was incurred on the pay and allowances of the staff employed between April 1956 and March 1962 and Rs 14.54 lakhs on other general charges against the provision of Rs 37.94 lakhs and Rs 23.56 lakhs respectiveiy on this account in the project estimate. The expenditure on the construction of workshops and stores buildings and procurement of workshop equipment was, however, only Rs 28.19 lakhs and Rs 29.14 lakhs respectively against the provision of Rs 133.22 lakhs and Rs 168.11 lakhs in the project estimate.

No loco components were actually produced upto the end of March 1962. An attempt in May 1960 to undertake manufacture of 10,000 super heater elements for Chittaranjan Locomotive Works proved abortive, resulting in an expenditure of Rs 12,630 on freight and handling charges for collecting and returning raw materials, etc. In another attempt at production, 52 axle box bodies were machined for a private company at a cost of Rs 20,847 in 1961, but a payment of Rs 2,775 only was received as the private company did not agree to the actual cost incurred.

By the end of 1961-62, a total expenditure of Rs 1.95 crores, or slightly over 40 per cent of the project estimates, had been incurred on the works. Then it was decided to abandon the project and the project accounts were finally closed on March 31, 1962!

Letter to Editor

Foreign Private Investment

ANANT NEGANDHI, presumably an Indian, has attempted to present his findings on the Government's decision-making apparatus as seen "through the foreign investor's eyes" (*The Economic Weekly*, January 23, 1965) after a fruitful stay abroad at the University of Michigan. May I, a foreigner who has spent a few years in India, attempt to present some aspects of foreign investment as seen "through the eyes of government officials"?

Negandhi argues that red tape, bureaucracy and the lack of a clear-cut foreign investment policy are the factors inhibiting the flow of private foreign capital into India. In a planned economy, however, the foreign investment policy is incidental to and an outcome of plan priorities and since these priorities evolve over time, the sectors in which foreign investment is welcome also change *pari passu*. Thus, a sector in which foreign investment would be welcome a decade ago would not warrant the same facilities today. As Negandhi would have it, the Indian government should specify the sectors in which foreign investment would be welcome and then adhere to this policy, at least for a few years.

Again, the costs of servicing foreign equity investment are known to be extremely high in many sectors of Indian industry and one cannot but have sympathy for the "bureaucrats" and their "red tape". The fact that foreign private capital and technical know-how comes into India notwithstanding the hurdles mentioned by Negandhi is an indication not of the samaritan spirit of the foreign companies as much as the highly lucrative Indian market. In this context regular readers of *The Economic Weekly* (and one hopes that Negandhi is one) will recall Michael Kidron's 'Behaviour of Foreign Capital' (*The Economic Weekly*, Special Number, July 1964). A reading of Kidron's exhaustive study should convince Negandhi that what is required is perhaps an even less certain foreign investment policy, more red tape and more bureaucracy—if this could ward off the foreign investor! Foreign investment in India hardly needs to be encouraged; it has to be suffered as a *quid pro quo* for Government aid. While public pronouncements discouraging foreign investment cannot be made for reasons only too well known, at least intelligent young Indian economists should know better.

The Politics of Language

Romesh Thapar

DO not imagine that this controversy over language is a passing phenomenon, that it is capable of resolution through slip-shod or piecemeal compromise among the faction leaders of the ruling party. A terrible confusion grips the ministerial and organisational wings of the Congress machine now locked in what threatens to become a continuing conflict with no clearly demarcated lines. Whether in the Cabinet, in the Working Committee or at the level of the Chief Ministers the pattern is the same—heated, over-emotional, self-centred interventions which have little relation to current realities or to long-term perspectives.

Initiative with Extremists

Shastri's silence, his reluctance to enter the fray until the balance of forces is clearly visible, has in a sense placed the initiative in the hands of the extremists in the north and the south. The energetic efforts of Indira Gandhi to bridge the gulf between north and south and to discipline the aggressive Hindi protagonists in the north, and of Subramaniam to warn the south against linguistic excesses, together with Chavan's worthwhile attempt to project the need for a more relevant link language capable of enriching itself by absorbing words from the many distinct regions of the subcontinent, are sought to be neutralised by the men of the Syndicate who remain wedded to the notion that a solution to the crisis can be confined to a remoulding of the linguistic concepts thoroughly exposed during this past fortnight.

The lack of organised support for the rational, thinking elements within the ruling party—elements which even now command a majority at ministerial level in the GOI—cannot but be contrasted with the manipulations of the unprincipled *dadas* of the party who seem to be concerned only with the thought of preserving their positions of profit and patronage. Politically, over the past week, the Congress Party has shown itself to be sick, very sick. Shastri is reduced to off-stage whispers. Nanda awkwardly woos the Hindi lobby. TTK tails a nervous Kamaraj. Krishna Menon absorbs himself in those legalistic doodles which Morarji Desai so admires. K D Malaviya convinces himself that his future is with the screaming herd from Bihar and Uttar Pradesh. Patil and Atlulya Ghosh watch, strangely amused.

Other Voices

While this Delhi drama was being enacted, the stupor of Indian politics was disturbed. All manner of small fry started testing their muscle. In Delhi, the activists of the Jan Sangh got busy smearing English sign posts with tar. In Chandigarh, the dormant Akalis suddenly broke the linguistic truce, insisted that the Governor, Hafiz Mohammed Ibrahim, address the legislature in Punjabi. In Lucknow, the dull ministers of the U P government declared that invitation cards in English will be returned to the senders. On an all-India plane, limelight-lover Lohia called for a crazy division of the country into Hindi and English speaking zones. An hurriedly assembled pressure group in the Capital thought it fit to move for an Urdu-speaking area with Delhi as the starting point.

At one stage of the parleys in the Capital, it certainly appeared as if India was heading for one of those showdowns which have the effect of weakening central power and building the image of regional leadership. Indeed, some were convinced that Shastri's government would not survive the crisis. Conscious of this mood, the Syndicate decided that the Working Committee of the Congress Party should lay down the line, although care was taken to have the Chief Ministers fully represented in the Committee.

Linguistic passions were high on the first day of the Working Committee's deliberations, with the disgruntled Morarji Desai and the still ambitious Jagjivan Ram on the offensive. However, sensing the trend for compromise, these 'Hindi Now' stalwarts played it soft on the second day. The inevitable sub-committee was formed to devise the exact nature of the amendment to the Official Languages Act, an amendment which would require a two-thirds majority in Parliament. The strategy of the Syndicate is expected to pay off, but is this the end of the story?

An Issue for Dissidents

Congress dissident groups in every State have been handed an issue which has all the necessary ingredients for making the kind of easy mischief which in our country can apparently isolate or topple governments. In Bihar and Uttar Pradesh, in Bengal, in Tamilnad, Kerala and Andhra Pradesh, in Punjab, every political trickster will be able to seize upon the linguistic errors of omission and commission to mount emotionally surcharged agitations. The refusal to face the problem squarely, to re-assess past commitments, to evolve a viable policy on the question of language, leaves inflammable material within easy reach of those who fail to understand the foundations upon which the government of this sub-continent rests.

The formula which has been evolved—at least, the formula which is being touted around at this moment of writing—represents an agreement among the factions to give legal shape to Nehru's assurance that English will continue as an associate official language so long as the non-Hindi-speaking peoples consider it necessary. The feelings of the Hindi lobbyists are partially assuaged by the additional commitment that the teaching of Hindi will be intensified as part of the so-called three-language scheme which is designed to impose equal burdens on North and South.

The messy patchwork can be seen for what it is, but there is a dangerously explosive element in the formula too. I refer to the lunatic proposal to fix quotas for States in the all-India services. It is bad enough to allow all languages as media in UPSC competitive examinations. It is utter madness to destroy the administration with quotas of incompetence. In fact, we are merrily sowing the seeds of dissension, disruption and secession merely because a bunch of second-rate politicians, elevated to national status, cannot work up enough courage to challenge the vociferous lobbyists who by no means represent the people. The people want a sensible plan to cope with the problems of the transition in language — and they expect their leaders to evolve such a plan.

What could this sensible plan be? We could have returned to the position as on January 26, not before or after; Hindi had been recognised as the official language in association with English. A categorical assurance could have been given that no change would be countenanced without reference to a high-powered, fully representative, permanent language commission; this language commission could have been entrusted with the task of coping with all the many problems related to the use of mother tongues, the build-up of the link language and the relevance of the proposal (still to be enunciated) for a single Roman script. An atempt could have been made to rally the people on a sane and thoughtful policy, despite the activity of the extremists.

But when the national leadership refuses to lead — is, in fact, led — then there is no hope. Language becomes a matter of politics, of whipping up emotions, isolating this or that leader, a weapon of blackmail. This is exactly how the language question has been used by the leading members of the Working Committee, by members of Shastri's Cabinet, by the Chief Ministers and by the Members of Parliament. The see-saw debate at the level of what is now never referred to as the 'High Command' provides ample evidence of this snuster, unprincipled manouvering. Will the obvious lesson be leraned or will we stumble from one absurd position to another until we are cornered by an assortment of adventurers who are determined to wreck the dynamic, growing consensus which Jawaharlal Nehru attempted to forge as the foundation of our democratic, secular, socialist society?

No Time for "Linguistics"

It is time to ask ourselves this question, for unless the sane, thinking elements in our political life assert their will, the battle will be lost. This mobilisation against the fanatical linguistic lobbyists, the opportunist elite groups which in their narrow-mindedness are prepared to sacrifice the unity of India, would soon strengthen the healthy instincts of the people, particularly if the mobilisation cuts across party labels. Political workers can no longer ignore this paramount task. The events of the past few days have made this abundantly clear.

Everyone is scanning the gloom-enshrouded political horizon for the signs of an alternative focus of ability, coherence and power. With economic policy being kicked around among the Finance Ministry, the Planning Commission and various chambers of commerce, local, foreign and international, with foreign policy dependent on our submission to the manipulations and pressures generated by the interests of the dominant nations, particularly those in the West, with defence policy based on the divided favours of Moscow, London and Washington, we cannot continue to be diverted on a diet of linguistics, jingoism and that handy standby, opportunist pragmatism, which covers the entire field of internal policy.

And so in this mood we await the Budget, the Kerala election result, the Kairon murder enquiry, the details of the CBI report on affairs in Orissa, and what have you . . .

Letter from South

Three Faces of Linguism

TAMILNAD, and to a far lesser extent Andhra, have gone through days without splendour, without love. These have been the days of death. Revival will come but the shock will not pass soon nor easily. Few could have imagined that so much hate lurked beneath.

The basic impulse was frustration. And those who feel that frustration most keenly are those who have felt the possibility of opportunity, who have not given themselves a vision but known all the lure of lucrative careers within an underdeveloped country. In the forefront of the anti-Hindi agitation in Tamilnad as well as in the Rayalaseema region of Andhra were the students of the medical and engineering colleges. These are certainly the students who have done best in their examinations and for whom job opportunities are the greatest. Why should they be the foremost vehicles of hate?

It would take one too far afield if one attempted to describe the corruption, the slackness and the stagnation that creates the atmosphere in most of our medical colleges and engineering institutions. The majority of the teachers provide anything but an edifying example. One has only to talk frankly to the students to discover a situation quite close to horror and shame. Even worse is the aim with which most of the students have taken to these particular branches of study. There is a nakedness about the search for the highest possible income. It is a fairly frequent phenomenon that the studies are being paid for out of dowries already given or promised. The tragedy is that this conversion into a commodity amuses, perhaps annoys, but seldom angers the student.

Combined with those who feel that they have a reasonable chance of getting into one or another of the central services, quite a formidable number of better students gets formed. This is the social base of the slogan "English-ever, Hindi-never". And in India as it has developed since Independence this social base has an importance quite out of proportion to its actual numbers or even significance for the evolution of the Indian nation.

It has to be stressed that this social base does not love English but it hates Hindi as an obstacle to its scramble for the goods of life. This social base is not distinguished by any genuine urge for westernisation or moved by the beauties and possibilities of English. Its approach to language is purely instrumentalist. This is the ugliest face of linguism even if some of the worse acts of carnage and burning would be beyond the capacity of this group.

Increasinly Rajaji is emerging as the astute leader of this group. Its ambitions and orientations coincide almost perfectly with the combination of discourses on the Ramayana and belief in the U S as the saviour which Rajaji passes off as the distilled wisdom of eighty years. Mediaevalisation of private life with Anglicisation of public activity—that is the India of this group's and his dreams.

But linguism has another face. There is a powerful segment of opinion in Tamilnad and Andhra, to mention the two States most affected by the recent upheaval, that rightly senses danger in the move from Delhi to make Hindi take over from English. This would be

quite as fatal to the burgeoning of their own languages as the domination of English has proved to be. It may be that Tamil is a fairly developed language with a distinguished modern literary tradition. It has not become, however, the vehicle of the more intricate and subtle thoughts of modern man, whose make-up includes a large portion of science, sociology, economics and the more intellectually demanding aspects of politics. It is still largely—as are most other Indian languages—a language of the vaguer feelings, of the looser emotions and is not bound tight yet by the rigorous demands of intellect.

To develop into that dimension, a language has to confront the task of conveying all the achievements of modern thought directly and without allies. It is fantastic to expect it to develop and then take over this task. It is the taking up of this task that develops it. Anything or anybody who comes in the way of this challenge being accepted is rightly to be regarded the enemy of the language.

It is true that a good percentage of intellectuals doubt whether this challenge can be accepted at all, betraying a sense of self-respect that appals quite as much as it amuses. Yet there are many good people and true who consider that any attempt to rush through Hindi before regional liguistic development has had a chance is an enemy to be fought.

Wise Move in Andhra

It is significant that observers in Coimbatore as well as in Kakinada reported that many among the crowd who attacked the trains or burnt the post offices believed that from January 26, 1965 Hindi was to replace Tamil and Telugu as rapidly as possible. It is, of course, true that they had no anger against English which remains the main barrier to India's linguistic growth. But Hindi was seen as a new threat.

It was very wise, therefore, on the part of the Chief Minister of Andhra, Brahmananda Reddy, to quickly accept the plea of the Communist opposition to hold a meeting of the leaders of all parties and then announce that a crash programme would be undertaken to establish the supremacy of Telugu in the State. Any honest attempt to implement this programme would immediately encounter the resistance of the present supremacy of English. This attitude was far removed from the stand taken by the Union Steel Minister, Sanjeeva Reddy. This worthy member of the 'Syndicate' who is believed to aspire to displacing Nanda as the first step towards the Prime Minister's job, made the most reckless pro-English statements that Andhra has heard since the demise of the Justice Party.

Genuine Apprehension

The third face of linguism is a genuine apprehension as to the possibility of linguistic national integration on the basis of Hindi as the official language. There is the fear that the ramifications of any all-India official language are such that the Hindi-speaking people would inevitably evolve into ruling people in India. However hard a Tamilian or an Andhra might try he could never hope to be as at ease in Hindi as somebody whose mother-tongue it was. There is little hope that a time would ever come when, as had happened with English, a Tamilian or an Andhra or a Bengali would know Hindi better than his own language. The idea is that English, at any rate, would be equally disadvantageous for *all* the linguistic nationalities of India.

It is recognised that at present command over English is largely a matter of class privilege. But there could be a policy of scholarships and special merit clauses which could cut at the roots of this privilege and make proficiency in English vertically dispersed. It is argued that already wider social strata are able to command English than was the case fifteen years ago. A greater dose of egalitarianism in education could considerably hasten the process.

Whatever the final outcome the immediate needs of the situation, almost universally accepted, are that what is called the 'Nehru assurance' should be given statutory form and a big push should be given to the development of the different regional languages. This alone could turn the tide of hate and bring back the pendulum to a point of sanity.

From the London End

Advice from the Governor

A MAJOR controversy on the role of the nationalised Bank of England has been started by the political implications of Governor Lord Cromer's outspoken and obviously unvetted speech to a gathering of bankers in Edinburgh last week in which he stated quite categorically that Britain should defer public spending in order to preserve monetary stability. After referring to his negotiations for the renewal for three months of the $3,000 million credit granted to Britain last Novemhber, he said that he could take no pride in the fact that these credits had been renewed. Rather, he was inclined "to look askance at the fact that we, in the United Kingdom, should have run our affairs in such a way that we need to seek short-term banking accommodation abroad". He went on to say that if at home central and local governments subordinate costs to other considerations in an attempt to meet "the desires as well as the needs of the citizen," and if, at the same time, the Government shoulders overseas commitments with insufficient regard to the nation's earning performance, "then one day there has to be a reckoning with the rest of the world . . . We got uncomfortably close to that day of reckoning last November".

The political implications of this speech are quite clear coming at a time when a major tussle is going on between the Treasury and George Brown's Department for Economic Affairs over the question whether the forthcoming budget should work for disinflation or expansion. The Treasury has taken a cautious view whereas the Ministry of Economic Affairs is pushing for expansion. The clear meaning of Lord Cromer's speech was that the Government could certainly not expect the approval of either the City of London or foreign bankers unless it adopted a deflationary policy by slashing public spending. That this might mean the abandonment of many of the proposals outlined by the Labour Government in the Queen's Speech, seems to have been a matter of no moment to the Governor of the Bank of England.

Whatever the advice Lord Cromer may give to the Government in private, it is surely not his place to speak up in public and dictate the lines on which the British Government should conduct its financial policy. It is, therefore, not surprising that this public pronouncement at this particular time should have caused a political storm and should have led to demands, particularly from the Labour Party's Left Wing, that Lord Cromer should go and that it should be made quite

clear that it is the Government and not the Bank of England which ultimately decides the lines of policy which are to be followed.

When the Bank of England was nationalised in 1946, the late Sir Stafford Cripps referred to it as "my creature", but went on to add (prophetically), "but like many creatures, it tends to go its own way". The Bank of England has always found it difficult to accept that as a result of nationalisation it should merely become an instrument of the Government. At the time of the Radcliffe Committee on the Working of the Monetary System in 1959, the Bank of England argued that complete independence from political influence should be guaranteed to the central bank—a view which was not shared by the Radcliffe Committee. The actual legal position is that after nationalisation in 1946, the Government has the power to issue a directive to the Governor, and if he is not prepared to accept this, the only way out for him is to resign.

Cromer's Strong Card

In theory, therefore, the Government if it so wished could ask Lord Cromer to resign, but everybody knows, particularly Lord Cromer, that such action would at the present moment have most unfortunate repercussions on the international front which might gravely reduce the Labour Government's ability to manoeuvre in the difficult balance of payments situation it now faces. This is the strong card that Lord Cromer is now playing. The Third Earl of Cromer, Harold Macmillan's appointee in November 1960, is the youngest Governor of the Bank for well over a century, and now seems to regard himself as the keeper of the nation's financial conscience — on lines that seem to suit the interests of international high finance.

One of the most distressing features of the Governor's intervention at this critical time is that it is likely to influence the attitudes of foreign bankers. The latter will certainly look askance if the Government disregards a warning from the Bank of England about the need to cut back Government expenditure. This will make a difficult situation considerably worse for the Labour Government. To begin with, foreign central bankers will be even less enthusiastic than they are at present about providing assistance to the United Kingdom under the international financial collaboration scheme. Lord Cromer's comments, coming at a time when confidence in the pound abroad is at a low ebb, will certainly have a damaging effect on Britain's balance of payments. It is strange indeed that the self-appointed custodian of the nation's financial interests should threaten to rock the boat thus.

It is no secret that European officials at the O E C D have been urging more drastic action by the U K, particularly in the field of additional deflationary measures in the Budget to correct the balance of payments. Unless this advice is followed, it is doubtful whether the Group of Ten's General Arrangements to Borrow will be activated.

Government's Reaction

The Government's reaction to Lord Cromer's speech are awaited with interest. Both Wilson and Callaghan have pointed out that while the advice of the Governor will be listened to, it is the Government which must finally decide on policy. Without mentioning Lord Cromer by name, both the Prime Minister and the Chancellor effectively snubbed him on his gratuitous advice on the need to curb Government spending.

In a tough campaigning speech in London, Wilson replied to Lord Cromer in clear terms and prepared international opinion for increased public expenditure. Referring to Lord Cromer's advice, Wilson said he recognised "the necessity to relate total national expenditure, public and private, capital and current, to resources", but he scoffed at suggestions made by Lord Cromer that public expenditure is more inflationary than private expenditure. "A million pounds spent on schools, housing, or roads, or productive capital investment in a publicly-owned industry, is no more inflationary than the expenditure of the same resources on a vast block of offices, or a private housing scheme, or productive investment in private industry". The Government would take effective measures to limit the rise in public expenditure to what the country could afford, but, he added significantly that it was the Government and Parliament who must finally decide. "The decisions that have to be taken at national level will be taken—taken by the Government which you elected with a mandate to get these things done. We shall welcome and give full consideration to advice we receive from those who have the right, indeed the duty, to give us advice ... But it must be the Government after seriously weighing all the advice that may be tendered to us, which takes these decisions and bears responsibility for them in Parliament and in the country".

A similar view was taken by Callaghan in a speech at Cardiff when commenting on advice given to the Government about policies it should follow. He always hoped to profit by such advice, but added: "I must say some of the voices seem a little more shrill now than they did before the days of a Labour Government". He thought also that some of the advice was "rather off beam" because it assumed that all public expenditure was bad and all private expenditure good.

There is no doubt that Lord Cromer's exercise in political power was most unfortunate. It is encouraging, however, that both the Chancellor of the Exchequer, and more especially the Prime Minister, have made it clear who is, and must be, the master of the house.

Book Review

Fiscal Policy in a Vacuum

Arthagnani

The Highest Taxed Nation by N A Palkhivala; P C Manaktala & Sons Private Limited, Bombay, 1965; pp 93; Price Rs 5.

THIS book deals with taxation in India—or, rather, one part of it, namely, direct taxation. Its central theme is clear: Rates of direct taxation in India are the highest in the world, excluding, perhaps, only Ceylon. To illustrate this, the author gives comparative tables of taxes payable in India and other countries by an individual at different levels of income and of tax rates on companies in different countries. In addition, the author argues that the direct tax framework also has other drawbacks; uncertainty, complexity, imposition of unduly high burdens which encourages dishonesty, injustice and lack of discretion in administration.

From the above, the author goes on to draw the conclusion that the direct tax system, by discouraging rewards from work and saving, has stifled the growth of the Indian economy. He refers to the examples of Japan, West Germany and (in the last year) the U S A whose economies have grown rapidly as a result of reduction in levels of direct taxation. He, therefore, argues for lower rates of direct taxes in India in order to foster growth.

The argument, as presented above, might appear facile; it is no weightier as presented in the book. The fallacy lies both in the presentation of findings and in the conclusion drawn.

Untenable Comparisons

Palkhivala is by profession a lawyer and he presents arguments which seek to make his case. The comparisons of tax burden and tax rates he gives in the book are valid—in an absolute sense. But is the inter-comparison of income utility implied in such comparison—and that, too, among individuals in different countries—valid in economics? Is an individual (that, too, married and with two children) earning an annual income of, say, Rs 50,000 in the same position in the U K, the U S A, Canada and Japan or in Pakistan, Burma, Malaya and Brazil as in India? The amount of goods and services he can buy with this income would vary in the different countries, and, so also, his relative position in the societies, with widely differing *per capita* incomes in the counties. If that is the case, would it really matter that he has to pay 39.5 per cent of his income as tax in India, against, say, 23 per cent in the U K and 11.9 per cent in Malaya?

If comparisons are to be made, it can also be said that many countries (in fact, all in Palkhivala's list except Pakistan) derive tax revenue which is a larger proportion of their national income than in India. Morever, all these countries derive a larger proportion of their tax revenue from direct taxes (and personal income taxes) than India. Would this justify imposing more taxation in India or more direct taxation?

Small Base of Taxation

If comparisons have to be made, they have to be much deeper than mere mathematical computations of taxes at given levels of income. In equalitarian societies progression has less meaning than in societies with gross inequalities. If the Russian tax rates are held out as examples of rectitude in taxation (as they are on p 41), would the author accept the other parts of the Russian system? As Will Rogers put it, Soviet Russia does not have an income-tax because Russians do not have an income to pay it on. And where other tax sources (for example, exports in export-oriented economies like Malaya) are important, direct taxation can play a lesser role.

Taking India as a case, it lacks a single source from which to derive large revenue painlessly. And with very low *per capita* income among the mass of the people, the Finance Minister can afford to get away with highly progressive rates of income-tax. After all, direct taxation affects less than 0.3 per cent of the population in the country. And an individual (married and with two children, as mentioned by Palkhivala) becomes liable to personal income-tax in India only when he earns 10 times the per capita income in the country, while he becomes so liable in the U K at two times the per capita income, and in the U S A at the same level as the per capita income. Or, to take another example, at 100 times the per capita income, the tax percentage is 24.6 in India, 31 in Ceylon, 69 in the U S A and 78 in the U K. Statistics is a slippery base to conduct an argument from.

Case Based on Exceptions

The author further has a tendency to make his case on the basis of exceptions rather than the general rule. The Table given on p 33, reflecting the dividend received by a shareholder from a company which has a wholly-owned subsidiary, tries to juxtapose two exceptions to make its point—a company liable to the maximum rate of corporation tax and an individual liable to the maximum rate of personal income-tax. Moreover, the calculation itself is wrong insofar as 88.12 per cent is the highest *rate* of tax and the average tax liability of the individual on his whole income would be less; if any particular rate is to be applied, why not deem this part of the income as income which is included in exempt income and income from some other source be shown as liable to the marginal income-tax rate? And, is there really no escape from the hardship? Presented with the case, Palkhivala as a lawyer would promptly advise the wholly-owned subsidiary to merge with the parent company and the parent company not to distribute any dividend.

The same difficulty arises on the argument about closely-held companies. While the definition is based on the number of persons who hold controlling interest, Palkhivala tries to rebut the provision by referring to the fact that such a company might have a large number of share-holders for the balance shareholding. If the controlling shareholders feel the provisions regarding closely-held companies to be penal, the remedy is clearly in their hands—by disposing of a part of their shareholding. In fact, in India a major anti-concentration measure would be to bring about a divorce between ownership and management of enterprises by requiring the divesting of shares held closely.

Similarly, one has to recognise the exception arising out of the difficulty in determining the status of Raghuvanshi Mills Limited for the assessment year 1943-44. The difficulty may lie not so much in the complexity or incomprehensibility of law as the ingenuity of lawyers. After all, people have been known in the U S A to have avoided the electric chair a decade after their conviction and sentence. So also, almost every example of irrationality of depreciation cited on p 21—for example, the fact that depreciation rate on furniture is higher than on machinery—can be justified as logical. So also the argument against the 1963 Budget which was framed to take care of an emergency.

If the development of the argument is vitiated, so also is the conclusion derived from it. The low tax rate system cannot become a dogma merely because Palkhivala calls it "the modern fiscal method". And, behind the West German and Japanese miracles lie many vital factors like the past accumulation of technical knowledge and skills, besides the low tax rates to which alone Palkhivala attributes these miracles.

This explains the entire fallacy of the logic presented in the book—the habit of abstracting from the many factors which govern a nation's progress and to seek to explain the situation by reference to one factor alone. Palkhivala, like a lawyer, has a brief which he tries to present within a narrow framework. It is an argument which reads like a special plea for a client: and it is an argument which appeals to a narrow group of intelligentsia in metropolitan towns. Palkhivala, in short, is basically concerned with *fiscal law*.

Narrow Vision

However, the politician (and a Finance Minister cannot but be that) is basically concerned with *fiscal justice*. He has to weigh the incidence of direct taxes on one class of people with that of indirect taxes on the others. He has to take the distribution of income and wealth into account and make a judgment, basically political, on how he will divide the burden of taxation among different classes. His brief, therefore, is far wider than Palkhivala's.

There is much in what the author says, particularly the need to rationalise the direct tax structure and lower the rates; this would have to be done within the framework of the objectives of planned growth and social justice. The main consequence of a system of high tax rates is to encourage tax avoidance certainly and perhaps, to a large extent, tax evasion. As Titmuss showed in his "Income Distribution and Social Change", it is possible to avoid the impact of high tax rates, keeping within the framework of tax laws. High tax rates, therefore, neither bring in revenue nor make for equality. What India needs is not less taxation but low tax rates spread on as wide a base as possible. This is the only basis on which an economic rationale for fiscal policy can be presented.

By restricting the argument within a narrow sphere, Palkhivala starts upon a self-defeating course. Moreover, the enunciation of the argument in an ornate, flowery language, while apposite in a lecture to a converted audience, reads flamboyant in a book, and gives it an air of superficiality. A case for lower tax rates has to have a wider vision than what the author brings to the subject.

The Economy in 1964-65

S K Nath

Last year's Economic Survey contained this hopeful sentence: "the overall picture is one of promise of **rising** *growth rates" (emphasis added).*

The Economic Survey for 1964-65 reveals that the promise has not been fulfilled.

THE rate of growth of industrial production during 1964-65 may at best work out to be 8 per cent; this will be 1 per cent *less* than the rate for 1963-64. Agricultural production during the current fiscal year "should be substantially higher than in the preceeding years"; but we do not yet know if its rate of growth will exceed that of 1963-64, namely, 2.4 per cent. In short, the latest survey reveals no sign of the badly needed acceleration in the growth of the economy's two major sectors. National income according to the Third Plan target should rise by 34 per cent in five years. Its annual rate of increase during the first two years of the Plan was 2.5 per cent. During 1963-64 national income rose by 4.5 per cent. For the current fiscal year, the Survey says that the rate of increase "should on all accounts be better"; but it contains nothing to justify this expectation.

Prices

While growth has failed to pick up speed, prices and the balance of payments have been getting out of hand. Prices went up by 9.1 per cent in 1963-64; this rate of rise has been accelerating so that between the end of March 1964 and January 23, 1965, prices rose by 14 per cent. Of course, the biggest rises have been in the prices of food articles and industrial raw materials rather than those of finished goods. The rise in the prices of the former two between March 1963 and January 1965 has accounted for 87 per cent of the rise in the general level of prices. It is true that prior to 1962-63, the producers of agricultural commodities can be said to have suffered in some sense, because for about ten years their prices rose much less than other prices. The price of wheat in fact fell by 14 per cent in the ten years preceding March 1963. So, some rise in the prices of agricultural commodities was due. But the actual rise over the last two years has been much too fast not to affect the morale of the urban population at least.

The other problem which has become unusually serious during recent months concerns our balance of payments. During 1963-64 there had been some optimistic developments: our foreign exchange reserves had increased a little (by Rs 10.8 crores) and we had also repaid a modest sum (of Rs 23.8 crores) to the International Monetary Fund. During the current financial year our exports have continued to rise, but a large part of this increase has earned no free foreign exchange because it has gone to the rupee payment countries. In the meantime, the government has had to pay shipping and other charges for the greatly increased imports of foodgrains and fertilisers; payments of international debt charges have also been increasing.

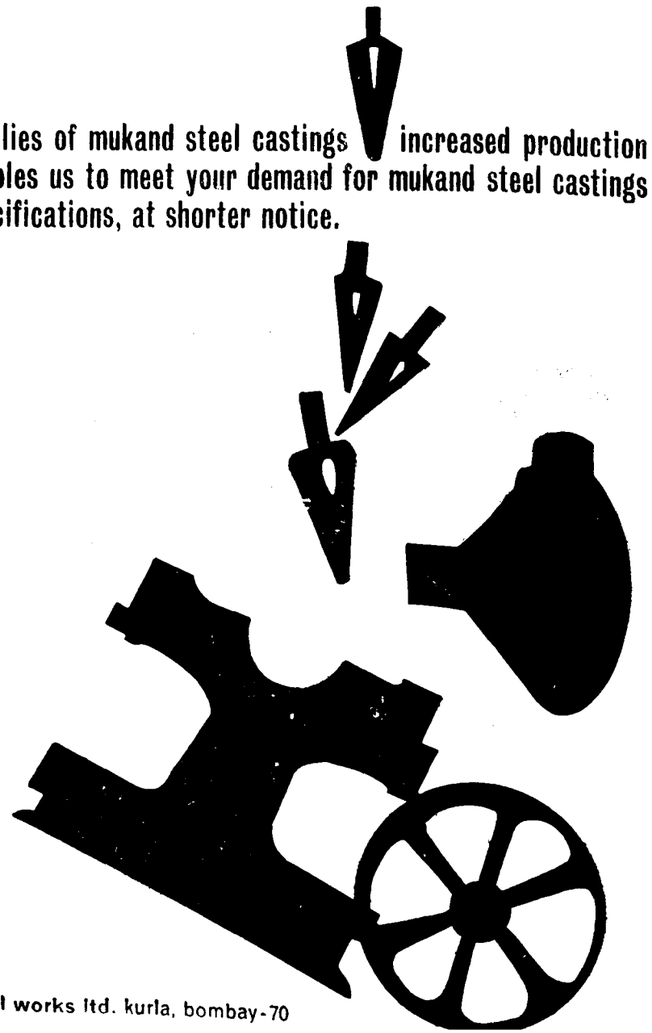
Decline in Reserves

A combination of these (and other not fully known) circumstances has resulted in a steep decline of our foreign exchange reserves. From April to September 1964, foreign exchange reserves declined by Rs 55.4 crores. These early months of a fiscal year are always a lean season for exports; the trend of the following six months is usually different. But between October 1964 and January 1965 the foreign exchange reserves declined further by Rs 32.6 crores. At the end of January 1965 they stood at only about Rs 100 crores. This is a critical position particularly because the next six months are going to be a lean season for exports and because over the next 16 months there is a repayment obligation of Rs 95 crores to the IMF.

Most of the increase in imports between April and September 1964 was on Government account; private imports rose only a little. Increased government imports were mainly of food and capital equipment (the latter reflecting an increase in aid utilisation). Among private imports the major increases were in the imports of raw cotton (Rs 5.5 crores), vehicles (Rs 4.3 crores), food, drink and tobacco—mainly dairy products (Rs 3.8 crores), and textile yarns (Rs 2.7 crores). But the following commodity groups showed notable declines; machinery (Rs 6.2 crores), mineral oils (Rs 5.4 crores) and electrical goods (Rs 1.3 crores). Indeed, the record in import substitution has not been too bad; though it has been worse than it could have been if some important industries had expanded according to the Plan. The worst in this respect has perhaps been the chemicals industry. The import substitution record, such as it is, is summarised in the table on page 405.

India's exports have at last been rising significantly over the last three years or so. They stood at Rs 660 crores in the last year of the Second Plan. In 1963-64 they had risen to Rs 794 crores. This amounted to an increase of 20 per cent in three years. During April-September 1964 there was a further increase of Rs 38 crores, compared to the corresponding months of 1963.

Our debt service charges (involving foreign exchange) were Rs 49.9 crores in 1960-61. They jumped to Rs 93.8 crores in 1961-62. In 1963-64 they had only risen to Rs 95.5 crores. But the estimate is that for 1964-65 they would have steeply increased to Rs 140.0 crores. It is expected that during 1965-66 they will increase further.



Aid Utilisation

Though there has been some improvement in aid utilisation recently, there is still a wide gap between approvals and utilisation. The Aid-India Consortium has pledged Rs 489.5 crores for 1964-65. It had already pledged Rs 1,627 crores for the three years of the Third Plan. This brings the total of their pledged aid to Rs 2,117. Authorisations—i e, actual agreements signed against these pledges —amounted to Rs 1,684 crores up to the end of September 1964. The value of orders placed against this aid amounted to Rs 1,147 and payments made against these orders to Rs 756 crores. There has also been some help promised by the non-Consortium countries. From the Second Plan there was a carry-over of assistance of Rs 687 crores; the Survey promises that "there will be a sizeable carry-over of assistance committed during the Third Five Year Plan into the Fourth Plan period"!

Agriculture

The recent story of agriculture is already familiar. In 1961-62 agricultural production had increased by 1.2 per cent, but in 1962-63 it declined by 3 per cent. During 1963-64 it recovered a bit and increased by 2.4 per cent and just about reached the level of the last year of the Second Plan. But in that year (1963-64) rice output reached a record figure of 36.5 million tons. During the current year (1964-65), rice output is expected to increase further to about 40 million tonnes. The wheat crop, however, was very bad in 1963-64, and is not expected to show a great rise during the current year either. The same seems to be true of other crops like pulses, mustard seeds and sugarcane. The performance of cotton and jute was only slightly better. Apart from rice, the only other significant increase has been in groundnuts. With the total output of foodgrains in both 1962-63 and 1963-64 lower than in 1961-62, their imports have had to be increased from an average of 4 million tonnes in previous years to 6.27 million tonnes in 1964. At the same time, Government stocks of foodgrains have declined by 1.4 million tonnes. According to the Third Plan the output of foodgrains in its last year should be 100 million tonnes; in 1963-64 (the third year of the Plan) their output was still only 79.43 million tonnes. Incidentally, it is clear that some States have made much greater progress than the others in raising agricultural outputs. The Survey says: "Already large parts of States such as Gujarat, Punjab, and Madras have achieved a growth rate in agriculture of more than 5 per cent per annum over the past 12 years or so" (p 10). Why has no information been gathered either in this Survey or elsewhere to suggest the factors which have been responsible for this atypical progress?

Industry

The 9 per cent rate of expansion of industrial production during 1963-64 was the highest achieved under this Plan. In 1962-63 the rate was 8.1 per cent, and in 1961-62 only 6.6 per cent. The Plan target of annual increase is 11 per cent. In the current fiscal year the rate of expansion, instead of accelerating as had been hoped, has declined again; it is likely to amount to about 8 per cent. Not all industries ever expand equally in a growing economy. The greater share of the burden of industrial growth always falls on a few industries, which are usually "new" in the sense that their products or processes are the result of recent scientific discoveries. The rate of technical improvement tends to be highest in these industries. Some examples would be chemicals, petroleum products, synthetic fibres, electricity generation, electrical machinery, and automobiles, etc. It so happens that most of these industries are also highly important to India for their import-saving potentialities.

During January-October 1964 — as compared to January-October 1963 — the output of petroleum products increased by 11.5 per cent; of metal products by 11.5 per cent; of machinery also by 11.5 per cent; of electrical machinery by 16.1 per cent; of electricity also by 16.1 per cent; but the output of chemicals and chemical products actually fell by 0.9 per cent. The performance of chemicals is of course deplorable: but that of the other industries cited is not very encouraging either. They have expanded only a little faster than the rate (11 per cent) at which the output of the industrial sector as a whole was envisaged to expand annually: and yet these very industries are meant to be the leaders of industrial advance; therefore, their own rates of advance should have been very much higher. Though the Survey does not at all facilitate comparisons of this kind, it is revealing to compare the outputs achieved by some of these industries with their targets for the last year of the Plan. The output of steel ingots in the third year of the Plan was 5.9 million tonnes while the target for the fifth year is 9.2 million tonnes: that of copper was 9.6 thousand tonnes while the target for the fifth year is 20.0 thousand tones; that of machine

Import Substitution: Percentage of Imports to Estimated Total Supplies

	Unit of Account	1950-51		1955-56		1963-64

Paper and paperboards, etc	'000 tonnes	151	23.2	260	26.2	503	5.0

Notes: (1) In the case of raw cotton and raw jute, the total estimated supply is for crop/agricultural/years; in the case of foodgrains, production is for agricultural year and imports for the financial year.
(2) In the case of raw cotton, raw jute and foodgrains, figures under 1950-51 refer to the average of three years viz 1949-50, 1950-51 and 1951-52 and those under 1963-64 refer to the average of 1961-62, 1962-63 and 1963-64.
(3) Petroleum products include only motor spirit, kerosene and diesels.

tools was Rs 201 million while the target for the fifth year is Rs 300 million; and electricity generated in the third year was 25.9 billion kwh whereas the target for the fifth year is 45 billion kwh. As for fertilisers (which come under the general heading of chemicals) the gap between the target and the achievement by the end of the Plan is likely to be the widest.

Budgetary and Monetary Trends

Central and State Government expenditures were budgeted to increase in 1964-65 by Rs 407 crores as against the increase of Rs 900 crores in the previous fiscal year. This increase — as the price behaviour over the following months was to show — exceeded the safe limit, given the behaviour of agricultural and industrial outputs. Central and State Governments did introduce additional taxation which was expected to yield about Rs 50 crores during the current year. The Income-Tax Annuity Deposit Scheme was expected to collect deposits of Rs 67 crores. These two together would have covered about 30 per cent of the increased expenditure. The overall deficit of the Central Government according to the Budget was Rs 97 crores. During the year the Parliament has had to vote additional amounts to cover increased expenditure on the rehabilitation of refugees, the purchase of foodgrains, and the greater dearness allowances of Central Government employees. However, receipts from the direct and some other taxes have also been better than expected so that the overall deficit of the Central and State Governments during the current year is likely to be smaller than the Budget provision.

Similarly, during the current fiscal year money supply has expanded more slowly than recently. In 1962-63 money supply increased by 8.5 per cent, and in 1963-64 by over 14 per cent. Up to January 15, 1965, money supply during this fiscal year had increased by 5.6 per cent; whereas the figure for the similar preceding period was 10.1 per cent.

Conclusion

We arrive back where we started. It was hoped at the end of the Second Plan that by the end of the next Plan the character of the economy will be significantly changed: perhaps something like the pre-conditions for a take-off would be all more or less nicely settled. Unfortunately that promise has not come true. The fiscal year (1964-65) which has approached its end was the fourth of the Plan. In most respects the economy's performance was worse during it than during the third year of the Plan.

Though performance in many crucial industrial fields (like chemicals) has also been very poor, the basic problem remains that of our backward agriculture. Each year some new ideas are tried. Last year's Survey mentioned an Agricultural Production Board to integrate agricultural policies and to secure effective coordination between the Central and State Governments. This year's Survey makes no mention of the Board. Instead, the newly formed Agricultural Prices Commission is mentioned. Once again, and naturally, a great deal of hope is pinned on this body. But whether this body — and other bodies concerned with improving the tone of the implementation of our economic policies — will be paid the unusual compliment of having their suggestions systematically adopted, remains to be seen.

Agricultural Growth and Stagnation in India

C H Hanumantha Rao

The object of this paper is two-fold:

(1) to analyse the trends in agricultural growth in the country as a whole and in different States during the period 1949-50 to 1961-62 with a view to bringing out the main ingredients of past experience; and

(2) to examine some of the current explanatory hypotheses relating to the relative stagnation of the agricultural sector. An attempt is made in this process to suggest the policy implications of the explanations that are found to be more relevant.

THE All-India and State index numbers of agricultural production, area and productivity issued by the Ministry of Food and Agriculture fill a significant gap in available knowledge regarding the trends in growth. These index numbers are constructed after making due adjustments in the original data for changes in coverage and methods of estimation and are, therefore, comparable over time. For the purposes of this study All-India growth rates have been obtained by fitting a linear equation $y=a+bx$ to these series of index numbers.

Two Seven-Year Periods

Separate growth rates have been estimated for two seven-year periods 1949-50 to 1955-56 and 1955-56 to 1961-62. These estimates given in Table 1 reveal that the rate of foodgrains output had already slowed down from 4.4 per cent in the first seven-year period to 3.8 per cent in the later years, so that the growth rate of aggregate crop output remained more or less constant (4 per cent) despite an acceleration in the rate of growth of non-foodgrains from 3 per cent to 4.5 per cent. Another significant fact to note is that the growth of area under crops slowed down considerably from 2.8 per cent to 0.9 per cent between the two periods.

It would be interesting to know the relative contributions of area and productivity to the growth of output in different periods. If productivity per acre remained constant, output would grow at the same rate as the growth of area. Therefore, the growth of output attributable to the changes in productivity is given by the difference between the growth rates of output and area. The percent contributions of area and productivity to the growth of output computed on this basis show that although for the 13 year period under study, area accounted for 48 per cent of growth in output, its contribution declined significantly from as much as 72 per cent to 23 per cent between the two periods. Thus, increases in productivity per acre accounted for as much as 77 per cent of output growth in the later period.

It would appear from this that the increase in area as a source of growth has almost exhausted itself in the Third Plan period and that further growth of output could be achieved mainly through the increases in productivity per acre. Although the growth of productivity accelerated between the two periods studied, it is clear that only a much higher rate of growth in productivity could have accelerated the growth of output in the Third Plan period. The Mid-Term Appraisal of the Third Plan revealed significant shortfalls in the supply of two main productivity increasing factors, viz, irrigation water and fertilizers. There was an element of spontaneity in growth so long as area was an important factor. Increase in productivity, on the other hand, requires input intensification involving large outlays—both public and private—as well as considerable organisational and administrative efforts. The difficulties associated with input-intensification in this new phase seem to lie at the root of the present stagnation in agricultural output.

Marked Departures

The inter-State disparities in the growth of agricultural output are quite marked. The growth rate ranges from about 5 per cent per annum in the case of Punjab and Madras to just around one per cent for Assam, Orissa and West Bengal (see Table 2). That productivity per acre has become a predominant factor in growth is evident from the fact that all the seven States where growth of output is above the national average reveal higher growth rates in respect of productivity also. Except for Andhra Pradesh, the growth in productivity among the remaining eight States of slow growth was below the national average. No such correlation is found between the growth rates of output and area: the growth of area was lower than the national average for at least four of the Seven states in the higher range.

Another important feature of agricultural growth in this period is the marked shift in the crop-patterns in different states. Table 3 shows that Kerala and Andhra Pradesh whose growth of aggregate crop output was below the national average, were well ahead of the national average in regard to food grains output. Likewise, the growth rate of non-food grains in Gujarat, Uttar Pradesh and Rajasthan was above the national average despite their slow overall progress.

Output and Yield

Again, the growth of output is found to be significantly correlated with the growth of productivity both in the case of food and non-food grains. On the whole, it would seem that high overall progress is associated with balanced growth between food and non-food grains. Punjab, Madras Madhya Pradesh and Mysore represent such a category. On the other nand, the areas of lowest overall progress, viz, Assam, Orissa and West Bengal are those whose performance is below the national average both in respect of food and non-food grains.

How would one explain these disparities in growth between different States? A State is a highly heterogeneous unit and may very often conceal significant differences in growth between its constituent units. Although the study of growth factors would be precise and more fruitful at a much disaggregated level, it should nevertheless be possible to discern factors which have a fair degree of validity over space. The hypotheses discussed in this connection fall broadly into two categories, viz, those which emphasise the institutional factors, move specifically the incentives associated with farm size and tenure conditions and those which emphasize material inputs—traditional as well as modern. It is true that the average size of farm is low in quite a number of States recording slow progress viz, Kerala, Uttar Pradesh, Assam, Orissa

and West Bengal (see col 6 of Table 4). But it will be seen that the net value of agricultural output per acre in these States is invariably higher than the All-India average (col 5). In fact, in the case of Kerala and West Bengal it is nearly twice the All-India average. Therefore, in a vast country like India where there are extreme regional variations in the soil-climate-crop complex, farm size is not a sufficient indication of income level. Moreover, Madras and Bihar where the average farm size is lower than the national average recorded satisfactory progress. Besides, Kerala with extremely low size of farm showed an impressive performance in regard to food grains while Uttar Pradesh was above the average in regard to non-food grains. It is hard to reconcile the resilience shown by these States with the 'disabilities' of size.

Size of Farms

The size problem may become relevant in a different sense within each homogeneous region. The Farm Management Studies conducted in various parts of the country have shown that output per acre is generally higher among the smaller farms and that it shows a significant decline with the increase in farm size. That this should be so is understandable in view of the prevailing labour-intensive techniques and when there is abundance of labour among smaller farms. Also, large farmers encounter supervisory and managerial bottlenecks as they have to operate with a large number of paid labourers. The logical implication of these findings is that output and productivity can be maximised if ceilings on land holdings are imposed at a sufficiently low level and surplus lands distributed among small farmers. But if a significant redistribution of land under the existing socio-political conditions in India is ruled out, then an alternative size policy suited to the immediate requirements of growth would have to be pursued. Even though the application of labour may be higher among smaller farms they may lag behind the larger ones in regard to the application of technologically new inputs such as fertilizers, improved seeds and insecticides, etc, owing to their low investible surplus. But this problem cannot be solved by merely amalgamating the existing small farms into larger ones unless an opperessive policy of extracting surpluses is adopted. Since smallness of size *as such* does not offer any technical hindrance to the application of modern inputs, the provision of credit to the smaller farms in a liberal way should meet the ends of growth. The enormous agricultural progress achieved by Japan despite the smallness of farm size should dispel many misconceptions in this regard. Although the large farms may be relatively quick in taking to improved techniques, progress may still be restricted owing to the managerial difficulties. The supply of mechanical power through small tractors and pump sets would promote the intensive use of land by lessening the managerial and supervisory difficulties. Such a technology may even increase the overall employment of labour by making possible the extension of intensive methods of cultivation such as irrigated farming to new areas. The structure of employment may alter but the volume of employment may not necessarily decline. The provision of credit to the small farmers in a liberal way and mechanical power to large farmers could well be the two main elements in a growth oriented size policy.

Estimates of cultivated area under pure tenancy are available for different states from 1961 Census. Consi-

derable degree of precision attaches to these estimates as the information was elicited directly from the tenants themselves. Figures of area under mixed tenancy are not yet available but they may reasonably be assumed to vary between different States in the same direction as the area under pure tenancy. These figures do not reveal any precise relationship between the tenurial conditions and agricultural development. Although some States of slow overall growth, notably Kerala and West Bengal, account for very high ratios of cultivated area under pure tenancy (see col 1 of Table 4) there are significant exceptions notwithstanding the fact that it is difficult to reconcile this with the impressive performance of Keraia in regard to food grains. Pure tenancy is above the All India average for States of highest growth, viz, Punjab and Madras. Similarly the ratios are quite low for many States revealing slow progress, viz, Orissa, Uttar Pradesh, Rajasthan and Gujarat.

Fertility and Tenancy

The 1961 Census revealed that the proportion of tenanted holdings were particularly concentrated in the fertile coastal belts (see P S Sharma, "A Study of the Structural and Tenurial Aspects of Rural Economy in the light of 1961 Census," mimeographed). A precise study of the relationship between land fertility and tenancy would be possible only at the field level. But even at the State level one finds a strong positive association between the proportion of area under tenancy and the productive capacity of land (see Table 4). Among all the seven States where the proportion of area under pure tenancy is distinctly higher than the national average, the proportion of area irrigated is also well above the national average. In as many as five out of seven States where the area under tenancy is below the average, the proportion of irrigated area is also below the average. Further, the States where tenancy is significant, viz, Kerala, West Bengal and Assam account for very high annual rainfall. It will also be seen that except for Punjab and Mysore, the remaining six States are characterized by high density of rural population. Also, the net value of agricultural output per acre for these States is distinctly higher than the national average.

These facts provide, in the first place, a rationale for the concentration of tenancy in fertile areas: land should be fertile enough to yield sizable surplus to feed both the tenant and the landlord. Also, since the element of risk and uncertainty is considerably reduced because of the assured rainfall and irrigation, this would result in the high density of agricultural workers owing partly to the large-scale original settlements on fertile soils and also presumably to the higher rate of population growth resulting from the assured supply of food. All this would encourage tenancy because the rents would more or less be equated to the surplus that landlords would alternatively get by cultivating the lands themselves through hired labour.

Exaggerated Fears

The next important implication is that owing to the excessive demand for land, it becomes extremely difficult to obtain proper records of tenancy and to regulate rents through administrative action. Any administrative decree in this respect would most certainly drive tenancy underground with secret arrangements between the landlord and the tenant because of the real possibility of subsistence for both.

Lastly, from the standpoint of growth these facts should serve to dispel certain exaggerated notions regarding the discouragement of inputs among tenanted holdings. Since labour is abundant with hardly any opportunity cost, its application will add to the income of the tenant so long as the marginal product of labour is possitive. The Farm Management Studies have revealed that the input of labour is highest for predominantly tenanted holdings and their output per acre is higher than for larger holdings operated through hired labour, as the input of labour among the latter can be extended only upto the point where the net marginal product is equal to the wage rate. There is no reason to believe that the fear of resumption of land by the landlord would discourage investments by the tenants in the input factors which are mobile such as bullocks and implements. In theory, the investments in permanent improvements on land would be discouraged but this becomes largely irrelevant when the tenanted holdings are situated in fertile coastal or irrigated areas. Again, the investments in modern inputs such as fertilizers, improved seeds etc would, in principle, be discouraged if the tenants have to bear the full costs on them. But if landlords share such costs in the same proportion in which they realise rents from gross produce, then it would be profitable for both the tenants and landlords to invest in such factors until the marginal cost equals marginal revenue.

The practice of sharing inputs between landlords and tenants is not un-

common in this country. In fact, the so called "concealed share-cropping tenancy" is characterised by the system of sharing inputs. A recent study made by Wolf Ladejinsky in the Package districts where nearly 60 to 80 per cent of cultivated area is irrigated revealed that although about 50 per cent of cultivated area is under tenancy mainly through "off the record" arrangements, the expenditure on fertilizers is generally shared equally between the landlords and the tenants.

Japanese Experience

The Japanese experience in this respect has a particular relevance to Indian conditions. During the whole period of over half a century right from the Meiji Restoration to the close of Second World War, when the technological break-through in agriculture was effected mainly through the extensive use of fertilizers, improved seeds etc, the area under tenancy continued to constitute nearly 50 per cent of cultivated area (See Takekazu Ogura Ed, "Agricultural Development in Modern Japan"). However, there is no gainsaying the fact that if somehow ownership rights can be conferred on the tenants in India such as had happened in Japan after the Second World War, agriculture would become more dynamic. But if past experience in India rules out this possibility for a reasonable period of time, then we need to have a more pragmatic and growth oriented tenure policy, the objective of which should be to promote input-intensification by insisting that the landlords share the expenditure on improved improvements at least to the extent of 50 per cent. Also credit should be extended to the tenants liberally in order to enable them to avail of these inputs.

Among the material inputs, irrigation is known to bear the highest correlation with productivity. Unfortunately, the latest published statistics on irrigation in India do not extend beyond the year 1958-59. But some interesting information on this aspect is contained in the Food Ministry's "Growth Rates in Agriculture". According to this Bulletin, between 1952-53 and 1961-62, the increases that took place in the gross irrigated area in the first seven States of above average growth are much more than those in the States of slow progress. In Punjab and Madras gross irrigated area went up by 23 per cent and 33 per cent respectively; in Maharashtra it increased by 37 per cent; by 17 per cent in Madhya Pradesh; by 58 per cent in Mysore; and by about 15 per cent in Bihar. Among the States of slow growth, Rajasthan and Assam recorded some increase in the sown area without a corresponding increase in irrigated area leading to the negative growth of productivity. In Kerala, although there was some increase in the gross irrigated area, the per cent of net area irrigated to net area sown showed a marginal decline. Likewise in Gujarat although gross irrigated area increased appreciably, it failed to have significant impact on productivity because irrigated area constituted hardly 6 per cent of sown area. In Uttar Pradesh gross irrigated area showed a decline of 3 per cent. In Orissa and West Bengal too, there is no evidence of an increase in the proportion of area irrigated. Andhra Pradesh is the only state which despite an increase of 48 per cent in the gross irrigated area and the consequent increase in productivity, failed to show significant growth in overall production. This is explained by the fact that in the dry regions of the State where cash crops used to be grown extensively, net sown area declined by 1.5 million acres between 1956-57 and 1961-62 owing to the continuous failure of rains. On the whole it would appear that the growth in productivity and output in different States is found to be significantly associated with the increase in the proportion of area irrigated.

Role of Irrigation

At present, the irrigated area in the country constitutes around 20 per cent of sown area. It has been estimated that about 50 per cent of cultivated area can be brought under irrigation (see Planning Commission, "Memorandum on the Fourth Five Year Plan"). It is evident from the Farm Management Studies that output per acre for irrigated crops is significantly higher than from dry ones ranging from 150 per cent to 400 per cent in different regions. Besides, irrigation increases output by making possible the cultivation of land more than once in the year. Assuming that, on an average, irrigation would raise output per acre by at least 200 per cent, aggregate output in the country would grow at the rate of 4 per cent per annum if two more acres are irrigated each year out of every hundred. According to a survey of minor irrigation made by the Programme Evaluation Organization of the Planning Commission, over 60 per cent of cultivators in various parts of the country felt that the main problem faced by them in regard to irrigation was the construction of feed channels and the renovation of old tanks and wells. These rural works require community action on a big scale and it is here that the most difficult organizational problems are encountered. The breakdown of traditional leadership provided by the ex-landlords and the failure of Village Panchayats to fill in this vacuum has created a sizable bottleneck in the sphere of community capital construction. Without planned direction and enforcements combined with necessary incentives it is doubtful whether the democratic institutions will, on their own initiative, apply themselves to these tasks. So far as irrigation is concerned it is of utmost importance to reduce the dependence on the usual administrative channels by entrusting this to the technical-cum-representative bodies at the district level constituted exclusively for this purpose with adequate resources as well as powers.

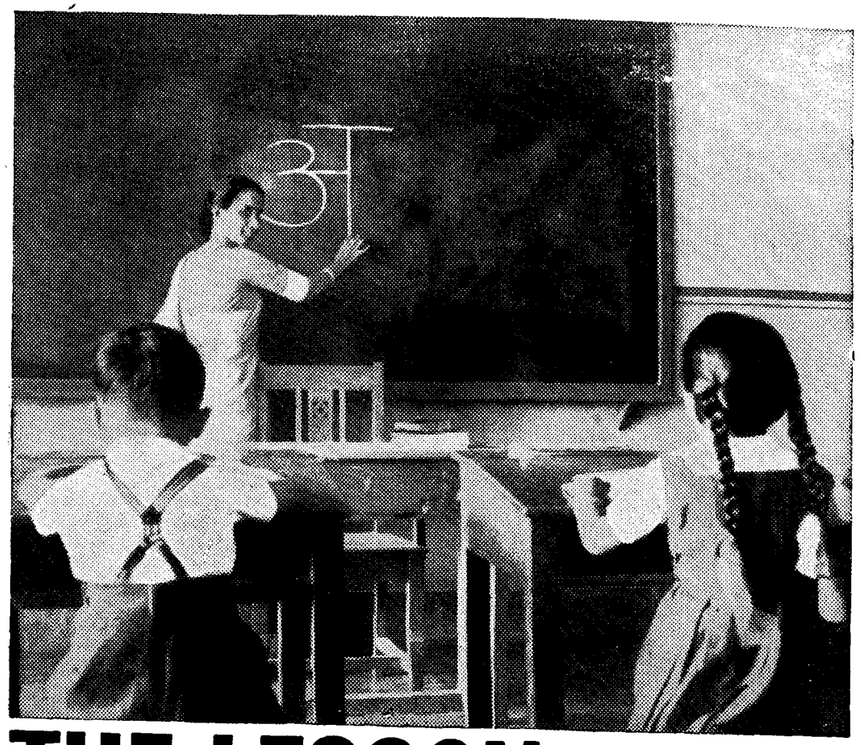
The role of science and technology in promoting agricultural growth in India is being increasingly realised. Theodore W Schultz in his recent book "Transformation of Traditional Agriculture" has advanced a rather persuasive hypothesis to explain the slow growth of agriculture in many of the underdeveloped countries. The basic elements of his hypothesis are: (1) the rate of return on the investment in traditional factors of production has declined to such a low level that there is no longer any incentive for cultivators in poor communities to save a larger proportion of their income to invest in such factors; (2) the only way to stimulate agricultural growth in such communities is to raise the investment opportunities by supplying new agricultural factors — both material and human — that embody improvements in technology and are therefore profitable for farmers to adopt; and (3) these two classes of investment are beyond the means of the individual cultivators and therefore require considerable public expenditures and the organisation of particular public activities to serve the agricultural sector.

Techniques Suited to India

As already mentioned, output can still be expanded profitably through the traditional irrigated farming. Even here, Schultz's hypothesis is relevant as the supply of water on an adequate scale is possible only through the modern means such as irrigation dams, tube-wells and pump sets which are beyond the means of individual cultivators. However, an important difference between these and the other modern factors is that once the water is provided, output can grow through the application of traditional skills at the farm level. It is heartening to note in this connection the crucial role assigned to science and technology in the future agricultural development of the country (see "Draft for the Fourth Plan"). However, without large scale public investments and community action at the village level for irrigation and soil conservation through afforestation and drainage schemes it is difficult to stimulate growth even through the use of modern factors of production as the profitability of the latter depends crucially on the availability of the former. Considerable public investments in the supply of modern inputs and improving human capabilities are nevertheless required right now for a number of reasons. For one thing, investments in research have a long gestation period and have, therefore, to be undertaken far in advance. Besides, farm children attending schools now will form effective labour force only after two decades or so and will remain in the labour force for several decades thereafter.



Considerable research is needed for evolving techniques suited to the Indian conditions. In a situation where there is considerable uncertainty and risk, and where the ruling interest rates are very high, the profitability of new techniques will have to be quite high for making them acceptable to the cultivators. It may be noted that the Rice Revolution in Japan and the Corn Revolution in the United States were the results of entirely new varieties of seeds suited to their local climate and distinctly fertilizer-consuming. Also, there was a technological break-through in the production of fertilizers leading to an appreciable reduction in their costs. The experiments conducted by the Indian Council of Agricultural Research have shown that under the existing price structure, the application of fertilizers was relatively more profitable for rice than wheat. This explains why the rice growing States of Andhra, Madras, Mysore and Kerala which had about 25 per cent of irrigated area of the country accounted for as much as 50 per cent of fertilizer consumption in the country in 1961 (See Planning Commission, "Third Five Year Plan"). On the other hand, Punjab which had about 9 per cent of the irrigated area of the country consumed only about 3 per cent of country's fertilizers.

These facts suggest the need for strengthening research both for evolving fertilizer-consuming seed varieties suited to different climates and for reducing the costs on fertilizer production. One of the main reasons why Community Development Programme failed to make an appreciable impact on agricultural productivity is that it was extended too soon to too many areas with too little of effective techniques at hand. The solution lies in evolving and promoting profitable technology and not merely in raising the status or salaries of Village Level Workers. All this implies that considerable resources should be allocated to scientific research. It is time the emphasis shifted from the role of agricultural surpluses in economic development to the role of science and industry in the development of agriculture. Agricultural surpluses would automatically emerge through the increase in agricultural productivity.

Village Politics in Kerala—II

Kathleen Gough

This study of village politics in Kerala, the first part of which appeared last week, attempts to provide general insights into how and why villagers of different castes and classes, in the farming and suburban areas, support the Congress or the Communist parties, how the inter-party conflict is pursued through local institutions and what factors hold it in check.

These questions are discussed with reference to a village in central Kerala with comparative data from a second village in the northern part of the State. The author's first acquaintance with these villages was in 1948 and 1949. She returned to re-study them between April and September 1964.

The Leaders

THE origins and social networks of village party leaders cast light on their influence and roles. In both panchayats, the top Communist leaders have a double advantage. They come from ancient, high caste, local families who were formerly prominent landlords and village headmen. At the same time, they promulgate policies designed to aid lower caste and poorer villagers in their struggles against the privileges of the very classes from which their leaders came.

In the Palakkara panchayat, Visvanathan, the panchayat president, is a Brahman from a formerly wealthy — and still moderately prosperous—village headman's family. Gopalan, the Palakkara Communist ward-member, comes from the most ancient, and by far the biggest, Nayar matrilineage in the village. His ancestors were once prosperous military commanders of Palakkara's Nayar soldiers and also bailiffs of the Brahman village headmen to whom these Nayars were attached as retainers. Gopalan's lineage, and he himself, are now almost landless, but their ancient name and overwhelming numerical preponderance over the other Nayars of the village give his leadership a kind of local authenticity.

In Parambur, Parameswaran, the Communist ward-member and former panchayat president, hails from Parambur's former village headman's lineage, who lost much of their land in the nineteenth century to an "alien" lineage of Nayars.

All three of these men broke completely from orthodox but educationally backward families in their adolescence. They left their villages and underwent a kind of *brahmacharyam*, submitting to the rigours of party discipline and elders' intellectual training, the alienation of imprisonment, and the uncertainties of poverty or of hiding out in the homes of Communist supporters—often of the lower castes. Their marriages and return to their villages shortly preceded the beginning of the Communists' parliamentary period in 1951. With their honourable family histories, local origins and intimate knowledge of the villagers, yet their revolutionary convictions and identification with the lowly, they were ideally suited to guide the ferment toward social and economic equality which was beginning in the lower ranks of their local societies. The fact that all hailed from "feudal" families which had experienced loss of land to the new capitalist classes of cash crop farmers and merchants perhaps aided their identification with the poor. It also helped them to attract some followers from their own caste and class similarly situated to themselves. It need hardly be mentioned that E M Sankaran Namboodiripad and A K Gopalan, the two Communist leaders in Kerala who tower above all others in the popular imagination, come from similar Brahman and Nayar backgrounds and had similar, if more spectacular, personal careers.

Newer Type of Supporter

Such men still hold the reins in both the panchayats and, I believe, in a large proportion of the Communist dominated panchayats of these areas. A newer type of Communist and C P supporter is, however, appearing on panchayat boards and in district offices. The panchayat to which Palakkara belongs has five such men on its board, and the Parambur panchayat, four. They come from the Irava group; they lack both the aristocratic traditions and the revolutionary experience of their high caste mentors; but they are locally born and have a primary or high school education. Occupationally they include private school teachers, unionized factory workers, village teashop keepers and landless labourers. They obviously illustrate the push toward local power and social equality on the part of propertyless, but increasingly educated, low caste people which the older high caste Communists helped to liberate.

The Congress Party's village leaders have similar social origins to the Communists, but different networks of relationships. Until recently, Congress leaders in both neighbourhoods came from ancient, high caste, local landlord families of the same traditions as those of the Communists. Where these were not already Congressmen, the Congress Party immediately after Independence seems in fact to have co-opted the rural gentry and tried to take over their bailiwicks intact. In both neighbourhoods the top leaders of those days were men of the wealthiest Nayar or Brahman landlord families; their subordinates, junior men of their own lineages or heads of lesser landlord lineages of the locality. Visvanathan's elder brother won a place as a Congress candidate on the Palakkara panchayat board in 1953, and in Parambur Parameswaran has been opposed by Congressmen of his own lincage. The difference between such men and the Communists was, of course, that while sometimes reformist in outlook, they had never broken sharply with the conservative values of their castes and families. They relied for followers on traditional kinds of authority, rather than on revolutionary experience coupled with rejection of such authority.

Two Changes

In the past few years, two changes seem to have occurred on the local scene and in the Congress Party's policies. One is that capital owners such as bankers, merchants, industrialists and export-crop planters—often Christians or "upstart" Hindus, but sometimes drawn from the older landed gentry—are gaining influence in the higher ranks of the party. The other change is that, with the modern pressure of the propertyless toward social and economic equality, multitudes of villagers now refuse to support their own local landlords of Congress persuasion. The party must, therefore,

seek other kinds of candidates for the panchayat elections. In the neighbourhood of Parambur its choice has tended to fall on Nayar, Irava or Muslim owner-cultivators or village merchants. In the more urban neighbourhood of Palakkara, it has fallen on Christian or Nayar owner-cultivators, white-collar workers, store-keepers or mill-owners, most of whom work in the town.

Most of these men lack the aristocratic mode of life of the old-style landlords, as well as their traditional authority. Engaged in private enterprise, they have a more bustling manner and egalitarian etiquette. Although most have moderate to great wealth, some of the lesser leaders are of poor or low caste origin.

Congress Disadvantages

In Palakkara, a disadvantage of these men is that their top leaders are not locally born. The president of the Congress *mandal* is a Christian of 24 whose father came to live in the panchayat 20 years ago. The family, located in Ambalapuram, are extremely wealthy owners of rice and oil mills, a timber business, and stores for electric and motor parts. The *mandal* secretary is a Nayar timber merchant with a workshop making plates for electric switches. This man hails from 60 miles away and arrived three years ago. When I first met him, he did not know how many wards there were in the panchayat or who headed some of them, although he was collecting petitions to the district Collector to complain about the Communist panchayat board's failure to clean out the public wells.

A second disadvantage was the Congress leaders' alleged involvement in the use of improper political influence and in corruption. The president was accused of using his party-role to obtain government licences and subsidies for his various businesses. Both president and secretary had founded a farming cooperative of 46 local small landowners. The group had received Rs 20,000 from the Community Development Block to buy improved tools and fertilizers on condition that they engage in joint cultivation. In fact, no joint cultivation was done, most of the labour being by coolies, and a large part of the grant was said to have been "swallowed" in personal expenses.

It must be said that Communists, too, are often accused of double-dealing with government agencies as well as with the public. A Congress member in Ambalapuram accused Visvanathan of pocketing funds from rubber workers' unions, although I never heard this allegation in Palakkara. Gopalan was accused of making money illegally out of a government cement permit, and Parameswaran, of having shared surplus funds from the Communist government's housing scheme with the coolies to whom the houses were allotted. In the Parambur panchayat, 100 Iravas formed a co-operative to make jaggery and sell it to the local Communist-run multi-purpose cooperative. In fact the group used their government toddy-tapping permit in order to sell the fermented liquor illegally to the public. They paid the cooperative manager the amount he might have made if he had bought the jaggery and sold it at standard prices.

There does, however, appear to be a difference of scale between the corruptions of which Congress and Communist members, respectively, are accused. Congress members are more often initially engaged in substantial private business than are Communists, and so have far greater access to government contracts and the "gravy" that comes with them. Under a Congress State Government they also, of course, wield greater influence to obtain such contracts.

The Congress leaders of other villages of the Palakkara mandal are locally born and of modest means. Palakkara's own Congress ward president is a Nayar owner-cultivator, formerly a motor-mechanic but now a paid party worker. He comes from a smaller lineage than Gopalan, and is an inconspicuous figure in the village. His secretary is the Carpenter-school-teacher who, seventeen years ago, belonged to the Indian Socialist Party. The teacher's elder brother, an actual carpenter and a Congressman, receives contracts through the timber merchant who is the mandal secretary. Earlier he gained wealth through the new building associated with the government offices, and he is now the most prosperous carpenter in the village. My point is that even when the village Congress leaders are locally and humbly born, their concern with private enterprise cuts them off from the mass of propertyless labourers. Their ties to more powerful Congressmen outside their village tend to be at least partly a matter of personal financial advantage, and, directly or indirectly, bind their interests with those of the wealthiest urban capitalists.

A similar though less mercenary situation exists in Parambur. The village Congress president is a Nayar owner-cultivator of modest means. He comes from the same lineage as Parameswaran and ran against him unsuccessfully in the panchayat elections. Balachandran's disadvantage is that, while evidently honest, he has no strong networks of influence in the village except with his own kin and labourers. His father was a bailiff for the wealthiest local landlord and, on their behalf, opposed the rise of the peasant union in the 1930's. His mother's brother was a former village headman, loyal to the British and to the landlords. Balachandran in his turn tends to be viewed as a party-functionary who canvasses on behalf of the landlords, cash crop merchants, store-keepers and more prosperous cultivators who finance the local party unit. In the wider neighbourhood, the Congress mandal treasurer is a member of one of the two greatest Nayar landlord lineages of the region, as well as the owner of two cloth stores. Such a man, however well intentioned, naturally tends to protect the claims of both landlords and merchants against those of landless labourers and small tenants. Towering above him in the town sixteen miles away are higher-echelon Congressmen involved in the really big money of textile manufacturing, whose long arm of influence was said to reach into the legislature, and even the cabinet.

The Voters

Most men in both villages have a definite party allegiance. More than half of those over thirty have maintained the same allegiance for a decade. I found none who had shifted from Communist to Congress since 1957; a number have switched from Congress to Communist in the same period. This paper concerns only men, for I found it more difficult to discover the political allegiances of women. Most women are said to vote as their husbands or other close kinsmen do, but I am unsure how true this is.

"Party allegiance" means the party for which a man said he voted in the state and national elections, or for which he was reliably reported to work. The data were collected by myself and my research assistants, from the individuals or from their close friends or kinsmen. I realize

that some of my information may be false. If anything, it errs by favouring the Congress Party. Some men with government jobs fear what is called "police verification". They believe that if they are reported to be Communist supporters, they or their kin may lose their employment. For this reason some men who wish to enter the army or to become postmen or police constables even enroll as Congress members to impress the authorities, while voting for the Communists.

In addition, some men who gave their normal allegiance as Congress actually voted for Gopalan, the Communist candidate, in the panchayat elections, because he was a kinsman, or a lineage-mate, or because they admired him personally. These facts partly explain why my own figures show a more even breakdown between Communist and Congress supporters, while those for both men and women voters in the panchayat elections favour the Communist more strongly. Moreover, I was unable to obtain the information for 32 male voters, while 28 more said that they had "no politics" but may actually have voted in the panchayat elections. Most men, however, vote for the same party in panchayat as in State and national elections.

Caste and Party Allegiance

Table 1 shows the male voters of Palakkara by party allegiance and caste-category. The table shows a moderately strong and highly significant association between caste and party affiliation, with higher castes favouring the Congress. I have not yet analysed my figures for Parambur, but the trend is in the same direction and is, if anything, more pronounced. The Parambur picture is complicated, however, in that some of the Muslims support the Muslim League. I was unable to discover exactly how many, because in the last panchayat elections the League had an alliance with the Communists and supported Parameswaran as its candidate. Some Muslims are actually Communist rather than League supporters, but I am unsure how many. Only two Muslims support the Congress. In Parambur as in Palakkara, a much larger proportion of the "Nayar group" than of the "Irava group" support the Congress.

The correlation between caste rank and party support raises the question of "casteism" in Kerala politics. The leadership of the Congress Party has been *internally* divided — and in late 1964, finally split — between competing groups dominated by Iravas, Nayars and Christians. The League is an openly communal party. The Communist Party is sometimes accused of favouring Iravas and Harijans *as castes*, and it has in the past at times made electoral "adjustments" with the League.

I cannot argue the question here except to acknowledge that all the parties, in their effort to control more seats, jockey for influence with one or another of the communal associations (Nayar Service Society, SNDP, Muslim League and Catholic church.) What I wish to point out, however, is that in these villages I found that once they have begun actively to support the Communist Party, men have greater *political* allegiance to it than to their caste or to any organized communal association. Communist supporters are also in general men who wish to abolish both inter-caste competition and social inequalities between the castes. Space prevents me from quoting the many instances in which this was illustrated, but I may mention one. The Irava Congress Chief Minister, R Sankar, fell from office in September. Communist supporting Iravas, as well as Nayars, in Parambur rejoiced exceedingly. Some went sixteen miles to the town to join the celebration with bonfires and fireworks. Irava coolies jubilated that "Now our EMS (a Brahman) and AKG (a Nayar) may come back to power." It was only among Congress supporters that I heard discussion of the communal implications of Sankar's fall and of the secession from the Congress Party of the 15 dissident Nayar and Christian legislators of Central Kerala, who later formed the nucleus of the Kerala Congress Party.

The Communist Party's problem seems to be, therefore, not what to do about communalism among its own followers, but about that of the poorer classes of Muslims and Christians who are more influenced by their own religious leaders than by the class doctrines of the Communists. Of late this problem has become less acute with regard to the Christian poor, for since 1960 many have disregarded Church teaching and come to support the Communists. Palakkara is especially instructive. Most of the Christians still attend the Catholic church, but a majority now openly support the Communists, as their priest told me he was aware. "What can I do about it?" he asked. "They are good people: I leave them alone." Still other Christian tenants and workers of this area (though not in Palakkara) support the Karshaka Tozhilali Party of Father Vadakkan, a class conscious organization which has come increasingly to align itself with the Communists.

Communists and Muslim League

Among the Muslims, however, many of the poor still appear to be without politics or to support the conservative leadership of the League. The question for the Communists is whether to sacrifice principle and maximize their chances in any given election by making "adjustments" with the League, or to reject its communalism and make a drive to convert its followers.

Leftists differed on this question. Parameswaran said mildly that he supposed the Leftists must ally with the League to win the elections, but admitted that this made his life more difficult. Between elections he worked to persuade Parambur Muslims that the League was against their interests, but at election time had to announce alliance with its leaders. He saw that electoral alliances freeze the *status quo* of the parties and turn the Communist Party into a machine rather than a revolutionary movement. In Palakkara, Visvanathan's approach

Table 1: Caste and Party Allegiance

Palakkara Men

	Communist	Congress	PSP	No politics	Unknown	Totals
Nayar Group	46	131	1	5	7	190
Christian	45	29	0	6	7	78
Irava Group	100	44	1	15	14	174
Harijan	38	7	0	2	4	51
Totals	229	202	2	28	32	493

was one of hard-boiled cynicism. "We must use them (the conservative League leadership) to smash the Congress, and then we can easily smash them." When I discussed this view with Leftist supporters in both villages I met some troubled reactions. A teacher said with disgust, "It is bad — it is cheating the people. It is simply telling lies to the people." He added that electoral opportunism and deceiving those who do not agree with them are the worst faults of the Communists and the main reasons he did not try to join the party. "What is your idea?" he asked sadly. "My idea is that we should get rid of *all leaders*. All are old-fashioned, corrupt. We should raise up a new leadership from the schools and countryside." This view was shared by some other Leftist *anubhavis* who were disillusioned by the vaccillations of policy and internal disruptions of the Communists. Nevertheless, there was no doubt that they would go on supporting the Leftists unless a more principled leadership appeared with the same programmes. Writing in February, 1965, it is interesting to note that to date the Rightist Communists apear to have taken a more principled position than the Leftists with regard to the coming elections. I do not know what effect this is having on Leftist supporters. I am doubtful, however, if many village Leftists will switch to the Rightist party, for they doubt the Rightists' general intention to press for revolutionary changes.

Caste and Class

The correlation between caste rank and party support rests chiefly, it seems, on two factors, neither of which signifies competitive "casteism" in the usual sense of the term. One is that caste rank is still closely related to socio-economic class, and the Congress/Communist cleavage is at least partly based on class. The other factor is that the Communists have, more than all other parties, attacked the traditional religious and social rank discrimination between high and low castes. It has been the Communists in Kerala, above all, who have visited Harijan houses, fraternized in low caste tea-shops, and upheld irregular marriages between persons of high and low caste.

Table 2: Occupation and Party Allegiance

Palakkara Men

Category II	94	126	25	245
Category III	40	18	8	66
Category IV	91	13	27	131
Totals	229	202	62	493

A Palakkara Nayar Congress supporter commented wryly on this. "See this Visvanathan, what a clever fellow he is! He will go even to the very huts of Vettuvas, and enter in when they are eating. And he will say, 'What, man, what is this you are eating? Is it good or is it bad, what you are getting from your landlord? Let me taste that *kanji?*' And he will taste it. Then these Vettuvas think, 'Who is this Namboodiri? He is coming into our huts and eating our food!' And then they will adore him like a god — is it not natural? And they will think, 'Surely we must do everything for this Namboodiri.'" The appraisal, although cynical, hits on an important reason why so many Palakkara Iravas and Vettuvas do "adore" "our Visvanathan", and follow him for other reasons than the meagre economic benefits he has been able to confer on them. This was shown, I think, on another occasion when I asked a wretchedly poor Irava coolie woman why she voted for the Communists. Had they helped her in any way? She answered soberly, "Nobody really helps us. But we feel that the Communists are thinking of us. They are friendly, and have good hearts."

Table 2 shows the male voters of Palakkara by party allegiance and occupation. I have ranked occupations into four categories, based on rough estimates of household income, including income from land and other property. Category I contains landlords, businessmen employing more than 12 people, bigger store-owners, owner-cultivators with more than five acres, and white collar workers of higher grades. Category II contains owner cultivators of smaller holdings, lower grade clerks, skilled urban workers, highly skilled craftsmen and village servants, and businessmen with 5 to 12 workers. Category III contains tenant-cultivators, petty brokers, individual shop-keepers and the less skilled village servants. Category IV contains unskilled day labourers and the unemployed.

The table shows a moderately strong and highly significant association between occupation and party affiliation*. Although the association between occupation and party is slightly stronger than that between caste and party, there is no satisfactory way of assessing whether the difference between the two associations is significant. Nevertheless, Table 2 supports my view that although both Congress and Communist Parties have originally been led mainly by high caste men drawn from land-owning families, the contemporary struggle between them is based substantially on a struggle between propertied and propertyless classes. There is no doubt that the trend in Parambur is the same.

The Issues

Among preliterate and propertyless Communist supporters, economic issues are prominent. In both villages the poor cite benefits received during Communist rule in 1957-59. They included debt-relief, fixity of tenure, a ten cent plot for landless labourers, higher agricultural wages, free housing for the homeless, lower food prices than subsequently, ceilings on land ownership, and for tenants, the prospect of buying some land. Some of these benefits were carried over into the Congress period after 1960, but most have been seriously diluted or made impracticable by the more moderate Land Reforms Act of 1964. The runaway rise in food prices in summer 1964 confirmed the poor in their belief that the Congress is opposed to their interests — although few needed the confirmation after seeing "their" government ejected in 1959. The food crisis since September, followed by the arrests of their leaders, can only have deepened their bitterness.

"Equality", often talked of, vaguely defined, is the objective of the village poor, and they believe that the Communists will bring it. It means the end of *mudalalithwam* (capitalism, or more literally, "rule by big men"), which to the poor means both rule by the Congress government and the more immediate exactions of the landed, mercantile and industrial rich. "Equality" means the end of the rank distinctions, of privilege and etiquette, and of all traces of the religious discriminations of caste. But it also — and in a quite simple and literal way — means equality of wealth: land, wages and profits, they believe, should be equally divided, and there should be no more rich and poor.

* Chi square for Table 1 is 92.239, significant at better than the .001 level; for Table 2, 104.524, significant at better than the .001 level. Phi was used as a non-parametric measure of association. The association between caste and party is .46, and between occupation and party, .49.

Among party members, educated Communist supporters, and the younger and more informed labourers, discussions entered realms of theory embodied in the Tenali draft platform, which cannot be reproduced here. Briefly, one thing was certain to them: the Congress is the captive of the national and imperial bourgeoisie, and cannot bring socialism to India. It must be removed, "somehow". The Rightist Communists were seen as revisionists who had surrendered revolutionary ideals and, on the national scene, were "compromising" with the Congress.

Left Communist Stronghold

There were no Rightist Communists in Palakkara, and only one in Parambur. Communist supporters followed the Leftists for two reasons. First, both their own local leaders, and also E M Sankaran and A K Gopalan, the most popular state-leaders, were Leftists. For most people, this was evidence enough where their own allegiance should go. Second, there was a popular revulsion against any hint of compromising radical programmes. Significantly, Leftist village Communists and their supporters, in August-September 1964, did not want a United Front with the Rightists. As a party member in Parambur put it, "Yesterday we ate from the same leaf with the Rightists, but today they call us Chinese dogs. Why should we join with them tomorrow?" As for the Samyukta Socialist Party, they were seen as "not a party at all", but an opportunistic clique, and "even more reactionary than the Congress." For this reason I heard, and heard about, covert grumblings among some village Communists in late August and early September as electoral alliance began to be talked of. Among the preliterate, less sophisticated Leftist supporters, uninitiated in party-manoeuvres, the reaction was still stronger: the Leftists should go it alone with their own programmes and methods, and win or lose the elections on the merits of their appeal to the people. I do not know how these villagers, with their urgent need and simple revolutionary fervour, have reacted to the recent vaccillations over a United Front.

Not a Live Issue

The Chinese invasion was not a "live" issue among the less educated Communist supporters. China was far away, and the details unknown to most people. When I suggested that non-Communists accused the Leftists of national betrayal, the most common response was that this accusation was designed to confuse the real, local issues of land, wages and prices. In Parambur a tenant farmer did try to come to grips with the issue. He told me, "Often in our country two men plant cashewnut trees on a hillside. Eventually they meet near the summit. Each knows his trees and they do not worry about it. The trouble comes in the next generation. And then it is very, very difficult to draw a boundary on these hills. I am thinking that the Chinese and Indian quarrel is of this kind." He thought that it should be arbitrated in the same way that a village arbitrator *(madyesthan)*, disinterested, but with friendly ties to both parties, would try to settle a local boundary dispute.

Among Leftist party-members and those in their confidence, there seemed to be more deep-seated anxiety about China and a greater range of disagreement. A prominent woman Leftist told me with tears that China had betrayed the Indian Communists and India must defend herself at all costs. It was right for India to buy weapons from any country — even the United States — provided she paid for them, although meanwhile, negotiations to settle the border issue were essential. At the other extreme was a Leftist who told me that both India and China had been at fault and the border should be internationally arbitrated, but that China's actions should not deter the Leftists from pressing towards socialist revolution in India. His personal view, which he distinguished from party policy, was that Indian revolution should not, and could not in the nature of things, be instigated by a foreign power, but that when it began, "Certainly we shall need and will receive all help from our Chinese comrades." Most Leftists to whom I talked took a less definite position. Most held that (1) China had been largely at fault on the border, but China was not out to conquer India, and international arbitration, not war preparations, was the answer; (2) in general the Chinese line on world socialism was correct, the Russian, revisionist, and Khrushchev, "not at all a Marxist"; and (3) it was unlikely that India would reach socialism through the present electoral process, but that its channels had not been exhausted and the time for revolution was not in sight.

The Congress Supporters

Among persons who supported the Congress, there seemed to be a wider range of reasons and of political positions. Two types of reaction were common among lower caste Congress supporters. One was that of the younger or middle aged man who, through personal enterprise or the patronage of superiors, was improving his lot in society. Such men saw the Communist poor as thriftless and parasitic. Why should they clamour for equality and free benefits, when everyone knew that life was a struggle and men advanced through perseverance? A second type of Irava or Harijan Congress supporters, usually older men, comprised those able to retain security and favour through traditionally "moral" relationships, for example, loyalty to a long-term employer.

Among high caste, but less educated and less prosperous Congress supporters, there was often a wish to hold on to traditional caste privileges, which the Communists were out to destroy. With this frequently went the view that the individual's own property and status had been undermined by Communist assaults. This was especially true of Nayar owner-cultivators and small non-cultivating landowners who had been impoverished by the Communist land act — obliged to give fixity of tenure to a recalcitrant labourer, or to sit quiet while a tenant withheld or delayed his rent. For such men Communism meant violence, irresponsibility, and even plain robbery, and support of the Congress, the only hope of stemming the frightening tide of rebellion.

A small number of prosperous, high caste Hindu or Christian landlords and merchants opposed both Congress and Communist policies, but voted for the former as the lesser evil. For them socialism was a farce and democracy (as a lawyer landlord put it) "the anarchical nonsense of the multitude". Such men had opposed Independence in the first place, and would

have preferred India to be ruled by the army, or Kerala to be under permanent President's rule.

For all of these people, support of the Congress meant, primarily, opposition to the Communists. Their objections to the Communists were regularly coupled with two other highly charged accusations: atheism and national betrayal. There was also a more discriminating category of men, most of them white collar workers, who expressed positive faith in democracy and socialism. Most were pre-Independence Congress supporters or, if young, were informed about and proud of the Freedom struggle. Some of these men had opposed the 1959 "Liberation Struggle" against the Communists because they considered it undemocratic. Some approved of both the Communists' Land and their Education Acts, and opposed Communism chiefly because they thought it involved oppressive dictatorship. For such men, eager to maintain faith in the electoral process, the factionalism, corruptions and economic failures of the Congress in Kerala were extremely distressing. Memories of the Independence struggle, and reverence for Gandhi and Nehru, were the mainsprings of their support. As one Nayar put it, "In my youth I have touched the robe of Mahatma Gandhi when he came to visit my high school. From that day I vowed that I would not depart from this Congress."

Working Out of the Party Conflict

The party-conflict is the deepest in both villages, and ramifies through almost all institutions. It takes two forms: (1) a long-term struggle for power between propertied and propertyless classes, with the Communist Party usually championing the propertyless, and the Congress Party, or individual Congress Party members, usually defending the traditional rights of property-owners but sometimes nervously challenging them or conceding points to the propertyless; and (2) a struggle between actual local political factions (which are not solely based on economic class) for control over available resources, goods and people. These two types of struggle are not always mutually compatible. In different contexts now one, now the other, predominates.

Struggles to control land are naturally prominent in both villages. On the "class struggle" front, the Communists try to get land or its produce away from landowners and give it to tenants and labourers. Visvanathan, for example, fought a struggle in court against his own elder brother, a Congress candidate in the 1963 panchayat elections and a Congress ward-representative on the previous panchayat board. The struggle was to have sixty Harijan families, domiciled on the latter's land, provided with 10-cent plots and new small houses when they were evicted from their old sites in order that a spinning mill could be built. Each brother employed a "party lawyer" who takes cases only from members or supporters of the party that he himself favours. It is struggles of this type which bind the landless, as a class, ever more closely to the Communist Party, and alienate them from the Congress Party. On the "party factional" front, however, both local party units try to obtain plots of waste or government land to house their own supporters or to augment the gardens which their supporters already own. With the acute shortage of land in Palakkara, this often means struggling through the courts or through influence with government officials, to have supporters of the "anti-party" evicted.

In Factories and Offices

In the urban context of which Palakkara is part, struggles inside factories and government offices resemble those over land. From the class-angle, both N G O's and factory workers press for higher pay from their employers. Factory owners are almost all Congress supporters, while government has usually, and of late, been a Congress government. In both contexts Communist unions wage the most uncompromising struggles. On the party-factional front there are, however, rival Congress unions which compete with the Communist ones for influence among workers and for some measure of benefits from employers. These unions sometimes ally with the Communists in strikes, but sometimes reach separate compromises with the management. In Palakkara, Congress unions are widely regarded as "management unions". Thus, the Congress-supporting Christian owner of a local handloom mill closed down the mill in the Communist period because the Communist union demanded higher wages and various other concessions. When Congress came to power he re-opened the building as a power-mill in which village women now make undershirts for very low wages. In 1963 a Communist union formed in the mill, with local party instigation, but its registration was legally suspended after the owner had fought a battle in the courts. In 1964 the Congress *mandal* secretary was forming a new union among the women, to "get some help and benefits" from the management in the form of tea-breaks and medical care. As he was himself a businessman and as the mill-owner was a Congressman, local Communists thought his actions completely bogus. A Congress supporter remarked that there was always an element of self-interest in all union organizers' activities, Congress or Communist but that the secretary might sincerely help the women in order to gain their votes.

Control of Public Funds

Another area of party conflicts is that for control over public funds obtained from local taxes or provided to the village by government agencies. The most important are (1) the panchayat budget, (2) special-purpose grants from the block development office, and (3) loans and grants to co-operative societies. The first set of funds concerns such matters as road maintenance, rural sanitation, electric lighting, public wells, etc. In all panchayats, parties campaign strenuously to gain control of the panchayat board, and whichever party wins tends to favour its own followers in the distribution of public benefits. In Palakkara and Parambur, where Congress supporters have consistently lost the panchayat elections, they have tended to seek control of alternative funds through co-operative societies and block development projects. In general, block development funds tend to go more often to individuals and groups who support the Congress Party, because such individuals usually have a better credit rating, and security is required for loans from the development fund. There is therefore a growing tendency for the Communist party units to ignore or to fight the block offices on the theory that they are unable to help the poor.

Party conflict erupts, again, over the control of churches, mosques and temples. This may seem strange, for the authorities of all these institutions charge the Communists with atheism. Some are, indeed, militant atheists. Visvanathan is said to have made a microphone speech on the green two years ago in the middle of the village goddess festival, beseeching the people to abandon such foolishness. But I found that many village Communist members are vague about belief and

quietly practice religious observances. Gopalan worships at a shrine dedicated to the spirits of his parents, and goes on pilgrimage to Rameswaram. Parameswaran made a vow to Kondungalur Bhadrakali when he had smallpox, and fulfilled it a year ago.

Religious Institutions

What seems to happen in the case of religious institutions is that movements form among lower ranking Communist supporters for more democratic control of the institution, which are partly *sui generis* and partly indirectly stimulated by Communist teachings about equality. The Party itself may be unconnected, or its members may take individual stands. In Palakkara, for example, the Harijans last year staged a campaign to perform their own annual temple festival inside the village Bhagavadi temple, with appropriate Sanskritic rites, rather than performing it with traditional rites to a Harijan diety several hundred yards away. Their unsuccessful petition to the Congress-dominated Nayar temple committee to be allowed to do this was signed by eleven Nayar Communist members and party supporters, but the party members did not actually attend the festival when it took place outside the locked temple gate. In Parambur, a struggle was being carried on by Communist-influenced Muslims against elders of the mosque to stop the latter from making propaganda for the Muslim League in the Friday sermons. In the town near Palakkara, a similar struggle was occurring inside the Chaldean Syrian churches between a conservative faction who support a Middle Eastern patriarch now living in America, and a left-wing faction who support an indigenous patriarch. I was told that although the parties may not be directly "behind" this schism, members of the American faction tend to support the Congress, and those of the left wing, the Communists. The interesting point is that even where the parties do not themselves engineer fission, the different value-premises of their supporters cause the fundamental conflict to ramify through every aspect of public life.

The same kind of conflict occurs in connection with the caste associations of Nayars and Iravas. As Communism gained strength in Palakkara, Irava allegiance to the S N D P weakened, and the local branch faded out a decade ago. In 1959, however, an Irava government servant came to live in the village and tried to restart a branch with the aid of the Congress Party unit. The group's aim seems to have been to raise the educational standards of Iravas and try to "rescue" them from Communism. Funds were collected from Ambalapuram Irava businessmen to build any office and reading room. When the office was half erected, Palakkara Iravas voted in a local Communist President and office bearers, and physically drove off the Congressmen. The sponsors withdrew their funds in dismay, and for five years the building has stood uncompleted. In a nearby village, Communist Iravas "captured" the S N D P temple and reading room some years ago through elections, and have turned both into multi-caste facilities used mainly by Communist subscribers. Carpenter-Blacksmith and Irava-Christian marriages have been conducted in the temple. The branch retains its allegiance to Sri Narayana Guru, but operates autonomously. Its members have broken their connection with the statewide, Congress leadership of the S N D P, in response to a hullabaloo at the election of the State leaders in 1962. Communist S N D P members, who appear to be the majority of the rank and file, accuse the Congress leadership of having held on to its power by fraud and police intimidation at the elections. Since 1962 many S N D P local branches have dissociated themselves from the official body. The S N D P was never strong in North Kerala and appears to have virtually disappeared.

Nayar Service Society

The Nayar Service Society, beginning in 1924, expanded greatly in the 1950's. It became a powerful corporation owning schools, colleges, a hospital, rubber plantations, a sugar mill, and areas of forest land which have been newly colonized by Nayars. Always a secular organization, its goals have been Nayar education, the development of capitalist enterprise, and economic and political competition with Christians and Iravas under the new democratic dispensation. As a joint-stock company, it jockeys with the S N D P and with Catholic corporations to obtain educational and development funds from the government. In rural areas its branches have tried to revive ancient Nayar art forms, temple organizations and caste assemblies. They thus foster Nayar separatism from the lower castes while easing the transition from "feudal" dominance to capitalist competition. At the same time they recruit a portion of the electorate for support of N S S — sponsored candidates for state and local offices. While superficially similar to the S N D P, the N S S, a high caste organization, has never had its crusading faith in social equality nor its popularity among the poor. Its leadership influences right wing pressure groups both inside and outside the Congress Party and was, of course, with the Catholic hierarchy, instrumental in ousting the Communists from office. The N S S and a portion of the Catholic church are now dominant power-groups in the new Kerala Congress Party.

Constant Tension

The N S S made its debut in Palakkara two years ago under the influence of an R S S-supporting leader from Ambalapuram, but with the sponsorship of the Palakkara Congress unit and the Congress-supporting Nayar village temple committee. An initial meeting was held and plans made to start a reading room and local office. Evidently, Congress members hoped to use the N S S and its urban sponsors as an educational and financial bulwark against the Communists. At the first meeting, however, Gopalan cheerfully turned up with his followers and, playing on his panchayat authority and lineage membership, got himself elected to the executive committee. The urban sponsors appear to have withdrawn, and the N S S has made no further headway in Palakkara.

All of these power struggles between Congress and Communist factions occasion a constant state of tension in both villages. Villagers on both sides lament that the tensions produce stalemate in many activities and prevent the village from carrying out its goals of production increase and public welfare. The stalemate is especially noteworthy in land-relations. With the see-saw changes in land laws under the successive Communist, P S P and Congress ministries between 1957 and 1964, conflict and litigation have increased phenomenally. Some tenants in 1964 refused to pay their rents at all, hoping the government would change before the Congress Act of 1964 was fully implemented. Land revenue had not been collected for two years. Landlords tended to lose interest in the care of their land, and to exploit tenants and labourers to the maximum, fearing that their land might be taken from them within the next few

years. Several village projects, too, were abandoned or delayed by the mutual sabotage between the parties. So demoralizing was this state of affairs that I had the impression of witnessing a terminal period of some kind in Kerala's political relations, although I had no idea what would follow it. The sudden collapse of the Congress government, the alarming food crisis in the period of President's rule, the new fissions and vaccillations in both the Congress and left-wing parties, and the arrests of the Leftist leaders, must have greatly increased the villager's frustrations.

Covert and Restrained

It must be said that most of the time, tensions between the parties remain remarkably covert and restrained. In Palakkara, however, with its overcrowding and unemployment, they do periodically erupt in violence. Each party faction has a few expert fighters as henchmen. Fights are most likely to occur just before or after an election, and several took place in 1960. A series of episodes also occurred in 1964 soon after the panchayat elections. A mixed party of Nayar and Irava men attended the wedding of a Palakkara Nayar in a village some miles away. Coming home in the private bus (actually, a borrowed police-van) a drunken Nayar accused the Communist panchayat board of incompetence, and a fight broke out between the factions. For several weeks thereafter Congress and Communist supporting Nayars hired Christian and Irava men from Ambalapuram or elsewhere to beat members of the "anti-party" of each on their way home from work in the dark. Four such incidents occurred, two on each side, before the conflict temporarily subsided. The injured persons filed complaints at the police station but no action was taken, although "investigations" were going on. I was never able to discover the extent of responsibility of the local party leaders for these incidents. Each faction leader denies his own responsibility for such assaults, attributing the blame to lesser individuals, while accusing the other party's leaders of financing and engineering counter-assaults, and sometimes of bribing the police to take no action. My information suggests that party leaders of both sides may occasionally hire henchmen to carry out assaults on party-enemies, but that most such assaults are made by *ad hoc* groups of faction supporters who feel that they are defending the pride and interests of themselves and their party. It is interesting to notice that whereas some decades ago, Nayars of opposed lineages sometimes employed their hereditary lower caste tenants and labourers to fight for them, today they may employ lower caste political supporters of the village, or even politically unaffiliated mercenaries, to prosecute their inter-party feuds.

Mutual Restraint

In spite of these eruptions, a cheerful, kindly temper, stoical endurance, mutual restraint, and orderly prosecution of routine tasks prevailed in both villages most of the time. In the midst of hunger, unemployment, and the general struggle for survival, such personal strength could only evoke admiration. I am unable to "explain" and can only pay tribute to these individual moral qualities, but may suggest some social reasons why, in spite of the basic cleavage, the parties do not engage in more continuous and overt conflict.

One reason is of course that some relationships do cross the party cleavage, and in individual cases prove temporarily stronger than party-allegiance. In Palakkara, Ammini was a strong-minded, dominant Nayar Communist supporter who had made an unorthodox marriage with an Irava factory worker. Early in the fights referred to, she boasted to me that her husband was a henchman of the Communist faction, and could beat up any Congressman within miles. But when her own father's brother's son, a Nayar Congressman, was hospitalized after being beaten by an Ambalapuram Communist Christian, Ammini became subdued and hastened to tell me that her husband was not involved, and that "some outside people have bad customs and are giving blows without reason." She blamed it on alcohol, but from that day withdrew her support of the vendetta.

Similarly, neighbours and occupational companions, as well as kinsmen, often have reciprocal interests in helping each other out in emergencies, and personal friendships which override party. Moreover, most people simply do not wish to be at loggerheads with others most of the time. Parameswaran, an unusually affectionate and mild-mannered leader, prided himself that he had no personal grudge toward the younger lineage-brother who ran against him as Congress candidate for the ward. They greeted each other on footpaths and had never broken the pattern of mutual visits and help at life crisis. Visvanathan did stay away from his family for most of two decades, but in the end went home to make peace with his mother.

Present System Cannot Continue

Everyone, moreover, especially the panchayat board, has an interest in maintaining peace and at least trying to carry out public development projects. The panchayat board wishes to be re-elected; its members wish their panchayat to be a credit to them and a rival to other panchayats. They do not want to be accused of trouble making and continuous negativism. That is why panchayat board members always claim to outsiders that in their panchayat "party really does not matter" and that all of them represent the panchayat as a whole, rather than their separate party factions. In fact, of course, they do both, prosecuting the party conflict when it is a question of defending their own supporters, and co-operating for the panchayat when they need to wrest money from the government or to satisfy an impatient public. Parameswaran, for example, had a hard time explaining to his own followers, as well as the Congressmen, why two minor irrigation projects failed because of poor engineering. He is now struggling to persuade higher officials to finance some needed adjustments.

This does not mean that the present system in Kerala can continue indefinitely. My own impression is that the Communist period so deepened the existing class struggles and liberated propertyless people from their old ties of subordination, that traditional relations of private property, tenancy and wage labour cannot now be made to work harmoniously. Especially if the economy does not rapidly develop and spread its benefits, the poor will now, of their own initiative, sabotage efforts aimed at restoring the class-relations of pre-1957. The arrest of Leftist leaders will not, therefore, solve the political crisis in Kerala. Deeper measures, aimed to harness rather than repress the strivings of the common people, will be needed to bring this about.

(Concluded)

Around Bombay Markets

Dalal Street Makes New Low

Wednesday, Morning

DALAL STREET's initial reaction to the one per cent increase in the Bank Rate and the imposition of a 10 per cent regulatory import duty had been very mild. But it did not take long to realise that both these measures along with the increase in the railway freight rates would have a significant impact on corporate profits because of the rise in costs of production resulting from costlier credit and higher prices of imported components and raw materials. On second thoughts, market men also felt that the upward revision of the interest rate structure will make the yield on equities, which had never been really very attractive, look more unattractive than before thereby necessitating a reassessment of the outlook for equities.

Sellers predominated almost throughout the week and the market broke through its January 5 low and moved down fairly close to its important December bottom. While the decline in prices was caused mainly by anxious bull liquidation, bears too took their chance though they were not aggressive. The market was at its worst on February 22. Lower levels induced bear covering and some replacement buying and a small rally ensued at the week-end.

The rally appears to be essentially of a technical nature. How far this rally might go and whether this rally will develop into an important upward move will depend to a very large extent on the Central Budget due to be presented on February 27. The generally optimistic note struck by the Economic Survey for 1964-65, Government's concern about the poor state of the capital market and the Finance Minister's emphasis on the need for stimulation of private investment have raised hopes of substantial tax relief in the Budget. The belief is widespread that the Finance Minister will try his utmost to devise measures to restore confidence in the capital market. It is true that the subdued trend in the capital market over the past two years has not reduced the amounts actually raised by non-Government companies from the market. But this became possible mainly because of increased underwriting activity. With the public response to new equity issues inadequate to match the increasing demand, underwriters have had to take up substantial portions of the new equity issues with the result that the resources of various financial institutions have been considerably strained.

Fortunately, the budgetary position is not uncomfortable and the new 10 per cent ad valorem import duty alone is expected to yield about Rs 100 crores in a full year. But considering the Finance Minister's determination to do without deficit financing in the new fiscal year and also the pressing need for mobilisation of resources for the massive Fourth Plan, any undue optimism about tax relief in the coming Budget should be avoided. Moreover, from the point of view of the stock market, it is not merely the amount of relief that matters, far more important is the nature of tax relief. Fiscal concessions designed to promote corporate savings need not necessarily be conducive to a marked and sustained recovery on the stock market.

Cotton

Cold War Continues

THERE has been no important change recently in the situation obtaining in the cotton market. The cold war between the industry and growers and traders continues and its end is not yet in sight. Excepting Combodia and L 147, all other varieties of cotton are quoted well above the statutory ceiling. But the authorities entrusted with the task of administering price control remain virtually unconcerned about the open violation of the price control order. Nearly half the cotton season is through but no firm action has yet been taken to deal with the situation though it was quite early in November that prices had pierced through the ceilings. The Indian Cotton Mills' Federation has been unable to implement effectively its scheme of buying cotton at or below the ceiling prices through self-discipline because the Textile Commissioner has not cared to take any firm action against the erring mills; the scheme itself had no legal sanction behind it.

With the prices of Cambodia A and B of L 147 quoted below the ceilings, the Federation has relaxed restrictions of their purchases by the mills. These varieties are allowed to be purchased freely up to the end of March outside the purchase authorisation under the 8-point scheme. Excess purchases will, however, be adjusted in equal instalments in the mills' purchase authorisations in the four months beginning with April.

Reports that the issue of purchase authorisation for allowing import of American cotton under P L 480 is imminent have failed to affect the trend of cotton prices. It is not merely because the quantity involved is not very large—1.38 lakh bales are being imported under the proposed arrangement; foreign cottons will become costlier by Rs 150 to Rs 200 per candy because of the recent 10 per cent ad valorem import duty. Shipments of U S cotton under P L 480 are expected to reach the country some time in June or July.

A proposal to abolish the present ceiling and floor prices and to introduce in their place appropriate support prices will come up for discussion at a meeting of the representatives of State Governments, the trade, growers and the industry called by the Textile Commissioner and due to be held in Bombay on February 27. Cotton growers have always been agitating for the abolition of price control on the argument that the rise in cotton prices has been less marked than in other agricultural commodities and that this in turn is hindering an increase in cotton production. The trade is opposed to any kind of control for the simple reason that it restricts freedom of their operations. The industry too has never very strongly favoured price control over cotton because whenever a shortage has emerged it has been forced to purchase cotton above the ceiling prices. The Government's record in regard to the implementation of the price control order has been extremely disappointing. Opinion therefore is becoming increasingly in favour of the abolition of ceiling prices of cotton. Not many people, however, seriously believe that higher prices will bring about any improvement in cotton production, not without upsetting the programme of other agricultural crops in any case. A very thorough study of

farm accounts alone can provide an indication about the economic relationship between the prices of various agricultural crops. It is to be hoped that the Agriculture Prices Commission will give urgent attention to this problem.

Oilseeds

Steadier Tendency

THE oilseeds market last week displayed a slightly steadier tendency mainly because of the further strength in castor futures. The March contract in castor was bid up to Rs 209.37 (per 250 kgs) — the highest rate for several weeks. The rise in castor futures is due entirely to strong bull manipulation based mainly on the idea that bears will not be able to tender goods against their sales in March because of the premium enjoyed by the spot material. The time factor is no doubt in favour of bulls but the bulls might find it very risky to insist too much on deliveries because of the likely increase in the tempo of arrivals in coming weeks. The movement of the castorseed crop is beginning to pick up in Rajasthan, Uttar Pradesh and Bihar and spot prices have already eased from around Rs 43 to Rs 41.50 per 50 kgs over the past few days. This in turn has also had an unsettling effect on futures and the March contract itself has eased from Rs 209.37 to Rs 206 within two days. With export activity in castor oil at a standstill — shipments from Bombay since January 1 total only 36 tons so far — and overseas demand unlikely to revive in the near future because of the wide disparity between Indian and overseas prices of castor oil, it is difficult to take a bullish view of the outlook for castor. This is probably why the distant contract in castor — June delivery — is quoted at a discount of about Rs 12 per 250 kgs.

Linseed March moved irregularly between Rs 46.25 and Rs 45.62; the contract had touched a low of Rs 44.50 in the preceding week. The steadiness in linseed was due to the steadier tendency in groundnut oil which fluctuated between Rs 21.40 and Rs 21.70 per 10 kgs most of the time. The delay in the arrivals of soyabean oil from the US has led to increased demand for groundnut oil from vanaspati manufacturers. Now that soyabean oil will start moving in because of the end of the 32-day dock strike in the US, groundnut oil prices are unlikely to show any marked strength in the near future unless, of course, the Government lifts the ban on the export of groundnut oil and vanaspati. Hopes of a substantial decline in the prices of vegetable oils as a result of the supply of 75,000 tons of soyabean oil and 50,000 tons of mutton tallow by the US have been belied. This is partly because the price of soyabean oil itself has registered an impressive rise in recent months. Soyabean oil is not much cheaper than groundnut oil any more.

Export activity remains confined to groundnut extractions and cottonseed cake. Business has been going on in these two items on a satisfactory scale though there have been no important changes in overseas prices in recent weeks. Some business has also been reported in linseed extractions, the UK being the main buyer.

Business Notes

Associated Battery

OVER the past year and a half the price of lead has shown a sustained upward trend. Lead being a major raw material in the manufacture of storage batteries, the industry is naturally apprehensive of the high cost of imported metal at a time when both indigenous and export demands have markedly increased. Without satisfactory home production, manufacturers find it difficult to compete in export markets; such indigenous metal and scrap as are available cost nearly double the average world prices for similar metals. It is felt that lack of supplies of lead will endanger production of a wide range of essential manufactures.

The general industrialisation in India and the increased manufacturing programmes of motor vehicles and railway coaching stock have meant increased demands for batteries. In addition, keen demand for stationary batteries continues for telephone exchanges, railway signalling and electrification control systems and for emergency and control duties in power stations. Moreover, the various units now established to produce electrical industrial trucks have raised the demand for industrial batteries.

In the context of this situation, the factory of Associated Battery Makers (Eastern), a leader in the industry, has been working at high pressure with a view to achieving higher output by the increased use of automatic production facilities together with improvements in process methods and material usage. During the company's financial year ended August 1964, the lead recovery plant produced nearly a third of the factory's total metal requirements from lead scrap, and efforts are being made to increase further this contribution to meeting raw material requirements.

Despite rising costs, the year's results have shown a significant improvement. Sales at about Rs 3 crores have increased over the previous two years by 18 per cent and 32 per cent and trading profits of about Rs 69 lakhs by 28 per cent and 35 per cent, respectively. Both sale and profits for 1963-64 are the highest figures in the company's history. Despite the removal of the Super Profits Tax, the imposition of the Surtax and the new Super Tax on dividends has created a heavy tax liability which, as in the previous year, has syphoned off nearly 62 per cent of trading profits. Even then, after-tax profits are Rs 26.34 lakhs compared to Rs 15.70 lakhs previously. The dividend raised by 1.5 per cent to 16.5 per cent absorbs Rs 19.47 lakhs.

In his annual statement, H R Gregson, managing director, has pointed out that due to severely increased lead prices product costs have risen appreciably and that this has been brought to the Government's attention. If the raw material shortage is eased, the company has a very good future ahead. The management is taking steps to implement the scheme for increasing the output of automotive batteries. The company has already produced various new items including a special range of aerobatic aircraft batteries for the defence services. Additions to the range of injection moulded polystyrene battery and cell containers and other components have been introduced, and designs for certain special purpose batteries also progressed. Exports of batteries and components have also shown considerable improvement. Buoyant demand for the company's full production range continues.

Rallis India

DESPITE a sizable increase in production, Rallis India's profits for the year ended August 1964 have

Age is not all... nor the mere fact of survival on the frayed ends of tradition. Among the earliest promoters of a *concept* — that of self-sufficiency for our country through extensive industrialization, we have known no ingenious ways to overcome obstacles apart from flexibility in decision making, and regard for ordinary principles of management wedded to probity. If we are today a rational complement of industrial units, that is because of our reluctance to sit on the fence of the status quo — waiting for an overwhelming consumer demand to develop before being able to set our sights. And if we have a modest reputation of worthiness, we intend to live up to it through an optimum use of talents, available resources and initiative.

AGE IS NOT ALL...

AMONG THE COMPANIES IN THE MARTIN BURN GROUP ARE:

THE INDIAN IRON AND STEEL CO. LTD.: With an enviable record of production efficiency the million ton integrated steel plant at Burnpur is ready with another two-phase expansion programme to double its production capacity by the end of the Fourth Plan period. The largest foundry in the Commonwealth at Kulti is being steadily modernized and expanded.

A subsidiary, The IISCO-Stanton Pipe and Foundry Company Limited, recently inaugurated, has its brand new factory coming up at Ujjain for the manufacture of spun iron pipes and ancillaries directly for the benefit of consumers in developing areas.

BURN & COMPANY LTD., HOWRAH WORKS: Pioneers in foundry practice in India, in structural steelwork fabrication and the manufacture of rolling stock—the origins of the Company go back to the year 1781.

BURN & CO. LTD., REFRACTORY & CERAMIC GROUP: Apart from stoneware pipes and chemical stoneware, the works of this group—eight in number and located in four states—manufacture nearly all types of refractories to meet the requirements of India's steel industry, power undertakings, railways, ordnance factories—in fact, any industry requiring refractory material for the maintenance of furnaces.

THE INDIAN STANDARD WAGON CO. LTD., SANTA: The oldest Indian unit started for the specific purpose of manufacturing railway rolling stock—has been mainly responsible for building up the wagon building industry. Also manufactures springs, forgings, pressings and stampings for heavy industry as well as automotive springs and components.

THE HOOGHLY DOCKING & ENGINEERING CO. LTD. Established in 1819, the Company with its shipbuilding yard, dry dock and extensive workshops is geared to meet defence and civilian requirements, and to produce dredges to keep our new harbours and channels of inland navigation open.

ROBERT HUDSON (INDIA) LTD.: A premier concern in its own field, the Company devotes itself to all types of light railway engineering—has important connections with the mining industries.

RAILWAY COMPANIES: Some of the first feeder railways in India, with six systems in four states, still a great aid to suburban travel.

ELECTRIC SUPPLY COMPANIES: Pioneers again in the generation and distribution of domestic power in India serving a wide area in Uttar Pradesh and Madhya Pradesh.

THE VAUGHAN BURN CRANE COMPANY LTD.: A collaboration with The Vaughan Crane Company Ltd. of Manchester...Hand operated and electric overhead travelling cranes and chain pulley blocks.

REYROLLE BURN LTD.: A collaboration with A. Reyrolle & Co. Ltd., Hebburn, England—for the manufacture of specialized types of electrical switchgear of worldwide repute.

Lost Opportunity

THE Finance Minister apparently derives no little satisfaction from the fact that the Budget he has presented "holds every promise of being a balanced one — if not a surplus one— taking both the revenue and capital accounts together". He values this achievement particularly because he had to provide for a larger Plan outlay next year and at the same time give "a measure of relief in direct and indirect taxation". This claim needs to be examined.

First, the balance secured in the Budget is not due to a better performance on revenue account. The surplus on revenue account will be just Rs 4 crores larger than the revised figure for 1964-65. What has made the balance possible is a fortuitous receipt of Rs 191 crores on account of PL 480 deposits as against only Rs 11 crores in 1964-65 — a circumstance which, one fervently hopes, will not repeat itself.

Further, as the Finance Minister himself concedes, a part at least of the Government's long-term borrowing "represents deficit financing rather than the mobilisation of the voluntary savings of the people". In the past few years a not inconsiderable part of the market loans floated by the Government has had to be taken up by the Reserve Bank. In the current year, for instance, as against the net Government borrowing (market loans plus treasury bills) of Rs 178 crores, the Reserve Bank's holdings of Government securities seem to have increased by Rs 128 crores, after allowing for the substitution of foreign securities and balances in the Bank's portfolio by rupee securities. Thus 70 per cent of Government borrowing can be said to be actually deficit financing. On this basis, of the net Government borrowing of Rs 100 crores proposed in 1965-66 as much as Rs 70 crores could turn out to be concealed deficit financing. If this proves to be so, the Budget next year will not be really balanced. In any case, as argued above, even the present *apparent* balance has been achieved as a result of a purely fortuitous circumstance.

Turning to the Budget proposals, the Finance Minister has claimed that they are designed to erect in all its essentials the framework to meet the demands of the Fourth Plan. This framework, according to him, "must be consistent with our desire to harness every possible source of dynamism and enterprise — whether domestic or foreign, public or private — to the task of rapid economic growth". He acknowledges that in spite of the "several changes to reduce the severity of our corporate taxation" introduced last year, the feeling persists that "corporation taxation is high and that some of its features inhibit the progress of the corporate sector". What has he done to improve the situation? Principally, a ceiling of 70 per cent on income tax payable by public companies, addition of five industries to the list of industries liable to corporation tax at the preferential rate of 45 per cent and reduction of penalty tax rates on Section 104 companies. In addition, Parliament has been asked for executive powers to give tax credit certificates for increased production and exports. All these concessions taken together are not likely to cost the exchequer more than Rs 5 crores (apart from the loss on advance payments) on the Finance Minister's own calculation. Admittedly, it is difficult to say how far this will go to invigorate the corporate sector without a much more detailed examination of the concessions than is possible here, but one's first impression is that they add up to too little to produce any marked difference by themselves.

Let us take a look at the measures intended to give relief to companies. It is doubtful if the ceiling of 70 per cent will benefit more than a microscopic number of public companies. It is possible that in introducing this ceiling of 70 per cent, the Finance Minister was offering no real relief but just making a gesture to appease that vociferous section of the critics of the tax structure which holds that tax rates on companies are too high.

The extension of the list of industries subject to corporation taxation at the preferential rate is a move in the right direction as is the tax credit

on additional production. The items on which the tax credit will be available are yet to be specified, but the concession, if liberally extended, will certainly mean a substantial saving to beneficiaries. But it does not appear that the Finance Minister means to extend the concession liberally because in that event he will lose much more revenue than he is prepared to. The Minister could consider the suggestion that the tax credit on exports should be linked not to the total value of exports but to additional exports. If he does so, he will be able to offer a much larger tax credit, say around 50 per cent if not more, without losing more revenue.

And now we come to reliefs in personal income tax. There is no doubt that the reliefs, particularly the reduction in basic rates, go much farther than the reasonable expectations of most. The only sufferers in the process are bachelors and unmarried women with income falling between Rs 2,000 and Rs 3,000 a year because under the proposed new system they would be liable to tax. While thus the lowest income-tax-paying group will suffer, the benefit of the new scheme becomes greater at higher incomes. The 'simplification', let us face it, has been introduced only at the expense of progressivity.

The same applies to the change made regarding rebate on contributions to life insurance and provident fund. By allowing 50 per cent of annual contribution as a straight deduction, the tax-rebate may now be as high as 40 per cent to an individual approaching the highest rate of income tax whereas formerly the maximum rebate was restricted to 25 per cent, i e, the maximum of what was until now known as 'income tax'. This certainly is a type of change that ought not to have been introduced on the flimsy plea of simplification. Surely, the Minister cannot be unaware of the highly regressive character of this relief?

The additional wealth tax on urban residential property has been introduced with a view as much to raising revenue as to achieving "wider social purposes". The tax is to be levied at progressive rates rising from 1 per cent to 4 per cent but lands and buildings used for business or professional purposes are excluded. Will land and buildings rented out for residential purposes be included or not? If yes, will it not lead to attempts to raising rents? If not, will it not make a farce of the whole measure? The answers to these questions will, we hope, become clear as Parliament starts debating the Budget.

The overall impression that the Budget leaves is one of missed opportunities. Even if the reliefs in personal income taxation had not been given, the Finance Minister could not have really balanced the Budget. But it is difficult not to feel that a very considerable sum of revenue has been forgone fruitlessly. Could not the same amount of tax cut have been applied in a way better calculated to further the objectives the Finance Minister has set himself?

Left Communists after Kerala Election

RESULTS of the mid-term election to the Kerala Legislative Assembly have begun to trickle in as we go to press. Those known so far give the Left Communists the largest number of seats among all the parties, including the Congress. It is possible, though not likely, that ultimately the position may be reversed and the Congress may emerge as the largest single party, though without absolute majority. But the Left Communists are unlikely to be very far behind. The significance of this remarkable performance by the Left Communists, which is underscored by the unexpectedly good showing by the SSP with whom they had an electoral alliance, naturally extends far beyond the question of the shape of the coming Government in Kerala.

All the first and second rank leaders of the Left Communists, with the exception of E M S Namboodiripad, have been under arrest since January under the Defence of India Rules on the ground that they are pro-Chinese —in thought, speech and action—and, therefore, constitute a threat to the security of the country. The arrests were explained to the country in a 'broadcast to the nation' over the All-India Radio by Home Minister Nanda. Subsequently, leading members of the Government, including the Prime Minister, have justified the arrests in public statements in an attempt to educate the people on the activities of the Left Communists. Early in the current session of Parliament the Government tabled a brief document purporting to give a part of the evidence against the Left Communists which it had earlier refused to reveal. In the document the Left Communists were for the first time officially addressed by the term "pro-Peking". Of course, the Home Minister was careful to emphasise that the Government had in its possession much more evidence which it did not consider in the public interest to publish.

The arrest of the Left Communist leaders and the statements of the Prime Minister and the Home Minister were fully exploited by the other opposition parties ideologically and politically antagonistic to the Left Communists—not least by the Right Communists led by Dange. Their alleged anti-national character and activities naturally constituted the principal plank in the attack on the Left Communists by the other parties in the Kerala election campaign. It was against this near-comprehensive, highly powerful and politically very active opposition that the Left Communists contested the election with 74 candidates, 30 of whom were in jail and so were prevented from participating in the campaign. In contrast, the Congress contested all the 133 seats and the Right Communists 76. At the time of writing, news agency reports show the results from 108 constituencies of which the Left Communists have won 35, Congress 33 and the Right Communists one! Among the Left Communists returned are a number of those in detention.

In the context in which the election was fought, the implications of the victory of so many Left Communists are obvious. Before the election the Home Minister had often expressed the confident hope that the people of Kerala would reject the Left Communists and thus vindicate the Government's punitive actions against them. It is hardly necessary to await the results from the remaining 25 or so constituencies to state categorically that such vindication has not been forthcoming. Will the Home Minister accept this or will he exploit the immunity granted by the Emergency and the Defence of India Rules to ignore public opinion so unequivocally expressed?

Weekly Notes

Will Gold Bonds Click?

THE Finance Minister was not exactly revealing a secret when he admitted in his Budget Speech that the Gold Bonds issued in November 1962 in the wake of the Emergency after the Chinese aggression had flopped. The Bonds had then been issued, in the first instance at least, with little to commend them to the economic calculations of the people. It was assumed that people with gold would buy them out of the patriotic urge to help the Government to pay for urgently-needed defence imports. This hope, as it turned out, was sadly disappointed and, on the Finance Minister's own admission, the collection of Rs 8.61 crores during the three and a half months the Bonds were open to subscription (November 12, 1962 to February 28, 1963) "did not come up to expectations". Why then has the Government decided to float Gold Bonds once again, particularly when the new Bonds are not more attractive than the old ones in any respect, except one relatively trivial one? The new Bonds will carry interest at 7 per cent instead of at 6.5 per cent. Surely, the Finance Minister does not expect that this slight increase in the rate of interest, which is in fact offset by the general rise in interest rates in the economy since the last issue, will make all the difference between failure and success of the Bonds?

No, he does not. When the old Bonds were floated, there was a free market in gold where one could get about Rs 109 per ten grammes against the rate of Rs 53.58 — the I M F rate — at which Gold Bonds were offered. It was only on the day following the floatation of the Gold Bonds that forward trading in gold was banned and it was not till January 10, 1963 that the Gold Control Rules were promulgated under the Defence of India Act. The Rules required all those possessing non-ornament gold in quantities in excess of a prescribed limit, to declare their possessions and also banned trading in gold. The free market in gold thus came to an end formally, leaving the Gold Bonds the only legal outlet for those who wanted to dispose of gold. It is difficult to be sure, but there is some evidence to show that perhaps subscriptions to Gold Bonds picked up somewhat in the period between January 10 and February 28, 1963 when subscriptions to the Bonds were closed.

Of course, the improvement could not have been particularly marked since the enforcement of Gold Control was never particularly effective. The amount of gold declared during the period fixed for declaration was microscopic — worth about Rs 8.15 crores at the international price, according to the Report of Informal Group on Gold Control. Nor did even trading in gold come to a stop. A black market flourished, functioning fairly openly with even "unofficial" prices published in the newspapers. The prices were higher than earlier, naturally, in view of the risks of detection and punishment.

The clandestine market in gold continues and, in fact, the "unofficial" price of gold is reported in the newspapers to have risen to as high as Rs 120 per 10 grammes following the floatation of the Gold Bonds. Ironically, perhaps this augurs well for the Bonds since the new demand for gold in the black market is said to come from those who want to convert unaccounted money into gold for investing in the Bonds. Since no questions are to be asked about the gold presented for subscription, subscribers to Gold Bonds would be moved by two motives, principally. First, those who have undeclared gold, the possession of which is illegal and punishable, and who have now got cold feet might surrender it for the Bonds. Second, those with unaccounted money may find it worthwhile to buy illicit gold for conversion into Gold Bonds instead of taking advantage of the new proposal for declaration of unaccounted wealth. Since the tax on such declared wealth is fixed at 60 per cent, it can be calculated that at a certain price of gold this may involve a smaller loss than straight-forward declaration.

The point is that both these predominant motives for subscribing to Gold Bonds will be the stronger the greater the risk of detection of undeclared gold or unaccounted money. From this point of view, the ideal climate for floating the Bonds would have been after an intensive and widely-publicised drive to bring out illegal gold and other wealth. While effort in this direction has been no doubt stepped up recently, it would be too much to claim that there exists in the country today the psychological atmosphere which would impel tax-evaders and illegal holders of gold, particularly the big and the influential ones, to accept the very considerable losses which both subscription to the Gold Bonds and declaration of unaccounted money involves. It is to be hoped that during the three months that subscription to the Bonds will be open, the Government will continue and indeed step up its efforts in this direction. Without that the new Gold Bond scheme may not do much better than its predecessor.

Inducement to Change Colour

THAT the Finance Ministry was working on a scheme for voluntary disclosure of unaccounted wealth was known for some time. The scheme has now been outlined in the Budget. Any person (or company) can surrender 60 per cent of such wealth to the Reserve Bank and credit the remaining 40 per cent to his (or its) accounts after informing the income-tax department. If the surrender is effected by March 31, the rates would be 57 per cent and 43 per cent, respectively. Those who cannot surrender 60 per cent cash immediately can furnish a bank guarantee for six months. No further questions would be asked by the department in relation to such disclosure.

The Finance Minister himself has recognised that this scheme is unfair to the honest tax payer but he has to give an opportunity to those who wish to break away from their past, as a prelude to more vigorous tax enforcement. The Budget takes no specific credit for collections from this source. How successful the measure would be in diverting wealth from surreptitious and less productive channels into productive investment is a matter of conjecture. Leaving business psychology and behaviour aside, there is, first of all, the procedural hurdle that the Finance Bill (clause 68 deals with the scheme) will take quite some time to get through Parliament, perhaps not till the end of March. Second, a cash payment of 60 or 57 per cent of accumulated wealth is not easily made, nor are bank guarantees available for the asking. Assuming that the errant tax payers are sud-

denly overcome by remorse, they could sell ornaments and put the gold in the new gold bonds, but how will they find ready customers for real estate or suddenly forsake their *benamidars* with a long record of fidelity?

It has been suggested that the 60 per cent tax is too high. But, then, the black money (except the currency notes hoarded by the less enterprising or more timid) has been earning interest at *bazzar* rates all this time and the disclosure would, in any event, pertain to marginal income in the highest ranges where it would normally have been taxed at a higher rate.

A similar scheme to encourage disclosures of black money was proposed in the late forties under the supervision of Mahavir Tyagi when he was Minister of State for Finance. Roughly Rs 23 crores were then collected. True, things were more difficult for the authorities then. War fortunes had been salted away in princely states, the income tax authorities had much less powers and the Income-tax Investigation Commission had been struck down by a Supreme Court judgment. Now tax evasion is admittedly more risky.

If the present scheme is a success, trade, industry and the market could be relieved of many strains which have been undermining their stability and business practices. Whether it succeeds or fails, a few hundred evaders prosecuted and jailed are an absolute necessity. It would be interesting to know in this context, how many prosecutions have been launched since evasion became a criminal offence?

Tax Credit on Exports

ONE cannot say yet whether the export rebate granted in the Budget is a substantial one or not, for only the maximum rate — 15 per cent of the value of goods exported—has been specified yet. But it marks an important departure from export incentives granted by the Finance Minister hitherto, insofar as it is no longer necessary for an exporter to make profits or pay tax in order to earn the rebate. The "tax credit certificates" will be issued to exporters of commodities to be specified, and the value of the certificates can be set off against the tax liability arising in the year. If their value exceeds the tax liability, the balance will be refunded to the assessee. The concession, therefore, amounts to an unconditional export subsidy.

By taking a commodity-by-commodity approach, the Finance Minister retains the freedom to adjust the subsidy to the supply and demand conditions of particular exports—a possibility which he ignored when he imposed the 10 per cent surcharge on imports a fortnight ago. It is to be hoped that the Minister will now direct some effort towards finding out which commodities are worthy of subsidy and why. In fact, he should have done so long ago and announced the rates of subsidy in the Budget; as long as they are not announced the scheme will not stimulate exports.

The new scheme is superior to the other two existing schemes of drawbacks on imported materials and import entitlements insofar as it would not induce unintended distortion of the industrial structure. Both drawbacks on materials imported for use in exports and import entitlements are attractive to industries that need foreign exchange for materials or equipment; they thus tend to favour import-dependent industries. They probably do increase our net foreign exchange earnings in the short run; but industries that grow up under such schemes are hardly going to be starved of foreign exchange whenever their exports fall. We have built up more import-dependent industries than we can afford, and any measures that encourage their growth must be frowned upon. The new export incentives are free from this fault, and an excellent beginning for a long-term policy of export promotion.

So Many Deficit Budgets

SIZEABLE deficits in spite of buoyancy in revenues characterises almost all the State Budgets for 1965-66 presented so far. In certain cases, the deficits are large enough to cause concern. West Bengal, for instance, shows a deficit of Rs 17.63 crores, and U P of Rs 14.91 crores. Bihar's deficit is even larger at Rs 38.94 crores and the State Finance Minister proposes to do nothing to cover even a part of it—a fact which is hardly in keeping with his passionate affirmation that the "execution of the development plan is a problem of life and death for us and the final purpose of our efforts".

The States are obviously living beyond their means. This is a matter for concern since 1965-66 marks the climax of the efforts to fulfil the Third Plan; it is also a precursor to the "more complex and sophisticated tasks" of the Fourth Plan. But, clearly, the Budget performance of the State Governments has not been consistent with the "important role in strengthening fiscal and monetary discipline" which the Central Finance Minister ascribes to them. It will be recalled that when the Planning Commission approved the annual programmes of the States for 1965-66 the States had promised to mobilise financial resources to the maximum extent possible. The series of deficit Budgets which have been just presented show complete disregard of this undertaking as well as scant regard for the Central Finance Minister's exhortation that "there will be no more deficit financing".

The failure of the States to raise adequate resources is pointedly revealed by the fact that in the last year of the Third Plan the Centre will provide no less than Rs 650 crores of the Rs 1,027 crores which is the estimated aggregate expenditure by States on the Plan during the year. The revised estimates of loans and advances from the Centre to States in 1964-65 also show an increase of Rs 85 crores over the Budget estimate of Rs 605.80 crores. If, therefore, this experience is any guide, 1965-66 may close with Central assistance to the States substantially exceeding the Budget figure.

The future of State finances is thus not a little bewildering. With increasing debt charges, fast rising revenue expenditure and consequent large budget deficits, how do State Governments expect to shoulder the heavier burdens in the offing?

A review of the growth of the States' financial dependence on the Centre during the 15 years of planning presents a sombre picture. In the First Plan the Centre contributed 30 per cent of the States' Plan expenditure. The proportion rose to 50 per cent in the Second Plan and is expected to be well over 65 per cent in the Third Plan. As against the Third Plan target of additional taxation by the States, of Rs 610 crores the States' achievement is not likely to exceed Rs 500 crores—this during years of near-inflationary conditions. Not surprisingly, the Union Finance Minister has emphasised the need to persuade the States to review their financial position. The urgency of the task is obvious from the fact that of the eleven States which have presented their Budgets for 1965-66 at the time of writing only Madhya Pradesh has actually proposed new taxes. In UP the Finance Minister has promised that he would announce new taxes to raise Rs 7.50 crores in "due course".

How the States neglect their potential for raising tax revenue in the scramble for Central bounty is best illustrated by their failure to make the rural sector contribute, even to an inadequate extent, to financial resources for development. Many States have yet to impose a tax on agricultural incomes. The failure is particularly glaring in the case of States like Andhra, in parts of which relatively well organised, commercial agriculture has made considerable headway. Even in States which have an agricultural income tax, its administration has been far from effective — a fact which is amply reflected in the receipts from the tax. What is true of the agricultural income tax is no less true of other possible measures to tap the rural sector for resources.

The unwillingness of the States to impose taxes is particularly significant considering that the Fourth Finance Commission is currently engaged in its labours. No doubt the States feel that large uncovered deficits will strengthen their case for larger shares of Central taxes. This tactic is implicit in the Budget speeches of the Finance Ministers of Bihar, U P, Orissa, Madhya Pradesh and Gujarat. But their counterparts in Maharashtra, West Bengal, Mysore and Madras have shed all inhibition and made a straight-forward plea to the Finance Commission to allocate them larger shares of Central taxes. The budgets of the latter States look very much like memoranda to the Finance Commission.

Development Banking and Planning

AT a time when planners and planning are both at a considerable discount for their alleged contribution to the malaise in which we find our economy today — both internationally as well as internally — it is refreshing to read a handsome, though restrained, tribute to planning from a notable champion of the private sector. The tribute comes from G L Mehta, Chairman of the Industrial Credit and Investment Corporation, in his statement to the shareholders of ICICI. Even apart from his rich previous experience in many other fields, his long association with ICICI, which has now completed the first decade of its existence, places G L Mehta in a vantage position. Fairly early in his statement, he states quite clearly that "planning has helped the economy to grow at a fairly rapid pace and in a reasonably orderly manner". This is soon followed by encomiums for three other achievements — planning has led to the setting up of several non-traditional industries; under planning, several new entrepreneurs have been induced to enter industry; and, lastly, planning has helped to decentralise the location of industry.

But planning has had also certain limitations; the operations of the ICICI have made it acutely aware of them. Thus price and distribution controls on many essential commodities like cement, sugar and paper, have severely reduced investment interest in these industries and their ability to generate internally sufficient funds for expansion, leading to a "perpetuation of the shortage which initially brought about price controls". Second, the Government's insistence that industries should follow a phased programme of manufacture has placed a great strain on several industries, particularly as economies of scale in different lines of manufacture vary. A phased programme, says G L Mehta, necessarily depends upon co-ordinating several manufacturing activities, and where one of them lags behind for any reason, it upsets activity elsewhere. Third, the failure to meet the increasing demand for maintenance imports as industrialisation gathers momentum in particular sectors has resulted in under-utilisation of capacity. Fourth, the economy has suddenly come face to face with unbalanced growth with shortages in respect of some goods and surpluses in others. G L Mehta feels that the latter in particular indicate that demand assessments made by planners in many cases have been too optimistic. Lastly, he has complained about the increasing complexity of the mechanism for procedural controls associated with planning.

These are highly pertinent observations, even if G L Mehta's diagnosis or his remedial prescriptions may not meet with approval in every case. Thus it is true that price and distribution controls in many sectors have lost the justification they had at some earlier time. There is need, therefore, for a constant review of these controls. But there are even then likely to be some sectors where such controls have to be continued for protecting particular classes of consumers, which includes also the Government in a situation like ours. And, surely, one of the major benefits that a development bank

Revised Subscription Rates

WITH effect from March 1, 1965 the price of THE ECONOMIC WEEKLY is raised to 75 Paise. Correspondingly the annual subscription is Rs 36 in India, Pakistan and Ceylon. The half-yearly subscription is Rs. 20. Foreign annual subscription rates are £3 10s and $10.

For the last 16 years, the price of THE ECONOMIC WEEKLY has been maintained unchanged in spite of heavy increases in costs. Circumstances beyond our control have compelled us to take this step and we hope readers will continue to extend to us the same patronage as in the past.

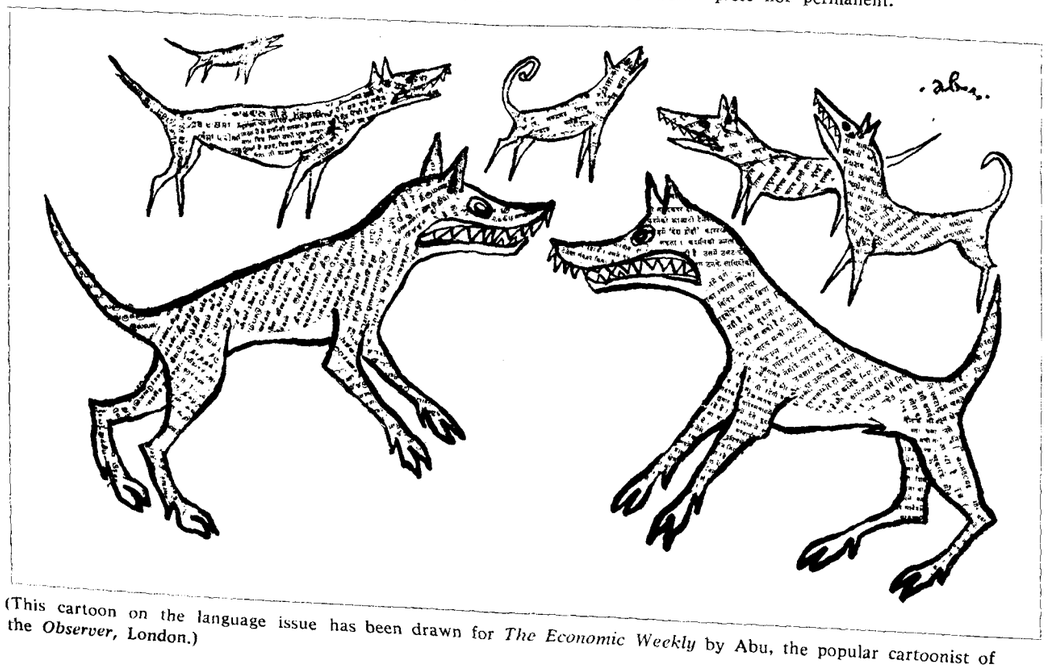
like the ICICI may confer on a developing economy is to facilitate the flow of funds to such sectors?

To complain that planners have been over-optimistic in their assessment of future demands in certain sectors, is, perhaps being less than just to them. Projection of demand, particularly where a number of basic series of statistics are just not in existence and where it is to be made for an economy in which the benefits of industrialisation are just beginning to permeate into the countryside which contains almost four-fifths of the total population, is, in any case, a formidable task. But it would be worthwhile to find out how far the surpluses that have emerged in the case of some commodities are not due to the failure of production to increase according to the programme adopted in certain other sectors. Railways, for instance, have had surplus capacity in the current year largely because they did not have to carry the ores and coal and other materials which they would have had to if the Bokaro steel plant had not been so unfortunately delayed.

The Communist Divide



THE Russian-sponsored conference of communist parties began in Moscow on Monday with some very conspicuous absentees. Of the 25 parties invited, those of China, Japan, Indonesia, Albania, Rumania, N Korea, and N Viet Nam have chosen to stay away.

The idea of calling this meeting, officially designated a 'preparatory meeting' for a future 90-nation World conference, had originated with Khrushchev. The Soviet leadership which took over after his dismissal decided to go through with it presumably to emphasise the continuance of Soviet policy on the vital issue of differences within communist movement. Yet, it needs to be noted that the Russians are represented at the conference not by Brezhnev, the Soviet Party Secretary, but by the theoretician Suslov. In fact, most countries present are represented by second rank delegations. The notable exception to this is Cuba which is represented by Fidel's brother, Raoul Castro.

The professed aim of the proposed world conference, for which the present conference is supposed to prepare the ground, is to restore unity in the international communist movement. But, in fact what even this preparatory meeting has done is to make the present alignments in the communist world clear. The Chinese have made it obvious enough that they are not terribly concerned with communist unity for the moment. They deliberately chose the day the Moscow conference opened to make a sharp anti-Soviet attack through the *Peoples' Daily* which accused the Soviet communist party of hypocricy in "working for a real split". And as the Moscow conference got going, the Chinese were playing host to President Ayub Khan apparently uninterested in the proceedings in Moscow.

Apart from China there are the other, not unexpected, empty seats at the Moscow conference. N Korea and N Vietnam want to offend neither Russia nor China and presumably they felt it was less risky to be absent than to attend the Moscow conference, as it is necessary for them to appease China just now in the critical situation created by the American attacks on N Vietnam. The absence of the Indonesian delegation was expected since the Indonesian communist party is among the most staunchly pro-Chinese parties. The Japanese communist party has also been veering towards China. In any case, it has nothing to lose from a cautious policy of waiting and watching.

But the most significant absence at Moscow is, of course, Rumania's. Even in Eastern Europe, this seems to indicate, the Russians can no longer be sure of total commitment. The East European communist parties have found that the Sino-Soviet split leaves them in a highly favourable position, with far greater freedom to pursue national ends than they ever had. Rumania has openly disregarded the Moscow conference, but even among those present acquiescence in the Soviet line is likely to be neither complete nor permanent.

Beguiling Budget

Romesh Thapar

I WAS in Bombay as the budget details trickled in. Much excitement had prevailed all Saturday afternoon. By and large the betting was that a rather battered TTK, nursing the still raw wounds of the language agitation inflicted on the Congress Party, would produce the kind of fiscal balm which would lessen the tension of various elite groups in the North and the South. Stock-marketeers seemed to be confident and optimistic all over the country, a strange effervescense considering the imposts announced skilfully before the budget and the picture sketched by the Economic Survey prepared by the Finance Ministry. An unreal boom atmosphere was being engineered — and the speculation in scrips reflected it.

Speculators Disappointed

The bubble burst as TTK read out his speech in Parliament. Not a single assumption seemed to hold. True, the tax on personal income had been reduced, a most unexpected development. But, said the speculators, it was unlikely to cheer the markets because there were no parallel incentives offered to encourage the monies saved to seek out profitable investment in scrips. Yes, there was the offer to legalise 'black money'. Could this create the longed-for boom conditions by pulling considerable funds into open circulation? Unlikely, for these still illegal funds are already somewhat 'integrated' into legal deals and the reluctance to expose oneself to the future attention of income-tax officers will persist. Then what? Will the present investment paralysis continue?

No one takes the trouble to study the statistics which point to an increase in last year's total private investment in industrial development. No one attempts to analyse this increasing investment or to determine the point at which new industrial floatations will not be able to depend almost totally on the underwriting operations of the sponsors. No one bothers to detail the effects that investment apathy can have on development in a 'free' mixed economy which is also becoming increasingly dependent on foreign aid and direct foreign capital investment.

The Finance Minister imagines apparently that the problem is brought nearer to a solution because a tax on urban property has been imposed, 'forgetting of course that, if necessary, middle class capital can move easily to non-taxable agricultural farms on the outskirts of our cities. What with industrial establishments being offered tax concessions should they chose to move out of town, and the possibilities of living-it-up in luxury farm houses, we may well be on the verge of spawning a new class of privileged citizens!

Extraordinary Budget

But, seriously, it is an extraordinary budget for a society that claims to be socialist, is in a serious economic-cum-political crises and needs to be roused from its stupor. That this very upper class budget should cause temporary confusion even among those whom it benefits only goes to show that outside the government the industrialists, businessmen and entrepreneurs expected a more decisive shift towards capitalist development. They cannot understand the inhibitions of the ruling party particularly at a time when no opposition of any consequence can be mobilised. This, they believe, is the time to push ahead —and leave socialism behind.

As always, the captains of the private sector show themselves to be hasty and immature. In their passion to bury the Nehru Era, they are blind to the remarkable ability that TTK has shown in steering the country towards a system which they would control and manipulate. This process has been going on for some time now. The present budget marks a major step forward. But we continue to be 'TT-lated'—that is, persuaded to accept his carefully disguised fiscal formulations as an essential part of the difficult and ramified business of implementing socialism in a democratic setting. And if climatic conditions help food prices to fall somewhat by the end of this year, the 'TT-lation' will increase.

Seldom have established economic and social objectives been abandoned with such *finesse*. The performance is worthy of the Bharat Ratna. Compare it with the awkward honesty of simple Shastri. Only the other day, in Parliament, he was explaining the need to permit foreign capital a controlling interest when necessary in certain industries. Jawaharlal Nehru was quoted out of context in support. Not a protest was voiced. Then there is Sanjeeva Reddy, the Steel Minister. Having presided over the destruction of the Indian designing and engineering of Bokaro, and blessed the system of 'turn key' collaborations, he now croons about his plans to give Indian engineers and designers the chance o show their talent. He, too, is heard in silence.

Clear Pattern

A fairly clear pattern is emerging. In the absence of strongly institutionalised support for socialist action, the striving within the ruling party for a capitalist path of development is becoming more open, more vocal. The planning machinery will also be made to serve this end despite the theorising of its leading elements. And foreign capital will enter to consolidate the trend, to push up the growth rate. Already, in the offices of the Secretariat the 'TT-lated' claim that all India needs to do is to study the Japanese model!

No embarrassment is expected from the Foreign Office. Swaran Singh is expected to make all the expected noises, but with a 'low posture' *a la Japan*. Probably, V K Krishna Menon will be paraded as a vital element of the Indian image for the Afro-Asians, and Vijayalakshmi for the Anglo-Americans. If the Russians get anxious, Indira Gandhi will be despatched to reassure them. This is non-alignment with new notations, a policy which it is expected will keep India 'respectable' until the point of economic take-off is reached. Then, who cares what the backward world thinks!

To dismiss this logic with a sneer would be a mistake. It looks primitive, and could be applied rather crudely, but it is being fashioned by men who have shown themselves to be more expert than their socialist opponents in the country. Those within the leading organs of the Congress Party who thoroughly disapprove of the policy trend which is now visible are unable to unite around a nationally-accepted

leader or a relevant centre of power. Were the socialist and communist parties more united and active, this development within the Congress Party might have become possible. I say 'might', because it is the purpose of 'TT-lation' to prevent such an eventuality.

The feeling in political circles in the Capital is that TTK will announce 'incentives' from time to time. He does not believe in revealing his hand all at once. Budget-time next year will mark the break with 'socialist dogmas'. It will be the pre-election budget when even the leftists accept the need to be soft with those who have the money. Then, it will not be necessary to indulge in 'TT-lation'.

More than ever before, the task of making clear the implications of the policies now being adopted falls on the economists and political scientists assisted by other thinking elements. Too long have they been silent, separated one from the other. If the response does not develop, then the younger elements will have to stir—those who have not been absorbed by the Establishment. The task looks forbidding. Confusion is widespread. A focus of action has to be located. But the job has to be done.

From the London End

Another Dose of Deflation?

THE shape of the coming budget is a subject which is exercising the minds of many people, and as usual there is a spate of pre-budget advice. The perennial problem that faces Britain is whether, in the face of her balance of payments difficulties, she is in a position to go ahead with active measures to build up the economy without damaging even further her balance of payments. If home demand sucks away goods which should be boosting the export market and improving the balance of payments, the deflationists argue, deflation at home to restrict demand is the only possible solution. The expansionists, on the other hand, have argued that the "stop-go" policies in the last 13 years have only served to deepen Britain's economic problems, and without a thorough overhaul of the economy and a determined effort to increase production, Britain will never break out of the vicious circle which at present dominates her economy.

Callaghan Vs Brown

In the popular press, the problem is often discussed as one of a personal conflict between Callaghan at the Treasury, whose advisers take, in general, a deflationary view, and George Brown of the Department of Economic Affairs, whose very job was created to galvanize action to ensure the rapid development of the British economy and initiate a drive to modernise and increase industrial efficiency. Naturally, the main object of this Department is to push for rapid economic expansion. One of Harold Wilson's ideas in creating this new Department was to bring some measure of balance against the traditional Treasury viewpoint, but all indications seem to be that the argument will now be won by the Treasury. The main question remaining to be decided is how deflationary, in fact, the budget will actually be.

In these circumstances, one of the main worries of Brown's Department is to try and ensure that such deflationary measures as are introduced do not make even more difficult the problem of regional development. While in the south-east part of the country the economics may be overheated, the unemployment figures in many parts, particularly in the north, show that what is needed here is not a dose of deflation but a shot in the arm for industrial expansion.

The point of view taken by the Department of Economic Affairs is that there is a distinct possibility that there will be an automatic slackening in the present rate of industrial production some time in the autumn. This will result, according to the Department, from the delayed effects of the budgetary measures announced last November, and from a drop in industrial investment because of flagging business confidence. These will be intensified by the cumulative impact of the credit squeeze. Thus, if there are any substantial new deflationary measures in the budget, the economy will be pushed into a quite unnecessary and sharp recession in 1966. Yet the overall balance of payments position reflects only too clearly the tragic dilemma that faces the British Government in trying to promote economic expansion while avoiding another sterling crisis.

Support for a "Tough" Budget

Lord Cromer's controversial speech on the need for drastic reductions in Government spending has already made quite a stir. The latest review of the National Institute of Economic and Social Research comes down quite firmly on the side of the Treasury and bank economists who have been advocating a tough budget next year. The main point of the Institute's review is that the improvement in Britain's balance of payments must be the overriding aim of Government policy, and the only way this can be achieved is by higher taxation. This is believed to be imperative in view of the weakness of the U K's gold and dollar reserves. It is true that in January the reserves stood at £821m but much of it was borrowed from the International Monetary Fund and foreign central banks. The main conclusion of the Institute is that even when confidence in sterling returns to "normal", Britain in the next three to five years will be faced with repaying loans of between £400m and £450m. The Government should aim to eliminate this deficit by 1966.

In analysing the situation in Britain, the Institute believes that on present policies, British output and capacity might grow at the current rate of about 3½ per cent and unemployment remain at a little below 1.5 per cent. Even with a spurt in exports, the balance of payments will still be in deficit by about £350m a year by the middle of 1966, and since the Government is likely, on present showing, to abandon import controls by the end of the year, some other way has got to be found to close the gap.

On the subject of economies in overseas expenditure, the Institute suggests that it might be possible to save about £100m, leaving a balance of some £200m to be found from some other source. The only solution that the Institute can suggest in these circumstances is a cut in home demand on productive resources by £200m. A further increase in income tax, or the use of the regulator to increase pur-

chase tax and other indirect taxes are mentioned as means by which this could be done.

Cuts in Overseas Spending

There are some, however, who question whether it would not be possible to make greater cuts in Government overseas spending which certainly contributes to Britain's balance of payments difficulties. The Defence White Paper has made it quite obvious that no drastic cuts will be made here. Indeed, the arms budget has gone up to the record figure of £2,120m and nothing has been done to cut down overseas military bases. But surely some greater economies could be achieved in Government overseas spending and private overseas investment above the £100m figure suggested by the Institute. At present this accounts for some £700m a year, but it appears unlikely that drastic cuts in this field will be made.

Judging by statements from Labour Party leaders, the ground is being prepared for a tough budget. In his recent broadcast, the Prime Minister spoke of the "tough" measures that would be needed to put Britain's economy on its feet, and in his last public speech before the budget made towards the end of February, the Chancellor of the Exchequer gave a clear hint that the budget was definitely going to be deflationary, although he went out of his way to give a reassurance that whatever degree of deflation was imposed, it would not be drastic and would certainly not be on the scale of 1961.

Where the tax burden is going to fall it is difficult to see, and the Federation of British Industries has added its mite of advice to the Government by publishing a booklet containing the views of the Federation on the forthcoming budget and Finance Bill. This gives a sharp warning on the adverse effect on investment decisions caused by the "many uncertainties" still surrounding the proposed corporation tax. The report suggests that balance of payments weakness will best be remedied "by encouraging industrial investment and recasting the tax system so as to bear less heavily on incomes and profits".

It, therefore, seems likely that the budget, when it does come, will show an increase in taxes, not only to cover the promised social benefits which the Labour Party was elected to ensure, but also in order to protect the balance of payments.

Martin Burn Limited

NOTICE

THE Annual General Meeting (being the Nineteenth Ordinary General Meeting) of the Company will be held on Friday, the 26th March, 1965 at 11 A.M. at the Registered Office of the Company, 12 Mission Row, Calcutta, to transact the following business:

1. To receive and adopt the Audited Accounts for the year ended 30th September, 1964 and the Directors' and Auditors' Reports thereon.
2. To declare a final Dividend and to confirm the payment of interim dividend paid on 1st October, 1964 on the Ordinary shares in the Company.
3. To appoint a Director in place of the one retiring.
4. To appoint Auditors and to fix their remuneration.

Special Business

5. To consider the re-appointment of Mr Saradindu Gupta as a Managing Director of the Company for a further period of four years with effect from the 1st May, 1965 and in this connection to consider and if thought fit to pass with or without modification the following resolution which will be proposed as an ordinary resolution:

"That pursuant to Section 309 of the Companies Act, 1956, this meeting approves the re-appointment of Mr Saradindu Gupta as a Managing Director of the Company with effect from the 1st May, 1965, on the terms and conditions contained in an Agreement dated the 29th January, 1965 and made between the Company of the one part and Mr Saradindu Gupta of the other part a copy of which was laid on the table and signed by the Chairman for the purpose of identification."

6. To consider the appointment of Sir Narayan Raghavan Pillai as a Managing Director of the Company for a period of one year with effect from the 1st March, 1965 and in this connection to consider and if thought fit to pass with or without modification the following resolution which will be proposed as an ordinary resolution:

"That pursuant to Section 309 of the Companies Act, 1956, this meeting approves the appointment of Sir Narayan Raghavan Pillai as a Managing Director of the Company with effect from the 1st March, 1965, on the terms and conditions contained in an Agreement dated the 29th January, 1965 and made between the Company of the one part and Sir Narayan Raghavan Pillai of the other part a copy of which was laid on the table and signed by the Chairman for the purpose of identification."

The Ordinary Share Register and Transfer Books of the Company will be closed from 16th March, 1965 to 26th March, 1965, both days inclusive.

A member entitled to attend and vote at the meeting is entitled to appoint a proxy to attend and vote instead of himself and a proxy need not be a member.

By Order of the Board,
L K SEN CHOWDHRY
Secretary.

Registered Office,
12, Mission Row,
Calcutta-1.
1st March, 1965.

NOTE — The Dividend, if sanctioned, will be paid on or after 1st April, 1965, to those shareholders so entitled whose names appear on the Company's Register of Members for Ordinary shares on the 26th March, 1965 or to their mandatees.

An Explanatory Statement annexed to the convening notice as required under the Companies Act, 1956, has been forwarded to the members of the Company.

Book Review

The Atlantic Economy in the Fifties

Ashok V Desai

Economic Growth in the West by Angus Maddison; The Twentieth Century Fund, New York, 1964; pages 246, £ 4.50.

THE two questions Angus Maddison has tried to answer are: why have the countries of Western Europe and North America achieved higher growth rates in the 1950's than in earlier recorded history?, and why have some of them increased their national product faster than others? He has not got the answers but in the process he has written a highly interesting economic history of the Atlantic economy in the fifties.

Maddison's framework belongs to the economies of 1950's. He believes that there is a certain stock of technical knowledge available all over the world: "In modern conditions there cannot be widely varying degrees of technical advance due to differences in technical knowledge" (p 88). For the technical advances to raise labour productivity, it is by and large essential that they should be embodied in capital equipment; hence new investment will raise output per head (presumably without an increase in the capital-output ratio). The scope for raising productivity by investment depends on how far productivity is below the known best-practice levels in the world as well as on the rate of improvement of the best techniques; so the response of labour productivity to a rise in capital per head will be higher in countries with low output per head. Differences in the rates of growth of per capita output are therefore due to differences in the rate of investment.

Besides this possibility of increasing output per head by raising capital per head without changing the capital-output ratio, Maddison envisages movements along production functions—i e, possibilities of raising output per head by an increase in the capital-output ratio. Here he runs into heavy weather. Referring to capital widening he says: "If the initial ratio of capital (per employed person) is 2.5, an increase of 1 per cent in the employed labour force will require investment of 2.5 per cent of the GNP" (p 91). It is no use wondering whether this 2.5 is tons, miles or gallons: it is the capital-output ratio, not the capital-labour ratio. Further, the gain in productivity due to capital widening (i e, proportionate increases in capital and labour inputs) is supposed to be due to technical progress, whereas that due to capital deepening (i e, faster increase in capital than in labour) is due to the use of existing technical knowledge (pp 91 and 93). This distinction is unjustified: on the assumption of universal availability of technical knowledge, all improvements other than those in the world's best techniques must be made out of existing knowledge. There should be little scope for "technical advances" in Western Europe, which can live for many years on American patrimony.

Capital Widening and Deepening

In fact, it is worth asking whether it helps to distinguish between capital widening and capital deepening. Maddison makes four predictions: (1) capital deepening will increase labour productivity; (2) the capital-output ratio associated with deepening will be higher than with widening; (3) successive increases in capital-labour ratio will result in less than proportionate increases in output per head; and (4) the same increase in capital-labour ratio will be associated with a smaller rise in labour productivity in the United States "which is operating near the fringe of technology" than in Western Europe. (pp 88-95). He gives no figures of capital stock, but he gives investment-output ratios for eight contries in 1913-50. Let us asume that these ratios were stable, that the capital-output ratio of particular pieces of capital did not vary with age and that no capital lived more than thirty-seven years.* Then the capital-output ratio in 1950 would be equal to the investment-output ratio in 1913-50, and we could calculate figures of capital-output ratio, annual changes in capital per head and output per head for the eight countries. This has been done in the table.

Comparison of columns 1, 6 and 7 bears out none of Maddison's infe-

* Actually, most of Maddison's investment-output ratios are for shorter periods than 1913-50 — 1921-50 for Denmark, 1925-37 for Germany, 1913-38 for Norway and 1926-50 for Canada. Our assumed life of capital for these countries must be correspondingly shorter.

Table

	Investment-Output Ratio 1950-60	Capital-Output Ratio 1950	Proportion of GNP Invested 1950-60	Annual Growth Rate of Capital 1950-60	Annual Changes in Man-hours 1950-60	Annual Change in Capital per man-hour 1950-60	Annual Growth of Output per Man-hour 1950-60
	(per cent)						
	1	2	*3*	*4*	*5*	*6*	*7*
Canada	*6.4*	*4.6*	*24.8*	*5.4*	*1.3*	*4.1*	*2.6*
Denmark	*5.5*	*5.0*	*18.1*	*3.6*	*0.4*	*3.2*	*2.9*
W Germany	*3.2*	*4.1*	*24.0*	*5.0*	*1.6*	*4.3*	*6.0*
Italy	*3.5*	*10.4*	*20.8*	*2.0*	*1.8*	*0.2*	*4.1*
Norway	*7.5*	*5.3*	*26.4*	*5.0*	*−0.5*	*5.5*	*4.0*
Sweden	*6.5*	*7.0*	*21.3*	*3.0*	*−0.2*	*3.2*	*3.5*
United Kingdom	*5.9*	*4.6*	*15.4*	*3.4*	*0.6*	*2.8*	*2.0*
United States	*5.8*	*5.1*	*19.1*	*3.7*	*0.9*	*2.8*	*2.4*

rences. The association between the investment-output ratio and rate of change of capital per man-hour is very poor. The same is true of the association between the rates of change of capital per man-hour and output per man-hour. And the response of output per man-hour to increases in capital per man-hour is poorer in Norway, Sweden and Britain than in the United States. So growth has by no means been easier for Western Europe on account of stores of unutilised technology, and the introduction of a technological fringe does not advance explanation.

However, the elaborate theory is only meant to embellish Maddison's main point, which is that better growth performance was related to higher investment rates. This, I think, is adequately borne out by Maddison's figures. But why were the rates of investment so much higher than before the war, and why did they differ so radically from country to country? We get no good answers to these questions. He begins an analysis of demand and profits and shows that profit margins and the rate of profit on capital in manufacturing were markedly higher throughout the fifties in West Germany than in the UK or the USA; but he stops there. Here a good opportunity was neglected; the use of international data in investment functions is worth trying out.

Lame Analysis

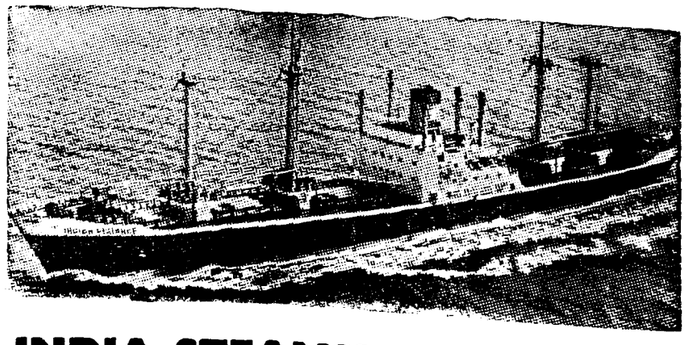
In the absence of a clear picture of the forces influencing investment, the rest of the analysis is lame. Maddison thinks that government could give important stimuli to investment through maintenance of demand, encouragement of competition and planning. However, the only concrete conclusion that emerges is that governments slowed down growth in Britain and the USA by deflationary policies.

The chapter on international trade has even less to say about differing growth rates, and seems a *non sequitur* to me. It is noted that "the fastest-growing countries, in terms of output, tended to be those with the most rapid increase in exports", but there is no analysis of the reasons; all we are told is that "payments deficits were due to the pressure of domestic demand on imports rather than to falling exports. When exports were falling or stagnant the cause was usually rising prices and declining competitiveness and not deficient external demand" (p 166). This is the wrong tree to bark up: the course of export prices of industrial countries shows no similarity to that of home prices except for Britain and the USA; nor is there much connection between trends of export prices and volume of exports.

However, to regard this book as a problem-solving exercise would be taking too narrow a view. Among other things, it gives a very lucid survey of economic policies followed in the fifties as well as of the international monetary system. And the numerically minded reader must get much instruction from the league tables of the western countries and the long-term series of output, population, labour force, investment and productivity, many running from 1870 to 1960.

...n towards progress...

India Steamship Co., Ltd., has a steady record of progress... Since Independence, its tonnage has increased from about 85,000 D.W. tons to over 200,000 D.W. tons—more tonnage being still on order.



Its services are also extending to various trade routes. After initial consolidation in the India-U.K.-Continent trade—the Company entered the Indo-Soviet service to the Russian Black Sea ports in 1956 and later to Rumanian ports. In 1959 the Company forged still another link in the overseas with South America, and in 1960 it extended its service to Poland.

Their experience and reputation for fast, efficient and dependable service built on the personal care given by their experienced officers and crew to the cargo entrusted to them, have earned them the goodwill of their customers.

China: 'Consolidation Period'

(From a Correspondent Recently in China)

None of the impressions one gathers in the course of a journey through China can be validated with figures, for China has published no statistical account of its economy or any major sector since 1959. All that one has are isolated facts, percentage increase figures, numbers of 'innovations' or new varieties of goods now produced—all of them hanging in a limbo that cannot be evaluated.

However, if heavy industry still seems relatively slack, light industry, consumer goods and, in particular, enterprises related directly to agriculture, seem active. Even here one cannot be sure of what is happening, but there seems to be much more confidence, much more willingness to give explicit figures on the increase in output in the past year.

There is some hope that the greatest gap in the Chinese economy, the vulnerability of its agriculture, can ultimately be plugged. Fertiliser production has been accorded very high priority and new plants have been opened at different points throughout the country. Production of tractors and trucks, now more soundly based as a result of the increased variety of special steels that are being produced, is being pressed as hard as possible.

More generally, life in China nowseems to be a little more stable and comfortable. Social differentiation is still there and is often marked but much has been done to improve the lot of the lowest strata of society.

Of course, the stability and the modicum of comfort is also a danger. The Government is fully conscious of this. How can the Chinese people be constantly harnessed to increased effort if public policy is conservative and pragmatic, without explicit long-term targets, when ordinary incentives, however mild, are used.

CHINA is now well out of its disastrous slump of 1960-61, but there is still much slack in the economy and no-one is yet confident enough to project some perspective beyond the immediate. Almost nothing emerged publicly of great significance from the recent National People's Congress in Peking, and that there was nothing public suggests there has been no return to adding some flesh to the mythical Third Five Year Plan. If one asks people about this Plan, now ostensibly in its third year, one usually gets the answer that it has not yet been worked out, so that one wonders precisely what the function of a Plan is if one can run along happily to over halfway through it without having it 'worked out'. Not that this is in anyway unusual, for the Second Plan (ostensibly from 1957 to 1962) was so flexible that it included the Great Leap Forward, not intended when the few targets made available were published in September 1956, and the 'Adjusted Plan for the Last Two Years of the Second Five Year Plan' which officially consolidated after 1960-61, was only approved (but not published) by the People's Congress in April 1962.

No Relaxation of Controls

However, while this may suggest that the Politburo is not absolutely sure what it should aim for in five years time, it does not imply any relaxation in controls. Pruning the economy, shifting out of the urban labour force the millions of Great Leap newcomers, controlling prices during the terrible dearth of 1960-61, ensuring that the distribution system accurately ensured that all tightened their belts together (even if by different notches), this demanded very much intensified controls—and that it was carried through without proven substantial public revolt is perhaps the greatest testimony to the stability of China's Government and its relative popularity.

The web of controls, the strategically placed 17 million cadres or so, remain, and are the steel frame which permits the economy to function. Heavy industry, extravagantly overexpanded in the Great Leap Forward so that certain categories of capital goods supply was swollen far beyond its marginal productivity, given the supply of complementary factors, has been most ruthlessly pruned. Much of it, so far as one can tell, remains underutilised, and when one visits heavy plants, there is much evasion about the statistical series through from 1949—the one to 1957 is available as is production today, or rather the per centage increases between then and now, but not a blow by blow account of the plant concerned for the years between 1958 and 1963. Many of the chimneys are not smoking, and there always seems to be two or three shops closed 'for minor repairs'. Heavy industry processing plants are stringently controlled now by the flow of raw materials—given constant extraction ratios, no more steel can be produced than ore is supplied, and the Government has imposed much stricter quality controls on raw material output to minimise the output of rubbish called coal or iron ore as in the Great Leap days of bounding output figures. This ensures both that the output of processing plants corresponds more closely to the output of raw material, and also that exports of raw materials becomes more possible. Manchuria remembers its old Japanese outlet of prewar days, but so far the Japanese have been reluctant to take up its former iron ore imports from China because of its fluctuating quality.

Not that any of the impressions can really be validated from the figures, for China has published no statistical account of its economy or any major sector since 1959. All that one has are isolated facts, percentage increase figures, numbers of 'innovations' or varieties now produced, all of them hanging in a limbo that cannot be evaluated. However, if heavy industry still seems relatively slack, light industry, consumer goods, and especially enterprises related to direct production for agriculture, seem to be reasonably active. Even here one cannot be absolutely sure what is happening, but there seems to be much more confidence, much more willingness to give explicit figures on the increase in output in the past year.

High Priority for Fertilisers

Fertiliser has been the favoured son among industries since the change in policy from developing industry as first priority to developing agriculture, and new plants have been opened at many different points throughout the country, are being rapidly expanded and brought into capacity (or as the Chinese persistently and innocently claim 'over-capacity') production. The one recently examined by your correspondent did show signs of the haste with which it had been constructed, and although no one would admit it, it seemed there were persistent breakdowns because of this speed—but they were producing, and no doubt as the teething troubles subside, the

expansion will steady itself. Of course, by Indian standards, such projects are technologically relatively primitive, nor can one appraise the quality of output nor the use to which output is put, at least now the stress of Chinese development has changed. There is some prospect that the greatest gap in the economy, the vulnerability of agriculture, can ultimately be plugged. Chinese tractors and trucks, now more soundly based by the increased variety of special steels that are being produced in this 'consolidation period', are still scarce in relationship to the need, but output, like that of fertiliser, is being pressed as hard as practicable—as is the production of pumping and water conservation equipment.

No Shortage of Food

Light industry, particularly where related to a low income domestic market or, even more important, exports, is humming, and the rush of home-grown prestige innovations remains strong (even if the innovations remain in prototype form, not put into production, and owe extensive unacknowledged debts to foreign patents) —transistor radios, cameras, television sets and equipment, precision medical appliances, semi-automated looms, to large-scale generators, are on show in the permanent exhibition of Shanghai industrial output, but one sees few on sale in the shops; Chinese motor cars are said to be expanding, and in the largest cities, one already sees a few on the streets. Cotton textiles are, of course, working at maximum level, although they suffered in 1960-61 from the decrease in domestic raw cotton production (and the consequent necessity to increase raw cotton imports). From purely superficial acquaintance the mills are impressive. Sharp division of labour permits vast sheds concentrated on a particular process, with minimised labour inputs and 24 hour shift working for the maximum days per year (allegedly, about 350, but this was obviously the aim rather than the achievement)—China makes no bones about having chosen to maximise labour productivity in its modern industrial sector, despite slack labour demand and rural underemployment. Much of the loomage in the mills is old—Lancashire and Japanese made dating back to the first World War or the twenties, but now increasingly replaced by more modern Shanghai-built equipment.

Of course, a tour of some of the best of China's modern industry is as illuminating a view of China proper as a tour of Durgapur or Sindhri is characteristic of India as a whole, even though in China, one suspects on the limited view available to a foreigner, the gap between modern industry and the ordinary rural dweller is less wide than it is in India, both because even the best industry does not attain the technological standards of the best Indian industry and also because the Chinese countryside has been transformed in a way the Indian has not. Again, one's impressions, fragmentary and unrepresentative as they are, are all one has to go on, and these are favourable. There is absolutely no evidence of starvation or malnutrition in town or country: all seem to be fed somehow, and at the moment the foodgrain ration is more than enough for ordinary consumption; shortages exist (in cooking-oil, for example, shades of Calcutta) but they seem generalised, and basic commodities seem available in moderate abundance at prices within the scope of good industrial wages. The shops have reasonable supplies of fruit and vegetables, milk and eggs are relatively cheap, and even meat does not seem excessively scarce. From the urban end, the harvest looks to have been good, an impression confirmed by the fragmentary reports from the countryside. The spring crops were good, and the overall 1964 performance suggests that wheat did well, rice was adequate, and raw cotton mediocre: the Chinese can breathe another sigh of relief for the third reasonable year's harvest in a row.

New Role of Commune

In the countryside, conditions are spartan but still not bad—food does not seem difficult (although, only one deficit area, and that a prosperous one, was visited), and all are clothed. The Communards farm in the fields in the South without shoes on, but otherwise most adults seem shod. The very small rural industrial enterprises have generally been scrapped with no intention of resurrection, but the medium small plants are slowly coming back into production, particularly where they directly supply consumer demand and can be used to mop up surplus purchasing power. The Commune itself remains now not so much a vision of a new society as merely the lowest local government level, a rather mundane organisation. However, in many areas it is still very important for mobilising the combined labour force of the now much reduced Commune area for joint projects—irrigation, road building and general water conservation projects; and it supplies a number of collective services: seed and equipment centres and workshops, advice agencies, schools, a local marketing centre, a rediffusion centre, a cinema or small opera house.

More generally, life in China seems now to be a little more stable and comfortable for many. Social differentiation is still there and often marked (particularly in the winter when some can wear expensive fur jackets, and some only patched denims) but what has been done to improve the lot of the lowest stratum of Chinese society is still a monument to the Government's efforts. Of course, the stability, the tiny modicum of comfort, is a danger the Government is fully conscious of. How can the Chinese people be constantly harnessed to increased effort, whipped into improvement, if policy is conservative and pragmatic, without explicit long-term targets, when ordinary incentives, however mildly, are used?

Dangers of Stability

The socialist education movement, launched in 1962 and now in full swing, is designed, one suspects, to try to remedy any sign of back-sliding. Every medium of cultural communication has been 'reformed', from the Universities to the newspaper or opera, in order to continue to ram home the strident lesson that the past before 1949 was inestimably abominable, that the Party and the now deified figure of Mao are the distillation of traditional wisdom and modern 'science', that all must work a little bit harder, be a little bit nicer and a little more loyal every day. The results are disastrous in terms of the future of Chinese culture—the complex lessons of the history of ethics and economics, the complexity of modern international politics, are successively reduced to the same magic incantations, the same trivial formulae and empty slogans, the same smug vulnerability. Yet, although the intellectuals suffer most, cultures have recovered from such onslaughts before (Zhdanov and Stalin did their worst, but the Russian people recovered), and mere verbal moralising is ultimately ineffective in sustaining a revolutionary ardour that actual material conditions contradict. Which suggests that sometime in the future the Chinese Government will have need to change material conditions with rapidity and great tension to revivify that ardour—which could mean a whole series of imponderables.

English, Hindi and the Regional Languages

I P Desai

Thanks to the lack of a clear policy on the official language, from time to time English or Hindi has been pushed forward and backward at the cost of the regional languages. Attention and energy have been diverted to the Hindi-English controversy while the State administrations have continued to use English and not the regional languages.

The conflict between Hindi and the regional languages has been fostered and aggravated very cleverly by the proponents of English, aided, of course by the folly of the Hindi-speaking supporters of Hindi who have failed to realise that the growth of the national language will come about only through the growth of the regional languages.

The fact, as The Economic Weekly's *South Corespondent pointed out in his despatch in the Annual Number, 1965, is that the only way for Hindi to become acceptable is through emphasis on the regional languages with a view to their gradual take over from English.*

I ENTIRELY agree with the conclusion of your correspondent in his Letter from South in the Annual Number, February 1965, that "The only way for Hindi is first and foremost an emphasis on the regional languages, carefully worked out plan for their rapid take over from English."

I also agree with the reasoning by which he arrives at this conclusion and I endorse the social realism behind it. Your correspondent observes correctly, "India has still largely a pseudo-self" and "what has not happened is the creation of Indian nation". He comes to the point which touches the sociologist when he says that "this must rank as one of the biggest failures of middle class in history." The important question, therefore, is what is the character of the middle class? What are the social groups from which this class comes and what are the values and attitudes that it possesses at this particular point of time in the history of the nation?

Changed Role of English

The identification by your correspondent is simple and workable. He refers to the class of persons educated under the system of education introduced by the British, particularly the class which has taken education upto graduation and above. "In the early phase this intelligentsia drawn from the landlord class or from one or another comprador occupations came to English as a means of westernisation which they felt was the only way forward to the modern regeneration of their country." A point needs to be added here. These were also the people settled in the urban areas, the big towns of those days and they came from one or two higher castes in each linguistic region.

To these 19th century proponents of English, the English language was the language of culture. The role of English today has changed and it has become the means of earning the livelihood and of achieving social status. The position of English in the hierarchy of values has come down to more immediate ends than to distant ends in the minds of the mass of population which is taking to education in numbers much larger than at any time in the past. And what is more important, it will continue to grow larger. This means that the social base of the college and university educated is becoming broader and will continue to do so. Education is growing among the lower income groups of the higher castes and higher income groups of the so-called lower castes in urban and rural areas respectively. Their traditions and the contemporary experience of life are different from the traditions of the 19th century educated class. Consequently, the large mass of recently educated and uneducated class has different values and its attitude towards English, as we have said, is of a more functional nature and there is a hiatus between the values of the policy makers and of those influential in policy making and the values and attitudes of the large number of newly educated people.

The Stumbling Block

These policy makers and influential persons do not see or probably do not like to see the changed role of English. They cannot get rid of the heritage of the 19th century intelligentsia which was clear and honest about the Indian society of the future—the westernised India. Westernisation was the openly accepted creed with them. Their contemporary inheritors are not in a position to stand by them in their creed, probably because they do not have the conviction and perspective of the 19th century Indian westerniser. That is why the defenders of English always begin by agreeing that the regional language is the proper media of instruction and administration in the states. But in the same breadth they start advocating caution, gradualness, preparation, etc, so that ultimately the change over to regional language never materialises. They know that English just does not work in the colleges and universities but they cling to it. They know very well that the large mass of students do not have the environments, either at home or in the educational institutions, congenial to English as a medium of instruction. They run away from this reality and try to save English by advocating the restriction of admissions and by proposing increase in papers, hours and years of teaching English. But the command of the students over English does not increase. Yet English is continued as the medium of instruction. The same students go out as assistants in offices and teachers in schools and colleges. Hence again the complaint of their poor standard of English. They just fail to realise that the regional language is the most effective means of communication, for the spread of science and scientific attitude. Not to introduce, therefore, the regional language as the medium of instruction is to hamper the spread of science and scientific attitude. The advocates of English in this sense are becoming the stumbling block in all that is new and desirable. In effect, they are playing the role of conservatives and reactionaries however progressive they may like to appear.

Role of Intelligentsia

Is the intelligentsia not intelligent enough to realise this? The intelligentsia is, though the class of influential persons may not be. Here it is necessary to point out a new development in the composition of the intelligentsia. With the growth of university education an academic intelligentsia is growing as specialists in their subjects. It is not of any significant size but it is a qualitative difference which will grow. These are the persons with ability to see things but they are cut off

from the social currents because they are interested in solving their own academic problems. Their intellectual honesty is not questioned here but their awareness of their social responsibility is perhaps not based on sufficient observation and thought, just because they dislike being disturbed in their pursuits. Yet they have opinions based on their contact with their "society" of policy makers and the influential who use them for their own purposes. Also, they are cut off from the large mass of teachers who handle the large mass of students in undergraduate colleges and post-graduate students in places other than the metropolitan cities. If they had either first hand experience or contact with those in touch with the large mass of students, they would very probably hold different opinions.

So the effective supporters of English are the policy makers and the influential. Who are they? Among the policy makers are included the secretaries—joint, additional, deputy, assistant and under — and advisers. We designate them as government intelligentsia. Then there are the ministers of various statuses at the Centre and in the States. They are directly related to the influential in their political party as also the members of legislatures at the Centre and in the States belonging to the non-government parties. These have their supporters in their parties and outside it in the society who may not be the members of any political party.

The Policy-Makers

The social characteristics of these policy makers and the influential, their values and attitudes enter into policy making and in the execution of the language policy and in the reactions of the people to the policy.

The government intelligentsia comes from the upper castes, upper income groups and urban areas or from the urban influenced sections of rural areas, but in small numbers. They are all degree holders and also probably specialists in some branches of knowledge. They obey and respect the ministers as a matter of routine. But they like or dislike the minister according to his social origin, his academic achievements, experience and ability. Being what they are, they have to execute the policy. But they can influence the ministers by putting up a weak case strongly or a strong case weakly. The declared policy can be delayed, hastened or twisted in practice. The dependence of the ministers or the government on these persons is an established fact all over the world. Thus their social base, their values and attitudes play an important role in policy making and its execution. It is not that they consciously ally with the particular stratum from which they come. The stratum strongly conditions a man's outlook and he normally acts according to its standards. Hence we find that persons from a given upper strata are against their own regional language or at least they are not enthusiastic for their regional language.

Difference in Outlook

The government intelligentsia do not find much difficulty in their daily work because the politicians who are the principal policy makers are as a rule English knowing, at least those who are put in ministerial position. But among politicians the heterogenity in terms of the university degree, knowledge of English, occupation, income and rural or urban origin and outlook and caste is more pronounced than in the case of government intelligentsia. In all the political parties at the leadership level in the parliamentary groups the ministers are either degree holders or English knowing but the members of the legislative parties are not always. Yet the proportions of rural agriculture based persons, having not much knowledge of English, do not have dominating influence in the parliamentary parties at the centre. The urban based working class members are still rare, but their number and the number of agriculture based members are growing in the State legislatures. The result is that the difference in the outlook of the leadership and of their immediate supporters is growing in all the political parties.

But the difference between the top leaders and the electorate is still wider. It is true that in any State a political party can come to power only on the agricultural vote. At least this is true in the case of the present ruling party. Nearly seventy per cent of the Indian voters are illiterate, i.e. innocent of even the alphabets of their regional language. Yet it is this voter who puts a party in power. They live in rural areas and earn their living by agriculture and occupations dependent on it. But the top level leadership comes rarely from this group and even the second rank leadership which is nearer to this group, physically and socially, is yet not of that group.

By the very nature of the political activity this is bound to happen and there will always be some distance between the various levels of leadership and their supporters through whom they gain positions of power. This gulf is generally narrowed by the growth of specialists in political activity, the professional politician. He generally represents the interest group in wider society. Until, therefore, the interest groups are organised, this hiatus continues to be glaring. As interest consciousness grows, the distance between leadership and its following narrows down. This is probably what is happening at this level in India.

Urban Interests in Rural Areas

The rural areas in India are not the same today as they were in pre-independence era. Of course, the changes have not been to the same extent in all the States, and that makes a difference. The main difference is of the penetration of the urban occupational interests and the outlook co-related to it in the rural areas. The small towns, with population ranging from say, thirty thousand to one lakh are growing in number and importance and the metropolitan urban interests have their footholds there. Their agents there set a standard for the style of living and aspirations. These agents are the lawyers, doctors, businessmen, government officers, branch managers of banks and such other concerns. All these groups have their associations with the bigger cities of the area and the importance of the individuals in these groups in their local setting depends on this contact with the luminaries of their interests in the bigger cities and, in the final analysis, in the capital city. The Rotary, the Lions Clubs and the Junior Chambers provide them the contact places. The well-to-do agriculturist and the shopkeeper in the interior is their last post in the rural area. The leadership comes from these interests or their nominees and they are the proponents and supporters of English in rural and they are the vocal groups and when it is said that even the rural people want English, these are the rural people, the vocal groups. The social base of English is thus widened and its spread has gone into the rural areas, i e, nearer to the villages.

A development which the proponents and supporters of English deplore is that the strata which formerly remained untouched by education now show a strong desire for it and are sending their children to schools and colleges. The social composition of primary and secondary school pupils and of college students in rural areas is changing. Though the higher caste students may be larger in proportion to their caste population, the absolute number of other castes is increasing. These are also the lower income groups. For them education is not only a means of earning the livelihood, it is also a means of raising their own status in their groups and of their groups in relation with the traditionally higher groups.

The whole mass of rural students and that section coming from lower income groups of all castes in urban areas suffer the most from the handicap of the English medium. Compared to the size of these groups it is to the insignificantly small group in society that English medium affords an advantage in addition to the social and economic advantages that they already have. Large number of school and college teachers come from this latter section and their views are generally consistent with their position in the hierarchy. There is some modification in their position when they are guided by linguistic chauvinism and by the considerations of job opportunities for men from their own region.

English and Mobility

The usual argument in favour of English as promoting mobility is a further illustration of the interests of the small group that English serves. From every region two types of persons migrate: the educated and the illiterate. The educated communicate in English with the English-knowing persons of the other regions. But do the large numbers of engineering, textile and building workers from other regions communicate with the local people in English? They manage with some sort of Hindi. Do the proponents of English visualise a day when all such migrants will be communicating in English? This is moonshine in view of the fact that only 35 per cent of the population is literate and 2 per cent know English. Even so English is shown as the language promoting mobility. It does, but whose? Of the minor groups of two or three higher castes and the new well-to-do of the lower castes. The reference group of the proponents of English is that small group from which they come.

English medium is thus thoroughly inconsistent with the advocacy of democracy and socialism. Yet what has been the position of the parties professing these? The position of the Swatantra party is easily understandable. Their vision of the future Indian democracy is that of the nineteenth century British society. But have the communists and the P S P unequivocally and wholeheartedly proposed and propagated for the regional language as the medium of instruction at all levels of education? It is possible that in particular plans and in particular situations they might have paid lip service to regional language because it suited their immediate political aims. Otherwise, they have been more faithful to the strata from which their leadership comes than to their rank and file on whose votes they win their elections.

The real conflict regarding the place of English, Hindi and the regional lenguages is in the Congress Party. At the States level, the consensus is on the regional language as the medium of administration. But there is division regarding the medium of instruction at the university level. Even regarding the administration, the judiciary at the top level is conservative.

Language and the Civil Service

In administration the resistence to the regional language comes from what we have called the government intelligentsia and the high-ranking officials, many of whom might belong to the central services. In some regions which were slow in catching up with the spread of education, there are many persons from other linguistic regions. But in others there are few persons from other linguistic regions in that cadre. A powerful Chief Minister of a State was reported to have said that he would not have central service men coming from a different linguistic region. The distribution of regional and non-region men in every State, in Central and the higher services of the State will be quite revealing. It would reveal that mobility means mobility in one direction only and it is not inter-regional mobility. This will be true even in regard to secondary and university teachers. Thus the personnel of the services in one factor in the resistence to the regional language. When the personnel is from the same region, the resistence to the regional language is largely due to their class position. The resistence to Hindi as the official language of the union is due to the expected competition to existing groups from other regional groups. The members of the central services who are working hard against monopolies in the economic field are working equally hard to maintain their monopoly in their own field.

This situation is largely due to the unequal development of different regions in economic and educational fields. But it has given a sense of inherent quality to certain regional groups in regard to certain types of administrative and technical jobs. Side by side with the channelisation of ambitions of the educated section of that region in that direction comes the belief in the inherent incompetence of the people of other regions in that field. The other groups do not admit that claim. Consequently, there are tensions. This sort of tensions are not peculiar to India, but they exist in all countries wherever similar situations obtain, including Europe and America. They are eased when development reaches a comparable level in all regions. But the intensity of the tensions becomes greater while development is taking place and also probably when the rate of development is faster or slower in different regions. The political policy makers have to devise mechanisms to manage these tensions and not wait till the crisis overtakes them. If the tensions are not managed now they will hamper the development process. Therefore it is necessary to face the problem and not postpone it. The ostrich-like policy of the last 17 years has aggravated the tensions and not eased them.

Regional Languages Neglected

The clever policy of giving support to English, Hindi and regional languages has not satisfied anyone, and by administrative manouvers, English or Hindi has been pushed forth and back at the cost of regional languages. In each State attention and energy have been diverted to the Hindi-English controversy and the State administrations continued to operate in English and not in the regional language. Not only that but the conflict between Hindi and regional languages was aggravated, thanks to the cleverness of the proponents of English and the folly of some Hindi speaking proponents of Hindi. The latter did not declare their full-throated support to the regional language in State administration and as the medium of instruction. They thought that more officers and teachers from Hindi speaking areas would automatically strengthen Hindi in other regions. The behaviour of these officers and teachers was also repugnant to the local people. They not only brought the clerks but also the peons from the Hindi speaking areas (e g, in the oil projects in Gujarat). The standards of efficiency of the local peons fell much below the standards inherited by the officers and their wives from the feud-

al landlordism. If the peons do not come up to that standard of efficiency, need anything be said of clerks and lecturers from that region? If such was not the situation, the Maharashtra Chief Minister would not have to plead while inaugurating some project that local people should also be given opportunities of employment in that project. Thus the suspicion of Hindi imperialism becomes stronger. The English enthusiast asks the peon if he knows English. Whether or not he knows cooking and table service is inquired by both Hindi and English enthusists. As a matter of policy in all the central projects the smaller posts must be filled by the local people. This will not affect efficiency at all, because we complain of inefficiency all over India. An inefficient man does not become efficient in another region. And further as our aim is to reduce tension a little difference in efficiency should be tolerated in favour of the local man.

The higher posts have to be filled keeping the requirements of the post in view and not the region of the candidate or his mastery over English or Hindi. And whatever the language of

ASP/LIC/PR-2

LIC PLANTS THE MONEY

L.I.C. sows saplings into the economic soil of the country. Saplings which will grow into a rich harvest of prosperity tomorrow.

L.I.C. invests nearly 3 million rupees a day in industry, agriculture, railways, transport, electricity and many other projects. The growth effect of these investments creates more jobs, more incomes, more food—in fact, a higher standard of living for everybody.

Remember, when you insure or are already a policyholder, your premiums are helping in two ways. Firstly in protecting yourself and your family, and secondly in helping to improve economic conditions for the country at large.

Some LIC investments at a glance	
Plantations	Rs. 240 lakhs
Rubber Products	Rs. 253 lakhs
Coal	Rs. 316 lakhs
Dyes, Chemicals & Pharmaceuticals	Rs. 323 lakhs
Banks	Rs. 462 lakhs
Cotton Textiles	Rs. 1,216 lakhs

LIC—YOUR COMPANION IN PROGRESS

the union may be, government officers must be required to know the language of the region in which he works. A good deal of the edge of inter-regional mistrust will be eased off if this is done.

But who will make the rules we ask for? The services will depend on the political policy makers. In the Congress Party with which we are concerned now, the urban interests which have penetrated into the rural areas from the social base are the proponents of English. We have described their character. A section of them, particularly in the bigger cities and towns, and even agriculturists support the Swatantra Party openly. The Swatantra party relies on the English supporting interests as their fifth column in the Congress Party. As against these interests in Congress and outside, there are the supporters of Hindi and the regional languages. Their main source of strength is in the rural areas. In terms of interests, the P S P members who have recently joined Congress have more things in common with them. But the social roots of their leaders and their urban nurture fosters in them a "modernistic" mentality and they cannot easily join hands with the leadership of the pro-Hindi pro-regional language group. Also tactically they would not like to toe the line easily. But if they do not unite with them they will be as ineffective in the Congress as they were when they were outside it. The realisation of this position and corresponding action requires political maturity and vision which may be wanting. The probability is that they might act more as individuals rather than as a group or they might act as sub-groups among themselves. What the actual outcome of their union will be also depends on the sections of the Swatantra and anti-Swatantra or rural based group in Congress. Any way the present position is that P S P group in Congress, though it is nearer to the rural group, does not support them wholeheartedly in their pro-Hindi pro-regional language policy. Among the leaders, some are rootless and some are still rooted in Swatantra social base.

Thus within the Congress there is rivalry and conflict between pro-Swatantra interests and what we have now called the rural interests. The strengthening or weakening of these interests within the Congress will decide the language issue.

The Communists, if they remained true to their ideology, cannot but support the pro-Hindi pro-regional language groups. But who can say what they are and what they will do. For an immediate tactical gain, they may do quite the opposite of what their philosophical position would require them to do.

The question of medium of instruction and the medium of administration are thus closely linked with the "interests" in society and the political action of the parties according to the interests that they serve. It may happen that the actions of political groups such as the Swatantra section among the leaders and the influential in the Congress or some P S P leaders and the communists may go against the interests of the masses for which their parties profess to stand. But that does not divert the language from its political and social linkage. It happens because of the social charcteristics of these leaders.

Conflicting Interests

The proponents of English lack the conviction and therefore the courage of conviction because their idea of 19th century British society and the polished Indian Englishman does cut ice with the large masses. The masses want to know English not for the love of it but because they know that it has some use for them and there it ends. Their attitude towards English is like that of a tenant towards hired house in which he lives. Consequently, the command over English of the large mass of students and teachers, lecturers and of clerks and officers is not of that standard expected by the minority coming from higher castes, higher income groups and prestige educational institutions expect. Each group has the feeling of separateness or enstrangement from the other. The only consequence can be inefficiency. Yet English helps the top people as a means of showing and retaining their superiority. Thus they have become a vested interest.

The proponents of Hindi fear the growth of regional languages. Their fear was and is that if the regional languages become the medium of instruction and administration, it will be difficult to dislodge them and the state administration and education in the States will be in Hindi. That is why without specifying whether it was English or Hindi, they emphasize the need for a common language for the whole of India whenever the question of medium of instruction and administration comes up. The result has been that the regional languages have not been encouraged and English has remained entrenched in its position. None of the accredited associations of Hindi has wholeheartedly and unequivocally declared itself in favour of regional language as the medium of instruction and administration in the States. Supporters of English were naturally glad. Thus English and Hindi supporters have been for sometime partners, though strange partners, against the regional languages. When the Official Language Act came into force on January 26, 1965 the proponents of English naturally thought that Hindi was scoring a point and therefore regional chauvinism was commissioned into the service of English. If the regional languages had by now come into their own what happened in Madras would not have happened. The natural course for Hindi is to come *via* the regional languages. The Hindi expansionists are pressed by the growth of the new educated class in Hindi speaking areas which in the part were lagging behind in the economic and educational race. They find the Bengali and the South Indian English speaking people entrenched in their own regions. They want to shove them off and export their surplus to other areas. Education in the Hindi speaking areas is still confined to upper income and upper caste strara there. They press for standard Hindi of their stratum and their attitude towards Hindi speakers of other regions is the same as those who complain of poor English of the new English speaking stratum. Consequently the Hindi speaking man from the standard Hindi speaking area is to be preferred to Hindi speakers from the non-Hindi speaking area for jobs. This is encouraging Hindi provincialism in non-Hindi regions and the regions which are not opposed to Hindi also begin to be apathetic to Hindi. The genuine fear of Hindi imperialism is aroused and the creation of a new-Hindi *herrenvolk* in addition to the English *herrenvolk* is threatened. If the regional languages are freely entrenched in their regions looking to the growth of education among the masses in every region, inevitably poor command over English will naturally lead to Hindi being accepted as the link language. But the reasoning of the Hindi *herrenvolk* is the reasoning of the feudal-based expansionist.

The growth of the national language will come through the growth of the regional language and not *vice versa* as some Hindi protagonists think.

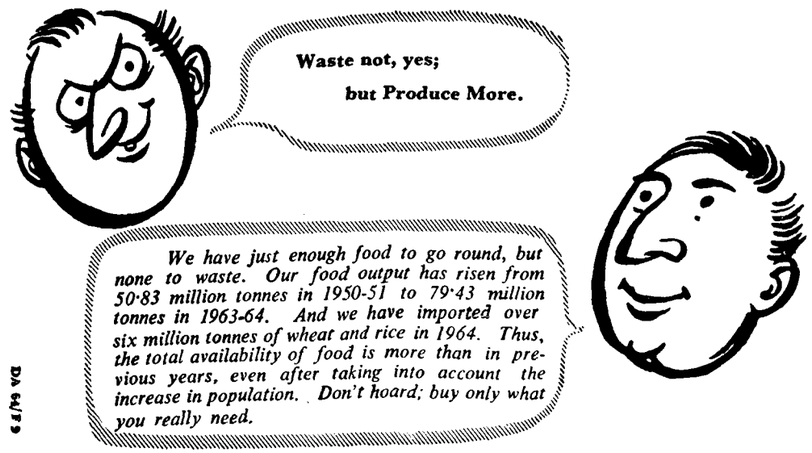
REPORT OF THE AUDITORS

TO THE PRESIDENT OF INDIA,

We, the undersigned Auditors of the State Bank of India, appointed under Section 41(1) of the State Bank of India Act, 1955, do hereby report to the Central Government upon the Balance Sheet and Accounts of the Bank as at the 31st December, 1964.

We have examined the above Balance Sheet and the Profit and Loss Account and the Accounts relating thereto of the Central Office and the Local Head Offices at Bombay and Calcutta and the Returns submitted and certified by the Secretaries and Treasurers of the Local Head Offices at Madras, New Delhi, Kanpur and Ahmedabad, by the Manager of Pakistan Branches and by the Branch Agents, which Returns have been incorporated in the above Balance Sheet and Accounts, and report (i) that, in our opinion, the Balance Sheet is a full and fair one, containing all the necessary particulars and properly drawn up so as to exhibit a true and correct view of the affairs of the Bank, according to the best of our information and the explanations given to us and as shown by the Books of the Bank; (ii) that where we have called for any explanation or information such explanation and information have been given to us and have been satisfactory; (iii) that the transactions of the Bank which have come to our notice have been within the powers of the Bank; (iv) that the Returns received from the Local Head Offices at Madras, New Delhi, Kanpur and Ahmedabad and from the office of the Manager, Pakistan Branches and from the Branches of the Bank have been found adequate for the purpose of our audit; (v) that the Profit and Loss Account shows a true balance of profit for the period covered by such account; (vi) that, in our opinion, the Balance Sheet and Profit and Loss Account are drawn up in conformity with the law; and (vii) that, in our opinion, Books of Account have been kept by the Bank as required by law.



The audit of the Books and Accounts of the Central Offiec has been carried out jointly by Messrs. S. B. Billimoria & Co. and Messrs. Ray & Ray. The audit of the Books and Accounts of the Local Head Offices has been carried out at Bombay by Messrs. S. B. Billimoria & Co. and at Calcutta by Messrs. Ray & Ray.

From the Chair

The State Bank of India

Speech of the Chairman, Shri B. Venkatappiah

THE following is the speech of the Chairman, Shri B. Venkatappiah, at the Tenth Annual General Meeting of the Shareholders held in Bombay: Gentlemen,

We are assembled here to consider the Report of the Central Board of Directors of the State Bank of India for the year 1964. The Report, along with the Profit and Loss Account for the year and the Balance Sheet as on December 31, 1964, has already been circulated. This is the Tenth Annual General Meeting of the Bank, and the third and last at which I shall have the privilege of addressing you. My pleasure is, therefore, all the greater in welcoming you here and reviewing the progress—in the words of the Central Board of Directors, the exceptional progress—made by the State Bank of India and its Subsidiaries during yet another year.

In reflecting on the events of the last twelve months, our first thought is to offer affectionate homage to the memory of our late Prime Minister, Shri Jawaharlal Nehru. He was so much a part of us that his death was an uprooting. Today, and in this particular gathering, we think especially of his passionate vision of economic development—yet unfulfilled, but on the way, we firmly hope, to realisation—to which the country already owes so much of the progress it has been able to make.

Noteworthy Achievements

In what way have the achievements of the State Bank—and its Subsidiaries—been more than usually noteworthy during the year 1964? And, if we take a somewhat longer perspective, what has been the record of this state-associated sector of banking during the three-year period 1962-64? I will, if I may, answer these questions briefly for that composite structure which comprises the State Bank and its seven Subsidiaries before going over the year's working in some detail for the State Bank alone and thereafter, very concisely, for the Subsidiaries as a group.

In the growth of deposits as in the expansion of credit, the State Bank of India and its Subsidiaries have outstripped their previous records and in 1964 obtained, as their share, nearly 50 per cent of the total increase pertaining to all the scheduled banks in the country. The deposit accretion for all scheduled banks was Rs 269.6 crores in 1964. For the State Bank and its Subsidiaries the corresponding figure was Rs 126.6 crores. The total credit of scheduled banks expanded by Rs 231.2 crores during the course of 1964. Out of this, the State Bank and its Subsidiaries accounted for as much as Rs 113.5 crores. Much of this increase in credit went into industrial production. Moreover, there was a very large stepping up of the assistance given to small industry by the State Bank of India and its Subsidiaries. The increase over the year was, in terms of limits, 63 per cent, and in terms of outstandings, 71 per cent. Further, as I shall later recount, major organisational and procedural changes were effected in both the State Bank and the Subsidiaries with a view to greater decentralisation and delegation. In the State Bank alone three new Circles—with full-fledged Local Head Offices—were established in the course of six months. A number of other changes were brought about with the object of streamlining the administration of the Bank, diversifying its activities and making provision for specialised services and departments where these were considered necessary from the point of view of the usefulness of the institution. Branch expansion was continued, but there was planning ahead of both recruitment and training; a consultative machinery was evolved for harmonious communication between Management and Staff; and, in general, attention was devoted to problems of personnel no less than to those of business, and to the need for consolidating results no less than to that for expanding branches.

Growth of Business

Turning briefly to the position as it stood at the end of 1961 and comparing it with what it is now after three years at the end of 1964, I will content myself with giving a few figures. During this period the number of offices of the State Bank and the Subsidiaries together has increased from 1,444 to 1,759, i.e., by 315 or over 100 offices per year. The total deposits, excluding P.L. 480 funds, stood at nearly Rs 500 crores at the close of 1961, this figure again being for the Bank and its Subsidiaries. The corresponding figure at the end of 1964 is over Rs 787 crores, raising our share to one-third of the deposits of the Indian banking system. Likewise, for this combined structure, the credit portfolio, which stood at slightly over Rs 323 crores at the end of 1961, was of the order of Rs 489 crores at the end of 1964. The growth of business, therefore, has been substantial—more than 50 per cent—during this period. Nor was the progress confined to traditional business. Indeed, the three years witnessed even a more rapid increase in the assistance rendered to small industries and co-operatives. Thus the credit limits to co-operatives went up by over 100 per cent, from about Rs 30 crores at the end of 1961 to nearly Rs 67 crores in December, 1964. As for small industries, the corresponding increase was more than threefold, namely, from about Rs 13.5 crores to about Rs 40 crores.

Salient Features of Working

I now pass on to the salient features of the working of the State Bank of India for the year 1964. There was considerable increase in the volume of business and the level of earnings. The Bank's average advances in India rose by Rs 67 crores. Moreover, as you will recall, our lending rates had been increased on April 5, 1963. The revised rates were in force upto the end of September 1964, when they were further raised by ¼ per cent on account of an increase in the Bank Rate. Yet another and very recent increase in the Bank Rate, the one effected a few days ago, is fresh in your memory. In consequence, the State Bank Advance Rate has, as you are aware, been raised to 7 per cent as from the close of business on February 17, 1965. I mention this merely to complete the picture. During the year 1964, with which we are here concerned, the State Bank Advance Rate was 6 per cent from January to

September and 6¼ per cent thereafter. The large expansion of the business of the Bank, together with the operation over a whole year of the higher interest rates to which I have referred, accounted for an increase in earnings of Rs 4.72 crores by way of interest and discount. We also earned more—the increase was of the order of Rs 85 lakhs—on commission, exchange and brokerage. These and a few minor items of increase resulted in our income rising by Rs 5.65 crores to Rs 31.02 crores. There was at the same time a substantial increase in expenditure. This is attributable in part to the higher cost, firstly, of deposits and, secondly, of borrowings from the Reserve Bank. Together, these two items accounted for as much as Rs 2.34 crores. Here again, I am not referring to the very recent increases in both these respects which have come into effect on February 18, 1965, as a result of the Reserve Bank's directive in this matter. What I am alluding to is, firstly, the increase in deposit rates which had been effected by the State Bank on April 1, 1963, and was therefore in force for a whole year in 1964. Secondly, I am referring to the measures for the rationalisation of interest rates on bank deposits, including a stepping up of the rates on longer term deposits, which were initiated by the Reserve Bank in September last and were operative throughout the last quarter of 1964. Apart from the higher cost of deposits and borrowings, there was an increase in overheads of Rs 3.10 crores. Three main factors contributed to the increase. With the extension of branches and expansion of activities, establishment had necessarily to be increased. The accrual of annual increments was, as usual, a large element in the increased wage bill. And, in particular, with the increase in the cost of living, the dearness allowance paid to the Award Staff was substantially higher. Nevertheless, after due allowance had been made for the usual and necessary provisions, the net profit of the Bank increased by Rs 20 lakhs to Rs 2.95 crores.

Dividend Maintained

Inclusive of the balance of Rs 36 lakhs brought forward from last year, the sum available for appropriation was Rs 3.31 crores. The dividend to shareholders has been maintained at Rs 23 per share (subject to deduction of tax). In compliance with the statutory requirement, a sum of Rs 60 lakhs has been appropriated to the Reserve Fund. Provision for bonus to staff, computed on the same basis as last year, accounts for Rs 90 lakhs, while the usual allocations to the Pension Funds and Staff Co-operative Housing Fund have taken up Rs 9 lakhs and Rs 5 lakhs respectively. It has been decided to allot Rs 10 lakhs, as compared with last year's Rs 5 lakh, to the Staff Welfare Fund. The balance carried forward at the close of 1964 is Rs 27 lakhs.

Record Credit Expansion

The credit expansion of the State Bank of India broke all previous records in the 1963-64 busy season. The advances of the Bank touched a new peak at Rs 378 crores, compared with Rs 319 crores in the previous season. I may mention in passing that this level too has already been surpassed in the current busy season and the advances now stand around Rs 410 crores. While it is true that we are lending much more than in the past, it must be made clear that the additional credit we are providing is for purposes which are important from the point of view of the country's economy. Thus we are substantially assisting State Governments in their programmes of food procurement and food distribution, besides financing other projects in the agricultural sphere connected with State policy such as the jute buffer stock operations. Apart from this, it is industrial production of high priority and industrial units of all sizes—big, medium and small—that have claimed our first attention and, therefore, account for the bulk of the additional credit we have been providing. Finance for industry constitutes 76 per cent of our total credit portfolio. About a seventh of our finance for industry is accounted for by units in the public sector and the rest by industries in the private sector. You will also be interested to know that, over the past three years, the number of accounts, in so far as industrial units are concerned, has gone up by about 47 per cent, while the average size of loans has significantly declined. Besides, a survey recently made has indicated that advances with limits of less than Rs 5 lakhs covered 99 per cent of the total number of advances. There is every reason to believe that, without any diminution of the significance of the Bank for the larger units and accounts — public sector or private — its usefulness is rapidly permeating to medium and small enterprises throughout the country. It will be relevant to mention here the almost spectacular increase we have been able to effect in 1964 in the matter of accommodation for small scale industries, from which term, for the purpose of these statistics, we exclude traditional types such as rice and oil mills. The number of units assisted by the State Bank of India went up from 3,899 at the end of 1963 to 5,834 at the end of 1964. The limits in force increased by 74 per cent from Rs 17.59 crores in 1963 to Rs 30.58 crores in 1964, while the outstandings or utilization rose by 77 per cent from Rs 8.55 crores to Rs 15.17 crores. Our policies and procedures in this regard are being reviewed, liberalised and adapted to the actual needs of small entrepreneurs from time to time and we may reasonably claim to have laid the foundation for even more rapid progress in the future.

Rise in Deposits

In regard to another aspect of our performance, I am glad to be able to report to you that our deposits have increased by as much as Rs 100 crores over the year. Besides other things, this has enabled us to effect more smoothly than would otherwise have been possible the transfer of as much as Rs 44 crores of P L 480 deposits to the Reserve Bank. The net increase in deposits was therefore of the order of Rs 56 crores. In terms of an average for the whole year, the level of deposits in 1964 was Rs 77 crores higher than that for 1963. We have crossed the Rs 600 crore mark and now stand at about Rs 610 crores. Of the total deposits, over 65 per cent are from the private sector, the main component numerically being small savers. Out of the public sector funds lodged with the Bank, nearly a third is from industrial and commercial institutions which, of course, also borrow on a large scale from the Bank. Experimental procedures introduced in some branches for the convenience of depositors have met with encouraging response and we are now in a position to assess our experience and extend suitable measures to other offices. Nevertheless, the situation does not warrant complacency and sustained efforts have to be continued to increase the pace and volume of deposit mobilisation. We are alive to this responsibility.

It is appropriate that I should pass on to the performance of our Subsidiaries while on this subject of attracting more deposits. You will recall that I had referred last year to the ap-

pointment of a Committee to investigate and make recommendations in regard to the mobilisation of deposits in the areas, more especially the rural areas, served by our three Subsidiaries in the south, namely the State Banks of Mysore, Hyderabad and Travancore. One of the decisions we have taken on the Committee's Report is to assign field-workers to selected branches in rural areas not only for attracting deposits but for promoting banking services. I am glad to state that this measure has yielded encouraging results. We have also evolved a scheme of opening 'one-man' offices in a large number of rural centres. We are hopeful that this project with its threefold objective of reducing the cost factor, providing banking services and mobilising deposits will prove to be a contribution of real value to the promotion of rural banking in the country. Turning now to the figures given for our Subsidiary Banks as a whole in a separate section of the Report of the Central Board of Directors, you will notice that, in the aggregate, their deposits rose by Rs 27 crores to Rs 183 crores and advances by Rs 21 crores to Rs 95 crores. The combined profits have gone up from Rs 67.98 lakhs in 1963 to Rs 72.60 lakhs in 1964. Out of the seven Subsidiaries, five have declared dividends at the same rates as last year. The State Bank of Saurashtra has for the first time declared a dividend at 5 per cent. The State Bank of Bikaner and Jaipur, however, was not in a position to declare a dividend.

Activities in Rural Areas

Though we have decided to proceed with caution, and where necessary on a purely experimental basis, we are by no means content that the contribution which we make to the rural areas should be limited to the opening of branches, provision of the ordinary banking services and the mobilisation of savings through depositors' accounts. I have already referred to the large volume of finance we are making available for the procurement of foodgrains, as well as of other agricultural produce such as jute, by agencies sponsored by Government. Apart from this, in the allied sphere of co-operative credit, our limits to all types of co-operative institutions have increased from Rs 44.5 crores on December 31, 1963 to Rs 61.9 crores on December 31, 1964, and the outstandings from Rs 10.9 crores to Rs 21.4 crores. But all this does not amount to as large or as positive a contribution as we might eventually be able to make — that is to say, if we adequately equip ourselves in the matter of personnel, organisation and procedure — to the solution of the vast and diversified problem of rural credit in different parts of the country. We are already making a substantial contribution to marketing and processing credit in the rural areas. This is largely in the shape of loans to co-operatives or, as in the case of procurement, to State Governments. In the matter of credit for production in the rural areas — whether agricultural production or industrial production, and whether short-term credit or medium-term credit — our contribution is still small. It is deliberately and understandably so, the main role in this connection being that of co-operative banks, as distinguished from commercial banks. As you are aware, the co-operative credit structure operates in this particular context under the immediate guidance of the Reserve Bank and with its massive assistance. But the co-operative agency has not always or in all States attained adequate strength and resources to fulfil the role assigned to it, or at any rate to do so to such an extent as to make a supplementary agency unnecessary. The problem has consequently been under constant review at high levels of policy-making. So far as the State Bank is concerned, this important matter has also been under the consideration of your Directors for some time. While giving it the utmost attention, they have also had in mind, firstly, the limitations inherent in the working of a commercial bank, and secondly, the considerations arising from the need to co-ordinate the operations of the State Bank with those of the co-operative credit agency. This latter, it must be remembered, is at different stages of development in different States. It was after weighing all these aspects carefully that your Directors have recently approved of a scheme of Rural Pilot Centres to be operated by the State Bank of India and its Subsidiaries. After details are worked out, the scheme is to be introduced in different parts of the country. The main object is to assist in the provision of credit for production, agricultural and industrial, in rural areas. There will be 50 to 70 pilot centres distributed over the whole country: five to seven in each of the seven Circles of the State Bank, and two to three in the jurisdiction of each of the seven Subsidiaries. The unit of experiment is called a Pilot Centre, and not a Pilot Branch, because each branch selected (existing or new) is intended to serve the whole of the surrounding rural area which in many instances may comprise a number of villages. In addition to the usual items of banking services and mobilisation of savings, such a centre will seek to fill in, on a pilot basis, the gaps and inadequacies, if any, in the existing rural credit institutions: *e g*, provision of medium-term credit for agricultural machinery which may not be available to even creditworthy farmers in certain areas. The financing arrangements will, of course, be co-ordinated with the programme of re-organisation of co-operative credit and the operations of co-operative banks and societies in the areas to be covered. In working out the details of the scheme a distinction will be made between the different States with reference to the stage of growth of their co-operatives as well as the nature of the credit requirements of agriculture and rural industry in the particular area.

Foreign Exchange Business

Turning now to an entirely different aspect of our activities, namely, our increasing participation in foreign exchange business with the help of correspondents abroad and in some cases our own branches, I am glad to be able to announce that we have now finalised arrangements to open two Representative Offices abroad, one in New York and the other in Frankfurt. The Representative in New York will provide liaison with our correspondents not only in the United States but also in Canada and the Latin American countries, while the one in Frankfurt will do so in the whole of Europe. The arrangements are likely to come into force very shortly. Apart from fostering correspondent relationships in their respective areas, the Representatives will assess the market situations and other relevant factors in these areas, and generally provide a useful point of contact for us and our constituents with the banking, business and other interests in the countries which form their jurisdiction.

Within the country itself, the Bank has from its inception, as you are aware, embarked on a series of Branch Expansion Programmes. At the end of 1964 there remained 49 branches to be opened under the Second Programme. Meanwhile there had intervened the Third Programme which was intended to cover 319 branches at non-banking treasury and sub-treasury

centres over the five-year period 1964-68. Nine branches out of this programme were opened during 1964. There thus remain 359 branches to be established during the four years ending December 1968. Besides, there will, of course, be urban, suburban and other branches that will be opened outside the Expansion Programmes. This is for the future. As on December 31, 1964, the State Bank of India had 1,147 offices (and the Bank and the Subsidiaries together, as I have already mentioned, 1,759 offices). The number of offices of the State Bank in small towns and hitherto unbanked centres now comes to 564. In other words, more than half of our offices are currently located in small centres.

Change in Organisation Needed

It has been apparent for some time, against this background of expansion of branches, increase in work and diversification of activities, that the Bank's organisational structure would have to be modified and strengthened. The steps taken to that end are set out in the Directors' Report. First of all, in order to decentralise authority, it was decided to open three more Local Head Offices, so that each Local Head Office might have a relatively compact jurisdiction. The centres selected were Kanpur, Ahmedabad and Hyderabad. The first two came into existence during 1964, on the 1st of August and the 1st of December respectively. The third too has since been opened, six months after the first, on February 1, 1965. Today, therefore, there are seven Local Head Offices of the State Bank of India. Their establishment, and the concomitant reconstitution of the Central and Local Boards, were made possible by the amending legislation which came into force last year. Opportunity was at the same time taken to enhance, with effect from December 1, 1964, the powers and authority of the Local Boards. Suitable delegation has also been made to the Officers of the Bank at different levels. In the result, both the Local Boards and the allied Head Offices will now be able to cater much more effectively to the banking requirements of the respective regions. I am confident that this is a reform which all of you welcome. I should add that, with a view to enabling the Subsidiary Banks to handle expeditiously their own growing business, the powers of their Boards have also been recently enhanced. Moreover, in order to ensure a greater degree of co-ordination between the State Bank of India and its Subsidiaries, it has been thought desirable to associate some of the members of the Local Boards of the State Bank of India with the Boards of the Subsidiary Banks and *vice versa*. I am glad to be able to tell you that this decision too has already taken concrete shape.

New 'Service' Departments

Apart from decentralisation of authority and delegation of powers, a number of organisational changes have been effected during the last year or two. Thus, several new 'service' departments have been set up in the Central Office, with corresponding functionaries, where necessary, at the Local Head Offices. I made a reference last year to the Premises Department which has taken up, in a planned and phased manner, the task of improving our office premises at various centres in order to provide better working conditions for the staff and better customer facilities for our constituents. A new department has been organised under the name of 'Development and Public Relations Department' to handle more effectively our public relations and publicity, and, in particular, to bring the relevant aspects of the Bank's services to the notice of those who need them. A Personnel Department has been created in order to deal with all matters connected with recruitment, training and staff relations. With the growth of the institution, the need for ensuring a steady supply of suitable personnel assumed considerable importance, and so did the provision of adequate training facilities for them. To meet this requirement for the officer cadre, we have strengthened our recruitment machinery by constituting a Central Recruitment Board. We have also suitably extended our training facilities to different categories of staff at various levels.

I told you last year of the establishment of the Planning, Organisation and Methods Division which, apart from long-term problems of planning, has concerned itself with the simplification of procedures, the improvement of customer service and, more recently, with the various steps to be taken for setting up an Electronic Data Processing Centre. With the very large increase that has taken place in the number of branches as also in the volume of business, the handling and control of inter-office transactions has become a major problem. In dealing with this, we have not only had to revise our procedures but also actively envisage the installation of data processing machines which would ensure the speed required and at the same time adequately meet our needs for some years to come. It is intended initially to take up the reconciliation of inter-office transactions. The conclusion that it is necessary to establish an Electronic Data Processing Centre, as well as all the material on which the conclusion has been based, have been placed before the representatives of the Staff, and discussions held in the Joint Consultative Committee and outside. Further, an unqualified assurance has been given that there will be no retrenchment whatever on account of the scheme and that no existing employee will be adversely affected. May I express the hope that full co-operation on all sides will be forthcoming for the implementation of this scheme which is of the greatest possible importance to the State Bank of India and the public it serves?

Joint Consultation

I have referred to the Joint Consultative Committee. This is part of a scheme of joint consultation which has been evolved after considerable discussions. I am glad to say that the scheme is not only working satisfactorily but has, in my opinion, contributed materially to the fostering of cordial relations between the Management and the Staff. Some progress has also been made in the matter of formulating a suitable grievance procedure. I trust this will take shape shortly and help in eliminating many of the usual sources of friction. I am also happy to record that a number of welfare schemes have been initiated following the agreement to which I alluded last year regarding the utilisation of the Staff Welfare Fund. Apart from this, much progress has been made both in co-operative housing and co-operative consumer stores for the staff. There are now 70 co-operative housing societies in 60 different cities and towns. Eight buildings with 428 units have been completed so far, and some 60 buildings are in various stages of construction. The total loans made available on concessionary terms by the Bank now amount to Rs 1.05 crores, of which a sum of Rs 73 lakhs has already been utilised. Co-operative Consumer Stores have been established at 4 centres and others are scheduled to be opened in the near future at six more centres, all these being the bigger cities in which Local Head Offices of the State Bank or the Head Offices of the Subsidiaries are situated. It is with

some gratification that I look back on these and other constructive efforts which the Bank has initiated and is pursuing for the promotion of staff welfare as well as for the building up of harmonious relations between Staff and Management. I thank all members of the staff at all levels for their good work and devotion to duty during the year.

Before I conclude, I should like to place on record, on behalf of my colleagues on the Board and myself, our high appreciation of the services rendered by Shri B Mukerji and Shri N A Krishnan, Managing Directors, who are no longer with the Bank, as also of all those other Directors of the Central Board or Members of the Local Boards who have ceased to be on these Boards since we last met. It now remains for me to bid farewell to all of you — Shareholders of the Bank, Directors and Members of Boards, and colleagues of all ranks in the institution — and to thank you for the goodwill and co-operation I have consistently received from you during my term of office as Chairman. My successor, Shri Dehejia, has wide experience of finance. He is well-known to you. He will take over in a few days and I am confident that you will give him all the support which, over these three years, you have so kindly extended to me.

The Industrial Credit and Investment Corporation of India Ltd

Statement of the Chairman, Shri G L Mehta

THE Annual General Meeting of the Shareholders of the Corporation will be held at the Registered Office of the Corporation, 163, Backbay Reclamation, Bombay 1, on Thursday, April 8, 1965, at 4 p m. The following is the Statement by the Chairman, Shri G L Mehta, circulated to the Shareholders with the Directors' Report and Accounts for the year ended December 31, 1964.

Before I place for your consideration the Tenth Annual Report of the Board of Directors of the Corporation for the year ended December 31, 1964, I would like to refer to the sad demise of Pandit Jawaharlal Nehru. Of his multifarious interests, the one that concerned ICICI was his deep interest in India's economic growth and his faith in planning to achieve it. We owe to him in no small measure a consciousness of planned endeavour for national development as well as the achievement of political stability essential for economic progress.

On January 5, this year, ICICI completed ten years of its existence. During this period, ICICI has sanctioned, to 328 companies for 374 projects, total assistance exceeding Rs 100 crores — to be exact, Rs 102.29 crores (Rs 22.25 crores by way of underwriting, Rs 5.53 crores in direct subscription, Rs 25.54 crores in rupee loans including guarantees and Rs 48.97 crores in foreign currency loans). ICICI-financed projects, when completed, are expected to produce 150,000 tons/year paper, 3,657,000 tons/year cement, 173,000 tons/year steel tubes, 118,000 tons/year cast iron spun pipes, 20,000 tons/year wire ropes, 217,000 tons/year super-phosphate, 3,400 miles/year power cables and 243,000 units/year electric meters.

This has been an eventful decade both for the national economy and for ICICI. ICICI is a small element in the total economy but its experience under planning and of planning is sufficiently long to enable us to draw some lessons for the future.

At a time when it has become habitual in some quarters to blame planning for all the evils of the economy, let me state that planning has helped the economy to grow at a fairly rapid pace and in a reasonably orderly manner. Psychologically, it has helped to induce some measure of discipline in the use of scarce resources and to bring hope to the mass of people by breaking the vicious circle of stagnation in the economy.

Within the ambit of planning the economy has grown, and ICICI has grown with it. Planning has led to the setting up of several non-traditional industries; we have participated in the setting up of many of them. Under planning, several new entrepreneurs have been induced to enter industry; we have helped in this process by financing many of them. Planning has helped to decentralise the location of industry, and our operations, following this, are distributed all over the country.

Our operations, however, have also been subject to the limitations that certain policies under planning have involved. To some of these I would like to allude specifically.

To begin with, I would like to refer to the existence of price and distribution controls on many essential commodities, notably cement, sugar and paper. One of the results of this policy has been to reduce, severely, investment interest in these industries. Cement shares are not fancied by the investing public, and most new paper shares are quoted at substantial discount. This, combined with the failure of these industries to generate internally sufficient funds for their expansion, has led to a perpetuation of the shortages which initially brought about price controls. Price controls have not prevented inflation, but only helped to divert inflationary pressures in other directions. Where we have taken interest in these industries, it has been due mainly to a sense of public spirit and in the hope that the Government would modify their policy in regard to these industries.

Moreover, Government has required many industries, both chemicals and engineering, to follow a phased programme of manufacture. This has created undue strain on several industries, particularly as economies of scale in different lines of manufacture vary. A phased programme necessarily depends upon co-ordinating several manufacturing activities, and where one of them lags behind for any reason, it upsets acitvity in other lines. For example, the failure to set up adequate capacity for basic chemicals, pig iron and flat products, has created difficulties for many fine chemical and pharmaceutical manufacturers, foundries, and structural engineering companies.

Besides, as the economy has grown, it has become increasingly difficult to provide for all its requirements for raw materials and components—what have come to be called maintenance imports. As each new industry is set up to meet some existing need of the economy, it, in its turn, creates a demand for other imported goods. As we become more industrialised, the demand for imports does not decrease; it only gets transformed. Unfortunately, while we are putting up more factories, we have failed to provide for their requirements of maintenance imports. Many of ICICI's clients, at a conference we recently held, referred to this shortage of imported raw materials and components.

We also need to take a more critical look at the kind of industries we are setting up. Many industries we have set up, involve high costs which are reflected both in the price differentials of products in India and abroad as well as in our export performance. There are many reasons for this, such as the high level of taxes on imported capital equipment and materials, inadequate utilisation of capacity and so forth. But there are other reasons, like setting up plants of less than an optimum scale, which are within the planners' control, and we should seek to overcome such limitations.

Unbalanced Growth of the Economy

Furthermore, we have suddenly come face to face with unbalanced growth, shortages in respect of some goods and surpluses in the case of others. The growth rate itself has tended to falter in recent years and the emergence of surpluses has tended to dampen the enthusiasm of entrepreneurs. The emergence of surpluses indicates that the demand assessment made by the planners in many cases has been too optimistic.

Finally, as our economy has grown, the mechanism for procedural control has become more complex. In our day-to-day operations, the procedure that concerns us most is import control for capital goods. This is a detailed system of control by reference to individual pieces of equipment—a process which is necessarily time-consuming. Last year, a Committee examined these procedures, and suggested various measures for expediting action. In fact, the system of having a preliminary clearance by the Capital Goods Committee which has been recently introduced, has facilitated considerably the issue of import licences.

As we are in the midst of assessing our performance under the Third Plan and, on this basis, are endeavouring to formulate the outlines of the Fourth Plan, we need to take into account these lessons of the Third Plan. A 10 to 15 per cent shortfall in investment with a much larger shortfall in physical output, as also at least one economic crisis, have become common features of each of our plans so far. We can ill-afford to carry on in this manner for long.

We need, therefore, to take a close look at our system of planning and the policies needed to achieve the plan objectives. First of all, it is necessary to break through shortages in certain critical commodities; besides foodgrains, these items are sugar, cement, fertilisers, steel and alloy steels. In many of these cases, the adoption of proper pricing policy would help to work off the shortages. There is little justification for keeping low the prices of these basic goods for all uses. There is a case for allowing free sale of a part of the total output of these goods which can go to meet their low priority uses.

Another step would be to examine the implications of our industrial programmes on the maintenance import budget and to frame a programme which would, at the least, not worsen our position in this respect. It is essential to intensify the programme aimed at import substitution or export promotion to a significant degree.

We should then seek to so formulate our procedures that the execution of the programme laid down is expedited. We are even today suffering owing to the fact that we did not have the steel plant which we planned during the First Plan period, the alloy steel capacity which we planned for the Second Plan period, and the fertiliser capacity we planned for the Third Plan period. Even in the much smaller projects which ICICI finances, we find that delays occur, sometimes of periods exceeding one year, in the completion of projects, resulting in corresponding loss of output.

★

During the last two years, the Government has done considerable rethinking which concerns the direction of our economic policy. As a result, we have removed, wholly or partially, controls on many commodities, revised procedures to make for quicker decisions, and sought to change the bias of planning in favour of less spectacular but more essential projects. The increasing emphasis on agriculture will have its impact on fertiliser and tractor output, and thus may help to shape industrial programmes. We are living in the midst of a dynamic situation and there can be no end to the process of re-thinking. It must go on, even as new economic problems face the economy.

I have deliberately not referred above to the condition of the capital market—a situation which affects directly a finance institution like ours, and which, therefore, needs to be examined closely. It is only emphasising the obvious when I state that the capital market has been stagnant throughout the last year and remains so at this moment.

Underwriting Operations

The impact of such a situation is felt on our operations. During the last 10 years of completed share underwriting operations of Rs 11.52 crores, ICICI was left with Rs 6.10 crores. As against this, of the nine share underwriting operations for Rs 132 lacs completed during 1964, ICICI was called upon to take up as much as Rs 122 lacs. This, by any standards and in relation to our past experience, is a high figure. It is hardly a satisfactory position in the long-run for a financial institution.

This is not purely a financial phenomenon but has its repercussions on the economy as a whole. Entrepreneurs, faced with an unfavourable capital market, hesitate to take up projects or take much longer to complete the financing of their projects. We have to weigh this factor in undertaking underwriting obligations as one after another share issue underwritten by us has failed to meet with public response.

Underwriting has some meaning when there is a fair prospect of success for a public issue. And, while we do not object to holding an investment in the construction phase of a project, we do look forward to a time when we can dispose of our investments on the market. A development bank like ICICI depends upon revolving its funds invested in shares. And yet, in the last year, we have found it difficult to sell much of our holdings of ordinary shares.

The capital market has passed through almost three difficult years. After a lag, this is being reflected in a fall in the fresh issues of equity capital, as well as in the rate of growth of industrial production, and presumably also in that of the industrial investment rate. If investment activity has been sustained, it has been principally because of institutional support. I believe that this situation can be easily and quickly corrected by appropriate fiscal measures. The re-

cently announced tax relief for subscription to new issues is welcome as an indication of Government's concern about the capital market. I hope that Government will follow this up with further measures to help revive the market without which industrial development and economic growth will not be possible.

★

ICICI sanctioned in 1964 net financial assistance of Rs 19.08 crores; of this, the amount sanctioned for new projects was Rs 14.03 crores for 67 projects. The total cost of these projects, on completion, is estimated to come to Rs 112.26 crores (including Rs 27.65 crores for working capital). This cost is expected to be financed by the issue of Rs 30.83 crores of share capital (Rs 26.13 crores ordinary and Rs 4.70 crores preference), long-term loans of Rs 38.52 crores and bank borrowings and cash accruals of Rs 42.91 crores. When these projects reach normal production, their turnover is estimated to amount to Rs 68.48 crores. These projects would then bring about a net foreign exchange saving of Rs 24.96 crores.

With the continued growth of our operation, we have found it necessary to increase our resources. In 1964, we obtained two further lines of credit, one of DM 10 million and another of DM 5 million, from Kreditanstalt fur Wiederaufbau, making in all DM 40 million from that institution. We are obliged to the Kreditanstalt authorities for their continued confidence in ICICI.

Towards the end of the year, we also exhausted the fifth line of credit of $ 30 million from the World Bank. We have approached, with the concurrence of the Government, the World Bank for a further line of credit of $ 50 million, for which negotiations have started. The negotiations have as always been cordial, and we are grateful to the World Bank and to the International Finance Corporation for their understanding of our problems and their continued support to ICICI. We appreciate the co-operation and support of the Government extended to us in this matter.

As our loan obligations have increased, we have felt the necessity to strengthen our equity base. We are, therefore, considering the question of making a rights issue of one for every two shares held. I trust we shall receive your valued support for this issue.

In 1964, the Corporation earned an income of Rs 311.85 lacs from interest, dividends, underwriting commission and other sources. After deducting interest on loans and other expenses, profit subject to tax amounted to Rs 124.60 lacs against Rs 101.54 lacs in 1963. From this, we have provided Rs 54.49 lacs for taxation and Rs 1.01 lacs for doubtful debts, the balance carried to appropriation account being Rs 69.10 lacs against Rs 57.88 lacs in 1963. An amount of Rs 31.50 lacs has been transferred to Reserves. The capital gain of Rs 3.06 lacs has been transferred to Capital Reserve Not Available for Dividend.

The Directors are glad to recommend a dividend of 7½ per cent, as against 7 per cent last year. Subject to adequacy of profits and the need to build up reserves necessary for a development bank like ours, the Directors have kept in view the shareholders' interests and have raised the dividend rate, whenever possible.

We have recognised the need to build up friendly relations with other development banks, both in India and abroad, and also with our constituents. We received in 1964, Mr S Barkhordarian and Mr I Hedayat, both of the Industrial and Mining Development Bank of Iron, Mr Samuel Odame-Labi of the National Investment Bank (Ghana) and Mr Paul C Joe-Adigwe of the Nigerian Industrial Development Bank (Nigeria) as trainees. We are also setting up a regular training programme for two officers from development banks in other countries.

Finally, I would like to express my appreciation of the work of our staff whose competence and devotion to the organization have helped to bring it to its present position.

Bombay, February 11, 1965.

The following statement about ownership and other particulars of *The Economic Weekly* is published in accordance with Rule 8 of the Registration of Newspapers (Central) Rules, 1956.

Dated March 6, 1965 **Sd. A Fernandes** Signature of Publisher

Direct Taxation

The principal features of changes in direct taxes announced in his Budget speech by the Finance Minister are:

(1) Drastic simplification and significant reduction of personal taxes.

(2) Ceiling on company taxation and advance rebate on future profits; and

(3) Selective tax concessions to promote investment in certain directions, to improve utilisation of capacity and step up exports.

THE long-standing superfluity of a super tax distinct from income tax has been removed. So far there was income tax with various (three or four) surcharges, and then super tax on income with its own surcharges, followed by a bewildering variety of rebates, some of which applied only to income-tax but not super tax or vice versa, or only one or both the taxes but not the surcharges. There will now be a single income tax with surcharges on unearned income above Rs 15,000 and earned income above Rs one lakh.

There will be a single rate schedule for three categories of non-company assessees, namely, individuals, Hindu undivided families and unregistered firms or associations of persons. Instead of different tax exempt minima, tax will be calculated on the entire income without providing for any exempt slab. Individuals and H U Fs will get tax relief on the basis of personal allowances, which would be higher than the present tax exempt slabs. Table 1 gives the new rates of personal allowances and the initial slabs so far exempt. The new scheme will benefit bachelors, too.

Lower Rates

The rates of income tax (as consolidated with super-tax) have been significantly reduced at all levels and the income slabs have been re-graded. There is, however, no change in annuity deposits. The rate on the first slab of Rs 3,000 will go down from 6 to 5 per cent and will be reduced by 5 per centage points on each slab from Rs 7,500 to Rs 50,000, and by 10 points to 60 per cent between Rs 50,000 and 70,000. The maximum rate exclusive of surcharge above Rs 70,000 will go down from 75 to 65 per cent. The taxes payable at various levels of wholly earned and unearned income are shown in Table 2. It would be noticed that there is a substantial decline in tax liability at all levels, especially if the reductions made in 1964 are also kept in mind.

The receipt of interest on government securities and annuities, under the annuity deposit scheme will henceforth be treated as earned income. The exempt slab for surcharge on unearned income has been raised from Rs 10,000 to Rs 15,000; surcharge therafter

Table 1: Personal Allowances for Individuals and HUFs

	Initial Tax-free Slab 1964-65	Personal Allowance for Tax Relief 1965-66
(1) Unmarried individual	1,000	2,000
(2) Married individual or HUF without minor co-parcener	i) 3,600 if income upto 20,000 ii) 1,000 if income above 20,000	3,500 3,500
(3) Married individual with one child or HUF with one minor co-parcener	i) 3,600 if income upto 20,000 ii) 1,000 if income above 20,000	3,900 3,900
(4) Married individual with more than one child or HUF with more than one minor co-parcener	i) 4,000 of income upto 20,000 ii) 1,000 if income above 20,000	4,300 4,300

Table 2: Tax and Deposit Liability of a Married Individual with More Than One Child

Income Before Deduction of Annuity Deposit (1)	Amount of Annuity Deposit (2)	Total Income (col 1 Minus col 2) (3)	Amount of tax: Wholly earned income 1964-65 (4)	Wholly earned income 1965-66 (5)	Wholly unearned income 1964-65 (6)	Wholly unearned income 1965-66 (7)
4500	...	4,500	30.50	10.00	20.00	10.00
5,000	...	5,000	60.00	25.00	60.00	25.00
7,500	...	7,500	310.00	285.00	310.00	285.00
10,000	...	10,000	685.00	525.00	685.00	535.00
12,500	...	12,500	1,060.00	910.00	1,102.50	910.00
15,000	...	15,000	1,560.00	1,285.00	1,756.00	1,285.00
20,000	1,000	19,000	2,360.00	2,085.00	2,656.00	3,245.00
25,000	1,880	23,120	3,832.00	3,221.00	4,312.00	3,608.00
40,000	3,000	37,000	10,340.00	9,285.00	11,891.00	10,885.00
70,000	7,000	63,000	26,590.00	22,585.00	30,578.50	28,436.00
100,000	12,500	87,500	44,615.00	39,160.00	52,422.62	47,303.75
200,000	25,000	175,000	1,15,865.00	98,472.50	1,29,532.00	1,18,997.50

will be at graduated slab rates (and not step rates) allowing for an exemption of Rs 15,000. The existing and new rates of surcharge are given in Table 3. The proposed surcharge will be levied on unearned income as a separate entity and not in the highest strata of the assessee's total income. For instance, if an assessee's total income was Rs 1 lakh, made up of Rs 70,000 earned and Rs 30,000 unearned, tax was levied on the latter at the highest rate of 75 per cent and then a surcharge was imposed on the tax. Thereby an earner with some unearned income was taxed more harshly than a person with wholly unearned income.

The surcharge on earned income will be levied above Rs 1 lakh as at present, but on the first slab of Rs 1 lakh, it will be reduced from 10 to 5 per cent. Beyond Rs 2 lakhs, it will remain unchanged at 10 per cent from Rs 2 lakhs to Rs 3 lakhs, and 15 per cent on the balance.

Insurance and Provident Fund

Instead of a proportionate rebate based on the average rate of income tax (till 1963-64) and super-tax (1964-65) allowed for life insurance premia, cumulative time deposits and provident fund contributions, there will be an outright relief by way of deduction now. An assessee can contribute 10 per cent of his income upto a limit of Rs 12,000 for individuals and Rs 25,000 for HUFs (against Rs 10,000 and Rs 20,000 respectively, so far) and claim an outright deduction of one-half of the total contribution from his liability. Salary earners will get this benefit from April this year and for subsequent years but others will qualify in respect of their income for 1964-65 also.

As announced earlier, individuals and HUFs will get assistance in the form of tax free tax credit certificates for subscribing to the first equity issue of public companies. The assistance will be 5 per cent for amounts paid upto Rs 15,000, 3 per cent for the next Rs 10,000 and 2 per cent for the next Rs 10,000, making in all Rs 1,250 or 3.6 per cent for a total investment of Rs 35,000. The certificates can be used to offset tax liability during the year of investment and the three following years if the assessee continues to hold the shares during that period. In the event of a sale or transfer before the completion of the fourth year, the certificate would be for an amount proportionate to the investment retained after the sales. This scheme, which is to be handled by the Reserve Bank of India, has yet to be drawn up. Besides, there would be exemption from wealth tax for five years for equity investment in companies issuing capital for the first time after February 28, 1965.

To meet the strong criticism of the levy of capital gains tax on bonus shares received by shareholders, it is proposed to reduce the tax by 10 per cent of the value of such bonus shares. This concession runs contrary to the general policy of simplification proposed in personal taxation. Since the capital gains represented by bonus shares is unrealised — and the total bonus issue is taxed at 12.5 per cent in the hands of the company — and since the revenue and social justice potential of the tax are nominal, this tax could have been dropped altogether.

In order to further encourage savings, it is proposed to restore the pre-1961 Act treatment of repayments out of approved superannuation funds on the resignation, dismissal or discharge of an employees. Such repayments will henceforth be exempt from tax.

Partners of professional firms like chartered accountants, architects, solicitors and lawyers, who cannot enjoy the benefits of provident fund and other retirement benefits would be permitted a reduction upto 10 per cent of their total income, subject to a maximum of Rs 5,000, for contributions to retirement annuities.

To curb the excessive diversion of investment into urban real estate, it is proposed to levy an additional wealth tax on such properties in towns with a population of 1 lakh or more. The exemption limit for this purpose would vary according to the population of the town—Rs 2 lakhs for population between 1 lakh and 4 lakhs, to Rs 5 lakhs for population over 16 lakhs. The population slabs correspond with the classification adopted for dearness allowance to central government staff. The additional tax would rise from 1 to 4 per cent on the successive slabs.

There is at the same time a minor liberalisation of estate duty and gifts tax to avoid the hardship caused by imposition of both where death follows within two years (generally) and five years (in case of close relatives) of a gift which has borne gifts tax.

The rate of interest payable on delayed dues or refunds, etc, by both assessees and government will be raised from 4 to 6 per cent.

The Finance Minister estimates the loss of revenue on account of personal allowances at Rs 3.64 crores, adjustments of rates at Rs 20 crores, and alterations in surcharges at Rs 69 lakhs. There would also be some loss of income because the 1965-66 rates will apply both to 1964-65 incomes and advance payments for 1965-66. He has given no separate figure of the loss in personal taxation. The income from additional wealth tax on urban property would be Rs 1.5 crores.

Table 3: Surcharge on Unearned Income

Income Rs	1964-65 Rate %	Income Rs	1965-66 Rate %
1 Upto 10,000	nil	(1) Upto 15,000	nil
2 Entire unearned income above 10,000 upto 25,000 subject to marginal relief	12.5	(2) Next 35,000	20
3 Entire unearned income 25,000-75,000	15.0	(3) Balance	25
4 Entire unearned income above 75,000	17.5		

Registered Firms

The rates of income tax on registered firms are unchanged (see *The Economic Weekly*, March 7, 1964, p 489). A slight modification is, however, being made in the rate of surcharge to remove the unintended bias in favour of income from house property and dividends, So far the surcharge on business income was 20 per cent and on other income 10 per cent. It is now proposed that when 51 per cent or more of the income of a firm is from a profession, the surcharge would be only 10 per cent, in other cases it would be 20 per cent.

Corporate Taxation

(A) Companies in which the public is substantially interested and their wholly-owned subsidiaries:

The rate of tax on companies with income upto Rs 35,000 will remain at 42.5 per cent. Companies with income above Rs 25,000 will be taxed at 50 per cent: if they are engaged in specific basic industries, the rate of tax would be 45 per cent. Besides the 14 basic industries specified last year, ships, limestone, flame and drip proof motors, malleable iron and steel castings and calcium ammonium nitrate are also classified as basic now.

There will be no change in the 7½ per cent tax on equity dividends, and 12½ per cent tax on the value of bonus shares issued from reserves other than the share premium account.

The surtax will remain unchanged but the 25 per cent rebate on income from basic industries will apply to newly included industries also. Besides, the total tax liability of a company, including the equity dividend tax, will not exceed 70 per cent; the balance of tax liability would be deductible against surtax. The present maximum liability, it is believed, is about 74 per cent in a few cases.

(B) Companies in which the public is *not* substantially interested.

It is proposed to amend Section 2(18) of the Income-tax Act to provide that a company in which 51 per cent or more of the equity capital is held by another company which is a genuine public company or its wholly owned subsidiary, will be deemed a company in which the public is substantially interested. This change would help foreign and Indian subsidiaries of foreign companies but it does not end the confusion about the definition of a Section 104 (formerly 23A) company for, Section 2(18)(b)(iii) still lays down as an essential condition that "the affairs of the company or the shares carrying more than fifty per cent of its total voting power were at no time during the relevant previous year controlled or held by five or less persons". Since each company and group of relatives count as one person, the anomalies of the definition would remain.

Industrial companies would be allowed to accumulate their reserves equal to twice (instead of just equal to) their paid up capital plus loan capital or value of fixed assets whichever is higher. They have to distribute only 60 per cent of their profits till this limit is reached, and 90 per cent thereafter. The penal rate on failing to distribute 90 per cent, when required, has been reduced from 37 to 25 per cent. In effect, such companies will never attract the penal rate now.

The taxation of Section 104 industrial companies would be significantly reduced. They would be taxed at 50 per cent (45 per cent for basic industries) on the first Rs 10 lakhs of income and 60 per cent (54 per cent on basic industries) on the balance In 1964, the concessional rate of 50 per cent applied only to companies with an income of upto Rs 5 lakhs and that too on the first Rs 2 lakhs.

Non-industrial companies, however, will continue to be taxed at 60 per cent, with a concessional rate of 54 per cent for income from basic industries.

Development Rebate

The tea industry would be allowed a development allowance of 40 per cent on new bushes and 20 per cent on replantation of old bushes. This would meet an urgent and long standing demand.

Development rebate would be graded according to priorities after March 31, 1967, till which date it will continue at 20 per cent standard. New ships and coal mining machinery will continue to get 40 per cent and 35 per cent. Specified plant and machinery will get 25 per cent after March 1965; others will get 20 per cent till March 1967 and 15 per cent thereafter. The major items in the specified list are equipment in steel, nonferrous metals, specialised equipment in certain industries, boilers and steam generating plants, machine tools, tractors, cement, fertilisers, paper, electronics and petro-chemicals.

After March 1965, air conditioners, fans and refrigerators will not qualify for development rebate.

The 1964 rebates on income from exports will continue. These are: (1) rebate of 10 per cent of tax on profits from exports, and (ii) for certain items, 2 per cent of additional sale proceeds is set off against tax liability. A further concession is now proposed. Under a scheme still to be framed, credit certificates upto a *maximum* of 15 per cent of additional exports after January 28, 1965 would be given and this amount can be offset against the assessee's tax liability within a year: alternatively, the assessee would qualify for refund.

Two long-term production incentives are also given, one in the form of excise rebate, the other for income tax. This is the first time that such a general tax concession for additional production and profits has been given and that too for a period of five years. Both the schemes have yet to be framed, however.

Taking 1964-65 as the base year, a manufacturer who increases production during the five years 1965-66 to 1969-70 will get tax credit certificates equivalent to a *maximum* of 25 per cent of the additional central excise duty payable in any year over that paid in the base year. These certificates can be adjusted against income tax dues or used for repayment of loans from financial institutions or for redemption of debentures.

Further, over each of the five assessment years 1966-67 to 1970-71 (fiscal years 1965-66 to 1969-70), industrial companies will get tax credit certificates equivalent to 20 per cent of the excess of aggregate income tax and surtax liability (excluding equity dividend and bonus issue tax) over the aggregate liability in the assessment year 1965-66, which will serve as the base year. The amount of the certificates (to be issued by the RBI) can be adjusted or utilised in the same manner as above. The maximum relief under this head would be restricted to 10 per cent of income tax and surtax liability in any particular year.

Public companies shifting their undertakings to new areas would be exempt from capital gains tax. The relief would again take the form of tax credit certificates. Expenditure on the promotion of family planning among employees would be allowed as a deductible expense.

Foreign Investors and Personnel

Non-resident individuals would be charged tax at the same rates as residents (which means at lower rates instead of the present high flat rate of 48 per cent and more). They will not, however, qualify for personal allowances or exempt slabs.

Royalties, technical fees, etc, will be taxed as before at 50 per cent. The tax on inter-corporate dividends would be 25 per cent standard and 15 per cent for basic industries. Non-residents will not pay capital gains tax on sale of shares if the gains are reinvested within two years.

The period of tax-free residence of foreign technicians still remains at three years. At present, they can remain for another two years if the tax is paid by the employer; this period will be extended to five years. The tax paid by the employer will also be permitted now as a deductible expense.

Around Bombay Markets

Budget Fails to Cheer Dalal Street

Thursday, Morning

ONLY the stock market seems sorely disappointed with T T K's Budget. Notwithstanding the announcement of considerable tax relief and various concessions designed to stimulate production and promote savings and investment, the stock market beat a hasty retreat in the special Budget session on February 27 and within an hour or so it lost all the ground it had gained in the pre-Budget week. It all happened because of the absence of the widely anticipated relief in respect of the dividend tax and the capital gains tax on bonus issues. It was a typical crisis of expectations. Since the dividend tax and the capital gains tax are thought to have adversely affected the climate for investment without making any worthwhile contribution to the national exchequer, the stock market had taken it almost for granted that these taxes would be abolished.

In its mood of frustration, the market paid little attention to the various fiscal concessions provided in the Budget. The stock market has never really taken kindly to TTK. The relief in personal taxation at all levels, reduction in excise duty on coarse and medium cloth, rayon yarn and a number of consumer articles, tax credit in respect of excise duty on production in excess of that in the base year, tax credit in respect of additional corporation tax including surtax paid by any company over the corresponding tax in the base year, tax credit for exports, increased development rebate for certain industries, wealth tax concession in regard to investment in new issues, enlargement of tax concessions to certain companies falling under Section 104, attractive bait for unearthing unaccounted money — all these add up to sizable relief, particularly when viewed in the context of the pressing need to mobilise resources for financing the massive Fourth Plan.

The stock market's reaction to the Budget proposals could not be dismissed as purely impulsive because second thoughts on the Budget brought little cheer. The market, in fact, made a new low on March 3 — the lowest in the downward move which has been in evidence since about the beginning of February. It is possible that the market's performance might have been less disappointing if the decline in equity prices in the special Budget session had not uncovered some weak bull positions which resulted in substantial forced liquidation. When one goes round the stock market one gets the impression that investors' confidence can be easily restored by the abolition of the dividend tax and the capital gains tax on bonus issues. And yet, their impact is mainly psychological: in real terms, the incidence of these taxes is very small.

While the trading sentiment is still unsettled, it appears that the market will not take long to appreciate the significance of the various tax reliefs and concessions provided in the Budget. Whether these incentives will have a strong impact on the economic tempo is a debatable point. Fiscal concessions cannot, by themselves, produce any economic miracle. Fiscal policy has its obvious limitations in stimulating production in an economy characterised by acute physical shortages. And so far as the outlook for equities is concerned one has also to bear in mind the interest rate structure that has come to prevail with the increase in the Bank Rate to 6 per cent.

Cotton

Ceilings to Go?

THE Indian Central Cotton Committee has recommended that for the 1965-66 season, ceiling prices for cotton should be abolished and only support prices fixed. Further, that the support prices should be related to the cost of production and should be in parity with the prices of other agricultural commodities and also take into account seasonal variations. The committee has prepared a report on the scheme for estimating costs of cultivation of cotton and its rotation crops in the major cotton growing tracts in the country. This report has been submitted to the Agricultural Economic and Marketing Committee of the Indian Council of Agricultural Research for a thorough study.

Since this report has yet to be made public, it is difficult to say whether the committee's recommendation to remove the cotton ceilings and fix only support prices instead is based on the findings in its study of costs of cultivation of cotton and other rotation crops in the major cotton growing areas. A very thorough study of farm accounts alone can provide an indication about the economic relationship between the prices of various agricultural crops. In the absence of any competent study on the costs of cultivation of major crops it is difficult to say whether the ceiling prices of cotton are hindering the production of cotton.

The main argument in favour of the abolition of ceiling prices has been that cotton has been unnecessarily singled out for control; there exists no statutory price control over other agricultural commodities such as oilseeds. Not only that, even cloth made from cotton is subject to only partial control. And above all, price control over cotton has always been honoured more in breach than in observance. If control cannot be strictly enforced, it is perhaps better to do away with it. No doubt, this is counsel of despair but there is considerable substance in the view that high prices are to be preferred to the deterioration in quality of cotton and cottonseed that comes about through mixing of different varieties which is widely resorted to in order to circumvent price control. While it is possible to build a strong case for the removal of cotton, especially when the industry itself is in favour of its abolition, one cannot be at all sure that higher prices will really help increase the production of cotton.

Amusing

In the February issue of its Journal, the Indian Cotton Mills' Federation says "The past month (January) was a highly fruitful month for the cotton mill industry. Among the constructive results which emerged during the month, the pride of place must go to the fairly successful implementation of the Federation's scheme of self-restraint in cotton purchases by mills. It must be said to the credit of the Textile Commissioner, the trade, the growers and the mills, that it was because of their cooperation in operating the scheme that it has brought about a fair measure of stability to cotton prices." All this makes an amusing reading in the context of the real situation

obtaining in the cotton market. For cotton prices continue to be well above the statutory ceiling, excepting a few varieties. Many mills are known to have been making clandestine purchases of cotton above the ceiling prices, the Federation's scheme of self-restraint notwithstanding. Growers have made several strong representations against the Federation's scheme. The Textile Commissioner is known to have taken no action against the erring mills or against growers and traders who have been contravening the cotton control order.

There has been no material change in the conditions obtaining in the cotton market recently. The turnover in the spot market continues to be restricted. Prices continue to rule above the ceilings. Mill consumption of cotton in the first four months of the season —September to December—is placed at 21.82 lakhs comprising 19.33 lakh bales of Indian cotton and 2.49 lakh bales of foreign cotton. In the same period last season, mills consumed 19.10 lakh bales of Indian cotton and 2.16 lakh bales of foreign cotton. Arrivals of foreign cotton since the beginning of the season on September 1 to February 20 are placed at 4.18 lakh bales as against 2.71 lakh bales in the same period last season. Of these, U S cotton accounted for 2.25 lakh bales against 1.09 lakh bales. Exports of Indian cotton during the same period total 1.05 lakh bales against 1.06 lakh bales, out of which Japan took 79,977 bales against 77,298 bales.

Oilseeds

Prices Drift Lower

THE oilseeds market showed a distinctly easier tendency last week. And what is more, the maturing contract in castorseed which had hitherto been remarkably firm on strong bull manipulation registered the sharpest decline. Castor March which was marked down to Rs 201 on March 3 had touched a high of Rs 209.37 (per 250 kgs) in the preceding week. The fall occurred despite the absence of any tenders on the first notice day. Bulls who had been dominating the scene for a long while on the idea that bears would be forced to give in because of the substantial premium enjoyed by the spot material are now beginning to feel uneasy as the spot premium has virtually disappeared with the increased tempo of arrivals in the main producing centres; castor ready Bihar variety is currently quoted around Rs 195 (per 250 kgs). While arrivals are picking up, export business in castor oil remains at a standstill and the wide disparity of about £40 per ton in the Indian and world prices of castor oil virtually rules out the possibility of any important export business in the near future, unless, of course, the Communist countries, more particularly Russia, enter the Indian market. Satisfactory domestic crop and unpromising export outlook for castor oil explain why the June contract is quoted at a discount of about Rs 4 per quintal below the March contract.

Linseed have been keeping distinctly subdued for quite some time and prices have been gradually sagging on reports of a better harvest and record production of mustardseed and rapeseed. Spot linseed which had fetched as high a price as Rs 72 in the beginning of January could be had at around Rs 45 (per 50 kgs) on March 3. Futures have also been drifting lower in sympathy with the declining trend in the spot material. The March contract which had been bid up to Rs 46.25 (per 50 kgs) in the previous week was sold down to Rs 44.06 towards the close of last week and the distant June contract moved down from Rs 91.75 to Rs 86.55 (per 100 kgs) during the same period. Linseed oil ready was quoted around Rs 18.50 (per 10 kgs); early in January, linseed oil ready had been marked up to Rs 31.

Groundnut and groundnut oil have held relatively steady in the past week or two, with groundnut oil fluctuating between Rs 20.70 and Rs 21.50 (per 10 kgs). The recent steadiness in groundnut oil is attributable to sustained buying by vanaspati manufacturers mainly because of the delay in the arrivals of soyabean oil from the U S owing to the dock strike there. The relief in excise duty on vegetable products has had no noticeable effect on groundnut oil prices though the price of vanaspati has come down by about Rs 3 a tin, that is, by about the full amount of the duty relief. There has been an extraordinary delay in securing soyabean oil from the U S and nearly all the price advantage that the vanaspati industry was expected to get from the use of cheaper oil has disappeared. Soyabean oil prices have recorded a marked rise over the past few months and imports have become costlier with the imposition of the additional 10 per cent regulatory customs duty.

The Budget proposal regarding tax credit certificates for exporters has caused very little excitement in the oilseeds market. This is partly because uncertainty continues about the details of the proposed scheme and partly because export of important edible oil is prohibited. Details of the scheme for grant of tax credit on exports are awaited with keen interest. Nothing is known yet as to how the existing export incentive scheme will be modified in view of the system of tax credit certificates that the Finance Minister Krishnamachari has announced.

Business Notes

State Bank of India

THE year 1964 has been one of exceptional progress for the State Bank of India. There has been a very appreciable increase in tempo along the whole range of its activities. The progress covers also such special fields as branch expansion, rural credit, assistance to small-scale industries and medium-term financing.

In the busy season of 1963-64, the volume of the Bank's credit operations expanded by Rs 125.3 crores, as against a mere Rs 42.9 crores in the previous busy season. The Bank thus accounted for a third of the total credit expansion by scheduled banks in the busy season, compared with a little over a fifth in the previous season. At the end of 1964, the credit-deposit ratio stood at 64.5 per cent, against 58.6 per cent a year ago. The Bank's deposit resources showed substantial improvement, with the aggregate deposits rising by Rs 100 crores, compared to a rise of Rs 75.2 crores in 1963. Demand deposits were up by nearly Rs 49 crores and time deposits by over Rs 51 crores; the corresponding figures for the previous year were Rs 25.7 crores and Rs 49.5 crores. During the busy season, the Bank's deposits increased by Rs 53.5 crores as compared with Rs 35.7 crores in the previous season.

During the year, financial assistance to all types of co-operative institutions recorded a further increase, and the Bank's assistance to small-scale industries under the liberalised scheme of finance set a new record. There was

also a significant increase in medium-term finance which now accounts for about ten per cent of the Bank's total credit portfolio. A scheme has been evolved to assist machinery manufacturers in respect of their sales on deferred payment basis. Foreign exchange business too recorded further progress, and the Bank continued to finance foreign trade arising from barter deals and other trade agreements entered into by the Government of India and S T C.

Of the 149 branches to be opened in the five-year period ending June 1965 under the second branch expansion programme, 100 branches were opened by the end of 1964. With a view to extending banking facilities to rural and semi-urban areas, the Bank has embarked upon another programme of opening 319 branches at non-banking Treasury and Sub-Treasury centres. Of these, nine branches have already been opened.

With the phenomenal increase in the number of branches and the growing expansion of the Bank's activities generally, many significant changes have been effected in order to bring about larger decentralization of functions, greater delegation of powers and wider diversification of services. The subsidiary banks also recorded further progress in 1964. Over the year, their total deposits increased from Rs 156.2 crores to Rs 182.7 crores and their advances rose from Rs 74.5 crores to Rs 95.5 crores.

The State Bank's earnings from interest and discount increased from Rs 18.48 crores to Rs 23.20 crores and those from commission, exchange and brokerage from Rs 6.62 crores to Rs 7.47 crores. On the expenditure side, interest paid on deposits, borrowings, etc, increased from Rs 8.86 crores to Rs 11.21 crores and salaries, allowances and provident fund from Rs 10.85 crores to Rs 13.15 crores. The net profit rose from Rs 2.75 crores to Rs 2.95 crores. Dividend is maintained at Rs 23 per share. Reserve fund absorbed Rs 60 lakhs, against Rs 55 lakhs in 1963. Allocations to pension funds, staff welfare fund and staff co-operative housing amounted to Rs 9 lakhs, Rs 10 lakhs and Rs 5 lakhs, respectively. Bonus to staff took away Rs 8 lakhs more at Rs 90 lakhs.

Air- India

THE year 1963 was a good one for international air transport industry as a whole, and an even better one for Air-India. Except in the carriage of mails, its rate of growth substantially exceeded the industry average. During the year ended March 1964, traffic on scheduled services increased by 20.3 per cent. The overall load factor improved from 45.3 per cent to 47.8 per cent.

Air-India carried a total of 191,000 passengers, over 15 per cent more than in the last year. At the same time, cargo earnings rose by 19 per cent to Rs 4.36 crores. Mail revenue, however, declined by 11.6 per cent mainly owing to the restrictions placed by certain countries on the lifting of mails. Operating revenues increased from Rs 24.53 crores to Rs 26.81 crores, and operating expenses from Rs 21.07 crores to Rs 22.97 crores, leaving a higher operating profit of Rs 3.84 crores compared to Rs 3.46 crores a year ago. An unchanged dividend of five per cent is to be paid to the Government on equity capital. Besides, despite the moratorium granted by the Government upto October 1966 on the payment of interest on the loan portion of the Government's capital investment, the Board has decided that interest at 4½ per cent should be paid with effect from April 1, 1963.

Air-India plans to purchase five subsonic jets for nearly Rs 27 crores during the Fourth Plan. In regard to supersonic transport, the Corporation's decision to pay deposits for both the American and Anglo-French proposed supersonic aircraft is justified by the Chairman, J R D Tata, on the ground of the uncertainties in both programmes and the imperative need to maintain Air-India's competitive position, in the industry.

Chemicals and Fibres

CHEMICALS and Fibres of India has been given a letter of intent to expand the licensed capacity of their polyester fibre plant from 4.5 million lbs to 10 million lbs per annum. Meanwhile, construction of the company's factory is nearing completion. The accounts for the fourth year ended September 1964 show that the company incurred a loss of Rs 6.91 lakhs. Together with the previous loss, the total loss amounting to Rs 8.02 lakhs is carried forward. Preliminary expenses and share issue expenses amounting to Rs 4.56 lakhs are also carried forward. From January 1, 1965 the company is selling imported polyester fibre.

Union Carbide

UNION Carbide of India has had another fruitful year, showing encouraging progress both in sales and profits despite continuing restrictions on the import of necessary raw materials. According to a preliminary statement, the company recorded during the year to December 25, 1964 a rise of over 10 per cent both in sales and profits which stood at Rs 15.95 crores and Rs 3.67 crores, respectively. Even after making higher provisions (Rs 60.46 lakhs against Rs 58.82 lakhs for depreciation, Rs 5.60 lakhs against Rs 4.55 lakhs for development rebate and Rs 172.74 lakhs against Rs 169.75 lakhs for taxation) the net profit is considerably higher at Rs 128.47 lakhs compared to Rs 98.91 lakhs a year ago. The total dividend is unchanged at 15 per cent, but is payable on an enlarged capital.

An application is being made to the Government for permission to capitalise Rs 45.50 lakhs out of the share premium account for the issue of bonus shares in the ratio of one-for-eight. The company's projector carbon and electrode plant was completed in late 1964, and production began in January this year. The Rs 9 crore expansion of Chemicals and Plastics is proceeding to schedule, and the expanded capacity is expected to come into operation during the next year.

Maharashtra Sugar

THE year ended September 1964 has proved a good deal better for Maharashtra Sugar which has reported a rise of about 16 per cent to Rs 94.95 lakhs in its gross profit. Although net sales have declined by Rs 39.37 lakhs to Rs 3.53 crores, taking into account the difference in stocks as at the beginning and end of the year, the total comes to Rs 3.41 crores—over Rs 31 lakhs more than last year's. Secondly, income by way of interest has gone up by more than Rs 3 lakhs at Rs 4.07 lakhs. And lastly, the company has derived some benefits from a nearly 30 per cent rise in the production of rectified spirit and from the manufacture of sugar cubes, which was undertaken only in the latter part of the year with a small quota of sugar. Demand for this product is fairly large, and the current year's results should reflect a full year's benefit from the production of this new product. Moreover, the company is reported to have been granted a letter of intent for the manufacture of potable liquor.

Out of the profits, provisions for depreciation and taxation have absorbed more at Rs 5.18 lakhs and Rs 52 lakhs compared to Rs 4.51 lakhs and Rs 48.60 lakhs, respectively, a year ago. The provision for development

rebate is slightly lower at Rs 0.44 lakh, against Rs 0.77 lakh, and the net profit is nearly Rs 10 lakhs more at Rs 37.33 lakhs. But the dividend is kept unchanged at Rs 14 a share with a view to conserving funds for the expansion and diversification programme undertaken by the company. Preference and equity dividends together claim Rs 26.96 lakhs, and are adequately covered by earnings.

Unichem Lab

WITH the prices of all pharmaceutical products frozen since April 1963 under D I R, rising production costs and tightening up of imports of raw materials and basic chemicals has led to a contraction in the profit margins of Unichem Laboratories in the year ended September 1964. Compared to the previous report covering a period of 9 months, sales during 1963-64 have risen from Rs 102.41 lakhs to Rs 156.66 lakhs and gross profit from Rs 16.91 lakhs to Rs 22.42 lakhs. Proportionately, sales have advanced by nearly 15 per cent, while profits have remained stagnant. All the necessary provisions have taken away bigger slices of the profit: depreciation Rs 3.79 lakhs against Rs 2.80 lakhs, taxation Rs 10.65 lakhs against Rs 9.34 lakhs and development rebate Rs 1.26 lakhs against nil. Equity earnings, however, are still a good deal better at Rs 7.03 lakhs compared to Rs 4.43 lakhs and the cover for the dividend, as raised by 3 points to Rs 9, is slightly higher at around 1¾ times.

In order to cater to the needs of the market in Northern India, a factory is proposed to be set up at Ghaziabad from internal resources. A new product called "Unimanitol", which is being introduced, holds promise of doing well.

Walchandnagar Industries

THE financial results of Walchandnagar Industries for the year ended September 1964 show a marked improvement in profit margins. Though sales were about Rs 12 lakhs lower at Rs 5.49 crores, gross profit shot up nearly Rs 18 lakhs to Rs 95.17 lakhs. Sales turnover was affected mainly by lower output of sugar, but bigger contribution from distillery, industrial machinery division and plastic factory brought in higher profits. A major portion of the rise in profits has, however, been taken away by necessary provisions; depreciation absorbs Rs 4.11 lakhs more at Rs 31.11 lakhs, tax charge Rs 7.50 lakhs more at Rs 30 lakhs and development rebate Rs 1.35 lakhs more at Rs 3.85 lakhs. Besides Rs 2.60 lakhs have gone to writing off debenture issue expenses and underwriters' commission for which no provision was made last year. Taking into account Rs 0.90 lakh, against Rs 0.18 lakh, being previous provisions no longer required and after providing Rs 5 lakhs (same) for preferential dividend, equity earnings are Rs 23.51 lakhs — nearly Rs 3 lakhs more than last year's. The dividend is raised by Rs 2 to Rs 14 a share, and absorbs Rs 21.21 lakhs (Rs 18.18 lakhs).

The outlook for the company appears promising. The earlier proposal to issue new debentures of Rs 60 lakhs has been abandoned as the company has received from Maharashtra State Farming Corporation amounts against sale of assets. The 4½ per cent 1959-64 debentures were also redeemed on November 1, 1964. The company has started manufacturing pressure vessels and storage tanks required by chemical and petro-chemical industries. The collaboration terms have been settled with MAAG Gear-Wheel Company of Zurich for the manufacture of MAAG speed reduction gears, pinions and their accessories required in sugar, cement, paper and pulp industries. The terms for the collaboration agreements with Escher-Wyss A G, Zurich, for the manufacture of paper plant and ancillary equipments and with G & J Weir of Glasgow for the manufacture of steam turbines for sugar mills are under negotiation. Equipment of the value of Rs 25 lakhs for cement machinery and gear making projects has been ordered against loan by I C I C I. An additional loan of Rs 9 lakhs is expected from this institution for importing additional equipment for these projects.

Phaltan Sugar

APART from expanding its original business of sugar manufacture, Phaltan Sugar Works is diversifying its activities into new lines. Having completed the previous expansion programme, the company is seeking permission of the Government for doubling the cane crushing capacity to 2,000 tonnes a day. A letter of intent has already been secured for setting up a plant to manufacture titanium dioxide, and some other new ventures are under consideration.

During the year to September 1964, the company crushed 1.28 lakh tonnes of sugarcane and produced 1.46 lakh bags of sugar with an average recovery of 11.38 per cent, as against 1.23 lakh tonnes of cane crushed and 1.61 lakh bags of raw sugar produced with a recovery of 12.97 per cent a year ago. Accordingly, net sales were lower by Rs 14.63 lakhs at Rs 158.41 lakhs, but gross profit was higher by over Rs 3 lakhs at Rs 41.05 lakhs. Considering that last year's profit included Rs 9.38 lakhs being the profit realised on acquisition of fixed assets by the Maharashtra State Farming Corporation, the 1963-64 performance looks more encouraging. All the necessary provisions have taken away more than in the last year: depreciation Rs 5.71 lakhs (Rs 3.45 lakhs), taxation Rs 18.87 lakhs (Rs 16.23 lakhs) and development rebate Rs 1.77 lakhs (Rs 0.81 lakh), leaving a lower net profit. Together with Rs 3.08 lakhs (nil) written back, however, equity earnings are a shade higher at Rs 17.78 lakhs, and the unchanged dividend of Rs 10 is covered a little over 1¾ times.

Jayant Paper

JAYANT Paper Mills' performance has been encouraging in the fourth year of its existence when total production exceeded 4,200 tonnes as against the licensed capacity of 3,600 tonnes and only 2,487 tonnes produced a year ago. The company's application for raising the capacity four-fold is being considered by the Government. Meanwhile, a ground wood pulping plant is to be installed shortly. When commissioned, this plant will increase the capacity of the pulp section by five tonnes a day.

The financial results for the year to June 1964 show that total sales rose from Rs 36.19 lakhs to Rs 67.52 lakhs, of which excise duty absorbed as much as Rs. 13.40 lakhs against Rs 4.42 lakhs, and net sales increased by about 70 per cent to Rs 54.12 lakhs. Profit margins, however, contracted and the gross profit at Rs 10.03 lakhs reflected a rise of about 41 per cent. With both depreciation 4.74 lakhs (Rs 3.57 lakhs) and Rs. 1.55 lakhs (nil), respectively, the increase in the net profit further narrowed down to Rs 3.74 lakhs compared to Rs 3.57 lakhs a year ago. But this is more than compensated by the saving in the development rebate reserve which requires only Rs 6,300 as against Rs 3.42 lakhs previously. After adjusting the previous year's loss of Rs 8,497 and providing a small

amount for taxes for the year 1961-62, the entire balance of Rs 3.55 lakhs is being carried to the balance sheet.

No dividend has been proposed by the directors although the question of declaration of a dividend figures on the agenda for the annual meeting called for on February 25. There is a contingent liability of Rs 11.58 lakhs against the company in respect of excise duty. The company has preferred an appeal, and the Government's order thereon is awaited. In case a favourable order on the appeal is received before February 25, the directors may propose a maiden dividend at the annual meeting.

The current year's prospects hold promise of further improvement in working results mainly because the rebate of 15 per cent on excise duty, allowed under the provision of Finance Act of 1964-65 to the paper mills which began production on or after April 1, 1961, should afford additional benefit to the company. The company has established its reputation for good quality products which are already in great demand from industrial consumers and the Government.

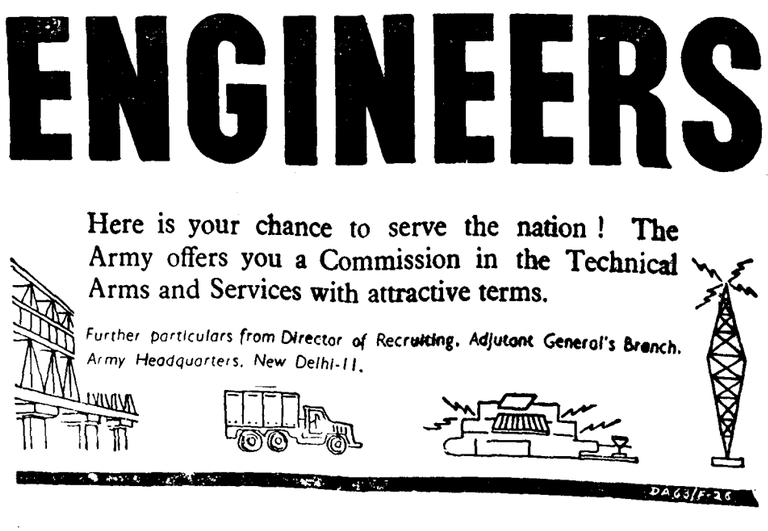
Chartered Bank

AT the annual general meeting of stockholders March 31, Directors will recommend final dividend 7½ per cent actual less income tax. The consolidated profits of the year 1964 amounted to £1,254,778 (1963, £1,069,378). After deducting allocations of $450,000 to reserve funds (1963, £450,000) and £100,000 to reserves for contingencies (1963, nil) and the net cost of dividends £707,437 (1963, £606,375) the carry forward is £571,365 (1963, £574,024). At the extraordinary general meeting of stockholders on March 31 the directors will recommend capitalising £770,000 out of reserve fund to be applied to paying up in full 770,000 new shares of £1 each which will be issued to stockholders on register on February 20 in proportion of one new share for every £10 stock held. If stockholders assent to capitalisation of £770,000, directors intend to transfer £770,000 from reserve for contingencies account to reserve fund. Directors hope to recommend maintenance of dividend payments of 15 per cent per annum on increased capital.

IEMA

FOUNDED in 1947 the Indian Electrical Manufacturers Association is a representative national organisation of those engaged in the manufacture of electrical and allied equipment. A very valuable function performed by the Association recently is the compilation of a Demand Survey for electric motors, transformers and switchgear to cover the period 1964-1971. The Survey is based on the growth of electricity generation which is expected to be doubled during the Fourth Five-Year Plan from approximately 10 million kw to 20 million kw. The survey indicates the enormous growth likely to take place in the demand for electric motors, transformers and switchgear during the Fourth Plan period.

Czech Machine Tools



A DELEGATION of Czechoslovak machine tool manufacturers is expected to arrive in India in the first week of March 1965. The Delegation will include leading representatives of the machine tool industry in Czechoslovakia.

They come to India with a view to exploring possibilities of concluding further collaboration arrangements for the manufacture of machine tools in India. It is well known that in respect of quality, precision, design, efficiency and output Czechoslovak machine tools are one of the most popular and demanded in India.

The Delegation will be meeting and discussing with parties, who are interested in securing collaboration for the manufacture of machinery, both in public and private sectors. Their itinerary includes Bombay, Bangalore, Madras, Calcutta and New Delhi.

Government of India have already sanctioned schemes for the manufacture of Slotting Machines, Radial Drilling Machines, Milling Machines and Planning Machines in the private sector in collaboration with Czechoslovak manufacturers. The collaboration agreements already approved by the Government of India will save for this country considerable foreign exchange.

It is expected that the proposed visit and the negotiations of the Czechoslovak machine tools manufacturers' Delegation will be of much help to the expansion of the machine building industry in India.

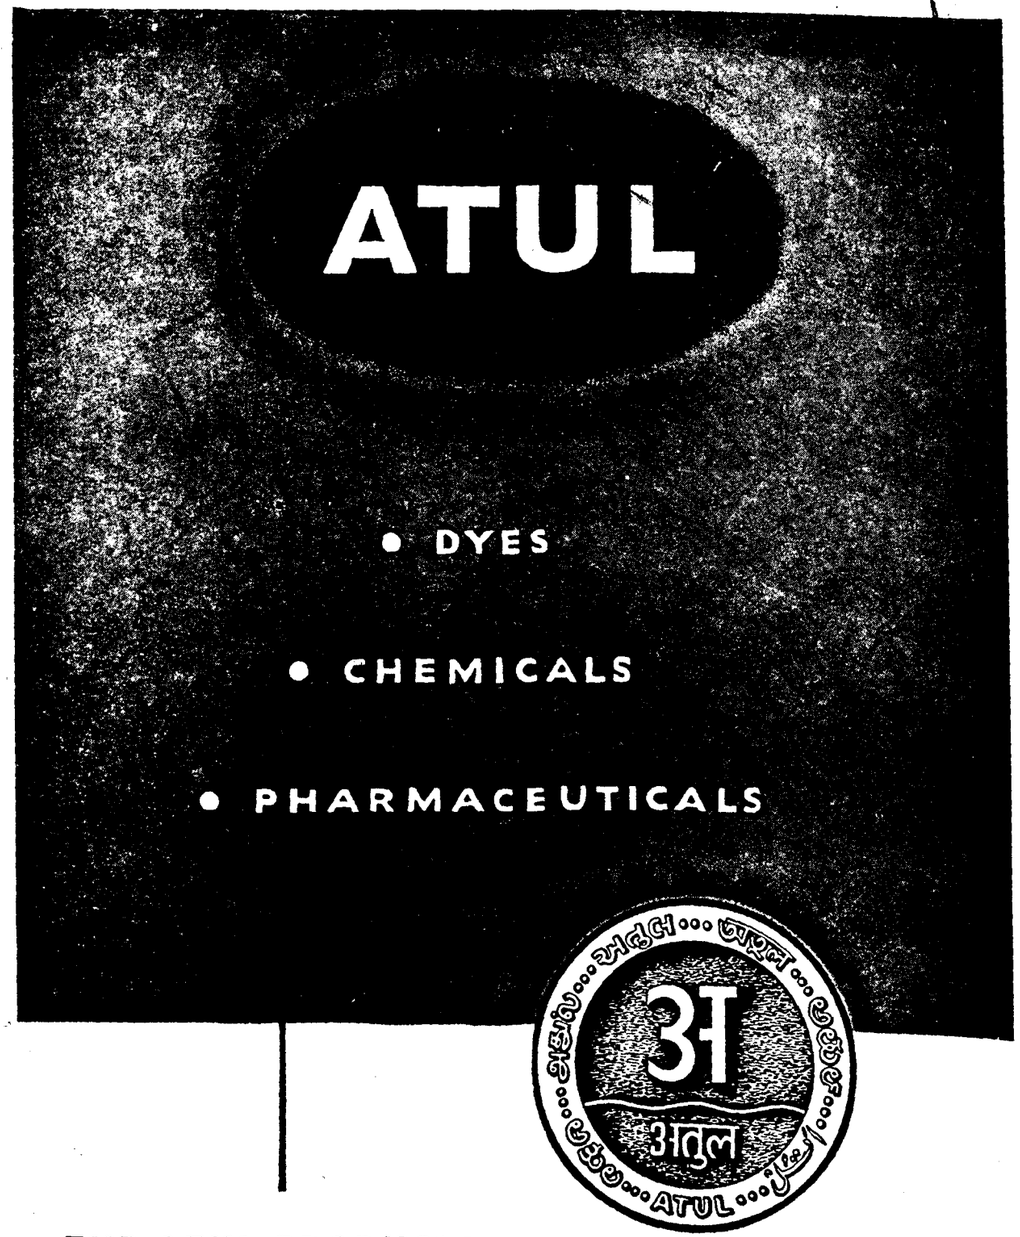
ACCOSET-50

—ACC High Temperature Refractory Cement—

for strong monolithic and rammed linings

Composed of finely ground plastic clays, specially processed high alumina refractory materials and special chemicals, ACCOSET-50 gives good bonding strength and high heat resistance. Once it is dried and burnt ACCOSET-50 becomes a part of the furnace.

YOU CAN USE ACCOSET-50 ■ for monolithic and rammed linings ■ for jointing, repairing and patching ■ for bonding and laying firebricks of any shape ■ for protective wash for furnace walls and floors, gunning etc.



Technical literature sent free on request.

What every engineer should insist on–in Switchboard Design

In evaluating a switchboard some features are of greater importance than others, depending on the environment in which it has to function. What are these features? Can you recognise them?

Totally enclosed design: In almost any industry, dust, like corrosion, is a very serious problem. To keep dust out, every unit has to be made to seal like an oyster-shell. Research has revealed that only a carefully machined, rigid, cast-iron clad enclosure, lined with rubber gasket, effectively resists dust, vermin and moisture.

Interchangeability: All components should have standard flange openings and machined surfaces; only then can they be inter-changed.

Flexibility: It should be easy to extend the switchboard at site, when you want to. This is possible only if the busbar chamber has standard end openings.

Maintenance: Must be judged largely by your ready access to busbars and easy examination of contacts.

Safety: A dented cover of a unit not only fails to keep dust, vermin and moisture out but could become a source of great danger without your knowing it. So value every safety feature in the design, the rigid sturdy shell, inter-locking system and insulated handles.

Carefully examine all these features listed here against your own specific needs.

LT-LK switchboards, like LT-LK motor starters, have secured in so short a time, the highest sales in the country. Take another look at the features and you will know just why!

On the Brink in Viet Nam

IT is time to ask the U S administration to pause and ponder before it reaches the point of no return in Viet Nam. Two battalions of U S marines have landed along the Viet Nam coast last week, sporadic bombing raids are continuing across the seventeenth degree parallel, and the White Paper issued by the Department of State indicates that the Americans are hell-bent to escalate the fighting. All this means that, over the next few weeks, more people will get maimed or killed, more huts and structures will be burnt down, more standing crops will be destroyed in the fields, more roads and bridges will be wiped out in a territory about ten thousand miles away from the United States mainland.

Till now both the Chinese and the North Vietnamese governments have responded with enigmatic restraint to the American offensive. But at some stage the decision-makers at Peking and Hanoi might feel tempted to drop one or two experimental bombs on U S bases in Okinawa or Taiwan, and the chain of consequences from then on is altogether unpredictable. Clearly, the U S administration has taken on a gamble: it is expecting a particular set of game-theoretic responses from China and North Viet Nam, and its strategy is closely bound to this specific string of anticipated responses, the hypothesis being that, under these conditions, the current temporary precipitation of the war will ultimately help the establishment of a detente in Viet Nam.

But what if the Americans prove wrong, and their impatience plunges the world in a holocaust? The people in Asia—and elsewhere—have a right to ask of the U S Government what for it is involving them into this awesome risk. If the U S reply is that they feel insecure with each spread of communist hegemony even if it be ten thousand miles away from home, the answer of the people of Asia—including, despite all that has happened in recent years, those of India—will continue to be that they are scarcely interested in accepting martyrhood merely to satisfy the security psychosis of the United States' citizens. In case the U S administration argues that it is the freedom and security of the people of South Viet Nam they are fighting for, one can only be impressed by the Gilbertian aspect of the argument. Roughly three-fourths of the total area and two-thirds of the population of what was euphemistically known as South Viet Nam are now under the control of the Viet Cong. No doubt, some degree of infiltration of both men and arms has taken place from the North in recent years, and yet, given our knowledge about liberation movements in other countries, it will be straining belief to suggest that the Viet Cong could establish itself so firmly without very considerable and dedicated support from the local population.

The so-called South Viet Nam Government based on Saigon is at present little more than a joke, and the unending succession of coups has proved conclusively the utter rootlessness of the regime. If reports emanating from Saigon have any basis, wide stretches of the capital itself have been infiltrated by the Viet Cong. Large sections of both the Buddhist and Catholic communities have of late been vocal in favour of a negotiated peace, and it is insolence on the part of the U S Government to suggest that they know the mind of the South Vietnamese population better. After all, even the Americans themselves know only too well that the moment their support is withdrawn the generals and the air captains and the naval lieutenants strutting about in Saigon will all be swept away.

There is hardly any necessity to question the *bona fides* of the recent U S actions: it could well be that the American administration, despite General de Gaulle's wry aside, does sincerely believe that the pristine qualities of democracy and freedom are in peril in South Viet Nam, and that their involvement is therefore a matter of morality. But one cannot salvage freedom by encroaching upon the freedom of action of other peoples. The mass of the South Vietnamese population have no desire left in them to

continue the war, they have made several categorical assertions to congregate at the negotiating table and hammer out the terms of an honourable peace. It is not for any aliens to veto this expression of desire for peace: saving Viet Nam and its people is more important than saving American face.

It is a great pity that on this issue the official expression of Indian opinion has been cautious and muffled. Given the current heavy reliance of this country on the United States for both economic and military assistance, it could hardly be otherwise. But let not the U S Government be misled: the temper of the people is a different thing. The U S marines may have marched into Viet Nam with saintly motives, but it would save and help peace everywhere if they would without further ado march out.

Credit Control Conundrums

TO the uninitiated at least there will appear to be some glaring contradictions in the state of the economy. That economic activity has been at an alarmingly low level, the Finance Minister has by now convinced almost every one. So no questions at all have been asked about the basic assumption of the 1965-66 Budget—that the economy, meaning here the private sector, needs a strong dose of incentives to get it off the ground to face "the more complex and sophisticated tasks" of the Fourth Plan.

But while, on the one hand, we have this picture of elephantine somnolence, there is, on the other, the impression of great pressure on the banks for credit and more credit, calling forth last month a sharp rise in the Bank Rate and higher interest rates all round. What can an anaemic economy be doing with all this money, Simpleman asks.

Simpleman has other questions, too. He was brought up to believe that a large State-controlled credit institution like the State Bank of India would make it easier for the authorities to regulate the monetary system since they had a direct channel to the credit market. If the Reserve Bank felt that there had been monetary over-expansion and felt the need to restrict bank credit, it would, Simpleman expects, work in close touch with the State Bank, the biggest unit in the banking system by far. But what does he find?

During the current busy season, between October 16, 1964 and February 12, 1965, commercial banks other than the State Bank increased their advances by Rs 65 crores as against Rs 131 crores in the corresponding period of the 1963-64 busy season. And their borrowings from the Reserve Bank increased by Rs 28 crores against Rs 49 crores. These banks, it would appear then, by and large conformed to the discipline enforced by the Reserve Bank in September last year when the Bank Rate was raised from 4 5 per cent to 5 per cent.

However, during the same period, i e, October 16, 1964 to February 11, 1965, the State Bank's advances increased by Rs 82 crores as against Rs 74 crores in the corresponding period of the previous busy season. And the rise in its borrowings from the Reserve Bank was truly spectacular—Rs 63 crores compared with Rs 11 crores! Is it that when the Bank Rate was raised in September, bank borrowings from the Reserve Bank were tied to their liquidity ratios deliberately to leave the State Bank enough room to expand its advances while keeping the other banks on a tight leash? Or did the State Bank exploit its technical advantage in spite of the Reserve Bank?

Even this is not all that puzzles Simpleman. In his circular on the Bank Rate raise on February 17 the Governor of the Reserve Bank connects the inflationary price situation to the fact that "expansion in money supply in the current busy season ... has not been much below the record rise achieved in the last busy season" and that "the reliance of scheduled banks on the Reserve Bank is substantially higher than a year ago". From the figures quoted above it is clear that in the expansion of both bank credit and bank borrowings from the Reserve Bank—in the latter particularly—the State Bank's share has been predominant. What view does the State Bank take of the contribution of its advances to inflation? Says the Chairman of the State Bank in his speech at the Bank's Annual General Meeting:

"While it is true that we are lending much more than in the past, it must be made clear that the additional credit we are providing is for purposes which are important from the point of view of the country's economy. Thus we are substantially assisting State Governments in their programmes of food procurement and food distribution, besides financing other projects in the agricultural spheres connected with State policy such as the jute buffer stock operations. Apart from this, it is industrial production of high priority and industrial units of all sizes—big, medium and small—that have claimed our first attention and, therefore, account for the bulk of the additional credit we have been providing. Finance for industry constitutes 76 per cent of our total credit portfolio. About a seventh of our finance for industry is accounted for by units in the public sector and the rest by industries in the private sector."

So, then, Simpleman has the Reserve Bank's conviction that bank advances underpinned by large bank borrowings from it have contributed to the inflation; the facts which show that the State Bank accounted for the bulk of scheduled bank borrowing from the Reserve Bank and a very considerable part of bank credit expansion; and the State Bank Chairman's emphatic assertion that his bank's advances went to finance activities vital to the economy. How much of the link between bank credit expansion and the rise in prices and how much of the rationale behind February's credit clamp down survive, Simpleman is left wondering.

Revised Subscription Rates

WITH effect from March 1, 1965 the price of THE ECONOMIC WEEKLY has been raised to 75 Paise. Correspondingly the annual subscription is Rs 36 in India, Pakistan and Ceylon. The half-yearly subscription is Rs. 20. Foreign annual subscription rates are £3 10s and $10.

For the last 16 years, the price of THE ECONOMIC WEEKLY has been maintained unchanged in spite of heavy increases in costs. Circumstances beyond our control have compelled us to take this step and we hope readers will continue to extend to us the same patronage as in the past.

Weekly Notes

Central Aid to States

CENTRAL aid to the States presents an ever more chaotic picture. The difference in circumstances when a State gets a grant and when it gets a loan is too subtle for ordinary minds. "Relief of displaced goldsmiths" qualifies for grants while "rehabilitation of displaced goldsmiths in the States" qualifies for loans; "development of border areas" gets grants while "development schemes in border areas" get loans. Further, some loans and grants are for specific purposes while others—such as ways and means advances—seem to be largely a matter of expediency.

It is difficult to see the rationale of lending to States. Constitutionally it is doubtful if the Centre and the States are separate entities, and loans between them look like a game of taking money out of one pocket to put it into another and then making the other pocket give it back with interest. Even if they are treated as separate entities, lending is becoming meaningless. The States are expected to owe the Centre Rs 3840 crores at the end of the new financial year; and given the rate of increase of their indebtedness it is highly unlikely that they will repay much of their loans. The loans might thus turn out to be a bookkeeper's misnomer for grants.

There is little to be said for the idea that asset-creating expenditure should be financed from loans. Firstly, asset-creating expenditure will not necessarily generate revenue from which debt might be serviced. If the distinction between current and capital expenditure must be made in Government budgets, the latter should only cover the purchase of revenue-earning assets, and the Government should see to it that they then earn the revenue. Secondly, even if revenue is obtained by States out of their investment, it is open to question whether, in their present penurious condition, the Centre should insist on a share of that revenue in the form of debt services.

There is such similarity between the heads of expenditure of the Centre and those for which it gives States loans and grants that one begins to wonder if it is really necessary to finance the same things in so many different ways. It would simplify matters and perhaps aid national unity if we had public services and projects jointly financed and manned by the Centre and the States on a proportional basis; it would also assist in maintaining uniform standards all over the country and give States the incentive to raise more revenue in order to participate in more cost-sharing schemes. Then, perhaps, the Finance Commission could be given the more interesting task of specifying the types of schemes in whose respect cost should be shared and working out the proportions of costs which various States should be required to contribute.

Import Entitlements on Way Out?

A Correspondent writes:

TAX credit certificates are to be issued upto a maximum of 15 per cent on exports after February 28 this year. The amount of the certificates can be offset against the assessee's tax liability; alternatively, the assessee will qualify for refund. Assuming that a company qualifies for the maximum relief and is subject to the standard tax rate of 50 per cent, as much as 30 per cent of its export revenue would be free of tax. This is a substantial concession.

This scheme raises three questions. Will it apply to all exports? Will it replace or supplement the import entitlements granted under export promotion measures? What will be the rates of deduction (or subsidy) for exports of various commodities and to various destinations?

It is widely believed that the tax credit scheme is meant ultimately to replace import entitlements which are proving rather expensive in terms of both foreign exchange and tax leakage. Import entitlements are available, in all, on only about one-fourth of total exports or about Rs 200 crores. The tax concession scheme would have to be so devised as not to suddenly upset the existing import entitlements, but to gradually replace it with a tax subsidy equivalent to the existing (unofficial and unaccounted) premia on import licences which make exports worthwhile. It may not be possible to save the entire foreign exchange outgo of somewhere between Rs 80 crores and Rs 140 crores under entitlements at present because, for one thing, the quotas of established importers have been slashed to the extent of imports under the entitlement scheme and these imports are necessary for increased production. Savings can be effected only by a more priority-conscious import policy which would mean starving some industries, if necessary.

Traditional exports did not, by and large, qualify for import entitlements. In their case, the rates of tax subsidy will have to strike a balance between two considerations: they have to be low enough to avoid excessive loss of revenue and high enough, where feasible, to operate on price elasticities of external demand. True, during the last two years of booming exports, traditional exports have gone up without many crutches, but this happy trend may not continue. While the subsidies for traditional exports have to be lower than those for new commodities, the problem would be complicated during the transitional period by the continuation of import entitlements for new commodities.

It is also worth examining — though this will further complicate the scheme — whether the subsidy should be uniform for exports to all destinations or whether it should be confined to or weighted in favour of exports to the convertible currency areas. A uniform subsidy would be, of course, easier to device and administer but an ideal scheme of tax incentives should attach a premium to earning convertible foreign exchange.

Semantics on Deficit

THE Finance Minister's claim to have produced a Budget "which holds every promise of being a balanced one, if not a surplus one" has not gone unquestioned. Attention has been focussed on the fortuitous circumstances which have made the small surplus possible—e g, the receipt of Rs 191 crores on account of PL 480 deposits—and on the concept of deficit most meaningful in the context of discussion of inflation.

What exactly constitutes a budget surplus or deficit from the point of view of changes in aggregate monetary demand in the economy? In the traditional budgetary parlance of this country, deficit or surplus is represented by the changes in the balance of outstanding Treasury Bills with the

Reserve Bank and in the Government's cash balance. The figure of Rs 4 crores given by T T K as the budgetary surplus for 1965-66 represents precisely this.

This definition of budgetary deficit or surplus is, however, inadequate and misleading. It is inadequate because it leaves out certain items which are as important as Treasury Bills sold to the Reserve Bank, such as sale of longterm securities to the Reserve Bank. It is misleading because it gives no idea of the impact of the budget on aggregate monetary demand. The only meaningful definition of a budgetary deficit is one which equates it to the banking system's net credit to the Government. Accepting this definition, it is doubtful whether the net impact of the 1965-66 Budget on the aggregate monetary demand will be contractionary.

It will depend, in the ultimate analysis, on the nature of subscription to Government loans. Public borrowing next year is estimated at Rs 270 crores. Who will buy these securities? The Finance Minister is aware that the Government's borrowing programme will have to "be based on a strictly realistic assessment of the flow of genuine savings". He also appreciates that Reserve Bank subscription to Government loans is a form of "deficit financing rather than mobilisation of the voluntary savings of the people".

But why only Reserve Bank subscription? What about subscriptions of commercial banks and co-operative banks? Sale of Government securities to commercial and co-operative banks is no less expansionary in its impact on monetary supply than their sale to the Reserve Bank. It is certain that a considerable portion of the proposed borrowings of Rs 270 crores would be subscribed to by commercial and co-operative banks. The data on ownership of Government securities published by the Reserve Bank show that holdings of commercial and co-operative banks of Central Government securities constituted about 18 per cent of the total at the end of March 1964. The marginal proportion may even increase in future in view of the higher statutory requirements prescribed by the Reserve Bank.

A functional concept of surplus or deficit must, therefore, leave out of public borrowing loans subscribed to by the banking sector.

More Taxed, Also More Profitable

THE tax burden on private companies has always been higher than on public companies but in 1962-63 the margin widened considerably. In the Reserve Bank samples, the ratio of tax provision to profits before tax rose in the case of public companies from 38 per cent in 1960-61 to 43 per cent in 1961-62 and further to 50.6 per cent in 1962-63 (it declined somewhat in 1963-64 according to *Economic Times* studies); for private companies the ratio went up from 47.7 per cent to 52.7 per cent and then to 63.8 per cent in the three years.

The increase in 1962-63 was in both cases (many public companies too are deemed to be narrowly owned) partly due to the raising of the standard tax rates on closely owned companies from 50 to 60 per cent, and the imposition of, first, the super-profits tax and, then, the surtax. An upward trend in tax liability had, nevertheless, appeared even before the additional imposts were levied. The only explanation for that could be (though this cannot be supported from either company finance data or income tax data) that over the period 1960-61 to 1962-63, the utilisation of tax concessions, like accelerated depreciation, development rebate and tax holiday, tended to taper off. This in turn could be due to a fall-off in corporate investment or the inadequacy of profits to absorb tax concessions or the non-availability of extra depreciation since 1959.

Company finance data do not show any significant falling off in the rate of gross fixed assets formation — rather the contrary for private companies. Profits before tax in relation to sales and total capital employed have not fluctuated very much either. Is the withdrawal of extra depreciation then largely responsible for the higher ratio of tax to profits? While the Reserve Bank could throw some light on this question, one wishes that the Income-tax Department would also bestir itself into publishing some useful and, for a change, meaningful statistics. At present, income tax revenue statistics easily take the cake as the worst set of statistics produced by the Government.

Coming back to comparisons between public and private companies, there is no doubt that the latter are more profitable, judged by any criterion (see table below). There was one rather curious development in private companies in 1962-63; their rate of growth of sales doubled as compared with the previous year, outstripping the increase in production and thus leading to a substantial decline in the accumulation of finished goods inventory.

On the Economic Survey

A correspondent writes:

THE economy passed through a testing time in 1964-65 but reading the Economic Survey one would not get that impression if one were to skip the first section which contains "an assessment in brief". Complacency seems to be the hall mark. How else can one describe this gem—"A good deal of the progress that takes place in the economy, particularly in small industry, dairying (sicl), poultry-keeping (sicl), retail trade, etc, does not in the nature of things get reflected in the national income statistics"? This is in seeking to explain the slower rate of growth than envisaged. If one were to be flippant, it seems as if the authors of the Survey are asking us not to mind the wheat crop failing as the hens are laying more eggs. The Survey continues: "But even without making allowances for this, it is clear that the *somewhat slow* rate of growth of the economy in the early years of the Third Plan was rather the result of *temporary* difficulties than of more deepseated reasons" (italics added). A growth rate of about 3 per cent on the average in the first three years as against an average expected of more than 5 per cent is regarded as "somewhat slow". And can we blame the weather gods alone? Are the failings that beset the agricultural sector only temporary? Is the shortage of fertilisers temporary? Are not the absence of a price stabilisation policy and effective land reforms "deep seated reasons"? One can go on.

The same complacent treatment marks the section on industry. The slower rate of growth is explained by the fall in coal output as if this was a reason instead of being a symptom. But why has coal output fallen and the transport situation eased? Not because the supply of these goods and services increased beyond the Plan targets but because the demand fell short due to other failures. The decline in coal is ascribed to better transport facilities; the easing of transport was no doubt due to the lower load of coal!

The complacency continues in the treatment of prices. At the end (one hopes) of a period of a sharply rising prices we are asked to take heart as "to *some* extent" (note the continuous hedging) this is a correction of earlier trends!

When it comes to a discussion of the balance of payments, try as one might, it is difficult to put on a brave face; there is a faint attempt at trying to explain away the gaffe in foreign exchange budgeting which has led to our present crisis and there is a curious reference to a change in the procedure of recording export receipts. If a change has been effected it should have been publicised and the difference in the data explained.

The sections on the lessons of last year's developments (temporary, were they not?) for economic policy read like a recital of all good things,—we should raise agricultural production, stimulate investment in priority areas, improve public sector performance, exercise greater monetary and fiscal restraint, promote exports and improve the distribution machinery. Reading the various plan documents (Models I, II and III) and the previous economic Surveys, one might be led to think that this is what we have tried to do all along. Or were we mistaken?

Ill-Paid Teachers

BETTER education can come only through better teachers. This has not escaped anyone nor the fact that teachers in India are woefully underpaid and compare unfavourably even with ordinary unskilled workers. After three Five-Year Plans, a minimum salary of Rs 50 for a trained primary school teacher has been barely achieved while the secondary teacher, who is invariably a graduate and holds a teachers' training degree, earns between Rs 160 to Rs 300 per month, with wide regional disparities.

As bits of statistics these are not unknown; what the West Bengal teachers' strike has achieved is to emphasise that they also determine the quality of life for thousands of men and women and their children—not only what they are and become, but even what they eat and wear.

The strike is not the first that teachers have been driven to in W Bengal. There was one in 1954 and another in 1961. On both occasions small concessions were won after bitter struggle. And currently, besides West Bengal, teachers are restive elsewhere. The All-India Secondary Teachers' Federation observed a 12-hour token fast all over the country on February 14. In U P teachers have threatened to boycott the High School and Intermediate Board examinations. Reverberations of the teachers' agitation have been heard in the West Bengal Assembly and even in the Lok Sabha and the Rajya Sabha.

The West Bengal teachers had submitted a 17-point demand to the Government covering revision of pay scales of both teaching and non-teaching staff of schools and an increase in dearness allowance upto Rs 30 with an extra Rs 5 for every five point increase in the cost of living index. Primary teachers had asked for an increase in pay to Rs 100 and in dearness allowance which, it deserves to be mentioned, is now at the princely level of Rs 5.

The Government's response to these demands was to promise to raise primary school teacher's dearness allowance to Rs 10 and to make corresponding adjustments for secondary school teaching and non-teaching staff. The Director of Public Instruction actually issued a circular to school managements inviting them to seek police help in keeping schools open and threatening them that if there was protracted stoppage of work in a school, Government aid to it would be withheld.

Finally, Chief Minister P C Sen agreed to the appointment of a high-powered committee on education to look into the teachers' demands and to review the school education system in the State. While the teachers have called off their strike in response to this offer, the question of teachers' pay is more than the concern of a single State. The All-India Secondary Teachers' Federation has been pressing for an All-India Pay Commission or a Secondary Education Grants Commission like the UGC.

The Planning Commission has recently suggested a national commission to study the wage structure of school teachers. If this marks a recognition of the fact that in a money economy, teachers are as much subject to the monetary incentive as any one else and that, therefore, poor pays can only mean poor teachers, it marks an important step forward. The mistaken belief that somehow good teachers can be produced and retained for absurdly low wages just through occasional verbal idealisation and observance of a "national teachers' day" once a year has already done enough harm. The National Education Commission may fruitfully investigate how much of the money so far spent on expansion of primary and secondary education has been permanently wasted as a result of the poor human material which the inexorable working of the allocative machanism of a market economy has left the teaching profession with.

Profit Allocation and Profitability Ratios of Private and Public Limited Companies

	Public Limited Companies			Private Limited Companies		
	1960-61	1961-62	1962-63	1960-61	1961-62	1962-63

Nasser Scores a Point

THE West German-Egyptian tiff, touched off by the revelation of the secret West German arms deal with Israel, has reached crisis proportions. With W Germany's decision to establish deplomatic relations with Israel, a complete break with UAR cannot be ruled out.

Since 1959, the West Germans have held to the Hallstein Doctrine—that any nation which recognises East Germany will lose Bonn's recognition. Under this doctrine, Bonn severed relations with Yugoslavia, Cuba, and several countries which recognized East Germany. Nasser has thus put the West German government in a particularly difficult position. They have already renounced their treaty with Israel under heavy Arab pressure, but apparently this action did not satisfy President Nasser, who proceeded to give Ulbricht a full welcome upon his arrival in Egypt. The West Germans have already cut off their substantial economic aid to Egypt (the "high interest" loans as Nasser described it) though they have hesitated to take more serious action.

In sum, it would seem that the West Germans have more to lose than do the Arabs. West German economic aid to Egypt could probably be replaced from the East Bloc nations without much difficulty, and Nasser has gained prestige in the Arab world by taking a resolute stand against West German military aid to Israel even at the cost of West German aid to UAR. The West Germans, on the other hand, would lose the substantial influence and goodwill they have built up over the past few years with much effort and not a little money. As West Germany has re-entered world politics after its post-war recovery, it has sought to maximise its influence in certain key areas, such as the Middle East. West German trade with this area is substantial, and the Germans are dependent on Middle East oil for their economic development.

As matters stand, it seems likely that Bonn will stand by its traditional, if ineffective, Hallstein Doctrine, though there are signs that both the UAR and West Germany are holding back from the final step. Clearly, President Nasser has handled this situation with characteristic skill and good timing. This victory, which butresses the one over the United States, when he retained U S foreign aid while actively supporting the Congolese rebels and attacking American policy in the Congo, promises to give him renewed confidence in dealing with the industrialised powers. And the East Germans, who have waged a long struggle for recognition in the face of substantial odds, have been handed almost their first major victory due to the mismanagement and ineptness of West German foreign policy.

LETTER TO THE EDITOR

Is this 'Functional' Inflation?

WHEN 'Wafflers' hold the field with all manner of prescriptions for the ills of the Indian economy, and when means and ends are confused at every stage of the debate not only by ill-informed politicians and administrators but also by some of the so-called social scientists who should know their onions better, it is refreshing to come across a piece such as "When So Much Is at Stake . . ." (*The Economic Weekly*, Annual Number, 1965). It puts the problems of inflation and development in focus and thus exposes much of the loose talk about them. It rightly points out that attention is concentrated on "evading problems rather than on finding special solutions for them". Rightly too, it condemns such omnibus suggestions as that for "according priority to agriculture in our development programme" and such vague pleas as for "budgetary balance or restructuring of plan outlays".

But I must join issues with you on some of the *non sequitur* in your analysis. Admittedly, inflationary pressures in the Indian economy are not the same as those in Keynesian literature; nor are they similar to those in primary producing countries during an export boom. Then why say: "It is a truism that when gross expenditure in an economy exceeds the gross supply of commodities and services available in the period concerned, there will be a pressure either on the balance of payments or on domestic prices. Obviously, if balance of payments cannot serve as a safety valve, then pressure manifests itself in the form of domestic price increase . . ."?

This is a truism, but it is analytically irrelevant in the context of the Indian economy. The gap in Indian balance of payments is not a consequence of the rise in domestic money income. It is the other way round in fact. It is imports *ex ante* which tend to create domestic pressures through their impact on investment. Let me clarify: what I object to is not the conclusion, which is sensible, but the way it is supposed to have been arrived at. No one disputes the contention that there are price increases which are functional and others which are the result of inflation. But the real issue is, how is the functional rise in prices to be distinguished from the inflationary price increase and where exactly do the two types of inflation tend to merge? It would be no doubt naive to believe that growth is possible without price-pressures or that resources would shift between sectors without relative price changes and, in some cases, changes in the general price level. But to treat a sharp rise in prices of vital commodities like food as an aberration is to lose one's perspective. The price rise in India during the last year or two certainly cannot be regarded as a functional rise.

When food prices rise as they did recently, the marketed surplus tends to shrink and with that the pressure on prices gets accentuated. The inevitable repercussions of this on the industrial sector, *via* the pressure on wages, is to lower the profit-income ratio and the saving rate. The rise in certain prices, therefore, far from being conducive to growth is inimical to it, and there is no knowing when such price increases would escalate into a serious inflationary spiral.

It is possible to differ from your implied policy prescription without falling into the trap of the Quantity Theorists who suggest a "smaller plan" or "consumption-oriented plan". You seem to be opposed to any "restructuring of the Plan outlays". One may as well ask: What is so sacrosanct about the "structure of the Plan"? One may get the impression from the Plan documents that the structure of investment is derived logically from the commodity balances and, therefore, what is physically feasible must be financially possible. If the argument is couched in these terms, it does make sense; but when a distinction is made between the "physical plan" and the "financial plan", it makes a mockery of planning. The divergence between the physical and the financial plan is only an admission of the fact that the physical consistency in the plan is no guarantee of its financial viability unless certain organisational and policy measures are taken.

CAPITAL VIEW

The Decline of Lal Bahadur

Romesh Thapar

IF Prime Minister Lal Bahadur (he does not use the 'Shastri' when signing letters) could control and doctor the coverage of events in India, the impression would certainly be created that he is firmly in the saddle and that there is no likelihood of his coming a cropper. These days, he appears supremely indifferent to the interlocking crises developing around him; indeed, he even manages to absent himself from the Capital or from Parliament when he is most needed. This indifference is no sign of strength, for now almost everyone, including the Syndicate which brought him to power, is willing to discuss the need for a new government—or, at least, a drastic overhaul of the existing set-up.

Not in Control

Several factors have contributed to this sudden decline in Lal Bahadur's usefulness to the party in power. The negative, nondescript qualities which made him so relevant in the faction-charged situation following Jawaharlal Nehru's death, qualities which even fairly intelligent observers believed would provide the basis for the functioning of a democratic collective at the Centre, have become a liability for a party which is being tossed here and there for lack of bold, meaningful and coherent leadership. The handling of the Punjab and Orisa tangles showed a thorough lack of political perspective. The language crisis heightened the impression of puerility. And, now, the result of the elections in Kerala has dealt a body blow to this government of indecision.

In a sense, Lal Bahadur's government appears no longer to be in control of the situation. By this I mean that it has lost the capacity to reach out to the people and to communicate with them, thrusting aside the host of mushrooming and unrepresentative lobbies which surround it and confuse it. Even before the Cabinet has had a chance to recover from the shock of the language revolt in Tamilnad, it is confronted by the election victories of the Left Communists who had been declared 'traitors and enemy agents'. The Cabinet moves from one meeting to another, unable to decide whether to release the elected 'traitors' and 'agents' in deference to the democratic wish of the people or to ride roughshod over the democratic process itself.

Adventurism to the Fore

It is now common knowledge that the decision to incarcerate the Left Communists was taken by Home Minister Nanda in consultation only with the Prime Minister. The ministerial and organisational leadership of the party was not consulted. Now that the fat is in the fire, these elements are being asked for their advice and support. They are, naturally, reluctant to dirty their hands at a time when a big question-mark is beginning to form over Lal Bahadur's government itself. If Nanda had the conclusive evidence to put the Left Communists to trial then, of course, things would be different. But his research is fumbling.

The implications are far wider than what most people imagine. Apart from the fact that the essentials of a free election were violated in Kerala, if the elected Left Communists still in jail are not released or put to trial we might soon find ourselves placing Indian democracy within quotation marks. Consider the prospect. E M S Namboodiripad threatened a new 'Kurukshetra'. The official C P I, in order to retain its crumbling support, may also be compelled to launch agitations for the release of those whom it describes as 'splitters'. The Lohia Socialists would join battle, too, for this is another opportunity 'to pull the Congress down'. The initiative, in such a situation, would pass rapidly to political adventurers on the make. And probably the Cabinet would continue to move from one meeting to another.

If anyone doubts the rise of this kind of adventurism, he has only to visit Parliament these days. Lohia's boys, and they are not unintelligent, are hell bent to disrupt the proceedings. Uproar follows uproar. Bedlam prevails. No one is respected. The decorum one associates with parliamentary debate is fast disappearing. Even the Prime Minister's interventions do not silence the members or prevent them from moving around for a chat with this or that person. This degeneration has been most noticeable during the present session, a sharp reflection of the slump in Lal Bahadur's political standing.

The fact that the country carries on with some degree of expertise at various levels, and that the electorate in Kerala shows its own brand of maturity and commitment, are positive signs. Perhaps, democracy has taken roots, and, whatever the leadership, we will manage to blunder along, happy and contented that we still possess the right to defy the powerful, to dissent. But the more one looks around, the more one sees the signs of that political, economic and social polarisation which spell out the collapse of democratic functioning. And all this within one year of Jawaharlal Nehru's death.

Dynamic Elements Must Take Over

It is not as if the battle is lost. The Congress Party still commands massive electoral support; in a manner of speaking, the Kerala election result shows a certain consolidation of Congress support although a serious split along its earlier communal composition has blurred the picture. But the present political drift will lead to a total break-up if the still dynamic elements within the ruling leadership do not get together to take control of the party. The task certainly presents formidable challenges. Yet, the people, from all accounts, would rally behind the initiators of such a move; they have a deep faith in the party of Gandhi and Nehru and would assist the effort to revive its lost sense of direction.

At the moment, however, there is no sign of a stir. We talk of the decline—and fall—of Lal Bahadur, but the least worried is Lal Bahadur himself. Apart from the growing passivity over internal problems, visiting statesmen from abroad, anxious to locate India's thinking on crucial international problems, return to their countries none the wiser. Indian spokesmen at these talks are generally ill-prepared and without a proper brief. Lal Bahadur and his Foreign Minister seem most unconcerned by diplomatic confrontations during which they have nothing to say.

So hazy has our thinking become at the Foreign office that we have not reacted to the somewhat suspicious

manoeuvrings of our old ally, President Nasser, during the visit of Abdullah and Afzal Beg to Cairo. These two, ostensibly on a pilgrimage, managed to get themselves recognised as State guests and were previleged to have a longish interview with President Nasser himself. This is, to say the least, a strange posture for a friendly State to adopt—a posture which, no doubt, will be promptly adopted by other not-so-friendly Arab governments. The argument that the UAR acted the way it did to prevent Pakistan from 'exploiting' the situation is too absurd to be taken seriously.

These recent goings-on in Cairo and the noticeable ambivalence developing in Arab attitudes to India need careful and immediate probing. If President Nasser is adjusting his position for a *rapprochement* with a Pakistan which is presumed to be disentangling from the western grip, we must make clear to him the implications this policy will have on Indo-Arab collaboration. To remain embarrassed and silent, as we seem to be, means that we attach no real importance to this alliance within the framework of the non-aligned world. The Arabs should not find it too difficult to understand what we mean. After all, they never seem to miss an opportunity to protest whenever Indians visit Israel or Israelis visit India—and that, too, without the trappings of State patronage!

Swaran Singh Must Go

It is clear that there must be a change at the Foreign Ministry. Swaran Singh is not the man for the job. If he continues in command there is even a likelihood that our relations with the Soviet Union will be damaged. His quiet diplomacy, it appears, is no diplomacy at all. The foreign Ministry needs energetic leadership at both ministerial and senior bureacratic level. A start could be made by placing this difficult task in M C Chagla's hands. But will Lal Bahadur be persuaded?

The Algiers conference of Afro-Asian nations is not so far away. Concerted attempts will be made by a number of ambitious powers to make India look as if she has forsaken her independent, sovereign role and therefore forfeited her right to be heard with respect. This is part of a plan, fathered by the Maoists, to lampoon her, to neutralise and isolate her. We cannot walk into the conference with the kind of representation we have at the moment. The story of the non-aligned conference in Cairo, and the role of our representatives there, creates only anxiety over what will transpire at Algiers.

Of course, it will be argued that in the context of the confusion which prevails internally in India, it is not possible to forge a viable foreign policy. This is only partially true. It does no harm to remind ourselves that the cards we hold can restore to us the initiatives we have lost—that is, if we play the cards with skill. It is this skill which needs to be concentrated at the Foreign office, without any further delay. In so doing, maybe Lal Bahadur could recover some of his political relevance.

FROM THE LONDON END

Indo-British Trade

At a luncheon organised last week by the Indian Chamber of Commerce, Douglas Jay, President of the Board of Trade, spoke about Indo-British trade and financial arrangements. He made it very clear that one of the aims of the Labour Government was to promote and deepen trade relations between the two countries, and emphasized the fact that despite the present difficulties the long-term prospects for trade and co-operation between the two countries on a much wider scale were very good.

He referred to the bonds between the two countries and remarked on the fact that the two countries shared in common the problem of a serious deficit in their balance of payments and had both imposed an import surcharge as one of the means of tackling this problem. It was only natural that in the circumstances trade between the two countries was not flowing as swiftly and as strongly as might otherwise have been the case.

Britain's Commitments

Dealing with the British balance of payments, he pointed out that one of the principal reasons why Britain was *in her present difficult position* was that with limited resources Britain was trying to do a large number of things. Overseas military expenditure to help her friends had led to a considerable strain on her balance of payments. This had been accentuated by the sums spent abroad as grants and loans to developing countries. Finally, there was British foreign private investment abroad. In these circumstances, the amount of additional financial aid that Britain could offer to countries like India was somewhat restricted.

Dealing more specifically with the question of import surcharges he pointed out that before imposing these surcharges, the Government had given very serious consideration to the need to use such measures as would have the least impact on developing countries. While the Government would have liked to exempt such countries from the impact of the surcharge, it would have been difficult since charges of discrimination would inevitably come from other countries. However, most of the major items of interest to developing countries had been excluded. He estimated that some 79 to 80 per cent of Indian exports to the U K were not affected by the surcharge and added that one of the first exceptions made in the original list was in favour of East India kips.

On the question of manufactured exports from India he showed a very sympathetic attitude. He said he perfectly understood the need for countries like India to increase their exports of manufactured goods if they were ever to make an impact on their balance of payments. He understood only too well the difficulties that these countries met in the face of the tariff and quota barriers erected by industrialised countries against their manufactured goods.

Textile Imports

Dealing specifically with the question of imports of textiles from India into Britain, he showed a great understanding of the Indian side of the problem and recognised the fact that something must be done to increase imports of items such as these into the markets of the industrialised countries. He pointed out that Britain's record in this respect was better than that of many other industrialised countries, and while he appreciated India's needs to expand exports it was difficult for the Government in the present circumstances to go very much farther except by sacrificing even more the Lancashire textile industry which, to do it credit, had made some progress in reorganising itself to meet the new circumstances.

At the moment the main action that the Government was taking was to persuade other industrialised countries to adopt a more liberal attitude to imports of manufactured goods from the developing world. He said that compared with the fact that Britain imported 30 per cent of her textiles from these countries, the U S A imported only about 10 per cent, while the proportion for the Common Market was only about 4 per cent. There was, therefore, much these other countries could do to help. Britain was using all the influence she could in this matter, and he hoped that in the new Geneva International Textile Agreement it would be possible to increase quotas for textile imports in a number of industrialised countries. He believed that it was necessary to give all support to the new trade body set up by the United Nations Conference on Trade and Development. He also referred to the new Chapter of G A T T which had been introduced in order to promote exports from developing countries. This, he felt, would be a useful instrument in the fight to ensure that increasing opportunities would be found for exports of manufactured goods from countries such as India.

International Liquidity

He dealt also with the question of international liquidity and the grave problem presented by the lack of reserves which inhibited countries like Britain and the U S A (whose currencies acted as international currencies) from increasing their aid to developing countries. He regretted the fact that it was not possible for Britain to extend more export credits to increase the flow of trade between Britain and India. He commented on the irony of the situation which prevented the flow of goods which India required from Britain (and which Britain would like to export) because of the lack of foreign exchange to cover the costs. Both countries lose in the bargain, but there was little that could be done to increase export credits until U K's balance of payments position improved.

Jay made a special reference to the shipping order valued at £4m which had been placed in British shipyards by the Scindia Steam Navigation Company, an order which had been assisted by both the British Board of Trade and the Export Credits Guarantee Department. He hoped that this would be the beginning of many more orders for British shipyards. He appreciated India's need to build up a merchant fleet which would help to ease India's balance of payments, although, of course, this would mean some loss to British shipping lines which had hitherto carried the business. He hoped that some mutually satisfactory arrangement could be made.

Jay said he believed that the Sterling Area had a very important role to play in the present situation where exchange and currency restrictions tended to inhibit trade. Here at least was an area in which trade and payments could proceed with relative freedom. It was because of this that the Labour Government attached the utmost importance to defending sterling to play its role as an international currency. They were determined by all means in their power to protect sterling and guarantee its viability, and many of the policies of the Government had been directed with this particular aim in view.

There is certainly no doubt about the sincerity of the Labour Government's desire to promote and expand trade relations with India. The Labour Party has always had a strong belief in the possibilities of increasing Commonwealth trade, unlike the Conservatives who were prepared to sacrifice the Commonwealth in order to enter the Common Market. It is unlikely, therefore, that the Labour Government's plans to expand trade with the Commonwealth will, by the pressure of events, be pushed into the background.

India's Invisible Men

India's Ex-untouchables by Harold R Isaacs; The John Day Co, New York; 188 pp; $4.50.

EARLY in 1963 Harold Isaacs who is a research associate at the Centre for International Studies at the Massachusetts Institute of Technology went to India to find out, in his own words "what has happened to educated ex-Untouchables in these first years of Indian independence". Isaacs said he used the term "ex-Untouchable" because Untouchability had been abolished in India by law, if not in fact. His aim was simple. It was to interview some fifty individuals from among ex-Untouchable students, teachers, civil servants, professionals and politicians who have come up through openings in Indian society created by the new educational opportunities of these years.

There is delicate—but probably intended—irony in the use of the term "ex-Untouchable" and what Isaacs learnt from his interviews suggests that for all the education the ex-Untouchables have received, they remain as Untouchable as ever. The question of questions was: how did the ex-Untouchables feel about their status? What were their doubts, their trials and tribulations in a society of which they were—and were not—so much a part?

Why the Silence ?

I have not read, to the best of my recollection, any article in the daily Indian press, or even in the serious weekly press, dealing with this question. The Indian press has been fairly well up on the problem of the Negro in the United States, the conflict in Vietnam, the German Question, the various anti-Colonial movements in Asia and Africa, but on the one question that interests 64 million of its own people, the Indian press has been stunningly silent.

Is this a deliberate conspiracy to keep the ex-Untouchables out of sight and therefore out of mind? This does not seem to be the case and most Indians would certainly feel horrified at the mere suggestion of it. Then why the silence? Is it simply that people feel that the Untouchables, like the poor, will always be with us and hence do not merit a second thought?

One good reason probably is that every Indian, whatever his caste, creed or community, feels at home in it and has no reason to seek an escape out. But the man who is outside the pale of Hinduism, the Untouchable, certainly does not feel that way. What then does he feel, beyond a vague sense of wanting to be different, wanting to be accepted? The privilege of asking this question has gone to an American. What Isaacs has to report—and he reported this first in, of all magazines, *The New Yorker*—needs to be put on every school bookshelf.

That fantastic characteristic of almost *all* Indians to indulge in symbolism, to replace words and symbols for action that V S Naipaul has written eloquently and bitterly about, describes the attitude of caste Indians towards the Untouchable. When the various States passed their Temple Entry Bills, it was considered a great step forward in the emancipation of the Untouchables. This reviewer remembers being thundered at by Dr Ambedkar when he sought to get the latter's views on the subject when Bombay, under B G Kher, passed the Temple Entry Act. "Who cares for your temples?" Dr Ambedkar said in effect, "what I want is decency from you people!". That decency the Untouchables still have yet to get.

No Leader After Ambedkar

The tragedy is that since Dr Ambedkar's death, there has not been a single Untouchable leader—and for purposes of this review and in conformity with fact rather than legal fiction, the "ex" will be dropped out of the term politely used by Isaacs—who has considered it worth his while to keep the problem of Untouchability constantly to the fore. There have been Untouchable leaders, yes. In high position, yes. But where is the Martin Luther King among India's Untouchables, who, like the Negro leader, is single-minded?

Equally tragic is the fact that not even Gandhi has been replaced, which is even more inexcusable. Acharya Vinoba Bhave has been concerned with the bhoodan movement, with the liguistic issue, but hardly with Untouchability as a *major* issue. Could it be that India's leaders think that Untouchability is not really a major problem and can wait? That the more important questions are how to grow more food, how to create new industries and more jobs and more patronage?

There is certainly no doubt that the question of Untouchability has been relegated to the background almost as if by universal consent in India. That the Untouchables themselves seem to be acquisceing in this, for a variety of reasons, like fear of the caste Hindus on whom they depend, mental sloth, and tacit acceptance of their lot is only to be regretted. If they would not raise the banner of revolt against caste Hinduism, who would do it for them? And yet, according to the Report of the Commissioner for Scheduled Castes for 1961-62 (which Isaacs quotes), only a total of 2,898 complaints had been filed with the police under the Untouchability (Offences) Act since its passage in 1955, of which fewer than a third had been disposed of in the courts and some were still pending after six or seven years!

Shades of Mississipi

Let us note the Commissioner's comments on this sad state of affairs. "As pointed out in previous reports" noted the Commissioner and the reference to 'previous reports' is highly relevant, "the number of cases registered under the Act by itself can hardly be taken as an index of the incidence of Untouchability. Due to their economic dependence on caste Hindus, the Scheduled Caste persons concerned generally do not risk approaching the police who also it is reported, do not at times properly register the cases reported to them". Shades of Alabama and Mississipi !

Untouchability then, exists, and as all Indians know, it exists in a virulent form in many ways all over India. "I did not meet a single ex-Untouchable, who thought that Untouchability was disappearing or that caste was less important now than it used to be in India" says Isaac. And he quotes the Commissioner for Scheduled Castes and Tribes as saying what every Indian knows in his heart of heart to be true, too true: "There is an amazing complacence among the intellectuals in the country and among the educated community in general. Our efforts have largely been confined to platitudes, publicity and propaganda which are hardly adequate to shake the roots of this evil which has persisted throughout the period of India's recorded history".

Isaacs awards good marks to India for making it possible for Untouchables to reach the upper ranks of life. Indeed for one who must have found the entire situation pretty ghastly, Isaac is charitable when he would have been completely justified in lashing out for the two-facedness of many Indians. His criticism is in the lowest possible key, which is perhaps just as well because a whisper is heard better than thunder. "The experience of Untouchability" he says at one point, "still waits for them (the ex-Untouchables) at every turning of their everyday lives. Every ex-Untouchable I met had personally experienced Untouchability whether in its traditional forms or in some of the new shapes of the new time. whether they were in their fifties or their twenties, whether in the village or in the city or while travelling between them. There have been changes, but nowhere, city or country, is it yet possible for such a person to live without being reminded constantly of his status or his lack of it".

The Difficult Journey

Some of the things that Isaacs learnt in his interviews make sad reading and the word "sad" itself sounds inadequate to describe what he heard. A highly placed young man in his thirties, who qualified for a Class I civil service post remembered:

> "Right from your childhood you were aware of it. You couldn't touch others or go into their houses or take water from the well. If you wanted water, you begged for it, and if they were kind-hearted, they would draw it and pour it into your pot. You were not allowed to take it yourself".

And Isaacs quotes a 20-year old undergraduate as saying :

> "In the village you learn your status. You know it by instinct. You begin to understand or get conscious of it, the separate localities for different groups, not being allowed to enter houses".

Comments Isaacs and how many millions would not agree with him: "It was easier for an ex-Untouchable youth to make the move from village to city than for an ex-Untouchable child to make the journey from city to village".

The incidents that Isaacs describes are familiar to all Indians and if they want to read what they know, there are several excellent documentations compiled not by Americans, but by Indians themselves. Isaacs' reportage is significant for the inquiry he made into what is acknowledged as a fairly common phenomenon in the United States: "passing". How many Untouchables were "passing" in India as caste Hindus and what happened to them?

Buddhism No Escape

One way of "passing", though Dr Ambedkar's plan to get Untouchables converted *en masse* was not intended for this purpose, is to become a Buddhist. But did that help? Isaacs quotes the instance of a young man who faced a horrid dilemma:

> "My father became a Buddhist in honour of Ambedkar but could not say so openly. I became a Buddhist too, but only orally, because on the forms you have to write down Scheduled Caste. If you are a Buddhist, you can't get the scholarship. But I am proud to follow Ambedkar. Being Scheduled Caste causes inferiority in our minds. To be Buddhist, it makes me feel free!".

Isaacs says that when he asked the young man how it felt to put down "Scheduled Caste" on the form, the latter "puled his face into a sudden hard grimace". As well he might. And this was the reply:

> "It is for this reason I *hate* this government. I have hatred for it. It says it makes no difference among any religions, but it supports Hinduism. It makes me put down Scheduled Caste on form! If I am asked what I am, I like to say, 'I am Buddhist. I have no community at all'. This does not happen and I say I am Buddhist and people then take me as an inferior. 'Oh' they say, 'you are a Mahar Buddhist' ridiculing us for this and I say, 'No, We are not Mahar, we are *Buddhist!*".

Is it possible for a caste Hindu to understand the bitterness and the burning hatred behind those words?

How many Untouchables do most caste Hindus know, in the first place? And what is the means of communication between the Untouchable and the caste Hindu? For if there is no normal contact between caste Hindu and Untouchable, if there is no way for the latter to unburden his thoughts, except occasionally by rioting in the streets (when he gets the short end of the stick anyway for his troubles) how is one man's cry to be anything but a cry in the wilderness? Isaacs in his quiet way says: "If my own friends and acquaintances are any fair indication—and I think they are—they never see an ex-Untouchable, as far as they know, unless they glimpse a scavenger or sweeper at work and the question of his identity and his place in the scheme of things catches for an instant at some edge of their minds. They say all the right things about it, but they are busy with other great affairs".

Not Conscious of It

Which is true. Most Indians take both the existence of Untouchability and the need to remove it root and branch unconcernedly *as if it did not concern them.* And therein lies the key to the Indian mind. Indians see Untouchability around them, but they are not conscious of it. They practise Untouchability in many subtle ways, but are not aware of what they have done. It is the *unawareness* of ancient wrongs because of their long existence which makes the situation so ghastly and intolerable.

Is mass education of Untouchables the answer? Is industrialisation it? Isaacs quotes a discouraged caste Hindu politician as saying:

> "Today they (Untouchables) are quite easily won over, a little money, a little position. This is what happens to most of them. They end up in minor jobs, not trying to fight the caste system, but trying to get individual status, trying to get accepted in the higher castes. May be, after they have had education in larger numbers and find they cannot get absorbed into the higher castes and also find themselves unemployed, they will become more revolutionary".

And an equally discouraging reply was had from a distinguished Untouchable himself:

> "When a man is taken into government service, he becomes a member of another class. He stops mingling with Scheduled Caste people. He becomes a victim of the caste system in a new way. In the new circle he is looked down on. So he ends up nowhere".

Too Little, Too Slow

Nowhere? Isaacs has his own answer. He says: "As the educated ex-Untouchables pull up and away from the sudden bleakness of their past estate, they do not quite get *nowhere*, but neither do they reach *somewhere*. They are people who want above all to become different from what they were and what their fathers were. They want to leave all that behind, to forget it, to blot it out, but they come into a situation where too little is changing too slowly; a society still governed by caste does not allow them to abandon their past, to forget it, to blot it all out. What they move into becomes a kind of semi-limbo".

As I kept reading the book it occurred to me that many of the things that the Untouchables told Isaacs would probably have not been repeated by them to their own caste Hindu brethren (*sic*). Or if they did, that would probably have been in a somewhat circumspect manner. It is impossible not to have a sinking feeling in the pit of one's stomach as one reads human sorrow being expressed with such revealing frankness as in the statement by an Untouchable M P in Delhi who thus described life in the capital:

> "Sometimes we get invited out, but most often I avoid it, because I know *they* feel it very much and just invite me as a formality. Suppose there is a marriage of a daughter of an upper caste friend. He will invite me, and I have to send a gift, but I avoid going. It *could* happen that they would give me some kind of a separate meal and I would resent it and be angry, and would make a scandal there. So I don't go. Sometimes I do go, but only to the houses of very trusted people. And I do go, of course, to official functions, like tea parties or 'at home' of other officials. There are friends I know won't practise untouchability in their homes here in New Delhi, but it is in my mind that at their homes back in the villages, they could not treat me like this. This troubles me because of all the experiences of my life. And I know their wives feel this more than the men do. They have inherited all these things from their parents, all of them, and they are not easy to overcome."

"I Am An Indian"

But two comments from Untouchables brighten the pages of an otherwise bleak book. And for these two we have to be grateful. Very grateful. First from a young Mahar:

> "I am not a Buddhist. I think changing names or religion won't remove these things. By converting to Buddhism you just change the name of the old Scheduled Castes. You have to change totally, not just the name, but totally, the thoughts, behaviour, discipline of life and everybody must change, not just the Scheduled Castes. If Buddhism were accepted by all, may be there would be some sense in it. But if only one group does it, it just produces a new name. Persons who are converted, if asked what they are, say they are Buddhists. But they know they are Mahars and the feeling is just the same. When I am asked, I don't feel ashamed of being a Mahar, but if I think it is asked with bad intentions, I say: 'I am a human being'. This is what I say. I hope my children will not experience any of this. I hope this question—who are you?—won't be asked. I hope my son will not be a Mahar, that he will be a man".

Second from another follower of Dr Ambedkar:

> "When anybody asks me (the question, 'what are you?'), I say: 'I belong to this nation, India. I'm an Indian.' If they persist after that, I say: 'Who are you, somebody from the census bureau?' And they keep quiet. I suppose they think: 'He's an educated Mahar'. And if they do, I am not ashamed. I am proud of this community, it is a fighting community, an honest community. But I do really *feel* like an *Indian*. This is the best answer. I consider myself one with my country".

In a country where everyone—or almost everyone—considers himself a Tamil, an Andhra, a Bengali, a Hindu, a Sikh or a Lingayat, first and sometimes last, it is like a refreshing whiff of breeze to hear a man say he really feels like an Indian. And this no caste Hindu, no fanatic brahmin, no wretched little tyrant in the village can take from the Untouchable. He is first, last and always an Indian and more an Indian than the many Indians who qualify themselves regionwise languagewise or religionwise. The country can do with more like him.

Deep Wounds

Isaacs interviewed only fifty people. If he had interviewed five hundred or five thousand the results qualitatively could not have been much different. He might have piled an impressive case history of 64 million unhappy lives, but that would have been about all. Hinduism has been indicted in the past. It has been indicted by Islam, by Christian missionaries and over the millenia by Hindus themselves. This does not seem to have made any real dent in the body of Hindu practices. The Untouchable has nowhere else to go to forget his misery or his unsought heritage. The American Negro, theoretically at least, can claim another continent as his home. For the Untouchable, India is his home. India alone can provide him the framework for happiness.

Seven years ago Isaacs wrote a penetrating study of American images of China and India and called it "Scratches on Our Minds". "India's Ex-Untouchables" is in the same tradition. Here he records not scratches, but the deep wounds in the minds of Untouchables, wounds that everyone knows exist, but few will recognise and fewer still move to heal. In "Scratches on Our Minds" Isaacs held the mirror to American thinking on China and India for which he probably got no thanks from India. In his present work he has done an even greater service to India and if Indians do not recognise it, they will be the poorer for it. The Untouchables in India have been docile for so long that most Indians have not considered it worth bothering about them except when there is an occasional editorial on some glaring injustice. The tendency is to be smug, to say, "but look, didn't we have an untouchable Chief Minister in Andhra? Didn't we have an Untouchable Congress President, an Untouchable Minister in the Central Cabinet?" and so on in the same vein. Indians would be even more willing to throw a few more golden apples into the laps of Untouchables to satisfy their conscience, but would not ever think of inviting even an educated Untouchable to eat with him in his village home. An Indian's home is his castle and so the rationalisation would go, it is his privilege to choose who he would invite home. Some day the Untouchable is bound to revolt and like another Samson, bring the caste edifice crashing down. Indians cannot say they have not been warned of the volcano on which they are sitting. Isaacs, with no axe to grind, has sounded a timely warning by telling Indians what he has seen and heard. A less scholarly man might have hurt the case by over-statement. By sticking to facts and curbing all urges to pontificate, Isaacs has let the Untouchables speak for themselves.

At $4.50 this book is not likely to be a big seller in India, but I understand that an Indian publisher has secured re-printing rights. One hopes that the Indian edition will be cheap, cheaper than usual, and that it will be talked about in every Indian home. For if ever there has been a need to publish an American edition in India, it must apply to "India's Ex-Untouchables". It may be many years, perhaps, before an Indian Baldwin will write an Indian "The Fire Next Time". But Isaacs—this time probably completely unintentionally—has already done it, even if ever so gently. Isaacs however, does not let his reader forget that for all her faults, India is trying to make amends. He constantly looks at the positive side of the picture, reminding his reader that already there are four million Untouchable youngsters in primary schools, another million and a half in middle and high schools, fifty thousand in colleges and universities and some 300,000 in government jobs. No one can say that Isaacs has been one-sided or that he has distorted the picture. In fact he has been so fair that one can weep for the lightness of his touch. As far as Untouchability is concerned, there is no need for distortion. The picture is distorted as it is. One has only to hold the mirror to India.

THE 1965-66 BUDGET

Indirect Taxation

Being in the rather fortunate position of not having to raise additional tax revenue, the Finance Minister intends the proposed changes in taxes to serve other purposes.

In direct taxation the proclaimed objective is "to harness every possible source of dynamism and enterprise —whether domestic or foreign, public or private—to the task of rapid economic growth."

In indirect taxation, the changes aim at one of the following two objectives:

(a) to give relief to consumers in those areas where the supply position is such that the relief may be expected to be passed on to them; and,

(b) to mop up, through taxes, some of the excess profits on commodities, whether produced in India or imported, as a result of acute imbalance between supply and demand.

INDIRECT taxes account for the major share of the Central Government's tax revenue. In 1965-66 they are expected to yield Rs 1254.65 crores out of a total revenue of Rs 1945.80 crores from all taxes, or roughly 65 per cent. Customs duties will provide Rs 419.50 crores and excise duties Rs 835.15 crores. Having been able to produce a balanced Budget—indeed one with a small surplus at prevailing tax rates—there was no compelling reason for the Finance Minister to make changes in indirect taxes. The changes that have been proposed have two purposes, according to the Budget Speech:

(a) to give some relief "in those areas where the supply position is such that one may reasonably expect the relief to be passed on to the consumers"; and,

(b) to increase taxes "in those areas where this might correct existing distortions in the price structure and mop up some surplus profits".

The net increase in revenue as a result of the changes proposed is just Rs 1.50 crores, resulting from a revenue gain of Rs 14.50 crores from customs duties and a loss of Rs 13 crores from excise duties. This does not, of course, include receipts from the 10 per cent regulatory duty imposed with effect from February 17, 1965 on all imported goods except foodgrains, fertilisers, pesticides, books and accessories for family planning. The regulatory duty not being a part of the Budget, the expected receipts from it are not shown separately. The Finance Minister appears to be taking credit for roughly Rs 20 crores from the duty in 1965-66. This is almost certainly an under-estimate, even allowing for some restriction of imports.

Export duties, of which only a few now remain, are left untouched. Changes in import duty are all upward.

The import tariff is at present cast in the form of a commodity schedule with broad distinctions indicating the treatment to be accorded to various classes of articles. The general rate of import duty is 60 per cent. On certain non-essential items where it is felt that the consumer can well pay a higher rate or where there is sufficient indigenous production to meet the needs, duty is imposed at higher rates. Certain items are subjected to protective duty while certain others are declared duty free or are subject to lower rates of duty in the interests of indigenous industry or the economy of the country.

Some of the items which carry the heaviest rates of duty are certain spices, tobacco and its manufactures, wines and spirits, artificial silk goods, gold plated articles, socks and stockings of silk or art silk, hardware, parasols, sunshades, gold and silver thread manufactures, silver thread and wire, clocks and watches, etc. Some of the protected goods are some chemicals, certain coal tar dyes, some non-ferrous

metals and manufactures, certain items of machinery and parts, ball bearings and certain motor vehicle parts for which the duties are fixed at such rates and for such periods as are found necessary by the Government after considering the recommendations of the Tariff Commission. Grams and pulses are on the free list while specially low but varying rates apply to a large number of essential items like batching oils, lubricants, raw films, machinery, etc.

In addition to the basic duty, a general import surcharge was imposed at the rate of 10 per cent of the effective duty in the 1964-65 Budget. And, finally, there is the 10 per cent *ad valorem* regulatory duty effective from February 17, 1965.

All the increases in import duty proposed in the 1965-66 Budget fall on commodities in whose case there is a very large margin between landed prices and current market prices. The higher duties are intended to reduce these margins. In the case of raw cotton while the statutory duty is raised to 50 paise per kilogram from 26 paise, no change in effective duty is proposed just now. The effective duty may be raised later on, depending on the movement of internal prices.

The increases in import duties proposed will yield in all Rs 6.50 crores of additional revenue. In addition, countervailing duties to offset increases in excise duties, will yield Rs 8.00 crores, giving a total additional revenue of Rs 14.50 crores from customs duties.

In excise duties the accent is on concessions as is evident from the net loss of Rs 13 crores from the changes proposed. The cuts in duty are intended, in most cases, to reduce prices and afford relief to consumers. Among the changes which fall in this category are in those in the duty on tyres and tubes for cycles (estimated relief: Rs 1.86 crores), certain types of writing, typing and printing paper (Rs 2.50 crores), controlled varieties of cotton fabrics (Rs 9.76 crores), cycle parts (Rs 2.25 crores) and footwear (Rs 2.60 crores).

In certain cases the excise duty has been reduced with a view to encouraging consumption. The duty on certain classes of paints in the use of which synthetic resins are used has been reduced as has been that on cellulose staple fibre and yarn and cellulosic filament yarn other than acetate yarn and on silk fabrics which are facing adverse competition from man-made fibres and fabrics.

In a few other cases the concessions are intended to help smaller manufacturers. For soap manufacturers, the quantity eligible to be cleared without payment of duty is proposed to be doubled, but the relief is being restricted to manufacturers whose annual production does not exceed 500 tonnes. Similarly, in the case of tyres for motor vehicles, the existing full exemption from special excise duty on the first clearance of Rs 50 lakhs and 50 per cent exemption on the next Rs 50 lakhs for each manufacturer is being revised to full exemption on the first clearance of Rs 1 crore during any financial year. This concession is also confined to manufacturers whose total clearance for home consumption does not exceed Rs 4 crores in a year.

Finally, in one or two cases, the excise duty has been abolished altogether as it has proved to be unremunerative—as, for instance, the duty on cigars and cheroots and on silver.

Excise duty has been raised on commodities which are in short supply which command high premiums. The most significant increases are on steel ingots and iron and steel products intended to narrow the gap between the producers' prices and market prices as recommended by the Raj Committee. The increase in duty on ingots and various steel products is expected to bring in Rs 11.41 crores which, incidentally, is some measure of the extent to which the producers' prices fixed last year after decontrol were off the mark. The duty on copper ingots, bars, etc, and on copper manufactures has also been raised partly to curb consumption and partly to reduce the very high profit margins. The increase will yield Rs 3.65 crores.

The aggregate additional revenue expected from increase in excise duty on various items is Rs 16.68 crores while the many concessions will cost the exchequer Rs 29.68 crores. There will thus be a net loss in revenue of Rs 13.00 crores as a result of the changes in excise duties.

Table 1 : Details of Changes in Basic Customs Duty

Article	Present Rate of Duty		Present Rate of Duty		Additional Revenue including Effect of Surcharge *(Rs Lakhs)*
	Standard Rate	Preferential Rate	Standard Rate	Preferential Rate	
Sodium Hydrosulphite	40%	30%	100%	90%	33

The "Manchesterisation" of Ahmedabad

Howard Spodek

The business skills of Ahmedabad, its indigenous entrepreneurship, set it apart from most Indian cities.

The leadership which brought industry to the city was, and remains, Gujarati. Many traits that mark the leadership today are carryovers from pre-industrial patterns.

By caste, most are Jain and Vaishnava banias or Patels from the Ahmedabad and Kaira districts.

How the industrial pioneers made Ahmedabad the "Manchester of India" is the subject of this study.

BY Indian standards Ahmedabad is a rich city. Its wealth rests on its 62 textile mills which employ 130,000 people, about one-tenth of the city's population. They produce about 1,150 million yards of cloth annually, a quarter of all of India's mill production. Although the workers seem under-nourished, overworked, and poorly educated, their basic minimum take-home pay of Rs 150 per month, including dearness allowance, puts them among the best paid industrial workers in India.[1] As to the owners and high level personnel, their dress, cars, and homes give ample evidence of their prosperity.

Gujarati Leadership

The business skills of Ahmedabad, its indigenous entrepreneurship, set it apart from most Indian cities. The leadership which brought industry to the city was, and remains, Gujarati. Many traits that mark the leadership today are carry-overs from pre-industrial patterns. It is close-knit and expert in finance rather than in technology. By caste, most are Jain and Vaishnava banias or Patels from the Ahmedabad and Kaira districts. They are intensely concerned with the status and progress of the city which they seem to rule on Medicean patterns. How the industrial pioneers made Ahmedabad "the Manchester of India", as Ahmedabadis call their city, is the subject of this preliminary research. Hopefully this sketch will form the background of a study of the personal and psychological motivations underlying entrepreneurship.

Ahmedabad got its first mill in 1861. Slowly, over a period of thirty years, the added example of eight more mills as well as vital changes in economic conditions and attitudes prepared the ground for the quick expansion of 1891-1905. Then the Swadeshi movement and World War I pushed both the number and the profits of the mills to new heights. Gandhi came to Ahmedabad in 1915 and for sixteen years made it his home. He brought labour-management harmony, continued swadeshi movements, and surging confidence to Ahmedabad and its people. Industry boomed. Finally, since 1933, first because of the general depression, then because of war conditions, and finally because of the economic policies of the Government of independent India, expansion in the mills stopped. New economic avenues have been pursued while mill growth has remained stationary.

The Pioneer

The Bombay State Gazetter for Ahmedabad district, compiled in 1879, presents a rosy, British, and comprehensive account of conditions in the earliest years of industrialization. It states that Ahmedabad was renowned for its high death rate and dirt and that Maratha and Moghul rule despoiled the city, but that in 1817, when the British assumed control of the city, improvements began. Population expanded, trade flourished, and the three traditional Ahmedabad manufactures of cotton, silk, and gold revived. The city walls were repaired, cesses were levied for city improvements. Merchants began to amass money and new public building gave evidence of the prosperity. Charles Heimsath in "Indian Nationalism and Hindu Social Reform" (Princeton, 1964), writes that reform and educational movements of increasing strength were spread by Gujaratis.

Onto this encouraging scene stepped Ranchhodlal Chhotalal, whose imagination, boldness, ingenuity, and success make him a classic example of the Schumpeterian entrepreneur. S M Edwardes, his best English biographer, records his birth in 1812 in a close-knit, honest, and thrifty family of the well-placed Nagar Brahmin community of Gujarat. Like his father, and like many of the subsequent mill leaders, he was orthodoxly religious. He followed his father into a career in government service. From the time he finished his formal education in 1842 until 1853, Ranchhodlal worked in a variety of clerical and administrative positions both in the Bombay government and privately. He was appointed Assistant Superintendent of Pavagarh in Panchamahals, the highest position to which an Indian in the political department of Government could aspire. With a salary of Rs 300 per month, he was the chief Bombay Government representative in the area. In 1853 his government career ended abruptly when he was charged with taking a bribe. Court proceeding dragged on and although the decisions were not unexceptionable, the slur on Ranchhodlal's reputation forced the government to discharge him.

From Administration to Business

Like others of the more turbulent times later, having lost the possibility of government work, Ranchhodlal turned his energies to business. As early as 1847, even before Cowasjee Davar's 1854 venture in Bombay brought the textile industry to West India, Ranchhodlal had, with the help of a Major Fulljames, investigated the possibilities of textile manufacture along British lines. Then, and again in 1851, money was raised, English manufacturers and machine producers were contacted, and preliminary plans were made. Apparently the investors wanted more security than the new industry could offer, however, and they withdrew their capital.

Perhaps the loss of his job and the added time to work on financial affairs were beneficial, for in 1859 Ranchhodlal succeeded in making the desired combination: his imagination and energy, with the skills of British technicians, and Rs 75,000 of investments by wealthy merchants to add to his own Rs 25,000 investment. Ranchhodlal was put in charge of construction and management in return for 2½ per cent on the sale of yarn. Problems of construction followed. Dadabhai Naoroji, who was then in England, served as purchasing agent for the machinery. Legend tells that the machinery burned and went down at sea,

grew at almost twice the rate of all-India growth, and by 1905, Ahmedabad mill facilities were about 15 per cent of the country's total.

As important as the physical growth was the psychological and institutional change. In 1891, the Millowners' Association of Ahmedabad was founded with Ranchhodlal as first president. Bombay had established such an organization in 1875 to represent the interests of the millowners and Ahmedabad was now following suit. In 1894, the Ahmedabad stock exchange was founded. Investment in cotton mills was booming and local trade could now support a local market. The Ahmedabad stock exchange replaced the Bombay market as an instrument for meeting the capital needs of the local mills. The investigation into the possibilities of dredging the Sabarmati River and opening a channel to the Gulf of Cambay, further indicated that the millowners recognized their common interests.

Among the managing agency firms, commissions based on sales generally replaced the system of commissions based on production. The 1927 Indian Tariff Board Report on textiles noted that this change took place generally in 1895 and was almost completed around 1917. It indicated greater responsibility on the part of the agents.

Parsis Come to Ahmedabad

Ahmedabad still trailed behind Bombay, remaining a regional or national, rather than international centre. It had no training institute like Bombay's Victoria Jubilee. It had far fewer mills. It carried on little international trade. By the turn of the century, however, when the Indian National Congress and the Bombay industrialists led the fight against the British free trade policy, Ahmedabad's business leaders and newspapers lent their voices to the protest. The local economic sensitivity to national polittcal questions which would motivate Ahmedabad during the twentieth century began to appear fifteen years before the arrival of Gandhi.

New kinds of firms were opened. In 1899, the firm of Ardeshir D Wadia, with Motilal Hiralal, began as engineers, contractors, and manufacturers of cotton gins as well as other industrial machinery. The firm had good success. From a capital of Rs 25,000 at the beginning, it expanded to Rs 4 lakhs by 1917. Thus Parsis finally entered Ahmedabad industry as entrepreneurs. In contrast to their foremost position in Bombay, they never played an important role in the financier-dominated Ahmedabad arena. By the time that Tata founded the first Parsi mill in Ahmedabad in 1903, the infancy of the industry had passed.

Problems of Industrial Labour

Another Parsi mill which met with less success was begun by Sorabjee D Karaka to weave fine cloth from imported British yarns. Its failure helped demonstrate the hold of the British on the spinning and weaving market in fine counts above 24s.

In the early years of this period Ahmedabad began to face the problems of industrial labour. Strikes were numerous. In 1893 every mill in the city was shut down by strikes. Workers even attacked Ranchhodlal's house. The working conditions in textile mills had been investigated and legislation regarding women and child labour had been passed in 1881 and 1891. Although some claimed that these investigations resulted from pressures from Lancashire to drive up Indian prices by increasing the cost of labour, the investigations showed conditions in the mills to be intolerable. The working day ran as long as fifteen hours and men, women, and children shabbily treated. The increasing size of the industry spread these conditions and they festered.

Three Families

Among the families which opened new mills in this period, three were to become most important in the future, and each came from a somewhat different background. Lalbhai Dalpatbhai, who opened the Saraspur Mill in 1897, was a wealthy and orthodox Jain bania whose education went up to matriculation. Lalbhai was a prominent financier who probably entered the mill industry as just one new investment. On it his son Kasturbhai was to build his fortune.

Mangaldas Girdhardas Parekh's father was a poor clerk who saved his money, went to Bombay and entered the cotton trade. With two friends he began to trade on the international market, but with little capital and often unprofitably. In the same year that Mangaldas passed his matriculation, however, his father executed a highly successful international cotton transaction and began to prosper. Mangaldas took a job as store clerk at Ranchhodlal's first mill. With the financial backing of Ranchhodlal and Mansukhbhai Bhagubhai, he founded the Aryodaya Spinning Mills in 1892 in partnership with Balabhai Damodardas. The Mangaldas pattern of a boy with a good education working in a mill office and gaining recognition from the owner who then helped him to start on his own was a common experience while the industry was in this formative stage. Relatively small, close-knit agencies, often supplemented by caste ties made this possible.

Mangaldas' partner, Balabhai Damodardas Shodhan, was, like him, a Vaishnava bania. His father was a clerk to a shroff and had arranged to get cotton market quotations from New York and London. These he supplied to various local merchants. For this work he won the family name of "Shodhan", which translates approximately as "entrepreneur" or "innovator". Balabhai also served in Ranchhodlal's mill as a store clerk. Once gaining control of one mill, he expanded to more, first in co-operation with his brother and then with his son. As managing agent, he applied the profits of one mill to the capital requirements of new ones. Also, like other agents, he solicited public and private deposits to cover the major capital requirements and depended on stocks for only about one third of his capital.

By 1905, the textile industry of Ahmedabad had developed an organizational and institutional framework. Its systems of finance and management were firm. It was developing and attempting to cope with the problems of a sizable industry. Labour strikes, foreign competition, and tariff policies were becoming vital. Most important of all, textiles had become a respectable and profitable investment. As Ahmedabad traditionally had a climate which favoured business, it now had a climate which specifically favoured textiles. The early examples, the chances of working in the mill offices, and the backing of experienced men invited and furthered expansion.

Swadeshi Movement

Between 1905 and the beginning of World War II, growth in the Ahmedabad industry proceeded rapidly. The Swadeshi movement, the needs of World War I, the first protective tariff, peaceful labour-management agreements, and, above all, the confidence inspired by Gandhi brought very favourable conditions. New technological and managerial pioneering as well as the entrance of yet more families into textiles marked the period.

Swadeshi, the nationalist movement to support domestic manufactures, gave a necessary and tremendous boost to the textile industry everywhere in India. Breaking forth in Bengal as a reaction to the partition of 1905, swadeshi included two schemes: a boycott of British imports and an emphasis on the use of domestically produced goods. This joint action at once exerted pressure on British business interests to change their government's policies in regard to India, and promoted the growth of indigenous industry. While Bengalis tended to emphasize the political importance of the campaigns, the Gujaratis saw swadeshi as economically profitable. India was willing to sacrifice better quality in order to create a strong home industry; Ahmedabadis seized the opportunity. The number of mills in Ahmedabad jumped from 32 in June 1905 to 52 in June 1910. Spindleage rose from 577,166 to 917,590, and loomage from 7197 to 15,526. To run these plants the number of workers increased from 21,585 to 30,013.

When the first swadeshi drive had slackened, in 1915, Mohandas Karamchand Gandhi came to live in Ahmedabad, bringing with him a new era of growth. As he later did for all of India, Gandhi introduced new expectations, possibilities, and goals. He continued the swadeshi drives and, most important for business, he inspired a high morale and confidence in the future.

Profits of War

At the same time, World War I brought profits so great that in 1917 the Government imposed an excess profits tax. Wartime shipping shortages, although depriving India of foreign markets, also rid her of competition at home. The mills of Ahmedabad, including those that had just been built in the first swadeshi campaign, boomed.

The end of the war generally brought cut-backs and depression, but not to Ahmedabad. Here, beginning in 1921, Gandhi was leading further nation-wide swadeshi drives. Many of the millowners tell of the effect of his spirit in impressing on them the importance of a strong Indian economy. Despite Gandhi's general opposition to machine industry, his work in Ahmedabad is credited as one of the driving spirits behind the growth which between 1920 and 1930 added 21 mills, 600,000 spindles, 16,000 looms, and employed an additional 20,000 workers per day.

Gandhi's Contribution

As Gandhi helped Ahmedabad to prosper even during years of general depression, so he insured labour peace during years of general unrest. Ahmedabad had earlier had the experience of labour violence and in 1918 when a general strike broke out to protest against the elimination of a "plague bonus", violence threatened again. Gandhi, however, exercising his personal influence and fasting to focus attention on the issue, brought together Ambalal Sarabhai representing the millowners and his sister, Anasuyaben Sarabhai, representing the workers. Their settlement began a new tradition of peaceful labour relations and equable settlements arranged out of court. Emerging from the workers' new-found strength and Gandhi's leadership, the Textile Labour Association, generally considered India's most effective labour union, was born. Ahmedabad had further strikes, until the general one in 1923, but almost all were short and none were violent. Since 1923 no strikes have occurred.[6] A general feeling of harmony obtained between labour and management.

Tariff reform helped the industry, too. In 1919 the Government of India was granted financial responsibility, and in 1922 it instituted the first protective tariff since 1894. Protecting the vast home market for Indian manufactures did much to save the textile industry from the ravages of the world-wide depression between the Wars. What swadeshi had attempted to do by voluntary measures, the Government could now effect through the tariff. In the protected markets, Ahmedabad began to push expansion of cloth production through a rapid increase in loom facilities.[7]

Conservatism, a Continuing Problem

Although growth marked this period, failures came, too. Even with the help of a protective tariff, foreign manufacturers as well as the carefully managed Indian mills could undersell the products of inefficient mills. By comparison with the war years when profits came to almost all, the post-war years brought more limited returns. While the greater number of mills prospered, others were sold, liquidated, or closed down. Among them was Ranchhodlal's original Shahpur Mill.

Apart from the possibility of mismanagement, one of Ahmedabad's difficulties continued to be conservatism. The Indian Tariff Board reports on the textile industry in 1927 and 1932 praised the Ahmedabad methods of finance through the deposit system and through large investments by the agency firm, but noted that while encouraging honesty and careful attention to finance, such practices also encouraged conservatism. In some plants, at least, the traditions of conservative financial backing inhibited progressive innovation.

Paradoxically, as conservatism crippled some firms, the new pioneering efforts of other Ahmedabad mills, especially Calico Mills, brought Ahmedabad to the forefront of the Indian industry. Ambalal Sarabhai, as chief managing agent and great-grandson of the founder of the company, introduced the innovations. Although personally reticent and aloof, Sarabhai has a reputation for being progressive, businesslike, anxious to exploit new ideas, and with his amazingly accomplished family, highly cultured. That he has left Jainism and that he, as many people say, "does not believe in charity", evoke a variety of comments. In fact, Ambalal has given considerable sums of money to educational and cultural institutions in Ahmedabad and throughout India. His support for Gandhi's ashram at the time the Mahatma was scorned for admitting harijans is legendary.

Pace-Setting Innovator

When Sarabhai was about five years old, in 1894, his father died. He was raised by his uncle, Chimanlal Nagindas. Subsequently, Chimanlal's death forced Ambalal to leave Gujarat College and to enter the textile industry. At about the age of twenty he found himself the managing director of both the Calico Mills and its sister concern, Jubilee Mills. In the 1918 strike when he was but 29 years old, he served as representative of the Ahmedabad Millowners Association. In 1922 he demonstrated that he was as interested in pace-setting experimentation as he was in adding to his fortune. Despite dissuation from friends, he pioneered finer count spinning in India and found quick and impressive success. Calico began spinning counts even up to 140s and led the way to recapturing from Lancashire the fine yarn and cloth market of India.[8] From that time on, Ahmedabad turned to producing fine cloth. Today that is its forte.

In addition to pioneering new products and qualities in India, Sarabhai wanted to replace British managerial and technical personnel, the mainstay of the upper echelons, with Indian men. He began a programme to attract the brightest of college graduates regardless of their fields of study. For one or two years he put them under the tutelage of his British employees and within two years he began the change-over. Sarabhai's plan for future Indianization of the mills was a success.

To the present day Sarabhai has continued to employ pace-setting innovations. He introduced the first plant in India for producing sewing thread (1922) and diamond mesh mosquito netting (1937). At Calico he has installed automatic loom sheds and has completely air-conditioned both the spinning and the weaving sheds. In collaboration with the Tavistock Corporation of London, Calico has worked out programmes for proper group relations for management and labour teams.[9]

Expansion Along Family Lines

As Sarabhai experimented with modernized methods of production, Kasturbhai Lalbhai was demonstrating that a business could profitably expand along family lines. In building his textile chain to seven mills, he promoted three mills for the benefit of the sons of his three married sisters. Yet while he expanded his holdings to create places for his relatives, he was also hiring top-level management for his mills on the basis of merit. After learning the working of the mill, these men often succeeded to the highest positions of management, either with Kasturbhai or with other millowners who, desiring such highly trained men, lured them with higher pay.

Kasturbhai seemed intent on coupling the virtues of family controlled business — quick, unified decision making, trusted personnel to oversee expansion — with the best of open business practices — personnel chosen on the basis of talent.

Indicative of the value system among the millowners has been Kasturbhai's rise to prominence. Not to be overlooked is the sheer fact of his wealth and the lakhs of rupees of charity he has given. Like many millowners he observes religious prescriptions, and he serves as president of the Anandji Kalyanji, an institution which looks after Jain temples and shrines throughout India. In times of famine he has served on relief committees and has himself travelled on foot through striken villages. He has been an important representative to and for the Government of India on tariff and textile questions. During periods of Hindu-Muslim rioting in Ahmedabad he led movements of reconciliation, even at physical risk to himself. Ahmedabadis today generally regard him as the final authority on charity, municipal matters and industrial policies. In patterns reminiscent of the old nagarsheths and of Ranchhodlal in his day, Kasturbhai stands pre-eminent in Ahmedabad.

Changed Priorities

Other millowners also continued to expand their control. The various branches of the Shodhan, Mangaldas, Hiralal, and Hirabhai families all added to their textile holdings. Those who had come to textiles from sharaffi businesses now found that their priority of interests had changed: industry came first, sharaffi finances and trading second. Generally the old families who did not invest in textiles, or who invested unwisely, dropped sharply in importance as the wealth of the textile magnates rose to prominence. The family of Premabhai Himabhai Nagarsheth, for example, which had received the honour of consideration as the most prominent business family in the city, declined in importance and was superseded by the new leading families. Also at this time the family of Ranchhodlal left the textile field and his family fortune, too, diminished in importance. The Becherdas family, whose one mill grew but little, suffered the same fate.

In the leading circles of Ahmedabad millowners, personal relations became closer. This led to some forms of co-operation among the mills. Since the market seemed always large enough, millowners and managers helped one another to open new enterprises. For example, two cotton trading families with much experience in Africa, the Patel family, which today controls the Asarwa mills, and the Parikh family, which purchased the Jupiter mill in 1935, were assisted by the Sarabhais and the Mafatlais (of Bombay), respectively. Mafatlal-Parikh co-operation began with the personal friendship of Mafatlal with his chief engineer, Bapalal. Through this friendship, Mafatlal decided to help his relatives enter cotton trading in Africa and later open a mill industry both there and in India. The Sarabhai-Patel agreement began in a joint investment in an East African cotton trading concern. Sarabhai was the principal financier and the Patels held a financial interest and served as managers. When the Patels returned from Africa, they used their profits to purchase the Asarwa Mill in 1945.

Marriages Strengthen Links

Marriages among the leading mill families strengthened the links between them. One of Ambalal Sarabhai's sons married a niece of Kasturbhai; one of his daughters married the son of Mangaldas Girdhardas Parekh. Another marriage united the Shodhan and Mangaldas families, early partners in textile entrepreneurship. Socially as well as economically the new class consolidated itself.

The successful and expanding industry also attracted new families. In 1913, Bhikhabhai Jivabhai Patel, born in a farming family and serving as a school teacher, founded a small power weaving factory. In 1917 he expanded the plant and in 1928, despite a damaging flood, he pooled his resources and opened a new and successful composite spinning and weaving mill, the New Rajpur Mill.

Another Patel from the Kaira district, a caste renowned for their success in education, government service, and business, Khushaldas Gokuldas Patel of Nadiad, having studied up to Matriculation, came to Ahmedabad and found a bank job in 1871. Through the years his position and income grew and in 1914 he and his son acquired control of the Himabhai Mill. Finding this profitable, they extended their control to two more mills in 1925.

In 1920, the two Marsden brothers, Ben and Charles, promoted the Marsden Mill and, following its success, added the Monogram Mill in 1927. These were the only mills in Ahmedabad ever controlled by Englishmen. The brothers had come to India, Ben in 1907 and Charles in 1916, to serve as weaving masters. In promoting their own mill, they experienced difficulties in finance, the default of a British company in supplying machinery, and the resignation of three of the directors. In 1921, however, they found in Manilal Mulchand a financier and helper and the mill began to succeed. In the early 'fifties, the Marsdens returned to England, selling out their interests to the grandchildren of Mulchand.

Modern Management

Apart from new families buying and serving as agents for textile mills, jobs within the mills opened for new personnel. High-level executive jobs were available to new men, unrelated to the agents by family or caste. The growing sophistication of the mills required increasingly skilled personnel, regardless of caste. Sarabhai's recruitment policies especially favoured well qualified college graduates. Such people today serve as important executive managers in the Sarabhai and Kasturbhai enterprises and, in lesser positions, in other Ahmedabad mills as well.[10] They now take part in entrepreneurial decisions.

Among the young men who came, many broke with caste occupational traditions. Some had worked in the civil disobedience movements and now found the traditional government jobs closed to them. Some were south Indian Brahmins escaping the growing anti-Brahmin prejudice in their home regions. Some consciously wanted to try a new field. More documentation is needed, but conversations with a few of the present day managers in the Ahmedabad mills indicate that in the managerial positions in the mills, traditional occupational patterns began to break down.

Renovation and Modernisation

Since 1933 no new mills have come to Ahmedabad. The last years before the war were years of world-wide depression that did not favour expansion. The war itself brought a boom with unparalled profits, but restrictions on material needed for the war effort precluded the construction of new facilities.

The war years saw also the continuation of Congress' struggle for independence. In this struggle the Ahmedabad industry helped with funds and workers, and in 1942, during the "Quit India" movement, with a three month voluntary shutdown of all of Ahmedabad's mills. The influence of Gandhi remained strong in the city.

Following the war, the profits that had accumulated were free for investment in new equipment and machinery. Many mills took this opportunity to renovate and modernize. In 1947, however, the Government of independent India issued a new policy ending the possibility for expansion. Ahmedabad, Bombay, and certain other centres were declared surplus areas in textiles. In order to favour the handloom industry and to give an opportunity to new textile centres to grow, the surplus areas were forbidden to expand their facilities. The Government also felt that with existing capacity, these centres could increase production by 25 per cent. In fact, production has risen and technical improvements have been instituted, but the limitation on expansion has dampened many spirits. In October 1963, the order was relaxed to permit expansion up to 10 per cent, but sufficient figures are not yet available to evaluate the effect of the new policy.

Diversification of Chemicals

Forbidden expansion, the leading managing agencies have sought diversification, primarily in the chemical industry. Kasturbhai, who had already founded the Anil Starch company in 1939 and had followed it with the Amrit Chemical Company, and the Atul dye manufacturing plant, now made arrangements with American Cyanamid and Ciba of Switzerland to begin chemical and drug production. Sarabhai, in 1947, opened a plant in Ahmedabad to manufacture caustic soda, chlorine, and related chemicals. He, too, contacted foreign chemical companies and continued to build in this field. His plants in Bombay and Baroda make him one of India's most important drug manufacturers.

The ATIRA, the Ahmedabad Textile Industry Research Association, was established in 1947. The mill industry regards it as a symbol of a new age of science in industry. It provides some of the training, education, and research which are today necessary for pioneering development. In the construction of ATIRA, as in the increasing quality of the education they are insuring for their own children, the millowners indicate that money and perspicacity alone are no longer sufficient to meet the complex needs of industry. ATIRA primarily carries on applied scientific research, but it also does work in quality control within the mills and holds occasional conferences on management techniques. It opened with a capital of Rs 71 lakhs, of which Rs 19 lakhs were given by the Central Government. Today it encompasses 88 mills, including many from outside the city. More active in training for management is the three-year old Indian Institute of Management in Ahmedabad. Supported jointly by the Government of India, the Government of Gujarat, the Ford Foundation, the millowners, and the Harvard School of Business, it provides degree and certificate classes in business administration.

Fears About the Future

Since World War II, the Ahmedabad industry seems to face the future with mixed feelings. The stronger mills, especially, look to a bright future. The days of struggling for establishment are past. They thrive and prosper with the finest mills in the world. Their reputations are international. Mill management is no longer a part-time, small-scale enterprise. It requires training, skill, and effort. Those unwilling or unable to supply these ingredients suffer.

Finally, to minds trained in terms of private enterprise, the government's regulating policies seem threatening. Especially since the death of Sardar Patel, the great champion of business, and the estrangement of Morarji Desai both from Congress and from the business communities, Ahmedabad's millowners feel unrepresented and at a disadvantage. Many managing agents seem uncertain of the independence and stability of private enterprise in India. This feeling, they say,

Table: Size of the Ahmedabad Textile Industry

Year	*Mills*[1]	*Spindles*	Looms	*Hands*[2]
1891	9	193737	2485	7451
1900	27	477242	5690	15943
1910	52	917590	15526	30013
1920	51	1079996	22718	43515
1930	72	1656202	38812	64480
1940	76	1898530	46278	73887
1950	74	1916908	42256	72761
1960	71	2112322	41997	135237
1964	72	2276642	44059	131454

Source: Figures from the Bombay Millowners Association.

[1] Figures here refer to the number of mills. The number of mill companies is somewhat less, because some companies hold two mills, e g, in 1964 sixty-two companies owned 72 mills.

[2] After 1960 the figures include workers on all shifts. Prior to that time they include only the first shift.

cannot but affect their plans for their own mills. Within this framework, Ahmedabad's present executive must work and plan their innovations for the future.

Appendix

Mill holdings by religion and caste.

Today, of Ahmedabad's 62 mill companies, eight are held by Patels, ten by Jains, two by Marwari Hindus, one by a Jain-Vaishnava partnership, and the rest by Vaishnava banias. In many cases, more than one mill is controlled by the same man or the same family. I include Sarabhai among the Jains though he disavows the religion, for I have followed the family tradition regardless of the present attitude. The two Marwari companies are controlled from offices in Calcutta, one by the enormous Birla industrial empire, the other by Kanoria Co, Ltd.

Notes

[1] Although the basic minimum pay with dearness allowance is about Rs 150, the average pay is Rs 181. This figure is supplied by H G Acharya, the Secretary of the Ahmedabad Millowners' Association. Acharya seems to have encyclopedic knowledge of the Ahmedabad textile industry. He has been a kind and helpful adviser in the preparation of this paper.

FDS-UBI

Econometric Approach to Planning Education

Comment

R K Srivastava

S S Suryanarayanan

Some limitations of the Correa-Tinbergen model, which considers the quantitative inter-relationships between the educational system and economic requirements of certain levels of manpower by means of linear difference equations were discussed by K B Griffin and Carlos Hurtado in the issue of The Economic Weekly, *November 14, 1964. The conclusion reached was that "the types of problems the model is designed to solve are not the problems over which economists working in the underdeveloped countries are likely to lose much sleep."*

This rather sweeping criticism of the C-T model can hardly be shared widely.

Essentially macro-models of this type attempt to clarify the links between education and economic growth to see how far problems of educational planning can be approached on the analogy of planning the requirement of capital goods. The initial focus in developing a model has to be placed on quantative aspects and measurable variables (to the comparative neglect of qualitative aspects) and a high degree of aggregation is unavoidable.

The limitations which are thus introduced do not, however, constitute sufficient ground for rejecting the model on qualitative or a priori *considerations, but point the way to further research and refinement.*

BEFORE commenting on this approach to problems of educational planning, we would like to deal with the points made by Griffin and Hurtado. This can be best done by narrating the further work that has been done on the model with a view to reduce the rigidity of originally assumed relationships.

In attempting refinements[1], one of the variations introduced is that the demand functions for manpower of different denominations have been given a more generalised form and non-linear relationships between volumes of production and quantity of labour required have been suggested. For instance, equation (1) of the first model which assumes simple proportionality with constant r^2 between manpower with secondary education and levels of production has been modified as follows:

$$(1a) \quad N_t^2 = r^{20}\, {}_v r_t^{21} \left(\frac{v_t}{a_t}\right)^{r^{22}}$$

N^2 then becomes a function both of volume of production and per capita income $\frac{v}{a}$ if a is total population. Changes in labour productivity and influence of per capita income on the composition of the final product can thus get reflected in the model. For manpower with third-level education, the corresponding relationships can be expressed thus:

$$(6a) \quad N_t^3 = r^{30}\, {}_{v_t} r^{31} \left(\frac{v_t}{a_t}\right)^{r^{32}} + \pi^2 n_t^2 + \pi^3\, {}_{n_t^3}$$

A second variation has been introduced by disaggregation of the national product into sectors, each with its own rate of development and manpower requirements. If v^1 and v^2 are net outputs of sectors 1 and 2 and ${}^1N^2$ represents labour force with secondary education in sector 1 and ${}^2N^2$ similar labour force in sector 2, the following new relationships can be formulated:

$$(laa) \quad {}^1N_t^2 = {}^1r^2\, v_t^1$$

$$(lab) \quad {}^2N_t^2 = {}^2r^2\, v_t^2$$

$$(lac) \quad N_t^2 = {}^1N_t^2 + {}^2N_t^2$$

and

$$(6aa) \quad {}^1N_t^3 = {}^1r^3\, v_t^1$$

$$(6ab) \quad {}^2N_t^3 = {}^2r^3\, v_t^2 + \pi^2 n_t^2 + \pi^3 n_t^3$$

$$(6ac) \quad N_t^3 = {}^1N_t^3 + {}^2N_t^3$$

The number of sectors can be suitably increased depending upon availability of data.

The introduction of different kinds of educational processes into the model is yet another refinement attempted. For instance, if the third-level education can be split up into humanities and science and technology, we get the following modifications of original equation (3):

$$(3a) \quad m_t = n_{t-1}^2 - n_t^3 - n_t^4$$

where n_t^3 and n_t^4 represent number of students in humanities and science/technology respectively.

The original model assumed a time-span of six years each at second and third levels, and the time-unit for the model was also, therefore, taken to be six years. This introduced a good deal of simplicity in the model. However, the duration of second and third level may not be six years each and besides, it may be desirable to consider changes over shorter time-periods in developing situation. Shorter time-spans have, therefore, been introduced.

Other kinds of refinements have been attempted by introducing alternatives for (a) retirement or withdrawal, (b) drop-outs or wastage and (c) elimination of surpluses of certain levels and types of manpower.

Some instances of applying the C-T model to situations in developing countries of the Mediterranean region have also become available[2]. In applying it to the situation in Spain, the model has been refined to the extent that data became available. The total product was split up into three sectors — agriculture, industry and services and equations (1) and (6) of the first model broken down into three equations each, relating the second and third-level manpower in each of the sectors to the respective volumes of production. Since the period of study at second-level is usually 3-7 years and at third-level 5-7 years in Spain, and there are sizeable dropouts, the following variations of original equations (3) and (4) were applied:

$$(3a) \quad m_t^2 = \alpha^2 (\delta^2 n_{t-1}^2 - \beta n_t^3 + \ldots n_1^3)$$

$$(4a) \quad m_t^3 = \alpha^3 \delta^3 n_{t-1}^3$$

where α^2 and α^3 are the 'participation rates' of second and third-levels of manpower in the labour force; δ^2 δ^3 are the ratios of persons in respective levels who actually graduated during the last period to those who were enrolled one time period before, β the ratio of those that actually enrolled in the third level institutions

during the last time period to the total enrolments, and σ the ratio of those who left the third level before obtaining a degree to total enrolments.

The original assumption of constant γ coefficients has also been varied by introducing new values for γ^2 and γ^3 for t=o and t=3 working out the values for t=1 and t=2 by using the method evolved for treating the problem of transition[3]. A further refinement attempted is to assume that the coefficients change by a given percentage over each time-period so that there is continuous change over time.

Distinctions have been introduced in N^2 and N^3 by distinguishing between manpower with general second-level education N^1, with professional and technical education at second-level N^2, with non-technical third-level education N^3 and with scientific/technical third-level education N^4.

Similar exercises have been tried out in case of Turkey and Greece.

In our view, the principal criticism of the C—T model rests on its more basic assumptions and on the question of its relevance to policy-makers. There is no denying that the model has given important insight into the relationships between educational structure and economic requirements of manpower but unless this additional insight can be used for purposes of planning, its utility will be confined to the realm of research only.

Does the concept of "balanced path of growth" represent the actual relationship between the educational systems and processes on the one hand and the complex of environmental factors that affects and influences them? There is more reason to believe that there are continuing imbalances between the two — a continuing state of disequilibrium. It would be wrong to rely on the assumption that in case of developed industrial nations the "main problem merely is expanding an existing educational pyramid which already has been adapted to the needs of a modern technical society.[4]" Nor can we realistically state "it is only after an optimum educational system has been encountered (assuming one exists and that it is reasonably stable) that we should concern ourselves with mechanically expanding it..."[5] At any given time, the educational system is assumed to reflect current needs and demands but the long gestation period in education introduces inevitable time-lags (both in quantitative and qualitative terms) in the process of adjustment between the educational system and other factors. Because of this factor, the long-term goals are seldom reached and continuous short-term and medium term adjustments are taking place. For purposes of planning, therefore, calculation of a balanced path of growth has limited utility notwithstanding the refinements and modifications attempted and the model should thus be regarded as only supplemental to other efforts in the field of educational planning. Perhaps the path of growth suggested should be called the "path of minimum imbalance".

The influence of economic factors on the educational system is well-established. Available historical evidence on the growth of education in the now-developed countries indicates, however, that economic considerations did not play a major or even a prominent role in the development of the educational system. The role of other factors — cultural, sociological and political must be taken into account. The total "need" for education, thus, cannot be planned or determined with reference to forces of economic demand only. The influence of these forces should properly be construed as representing only a segment of the total need for education. The objective of long-term planning should be to fulfil the "need" rather than the "manpower-demand-aspect" of education. To the extent quantitative measurements of the "need" cannot be made, the relevance of the model for educational planning is diminished.

Another basic assumption that underlies the models is that manpower with primary education has not been considered a bottleneck to growth. Current experience in developing countries shows, however, that with the bulk of the labour force with little or no education in the traditional sectors and the traditional sectors being the major contributor to national product, there is need for rapidly raising the educational level of the bulk of the labour force. It is likely that in purely quantitative terms manpower with primary education is of such magnitude as to ensure sufficient and continuing supply to other educational levels but the share of manpower with primary education in the total labour force is extremely low. This factor is being gradually recognised as one of the bottlenecks to growth.

A final point that we wish to make is that it is not possible to express the qualitative and functional aspects of the relationship between manpower and economic growth (and/or development) in a model of the C-T tpye[6], even if the model can express the quantitative relationships satisfactorily. Manpower is itself a functional term and cannot be expressed adequately in terms of numbers of persons with different levels and kinds of education. The process of learning or improving skills does not end with the educational process either but continues at a greater or lesser rate throughout the period of employment or utilisation.

Obviously econometric approaches of the C-T type to educational planning would have somewhat limited applicability in developing countries which carry a large back-log of educated unemployment and where time-series data on various aspects of economic and educational development are not available. No model can approach or simulate real situations fully either. It is also difficult to quantify the different non-economic factors that affect the growth and development of education. Yet, denying the usefulness of models of the C-T type would amount to closing a fruitful line of investigating the relationships between education and economic growth.

Andhra's Budget

CVH

LIKE most other State budgets which have been presented so far, Andhra's Budget for 1965-66 shows a deficit of Rs 6.70 crores. The Finance Minister, Dr M Chenna Reddy, has made no proposals to cover this deficit. He hopes that improvement in tax receipts, collection of past arrears and marginal adjustments in the scope and rates of existing land, sales and entertainments taxes will cover the gap. Whether this hope is in the event justified or not, it needs to be said that this is hardly proper budgeting. A leading member of the opposition in the Assembly and a former State Finance Minister himself, T Viswanatham, saw in the strange practice of leaving budget deficits to be covered by fortuitous circumstances, signs of financial delinquency.

An examination of the Budget shows that during the Third Plan the income and expenditure of the State have nearly doubled. Revenue receipts in 1961-62 were Rs 85.29 crores; in 1965-66 they are expected to be Rs 154.53 crores. Expenditure on revenue account is similarly expected to increase to Rs 181.23 crores in 1965-66 from Rs 84.98 crores in 1961-62. Even more striking has been the growth of the Government's public debt liability. Outstanding public debt by the end of 1965-66 is expected to be Rs 432.09 crores as against Rs 218.76 crores in 1961-62. This sharp increase is reflected in the large annual debt servicing liability. In 1965-66 it is expected to be as high as Rs 30.33 crores.

Plan Progress

The review of the porgress of Andhra's Third Plan, presented along with the Budget, shows that while financial allocations have been satisfactorily utilised, the results are not fully reflected in the physical achievements. Expenditure on Plan schemes amounted to Rs 239.43 crores in the first three years of the Plan and in 1964-65 it is expected to be Rs 79.48 crores according to the revised estimates. In 1965-66 Plan expenditure is expected to be Rs 100 crores.

As a result of the substantial outlays in agriculture and related fields in the Third Plan, an additional production potential of 19.23 lakh tonnes of foodgrains has been created. The production potential of oil fields has been increased by 4.38 lakh tonnes, that of cotton by 2 lakh bales and that of sugarcane by 1.24 lakh tonnes. A token provision of Rs 15 lakhs has been made in next year's Budget for an agro-industrial corporation. This would be an important step towards encouraging scientific agriculture. The corporation would assist manufacture of improved agricultural implements and also develop industries to profitably utilise available agricultural raw materials.

Industrial development, however, still continues to be the weakest link in the State's economy. The State Plan included a provision of Rs 16.72 crores for mining and industry over the five years. As against this, the proposed expenditure of Rs 3.69 crores in 1965-66 will bring the actual outlay on mining and industry to Rs 15.6 crores. The allocation for the next year is intended to speed up work on the industrial development areas, accelerate the promotional and underwriting programmes of the Industrial Development Corporation, facilitate the supply of electricity at concessional rates to industry and meet the State's share of expenditure on Central projects in the State. The outlay will also cover expenditure by the Khadi and Village Industries Board and the Small Industries Development Corporation.

Industry Lags Behind

The slow progress of industry draws pointed attention to the fact that a suitable industrial climate is still to be created in the State. Among the established industries, sugar registered a commendable increase in the output (24 per cent). Other industries which did well were jute (15.6 per cent), glass (72 per cent), cigarettes (58 per cent) and cement (2.7 per cent). Certain other industries, like vanaspati, cotton yarn and paper, however, saw a decline in output.

In the sphere of irrigation and power, while minor irrigation projects, for which the Centre has given substantial additional allocations during the last three years, have made considerable headway, the bigger and medium projects continue to lag behind schedule, largely due to insufficient finances. With the additional assistance assured by the Centre in 1965-66, the execution of the more important of these projects, particularly Nagarjunasagar and Thungabhadra, should be speeded up. The State Government is now committed to supplying irrigation water to 5.79 lakh acres from Nagarjunasagar during 1966.

In the field of power, a resolute attempt is being made to fulfil the target of 411 m W of additional installed capacity by the end of 1965-66. Among the more important schemes are Kothagudem and Upper Sileru which together are expected to increase installed capacity by 240 mW by the end of 1965-66. Other projects under way are Srisailam, Kothagudem Thermal and Ramagundam Project. These will, however, be completed only during the Fourth Plan.

Social Services

A significant feature of the State Budget for 1965-66 is the noticeably larger provision made for social services. In education the revised Plan target aims at the enrolment of 79 per cent of all children in the age-groups 6-11 in schools. However, it is technical education which would substantially benefit from the higher allocation for education. Proposals in this field include the starting of post-graduate courses in two engineering colleges and the establishment of a new engineering college at the Nagarjunasagar dam site.

In spite of being a food surplus State, Andhra experienced the full impact of rising prices during the latter part of 1964. The prices of almost all cereals rose during the year, those of rice by 18.7 per cent and of wheat by 28.7 per cent. Procurement operations in the State now in progress are designed to supply 7.5 lakh tonnes of rice to the Food Corporation and 2.5 lakh tonnes to the State Government.

It is estimated that some 9,000 unemployed were placed in jobs through Employment Exchanges in 1964-65. The number of those who could not be so placed is, however, at least four times as many. Of course, employment exchange statistics do not give a complete picture of either employment or unemployment in the State.

The family planning programme has had too little impact on the State.

The Finance Minister has confessed that progress in this sphere "is still rather slow and needs considerable impetus if we have to be assured of definite results". He has, however, promised to simplify the procedures governing disbursements of grants from State funds pending reimbursements from the Centre.

Regional Disparities

Finally, programmes for providing essential amenities to the weaker sections of the population have made little progress, whether in the urban or rural areas. In the urban area the principal problems are insufficient housing, slum clearance, shortages of water supply and unsatisfactory drainage. In villages things are even worse and many villages lack even drinking water and proper sanitation. It is unlikely that the target of providing at least one drinking water well for every village by the end of the Third Plan will be achieved.

Like other State Governments, the Andhra Government has also been preoccupied with the problem of correcting regional imbalances, though one can discern a sense of resignation to the fact that there is little that the State can by itself do in the matter. It is felt that in the ultimate analysis the problem can be solved only if some major Central projects are established in the State. The State Government is prepared to extend all facilities to entrepreneurs who wish to establish industries in the State. While so far the response has not been particularly enthusiastic, much is expected from the visit of the teams of Central Government officers and private industrialists to explore possibilities of setting up industries in the State. Also, the report of the Anglo-American consortium on the fifth steel plant is anxiously awaited by Andhra since she is one of the climants for the project.

Language and Indian Unity

Comment

Sankar Nath Maitra

THE article 'Language and Indian Unity' in the Annual Number of *The Economic Weekly* is puzzling. The article starts by being clear and analytical, but ends, if I may say so, in vagueness and diffusion, so that I am left wondering whether you advocate unity or disunity.

India may have a great spiritual heritage, but she often lacked body, not only political body but even religious. Except in the heyday of Buddhism there was no dogma and no visible church to uphold it. The result has been a great burst of undergrowth, choking, if not killing, the tree. In matters of spirit it may be possible to have faith without dogma and the faithful without a church, but it is difficult to think of a polity without form or instruments for the exercise of power.

Ancient India with its rock edicts in Brahmi script or copper plate grants in Sanskrit is a thing of the remote past. In better known mediaeval times the rulers, at least in the North, were Muslims. And the language of the court, right upto the Tungabhadra, was Persian, in which, using Arabic script, all business was transacted. In the last couple of centuries of Muslim rule, a camp version known as Urdu was evolved. In the 18th-19th century when the British established All-India on a bigger and broader basis, they spread the use of English, at first hesitatingly then firmly, as the Lingua Indica.

If India is to remain one country, it has to have one language for official and public use. It just will not do to elevate the many local speeches to the status of National Languages. If that is done there is grave danger that in time (and not too distant at that) there will be as many nations as languages. The break up of Austria-Hungary over the language issue is a fairly recent portent. Obviously, in a country of the size and diversity of India the language question has no easy answer. But it is as well to remember that ours is not the only country plagued with a Babel of tongues. In Europe the pattern is simple — one state one language, France (French); Germany (German); Italy (Italian). But even there the language problem is not unknown — witness the obstinate survival of Catalan in North East Spain.

But when the state is much larger or diverse in origin, the simple unilingual formula of Europe does not work. The two super-states of today U S A and USSR have solved their language problems in ways that are not open to us. For 'A nation of immigants', as President Kennedy has described it, it was comparatively easy for the US to stamp the well developed language of the first comers (English) on the later arrivals. In U S S R apart from the gravitational pull of Russian, the Communist party and ideology provide a kind of cement which builders of other states have not got. But the need for a common language in a state remains. Coming nearer home, in Indonesia with many languages in the string of islands, the new national government had to bring in for official and public use the Bahasa Indonesia, a partly artificial language written in Latin script.

Why Hindi Will Not Do

The need for a common medium will inevitably bring up the question — why not Hindi? Much as I would like to give an 'yes' answer, to show up our Indianness, to banish English to the oblivion of archives like the statues of British Viceroys in P W D godowns, sorrowfully I have to say 'no'. To begin with Hindi is not the language of the majority — a sacred principle in democracy where 51 per cent is everything and 49 per cent nothing. In all its variations and patois, Hindi is used by barely a third of India's population. I shall not go into the constitutional question, the pat answer to which is that if the Constitution can be amended seventeen times, it can be amended the eighteenth time. To be the all-India language Hindi must be accepted as such not only by the Hindi speakers, but the other Indians whose languages are different. To do so Hindi must have prestige either as the language of conquerors like Persian or English, or as a *Devabhasa* like Sanskrit, or for its own excellence and usefulness, like

English. It does not pass the test. Then how would it be accepted by the others, particularly those of the South? In North India, even parts of Deccan, where languages of Sanskritic origin prevail, Hindi being a sister language and the script not very different, the feeling for or against Hindi may not be strong. But in the deep South with its ancient Dravidian languages and entirely different scripts, Hindi is, to put it bluntly, a foreign language. It will not go down. Given the choice the southerner, if he has to learn a foreign, language, would rather learn English.

To justify his aversion to Hindi, the southerner can give reasons in support of English which are difficult to refute. He will say that India is one because, as the legal phrase has it, 'government established by law', which is English in thought and expression. The present form of government with its election and ballot box is also of similar origin. And so is the large apparatus of executive government from the district level upwards. Cut out English, he will say, and you snap the bond that holds the country together. If the writ issued by a court cannot be served in another part of the country, because nobody can read the language in which it is written (it happened the other day to a Hindi warrant in Kerala), it is the end of All-India. To disown all the gains in law and administration in the last two hundred years in a fit of xenophobia would be to throw out the baby with the bath water.

Medium of Instruction

Educational and cultural aspects of language cannot be overlooked. But the argument that natural talent must find expression through one's mother tongue sounds more reasonable than it is. To begin with, the all-India language is not for everybody for all uses. It will only be for official and public uses — and so necessarily confined to those who work in such restricted fields. And India has such a large population that even if all its talent got the finest expression, the backward economy of the country could not hope to utilise, let alone adequately reward it. Then again, a distinction can be drawn between the head and the heart. While those who read humanities can do so in the mother tongue, scientists and professionals could carry on in English. It is not true that all advanced nations use only their mother tongue for all purposes. For instance doctors in Scandinavia (whose mother tongue may be Swedish or Norwegian) go to German Universities for their medical degrees. And the oft quoted example of Japan is not quite so straightforward. It is true that the Japanese have managed to translate and use in their own language a good deal of western science. But it is also true that a very large number of Japanese scholars learn and use foreign languages for different fields of study. The number of books in foreign languages, not only English, sold in the bookshops of Tokyo is surprising. And the versatile Japanese, upto the last war, in addition read classical Chinese. It was part of a gentleman's education that he could write (in the difficult but graceful) calligraphy) elegant poems in Mandarin.

There is another example to which we might turn with profit. Take the Filipino. His many islands have different languages. A man from Manila speaking Tagalog cannot understand a man from Cebu speaking Ilongot. But they get on fine by refusing to be logical. To be sure Tagalog, the biggest single language (like Hindi) is declared the National Language. Ceremonial citations are done in that. But the workday official language (including the medium of instruction) is English. It is the language of courts, parliament, and office. Carlos B Gracia, who came from the South and had very little Tagalog, could be a successful President, and never felt embarassed by any language barrier. In fact the educated Filipino is trilingual. He has his own language (for private use); English (for official use); and Spanish (for elegance and church service). If progress is any guide, the Filipino example is not to be scoffed. His literacy rate is the second highest in Asia (next to Japan), and his per head income is three times that of an Indian. The Filipino has a strong sense of patriotism, but he uses English officially, and writes his own language in Latin script.

AROUND BOMBAY MARKETS

Further Break in Equities

Wednesday, Morning

IT was a disastrous week for the stock market. Equities simply tumbled. Several popular scrips like Century, Standard, Telco, Premier Auto, Belapur, Indian Dyestuff, Scindia, Bombay Burmah, Tata Oil and West Coast Paper — not to mention many cash shares — pierced through their 1964 lows in a decisive manner and the market as a whole also sought a slightly lower bottom. Panicky conditions prevailed on March 8 and 9 and the market's performance might have been still worse if the Life Insurance Corporation had not appeared on the scene. Whether the LIC buying was bargain hunting or it was in the nature of 'official' support to the market, it is difficult to say. Last week's decline was due both to bull liquidation and bear pressure and the fall was steep enough to unnerve even the inveterate bulls.

The sharp break in equity prices has intrigued many observers including the Finance Minister Krishnamachari who sees no reason why share prices should have fallen. He says that prices should, in fact, have risen and he has expressed the confidence that prices of some of the important shares — all shares are important for those who hold them — which had registered a fall after the Budget, would rise after the actual impact of the Budget had been understood fully.

May be that the stock market has not fully understood the actual impact of the Budget. And if that be so, it is the Finance Minister and not the market which is to blame because concessions relating to the corporate sector are not specific as regards the rate of tax credit and the industries and categories of goods to which they would apply. One would very much wish that TTK proves right and the stock market starts looking up. But that might be only wishful thinking unless the Finance Minister quickly incorporates some of the suggestions made by the Federation of Indian Chambers of Commerce and Industry for the revival of confidence in the capital market.

But fiscal concessions alone might not do. Because in marking down prices snarply, the stock market is simply hurrying the process of bringing equity yields in alignment with the interest rate structure that has come to prevail after the increase in the Bank Rate to six per cent. With bank credit available at 8-½ to 10 per cent and financial institutions like the Industrial Development Bank and the Industrial Finance Corporation—the ICICI is expected to follow suit shortly raising their lending rates to industry to 8 to 8-½ per cent,

the average yield on equities around 7 per cent had begun to look unattractive, particularly when prospects of capital appreciation did not appear promising. The process of adjustment had been delayed in the hope that TTK would provide adequate tax relief to the corporate sector and also do away with the dividend tax and capital gains tax on bonus issues in order to bring about the badly needed recovery in the capital market. Since these expecta-

tions did not materialise fully the market has made a hurried retreat.

The declining trend in equity prices can be expected to continue until the market reaches a level where the investors feel that the yield on equity shares is satisfactory in the light of the prevailing interest rate structure. Investors can be content with a somewhat poor yield only when they are able to take an optimistic view of the prospect for capital appreciation. However, since the recent fall has been precipitous and most of the bulls have been virtually liquidated, it is quite likely that the market may pause here for some time to allow technical forces have their full play before pushing its way further down. The market could also take an important turn from here if the Finance Minister decides quickly to offer further concessions designed specifically to stimulate investors' confidence.

COTTON

Intriguing Situation

THE high-power sub-committee of the Indian Cotton Mills' Federation which discussed the cotton situation on March 4 expressed the view that unless the Government resorted to requisitioning cotton on the required scale — not a single bale is known to have been requisitioned up to now — from all the sections concerned, namely, mills, merchants and growers and also took other remedial measures such as placing restrictions on cotton movements, the prices of cotton would not conform to the legally prescribed ceilings. The committee has urged the Government to use all the appropriate powers in its armoury in order to supplement the Federation's scheme of self-restraint and thus enable mills to obtain their cotton requirements within the prescribed ceilings.

While, excepting a few varieties like L 147, Cambodia A and B and Laxmi, cotton prices are still above the ceilings, the recent setback in prices of Cambodia cotton has posed a different kind of challenge to the Federation's scheme. Despite the imposition of the recent 10 per cent import duty and the relaxation of restrictions on the buying of Cambodia cottons — mills are allowed to make purchases of this cotton outside their quotas — the prices of Cambodia cotton have declined to below the ceilings and a small quantity has been offered to the Federation at 5 per cent below the ceiling. More offers are likely to be made in course of time. The Federation has given an assurance (it is really an undertaking) under its scheme of regulated mill buying through self-discipline that it will always be willing to buy throughout the season any cotton offered to it at 5 per cent below the appropriate ceiling. Will the Federation redeem this promise if cotton prices start drifting lower under the pressure of growing monetary stringency which has produced a sizable decline in the prices of foodgrains and oilseeds?

While cotton growers and the mill industry are engaged in the battle of prices, the cotton trade is perturbed over its declining fortunes arising partly from the shrinkage of turnover and partly from the locking up of its funds to the delay in the payments by mills for the cotton purchases made by them.

The turnover in the spot market has shrunk very considerably and conditions in the futures market are even worse. The March hedge contract has entered the delivery month when business is supposed to be only in the nature of squaring-up of outstanding positions. The trade has not been able to persuade the Forward Markets Commission to permit trading in another hedge contract, namely, August. But with spot cotton prices quoted around the ceilings, there seems hardly any sense in allowing forward deals. Only 200 bales have so far been tendered against the March contract which after touching a high of Rs 785 has receded to Rs 779.

The Indian Central Cotton Committee is reported to have suggested

DON'T ASK FOR TROUBLE

Would you? Of course, not. But that is just what you do every time you indulge in transactions in terms of seer or pound.

These are illegal weights; the trader who uses them is liable to punishment. But your punishment is immediate—you get less for your money.

buy in KILOS only

DA 64/372

to the Forward Markets Commission that the basis of the hedge contract for the 1965-66 season should be revised. It is to be hoped that the Commission would give thoughtful consideration to this matter because Moglai 25/32 inch which forms the basis of the present hedge contract has very little to commend. And since the total output of this variety hardly exceeds two lakh bales it creates all sorts of problems while fixing tendering differentials for effecting deliveries against the maturing contract.

OILSEEDS

Prices Ease Further

OILSEEDS prices suffered a further setback last week and despite the partial recovery near the close, Tuesday's final prices showed moderate losses over the week. Castorseed June moved down from Rs 76.40 to Rs 73.15 and linseed June from Rs 86.70 to Rs 83.20 (both per 100 kgs); Tuesday's closing prices were higher around Rs 75.10 and Rs 84.60 respectively. Groundnut oil was marked down from Rs 20.70 to Rs 19.75 and linseed oil ready eased from Rs 18.30 to Rs 17.25 (per 10 kgs). Though no tenders were issued during the week, the maturing contracts in castor and linseed continued to be subdued in sympathy with the general trend in the market.

The lowest prices recorded last week are the lowest for several months and they show a spectacular decline from the fantastic levels to which oilseeds prices had been pushed about the beginning of January. Several factors have contributed to the recent fall in prices which, however, is to be greatly welcomed. Apart from the substantially better supply due to record domestic output and intended imports of soyabean oil from the U S and the continued ban on the export of groundnut oil and vanaspati, the marked change in market psychology in recent weeks is in no small measure due to the acute financial stringency resulting mainly from the reported withdrawal of large unaccounted funds from the market. Stockists who had been holding goods mainly on the strength of unaccounted money are reported to be hurriedly liquidating their stocks. The pressure of arrivals of castorseed, mustardseed and to some extent of linseed crops is increasing at a time when the market is experiencing acute financial stringency. The downward trend in oilseeds prices can be expected to continue further unless the Government decides to allow export of groundnut oil and vanaspati. With the end of the prolonged dock strike in the U S, soyabean oil will begin to move freely and all the 30,000 tons for which purchase authorisation has already been issued are likely to reach India by the end of April.

While exporters of groundnut extractions had a rather dull time last week, good business was put through in castor oil. Russia purchased nearly 6,000 tons of castor oil and paid Rs 1680 to Rs 1710 per tonne for commercial grade oil. However, notwithstanding this large business castor oil prices did not register any noticeable improvement during the week. Shippers also reported business of about 4,000 tons in linseed cottonseed expellers and extractions. Linseed cake continued to be neglected.

BUSINESS NOTES

ICICI

STAGNATION of the capital market is not purely a financial phenomenon; it has repercussions on the economy as a whole. Entrepreneurs, faced with an unfavourable capital market, hesitate to take up projects or take much longer to find finance for their projects. These conditions have led to a fall in fresh issues of capital, as well as in the rate of growth of industrial production, and presumably also in that of industrial investment. If investment activity has been sustained, it has been principally because of institutional support. This view has been expressed by G L Mehta, Chairman, Industrial Credit and Investment Corporation of India, in his statement circulated to the shareholders with the report of the Corporation for 1964. Coming as it does from the chief of a financing institution responsible for aiding many industrial projects in the country, this view should attract due attention.

Narrating the Corporation's experience of a decade of existence, Mehta has said that of the completed share underwriting operations of Rs 11.52 crores, ICICI was left with Rs 6.10 crores. The experience of 1964 provides a sharp contrast: of the nine share underwriting operations for Rs 132 lakhs completed during the year, ICICI was called upon to take up as much as Rs 122 lakhs. This is hardly a satisfactory position in the long run for an institution which depends upon revolving its funds invested in shares.

In the last ten years, ICICI has sanctioned well over Rs 100 crores to 328 companies for 374 projects. When completed, these projects are expected to produce annually 150,000 tons of paper, 3,657,000 tons of cement, 173,000 tons of steel tubes, 118,000 tons of cast iron spun pipes, 20,000 tons of wire ropes, 217,000 tons of superphosphate, 3,400 miles of power cables and 243,000 electric meters. In 1964, it sanctioned net financial assistance of Rs 19.08 crores, of which Rs 14.03 crores was for 67 new projects.

Correction

IN the statement of the Chairman, Indian Oxygen Limited, published in our issue of January 23, page 141, the name of the Chairman was mis-spelt as "N Dandekar". The correct spelling is "N Dandeker". The error is regretted.

—Editor.

ICICI has approached the World Bank for a further line of credit of 50 million dollars. Besides, with the increase in loan obligations, it is proposed to make a rights issue of one for every two shares held, with a view to strengthening the equity base.

During 1964, the Corporation earned an income of Rs 3.12 crores against Rs 2.36 crores in 1963, and made a gross profit of Rs 1.25 crores compared to Rs 1.01 crores. After providing Rs 1.12 lakhs (1.30 lakhs) for depreciation, Rs 54.49 lakhs (41.42 lakhs) for taxation, Rs 17.50 lakhs (14.50 lakhs) for special reserve and Rs 14 lakhs (11 lakhs) for general reserve, the directors have set aside Rs 37.50 lakhs (35 lakhs) for payment of dividend as raised by half a point to 7½ per cent.

Pfizer

PFIZER Private Limited is a subsidiary of Chas Pfizer and Company Inc, U S A, which is the largest manufacturer of antibiotics in the world. Pfizer is interested in antibiotics, fermentation chemistry, pharmaceuticals and chemicals for medicine, agriculture and industry, cosmetics and many household articles.

One of the features of the operations of Pfizer has been the phenomenal growth of its international activities during the last 10 years or so. Even as recently as early 1951 there was not a single Pfizer product being produced or packaged outside the United States. Today Pfizer products are being manufactured in 67 plants in 27 countries.

In India, Pfizer acquired Dumex, in 1958. Dumex, then the Pharmaceutical Division of the East Asiatic Company, was the pioneer in the development of insulins, anti-TB drugs, nutritional preparations and antibiotics. At present, Dumex products are manufactured by Pfizer and marketed under the Dumex label.

Pfizer claims to manufacture in India more than 60 products and their numerous dosage forms. Broad-and narrow-spectrum antibiotics, nutritional preparations, anti-TB drugs, decongestants, anti-depressants, diuretics and anti-hypertensives, sulphonamides, anti-diabetic products and steroid and hormone preparations cover the range of Pfizer pharmaceuticals. In April 1962, Pfizer introduced a range of animal health products. These are classified in two groups: animal and poultry feed supplements and drugs for veterinary practice. Pfizer also has a Home Products Division. It has introduced two products on the market: a cold treatment, Sardilan, and sore-throat tablets called Galamint.

Pfizer India operates two plants at present — one at Chandigarh and the other at Darukhana in Bombay. The Chandigarh Plant manufactures oxytetracycline and tetracycline. Pfizer claims to be the first pharmaceutical company in India to manufacture tetracycline basically. A new packaging plant at Thana is now proposed.

Sen-Raleigh

THE bicycle industry produced a very much larger number of bicycles in 1964 than in the previous year, and demand too continued to grow. Sen-Raleigh's chairman, Abhijit Sen, expects new records established in 1965 both in production and sales. In this direction, the recent abolition of

excise duty on cycle tyres and tubes and such cycle parts as free-wheels and rims will be of considerable help to the industry. But it has to contend with occasional sudden shortages of raw materials that cause loss of production and raise costs. If this problem is overcome, the industry has great growth potential. Rising home demand apart, bicycle exports now occupy second place among exports of engineering goods.

During the year to September 1964, Sen Raleigh's bicycle production rose by 30 per cent and production of some components also showed marginal increases, but in no single item could the targets be realised because of failures in the supply of raw materials. The company is implementing a scheme of expanding production of chains to a million units a year. An increase in production of this item is expected during the second half of this year. Besides, production of hubs is to be expanded within this year by making minor changes in plant and processes.

An improvement in the opening months of the current year has encouraged the directors to propose, after a lapse of a year, a dividend of six per cent to be paid out of reserves. The results show a rise of 15.44 per cent to Rs 5.40 crores in sales with a 30 per cent rise to Rs 42.71 lakhs in gross profit. After providing Rs 22.46 lakhs against Rs 21.03 lakhs for depreciation, Rs 9.54 lakhs against Rs 7.51 lakhs for taxation, Rs 3.75 lakhs as before for loan repayment reserve, Rs 4.62 lakhs against Rs 1.12 lakhs for development rebate reserve and Rs 1.95 lakhs as before for payment of preference dividend, only a small sum of Rs 0.44 lakh is left. For payment of equity dividend amounting to Rs 8.10 lakhs, Rs 7.50 lakhs have been withdrawn from reserves.

Scooter Exports

A THIRD consignment of Lambretta scooters, numbering 26, are being exported to Bangkok (Thailand) by the Automobile Products of India Ltd this month. These scooters have been ordered by that country under the "U S Aid" Programme to Thailand. The export will earn a foreign exchange of $9,000. Another order for 22 more scooters is awaiting execution.

These Lambretta scooters are manufactured in India with nearly 85% indigenous components and have been found by users to equal, if not excel, in quality their Italian counterparts.

Sugar Production

ACCORDING to the Indian Sugar Mills Association the total production in the month of January 1965, was about 6.04 lakh tonnes as against 6.11 lakh tonnes produced last season during the corresponding period. This brings the total production during the first three months of the season 1964-65 to 14.34 lakh tonnes as against 13.88 lakh tonnes during the corresponding period last season.

The off-take of sugar from factories during the month of January, 1965 was 2.17 lakh tonnes (including 19,900 tonnes despatched for exports) as against 2.08 lakh tonnes (including 13,000 tonnes despatched for exports) during the corresponding period last season. The total despatches during the first 3 months in 1964-65 season were 5.85 lakh tonnes (including 19,000 tonnes despatched for exports) as against 5.93 lakh tonnes (including 30,000 tonnes despatched for exports) by the same period last season.

The total closing stock of sugar with the factories on the January 31, 1965, was 10.05 lakh tonnes as against 9.45 lakh tonnes on the same date last season.

A bus ride is such fun for Lalita

School-going Lalita always enjoys a bus ride. Little does she and children like her realise what INDIANOIL does for them, and the vital role this national organisation will play in their lives when they grow up to be citizens of India.

Besides the public sector refineries which have just come under its fold, INDIANOIL markets the entire range of petroleum products so essential to Industry. In the field of transport alone, INDIANOIL supplies the fuel and lubricant requirements of all major transport undertakings in India.

Vote, but No Vindication

ON Monday morning the leader of the PSP group in the Lok Sabha moved his motion calling upon the House to "express want of confidence in the Council of Ministers for failing to uphold the highest standards of public conduct by a deliberate suppression of truth and by abuse of power by persons in authority in the State of Orissa and other States and having brought into contempt the concept of constitutional government by putting party interest over national interest and attempting to shield and exonerate those who were guilty of abuse of power by the refusal to institute an enquiry against those who were responsible for such abuse of power and corruption". On Tuesday afternoon, after two days of agitated debate, the House rejected the motion by 315 votes against 44. This overwhelming affirmation of confidence in the Government reflected the Congress Party's overbearing majority in the House; it did not vindicate the Government's actions in regard to the allegations of corruption against the Orissa Congress leaders, Bijoyananda Patnaik and Biren Mitra.

Such vindication was virtually impossible after the disclosure of the report of the Central Bureau of Investigation on the allegations against the Orissa ex-Chief Ministers and the findings of the Cabinet sub-committee on it. These documents, which the Government had refused to make public, were placed before the Lok Sabha by H V Kamath, another PSP member, a few days ago. The Government refused to take congnisance of the documents, but there appeared to be no doubt at all that they were genuine. Indeed, while Government spokesmen were incensed that they should have been made public, none categorically questioned their authenticity.

The CBI investigated, at the instance of the Home Ministry, the charges against Patnaik and Mitra and submitted its report in November last year. These charges related principally to certain transactions of the Government of Orissa with Kalinga Industries, a Patnaik concern with Mrs Patnaik as chairman, and Orissa Agents, a proprietory firm owned by Mrs Biren Mitra. These transactions, in the consummation of which Patnaik and Mitra were alleged to have taken much personal interest during their terms of office, resulted in the accrual of substantial Government business to the companies and also in large over-payments at the expense of the State exchequer. Further, on November 17, 1961 the State Finance Ministry had issued a directive requiring Government departments to make all purchases only through local dealers in Orissa. Ostensibly the purpose of the directive was to prevent loss of State sales tax, but in effect it gave a virtual monopoly to Orissa Agents for the products of Kalinga Industries and Kalinga Tubes, another concern in which Patnaik is a director. Other allegations which the CBI investigated related to Government transactions with Patnaik Mines and Orissa Textile Mills, two other concerns in which Patnaik is interested.

Some of the charges the CBI was unable to judge since all the evidence was not made available to it, but on the majority its findings appear to be unequivocal. Thanks to H V Kamath's enterprise, lengthy summaries of the CBI report have appeared in the press; to anyone who reads them it should be clear that the CBI's investigation has more than made out a *prima facie* case. Indeed, the Cabinet sub-committee appointed to examine the CBI's findings was forced to admit as much. It agreed that the manner in which Patnaik and Mitra "conducted Government transactions in which were also involved the interests of private concerns, owned or controlled by them or their relations was definitely not in keeping with the normal standards of public conduct" and recorded its "profound concern at the picture, emerging as a whole from the series of such individual transactions in many fields of activity of the State Government, of improper use of authority by leaders of the Government". On a number of specific charges, it appeared to concur with the CBI. About the official directive restricting Government purchases to local dealers, for instance, it agreed that it was "improper, unwise and indiscreet" since it resulted in preference being shown to Orissa

Agents. It found the orders placed by the Government with Patnaik's and Mitra's concerns "improper and irregular". About the allegedly questionable appointment of a chief engineer for the Paradip port which was followed within days by large orders from the project for tubular trusses manufactured by Kalinga Industries, the sub-committee was "not satisfied that those orders were dictated by urgency as claimed".

And yet, in the Lok Sabha debate, the two principal Government spokesmen, A K Sen and M C Chagla, both of whom were members of the Cabinet sub-committee, played a different tune. As the CBI report had become common knowledge and since its findings were so obviously damaging, their concern was with minimising its significance. Chagla's attempt, in the process, to denigrate the CBI left a particularly bad taste in the mouth. He described the CBI's report as "a one-sided exparte statement"; worse, it was a "contaminated document"; something on the strength of which he would not "hang a dog"; something he wouldn't even "touch with a barge pole". The CBI's role in investigating the charges against the Orissa ex-Ministers had already come in for criticism by Congressmen—particularly at the "little AICC" meeting organised at Ranchi in October last year—but Chagla's attempt to lower an important Government agency in the public eye was almost unbelievable, coming as it did from a responsible Minister of the Central Government and an ex-Chief Justice of a High Court.

Both Sen and Chagla admitted, however, that the Orissa leaders had acted "unworthily" and were unfit to hold office. Yet they rejected the demand for further enquiry, and wanted the issue to be closed with the resignation of Patnaik and Mitra. Naturally, with the evidence of the CBI report before them, the Opposition, like a large number of people outside Parliament, cannot be expected to stomach this. The suspicion remains that in the matter of suitable action against Patnaik and Mitra the course of justice has been deliberately blocked and that this has happened because of the influence the two wield in the Congress Party. Such suspicion is the inevitable consequence of the procedure adopted by the Government to investigate the charges and the decision to close the case just when the public came in possession of authoritative confirmation of the charges. This should have been clear to the Prime Minister. Yet he obstinately maintained that "whatever action the Government has taken is right and proper" and that "the Government is not prepared to go any further". Indeed, he seemed to hint at making this the standard procedure for enquiring into allegations of corruption against Congress Ministers. Recalling an earlier statement of his, he said that whenever a *prima facie* case was established against a Minister he would ask him to resign or face an enquiry. And who would judge if there was a *prima facie* case? The Cabinet, presumably; or perhaps, as was suggested at the 'little AICC', the Congress Parliamentary Board!

This procedure, one would have thought, had been discredited enough by the suspicions, innuendoes and general dissatisfation generated by the Orissa case. Where allegations of corruption against Ministers and other highly-placed persons are concerned, it is not enough that justice should be done; it must appear to be done. Under the procedure adopted in the Orissa case, and which Shastri would follow in other similar cases, there is very real danger that justice may not be done at all. Since the tasks of judging whether there is or is not a *prima facie* case of corruption against a Congress Minister is left to his colleagues in the party, it is puerile to argue that political pressures will be kept out. This danger becomes the greater as the leadership of the Congress passes, as it is now passing, to a group of men whose survival in power is closely bound up with the faction politics within the party. With these men, political expediency must count above everything else; in the Orissa case, we already have evidence of the working of their influence. And even assuming that Congressmen could judge one of their peers objectively, the secrecy in which the whole operation is expected to be conducted will inevitably create surpicion and dissatifaction.

The Committee on Prevention of Corruption, appointed by Shastri himself when he was Home Minister under Nehru, had suggested that if specific allegations of corruption on the part of a Central or State Minister were made by 10 members of Parliament or a State Legislature, the Prime Minister should consider himself obliged by convention to refer them to a committee for immediate investigation. This committee would be selected by the President out of a national panel constituted by him; it would consist of three persons, one of whom at least should have held a high judicial office. This commmittee would ascertain whether there was a *prima facie* case and on the basis of its conclusions advise the Government about further action. If it found a *prima facie* case, it may advise the Government to prosecute the Minister concerned or appoint a commission of enquiry under the Comissions of Enquiry Act, 1952. Significantly, it was recommended that the findings of the committee should be placed before Parliament as a matter of course.

The Government has made much of the Santhanam Committee's report as the basis of its anti-corruption drive. Yet, neither the Prime Minister nor the Home Minister has cared to explain why the Committee's recommendations on corruption among Ministers have been found unacceptable. The Committee itself attached the utmost importance to these recommendations since it was convinced that "ensuring absolute integrity on the part of the Ministers at the Centre and the States is an indispensable condition for the establishment of a tradition of purity in public services". The Government apparently views the priorities totally differently. While it periodically publicises copious statistics of the number of civil servants, at various levels, dismissed, prosecuted or otherwise punished for misdemeanour, when it comes to corruption among Ministers it is content with the most imperfect and ineffective arrangements.

The implications of this for what Nanda likes to call "the war on corruption" are obvious. *If the salt have lost its savour, wherewith shall it be salted?*

Correction

IN our issue of March 13, in the table on page 470, the headings 'public limited companies' and 'private limited companies' got interchanged. The figures in the first three columns relate to private limited companies and those in the last three columns to public limited companies.

New Turn in Negro Struggle

MORE progress has been achieved in the American Negroes' fight for equality in the past one decade than in the nine that preceded it since the abolition of slavery. There was first, in 1954, the Supreme Court judgment against segregated education. Then came more positive advance in the form of the three Civil Rights Acts, the latest and most comprehensive and meaningful of which was placed on the statute books less than a year ago. And now there is the newly proposed legislation to ensure voting rights. This rapid progress has been achieved at a price. There has been much hatred and violence, some loss of life and ugly tension not only between the coloured and the whites and between liberals and reactionaries but between Federal and State authorities as well. Selma, Alabama, has just joined Little Rock, Arkansas, and Oxford, Mississippi, as the latest milestone in the Negro struggle.

But there is a basic difference in the quality of these "battles". What has brought Selma to the headlines is not spontaneous demonstration by Negroes but planned political action on their part. Martin Luther King chose this town—known as the "Capital" of the "Black Belt"—as the principal testing ground for the newly guaranteed civil rights and a vigorous voter registration drive was begun there. Subsequent events have proved what King obviously wanted to prove—that it is one thing to endow an under-privileged group with basic rights but quite another to ensure the conditions for their exercise. In the American federal structure, State laws can, and do, run counter to the policy of the Central Government, in spirit and in letter. In several Southern States, the "literacy test" required of a would-be voter becomes, when applied to Negroes, virtually an examination in constitutional law. And since it is the State authorities who device the "test" and pronounce judgment on it, in actual fact, the right to vote has meant very little to the Negroes. This is not by any means all. The stirring of white conscience in Washington and widespread Negro awakening have prompted many Southern States to desperate action against the weapons of non-violent protest. In many places, picketing, parades, processions, meetings and the distribution of leaflets have been declared unlawful.

The events in Selma—mass arrests, including that of King, firings and blatant suppressive action by the State and local authorities—have focussed attention on the inadequacy of the legal framework supporting civil rights. As the campaign spread to other towns and cities, official reaction from the White House was anxiously awaited. It was somewhat slow in coming but unequivocal and heartening when it came. President Johnson, terming Selma as an "American Tragedy", has reaffirmed his determination to provide for the Negroes "the full blessings of American life". He has asked Congress to enact a law to "strike down all restrictions which are used to deny Negro Americans the right to register and vote".

The American Constitution permits action against States that follow methods such as those currently used in Alabama. It provides for reduction of "the basis of representation" in the Congress of any State denying "the right to vote" to any of its citizens. The new legislation is expected to establish a simple, uniform standard for registration and voting, doing away with the notorious literacy "tests". More important still, it would provide for the appointment of Federal registrars when State officials are found to be dilatory. Where people are prevented from voting, courts would have the power to impound the ballots until all those eligible to vote have exercised their franchise.

It would no doubt take some time for these proposals to become law. The President himself expects the job to be done by November. What is significant is that not much opposition is anticipated. Obviously, last year's civil rights triumph is still in the air. But then, the new measure is only a logical continuation of the Civil Rights Act; and like that legislation it too would no doubt be a bi-partisan effort and would probably owe more to Republicans than to Democrats.

But what, one might ask, would the legal protection of the franchise mean for the Negroes? It would obviously not promote "acceptance" or reduce prejudice and indeed might well heighten existing tensions. And in terms of dignity in daily life, it might appear rather more remote than the right, say, to sit down opposite a white citizen for a meal in a restaurant. But legal safeguard of the franchise, if successfully implemented would mean that the Negroes would begin to count as a political entity. In the Southern states, where they form a sizable proportion of the population, the "Negro vote" would, for the first time, be a factor of importance in local, State or Federal elections. The fact that, as a minority, under-privileged group they would tend to vote as a block would further enhance their significance. Such potential could prove, in time, one of the surest means of further economic advance.

But, at the moment, the battle is still very much on and it is not against the steel of official resistence alone. Literacy "tests" and the like are not the only deterrents to voter registration. Even in the northern cities, where there are no such restrictions, the record of Negro registration is poor. King's campaign would have to be tuned as much to voter education as to voter registration and it would have to be far more widespread. The next step may well be for Negroes to contest elections, not so much with the idea of winning as to stimulate the interest of their people in political power and as symbolic of their gain in stature.

Revised Subscription Rates

WITH effect from March 1, 1965 the price of THE ECONOMIC WEEKLY has been raised to 75 Paise. Correspondingly the annual subscription is Rs 36 in India, Pakistan and Ceylon. The half-yearly subscription is Rs 20. Foreign annual subscription rates are 70s and $10.

For the last 16 years, the price of THE ECONOMIC WEEKLY has been maintained unchanged in spite of heavy increases in costs. Circumstances beyond our control have compelled us to take this step and we hope readers will continue to extend to us the same patronage as in the past.

Weekly Notes

Development Rebate on Ships

THAT the Finance Minister is not happy with the present system of development rebate is well known. He wants a more selective system to encourage industries which are basic and important instead of extending the rebate to all industries. The rationale behind this is not difficult to accept, but some of the changes which have been made seem rather pointless and ill-considered. Take, for instance, the reduction of development rebate allowable on second-hand ships. Development rebate was first introduced on new ships acquired or rew machinery or plant installed after March 31, 1954, the rate of rebate being 25 per cent for ships. The concession was extended to second-hand ships in 1955. It was felt at the time that purchase of new vessels would be unnecessarily expensive, and that it would be desirable for the Indian fleet to be expanded with second-hand tonnage. In 1957 when the present Prime Minister was Minister for Transport and T T K was Finance Minister, the development rebate was increased from 25 per cent to 40 per cent. At the same time a Shipping Development Fund was set up to provide finance to the shipping companies. The Development Fund and the higher development rebate have been regarded by many as the twin pillars which have supported the rapid growth of Indian shipping in recent years.

The reduction of the development rebate from 40 per cent to 20 per cent on second-hand ships in the 1965-66 Budget, therefore, came as a complete surprise to the shipping industry. The full implications of the cut do not seem to have been adequately considered by the Government. It is possible perhaps that the Transport Ministry was not even consulted. Why the Finance Ministry chose to make a distinction between new and second-hand tonnage is incomprehensible. Is it the argument that on principle purchase of second-hand ships or plants should not be encouraged? Whatever its validity in relation to industrial plant, in shipping at least it remains a wise policy to buy second-hand tonnage during a slump and new tonnage in a boom. The reason is very simple: in a slump second-hand tonnage is discounted at a higher rate and in a boom new ships maintain a steadier price; to the extent, therefore, that the rebate differential between new and second-hand tonnage encourages shipowners to buy new tonnage, the reduction will be harmful, particularly when shipping is still in a mild slump.

Foreign Investment vs Loans

IT is now taken for granted that development needs external assistance. The classical form of such assistance was through foreign investment—in the extraction, transport and, subsequently, other sectors. The post-World War II phenomenon is, of course, government to government assistance and its variant of loans from international institutions. This is but a reflection as much of the changed politico-economic set up in the world which has made the private investor unwilling to rush his capital into the 'newly emerging' countries (if he was lucky enough to escape expropriation or a phased easing out) as of the fear in the minds of the resurgent countries of domination by private foreign interests—a fear not unfounded in view of the character of such investment in the past.

We, in India, have passed through several phases in our attitudes towards private foreign investment—from one of suspicion at first to tolerance and now avid espousal. The external assistance we have sought has been largely on an official basis mostly from foreign governments and international institutions as loans (and, to some extent, grants) and was fitted into the programmes of development. This was natural as the emphasis in the earlier phase of our planning was, rightly, on infra-structural investment—a field which, despite the 19th century experiences of foreign investment in railways, etc, is not calculated to enthuse the foreign investor. The changing emphasis on investment in manufacture has widened the scope for foreign enterprise. Of greater import is our exchange problem. Official loans with fixed amortisation periods mean higher immediate costs in debt servicing and our ability to service the growing external debt has been put under increasing strain, as the current exchange crisis bears out. The Third Plan estimated our debt financing needs at Rs 550 crores whereas the preliminary estimates of the Fourth Plan point to a figure nearly twice as large. Attention has, therefore, turned to the prospects of foreign private capital providing the external resources (and technical know-how) without the immediate strain on exchange reserves.

The Economic and Scientific Research Foundation, an organisation financed by the Federation of Indian Chambers of Commerce and Industry, has presented its case for foreign private capital based on the experience of the period 1956-60. It finds that during this period the annual outflow on account of direct private investment works out at 7 per cent of outstanding investment as against 11 per cent in respect of official loans and argues from this that greater reliance on the former would provide relief on external account. The authors of the study are, of course, aware that the outflows on account of foreign private capital and official loans are not strictly comparable. In the case of loans the figure includes both interest and capital amortisation; the loan is, therefore, a liability which would be liquidated in due course. In the case of private investment, the liability is a continuing one and, with plough back of profits, an increasing one.

Despite recognition of this vital difference, the study slurs over it by assuming that the increasing capital liability "is a purely notional one—so far as it is unlikely to materialise". This is assuming away the problem. In fact, on the basis of experience elsewhere and the experience in India of the volatile nature of oil companies' profit repatriation, we know that outflows in respect of private capital can be de-stabilising—tending to aggravate a weak exchange position and strengthen a strong one! In any event, increase in external capital liability over a period is not a prospect one can view with equanimity from the payments angle, especially when we know the sheltered condition of the Indian market and the profitability ratios.

There is another point to be noted with regard to the findings of the Foundation's study. The years chosen are 1956-60 when most of the loan assistance was on hard commercial terms. Since then, there has been a great deal of softening of the terms of aid both in terms of lower interest rates and longer maturity dates. This would make a substantial difference to the comparisons effected.

Consortium Exercise

THE question of softening the terms of aid is a hardy annual at the Aid-India Consortium meetings, the latest one of which has just concluded the first stage of its deliberations in Paris. In keeping with the procedures which have evolved in the last few years, the Consortium meeting is a two-stage operation, the first meeting (at which India is represented) being a general exploratory one followed by a second 'pledging' meeting. At the first meeting the developments in the Indian economy, the pattern of aid utilisation and Indian policies are reviewed.

This year the going promises to be rough. The past year has been notable mainly for economic failures—the price situation has been ugly throughout, the rate of industrial production has slowed down, the capital market remains in the doldrums and the external payments situation has now reached a critical stage. An application for a stand-by agreement with the I M F is pending and we have had to take the first steps of a stabilisation programme.

According to newspaper reports, India has requested $1,250 million for 1965-66, the last year of the Third Plan, which is nearly a fourth as large again as what was committed last year. The demand has been pitched at a higher level, but the realism of doing so is open to question. The USA and UK are not in the happiest of positions today, to put it mildly, and we will find Continental fists as tight as ever.

Of vital relevance from the point of view of external payments is not so much the commitment of aid (which in the four years has totalled well over $ 4 billion) but the actual disbursements. A greater shift to non-project assistance in the last two years has quickened the pace of disbursement and it is reported that we have again pleaded for a considerable amount of untied aid.

Whereas untied aid ceratinly helps to ease our payments position, it is little realised that in the process the character of the investment programme might have been changed. Our Plan envisaged Rs 700 crores of non-project aid. In the event of our securing the quantum of non-project aid asked for this year, we would have received more than this. In fact, by the end of the Plan we may well find that external assistance (on a disbursement basis) may not be far short, if at all, of our earlier estimate despite severe shortfalls in key investment targets, e g, in steel, heavy engineering and other vital sectors. Non-project aid is certainly useful but let us not make the mistake of overdoing it.

Well Stocked, Indeed!

THE Finance Ministry has released its annual financial report on the working of public enterprises and the Society for Propagation of "Democratic" Thought has with predictable promptness pointed out that on a total investment of Rs 1,780 crores on these enterprises the return to the Government in 1962-63 was less than 2 per cent. Unfortunately, this indefatigable champion of "democracy" will not be allowed to score so telling a point against the public sector; it will be told that of the total investment, a good proportion was in undertakings still at the construction stage and that enterprises in operation showed a return of around 7.5 per cent on capital employed—rather low compared to the rates of profitability the private sector has got used to, but still not quite the same as "less than 2 per cent". It will also be pointed out that the financial institutions in the public sector yielded, on a total investment so far of Rs 81 crores, a surplus of Rs 89 crores in the year 1962-63 alone.

The propagators of "democratic" thought could, of course, return to the fray with the thrust that some of the so-called undertakings under construction ought to have been completed years ago. Thus of the 14 undertakings under construction, two were started in 1956, three in 1958 and four in 1960 and only two each in 1963 and 1964. These failures, however, have been well known and are glaring enough from the shortfall of output of steel, petroleum, fertilisers and heavy machinery, among others, below Plan targets.

But what light does the financial data presented in the Finance Ministry's report throw on the quality of management of the enterprises which have got going? Hindustan Steel, which accounts for 45 per cent of the total investment in such undertakings, made a loss again—though a smaller one than in the year before—inspite of the upward revision of steel prices following decontrol and inspite of working at 97 per cent of capacity on average through the year. Two other companies made losses while the remaining 31 stayed out of the red. Of these, 19 improved their profitability in 1962-63 while 12 slipped, some rather badly. In all, net profits of the running concerns amounted to Rs 18 crores against Rs 14.5 crores in the previous year. In terms of percentage of paid-up capital net profit increased from 7.3 per cent to 8.1 per cent—hardly a striking improvement.

However, it is not till we come to the brief chapter on "working capital and inventories" that we get some conclusive evidence of how the civil servants have been managing the factories. Here we find that, in the aggregate, inventories carried by the 22 running industrial concerns, including Hindustan Steel, were equal in value to 11 months' production. Hindustan Steel held inventories equal to nine months' production while inventories of the other 21 undertakings were the equivalent of 14 months' production! It is not necessary to be a management expert to see that only managements completely impervious to all economic calculation will require or permit the holding of such large inventories.

The point becomes clearer if we consider the broad distribution of inventories. The largest component is raw materials, stores and spares which account for almost 70 per cent of all inventories. Raw materials, stores and spares with the 22 running industrial concerns amounted to 14 months' consumption at the end of 1963-64. Hindustan Aircraft and Indian Telephone Industries had at the end of the year stocks which, on the basis of the year's consumption, represented production requirements of 30 months and 24 months, respectively. The stocks of raw materials, etc, carried by Bharat Electronics and Fertilisers and Chemicals were sufficient for 15 months' production needs. Stocks held by Hindustan Shipyard represented 13 months' consumption while those held by Fertiliser Corporation, Hindustan Antibiotics, National Instruments, Praga Tools and Garden Reach Workshop were equal to 12 months' consumption. Stocks with the National Coal Development Corporation stood at Rs 16.7 crores at the end of 1962-63 whereas total consumption during the year had been just Rs 4 crores. In the case of Travancore Minerals, stocks amounted to Rs 5 lakhs while the year's consumption was just Rs 0.3 lakhs!

Apart from mildly conceding that "inventory levels in most undertakings are high", the Finance Ministry's report pays no particular attention to

this aspect of the public sector's working. There is no recognition of the fact that in addition to imposing an avoidable heavy financial strain on the public undertakings themselves, the excessive stocks of raw materials, stores and spares represent waste of scarce resources which could have been put to productive use elsewhere.

In fact, the facts about their ridiculously large inventories tell more about the quality of management of public undertakings than profit and loss statistics. They draw pointed attention to the Government's complete failure to develop a cadre of trained managers for these enterprises and rely on the practice of deputing officers from the administrative services for short periods of a few years. As long as this system continues it is futile to expect that public enterprises will ever be run on sound business lines. While, therefore, focussing attention on particular instances of lapse from economy and efficiency in public undertakings, Parliament should go back to the first causes and press upon the Government the need to develop a management service for these enterprises. The parliamentary committee on public enterprises especially must turn its attention to this problem immediately.

Fertilisers and Irrigation

A Correspondent writes :

THE Indian Council of Agricultural Research might have invited controversy by suggesting that irrigation projects should not be undertaken without ensuring a simultaneous increase in the supply of fertilisers and pesticides; but the Irrigation and Power Ministry's reply to it reads like a swotted answer poured out in response to the wrong question in an examination. The Council's main point seems to be the not unfamiliar one that under very general circumstances water and nitrogen are joint inputs in plant production; if irrigation provides enough water, nitrogen must be the limiting factor, and crop yields can be increased far more by increasing inputs of water and nitrogen together than of water alone. This much is well-established; the Council has extended the argument to say that if the water input is increased, the nutrient intake of plants will rise, the stock of nutrients in the soil will be depleted and yields wil be reduced. This is questionable; introduction of irrigation will be accompanied by a new cropping cycle and hence a new nutrient cycle in the soil, and whether this will be more productive or less is a matter of circumstances. It is, however, likely that in conditions of short and uncertain monsoon, the very regularity of water supply assured by irrigation will lead to an appreciable increase in yields, quite apart from the possibility of raising a second crop.

These issues are apparently quite beyond the Irrigation and Power Ministry. It asserts that "from time immemorial" the Indian farmer has been supplying his crops with nutrients from farm yard manure. This is a *non-sequitur*: the question to ask is not whether he uses manure or not but whether the quantity of manure he uses goes up with irrigation. It is possible that with irrigation the farmer gets larger yields of fodder, keeps more livestock and gets more manure for his field; what is more likely, however, is that he uses his livestock more intensively and there is no great increase in the manure he gets. Any way, no one knows what happens, least of all, the Ministry.

To argue, as the Ministry does, that irrigation does not affect fertility because it is not applied constantly amounts to admitting that the more intensive the irrigation the more deleterious it will be to soil fertility; and the Ministry does not seem to know much about benefit-cost ratios, for it will simply not do if, as it states, schemes are undertaken provided the total benefit to the community exceeds the cost. What it ought to do is to compare benefit-cost ratios of similar projects and devote the limited resources to projects with the highest ratios. Then perhaps it will understand ICAR's point that benefit-cost ratios can be increased greatly by spending on irrigation and fertilisers together rather than on either alone.

A Minister's Statistics

IN his anxiety to smother the opposition in the debate on the Budget in the Rajya Sabha, the Minister of State for Finance quoted facts and figures in a manner which did little credit to him and his Ministry. He has gone on record saying that the targeted increase of 25 per cent in national income during the Third Plan would be almost reached as he expects that the actual increase would come to about 24 per cent. Also, he tried to meet the opposition criticism of high taxation by pointing out that the additional tax revenue had gone to finance investment in industry and elsewhere.

Now, to start with, the target of growth of income in the Third Plan is not 25 per cent but 31 per cent if the 'financial' plan is considered and about 34 per cent if we consider the 'physical' plan. As against this, the realised growth in the first three years of the Plan is hardly 10 per cent and even assuming that the most optimistic expectations are fulfilled in the last two years the aggregate increase during the five years would hardly exceed 22 per cent.

The Minister's other contention—that the additional revenues have financed developmental expenditure—is also refuted by available evidence. The Planning Commission's Mid-Term Appraisal gives figures of current account surpluses and additional taxation in the first three years of the Third Plan. These show that the current surpluses aggregated Rs 279 crores compared to additional taxation of Rs 931 crores. It is clear, then, that a good part of the proceeds of additional taxation has been diverted into current non-investment expenditure. Many explanations may be advanced to account for such diversion —e g, the sharp increase in defence expenditure, the need for which cannot be questioned—but the fact remains a part of the proceeds of additional taxation has gone to meet current expenditure. Nor does the Minister's argument that current expenditure includes some amount of investment cut much ice, for the figures quoted above from the Mid-term Appraisal are exclusive of the investment component of current expenditure.

What enboldened the Minister to be so careless with his statistics? Was it the confidence, having regard to the normal quality of vigilance of the opposition, that he would not be found out?

Voluntary Ceiling on Profits

IT costs politicians nothing to propound high-sounding principles which they know cannot possibly be adopted. The Prime Minister's plea to businessmen, while inaugurating a seminar in Delhi on the "social responsibilities of business", that they should voluntarily accept a ceiling on profits and dividends is a case in point.

The Prime Minister bolstered up his exhortation by referring to the "essence of our heritage" which, according to him, should be blended with modern science and technology. But what is the essence of this heritage? Does not it—either in its essence or some part of it—contain untouchability and a variety of serfdom? There is no historical foundation for the view that in the past Indians in their ordinary business of life were any more virtuous than other people. And in the present, there is enough evidence to suggest that they are definitely not. It is not, therefore, a question of reviving any ancient practices and virtues, but one of catching up with others in matters of business ethics, just as in science and technology.

If business ethics in India need to improve, it is not because businessmen here are guided by the profit motive while they are not in some other countries, but rather because often here the pursuit of profits is divorced from the principle of giving "value for money". The constraints under which businessmen work in the industrially advanced countries compel them to adopt a socially more responsible attitude than do our businessmen. There the standards of consumer awareness of and interest in quality are much higher. But, above all, in those countries there is much more competition among business firms. In India often the size of the effective market for a product is such that only a few firms can exist. Planning and regulation of private investment through licensing, etc, has further reduced competition. In these circumstances much more attention needs to be given to "customer protection" in India than in the advanced countries.

But Shastri's suggested "code of conduct", the adoption of which, the men of business and industry "might consider", is totally irrelevant for the purpose. Voluntary restraints on business just do not work, and especially so when what is sought to be restrained is profit. If increased profits arise due to improved efficiency then the business has a right to them—or at least is likely to think so; if they result from a privileged position—which is the general situation in an economy dominated by shortages—then again it is too much to expect that without any pressure (e g, from a monopolies commission or a price-review body) they will be given up.

Shastri also expressed the hope that a voluntary ceiling on profits "should help in some measure to remove the feeling that seemed to divide those who had and those who were still in want". This, again, is expecting too much. Even if there were some voluntary restraint on profits, its effect on the unemployed rural and urban workers can only be negligible. This is the most deprived economic class, an improvement in whose conditions can only come about by direct action concerning their problems.

Progress of Warehousing

HOW much sense does it make to talk in terms of state trading and buffer stock operations in food grains without adequate warehousing capacity? A study of the availability and utilisation of warehousing capacity in 1961-62, published in the February issue of the Reserve Bank *Bulletin*, presents a bleak picture. On the face of it, the "overall progress" with regard to both the number and capacity of warehouses of the Central and State Corporations appears satisfactory, showing a nearly two-fold increase between 1961 to 1963. But in aggregate terms, warehousing capacity is way behind requirements. And the capacity that there is does not seem to be very rationally distributed, judging by the very wide variation in utilisation among different States.

As is to be expected, the bulk of storage capacity (around 78 per cent) is used for foodgrains. This naturally results in very uneven utilisation through the year. The Central Warehousing Act of 1962 sought to extend the scope of the Central and State Warehousing Corporations to non-agricultural commodities. This was to enable use of the warehouses in the agricultural off-season. So far, however, this move does not seem to have produced a marked impact.

Even with regard to peak season use, there is great disparity in the performance of the States. Punjab, with less capacity than other States like U P and M P, uses around 90 per cent of it, while the latter states achieve only 60 to 70 per cent utilisation.

As a proportion of the marketed surplus, the storage in the warehouses is negligible. And, in any case, who uses the warehouses? Not the producers certainly; not even the co-operatives. The co-operatives account for exactly two per cent of warehousing capacity used! The Government's share is hardly 7 per cent. The principal benefactor, then, is the trading community which now accounts for 84 per cent of the storage.

An important objective of the warehousing scheme is to make credit available to the depositors against the warehouse receipt. Taking all commodities, advances against warehouse receipts come to about 16 per cent of total advances against the commodities concerned. Here again the inter-State variations are significant and seem to bear little relation to the availability of warehousing capacity. In Assam, with very low capacity, warehouse receipts account for 31 per cent of advances, while in U P, which has the highest capacity, only 15 per cent of advances are against warehouse receipts to obtain credit, the co-operative banks have once again shown practically no interest at all.

LETTER TO EDITOR

Language and Unity

I READ with considerable interest Sankar Nath Maitra's comment on 'Language and Indian Unity' in *The Economic Weekly* of March 13. The striking thing about it is that it is free from the cant and hypocrisy that usually surround any discussion of this problem. Above all, Maitra has made a constructive approach to seeking a solution.

I think the time has come when we should try to differentiate between a *national* language and an *official* language. Even when Gandhiji spoke of Hindi as the *lingua franca*, he meant it more as a spoken language that can be easily understood by different peoples inhabiting the subcontinent. (In fact the Oxford Dictionary meaning of the term *lingua franca* itself is "any language serving as medium between different peoples.")

As Maitra points out, the all-India official language is not for everybody for all uses, but only for official and public uses, and so necessarily confined to those who work in such restricted fields. Hindi, however, can be used as a language for State functions and ceremonial occasions to satisfy self-respect. This is not so novel as it may appear. The Filipino example that Maitra has suggested here is, therefore, very relevant. As he points out, Tagalog, which is spoken by the largest group, is the national language and ceremonial citations are done in that language. But the official language is English and it is used in courts, Parliament and offices. It seems to me that this Filipino case is one that deserves greater examination by our policy-makers if we are to extricate ourselves from the morass into which we are steadily drifting.

CAPITAL VIEW

Foreigners, the Only Experts

Romesh Thapar

WHEN persons who cannot be accused of holding dogmatic communist viewpoints begin to warn the country against the growing tendency to rely on foreign capital, foreign aid and foreign experts to solve our problems, it is time to take a long and searching look at ourselves in this eighteenth year of freedom. The analysis of the malady, as presented by widely differing persons such as banker and businessman G L Mehta, the cautious politician Vijayalakshmi Pandit and the impatient Cabinet Minister M C Chagla, is essentially the same. We are fast losing confidence in ourselves and might soon lose the capacity to defend our fundamental interests if this flirtation-turned-infatuation leads to a surrender.

There was a time when some of the more perceptive members of the academic profession used to describe the foreign intellectual visiting India as a kind of well-organised human computer. This foreign intellectual, backed by adequate funds, would select a theme for investigation and do an intensive tour of the country meeting all and sundry who had done some thinking on the subject. This research would be card-indexed together with solid documentation provided by a battery of research assistants, also financed from the funds available to the foreign intellectual.

This job 'on location' would be completed within one to two years. A year would be reserved for producing a book. The book would then become the bible of the local gentlemen whose brains had been picked — and the author would be elevated to the rank of an 'expert', a minor *guru*.

When this story was repeated in its many interesting permutations and combinations, the more cynical used to exclaim: 'And that's how it came to be that all the experts on India are foreign!' Perhaps, this irony and cynicism have had something to do with the popular concept, particularly in circles close to Congress policy-making, that these 'experts' are the only experts. Now the detached visitor from abroad is shocked by a fact which we seldom seem to notice — that very often in an important branch of government the only really brilliant men working on problems are the Indians *under* the foreign expert, and even they do not see the absurdity of their plight.

The New Climate

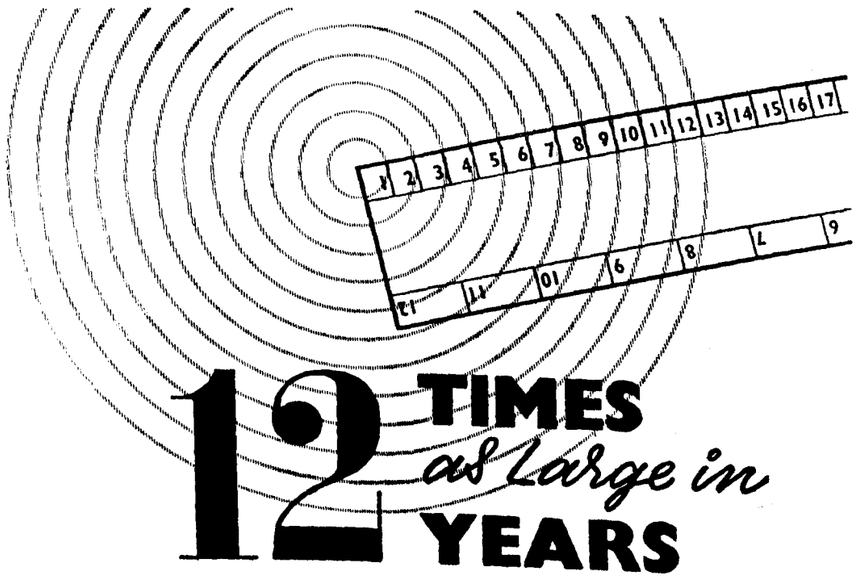
The psychological climate is no longer what it used to be. There was a time when leading politicians were dubbed 'Shri PL 420' because they called for too much reliance on U S PL 480 supplies. Now, the U S I S can issue pamphlets which speak of such supplies as "food for freedom" without the slightest danger of a snub. Just over a year ago, Prime Minister Nehru could reject the U S-sponsored Bokaro project because unfair, disadvantageous turn-key provisions were sought and there was a refusal to accept Indian consultants on the designing and engineering of the project. Now, we encourage the Soviet Union to insist on a turn-key arrangement over which we have practically no control, and we mobilise our bureaucrats to lobby the press and public with the view that no control means efficiency! So it is in agricultural planning, in the defence set-up and even in home affairs where F B I experts were recently called in.

Indeed, the current joke about our overworked hotels is that they are permanently booked by regiments of foreign experts who are here to guide us on everything from organising manure pits to manufacturing jet engines. From the looks of it, during the past eighteen years we have become more incompetent, less able to handle our affairs. And when T T Krishnamachari's appeal to foreign capital to enter the Indian market massively gets under way, we'll probably have to coin another phrase to describe the experts. These days, with bated breath, we study the impression that our leaders make on visiting teams of financiers, potential collaborators, investors and aid-givers. We are made to think that the future of this sub-continent depends crucially on these goings-on.

In many ways we are back almost to 1947. Arguments usually start from ground-floor. Concepts which we had debated threadbare and settled are again being scrutinised by the ruling elite. Is foreign capital such a bad thing? Does it really subvert a nation's sovereignty? Would it not be better to obtain foreign private equity investment rather than foreign loans which have to be repaid? Is the drain in the form of dividends and what-not, all that damaging? Can we really handle all these projects on our own or with limited collaboration? Have we not become victims of our own dogmas? Look at Europe. Look at Japan. That is the path to follow. Socialism has been discredited. It does not suit the Indian genius.

In other words, the *importance* of foreign collaboration is stressed, not its *need* in special cases. Statistics about these collaborations are widely publicised. Since the exchange crisis of 1957 to September 1964, 2,015 collaboration agreements were approved by the G O I. A country-wise analysis shows the United Kingdom with 574 collaborations, the USA with 337, West Germany with 294, Japan with 161, Switzerland with 90, France with 71 and Italy with 56. If these figures are criticised as suggesting too westward a leaning, it is pointed out that during the same period East Germany has concluded 44 agreements, Czechoslovakia 18, Poland 13, Hungary 7 and Yugoslavia 6. And so, presumably, we remain 'non-aligned' irrespective of the capital involved in these agreements, the nature of repayment or the structure of control.

Forgotten — or almost so — in all this discussion and debate are many relevant issues: that increasingly India's internal effort to mobilise resources and expertise to the maximum is flagging, that foreign capital intake should be only in those vital sectors where the indigenous effort cannot achieve the targets set, that wherever possible we must be in full control of the pricing of plant and ensure the most effective design and engineering, and that at no stage should we permit an imbalance to grow because of pressure from *entrepreneurs* interested only in easy and secure profit. Flabby leadership has destroyed the public's confidence that the essential perspectives of our planned development will be preserved. In such a situation, it is generally felt that foreign capital and expertise can become a dominant voice in the conduct of our affairs.



Politically, our present state creates the despair and demoralisation which

make us apathetic when confronted by determined lobbyists. The ruling party is fast losing its self-reliance, and the convictions which linked it with the people. The party is controlled by the manipulation of powerful organisers. But, significantly, it remains the only viable all India force capable of weilding power. There is no alternative — or, at least, no visible alternative. Until this alternative is forged, the present drift will continue. This has at last been recognised generally in Parliament and in the press.

Will the pressures build within the ruling party for a change in the leadership? Is there a potential leadership which can halt the drift and restore the perspectives? Must we plod along until the general elections in 1967, hoping that they will throw up an answer? These are some of the major questions which form as we try to make sense of the bedlam which prevails in Parliament, as we follow the mysteries of the hunt for Kairon's killers, as we speculate on who in government leaked the CBI Report on Patnaik's activities in Orissa, and as we marvel over the continuing confusion at government level on the language controversy.

Meanwhile, a subdued Holi festival has been ordered by the powers that be in homage to the memory of Jawaharlal Nehru. If only in remembering him they were to recall something of the passion which inspired him ...

Symbol of your Confidence

12 TIMES as large in YEARS

GROWTH OF DEPOSITS—

The deposits of the Canara Bank have grown 12 times as large in 12 years
At the end of 1952, the deposits were Rs. 7.32 Crores.
At the end of 1964, the deposits exceed Rs. 88 Crores.

This growth is entirely due to the great confidence reposed in the Bank by hundreds of thousands of its customers all over the country.

Heroic Statistics

Ashok Rudra

Levels of Economic Activity and Public Expenditure in India by K Mukherjee; Asia Publishing House, Bombay; XVI + 140 pp; Rs 25.

THERE are good statistics and bad statistics and there is a certain category of statistics which do not belong to either category and which may be given the appellation of "heroic statistics". The book under review presents a staggering volume of this type of statistics. I am not being sarcastic at the cost of the author who has taken very great pains in dealing with some extremely difficult and, at the same time, extremely important problems of economic historical statistics. All I mean by "heroic" is that the field of research for the author is such that there are no objective criteria which could be used to distinguish good statistics from bad statistics; and yet the object of measurement is so important that the statistics had to be produced by somebody or other. It is not always fair to describe as a fool one who rushes in where angels fear to tread. For quite often angels are much too discreet and territories abandoned by them have to be entered by somebody or other and it requires a hero to face the double hazards of unknown difficulties and the known possibility of being called a fool.

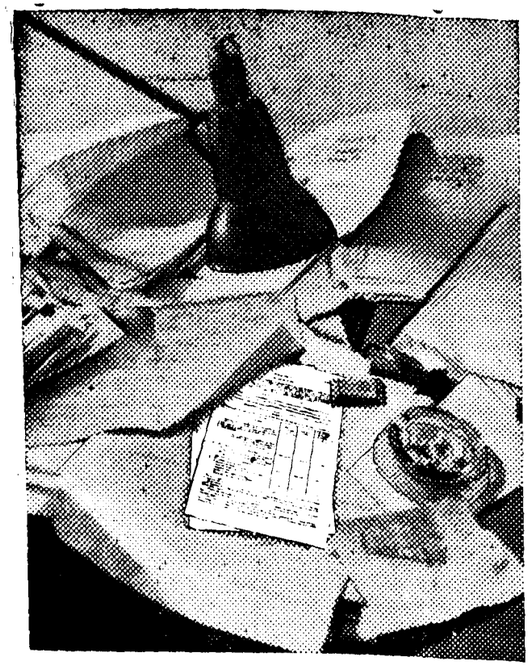
If I have started with this discursion on the distinction between fools and heroes, it is because I find it difficult to do justice to the task of reviewing this book. A review, I should imagine, consists of two things: it should indicate briefly the contents of the book and then it should assess the worth of the contents. Now the first task, that of describing the contents of the book, is made difficult by something for which I must hold the author squarely responsible. Lucidity is not exactly a quality in which the book abounds. Scholarship, erudition, hard labour, meticulous attention to details—all these one finds stamped on every page of the book. However, one does not quite understand what in the end is the net contribution of the author to the particular problem under study. Let us take a typical paragraph:

"These figures are not only relatively too high in comparison with the value of 'cereals and pulses', as pointed out by Thorner, but are also entirely out of line with his own figures for the subsequent years. In other words, Desai's 1931-2 per capita expenditure figure indicates a very sharp drop in prices for the three categories of products, which in view of the large imputations that are necessary in these sectors, appear to be somewhat unrealistic. It will also be noticed that depression downturn as indicated by Desai's figures are not corroborated by the general analysis of either Anstey or Gadgil. The correct position thus seems to be that Desai's 1931-2 figures are wrong on account of some price components being too high."

No Criteria

Unless one knows as thoroughly as the author himself the works of Blyn and Meek and Datta and Desai and Shastri and Gouri and Rao and the one or two dozens other names that are scattered all over the book with a high frequency density per paragraph one is quite incapable of appreciating even what the author is trying to say, let alone form any judgement about the wisdom of what he says and does. I do not know for what readers the book is meant. I do not think that there are very many persons in the country who are closely acquainted with the works of all these heroic statisticians. One purpose of the book could have been to make the readers acquainted with the works. This, however, is not achieved in the book, despite, or rather because of, the very profusion of references and quotations.

Apart from the lack of lucidity, the other most important reason why the reviewer is unable to make any assessment of the constructive work done by the author is, as has been mentioned before and implied in the appellation chosen, namely "heroic", there are no criteria to be applied in judging the worth of such statistics. The problem the author has set himself is the construction of statistical series that would measure the growth of agriculture, industry and national income and also of public expenditure during the first half of the present century. It is not the fault of the author that he did not have any rigorous methods of statistics that could enable him to make the best possible estimates. It is, therefore, only to be expected that his efforts would consist of groping amongst various other similar and comparable estimates made by others of unknown margins of error and blunder amidst masses of data and trying to put together something that he may call "estimates" guided by nothing more than his own common sense. It is not a fault of the author that he does not make use of any theory of estimation or of any theory of testing of hypotheses. One cannot, therefore, find fault with the author for not following any particular principles in making the choices and decisions he makes in arriving at his own series. That, however, is no reason to refrain from expressing one's feeling of discomfort when faced with such an exercise, especially when the author betrays a lack of awareness that in the absence of objective criteria, the opinions of individual research workers, in particular their opinions regarding the probable margins of error expressed in figures are of no worth whatsoever. In one place there is a whole paragraph giving a number of percentages reflecting what the different heroic statisticians regard as the margins of error of their respective heroic estimates. Thus, Mukherji writes, without expressing any concern about what might possibly be the meaning of the figures:



"Regarding the magnitude of error, Shah and Khambatta believe that their 'final result for any year may be taken to be correct within a margin of error of 5 per cent because it is extremely unlikely that all details will be wrong in the same direction and to the full extent'. That the errors could be all in the same direction is, however, exactly what Subrahmanian suspects. 'If the errors were random ones', he writes, 'the successive averagings may be expected to make the error... as small as possible. But these errors are systematic ones' and 'are known to have a strong downward bias'. Blyn does not try to estimate the overall accuracy of his figures and on the whole tends to accept the official view that a minimum error of 3 per cent each way or 6 per cent is reasonable.

Rao, on the other hand, considers that 'the results obtained have shown that taking the country as a whole the figures of agricultural output are not likely to be subject to an error of more than 10 per cent'. The National Income Committee, however, takes a somewhat gloomier view in so far as it regards that for its estimates for 'agriculture, animal husbandry and ancillary activities' the error would be as large as 20 per cent. It would, nevertheless, seem that the difference between Rao's estimate and that of the National Income Committee are not quite as much in conflict as might seem at first sight, because while Rao's estimates depend on the major crops generally, that of the National Income Committee includes a host of minor products where the accuracy of the figures are obviously of a low order. Since for several reasons, it has been found expedient to work on the basis of output figures for certain major crops it would be reasonable to accept the possibility of an error of 10 per cent, that is 5 per cent each way, in respect of the output figures subject, however, to certain qualifying conditions indicated in the following paragraphs".

Now, the statement may be made, in full responsibility, that the various percentages are *all equally meaningless and equally baseless.*

But why should one have to be heroic when facing such problems as the author has set himself? The obvious answer, as has been repeated before, is that there are no scientific tools that have been developed to this day to tackle these problems. What have, however, the so-called econometricians been doing all these days? If a problem like the one the author has chosen for himself is to be tackled in the heroic manner rather than in the scientific fashion, then what are the problems that the econometricians' tools are meant for? The econometricians have indeed been largely concerned with problems of estimation and of testing of hypotheses. However, in this field the econometricians have merely copied various theorems from test books of mathematical statistics into their own text books of econometrics. One finds in a text book of econometrics such things as the maximum likelihood method, the least squares method, etc, and of course also the elementary theorems of the calculus of probability. However, have econometricians ever paid any attention to the logical and conceptual foundations of probability? There are various schools of probability. Which particular conception of probability is applicable to econometrics? The most important and established school of probability is the so-called axiomatic school of which Kolmogoroff is perhaps the most important among the founders. The calculus of probability today in its most rigorous form is almost entirely dependent on the basic postulates of this school. Have the econometricians ever examined whether these basic postulates are acceptable in relation to economic problems? I dare say that they are not. If they are not, according to what other school of probability do the econometricians do their work? When one talks about the maximum likelihood method has one examined whether the conditions under which the method gives optimal results hold good in relation to economic problems? When an econometrician gives a figure, say .05, as the probability of rejection of a certain hypothesis, does he know what precisely this figure means?

The author of the book under review would not be in the quandary in which he finds himself if those who took upon themselves the task of developing econometric methods paid some more attention, on the one hand, to the basic concepts underlying present day mathematical statistics and on the other to the type of data that one has to deal with in problems of economic statistics—the type of data which is the despair, if not of the present author, at least of the present reviewer.

Plight of Higher Education

Philip Altbach

The Indian University by Robert L Gaudino: Popular Prakashan, Bombay, 1964; 268 pp; Rs 20.

ANY attempt to shed light on the plight of Indian higher education, however, incomplete, is greatly needed at a time of flux in education and of great soul-searching on the part of educators and government officials. Professor Gaudino has performed the valuable service of describing, with notable detachment, the state of higher education in India today. As an outsider, he has been able to see the totality of the situation, though perhaps he lacks some fundamental understanding of the traditions on which the Indian university is built. He has pointed out a number of the key problems facing the Indian university, and his book can go a long way toward providing needed perspective on a broad range of problems which are all too often approached from a very specific point of view or with only one aspect of the issue in mind.

Professor Gaudino places the Indian university in its socio-political setting, thereby providing a point of departure. He sees a number of factors as central to this setting. India, he says, is still a "traditional society with respect for hierarchy and the proper kind of deference." It is also, to quote Myron Weiner, a society of scarcity in many key areas, thereby creating stresses and strains on the resources that do exist. India is also a political society, but with politics of a "uniquely personal sort". It is a democratic society, but with a tendency toward pluralism. Finally, India is a changing society, with new ideas and practices in sharp conflict with older ways.

The typical Indian professor is sympathetically, yet critically examined. Professor Gaudino finds him exemplified by a lack of initiative. Serious scholarly endeavour, with a few notable exceptions does not form part of the life of the professor. While financial remuneration leaves much to be desired, the professor is able to live a fairly comfortable life. Too much deviation from the accepted norms would cause tension, and could perhaps mean loss of opportunity for promotion or even loss of job. The "machinery" of Indian higher education has caught the professor in its gears, and only the most energetic have the vision to overcome the odds against progress and scholarship.

Certainly one of the most fundamental problems facing both teacher and student in the Indian university is the system of external examination. This system, which places a premium on memorization and makes the individual staff member almost irrelevant in terms of the real rewards of academic life, has a profound influence on the entire educational system. No pronouncement by a vice-chancellor or a high level government body can have any effect until this examination system is altered. Professor Gaudino has no panacea to offer, though his discussion does indicate the centrality of this problem.

By Chance, Not by Plan

The unprecedented growth of higher education in India since 1947 has also had a profound inpact on its present condition. Gaudino points out that educational growth has been more by chance than by plan, and that, despite the best efforts of well-meaning educational experts, the newer universities have developed almost at random. True, the University Grants Commission, through its control of some of the purse-strings, can exercise some control and direction, but its impact is too diffuse to be decisive in any one institution. Several notable exceptions to this rule exist, particularly in the Indian Institute of Technology, which proves that it is possible to create educational and research institutions of the first rank in India. The problem, very simply, has been a lack of adequate resources combined with a lack of direction on most levels.

"The Indian University" attempts to discuss the organisation and government of higher education. Despite the complexity and subtlety of this issue, the reader can at least obtain an elementary understanding. The role of the vice-chancellor and rector of the university, and the lack of real democracy in the syndicates due to the preponderant influence of the university administration is spelled out. Academic politics, which can reach alarming proportions, is also discussed. The influence of caste or linguistic group in the appointment of lecturers or professors, and the substantial "patronage" of the rector in terms of appointments and other jobs cannot but have a profound influence on the university. As a political scientist, Professor Gaudino is particularly aware of the influences, the checks and balances, and occasionally the coercion, that enter into many important decisions on the university level. The university is, in fact, a microcosm of Indian political life on the broader level, and as such, must necessarily suffer academically and intellectually. Scholarly inquiry is subordinated to vote-getting in some cases, and the sum total of the situation certainly does not add to the dignity of the professor. Naturally, there are many reasons for this situation, and perhaps the key cause is the lack of adequate resources, which force underpaid staff members to spend undue time thinking about finances.

Professor Gaudino points out that the vice-chancellor (and occasionally the rector) are the "first among unequals". Though technically checked by the syndicate, vice-chancellor has almost unlimited power to make and implement his decisions. The University Grants Commission, the State legislature, and other bodies, can only exercise loose control and guidance over any given institution.

Problem of Indiscipline

What about the teacher and the student in the Indian university? Professor Gaudino points out that the relationship between them is shaped in part by tradition, in part by the system of examinations, and in part by the above mentioned paucity of resources. Most students come to college to obtain a degree, so necessary for a decent job, and without any particularly strong desire for intellectual stimulation or knowledge. They are notably unconcerned with the world around them, and caught between a traditional system of education which is almost extinct, and the Western model, imperfectly copied and slavishly followed. The student is faced with an almost insurmountable problem of language, with teachers who are uninterested in him as an individual, and with a system designed more for memorization than for scholarship. The teacher, however, well-intentioned, finds himself with a long schedule of lectures, thus making adequate preparation difficult. He has neither time nor often interest in meeting with his students and is often afraid of them.

Everyone concerned with education in India discusses the problem of "student indiscipline". Professor Gaudino is no exception. He says: "Fundamental to all indiscipline is the failure of the academic task, the absence of attachment to learning, the lack of the right conversation between teacher and student." As he says, the student comes to higher education at the age of fifteen or sixteen, with insufficient maturity to deal with a complex environment. Lack of stimulating subject matter, and actual physical deprivation on many levels also add to the problem. University and college officials continue to treat students in an authoritarian manner, thereby engendering as much hostility as respect. Afraid of any show of student initiative, they condemn the natural student leaders to frustration.

Professor Gaudino also briefly discusses some of the problems facing Indian higher education in the present period. Such matters as medium of instruction, adequate financial and technical resources and other issues are raised. "The Indian University" despite its valuable summary of higher education in India, has a number of drawbacks. Most important of these is its awkward and often confusing language. The book reads in parts more like a second-rate novel than a scholarly work; this is perhaps the result of Professor Gaudino's attempts to avoid academic jurgon. As a job of reporting, however, it is valuable. As a political scientist, and not an educationist, Professor Gaudino is able to see the issues in somewhat broader perspective. In total, "The Indian University" is a valuable addition to the literature on Indian education. It provides a valuable overview and is essential reading for anyone without knowledge on the subject. It stands out in sharp contrast to most of the treatises written by educationists interested mainly in justifying their own actions or by the various educational commissions, which are more concerned with developing an over-ambitious blueprint than with dealing with live educational issues.

Political Leadership in India

V M Sirsikar

The central leadership after Pandit Nehru represents a new trend towards collectivism and better co-ordination between the parliamentary and organisational wings of the Congress.

The State Chief Ministers played an important role in the succession battle; their importance in national politics is likely to grow in the years to come. This development reflects the growing strength of the different regions of the country.

The central leadership will also be more responsive to popular pressure than hitherto as the people, who tolerated the lapses of Pandit Nehru, would be now more exacting in their demands. Within the Congress Party itself, the rank and file are likely to become more articulate and critical, leading to a greater democratisation of the party-machine than obtains now.

The opposition parties may increase their pressure on the leadership through alliances or mergers. The same could be said about other organised interests and their efforts to influence Government policy.

THIS brief paper attempts a study of political leadership in the post-independence period in India. The paper is based on current literature on political leadership in India in the form of books, journals, research papers and on personal observation. Leadership is a phenomenon which pervades every human associational activity, but it assumes a certain crucial significance in an emergent democracy which boasts of the largest electorate in the world and also desires to modernise in a short period of time. The very future of this vast experiment depends on the continuous and steady flow of leaders who can be depended upon for the task of 'attending to the arrangements of the society'.

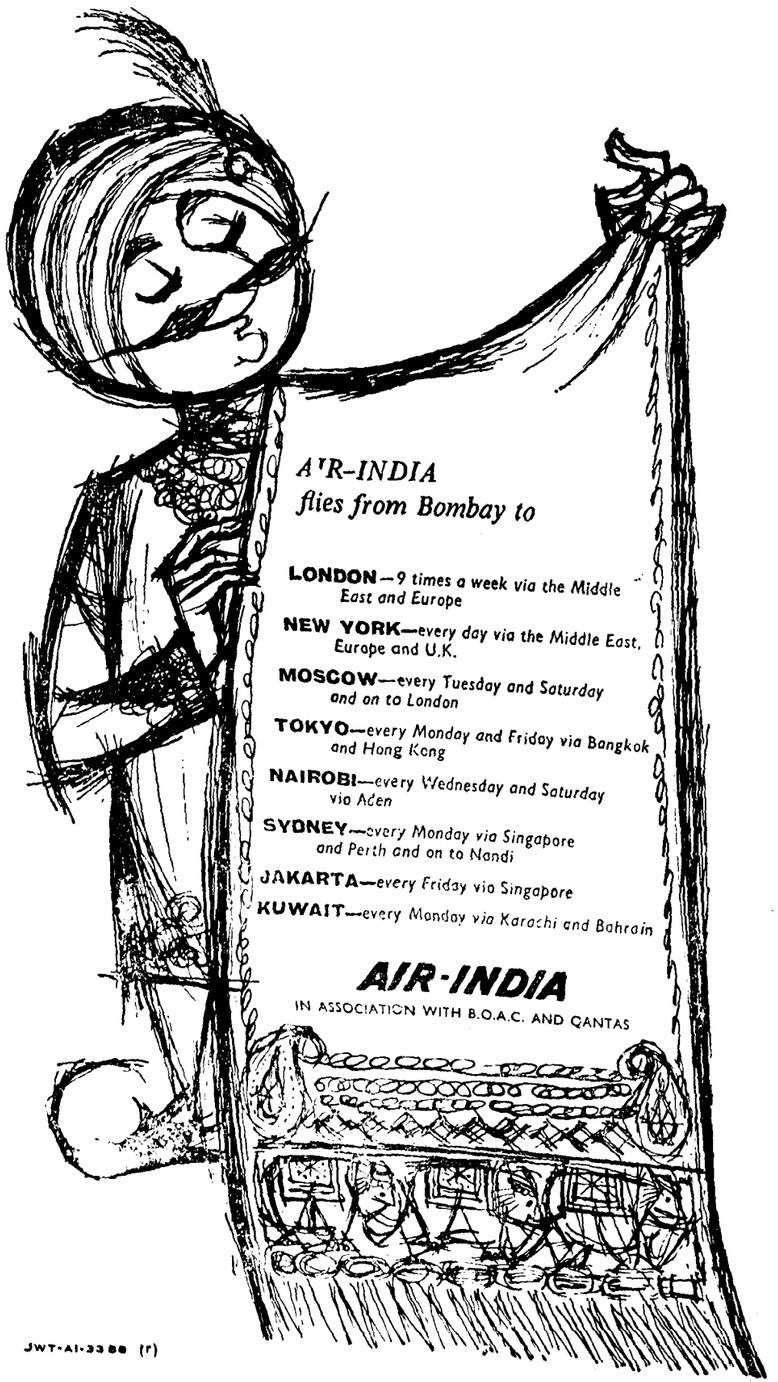
Crisis of Leadership

It is common place to say that India faces a crisis of leadership. The shortage of leadership is a result of the absence of social conditions and arrangements which would promote potential leaders. Thus it becomes urgent to think of the processes, problems and influences that shape the emergence of new leaders. Leadership is as urgent a social problem in India as the paucity of economic resources, technical know-how and trained bureaucrats. The problem assumes greater significance as the leadership is expected to undertake the triple responsibility of strengthening democratic institutions in a mass society, of modernising the masses and of initiating and performing developmental work. The role of political leadership in India has an added significance as the people look to the state as an agency of social change. The dependence on state initiative to undertake any new programme or policy is noticeable even at the lowest level. Thus those who would yield political power have to be initiators in social change. Is the leadership capable of shouldering the responsibility? On the quality of men will depend the answer.

Our argument involves certain broad assumptions. It needs no proof that the Indian National Congress—a party which is in power since Independence both at the Centre and in the States (with a few minor exceptions) is the most important political institution in India. Attention, therefore, has to be focussed on the Congress leadership at the national and State level. This does not mean that there are no non-Congress leaders worth the name. The paper is mainly descriptive and not normative in its approach. It attempts to be as objective as is possible for a contemporary Indian student seeking to describe the leadership situation in the country.

No attempt is made to suggest quick solutions to this basic problem. It is felt that the political leadership of a country is the product of interacting forces, of history, of competing ideologies, of cultural heritage and of the social structure of that community. Thus it is thought that there could be no "western" or mechanical solution to the leadership problem in India. This does not mean that the Indian situation is in any way 'unique', but it is radically different.

Period of National Leadership



It is not an easy task to survey the developing leadership situation in a country like India, with vast population and cultural variations, in a few pages. Certain obvious limitations are there. What is attempted here is to view the leadership situation in the post-1947 period within its social setting.

It can be stated that the urge for national freedom, unity and the sublimating influence of the non-violent struggle against the imperial power, resulted in throwing up a 'national' leadership, neither interested in sectional, regional or group interests nor in personal advancement. On the other hand, it could be demonstrated that there was a certain social pressure on the leadership to be 'national' in its outlook. No one could hope to be a 'national' leader and still strive for his sectional interests. Their identification with the abstract entity of the Indian nation was complete. The function of this 'national' leadership was to sublimate the parochial caste, communal and narrow regional loyalties into a broad stream of national loyalties for the freedom struggle.

The participation in the freedom struggle demanded from the leaders a certain amount of voluntary sacrifice of their personal careers, properties and even family life. Under Gandhiji's influence they had to live an ascetic life of self-imposed poverty and denial of worldly pleasures. All this resulted in making the leaders very much goal-oriented, and the service (of the people) motive became the dominant note. With the general sentiment in favour of renunciation of power, the power motive could not be much in evidence. Or it could be argued that the power instinct remained suppressed till 1947. It may even be pointed out that in that period, acceptance of a political career automatically divorced the person in question from the sources of wealth-getting. Austerity was thus in part, the consequence of lack of such opportunities.

Two Traditions

There is no doubt that there is a tradition of renunciation in Indian culture. However, this does not constitute a massive factor in any field of

national activity today. In the pre-independence period, achievements in politics, education or any other national activity were possible only on a sacrifice basis and hence the national movement threw up men, organizations and traditions of this type. The sacrifice tradition meant lack of specialized knowledge but the material costs were less and there was an unflinching pursuit of ideals with a zeal. With independence there has been a cataclysmic change in the psychology of the leaders, though the psychology of the people is still to some extent glued to the pre-independence traditions. This fact explains the wide gap in the expectations from, and the fulfillment of these by the leaders.

It can be argued that in the Indian leadership there are mainly two traditions — the Congress and the non-Congress. The Congress tradition continued in that party and the Socialist parties, while the non-Congress tradition is to be found in the C P I and the rightist parties like the Jan Sangh and the Swatantra. The common factor about the non-Congress tradition was that this leadership was mostly away from the national struggle. (A few of the leaders of the Swatantra party were veteran Congressmen and hence the statement does not apply to these individuals, who, however, do not represent the bulk of the Swatantra leadership. The same may be true of those nationalist communists who participated in some of the national movement*). This fact to some extent influences the relationship of the opposition parties to the Congress. The desertions from and to the Congress are again mostly from and to the Socialist parties. The C P I and the Jan Sangh have succeeded in creating a greater doctrinal and party-loyalty amongst their respective followers.

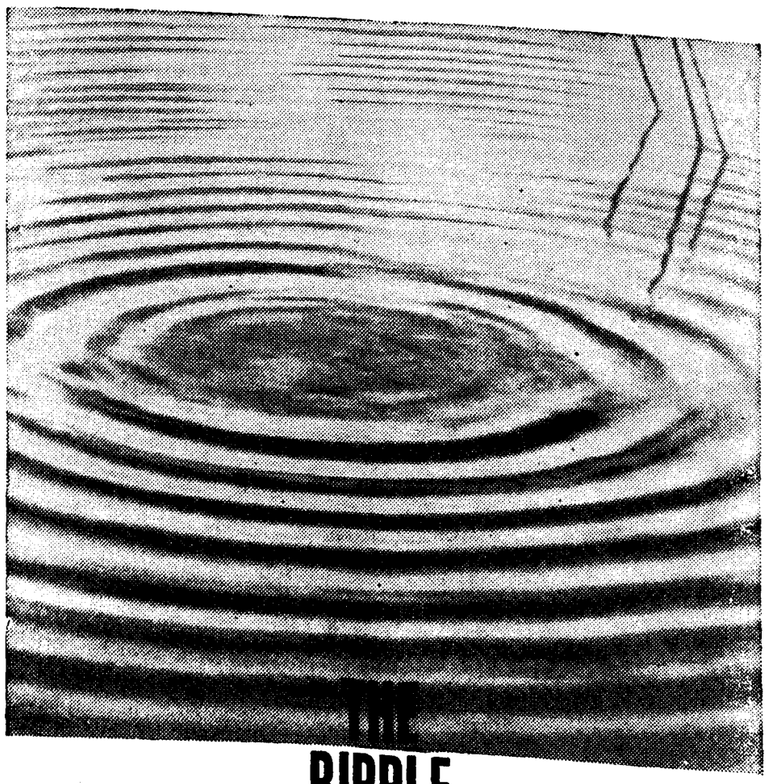
Well-Trained Team

Today it can be rightly said that India was fortunate enough to have at the start, a well-trained team of leaders under the able stewardship of Pandit Nehru. The role of Mahatma Gandhi as the friend, philosopher and guide of this team came to an abrupt end with his assassination in 1948. The sudden removal of the charismatic father-figure from the national scene, though much lamented, was in a sense instrumental in projecting Pandit Nehru as the new father-figure. Pandit Nehru had acquired a world personality even before independence. This fact together with his aristocratic origins, his legendary sacrifice, his revolutionary background and his love for the masses who adored him, contributed to his charismatic hold over the country and its politics.

The 1947 Cabinet contained a few non-Congress and non-party leaders. This had become necessary to give a national character to the cabinet which was mainly composed of Congressmen. The overall picture was that of the Congress monopoly of power throughout the country. The non-Congress elements remained in the government on the sufference of the Congress leadership. The country was passing through the ordeal of partition, facing the enormous problems created by the massive inflow and outflow of refugees and the post-war shortages. The leadership at the Centre was able to tide over these difficulties. There were, no doubt, stresses and strains, heart-burnings and whisper-campaigns, charges and counter-charges amongst the top Congress leaders, specially between Maulana Azad and Sardar Vallabhai Patel (K L Panjabi, "The Indomitable Sardar" and Maulana Azad, "India Wins Freedom"). But these did not reach explosive proportions. Credit must be given to Pandit Nehru for reconciling the divergent elements.

Period of Consolidation

This period could be regarded as a period of consolidation in many senses of the term. The integration of States was achieved peacefully (except in case of Kashmir and Hyderabad). There was a realignment of ideological forces in the country. The Congress Socialists left the Congress to set up the Socialist Party in 1948. The initiative for the break came from the Congress which adopted stricter rules for membership which prevented dual membership. The Socialists had no choice. Even before the Congress Socialists, the Communists had been expelled from the Congress. The Gandhians, mainly the Sarvodayaites, claiming to detest the increasing power struggle, left the Congress to undertake non-political constructive work. Vinoba Bhave and the 'Bhoodan' workers could be cited as the examples. Thus the Congress consolidated as an organisation. But in the process it became more conservative and less idealistic than it was before the attainment of independence. This was not unexpected as the Congress was transferring itself from a broad-based national movement into a closely-knit political party. And those who controlled the party-machine—like Sardar Patel, S K Patil and others—were typically conservative in their socio-economic outlook.



Beginning of Nehru Era

The second period coincides roughly with the start of the First Five-Year Plan, the coming into force of the new Constitution, the death of Sardar Patel, the rise of the Jan Sangh, and the beginning of the 'Nehru era'. The emergence of Pandit Nehru as 'the leader' had certain implications for the Government, the party and the people. It was alleged by the critics, that though the country had adopted the 'cabinet' system of government, in practice it was more of a "presidentialist" system. This, however, did not mean that the Cabinet did not meet or transact business. It meant two things. The domination of the Cabinet by the towering personality of the Prime Minister. It also meant that important policy decisions were made outside the Cabinet. There were, no doubt, instances when Cabinet members differed from the Prime Minister and had the courage to challenge him. Some of them even had the courage to leave the Cabinet. But these instances were rare. Pandit Nehru was never *primus inter pares;* he always remained *unus inter pares.*

The consequences of this for the party were extremely important. Before independence, the President and the Working Committee decided the main policies. But the situation radically changed after the Congres had assumed power and the responsibility of governing the country. Acharya Kripalani resigned his presidentship in protest against the neglect he suffered. All the major decisions were now with the Prime Minister and his Cabinet and the President was not even formally consulted. The exit of Purushottamdas Tandon from the presidentship of the party, a few years later 'was with so brazen a display of expediency' that it was commented on by the press and the public.

The enormous concentration of power in the hands of Pandit Nehru was now complete, with the taking over of the presidentship of the party. He was leader of the House, Chairman of the Planning Commission, Chairman of the Atomic Energy Commission, Minister for External Affairs, in addition to being the Prime Min-

* The term 'national movement' is used here with a limited connotation of a struggle against the foreign rule.

RIPPLE

The LIC is at the centre of a ripple whose widening impact is felt throughout the land.

On the one hand, LIC's operations are far reaching. They cover about 729 centres, a number which is steadily increasing. So is the number of new individuals in India being covered with Life Insurance.

On the other hand, the LIC invests nearly 3 million rupees a day in industry, agriculture, railways, transport, electricity and many other projects. The radiating effect of these investments creates more jobs, more incomes, more food—in fact, a higher standard of living—for everybody.

LIC—YOUR COMPANION IN PROGRESS

ASP/LIC/PR-3

ister. The immediate result of this was the enfeeblement of the party's organisational wing. The process of 'de-Patelisation' of the party-machine was in progress. The once mighty, highly coveted office of the presidentship went now abegging. Pandit Nehru continued to hold the twin responsibility of leading the Government and the party. The successors to the party presidentship were for all practical purposes, chosen and nominated by him.

A fatal consequence of this process was the reluctance of other leaders in the Government to use their initiative and take risks. S K Patil referred to this when he compared Pandit Nehru to a banyan tree under whose heavy shadow smaller plants did not get a chance to grow. The effect on the people was to encourage them to look upon Pandit Nehru as the infallible leader who would bring them to the promised land. This attitude made them very indulgent towards him.

Socialist Turn

The next phase in the developing leadership situation began with the inclusion of the 'left forces' in the Cabinet. Pandit Nehru's leaning towards the left was tolerated by the rightists in the Congress. But the increasing importance of the leftists, since the Avadi Resolution on the Socialistic pattern of society, and the emphasis in the Second Plan on physical planning was not much to the liking of the rightists. (The influence of Professor Mahalanobis in giving this slant to the Plan was hotly discussed.) This period witnessed the exit from the Congress of a few top conservative leaders like C Rajagopalachariar and K M Munshi who were later instrumental in launching the Swatantra party. The more decisive influence on the leadership situation was, however, the reorganisation of States on linguistic basis. The total effect of this momentous change was to strengthen regionalism, and to encourage local leadership having linguistic and regional homogeneity.

With the linguistic States the leadership became more rural in composition than in the composite States. The identification of this leadership was with more concrete realities like the caste or the linguistic group. This was an important change as it meant that gradually the urban-centred leadership of the highly educated high caste elites would be displaced by the 'new leaders'. These leaders have a stronger mass-base than those of the earlier period. The 'new leaders', it is claimed, belong to the 'new middle class'—the representatives of the newly-educated, rich, middle castes, mainly of the peasant stock coming from rural areas. There is evidence available to prove that many of the leaders are heavily dependent on the support of the particular caste/clan dominant in their constituency.

Power Shifts to the States

The pendulum of power started shifting from Delhi to the States in this period. The Chief Ministers began asserting their independence. This tendency gathered strength with the decline in the popularity of the central leadership and weakening of the party-organisation.

With the achievement of independence, the 'noble cause' motivation ceased to be decisive. But the elections, the plums of office, the chances of improving one's socio-economic status, attracted the 'new men of power'. Only after independence did politics in Max Weber's phrase, become a vocation in India. Those who wanted to live 'off' politics made a significant emergence on the political stage specially at the State and local levels. In contra-distinction to the 'national' leaders of the earlier period, the political support of the 'new' leaders has certain limiting factors. It has now a distinctive regional colour with the over-tones of caste and a bargaining quality. This bargaining quality emerges because of the growing strength of interest groups in Indian politics, specially at the State level. There are now visible signs of interlinking of business and industrial interests and political leadership, specially of the ruling party. This could be regarded as a new trend. This might be owing to the fact that the political leadership now controls the business and industrial sectors, through licensing, exchange controls, and such other mechanisms.

The last phase of the development of the leadership situation started with the 1962 General Election. The growth of the rightist parties in this election was sufficiently perceptible. This swing to the right in Indian politics might have influenced the Congress itself. The rightists in the party were strengthened. Though the Congress continued to rule at the Centre and in the States, the opposition parties, both of the right and left increased in strength. The Chinese aggression brought about many changes in the internal political situation. It significantly affected the unquestioned supremacy of Pandit Nehru. Within the Congress there was articulate opposition to him—a fact unknown before. The consequences were, the exit of Krishna Menon, perhaps much against Pandit Nehru's wish, and a significant change in Indian foreign policy. Public opinion, specially of the vocal section, asserted itself in this case. The three prestige bye-elections to the Lok Sabha returned Lohia, Acharya Kripalani and Minoo Masani and thus increased qualitatively the combined opposition in the Lok Sabha. This was a further proof of the decline in the Congress prestige—specially the influence of Pandit Nehru. K D Malavia, a close associate of Krishna Menon, and a pronounced leftist, had to resign in the Serajuddin Affair. This was interpreted as a victory of the rightists in the Cabinet.

The debate on 'after Nehru who' in this last phase of Pandit Nehru's life indicated the extreme anxiety felt in the party, in the country and outside about the peaceful succession. It also pointed to the close of the Nehru era —already his charisma was wearing thin, with the Chinese aggression.

The Rise of Kamaraj

This leads us to the present phase which can be conveniently termed as the 'Kamaraj era'. The era began with the 'Kamaraj plan' to revitalise the party by asking senior Congress leaders both from the Centre and the States to step down from the office and devote themselves to party-work. Kamaraj, a bachelor, with no family ties, a whole-time politician, with no vices and a simple life, but with innate appreciation of the mechanics of real politics in a democracy, became a symbol of sacrifice and was the first to follow the principle of 'party before post'.

The 'Kamaraj plan' gave an opportunity to Pandit Nehru to drop from his Cabinet six of his colleagues, including pronounced rightists like Morarji Desai and S K Patil. This was alleged to be the attempt to restore ideological balance in the Cabinet, (caused by the exit of Menon and Malavia). The ousting of six Chief Ministers resulted in new power alignments in those States. The plan succeeded because those who were sacrificed, accepted the decision without recrimonious public debate.

There was not even an idea of revolt against the leadership. Events followed in rapid succession with the failing health of the Prime Minister. After the Bhubaneshwar session, Lal Bahadur Shastri, who had resigned under the Kamaraj plan, was recalled to the Cabinet, to share the work of the Prime Minister. Kamaraj emerged as a strong man from the south who had the backing of the southern States and who, unlike his predecessors in office (of presidentship of the party), was determined to use his influence in shaping things after the departure of Pandit Nehru.

Can it be now assumed that the organizational wing would exercise a co-ordinate authority in the selection of the highest office? Or can it be regarded as merely a resultant of many accidental factors that Kamaraj projected himself beyond his capacity in getting Lal Bahadur Shastri through the ingenuous method of "consensus" and avoiding a direct confrontation? The power of Kamaraj is a result of many factors, principally his unchallenged supremacy in Madras, a state where the secessionist D K and D M K movements were posing a threat to the unity of the country. The strategic importance of the southern States in Indian politics, which the populous northern States dominate by virtue of their voting strength — a fact resented by the south — cannot be overlooked. The support which Kamaraj received was from different sections of the party—some of the party bosses, most of the middle cadre of leadership and the general rank and file. Every one of them might have supported Kamaraj for his own motives and sometimes for contradictory purposes.

Kamaraj, with the help of his supporters, was able to smoothen out the succession issue in favour of Lal Bahadur Shastri. This proved that the lessons he had learnt in the 'real politics' of his region, Tamilnad, were useful on a larger canvass. It is necessary to point out that the much-feared and expected 'split' in the party did not occur. Part of the credit must be given to those who were left out of power.

Conclusions

This brief survey of leadership situation in India does not entitle us to draw any inferences of a general character. What follows is to be regarded as tentative indications about the developing situation.

The age of 'the Children of Revolution' as Pandit Nehru said, is coming to an end. This is but natural, since after 17 years of independence the ranks of the freedom fighters are growing substantially thin. In the earlier phases, jail-going was correlated to remarkable social performance and leadership. This criteria will not now be available. Leadership based on the tradition of sacrifice, dedication and austerity would be replaced by the new leaders who represent their hold on their regions, either due to caste or interest group support. Really speaking the problem of substituting the tradition of sacrifice and dedication, by a tradition of specialisation is the basic issue. Specialisation means more material cost but more specialised knowledge of political organization and administrative skills. But to build up a tradition of specialization demands permeation of appropriate cultural values among the people. As yet no solution has been found. This does not mean that the present Central leadership lacks either in the sacrifice tradition or administrative experience. But if no conscious efforts were made to train a cadre of leaders specialised in political organisation and administrative skills, it would mean that the country would suffer from the demerits of both traditions. With the dedication-sacrifice tradition becoming scarce the material costs would increase, while in the absence of specialisation, there would be less expertise and there would also be a decline in the zealous pursuit of ideals. It is necessary to remedy this situation.

With the passing away of Pandit Nehru the chapter of charismatic leadership seems to have come to a close. The Central leadership at present represents a new trend towards collective leadership and better co-ordination between the two wings of the party—the parliamentary and the organisational. The Chief Ministers were influential in the battle for succession. The role and influence of the State Chief Ministers will be more significant in years to come. This might be regarded as a consequence of the strength of regionalism.

The Central leadership will be more responsive to popular pressure as people who tolerated the lapses of Pandit Nehru would be now more exacting in their demands. Within the party itself, the rank and file would become more critical and articulate. Indirectly, this might be a gain as it would democratise the party-machine.

The opposition parties may increase their pressure on the leadership either through united alliances or mergers. The same could be said about the growth of organised interests and their efforts, open and clandestine, to influence policies.

Pandit Nehru's leadership represented certain values in Indian politics like, secularism, modernism, scientism, socialistic planning, non-alignment, and democracy. Though the present leadership could be depended upon to follow these values by and large, yet their emotional commitment to these values is different from that of Pandit Nehru. It is very likely that the internal and foreign policies would be less idealistic and more down to the earth.

The functioning of democratic institutions depends on the internationalisation of democratic values by the community. Though such a claim cannot be made for the whole community it could be said that the leadership, the intelligentsia and the bureaucracy have a workable loyalty to democratic institutions. The smooth transition, contrary to the alarmist fears in certain quarters, from the Nehru era, demonstrates this workable loyalty and its efficacy. Barring an unforeseen catastrophe, the Indian leadership can be trusted to operate the democratic apparatus in a satisfactory manner.

States' Tax Effort in Third Plan

K Venkataraman

Complaints are heard, on the one hand, that State Governments are not exerting themselves enough to raise additional resources for the Plan and, on the other, that State resources are insufficient and that, therefore, the States cannot be expected to raise substantial additional revenue.

It is necessary to determine which of these viewpoints is more valid.

This article examines the additional taxation, its magnitude as well as nature, undertaken by the States in the first four years of the Third Plan.

THE data used in what follows are a consolidation and representation of the data in the individual annual articles on state finances published in the *Bulletin* of the Reserve Bank of India. When proposals for additional taxation are discussed, they refer to proposals made in budget speeches and/or immediately modified thereafter. In actual implementation, the nature of the taxation as well as the resources derived therefrom might be somewhat different.

Increase Since First Plan

We may begin by looking at the trend of the quantum and structure of State revenues from the beginning of the First Plan. Table 1 gives the average total tax revenue raised by States in the First and Second Plan periods and for the first four years of the Third Plan. (For 1963-64 Revised Estimates and for 1964-65 Budget Estimates have been adopted.)

It should be noted that the averages do conceal substantial variations between the beginning and end of each Plan period, but they are a useful method of looking at trends for our purpose. What strikes us first is the increase by 140 per cent between the First and Third Plan, being made up of an increase of 52 per cent between the First and Second and an increase of 60 per cent between the Second and Third. Interesting features emerge on the side of the structure of taxation too. Firstly, General Sales Tax, Motor Vehicles Tax and Tax on Motor Spirit have roughly doubled in each Plan period. This has been due both to substantial rise in rates as well as the general buoyancy of economic activity. Secondly, land revenue is still important in absolute terms and is second only to General Sales Tax as an important source of revenue among State taxes. What is more, there is some step-up in the yield of this tax. The increase between the First and Third Plan is 88 per cent made up of an increase of 42 per cent in the Second Plan and an increase of 32 per cent in the Third Plan. The increase between the First and Second Plan can be attributed broadly to the revision of assessments consequent on Zamindari abolition and the increase in the Third Plan to general step-up of taxation. Other features which we may take note of in passing at this stage are the growing importance of electricity duties, the spurt in State excise during the Third Plan and the apparent stagnation in urban immovable property tax.

We may now pass on to the additional taxation measures in the Third Plan. Table 2 sums up the additional taxation proposals yearwise and taxwise. Table 3 shows the total tax revenues raised by States in the Third Plan. Certain important features again stand out. (1) The tax effort has been concentrated in the second and third years of the Plan. (2) Almost all taxes have been relied upon, the increases in land revenue, motor vehicles taxes and sales taxes being significant. (3) There is a noticeable effort in electricity duties. (4) In terms of magnitudes of increase, motor vehicles taxation, land revenue and sales tax came in that order in the second year, while in the third year, the order was sales tax, motor vehicles taxes and land revenue.

Trends in Individual Taxes

The next step is to examine the trends of individual taxes in detail but before that we could have a look at the State-wise distribution of the tax effort. Table 4 provides this. Additional taxation targets for the Third Plan have been indicated for each State in the table but no attempt is made to correlate them to actual performance since the rate of growth of revenue from the tax proposals would vary from State to State depending on the component taxes and these rates cannot be reasonably fixed without detailed study. We may however note the estimate made in the *Bulletin* of the Reserve Bank of India with the help of information from the Planning Commission: "Measures taken by the States during 1961-64 are expected to yield over the Plan period an aggregate revenue of about Rs 460 crores and if account is also taken of the resources that will accrue to the States from the changes in inter-State sales tax effected during 1963-64, the additional tax resources accruing to the States in the Plan period will be of the order of Rs 534 crores ... Thus the tax effort of all the States taken together has so far been below the target visualised in the Plan, viz, Rs 610 crores for the five year period! (*Bulletin* of the Reserve Bank of India, May 1964, p 577.)

Inter-State Differences

We should note, however, that the performance of States in taxation and in Plan implementation need not be direct and proportional. A State may raise the targetted additional resources and yet find itself not fulfilling the Plan, if administrative arrangements and other factors stand in the way. Conversely, though with lesser likelihood, States may be implementing the Plan satisfactorily even though they may not have fulfilled their taxation targets.

Now, what does Table 4 show? The most conspicuous feature that emerges is that Bihar has not practically made any additional taxation at all. She appears to have made an effort of Rs 1 crore, vide the following statement in the *Bulletin:* "In the case of Bihar, the tax performance in the Third Plan period has been far from satisfactory, the only proposals being those made in 1962-63 for an additional yield of Rs 1 crore. Consequently the Plan outlay of this State has been reduced in 1963-64." (*Bulletin* of Reserve Bank of India, April, 1963; p 444.)

One other interesting feature is the time distribution of the tax effort in various States. U P's effort was concentrated in the first year while that of West Bengal and Rajasthan in the third year. Madhya Pradesh distributed it over the first three years and Mysore over the first two years. Kerala distributed it in the first and third year while Andhra in the second and third year. Maharashtra and Madras concentrated their efforts in the second year.

II

We now come to individual taxes. Let us take land revenue and agricul-

THE PORTRAIT OF A SUCCESSFUL YOUNG MAN—

■ He has a steady job with excellent prospects. He has a Savings Bank Account with The Bank of India Ltd. and keeps aside every month a minimum amount as soon as he gets his salary.

■ He makes use of the services of The Bank of India Ltd. —(a) to buy first class securities (b) to keep them in Safe Custody and (c) to collect the dividends regularly.

■ He takes advantage of the Free Remittance facilities and Standing Instructions facilities offered by The Bank of India Ltd.

■ He has appointed The Bank of India Ltd. as trustees for his life insurance policy under the Married Women's Property Act. The interests of his family are in the safe hands of the Executor and Trustee Department of The Bank of India Ltd.

■ He knows that in case of any financial problem, big or small, he can expect able and willing guidance from The Bank of India Ltd.

THE BANK OF INDIA LTD.

T. D. KANSARA, General Manager

tural income tax first. There were straight forward increases in rates of land revenue in most states like Assam, Andhra, Kerala, Madras and Mysore. There was some emphasis on irrigation rates and betterment levies in U P, Orissa and M P. A comparatively new feature was the introduction in Maharashtra of a per acre levy on cash crops in irrigated lands.* Gujarat also proposed a levy on cash crops but withdrew it and substituted it with a straight forward increase in land revenue. Punjab also levied a tax on certain cash crops on a per acre basis with different rates for canal-irrigated and other areas. Another feature was the introduction of a tax on land holdings (related to their capital or annual value), over 30 acres in U P and over 45 acres in Rajasthan. In West Bengal, an increase in land revenue by Rs 1 crore is ascribed to land reform measures.

In looking at the trends in land revenue, however, we must bear in mind two factors. Firstly, devolutions of land revenue are made to local bodies in practically all the States but the manner of its devolution and its exhibition in accounts may vary from State to State. Secondly, local bodies are given powers in many States to levy surcharges on land revenue. For example, in Madras local bodies levy on the average a surcharge of 25 per cent on the basic land revenue. So in assessing the increase in land taxation, we can get a total picture only by taking into account the financial interrelations with local bodies.

Agricultural Income Tax

It is in this context that agricultural income tax assumes greater significance even if it does not result in very considerable increases in revenue (though the revision of the composition rates may itself increase the receipts to some extent). The Taxation Enquiry Commission had recommended the levy and extension of scope of agricultural income tax, particularly from the point of equity. Since its report, however, there have been increases in land tax as well as levy of surcharge by local bodies, both taking the form of flat increases over land revenue. The result is that land taxation is apt to be more regressive now. An examination of the agricultural income tax system with a view to redress this tendency is therefore called for. Economic development is well known to require a measure of redistribution of income from the agricultural sector and hence an examination of the taxation of agriculture with reference to the development strategy applicable to India is essential.

Related to land are the revenues from stamps and registration. They have shown a measure of buoyancy in the last decade, due mainly to land reform measures. In the Third Plan period so far, all States except Andhra, Bihar, Jammu and Kashmir, Madhya Pradesh and Uttar Pradesh have effected straight forward or differential increases in the rates of stamp duty. It is well known that in this sphere there is a certain amount of leakage of revenue due to undervaluation and it is therefore significant that Rajasthan has proposed to take measures to check evasion. Registration fees have been stepped up in West Bengal, Orissa and Madras.

Taxation of Urban Land

Another feature of land taxation that ought to become increasingly important is taxation of urban land. Increasing urbanisation lends scope for this taxation which however seems to be lagging behind its potentialities. In the Third Plan period, Andhra, Assam, Madras, Mysore, Orissa and Uttar Pradesh have introduced this taxation. Jammu and Kashmir has levied a tax on property of commercial establishments and Rajasthan has imposed a tax on vacant

Table 1: Tax Revenue Raised by States

(Rs crores)

	Average in First Plan	Average in Second Plan	Average for Four Years of Third Plan
Land Revenue	65.81	92.91	113.00

Total	*17.33*	*38.41***	*37.00*	*6.62*

* Including those for which break-ups are not available.

** Subsequent modifications resulted in a loss of 1.63.

*** There were changes in Agricultural Income Tax in Assam, Mysore and Jammu and Kashmir but no break-ups are available.

* The old settlement procedures in land revenue do not recognise improvements made by the farmer for purposes of taxation and do not also in practice fully take into account the profitability of raising particular crops.

lands and a development fee. Gujarat, besides stepping up non-agricultural assessment and having 50 per cent higher rates for vacant plots, seems to have taken a step ahead by withdrawing exemption from assessment for lands in village sites adjacent to towns with a population of over 5,000. Bihar, West Bengal and Punjab which all contain increasing areas of urbanisation do not appear to have taken any steps towards taxation of urban land.

The figures relating to this form of taxation are not encouraging and this may be partly due to the manner of exhibition of these figures in the accounts and partly due to the time taken to put the scheme on the field and begin collection. There is no doubt however that this can be and ought to be an increasingly important form of taxation. Here again, the financial interrelationships between the state governments and the local bodies come into play. Taxation of urban property, whether regularly or at the time of transfer, comes into competition with property taxation by municipal authorities and the Taxation Enquiry Commission had recommended that the urban immovable property tax should be progressively reduced by the States levying the tax as and when and to the extent the municipality concerned raises the rate of its tax. Recognising this, Gujarat decided to discontinue the tax in Ahmedabad, the corporation having agreed to raise the property tax with effect from the same date. Likewise, Maharashtra proposed to transfer the proceeds of this tax to the local bodies and did not take credit in the budget for receipts under this tax.

There is obviously more than one solution to this problem and the solution actually chosen in each State depends on local conditions. The possible solutions are: (1) The entire field of taxation of urban property can be left to the local bodies; (2) The State government can levy uniform rates, collect them and hand them over to the local bodies; (3) The State government may levy, collect and appropriate the tax and give an equivalent amount of grants to local bodies, introducing a measure of equalisation in the process; and (4) The State government may levy such taxes and not accept any correlation at all to municipal taxable capacity or grant-in-aid. Suffice it to say that this question brings into play the entire gamut of State-local relations and the need to achieve a purposeful parity between functions and finances in local bodies.

Motor Vehicles Taxation

We may now turn to motor vehicles taxation, including taxes on fares and freights as well as motor spirits. This is becoming a fertile field of taxation, as already stated. The following are the major trends in this regard: (1) Taking the field of motor vehicles taxation as a whole, Bihar, Mysore and U P are the only States that have not substantially resorted to it. (2) Diversification or enhancement in motor spirits taxation. U P and Rajasthan brought diesel oil within the purview of this taxation, following the example of other States. Assam, Gujarat, Madhya Pradesh, Maharashtra and Orissa have stepped up the rates. The rates, of course, vary from State to State but the sales tax on motor spirit has now reached as much as 12 nP per litre in Gujarat. (3) Introduction, diversification or enhancement of the tax on passenger fares and freights. Assam Kerala, Orissa and Gujarat belong to the first two categories, while many other States have increased the rates. Here again there is an inter-State spiral. The tax is now as high as 25 per cent on fares in Punjab and 10 per cent on freights in Rajasthan. Maharashtra has levied a tax on goods carried by private carriers in addition to the more usual tax on goods carried by public carriers. (4) There were increases in motor vehicles tax proper in all States except Bihar, Mysore, Orissa and U P. Madras has introduced some refinements in the motor vehicles tax by relating the tax substantially to the daily mileage of passenger buses and laden weight of public carriers.

Reliance on Sales Tax

The importance of sales tax as the *prima donna* in State finances is too well known to need emphasis. We shall confine ourselves here to the directions in which the revenue from this source is sought to be increased: (1) There is a greater consciousness of the need to check evasion as evidenced by the steps taken by Kerala, Rajasthan, U P and Madras. (U P took credit for Rs 1.5 crores for 'adjustments and tightening' of sales tax. (2) Increase in the sales tax on luxury goods to 10

Table 3: Tax Revenue Raised by States in Third Plan

* As explained in the text, taxation to the extent of Rs 1 crore is reported to have been made in 1962-63.

** No details are available, though there was some taxation. Presumably the sum of 1.13 needed to tally the total was shared by U P and Bihar.

per cent in pursuance of the decision of the Finance Ministers' Conference in February, 1963. (3) Adjustments made in sales taxation to correspond to the inter-State rate of 2 per cent e g, Madras which increased the sales tax on cotton, cotton yarn, cotton waste, etc, to 2 per cent and Gujarat. (4) Increasing tendency to tax food grains and cereals, as in Kerala, Madhya Pradesh, Orissa and Rajasthan. (5) Inclusion of the Central Government within the scope of definition of 'Dealer' for the purpose of levy of sales tax, in Maharashtra. (6) Though comparisons are difficult and require to be made cautiously, relatively high increases in rates of General Sales Tax in certain states. Punjao increased its general sales tax from 4 per cent to 5 per cent and then to 6 per cent.

There is obviously need for tightening of evasion and for interflow of information and research on sales tax. The question also arises whether there is not need for an all-India survey of the structure of sales tax as well as the procedures in various States. This will throw up a wealth of material conducive to rationalisation in individual States.

We may now briefly refer to the position in respect of other taxes. One feature is the increasing exploitation of State excise after a period of stagnation. This trend is, however, confined to a few States only. Andhra and Uttar Pradesh have proposed to get sizable revenues from this source, the former by the reorganisation and tightening of neera shops (Rs 3 crores) and the latter by changes in vend fees and rate of duty on country spirit and rum (Rs 1 crore). On the side of entertainment taxes, there have been marginal increases in many States, though it is not clear whether the limits of taxable capacity have been reached under this source.

The imposition of electricity duties or taxes on consumption of electricity is probably the most important development in State finances during these years. It has been largely resorted to though it is only in Madras that it seems designed to fetch considerable revenue. Lack of information prevents an examination of this question in detail but if a guess may be hazarded, it looks as if in many States only electricity duties, i e, duties on sales by electricity companies, seems to be levied. But it is the tax on consumption of electricity including the electricity sold by State boards that will fetch large revenues. Such a tax deserves to be widely adopted, for it will be a growing revenue in the context of increasing generation of electricity. Moreover, carefully and differentially applied, it is not a burdensome form of taxation.

New Taxes

New forms of taxation adopted during this period are (1) Tax on state trading in kendu leaves in Orissa (2) Tax on certain forms of advertisement in Rajasthan (3) Tax on purchase of cows and shebuffaloes for disposal outside the State in Rajasthan, and (4) A total on new roads and bridges in Orissa. (No uniform policy seems to be adopted by the States in this regard.) These are, of course, taxes of limited application and very limited potential.

We may refer briefly to the non-tax measures taken: (1) Imposition of fees in all classes above primary stage in Punjab. Kerala proposed a similar measure but withdrew it. Kerala, however, increased the admission and tuition fees in colleges. (2) State trading in kendu leaves in Madhya Pradesh and Orissa. (3) Increase in state transport fares in Kerala and Madras. (4) Rationalisation of rates of royalty on timber in Assam and increase in rates of royalty on minerals in Madhya Pradesh and Rajasthan. Madhya Pradesh in particular seems to have taken up the question of royalties, grazing and mining rules, etc, in detail. The royalties on minerals would require to be looked into by all the States, for the mineral rules were framed long back and may not be quite appropriate now.

III

What conclusions can we draw from this brief and cursory survey?

This survey shows at once the limitations as well as possiblities of additional taxation by State Governments. It also points to the need for collecting information on the tax structures in different States as a measure for inter-State information and rationalisation. A comprehensive enquiry into State finances would be valuable. This apart, there are two sets of broad trends which may be touched upon briefly.

The first set of considerations relates to the short term trends in Central-State fiscal relations. Even though the additional taxation by State Governments has been below the target set in the Plan, State tax and non-tax resources have been able to hold their own relatively to central resources—*vide*, for example, the following statement in the *Bulletin* of the Reserve Bank of India: "Despite a significant addition to the States' share of the divisible pool of taxes consequent upon larger allocation recommended by the Third Finance Commission, as well as the step-up in the tax rates by the centre, the shared taxes in States' tax receipts which had risen from 21 per cent in

* Tax revenue raised by States.

1955-56 to 27 per cent in 1960-61, have tended to remain more or less at the same level (27 per cent to 28 per cent) during the Third Plan period. A factor explaining this trend is the buoyancy in states' tax revenue and the levy of sizable additional taxation by States during 1962-63 and 1963-64. (*Bulletin*, May 1964, p 581.) Likewise, the total resources transferred from Centre to States, that is, shared taxes, grants and loans, have remained fairly stable as a percentage of the total expenditure of States (Table 5.). It would, however, be rash to draw any general conclusions on Central-State relations from these figures, because (1) they reflect very short term trends and (2) towards the end of each plan period there is a likelihood of increase in central resources, as more plan schemes are implemented and arrears of shared taxes and grants are also also paid.

The other set of conclusions relates to the parallel trends in expenditure. The average revenue expenditure of States in each plan period is shown in Table 6, with the average tax revenues raised by States shown in brackets under the total for non-development expenditure. The results, for our purpose, are clear. The balance from current revenues raised by the States over non-development expenditure has not risen appreciably (as a percentage it seems to decline) due to the substantial growth in non-development expenditure, particularly in debt-servicing. We are not concerned here with the other implications of the Table.

Indian Mining Association

Mr Bhaskar Mitter's Call for Fresh Approach to Vitalise Coal Industry

THE following is the speech delivered by Mr Bhaskar Mitter, Chairman, Indian Mining Association, at the Annual General Meeting held on March 16, 1965, at the Bengal Chamber of Commerce and Industry:

GENTLEMEN

I would like to begin the proceedings of this Annual Meeting by paying homage to our late Prime Minister, Jawaharlal Nehru. It is difficult for me to speak of him with restraint, for to me, he was not only a great leader, but also a friend of our family. It is rarely that one sees embodied in one personality such an unique combination of great qualities —I refer to his zest for life, his grasp of affairs, his intellectual affluence, his concern for the individual, and his solicitude for the neglected and the forgotten. He articulated the hopes and aspirations of mankind, transcending national frontiers, and reaching to the far corners of the world. Perhaps the best way to honour his memory is to dedicate ourselves to the great ideals which animated him.

Gentlemen, would you please rise and stand in silence in his memory?

Since we last met, Sri Sanjiva Reddy has assumed charge of the Ministry of Steel & Mines. He brings with him into his new office great ability, and a wealth of administrative experience. Coal is not an unfamiliar subject to him, since he has been closely associated with the working of the Singareni mines in Andhra. We offer him our felicitations, and also our co-operation in the joint endeavours which will have to be made to build up a virile, and greatly expanded coal industry, of which the country as a whole may be proud.

Focus on Fourth Plan

Our Annual Meeting is invested this year with a special significance, for we are about to enter the last phase of the Third Plan, and our sights must accordingly be focussed on the Fourth Plan and beyond. This is the first time when we must assess again the place of coal as a source of energy in our country; estimate what the requirements will be in the coming years; examine the present state of the industry; and devise measures to give it a dynamic impetus, so that it can play its full part in the progressive expansion of the Indian economy. I do not propose, therefore, to catalogue the events of the last twelve months, but rather to discuss some of the more important issues which are before us today.

Depression in Coal

With the commendable efforts that we are making to augment our resources of oil, natural gas, and nuclear energy, it is expected that these sources of power will play an increasingly important role in future. When we consider these different sources, however, we must not lose sight of the fact, that our **per capita** consumption of commercial energy in India is amongst the lowest in the world, and will, in future, have to be raised rapidly, if we are to progress as a nation. Consequently, there is ample scope for all forms of power which we can harness. Whilst in terms of percentage, the coal industry's share in the future energy pattern may be reduced, in quantitative terms of production, its contribution must progressively show impressive advances over current levels of output. In the foreseeable future, coal will remain the preponderant source of commercial energy in India, and its importance to the country's prosperity is basic. On coal's performance will largely depend the success of our national plans as a whole. It is imperative, therefore, that on the eve of the Fourth Plan, we should take a careful look at the present state of the industry. When I talk of the coal industry, I must of course make it clear that I refer primarily to the Private Sector, although most of the issues have application to the Public Sector as well.

Widespread through the industry today there is an air of depression caused by two principal factors — a slump in demand, and a price structure which denies an adequate return.

Slump in Demand

Dealing first with demand, the Third Plan opened on a note of hope and enthusiasm. The target of production for industry was placed at 97 million tonnes — an appreciable increase over the actual production of 56 at the end of the Second Plan. It was authoritatively stated that the country would require the whole 97 million, and, in fact, in order to ensure that the economy did not falter for lack of coal, the industry was asked to create capacity for a total of 104 million tonnes. The plans were laid, a frantic search for finance ensued to match the handsome World Bank loan, to meet foreign exchange requirements, and investments were made on a massive scale. There was hard work at hand, but there was also a quickening of the pulse, for we were participating in a great nation building effort. By the summer of 1963, however, these early hopes began to fade, and it was not long before it was realised that, owing to a combination of various circumstances outside the realm of the coal industry, the tempo of the country's economic growth had slowed down considerably. The Planning Commission's mid-term reappraisal recognised this trend, and thought that a total demand of more than 90 million tonnes would not mature. Since then the rethinking has gone further, and the latest indications are that about 70 million would suffice. This is a far cry from the trumpet call of 97! No useful purpose will be served by indulging in any recrimination over this distortion in the original target, which may have been largely due to unforeseen factors affecting the entire economy. The fact cannot be shirked, however, that the coal industry has been hit badly by this colossal gap between anticipation and reality.

Within the overall figure, the Private Sector entered the Third Plan with a target of 62 million tonnes — an additional 17 over its level of production at the end of the Second Plan. But, currently, it is raising an extra 6

million tonnes only, and this is meeting the demand. If we exclude from this, the additional 2 million which have been contributed by units outside the Plan, in relation to the planned target, the increase required has been only some 4 million tonnes, or less than 25% of the original expectation. To help attain its allotted goal, the Private Sector has invested, under great strain, something over 25 crores during the last three years, and an investment on this scale would have been hardly contemplated if it were known that the extra demand in the current Plan would be so limited. When one considers these facts, it is not surprising that a sense of malaise grips the industry.

Inadequate Price

The other primary cause of this feeling is the inadequacy of the present price structure to make the industry the vital instrument of progress that it should be. This structure is based on the Report of the Coal Prices Revision Committee, which was accepted by Government in 1959. Two of the main conclusions of the Report were that the coal industry should have a notional sum of Rs 1.70 per tonne available to it as an item of expense for depreciation and development. In addition, a gross profit of Rs 1.75 per tonne was considered a fair return. The Committee felt that, if the industry could have these two built-in elements in its prices, it should be in a reasonably healthy state. In practices, the organised section of the industry, which accounts for the bulk of the production, is today unable to get either return as envisaged in the Report. Squeezed between mounting costs and low prices, this section is running into the red, with an available margin inadequate to conserve funds for expansion, and at the same time give a fair return to investors.

The provision of even working capital is becoming increasingly difficult. Between March 1963 and January this year, wages have been raised by some Rs 25 per worker per month. On an average employment of 4,35,000 persons, the industry has to provide an additional Rs 13 crores per year on this account alone. There are also vast sums owing from the Coal Board, which are usually paid long after they fall due. The problem will escalate further if the industry is called upon to meet additional obligations, such as, the contemplated Payment of Bonus Act, the final Wage Board Award, and the threatened imposition by State Governments of increased royalties. The depressed state of the capital market, recently ennanced import duties, restricitons on bank credits, and increase in bank rates, make the task of having adequate finance no easier.

It is not surprising, therefore, that coal is generally regarded today as one of the least inviting fields for new investments. Coal counters in stock markets are among the most neglected, and there is at present little stir over coal in the centres of finance, which attract all the growing, vibrant industries. Even the President of the Coal Consumers Association thought fit to open his presidential address not long ago with the words "The cauldron of coal problems is on the boil..."!

This, then, is the broad picture as we move nearer to the Fourth Plan. Obviously, a situation like this cannot be allowed to fester in a vital sector of our economy.

In regard to the slump in demand, it is anticipated that as the economy begins to grow faster, the present maladies might be gradually overcome. I naturally share these expectations, but there are some aspects of the Fourth Plan to which I must draw attention.

Demand Overestimated

The present indications are that the coal target for the next Plan will be 125 million tonnes, and the tentative allocations between the two Sectors are 72 to the Private, and 53 to the Public. Whilst the overall figure of 125 million appears impressive, I would like to sound a note of caution, having regard to our sad experience in the current Plan. If, as appears likely, a total production of something like 70 million tonnes will suffice for the country's requirements at the end of the current Plan, it would seem that the needs of the Fourth Plan may have been overestimated.

Taking one instance, the present offtake for power generation is about 8 million tonnes including middlings. The next Plan assesses this demand to shoot up to over 30 million tonnes! Whilst the authorities must have access to more precise information than we have, it seems difficult to visualise that coal-based power stations will, within the space of six years, increase their requirements to nearly four times their present needs. A World Bank study team suggested that a total of 110 million tonnes might be a more realistic goal. I would commend a very careful reappraisal of the position, so that we may avoid the quicksands of misleading hopes.

Individual Targets

Within the total figure of 125 million tonnes, if we look at the individual targets of different types of coal, further problems present themselves. In regard to coking coals, the Private Sector is expected to raise its output from the current level of some 14 million tonnes, to nearly 26 million. This poses a formidable challenge, since a substantial portion of this Sector's contribution must come from depillaring with stowing, and from vertical development in depth. It will require a fresh input of capital on an impressive scale. Again, as stowing must play a significant part, sufficiency of sand supplies will have to be ensured. The bulk of coking coal production moreover will have to be washed, and if washing capacity, and the expansion in steel, does not keep pace with increased production of coking coals, the industry's investments might be rendered largely sterile.

In the area of non-coking coals, the extra production required from the Private Sector is some 6 million tonnes over last year's level of 37 million. In this context, it should not be forgotten that this sector had been asked to create capacity during the current Plan for 47 million tonnes, and this has been largely accomplished. Consequently, it will be required to wait till after the end of the Fourth Plan, before offtake approaches the level anticipated for 1965/66.

A curious and, at the same time, unfortunate position is thus reached, in that the Private Sector's heavy investments in non-coking coals will have to mark time before earning the returns originally expected during the Third Plan, whilst vast new investments will be needed in coking coals, with the uncertainties I have mentioned.

The particular situation in the outlying fields must also be seen from another angle. Two years ago, producers were asked to step up output mainly to meet the requirements of Western India. Plans for increasing raisings of even Grade III coals were approved, though further production of this grade was not wanted in Bengal and Bihar. Mineowners in Madhya Pradesh went to great expense in meeting Government's request to develop additional capacity. They, too,

looked forward to a period of further expansion and much needed relief, but they are now informed that no extra coal will be required from them in the Fourth Plan.

Thus, whilst the next Plan with its new urges, holds out the promise of a gradual elimination of the present slump in demand, its detailed projections have brought in their wake major problems to be contended with. Whatever the ultimate size of the Plan for coal, it is manifest that the coal industry will have to discharge a heavy responsibility to make it a success, and this underlines the compulsions of creating a climate in which that industry can realise its full potential.

When discussing the inadequacies of the present price structure, I am fully conscious of the great national problem of checking inflation. Within the imperatives of this overall necessity, however, thought has to be given as to whether it is not desirable to make the prices of some basic things correspond to the realities of costs, so that the vital industries may grow and service the general economy. Presumably it is thinking on these lines that leads to periodic increases in such things as railway freights and electric power charges. Coal prices should not be excluded from this process.

Modern and Viable Industry

It is only a modern and viable coal industry that can, in times to come, stabilise coal prices to the consumer. In Britain, the price of coal had to be raised many times between nationalisation in 1946 and 1962. Huge investments for modernisation of mines have been made, and it is only now, as a consequence of this, that the National Coal Board has been able to stabilise prices. In the USA and Australia, it has been possible to reduce coal prices, but only because in those countries productivity has shown striking advances. In India, productivity remains pitiably low, and I shall refer to this again later.

Undoubtedly, the long term objective of our coal industry must also be stabilisation of prices, but to achieve this, it has to be financially strong. Because coal has been a relatively cheap commodity, inadequate attention is paid by most consumers to efficiency in fuel consumption. Fuel technology is now an advanced science in most developed countries, and it is time that here, also, the importance of this was fully realised. I believe that despite advances in coal prices, industrial costs could be maintained, if not reduced, if greater care is paid to avoiding waste in the use of fuel.

The fear of excessive profits accruing to some units in the industry through an increase in prices should not restrict official policy, as Government have many weapons in their armoury to mop up unhealthy gains. The word 'profit' often conjures up visions of something undesirable. There is no reason why this should be so. We must distinguish clearly between 'profit' and 'profiteering'. No one can support 'profiteering', and we condemn it in unequivocal terms. But profits are not only desirable, but essential, for vitality. It has been said quite rightly that profits are the sinews of growth, and a basic industry like coal must have adequate profits for sustenance and growth. I would submit that a thorough review of the pricing policy in coal has now become an urgent necessity, not only to meet today's needs but also to finance future expansion.

Stowing

Linked to the vital question of adequate prices, is the subject of costs incurred in stowing for safety and conservation. The Coal Prices Revision Committee, realising the importance of stowing to national interest, recommended that its cost should be neutralised in full, subject to an overall ceiling, and the recommendation was accepted. The stowing cess was increased suitably to finance this concept, and it was hoped that those units, which had undertaken this work at considerable expense, would get some much needed relief. However, in implementing the scheme, the Coal Board introduced a complex system of sub-ceilings of assistance under various heads, and arbitrary norms, which have largely eroded the fundamental concept of neutralising these costs. Thus, coal companies have today to incur very substantial losses in the process of stowing. This financial haemorrhage should be stemmed without delay. Then again those producers, who gather and stow sand in accordance with modern technological processes, qualify for less assistance than those who carry on under more primitive conditions. It is surprising that there should be a premium on obsolescence.

Since stowing will have to be extended on a much wider scale in future, I would suggest that both the outlook in giving assistance for stowing, as well as the cumbrous procedures which flow from that outlook, are overhauled with expedition. Then, only, can Government's policy to encourage stowing be fulfilled.

Subsidy Scheme Needs Review

With the gigantic strides in modern technology, the days of shallow pits, where the pick and shovel were the symbols of mechanical sophistication, are fast ending everywhere. They are being replaced by modern units, mining with the aid of the latest techniques that science has to offer. Indeed, if our coal industry is to meet the challenge of the future, it will have to dig deep, and to contend increasingly with the hazards of the dark depths — gas, water and the various geological obstacles, which have to be overcome before the earth will yield up her treasures. One of the necessary corollaries of working at depth, and under difficult conditions, is the question of abnormal costs, and it is recognised that production under such conditions should be subsidised. The subsidy scheme, introduced for this purpose in 1960, however, bears little relation to the actual costs of today, and an urgent review is called for.

As in the case of the stowing subsidy, so with this one for difficult mining, not only is the assistance given inadequate, but the inadequacy is magnified greatly by the long delays which occur in giving it. The prescribed procedures are pedestrian and deny prompt relief. There is a well known principle of jurisprudence that justice delayed is justice denied, and I would urge the authorities to have the process streamlined at the earliest opportunity, so that the policy of Government to give relief in certain circumstances is not enmeshed in a tangle of unnecessary red tape. Another factor which causes delay is, I believe, the lack of funds with the Coal Board. It is indeed regrettable that such a responsible body should not have adequate funds available for the proper discharge of its duties.

Apart from coal prices and subsidies, there is the important question of foreign exchange, which must be considered. At the start of the Third Plan, substantial foreign exchange facilities were organised for the coal industry through the World Bank. The industry has not yet been able to utilise these facilities in full, and this has been commented upon in some

quarters. At a time when the entire country is desperately short of foreign exchange, it is indeed paradoxical that coal should have been unable to take full advantage of the facilities offered. For the answer to this paradox, however, one has to look to the dimensions of the slump to which I have already referred. Indeed, having regard to the conditions prevailing in the industry during the last 18 months or so, I am surprised that it has been able to use as much as Rs 15 crores against a total allocation of Rs 16.5 crores. The incapacity of the coal industry to utilise fully these facilities should not preclude, in any way, the making of suitable arrangements for future foreign exchange requirements in the context of the new capital investments that will be needed.

Rail Transport

I cannot recall any speech at such a meeting, which has not referred to rail transport, with which the fortunes of coal have been traditionally intertwined. I remember when I occupied this chair about a decade ago, a very considerable portion of our time and effort was taken up in dealing with problems arising from a shortage of rail capacity. Today, I am happy to say, the position has improved, but I hope that this will not generate any sense of complacency on the part of the Railways. When the economy recovers its momentum, as it must do, if capacity is again unable to keep up with demand, then we may face a similar bottleneck as was experienced at the end of the Second Plan.

While I commend the general performance of the Railways, there are still areas of dislocation, such as the periodic shortage of four wheelers and, more recently, of even BOX wagons. When wagon supplies are erratic, coal has to be stacked at colliery sidings, which not only involves heavy handling costs, but also results in deterioration in its properties. This important matter has unfortunately not received the attention it warrants. Apart from the risk of spontaneous combustion due to oxidisation, of all the properties of coal, the coking property is possibly the most rapidly affected through storage. It has still to be fully appreciated that the interests of the producers and consumers of coal cannot always be subjected to the convenience of the Railways alone.

While discussing rail transport, we must not be oblivious to the need for developing roads, particularly the feeder roads in the coal-fields. Little has been done yet to improve them, and early action is called for. We had hoped that the Durgapur Expressway would have been nearing completion by now, but progress has been most disappointing. Traffic on the Grand Trunk Road has exceeded saturation point, and this venerable highway, originally aligned by the Emperor Sher Shah, can hardly be expected to cope indefinitely with modern twentieth century traffic. I trust that this much needed Expressway will be commissioned soon.

In common with the strenuous efforts being made throughout the country to promote exports, the time has come for a new drive to stimulate the export of coal. Our outlets today are virtually confined to Pakistan, Burma and Nepal. India has lost traditional markets like Ceylon mainly due to vacillating attitudes in the past. Official policy, over the last six years, has favoured, at different times, a general ban, partial relaxations, and somewhat grudging releases of coal, subject to various restrictions regarding the qualities that could be shipped. No country can hope to establish its exports overseas, and to sustain them, by such myopic measures. What is required is a well defined long term policy, not subject to violent fluctuations, and having as its inspiration the establishment of a steady export outlet for Indian coals. I therefore welcome the setting up recently of a Study Group to go into this matter under the chairmanship of Dr P S Lokanathan. I hope that its work will help India not only to recapture her traditional markets but also to establish markets in new areas as well.

Deterioration in Quality

This brings me to the question of quality, and the complaints, which are heard periodically about the deterioration in coal supplies. When considering this issue, two basic facts must be appreciated. The first is that coal is not a manufactured product, and, therefore, there is no question of inferior ingredients being deliberately used in producing it. The industry can only raise and despatch what nature has bestowed underground in our country. The second is that raw coal is not a highly standardised commodity. Nature has not worked to any standard specifications when laying down our coal seams. Consequently, quality is apt to vary a little and cannot be completely uniform.

If consumers require better coals than the country is endowed with, or completely uniform quality, as in manufactured goods produced under controlled conditions, then the answer must lie in washing on a massive scale. They must, in that event, be prepared to pay greatly increased prices. The only alternative to washing would be to import coals of better intrinsic quality from other countries. At a time when we are going through an acute foreign exchange crisis, the wisdom of adopting such a policy is open to serious doubt.

Royalties to States

I must refer now to an entirely different subject — Royalties. Both the State Governments of West Bengal and Bihar have recently amended the West Bengal Estates Acquisition Act and the Bihar Land Reforms Act. Under these amendments, the intermediary royalty receiving rights in both States have been abrogated. In West Bengal, an earlier attempt to vest these rights retrospectively in the State Government resulted in complex litigation. We have recently been having several meetings with the Finance Minister of West Bengal, and I welcome the initiative shown by him in trying to evolve a fair solution to this long standing dispute. On our part, we have submitted concrete proposals, and I would like to assure him of our full co-operation in finding an equitable compromise.

In Bihar, intermediary royalty receiving rights vested in the State with effect from October last, and the unfortunate experience of West Bengal has been avoided. We are, however, concerned with the Bihar Chief Minister's recent proposal to increase the rate of royalty from 2½% to 5% of the F O R selling prices. Despite the acute financial position of the industry, a feeling appears to persist in some States that the coal mining industry has an unlimited source of funds, which can be constantly tapped to augment their resources. This feeling hardly corresponds to facts. We are already contributing substantially to their revenues by way of royalties, cesses, taxes and other impositions, and if they wish to increase their income, State Governments should turn to other and more affluent sources.

We have been giving careful consideration to the proposed Bill for Amalgamation of Collieries. This Association does not oppose the principle of amalgamation to weld together small coal producing units, so that large viable units can be formed, capable of using the modern processes of production so important to our future. In a basic industry like coal there is no particular virtue in being small and primitive. It is sometimes suggested that amalgamation would help the growth of monopolies and foreign interests. A careful scrutiny of the industry's structure will show that such fears have no foundation whatsoever. The draft Bill as circulated, however, is unlikely to achieve the end in view. Its provisions are so sweeping, that if it is enacted in its present form, the entire infra-structure of the organised section of the industry may well be dislocated. This is a grim prospect, the consequences of which should be seriously pondered. In the years that lie ahead, this section will have to produce vastly increased supplies of coal, particularly coals of the higher grades, to sustain our steel industry, other essential consumers, and our drive for exports. The present provisions of the Bill can seriously prejudice all this. We are in consultation with Government, and I hope that our views will be given mature consideration before anything drastic is done.

Safety in Mining

We have been concerned also with the proposed Payment of Bonus Bill. The fundamental concepts of this measure, and its provisions, have been debated widely throughout the country. The coal industry has been paying a statutory attendance bonus since 1948, and now, in addition to this, we are called upon to meet a new burden not necessarily related to either efficiency or prosperity. This might well introduce a potential area of disputes where none had existed before. It will also involve a further financial strain on this already debilitated industry, and I trust the means will be given to it to meet the additional charges, for which there is no capacity within the present rigid price structure.

Safety in mining continues to receive the constant attention it warrants, and the Industrial Committee on Coal Mining last year approved several amendments to the Mines Act, which are expected to be enacted shortly. I would like in this connection to pay a tribute to the Chief Inspector of Mines, Mr G S Jabbi, and his organisation, with whom we have continued our joint consultations on problems of mutual concern. I firmly believe that it is only by maintaining these close contacts shall we be able to appreciate each other's points of view, and attain that difficult balance of ensuring safety, which we all naturally desire, without impairing the interests of production — particularly production at economic cost.

As in all forms of industrial enterprise, success in this industry also depends on the joint endeavours of management and labour, and I am glad to say that by and large we have worked in harmony.

Productivity

I appeared on behalf of employers before the Wage Board for the Coal Mining Industry, which is now in the process of finalising its recommendations. In my submissions, I pointed out that, from about the middle of 1963, a depression had overtaken the industry and made it financially weak; that the level of wages paid in the industry today compared most favourably with those paid for similar occupations in this part of India; that, within its existing price structure, the industry did not have the capacity to sustain higher levels of remuneration; that, in the interest of production and progress, much greater mechanisation in this industry was necessary; and finally, that while we share the natural aspirations of labour for a progressively better life, ultimately the ability of the industry to meet these aspirations must depend on its own viability, and such vital factors as productivity.

Too little attention is paid to the question of productivity. In the coal industry, despite all the machines introduced in the mines in recent years, and after more than doubling the raisings from highly mechanised open cast workings, the output per man year today is only slightly in excess of what it was thirty years ago! Higher wage rates and better standards of living are necessary not only as social objectives, but also as factors of economic growth. It must be recognised, however, that one of the essential means of achieving them must be productivity. Higher wage rates, without increased productivity, are incompatible with the sustained growth of the economy.

In branches of the Mineral Industry other than coal, progress has been made during the year, though there were some disquieting features. The supply of blast furnace grade iron ore was found to be surplus as a result of the expansion of captive mines by the Steel Plants. Competition in the export market became more acute on account of increased quantities offered by new areas, particularly Australia. While the world prices continued to follow a declining trend, our costs of production, unfortunately, recorded a sharp rise, the major contributory factor being the interim wage increase granted by the Wage Board for the Iron Ore Mining Industry.

The production of limestone and dolomite has expanded in line with the requirements of the steel and cement industries. I would also mention that there has been some improvement in the manganese ore export trade since the latter half of 1964, contrary to earlier expectations. The Government have decided to discontinue the practice of allowing exports of manganese ore against barter and link arrangements from 1st January, 1965, but the results of this change have yet to be seen. The need for making our ores fully competitive in the World Market is of great significance today, and I would suggest that the industry's plea for the restoration of railway freight concessions existing before 31st March, 1963, should be conceded without further delay.

No Expenditure on Welfare

Since the inception of the Iron Ore Mines Welfare Cess Act, 1961, there has as yet been no evidence of any expenditure on welfare amenities for employees in the iron ore mines. There has been a proposal for constituting either separate welfare funds for specified mining industries, or a common fund covering all mines excluding coal, iron ore and mica. At the Fourth Session of the Industrial Committee on Mines other than Coal, it was agreed that a general law, like a Minerals Welfare Act should be enacted by the Centre to foster welfare activities on an uniform basis.

The need for modern techniques of production and management in our mines underlines the importance of fostering better collaboration between men of science and business administrators. At present there is insufficient contact, and comparatively little exchange of ideas, and I would like to make a plea for closer association between the industry and such bodies as the Central Fuel Research Institute

and the Central Mining Research Station.

In the field of training, the industry has been keen to press on with the idea mooted some time ago of sending some of our promising young engineers to Britain for advanced training, through the generous help of the National Coal Board there. We have had further discussions on this subject with Lord Robens during his last visit to India, and I hope that the scheme will be implemented soon.

In the exciting task of building up our nation, the mining industry has a pivotal role to play, but in the industry's present picture, the darker shades stand out more prominently than the brighter ones. This, then, is the time for a dispassionate survey of the problems and their causes. Shapes of things are sometimes clearer under dull skies than in the bright shimmer of a blazing sun. This, then, is the time to frame a bold strategy for advance.

Gentlemen, this morning I have discussed our problems frankly. If at times I have had to sound discordant notes, I am sure you will agree that, with our democratic traditions, it is one's duty to speak one's mind freely in a constructive endeavour to resolve our difficulties. I trust that the suggestions I have made will be carefully considered by the authorities. On the part of my Association, I can assure them of our full support in removing the roadblocks to progress.

Acknowledgments

I would like to mention here that our relations with Government have been most cordial. Whilst on specific issues our viewpoints may have differed, our deliberations have been guided by a spirit of give and take, and we have been appreciative of each other's difficulties. Both Mr N C Srivastava and Mr Chhedilal, the Secretary and Joint Secretary in the Ministry of Steel & Mines, have shown us every consideration, as have our Coal Controller and Chairman of the Coal Board, Mr A C Bose, and his staff. I must also express my appreciation of the co-operation we have received from other Ministries who have an interest in our affairs. I have no doubt that these excellent relations between this Association and Government will continue.

Gentlemen, it has been a source of great personal pleasure for me to have been associated once again from this chair with the affairs of the Indian Mining Association. Another year is behind us—a year which has had its full share of worries and cares. But we cannot allow this to dampen our determination to face the challenge of the future, and move forward to new horizons of endeavour. I would like to end by recalling the words of President Radhakrishnan: *"From the altar of the past we should take the living fire and not the dead ashes. Let us remember the past, be alive to the present, and create the future with courage in our hearts and faith in ourselves."*

On towards progress . . .

India Steamship Co., Ltd., has a steady record of progress . . . Since Independence, its tonnage has increased from about 85,000 D.W. tons to over 200,000 D.W. tons—more tonnage being still on order.

Its services are also extending to various trade routes. After initial consolidation in the India-U.K.-Continent trade—the Company entered the Indo-Soviet service to the Russian Black Sea ports in 1956 and later to Rumanian ports. In 1959 the Company forged still another link in the overseas with South America, and in 1960 it extended its service to Poland.

Their experience and reputation for fast, efficient and dependable service built on the personal care given by their experienced officers and crew to the cargo entrusted to them, have earned them the goodwill of their customers.

Sen-Raleigh Limited

Increase in Production and Export

Chairman Mr Abhijit Sen's Review

THE fifteenth Annual General Meeting of the Sen-Raleigh Limited was held at the registered office of the Company, Mercantile Buildings, Lalbazar, Calcutta-1, on 19th March 1965 at 3 P M. The following are extracts from the statement by the Chairman, Mr Abhijit Sen.

The year under review was marked by a decided improvement in the Company's production performance. In this period production of bicycles could be increased by all of 30%, whilst production of some components also showed marginal increases. It is a pity however that in no single item could the targets for the year be realised because of unpredictable failures in the supply of materials. Production programmes for bicycles suffered most heavily on this count, whilst those for hubs, saddles and pedals were also affected.

Production

The expansion programme for bicycle production referred to in my last report to you was completed on schedule, but the fullest use could be made of the increased capacity in the absence of a regular flow of materials. Bicycle production could only be maintained at the highest level that irregular material flow would allow and though the increased production achieved in the face of considerable odds has gone a long way in bringing about an improvement in the Company's operating results, these are not as good as could have been expected had materials been available to feed the expansion in full, and had prices for these materials remained at the level of the previous period.

The current financial year has opened on a much healthier note with production of bicycles and components running well ahead of that of the corresponding period last year. The material supply position so far seems to have taken a turn for the better, and should this situation prevail throughout the remaining part of this financial year, the prospects for the year would appear to be brighter than in the immediate past, and an improvement in financial results can be expected.

There is however, still little sign of a break in the pattern of sudden shortages appearing on the scene without notice and making their presence felt in the way of lost production, that no amount of planning can hope to take care of. This has an unsettling effect on production costs and it can only be hoped that with the experience gained in planning over the past decade, it would be possible for the country to come to grips with this problem and overcome it in the not too distant future. In the meantime, we can but strive to operate as near targets as is possible within the limits of an economy, in which the demand for raw materials constantly outstrips its production.

Exports

The bicycle industry produced a very much larger number of bicycles during 1964 than in the preceding year, but this in no way diminished the demand for the product. Judging from the present trends there seems to be every reason to believe that 1965 would see records established in bicycle production and sales. With larger number of bicycles on the road, and more coming out every day the demand for components and accessories grew rapidly—and indeed scarcity conditions ruled for specific items such as hubs, tyres and tubes.

The market for your Company's products—particularly in original equipment field— continued to grow in this period and the demand for more bicycles and components continues into this year. It is hoped to meet some part of this demand through increases in the production of bicycles, chains and hubs as referred to earlier in the report.

Exports of bicycles recorded a steady increase throughout last year following on a revision of the Cycle Manufacturers' Export Pool Scheme and that of granting incentives against cycle and component exports carried out at the instance of the Minister of International Trade. Bicycle exports now occupy second place amongst exports of engineering goods. Our own exports have increased steadily principally to the African and Middle-Eastern markets. Arrangements were made for display of our products at the I F M A Fair at Cologne—the first time Indian exhibits have featured in this International Bicycle Exhibition in Europe. Keen interest was evinced in the Indian products.

From my last report to you, you are aware that the bicycle industry operates under a voluntary price control. The rising trend of prices for materials and services led to a representation being preferred to the Government of India by the Cycle Manufacturers' Association for a revision of the prices of bicycles manufactured by its constituents. Your Company associated itself with this representation. The results of the representation are awaited.

In August last, the Government of West Bengal by an order under the Defence of India Rules compelled your Company, amongst other Engineering units, to increase Dearness Allowances payable to its workers. Following the imposition of this order which has raised the Dearness Allowance payable to the worker by Rs 19.80 per month between August till this day, your Company has preferred a separate representation to the Government of India in its Ministry of Industry for a revision of its selling price for bicycles. This representation is under consideration by the Government and a decision in this matter may be expected shortly.

In my report to you two years back, I had mentioned that following the passing of the Trade & Merchandise Mark Act 1958, the Company had submitted new Agreements for registration of its usership rights in respect of Trade Marks owned by its Foreign Associates for approval by the Registrar of Trade Marks. We have now received communications from the latter which would seem to suggest that we be registered as users of these Marks only for export but we operate inside India without benefit of registration. This is a situation we find untenable, and not consistent with the law as we interpret it. A representation in the matter has therefore been preferred and it is hoped it would result in reason prevailing.

Productivity and Social Benefits

The year saw the introduction of a fresh 5-Year Agreement with the Sen-Raleigh Employees' Union in which the emphasis was on productivity and improved social benefits. Fullest advantage of improved productivity could not be reaped in the face of restrictions on production, due to reasons already mentioned before. Introduction

of a Gratuity Scheme, extension of Medical Benefits till such time as E S I comes into operation in the Asansol area, and better educational and housing facilities are the important social features of the Agreement. After paying retention charges for 12 years, we do feel justified in requesting Government to look into the question of extension of E S I facilities to Asansol without any further delay, as we do not see why we should be paying out twice for the same benefit.

A Consumer Co-operative run by the employees of the Company had already been in operation at Kanyapur for some time past. When the issue of arrangements for distribution of essential commodities to workers was taken up at the Tripartite Labour Conference, this Co-operative readily agreed at our request to undertake the onerous job of serving the needs of the 15,000 odd inhabitants of Kanyapur provided it could obtain some financial assistance from the Company. This is being extended through the Company subscribing to the Share Capital of the Co-operative.

During April and May 1964, we were pleased to receive a visit from a Raleigh Consultancy Team to advise on various facets of our operation particularly on the cost saving aspect.

I would take this opportunity of recording deep appreciation of the services rendered to the Company by Mr D P Harris who has resigned from our Board and Mr R B Mathur whose nomination to the Board has been withdrawn by the Industrial Finance Corporation.

I would close by extending my thanks to my colleagues on the Board, all staff and workers of the Company, Associates and our dealers.

Note: This does not purpor tto be a record of the proceedings of the annual General Meeting.

AROUND BOMBAY MARKETS

Technical Rally

Wednesday Morning

AFTER diving to a new low early in the week, Dalal Street took a pause, turned hesitant, and later moved irregularly higher under the lead of certain selected counters. By Monday-end (March 15)—the market was unofficially closed on Tuesday—the market had regained a considerable part of the ground lost in the preceding week. But this was not because the market had come round to Finance Minister Krishnamachari's view that equity prices would rise after the actual impact of the Budget had been understood fully. The rally seems essentially technical. The decline since the presentation of the Budget had been too steep to be continued without necessary technical adjustments; the bulls had been virtually liquidated and bears had accumulated a sizable 'short' interest.

While technical considerations alone favoured a recovery, sentiment was greatly helped by encouraging corporate news which, in normal conditions, could have given a real boost to the market. Premier Construction announced a one-for-three rights issue at par along with an increase in the dividend from Rs 14 to 20 a share. The extremely conservative Bombay Dyeing raised the dividend for 1964 from Rs 3.50 to Rs 4 a share (Rs 25-paid). But the highest surprise came from National Rayon. In view of the serious labour trouble resulting in a 59-day strike lasting upto the middle of January, few had expected that National Rayon would be able to fare as well as in 1963. But the company reported a 22 per cent rise in its turnover and a 28 per cent increase in its gross profit which enabled the management to step up the dividend from Rs 16 to Rs 20 a share. Shivrajpur too has returned to the dividend list after a lapse of three years.

If the stock market has been unable to present a firm appearance despite very pleasing corporate news, it is because of the general feeling that the average yield on equities which has now come up to around 7.5 per cent is still unattractive compared to the yield on preference shares and debentures and the interest rates offered by numerous companies for short and medium-term deposits received from the public. Equities are known to have yielded much less than debentures and preference shares and the spread has often been wider in the past than at present. If equities have lost most of their charm it is mainly because the general economic climate has seriously affected the prospects for capital appreciation and the volume of speculative activity on the stock exchange has been steadily shrinking. So long as the emphasis continues to be on yield, the stock market will find it hard to resist a further decline in order to bring about the required improvement in equity yields. Unless the interest rates are raised still higher, investors should feel reasonably satisfied with an averaged yield of 8 to 8.5 per cent. If the authorities are really keen on an early revival of the capital market, the least that they can do is to remove the dividend tax and the capital gains tax on bonus shares which can considerably help market psychology without any significant loss of revenue to the exchequer. There is not much substance in the official contention that the dividend tax is intended to discourage frittering away of corporate profits.

No Mystery

Brief mention seems necessary of what the chairman of the Company Law Board, Shri R C Dutt, stated in his address to the members of the Madras Stock Exchange. Shri Dutta is reported to have pointed out that business in the stock markets would pick up only when the "mystery" surrounding the activities of the companies and stock exchanges was removed. He has advised companies and stock exchanges to go out of their way to "woo" the investors by "fully and frankly" disclosing their activities. That stock brokers and the market authorities are doing very little to educate the clientele and to attract prospective investors may be conceded. But surely, no great "mystery" surrounds the activities of the stock exchanges. The stock market, in fact, receives much more attention than commodities from the Financial Press in the country. Shri Dutt's criticism that the "restricted annual reports that were now published (by companies) were not fully informative" will be widely endorsed. But, being the chairman of the Company Law Board, Shri Dutt would do well to address these remarks to himself and pay his utmost attention to how best the companies can be made to give maximum publicity to their practices and transactions.

COTTON

Cambodia Controversy

WHILE consumption continues to be well maintained at a high level, activity in the cotton market has shrunk to modest proportions. Quite a number of mills are reported to be reluctant to take delivery of cotton even after obtaining the purchase authorisation and the relevant certificates from the Indian Cotton Mills' Federation. This, however, is scarcely surprising. Faced with acute financial stringency and somewhat poorer off-take of cloth, it is only natural that mills should be going slow with fresh purchases. But the supply position of cotton being what it is, the slackness in mill buying should pose no problem.

Reduced spinner inquiry has imparted an easier tendency to the market but still most varieties are quoted above the ceilings. If price control has any meaning then the decline in unofficial premiums should be welcomed rather than regretted. In fact, growers and traders have little to worry about any possible decline in prices as the Indian Cotton Mills' Federation has already given an undertaking that it will be always willing to take up any cotton that is offered to it during the season at 5 per cent below the appropriate ceilings.

The Federation has recently reiterated that it firmly stands by its original commitment to purchase all the cotton offered to it. The need for such an assurance arose following the offer of several lots of Cambodia cotton. Market reports indicate that not all the Cambodia cotton offered by the trade has been accepted by the Federation. This is said to be due mainly to dispute over prices arising from the determination of appropriate ceilings. The Federation is said to insist that the offer to sell should be firm and that the verdict of the East India Cotton Association's sworn surveyors should be final in regard to the quality of cotton for the determination of appropriate ceilings. The trade wants the Textile Commissioner's Ad Hoc Committee's verdict to be final and then again it wishes to have the option whether to sell the cotton or not. It is really unfortunate that the trade should not be satisfied with the verdict of EICA sworn surveyers who are known to enjoy very high reputation in all respects. And if the trade is really keen on disposing of its cotton there is no reason why its offer should not be a firm one, especially when the Federation has given an undertaking to purchase all the cotton offered to it at 5 per cent below the appropriate ceilings.

The controversy about Cambodia cotton seems to have arisen mainly because of its rather poor quality. The general feeling in market circles is that Cambodia cotton this season has a poor spinning value and that this is the chief reason why its prices have suffered a bigger decline than other varieties. If the trade is satisfied with the quality of this cotton and it is also anxious to dispose it of, it does not have to sell the cotton at 5 per cent below the ceiling prices. It can realise much better prices by tendering this cotton against the maturing March hedge contract. The trade is not unaware of this facility; if it does not care to avail of it this must be because it does not wish to take the risk of survey by the E I C A.

OILSEEDS

Oil Exports — When and How

WITH the arrivals of the first consignment of a little over 5,000 tonnes of soyabean oil from the U S, speculation about the export policy for vegetable non-essential oils has gained considerable currency recently. All the 30,000 tonnes of soyabean oil for which purchase authorisation has already been issued are likely to reach India by the end of April. When the remaining 45,000 tonnes will be received is uncertain. In addition to 75,000 tonnes of soyabean oil for the vanaspati industry, 50,000 tonnes of mutton tallow are being imported for soap manufacturers in order relieve the pressure on edible oils. Moreover, the Government has also arranged for the import of 25,000 tonnes of rapeseeds. All these imports will considerably augment the domestic supply of vegetable oils and, fortunately, domestic production of oilseeds is much better than in the previous season.

Whether exports of vegetable non-essential oils, especially groundnut oil, should be allowed or not is a moot point. According to well-informed sources, however, the Government of India has only been waiting for the arrival of soyabean oil for lifting the ban, which had been imposed early in July 1964, on the export of vegetable non-essential oils. Reports are that New Delhi has virtually decided to permit free export of vanaspati and also release in the first instance, 35,000 tonnes of groundnut oil for export. The Government is said to be waiting simply for a suitable opportunity for making official announcement to that effect.

Improved supply position apart, the question of export of oils has gained importance because of the pressing need for importing copra in adequate quantity for meeting the requirements of the soap industry. The difficulty in taking a quick decision on the export policy arises from the fear of its likely effect on domestic prices of edible oils. Internal prices are highly sensitive to exports. But if exports have been having an exaggerated effect on internal prices it is mainly due to lack of a well thought-out policy for exports. That Exports have to be subsidised in one form or another so long as domestic prices keep well above world parity will be readily conceded. The important point is how to keep the cost of subsidy at the minimum. In the past, insufficient attention has been paid to a proper study of the price trends here and abroad and incentives have not been carefully thought out. If the Government wishes to effect substantial exports without unduly pushing up domestic prices it would be well advised not to announce the export policy for another two months by which time domestic prices would have registered a further sizable decline under the impact of increased arrivals of mustardseed, linseed and other crops. And even when it decides to allow exports it should so devise the incentive scheme that export becomes remunerative only when domestic prices keep at a level which is considered to be reasonable from the point of view of consumers and producers. The ideal way would be to devise a centralised system of effecting purchases for export whenever prices decline below certain levels. Unfortunately, strong pressure from vested interests makes it difficult for the Government to follow a policy which would be in the best interests of the country.

The oilseeds market last week displayed a distinctly steadier tendency, with prices registering moderate recovery from the lowest levels recorded in the previous week. Linseed June

and castor June which had been marked down to Rs 83.20 and Rs 73.15 in the preceeding week were bid up to Rs 85.85 and Rs 77.15 respectively (per quintal). During the same period, castor March rose from Rs 201.75 to Rs 207 (per 250 kgs) and linseed March hardened from Rs 43.62 to Rs 44.50 (per 50 kgs). Groundnut oil ready recovered from Rs 19.75 to Rs 20.60, linseed oil from Rs 17.25 to Rs 18 and castor oil Commercial from Rs 15.75 to Rs 16.15 (all per 10 kgs). Last week's recovery was due both to short covering and fresh bull support induced partly by technical considerations and partly by optimism about early announcement about export of vegetable non-essential oils. Export houses reported fairly good business in groundnut extractions and cottonseed expellers and extractions.

BUSINESS NOTES

Dalmia Iron

DURING the year to September 1964, Dalmia Iron and Steel had to contend with a number of difficulties and some of these are yet not over. Apart from the temporary suspension of production due to a sudden breakdown of the main power supply equipment, the licensed capacity of steel foundry could not be achieved due to non-receipt of the new arc furnace. The suppliers had promised to deliver it in April 1964 but they could not keep to the schedule. It is now expected to be commissioned by the middle of 1965. The production of spun iron pipes was limited to about a third of the installed capacity due to non-availability of pig iron. The company has modified the plant to suit the changed pattern of demand for smaller diameter pipes, but the management says that unless the pig iron quota is trebled the plant will have to run much below the installed capacity.

In spite of these difficulties, the 1963-64 results are satisfactory. There has been a fair increase in production, turnover and gross profits, but higher provisions for depreciation and taxation have more than erased the improvement. Sales are up from Rs 2.17 crores to Rs 2.73 crores and gross profits have advanced from Rs 40.09 lakhs to Rs 47.73 lakhs. Inclusive of Rs 1.55 lakhs being the triple shift allowance in respect of last year, the provision for depreciation at Rs 15.80 lakhs is Rs 2.44 lakhs more than the previous year's. Due to a smaller amount of development rebate to which the company is entitled and a provision of Rs 1.10 lakhs for the estimated liability of sur-tax, taxation is much higher at Rs 15.50 lakhs compared to Rs 8.75 lakhs last year. Allocation to development rebate reserve has been lowered from Rs 4.50 lakhs to Rs 2 lakhs but that to general reserve has been raised from Rs 4.50 lakhs to Rs 6.45 lakhs. A sum of Rs 8 lakhs, against Rs 10 lakhs, is transferred to dividend equalisation reserve out of which the proposed dividend of 10 per cent is to be paid.

In December last there was a strike by workers that lasted for 13 days, and the matter was settled by raising the dearness allowance which will inflate the wage bill by Rs 3 lakhs per year.

National Rayon

THE year 1964 has proved more profitable for National Rayon than generally expected. The company has produced impressive results which, according to the preliminary statement, show a jump of well over Rs 2.5 crores to Rs 14.9 crores in sales. This is accompanied by a proportionately larger rise of over Rs 70.5 lakhs to Rs 3.25 crores in profits. There is, consequently, a rise in margins on sales from 21.81 per cent in 1963 to 22.88 per cent in 1964. This outcome is the more satisfactory in view of a prolonged period of labour unrest culminating in sit-down strikes by factory workers. There was also a huge accumulation of unsold yarn stocks which the company had to carry for a considerable period during the year as a result of the unfavourable conditions in the yarn market. In fact, in view of these adverse factors very few in the stock market expected such good results from the company and the actual announcement caused a quick spurt in the price of the share.

The necessary provisions have taken away more out of the profits than in the last year: depreciation has absorbed Rs 34.21 lakhs more at Rs 164.73 lakhs, taxation Rs 18 lakhs more at Rs 84 lakhs and development rebate Rs 5.60 lakhs more at Rs 14.75 lakhs. But even then the net profit is sizably higher than last year's. As before, the preference dividend claims Rs 9.67 lakhs. After taking credit of Rs 6 lakhs, being the excess provision for taxes in previous years compared to Rs 1.90 lakhs withdrawn last year from deferred taxation reserve, equity profit works out at Rs 57.43 lakhs about a half more than last year's Rs 38.55 lakhs. The proposed equity dividend requires Rs 48.22 lakhs against Rs 38.55 lakhs and is covered 1.19 times by earnings, whereas the previous lower distribution was slightly short-earned.

J K Synthetics

THE 1963-64 report of J K Synthetics is impressive on three counts. First, the dividend is raised by 2.5 per cent to 12.5 per cent of which nearly a half is estimated to be exempt from tax. Secondly, both sales and profits have recorded substantial improvements over the previous levels, providing a stronger earnings cover for the increased dividend despite much larger amounts required for necessary provision. Lastly, the company has embarked upon its scheme for first stage expansion for which purpose loans of Rs 10 lakhs each have been secured from Rajasthan Financial Corporation and Bank of Rajasthan, besides a foreign exchange loan of Rs 16 lakhs from I F C.

During the year to June 1964, sales have jumped 93 per cent to Rs 2.78 crores and gross profit about 83 per cent to Rs 1.06 crores. After providing for depreciation Rs 23.41 lakhs against Rs 11.87 lakhs, for taxation Rs 26.50 lakhs against nil and for development rebate Rs 16.50 lakhs against Rs 20 lakhs, equity profit of Rs 40.78 lakhs is over a half more than last year's Rs 26.31 lakhs. The proposed dividend should cost Rs 15.63 lakhs against Rs 12.50 lakhs previously.

Asian Cables

LOSS of 25 working days due to two strikes and rise in costs and interest rates have not only belied expectations of "better results" from Asian Cables in the year ended September 1964, but the performance has actually turned out to be disappointing. Though sales are over Rs 10 lakhs more at Rs 74.78 lakhs, the net outcome is a bigger loss of Rs 5.37 lakhs than last year's Rs 0.59 lakh. This loss has been arrived at after providing Rs 6.07 lakhs against Rs 6 lakhs for depreciation and after setting aside an expenditure of Rs 5.32 lakhs against Rs 1.89 lakhs incurred during the period of construction to be adjusted on completion. Together with the previous losses, a deficit of Rs 18.13 lakhs is carried to the balance sheet.

The performance in the first five months of the current year, however, has again raised hopes of "a much better picture". Sales in this period are stated to have shot up to Rs 45 lakhs from Rs 24 lakhs in the corresponding period last year. A few sections in the factory have already started working two shifts, and other sections are expected to follow soon. The company's project II for the manufacture of power cables and magnet wires is nearing completion, and is expected to be commissioned in parts from April onwards. Exports are being fast developed, and steps are afoot to increase production of P V C insulated cables which are in greater demand in most foreign countries.

Martin Burn

PROFITABILITY of electric supply and railway companies managed by Martin Burn has declined but satisfactory showing by engineering companies has helped to bring about an improvement in gross profits despite an appreciable fall in total sales during the year to September last. But this improvement is more than wiped off by the "penal" taxation. The dividend is maintained at 25 per cent including the 10 per cent interim payment. Total sales have decreased by nearly 7.5 per cent to Rs 8.11 crores but gross profit has increased by five per cent to Rs 99.31 lakhs. Depreciation is slightly lower at Rs 2.67 lakhs than last year's Rs 2.84 lakhs, but taxation has syphoned off Rs 5.75 lakhs more at Rs 52.75 lakhs. Net profit is, therefore, a shade lower at Rs 43.89 lakhs against Rs 44.60 lakhs. Of this, the total dividend absorbs Rs 40.68 lakhs.

The Lucknow and Allahabad licences operated by U P Electric Supply and the licences operated by Upper Jamuna Valley Electric Supply were acquired by U P State Electricity Board in September and June 1964, respectively. The directors say that they have brought the difficulties of railway companies to the notice of the State and Central Government. These companies continue to face road competition, on the one hand, and mounting operating costs on the other.

United Bank

IN step with the performance of the banking industry, United Bank of India, has shown all-round progress in the year 1964. Deposits of the Bank have recorded a rise of Rs 15.98 crores to Rs 88.59 crores, as against a rise of Rs 7.90 crores to Rs 72.59 crores in 1963. The rise in 1964 over 1963 has been 22 per cent, as against a rise of 12 per cent in deposits of all scheduled banks. Advances have gone up by Rs 8.16 crores, from Rs 47.16 crores to Rs 55.32 crores, and constitute 62.45 per cent of the total deposits as compared to 65 per cent in 1963. The Bank's investments in Central and State Government securities and other trustee securities have registered a rise of Rs 9.6 crores to Rs 28.28 crores. Investments in these securities alone work out to over 31 per cent of deposit liabilities.

During the year, the Bank's total income has increased by Rs 1.09 crores to Rs 5.12 crores of which interest and discount have counted for Rs 4.26 crores (against Rs 3.31 crores), and commission, exchange and brokerage for Rs 69.80 lakhs (against Rs 55.92 lakhs). On the expenditure side, interest paid on deposits and borrowings has increased from Rs 1.25 crores to Rs 1.82 crores and salaries, allowances and providend fund have risen from Rs 1.91 crores to Rs 2.36 crores. After providing for taxes, the Bank has earned a net profit of Rs 26.34 lakhs, a shade lower than last year's Rs 26.39 lakhs. Of this, the unchanged dividend of 7.5 per cent absorbs Rs 20.20 lakhs. After bringing in last year's surplus of Rs 4.15 lakhs, Rs 5.30 lakhs have been allocated to reserve fund and Rs 4 lakhs to building funds. The surplus of Rs 99,936 is to be carried forward.

Greaves Cotton

THE subscription list of Greaves Cotton's Rs 1 crore 7 per cent debentures 1975-78 opened on March 11 and is to close on March 22. The issue is fully underwritten by I C I C I and U T I. Apart from repayment of loan to I C I C I, the main object of the issue is to enable the company to invest in the expansion programmes of the associated company, Crompton Parkinson (Works) Ltd and the subsidiary company, Ruston and Hornsby (India) Ltd as also in its own two new projects for manufacture of complete diamond drills and operation equipments and of crucibles.

The expansion programme of Crompton Parkinson will commence during this year, and the completion of installation of the full expanded capacities is expected to be achieved within two to three years of the issue of necessary licences. Expansion of production of Ruston and Hornsby will begin by the end of this year, and the expanded production targets are expected to be reached by the end of 1966. The manufacture of complete diamond drills and operation equipment is expected to materialise by the end of this year. With regard to the manufacture of crucibles it is expected that, subject to Government approval being received during 1965, production should begin by the middle of 1967.

The increased returns from further investment in Crompton Parkinson and Ruston and Hornsby and from the company's own two new manufacturing projects should be more than adequate to cover Greaves Cotton's commitments in regard to interest and repayment of these debentures.

Adarsh Chemicals

INADEQUATE and irregular supplies of raw materials restricted production of Adarsh Chemicals and Fertilizers during the year ended August last, and the company could not cope up with the rising demand for superphosphates. It has been now permitted to increase production upto 54,000 tonnes a year, provided it secures the additional requirements of sulphuric acid from the market. Meanwhile, erection of plant and machinery for the new projects of phosphoric acid and alum is in progress. Production can be expected to commence soon if the additional requirements of sulphuric acid are obtained.

The company has put up a good performance during 1963-64 enabling the management to clear arrears of preferential dividends upto August 1962. Production of superphosphates amounted to 37,918 tonnes, and the entire quantity was sold out. Sales rose from Rs 55.40 lakhs to Rs 85.76 lakhs, and gross profits advanced more briskly from Rs 5.45 lakhs to Rs 9.83 lakhs. A major portion of the profits, however, is absorbed by the provisions for depreciation and development rebate reserve — the former taking away Rs 5.09 lakhs (Rs 4.84 lakhs) and the latter Rs 3 lakhs (nil). A sum of Rs 0.33 lakh is utilised to write off a part of the preliminary expenses and previous year's tax liability.

Special steel for special tasks

In 1946, The Tata Iron and Steel Company started making dynamo grade electrical steel sheets on a commercial scale for the first time in India and are still the only manufacturers in the country. The indigenous production of these steel sheets, the basic raw material for the electrical industry, helped to bring about a phenomenal expansion of the fan and electric motor industries, and gave a fillip to the manufacture of switchgears, radio receivers, chokes for fluorescent lights, etc.

The manufacture of dynamo grade electrical steel sheets in India was made possible by the pioneering work done at the Research and Control Laboratories, Jamshedpur. Started in a small way in 1925, the Research and Control Laboratories today have three fully-equipped divisions—Chemical, Metallurgical and Refractories—where trained metallurgists carry on research on Indian steel-making materials, help meet operational problems and keep a check on the quality of the steel produced.

Thoughtless Move

THE general objective behind the amendment of the Income-Tax Rules setting limits on certain expenditures by companies is, let it be stated at the outset, unexceptionable. At present these expenditures are deductible from taxable profits and so companies are encouraged to inflate them—in any case, they have little incentive to control them as stringently as they might otherwise—since, in effect, something like one-half or more of the additional expenditure comes out of the Government's tax revenue and only the rest has to be borne by the company. As the Finance Minister pointed out when presenting the 1964-65 Budget: "the provisions of the Income-Tax Act allowing as deductible expenditure amounts spent wholly and exclusively for the purpose of business are being abused in respect of certain types of expenditure. Unduly large amounts are spent on daily allowance, on unnecessary bookings on planes and trains, on advertisement and on the maintenance of guest houses and suites of rooms in hotels outside the specific places of business, on providing conveyances and in paying high rents for accommodation for their officers and directors and in many other ways..... this tendency amongst companies is responsible in no small measure for the present high costs and the time has come to put a check on some at least of these expenses". With these views of the Finance Minister we are in the fullest agreement; in fact, we deem it a pity that action along the lines he had proposed should have been so long in coming.

Having said that, we come to the main point of this editorial which is that in putting a ceiling on expenditure by companies on advertising, residential accommodation and travelling, the Finance Ministry has completely ignored, or missed, the distinctive character of expenditure on advertising which sets it apart from the other two types of expenditure. For the advertiser, the purpose of advertising is, of course, to make known some product or service or institution. From this point of view, the maximum now prescribed for advertising expenditure will be claimed to be inadequate to fulfil the legitimate and reasonable purposes of advertising. It is not proposed here to go into this question though, since the advertising requirements of different companies necessarily vary very widely depending on the nature of their products or services, the criticism that a uniform maximum rate is unduly harsh on certain companies has much force.

But the restriction on advertising expenditure needs to be judged as much from the point of view of advertising media (we shall be concerned here with the press) as from that of advertisers. This should be obvious if we consider the fact that advertising constitutes a major source of revenue to the press. To put the matter differently, the press is a producer of joint products — it sells copies of newspapers to readers as well as advertising space to advertisers. What the restriction on advertising by companies achieves, in effect, is to circumscribe the market for the second of the two products. The grave implications of this for the press deserve the most careful consideration, but it is clear that no such consideration has been given by those responsible for the decision to amend the Income-Tax Rules. If they had, they would certainly not have imposed the limit on advertising expenditure as casually as that on expenditure on residential accommodation and travelling!

It is true, of course, that advertisement expenditure as such has not been pegged, only the expenditure deductible for calculation of tax. Expenditure over the permissible limit will be disallowed and to that extent taxable profit inflated. This amounts to a tax on advertising above the permissible maximum at the marginal rate of tax applicable to the company. No sophisticated estimates of the price elasticity of advertising are necessary to show that advertising above the deductible maximum will be severely restricted as a consequence.

Reliable data on the economics of the Indian press are notoriously non-existent, the Registrar of Newspapers' copious two-volume annual reports

being little better than useless. In the U K the mass circulation dailies almost all derive the major share of their revenue from advertising and for the periodicals, particularly the quality ones, the proportion is even higher. *The Economist*, for instance, earns roughly twice as much from advertising as it does from circulation. The Indian press, with far smaller circulations, is if anything more dependent on advertising. And while advertisers generally follow the principle "to him who has shall be given", in terms of their total revenue it is the smaller papers who depend most on advertisement (excluding, of course, those which are overtly or covertly subsidised by individuals, special interests, political parties and, not least, foreign embassies). It is these papers, again, on whom the advertiser's axe, as he looks around to cut his advertising, will first fall.

This is not the place to debate whether advertising is a desirable influence on the press or not, but it certainly enables newspapers to sell at prices which bear no relation to their costs of production and thus to reach a far larger readership than they would otherwise. Without advertisements this paper, for instance, would cost upwards of Rs 2 per copy. Theoretically, there is, of course, the possibility of exploiting economies of scale through larger circulation, but in practice both such economies and the possibilities of increasing sales have very definite limits, for each newspaper as well as for the press as a whole. In any case, talk of increasing circulation is academic in the present context of newsprint shortage and rationing. It was not so long ago that this paper was officially advised to cut down its size to reduce newsprint consumption!

As an industry producing joint products, the press thus has the supply of one of its products — copies of newspapers — limited by the control on newsprint and the demand for the other — advertisement space — limited by the ceiling on companies' advertising expenditure. Neither of these restrictions, it is true, may have been motivated by any wish to interfere with the freedom of the press. Yet insofar as this freedom consists in the right to inform the public of the facts and issues of the day and to express opinions about them, a society in which this right is circumscribed for economic reasons loses very substantially the distinction that sets it apart from societies where the same right is politically circumscribed. Newsprint control is perhaps unavoidable, but the restriction on advertising expenditure by companies is an appallingly thoughtless step. It will, we hope, be withdrawn immediately before it does the deep damage it is capable of.

Verdict in Ceylon

THE results of Ceylon's general election will appear far less decisive or portentous than the right-wing press in Ceylon has made it out to be if it is remembered that in the elections of 1960 the Sree Lanka Freedom Party had polled less than one-third of the total votes. Further, it had got over 100,000 votes less than the United National Party. If in spite of this the SLFP secured 75 seats which, along with six nominated members, gave a majority to the party in the 151-member House and enabled Mrs Bandaranaike to form the Government, it was because of the very effective election pacts which the party had made with parties other than the UNP. Details of the voting in the latest election are not available yet and so the shifts in the political balance revealed by the election remain unclear. But, broadly speaking, it would appear that the major changes have been in the relative positions of the SLFP and the UNP. None of the other parties, certainly not the genuine leftist parties, appear to have lost any ground to the UNP.

To interpret the defeat of the SLFP as the defeat of the left is clearly inadmissible. The SLFP, like the Congress in India, is an amorphous collection of politicians, not a few as committed to vested interests as any in the UNP and many others with nothing more than opportunism to light their political path. It was no small achievement of Mrs Bandaranaike's that she managed to hold together this incoherent mass by adroit distribution of the loaves and fishes of office. Unfortunately, the same skill did not mark her management of the affairs of State. In fact, if the election results can be said to be a verdict on anything, it was on the colossal inefficiency of Mrs Bandaranaike's Government. Its attempts to clip the wings of the scurrilously anti-Government Lake House group of papers are unforgettable for their clumsiness. The Press Bills had to be repeatedly withdrawn after their introduction in Parliament and redrafted to correct flaws undetected in the original drafts. Only such unmitigated incompetence on the part of the Government could have enabled the UNP to raise the bogey of "marxist dictatorship" and emerge as the champion of civil liberties.

At the time of writing it appears that the UNP will form the Government with support from the SLFP rebels, the Federal Party and the Tamil Congress. But there is no reason why this alliance should prove any more durable than those which Mrs Bandaranaike sought to form when in office. The Tamil Congress's and the Federal Party's honeymoon with the UNP is likely to be short-lived, coming to an end as soon as the Government faces the Sinhalese vs Tamils issue and the problem of the stateless Indians. Besides, it will be interesting to see how the UNP, with its hard core support coming from the Roman Catholics, confronts the most significant development in Ceylon politics in recent months—the return of the Buddhist monks as a political power to reckon with. In addition, of course, there is the generous legacy of economic problems which the new Government inherits from its predecessor. All in all, it seems Dudley Senanayake will be over-optimistic to view the result of the elections as a mandate to rule Ceylon undisturbed for the next five years.

Revised Subscription Rates

WITH effect from March 1, 1965 the price of THE ECONOMIC WEEKLY has been raised to 75 Paise. Correspondingly the annual subscription is Rs 36 in India, Pakistan and Ceylon. The half-yearly subscription is Rs 20. Foreign annual subscription rates are 70s and $10.

For the last 16 years, the price of THE ECONOMIC WEEKLY has been maintained unchanged in spite of heavy increases in costs. Circumstances beyond our control have compelled us to take this step and we hope readers will continue to extend to us the same patronage as in the past.

A FERNANDES
Business Manager

Weekly Notes

Revolving Fund Stagnant

THE revolving fund set up by the Export Credit Guarantee Corporation five months back for extending foreign exchange credits to manufacturer-exporters has not got off the ground. As against the foreign exchange resources available to the fund so far, which amount to Rs 15 crores, only two applications for a total sum of Rs 3 lakhs have been received. Under the scheme, any commercial bank licensed to deal in foreign exchange can arrange for a line of credit from its correspondents or principals abroad. It can then lend for a maximum of 18 months at one per cent above the bank rate of the country of origin to finance imports of raw materials, components and spare parts on condition that these imports are embodied in export of commodities within the loan period. ECGC guarantees fulfilment of the export obligation (there is a rupee penalty in event of non-fulfilment) and the Reserve Bank releases the necessary foreign exchange if the requisite exports fail to materialise.

Non-utilisation of this assistance clearly indicates — if any further proof were required — that the ubiquitous clamour for imported components and materials arises almost wholly from the pressures of home demand. The revolving fund was set up on the recommendation of the Mudaliar Committee and Mathrani Group, both of which were inundated with complaints that export of many non-traditional commodities was inhibited by non-availability of relatively small imported elements. Imports financed by the revolving fund can be used only for exports and cannot be sold away or used for sale of finished products at home. Since the imports precede the exports, the latter do not qualify for import entitlements except insofar as the exporter qualifies, after fulfilling his export obligation, for another slice of the foreign exchange credit.

True, the scheme has not been in operation long enough to be appraised fully and is obviously out-rivalled by more attractive alternative schemes. The suggestion that inadequate publicity is responsible for its lack of progress is, however, absurd. Had it been really attractive, by itself or in conjunction with allied schemes, manufacturers would have smelled it from afar, without the benefit of any publicity. How to make the scheme more attractive? So long as freely transferable import entitlements continue in their present form, and the penalty for non-fulfilment of export obligations is kept at as much as 50 per cent, there can be little hope. What kind of exports after all are covered by the revolving fund? Cotton and jute exports are left out because their imports of materials come under other arrangements; tea does not need this assistance; iron ore, manganese and oilseeds cannot qualify. That leaves only non-traditional exports and these, by and large, get the plums already in the form of import entitlements ranging from 40 to 70 per cent of exports. Besides, thanks to the proliferation of foreign collaborations, our demand for materials, components and spares has become highly fragmented and specific to certain countries; even if the domestic cost barrier is surmounted — an achievement in itself — it is not always possible to match demands against available lines of credit.

The remedy is not to make imports under the scheme negotiable, though some relaxations could be effected there, but to make exports more attractive, for instance, by tying up the scheme with the new tax credit certificates proposed in the Budget.

Failure of Monetary Policy

THE ineffectiveness of monetary policy in India has been explained by reference to fiscal policy and government spending, or more particularly, deficit financing, which swell money supply and over which the monetary authority—strictly defined to mean the Reserve Bank of India—has no control. From this it follows that the main objective of monetary policy is to maintain stability in the supply of money by preventing it from rising at a faster rate than required by the rate of growth in national income. At least, this is how the Reserve Bank appears to view its own task. In two lectures delivered this month at the Kerala University, Professor K N Raj of the Delhi School of Economics has examined this view of monetary policy and analysed its relevance in terms of the requirements of planned development.

The preoccupation with the quantity of money, Dr Raj points out, ignores the role of velocity of circulation of money. The fact that velocity can increase—and it is wrong to attribute any stability or even an "upper limit" to this phenomenon—implies that the effect of a credit squeeze could be nullified. This, in fact, is what has happened in India in recent years with current deposits declining as a proportion of national income on the one hand and their velocity rising—at approximately 5 to 6 per cent per annum — on the other.

Since it has no control over the quantum of credit extended to Government, the efficacy of the Reserve Bank's policy has to be judged from its success in curbing credit to the private sector. And it is Dr Raj's judgment that "in spite of the massive, sophisticated and discriminating use of all techniques of control, the Reserve Bank cannot be said to have had any conspicuous success in its attempt to restrict expansion in bank credit when and where such restriction was really most needed". In support of this he points out that the increase in scheduled bank credit in the period 1950-56, when the Reserve Bank had *not* followed an active policy of restriction, was of a much smaller order than the expansion in subsequent years. The reasons for this are many, but most of them stem from the basic weakness of the "lender of the last resort" function, through which the Reserve Bank has sought to influence the cost and availability of credit. Banks have been able to keep down borrowings from the Reserve Bank by reducing their cash reserves and liquidating securities (both found possible despite the increase in the statutory liquidity ratio) and by inter-bank borrowing. Equally, the profitability of banking operations has made banks in general insensitive to the higher cost of Reserve Bank credit.

The failure of monetary policy has a qualitative aspect as well. Dr Raj's conclusion is that the scale and terms on which bank credit has been made available to manufacturing industry have not exerted any pressure towards inventory control—or, in popular parlance, reduction in hoarding. Selective credit controls have failed because evasion is easy and, at best, what is altered is the location of the hoards and not the quantity hoarded.

It is again on the qualitative aspect

that the "alternative approach" to banking organisation and monetary control outlined by Dr Raj rests. The true purpose of monetary policy is not the control of the cost and total availability of credit—as now interpreted—but the optimal allocation of credit. This purpose, of importance even in a system uncommitted to centralised planning, is vital to an under-developed economy committed to planning and to certain social objectives. Private commercial banking, operating according to "sound" lending practices, tends to perpetuate and increase market imperfections, which tendency cannot be counter-balanced by supervision and control by the monetary authorities. The nationalisation of the Imperial Bank of India and the creation of various specialised financial institutions, all bear witness to this fact. It is this kind of promotional activity, according to Dr Raj, that has "saved monetary management in India from getting reduced to what might otherwise have been a series of sterile and ineffective, and in cases even unhelpful, operations." Only a nationalised banking system, discriminating between end-uses of credit and unhampered by the operational concepts of private banking, can achieve optimal allocation of credit, he concludes.

Life Insurance Rebate

I S Gulati writes:

APROPOS the editorial, 'Lost Opportunity', in the issue of March 6, 1965, I may be allowed to explain what lies behind the move to replace the existing system of rebate on sums paid as life insurance premia, provident fund contributions and cumulative time deposits by an outright deduction of 50 per cent of the qualifying amount of such payments. The qualifying amount was and is 25 per cent of the total income of the assessee subject to the maximum limit of Rs 12,000 for individuals and Rs 25,000 for Hindu Undivided Families. (Incidentally, the Memorandum Explaining the Provisions of the Finance Bill states that the qualifying amount is limited to 10 per cent of total income but a reference to the relevant provision in the Bill shows that the limit is still 25 per cent and not 10 per cent. The error needs to be rectified to correct any misunderstanding.).

Before the Finance Act, 1964 came into force, the rebate was restricted to a maximum of 25 per cent of the qualifying amount. In other words, an individual with income attracting the highest rate of income-cum-super tax was eligible for a maximum income tax rebate of 25 per cent of the qualifying amount, i e, Rs 10,000 or one-fourth of the total income whichever was less. Thus, on a salary income of Rs 70,000, an individual was liable to pay Rs 33,600 by way of tax (i e, at the average rate of approximately 48 per cent). But the qualifying amount on which rebate was admissible could not exceed Rs 10,000 even though the individual concerned had made such rebate-worthy payments exceeding Rs 10,000. And on this maximum of Rs 10,000 he got an income tax rebate of Rs 2,500. That is, he would be liable to pay Rs 31,100 (Rs 33,600 minus Rs 2,500) by way of tax.

In the Finance Act, 1964 the limit on rebate was raised from 25 per cent to 50 per cent but that on the qualifying amount was allowed to remain unaltered. The result of this change was that the individual in the above illustration was able to claim by way of rebate Rs 4,800 instead of Rs 2,500 as before (at the 1963-64 rates). The change effected through last year's Budget was clearly calculated to benefit income tax payers whose effective tax liability (and not just the marginal rate of income-cum-super tax) exceeded 25 per cent. It was, therefore, a clearly regressive step.

In the Finance Bill, 1965 what is proposed is to allow the reduction of taxable income by 50 per cent of the qualifying amount. Thus under the new scheme, rebate is allowed not at the average or effective rate applying to the total income but at half the marginal rate applying to the highest slice of income before the above reduction. Of course, the monetary limit of the qualifying amount has also been raised in the Finance Bill.

Thus, the individual in the above illustration who got a rebate of Rs 4,800 at the 1963-64 rates and of Rs 3,800 at the 1964-65 rates (payment by way of annuity deposit did not qualify for rebate), would, at the 1965-66 rates, get a rebate of Rs 3,900. All along we have so far assumed that the entire income is wholly earned. Since on unearned income the rate of tax is higher, the rebate earned on life insurance and other payments is correspondingly higher.

It will be observed that the really retrograde measure (insofar as one regards a regressive tax concession as such) was adopted in the year 1964. By raising the ceiling on rebate from the previous 25 per cent to 50 per cent of the qualifying amount, the Finance Minister was clearly benefiting the upper-income groups, the groups who paid tax at the average rate exceeding 25 per cent, i e, with an annual income exceeding Rs 25,000-28,000.

It has not been disclosed what exactly was the revenue loss as a result of change effected in the 1964-65 Budget. Let us hope some alert member of Parliament will persuade the Finance Minister to indicate the estimated loss. Assuming that (a) the rebate-worthy payments are currently running at around Rs 125 crores a year (this should, if anything, be an under-estimate for the total of life insurance premia payments, employees' contributions to provident funds and cumulative time deposits), and (b) the average rate of rebate admissible on these payments will be higher than the average rate of tax payable by non-corporate non-firm assessees, the total amount allowed currently by way of rebate should have gone up from around Rs 20-25 crores in 1963-64 to Rs 35-40 crores in 1964-65. This is by no means a small gift to the high-income groups.

Gradual Animal Husbandry!

AVOIDING conflict may be a laudable objective, but often it just cloaks the lack of a will to face issues squarely. Has one not heard enough the plea for a "balanced approach" and the "middle course" when the choice is clear and unequivocal? To Food Minister Subramaniam's appeal at the All-India Gosamvardhan Sammelan that "in the development of cattle, prejudice, sentiment and tradition had to be shed" and that in tackling the problem of the unchecked growth of cattle "the choice between science and sentiment" had to be made now, Prime Minister Shastri replied that compromises were necessary. In India, said the Prime Minister, any conflict between science and tradition and logic and sentiment would have to be resolved by striking a balance. He wanted a "middle path" between "extreme modernism" and sentiment.

Capital View

AS Capital View was received late, it appears on page 575.

And as far as the cow was concerned, the sentiments of so many people were involved that a strictly logical approach was of no use. He was against the slaughter of uneconomic cows and wanted that "steps should be devised for their utilisation". But why cow slaughter, even with regard to modern methods of animal husbandry like cross breeding and sterilisation to improve the quality of cattle, Shastri pleaded that neither the Gosamvardhan Council nor the Government should be "adamant". "I would like to tell Mr Subramaniam", he said, "that we could accept to the extent the Gosamvardhan organisation could go in these matters after which we can discuss, persuade and convince them. *It does not matter if we proceed gradually*" (italics added).

Unfortunately there happens to be no "gradualness" in the growth of our cattle population. The increase was 10 per cent in the Second Plan period. And about 40 per cent of this growing population are uneconomic and useless and are just a burden on available cattlefeed. Is it any wonder then that the average milk yield per lactation period in India is 400 lbs against 8,000 lbs in the developed countries? This inescapable logic has no "middle way" and ironically the tradition-bound villager is the first to admit it. He weeds out excess cattle by starvation and neglect because his society denies him a more humane and economical solution.

One recalls in this connection the furore over the proposal to set up a modern abattoir in Bombay some two years ago. It was then pointed out editorially in this paper how in our approach to a question like slaughter of animals we "ignore that there are slaughter houses, that the vast majority of Indian people are not vegetarians, that the quality of meat which is sold in the market is far below the standard desirable and that a poor country, particularly one which is bent upon economic development, cannot afford the continued wastage of valuable animal products". Prejudice against cow slaughter is, of course, deep-rooted in the Hindu mind, but that does not mean that cows are not slaughtered; what happens to unwanted cattle everyone knows, though no one would perhaps care to admit it. They are either starved to death or disposed of to agents to find their way eventually into a slaughter house. As we commented in the editorial referred to above, "by a curious twist of the Hindu mind, the idea of sin is dissociated and passed on from the principal to the agent—it is the Kaseem Alis who do the actual act of slaughtering!" It is the same curious twist of the Hindu mind that wants "measures to be devised for using unwanted cattle", when by definition they cannot be used, except after they have been slaughtered. The state of our leather industry is a measure of the price we pay. Carcasses of poor quality cattle cannot yield good hides and so, in spite of the largest cattle population in the world, we import a crore of rupees worth of hides.

After what he had to say at the Gosamvardhan Sammelan, Shastri can congratulate the State Governments. They have certainly followed his advice in implementing animal husbandry programmes. Out of an allocation of Rs 78 crores for these programmes in the first two Plans, only Rs 49 crores were spent and in the Third Plan even 40 per cent of the outlay of Rs 90 crores had not been spent in the first three years. The scheme to install 3 abattoirs, not surprisingly, remains on paper. According to preliminary estimates, the Fourth Plan is expected to provide Rs 157 crores for animal husbandry schemes. But what do these increasing financial allocations amount to when the Prime Minister counsels "gradualness" in the adoption of policies which are the pre-conditions for the success of any animal husbandry programme?

Tax on Unaccounted Income

A Correspondent writes :

WHAT is the effective rate of tax on unaccounted income under the scheme for disclosure of such income? Is the tax payable on the amount *disclosed* or on the total *unaccounted* income, whether held in one form of assets or another or spent.

To illustrate the point, if a person had an income of Rs ten lakhs over the last five years but did not declare it to the Income Tax Officer, his total *unaccounted* income is Rs 10 lakhs. But of this income, he has now left with him only Rs 5 lakhs. He discloses this latter sum to the Income Tax Officer. What is his tax liability—60 per cent of Rs 10 lakhs or of Rs 5 lakhs? If the latter, the effective rate of tax on *income earned but concealed* works out to only 30 per cent.

This question is not of academic interest only. It has been argued that the tax under the disclosure scheme is payable on the amounts disclosed. This can be true only in the sense that since the declarant still conceals a part of the income that actually accrued to him during a certain period, he manages to get away by paying 30 per cent tax and is enabled thereby to introduce the balance of 20 per cent of his total unaccounted income into his regular ('white') accounts. But he has obviously achieved this result by concealing a part of his income. Therefore, the immunity that the new scheme gives to the declarant cannot be taken to apply to this undeclared part of the past unaccounted income.

Or is it that under the above scheme, the declarations of unaccounted income are to be accepted at their face value and that the tax authorities are precluded from checking the veracity of the sums declared? If so, the effective rate of tax on unaccounted income could be even lower than 30 per cent, depending on what proportion of the total unaccounted income a declarant actually discloses under the scheme.

Good Chits and Bad

"THE evils of ultra-nationalism" is not ordinarily a likely theme for a bank chairman's annual statement to his shareholders, but then the Chartered Bank is no ordinary bank. With offices in almost a score of countries and with operations spanning continents, it is perforce acutely sensitive to changes in political climates. And in some of the countries of its operation such changes have been mercurial in recent years. In 1964, for instance, the Bank had to countenance the involuntary winding up of its activities in Iraq, Indonesia, Burma and Cambodia. It pains the Chairman of the Bank, Vincent Alpe Grantham, that it should meet with such fate in countries where it had been operating "for over hundred years, through good times and bad", whose wealth it had helped to open and build up and in whose overseas trade and local investment it was still paying an important part. But is this really surprising? Is it not the very importance of the Chartered Bank, and of institutions like it, which makes them the immediate subject of attention when there are political upheavals?

Grantham's succinct and penetrating survey of political and economic developments in the countries where his bank operates follows a pattern: stability is applauded, sudden changes are viewed with caution and left-ward

political swings are decried. No doubt, a certain political philosophy colours these judgments, but not all the way. If leftist politicians and policies are viewed with disfavour, it is because they spell nationalisation, restriction of private enterprise and political tension arising from conflict with entrenched interests. Ultimately, these may threaten the Chartered Bank's own operations and even its existence. But economics, not politics, dominates Grantham's judgment. His comments on China are proof of this. Here we have a sober, shrewd assessment of the Chinese economy. There is enthusiasm at China's vast trade potential and satisfaction that the break with the Soviet Union has diverted some two-thirds of her total trade to the West. The U K's trade with China, which has been growing at the rate of about 50 per cent per year, is regarded as still low and capable of much expansion. Evidently, the Chartered Bank's role in China's trade is neither inconsiderable nor unprofitable, though we are told nothing more than that the Bank's Shanghai branch "has had a satisfactory year and is well situated to assist in any increase in trade".

Grantham's view of India is cautious, but some of the Government's policies come in for severe criticism. These include allegedly undue emphasis on industry to the neglect of agriculture, restrictive regulations which impede the inflow of foreign private capital, high taxation which stifles investment and enterprise, tight credit which denies finance for legitimate business and contributes to the stagnation in the capital market and Government's failure to "confront" left-wing trade unionists.

Some of Grantham's facts can certainly be challenged — e g, his assertion that the returns on foreign investment in India are "small" — but, his overall view of the Indian economy is one with which an influential section of Indian opinion will enthusiastically agree. Of course, others may find his confident expectation that the Fourth Plan "will be trimmed to a more realistic basis than its fore-runners and with perhaps a more significant role assigned to private enterprise" rather disconcerting.

Corrections

IN the article "Agricultural Extension, Inputs and Community Development" by J P Bhattacharjee in our Annual Number, in the table on page 293, the figure in row 4 column 4 should read—1.5 insteed of +1.5 and that in row 5 column 4 should read +1.5 instead of —1.5.

In the article "Irrigation Rates versus Betterment Levy" by Nasim Ansari, also in the Annual Number, in Table 1 on page 299, the irrigation rate in Bombay for sugarcane should be Rs 80.00 to 120.00 instead of Rs 80.00 to 12.00. In Table 3 on page 303, "Upper Bari Donald Canal" should read "Upper Bari Doab Canal". In the same table, in foot-note (**) line 4, "more than 100 per cent on the intensity of cropping" should read "more than 100 per cent depending on the intensity of cropping".

The errors are regretted.

'Tax' on Advertising

S L Rao

THE Finance Minister is very good at introducing proposals for different reasons, when his object is only to increase tax revenues. Yet another instance of his devious methods of raising tax revenues is provided by the publication this week of the amendment to the income tax rules setting out new limits and conditions for allowance of expenditure permissible under the Income-tax Act. The intention to lay down free limits of expenditure on advertising, residential accommodation including guest houses, and travelling by business houses, was announced last year. The new rules take effect from the fiscal year beginning on the April 1, 1965.

This is not the first time that a government is trying to regulate business expenses. The first year of the Kennedy administration in the U S A saw the introduction of detailed proposals to regulate entertainment expenses in business houses. Some years ago, the Conservative Government in the U K introduced a tax on television advertising with a view to mop up some of the excessive profits of the independent television contractors as well as to try and limit the level of advertising expenditure on television. Even though most of the tax was passed on to the advertisers by the television contractors, the amount of money spent on television advertising did not decline, and the so-called "natural break" in the middle of a programme continues to plague viewers on the Independent Television (as opposed to the B B C which is a wholly government-owned Corporation and does not take any advertising).

Prejudice Against Advertising

A cursory study of the new rules reveals a violent prejudice in the Government of India against advertising. The permissible limits of expenditure on advertising, beyond which tax will have to be paid at the usual rates on income, are given in the table. Thus on a turnover of Rs 1.50 crores, the permissible extent of expenditure on advertising is only Rs 1.12 lakhs, or, 0.8 per cent. A business with a turnover of Rs 5 crores, will be permitted to claim tax deduction only on about Rs 2 lakhs which is 0.4 per cent of the turnover. The larger the business, the more minuscule the proportion of its turnover that the business can claim as advertising expenditure for tax purposes.

Any Government is, of course, fully justified in laying down limits to different types of expenditure that can be incurred by a business, to protect the interests of the shareholders, the consumers, and the Government's own interest in tax collection. Thus the newly-announced rules lay down limits on travelling expenses and on guest houses for example, which seem quite reasonable. The same cannot be said of the rules regarding advertising expenditure. On the pretext of controlling expenses, businesses will now be penalised for incurring what to them is necessary expenditure to maintain their identity and future growth. The effect of these rules will be to reduce advertising expenditures substantially.

Already, the Indian Society of Advertisers is believed to have recommended to its members to suspend advertising in newspapers, cinemas, and other media from April, until clarification is obtained from Government. Obviously, this suspension will not be indefinite. But it will still have considerable impact on revenues, particularly of the newspaper industry. If the rules are not modified, to raise the permissible limits substantially, there will be substantial reductions in advertising expenditure. This in turn will have adverse effects on the quality of products and services sold to the Indian consumer, and by placing brakes on the expansion of many industries, limit the overall rate of economic growth.

Definition Not Clear

The Rules also do not define what is meant by advertising expenditure. Does it include only expenditure on press and cinema advertising? Or does it also include advertising through posters, and in shops? What about special schemes that are run from time to time to enable the consumer to sample the product temporarily, wholly or partly at the cost of the manufacturers? Unless the Government also lays down the prices and terms at which all goods and services can be sold, it is unlikely that the Government can control advertising other than on what is called "theme", namely through press and cinema. It is possible that a great deal more emphasis might come to be placed on promotional expenditure. If this happens and manufacturers promote their products constantly through "special" and "limited" offers to the consumer, this is likely to reflect itself on the price that the consumer has to pay for the product.

All businesses, whether large or small, particularly those offering goods and services directly to the consumer, will be adversely affected. Not much thought seems to have been given to what can be bought with the pitiful sums that can now be spent on advertising.

All advertising aims to communicate effectively to the consumer about the product or service that the advertiser has to sell. Effective advertising requires that the advertiser should be clear as to the sort of people who are likely to buy his product. Having determined this, he then selects such media as his prospective customers are most exposed to. In the West this has become extremely easy, with a range of industrial magazines circulating among people belonging to certain industries or trades, magazines mainly bought by women, or teenagers or university students, or ethnic groups, etc. In India such specialisation does not exist. Almost any advertiser, in order to get his message across, has to advertise in papers which circulate also among people who are unlikely to be his potential customers. Hence a larger proportion of his expenditure is wasted in that, he is advertising in papers which charge rates in relation to their circulation and he has to pay that rate though he is interested only in a part of that circulation. As more

Table:

Turnover or Gross Receipts	Percentage Allowed	Maximum Permissible
First Rs 25 lakhs	2 per cent or Rs 5,000 whichever is higher	Rs 50,000
Next Rs 25 lakhs	1 per cent	Rs 25,000
Next Rs 50 lakhs	0.5 per cent	Rs 25,000
Next Rs 50 lakhs and over	0.25 per cent	Rs 12,500

specialised papers develop in India, this kind of waste is likely to be reduced and manufacturers will be able to aim more and more only at the people who matter for them, their potential customers.

In this context, in order to advertise effectively, there is an irreducible number of papers, and in the case of some products and services, cinemas, which almost any advertiser has to use. Normally the pressure of demand on the space available makes these particular papers and cinemas very expensive. With the new rules, most advertisers cannot even do a minimum of advertising, without having to pay tax on the expenditure.

Why Advertise?

It can be argued, of course, that it is not necessary to advertise except perhaps once a year to inform customers of the existence of a product. Obviously there are no hard and fast rules on how often to advertise. However, it is a fact that the customer's memory is fickle, and he must be constantly reminded about the product or service, and the benefit that it offers him. While past advertising continues the identification of a brand in the consumer's mind with certain attributes, the stoppage of advertising soon results in the loss of this identity. More important, a business which is advertising its product or service, cannot afford to take risks with its quality. By bringing and keeping the product or service in the consumer's attention, and claiming certain attributes for it in the advertising, the advertiser has to meet these claims in the quality of his product. If he does not, his product or service is soon found out to be unable to meet what is claimed for it, and the consumer shifts to another brand which claims to offer greater satisfaction.

The Soviet Union, till a few years ago, did not believe in making a multitude of brands of the same product. Nor was there competition for the consumer's rouble among different manufacturers. The consumer bought what was available or did without it. India does not claim to be such a rigidly controlled economy. Where there is a free market, and more than one manufacturer of one type of product (or supplier of one type of service), the consumer has to choose. In order to do so, he has to be informed, and this has to be done effectively. With the sums that will now be available for advertising it is unlikely that this can be done at all effectively. (Even the Soviet Union, with the recent emphasis on consumer satisfaction, is moving towards advertising products and services).

We are daily exhorted to export more. The export market is a highly competitive one. This competition is expressed in vigorous and heavy advertising. In the absence of a healthy advertising industry in the country, we are unlikely to be very competitive in foreign markets.

The choice that the Finance Minister is giving to businesses in India now is not an enviable one. He says in effect "Spend as much as you think is reasonable on advertising your product but pay for most of your expenditure from your profits. Or, do not spend as much as you think you need to communicate effectively to your market, and so reduce the prospect of your future growth and future profits".

One hopes that the Government will reconsider the rates that they have published and increase the permissible levels of advertising expenditure to more reasonable levels.

While the Government may not be very responsive to anguished cries from the private sector — after all, anguish is becoming a fairly common emotion in the private sector in recent months! — the newspaper industry should also consider what effect the substantial likely reductions in advertising expenditures, is likely to have on its already difficult economics. When there is so much talk of encouraging smaller papers, a measure which will reduce their advertising revenues, seems peculiar.

The chances are that most advertisers will prefer to advertise, perhaps less than before but still at a much higher level than can be done without increasing tax liability. The Finance Minister will get more in tax revenues without announcing a new revenue measure. The consumer, will probably be the worst sufferer in the long run.

FROM THE LONDON END

Growth Target Too Ambitious?

IT is only natural, with the budget looming ahead, that there should be much discussion of the direction that the British economy should take. The controversy over whether what is needed is an expansionary or a deflationary budget continues to rage. With the overriding need to reassure her foreign creditors, Britain may be tempted to impose a tough budget, but it is certainly against the natural bent of a Labour Government to undertake a policy that might well produce a recession and could do a great deal of damage to the long-term plans for economic development to which this Government is committed.

Whitehall's Dilemma

Some indication of the dilemma which is exercising Whitehall was reflected in a recent speech by Austen Albu, the Minister of State for Economic Affairs, to American bankers in New York. Albu pointed out that the Government was well aware that as the level of exports increased, domestic demand would have to be restrained, but the full deflationary effect of the autumn budget, together with the "severe squeeze" on bank liquidity and a "very high" Bank Rate, had not been fully appreciated. Albu stressed the fact that while the Government was always ready to take any corrective action necessary, it could not accept that "in order to try to secure a temporary improvement in the balance of payments we should push deflation to the point at which it would utterly defeat our long-term objectives". The real need of the economy was for consistent and enduring policies which would encourage growth and the modernisation of both equipment and human attitudes by which alone the recurring cycle of balance of payments weakness could be overcome.

This is certainly a pointer that the Labour Government has not yet given up hope of persuading opinion abroad that harsh deflationary measures would do more harm than good.

The views of Anthony Crosland who is now Secretary for Education, but was formerly Brown's deputy are also indicative of the same vein of thought. While he agreed that "we must so control demand as to release the resources needed to provide the exports and the import substitutes ... the illegitimate view is that we should deliberately deflate home demand not as a condition of correcting the balance of payments deficit, but as the sole means of correcting it". This, according to him, "would run wholly counter to the philosophy of Keynes and Bretton Woods".

The Bank of England's quarterly Bulletin published recently is also certainly less in favour of deflation than the National Institute of Economic and Social Research which advocated £200 to £300 a year more in new taxes. The Bank says "it is a matter of nice judgment whether the prospective demands upon the economy are likely to be met without excessive strain on valuable resources". It referred to a number of factors which together "constituted an appreciable deflationary force, the effect of which might become increasingly apparent as time went on".

Harrod Against Deflation

A much more forthright case for abandoning deflationary policies was put forward by Roy Harrod who said, in effect, that Britain would be unwise to proceed with deflation and that she should go ahead to promote economic expansion, regardless of foreign opinion which favours caution, since the views of these foreign Governments could safely be ignored as Britain's creditors would not dare to run the risk of withholding support from sterling.

The Government appears to be banking on restraint on incomes and increased productivity to remedy the underlying deficit in the balance of payments. Roy Harrod argues that "any application of 'stop-go' in the period ahead would doom the incomes and productivity policy to failure". The Unions would refuse to abandon restrictive practices if unemployment were rising. Britain's creditors have little leverage, according to Sir Roy, for compelling the U K to deflect her domestic policy from the lines Britain thinks best. Britain's negotiating strength lay in the weakness of the dollar. If the pound were to be devalued, serious doubts would be raised concerning the dollar. Therefore, he says, Central Banks will come to the support of sterling so long as the dollar remains weak. Furthermore, any bout of deflation in the U K would place an extra strain on the American balance of payments.

On the other hand, industrial production is continuing to rise strongly, the unemployment figure in February was among the lowest for ten years, and industry raised the level of its spending on new buildings, plant, machinery and vehicles by more than 3d in the pound last year—the fastest rise since that recorded during the big investment programme of 1959 to 1961. These facts indicate that the economy is on the way to becoming overstretched, and some economists suggest that what is now really needed is a tougher budget. This is certainly the view of Professor Paish who claims that a greater measure of unemployment is necessary in order to restrain the pressure on rising prices.

Sharp Rise in Production

The rapid increase in output has also prompted thoughts on a viable rate of economic growth for the U K. The January production index confirms the impression that output was up sharply for the fourth month running and reached a level of 6 per cent higher than twelve months before. The seasonally adjusted index of industrial production compiled by the Central Statistical Office was up by another point in January to 133, and the index for manufacturing industries only jumped two points to 135. However, the pattern of increase is not uniform. In contrast to every period since 1961, it is now the heavy industries that are setting the pace. As a result, production in the steel industry is now running at record levels of 30m tons a year. The British steel industry seems to have benefited more than most from the introduction of the import surcharge which has had a noticeable effect in switching demand towards the home producer. By contrast, the consumer industries are prosperous, but by no means excessively so. The motor-car industry continues to make progress, but other consumer industries, notably textiles and domestic appliances are only moderately active and are working below capacity. Opinions are still divided on the course the economy is likely to pursue later in the year. Many businessmen share the concern attributed to Brown's Ministry of Economic Affairs about a possible downturn.

The economic plan which Brown's Ministry was going to publish showing the way to a 25 per cent growth in national product by 1970 is taking longer to produce than expected. This adds particular interest to the recently published Political and Economic Planning broadsheet which takes a hard look at a viable economic growth rate for Britain. It casts doubt on the realism of the Government's growth target.

The author, Geoffrey Denton, lecturer in economics at Bedford College, London, points out that the Government has quietly scaled down the annual growth rate from 4 per cent, to 3.8 per cent and introduced a greater flexibility by phasing the plan over six years. "Unless there are indications of a fundamental improvement in the economy deriving purpose from an incomes policy, or from measures to improve the balance of payments, there would seem to be disadvantages in committting ourselves even to a phased target".

Export Needs Over-estimated

The broadsheet examines the causes of the failure of Neddy's first attempt in economic planning with a 4 per cent growth target. Although the target is not impossible from the point of view of the capacity of industry to expand "it showed a great lacuna in the case for 4 per cent in respect of export requirements". With import figures rising, the export target had to be raised from 5 per cent to 5.1 per cent to keep the growth rate consistent with a satisfactory balance of payments. Exports failed to rise significantly in 1964, and the target had, in practice, to be abandoned.

This brings one back to the fact that, as in India, exports have a fundamental role to play if the British economy is to expand. Indeed, export requirements were the main flaw in the original N E D C plan. It would, therefore, be unwise to base further plans for growth on the assumption that there will be a major improvement in export trends. Efforts to raise the standards of competitiveness of British industry can only pay off after a period of years. The same is true of more direct measures to step up exports, though P E P considers there is a strong case for re-examining the part a value added tax could play as a general incentive to exporters. As for the possibilities of developing import substitution, these are described as "at present little more than interesting ideas".

The verdict of the PEP study seems to be that the immediate prospects for fundamental improvements in the balance of payments are very limited, and without this there must be considerable doubt about the possibility of Brown's 25 per cent target.

Kerala without Democracy

THE heavy poll and the spectacular advance of the Left Communist Party to the position of first party, are clear enough evidence that democracy is alive and alert in Kerala. That it has failed so far to produce the possibility of stability is the result of the inability of the Left forces to hold together combined with a resurgence of communalism. This disastrous combination is likely to leave Kerala without democracy for some years.

It cannot be insisted too strongly that the combined votes of the two Communist Parties, the RSP and, to an extent, of the SSP demonstrate that the Left has not retreated an inch in popular support since 1960, that it seems to have crossed the 40 per cent barrier even without unity. Given an united front, the Left will sweep Kerala. The accumulated and spreading discontent against the Congress is reaching the point of detonation in this State. More acutely than ever the problem becomes one of an alternative with a concrete programme of rapid development and equality.

It would be fatal for the Left to imagine that the people will mark time or that their anger against the almost inevitable continued Congress misrule will keep on increasing till the Left reaches a safe electoral majority. The point is that as of now popular anger is tinged with radical hope. It could become anger against the Congress combined with disappointment with the failure of the Left to produce a coherent alternative. If this stage is reached, the Left in Kerala will face a set-back from which it will take long years to emerge.

Strength of Communalism

And it should be remembered that there are other contenders in the field. The Kerala Congress-Muslim League combine has shown a striking strength which is fairly formidable today and fraught with menace in the near future. The Muslim League suffered serious reverses in some of its traditional strongholds at the hands of the Left Communist Party, yet its vote has not gone down substantially. If we add to it the poll of the six "Independents", supported by the League and the Left Communists but who immediately joined the League after their victory, then a slight increase can be noticed. The communal incident at Tanur after voting is an ugly pointer to the allegiance of Muslims in Malabar to the unabashed communalism of the League.

The Kerala Congress was equally unabashed in its reliance on Nair and Catholic communlism, with the former slightly more to the fore. Mannath Padmanabhan demonstrated that in the game of communalism there are very few, indeed, who are his peers. He has also made it clear that he is now thinking in terms of using the success of the dissident Congress in Kerala to push ahead with the formation of similar groups, based on the same social conservatism, in other Southern States — Mysore to begin with. It should not take long for that other octogenarian, Rajaji, to catch on to this game and go forward with his absorption tactic. It may also happen that the Jana Sangh will acquire a real mass base in the South by uniting with and transforming this trend. It should be remembered that Hindu revivalism has got going on a vast scale in the South and that it does not necessarily need a Muslim antagonist to take on a political shape. It can emerge as a genuinely conservative party seeking to freeze social development for as long as possible.

Policy for Leftists

The failure of the Congress to provide any sort of meaningful ethos will soon enough lead to the organised entry of open social conservatism, if it is not compensated by the significant emergence of a radical democratic standard of values. The resources of Hinduism for this are enormous and sufficiently flexible, too, to accept the most Western of models of economic growth.

It should not be imagined that the Kamaraj strategy for Kerala was free of communal considerations. While he banked heavily on rallying the Ezhavas to the Congress banner, he did not overlook the tactic of attempting to drive a wedge in the Nair-Catholic leadership by adopting the late P T Chacko's brother and a prominent Nair Service Society leader as official Congress candidates. At the lower levels there was no lack of appeal to all the communal forces possible. This tactic did not pay off, since the sins of the Congress Ministry were so great and so recent that the electorate could not be cajoled. As things stand, there is very little chance of the Congress rehabilitating itself. What may happen, if Kamaraj follows up his recent attack on the "new class of new rich", is that the Congress will convert itself in Kerala into the minority party of the petty bourgeoisie. This would be such a revolutionary transformation that scepticism about it is more than legitimate.

What should be done by the various Left forces is to follow a policy of patient consolidation and continuous attempts at unity on all conceivable issues. The immediate is, quite obviously, the release of the Left Communists, particularly the detenus who have been elected. It is true that this is an all-India issue but the strength of the protest can and must be at its most formidable in Kerala. There should be no support by the Left to any party or coalition of parties, anxious to form the Government, who are not pledged to do their utmost in this regard. But even this minimum degree of unity will be far from easy. The election campaign has left a trail of bitterness.

Hopeful Trends

There are indications that hopeful trends are emerging in both Communist Parties. It is only to be expected that Namboodiripad would, to begin with, rub home the fact that he has swung the major section of the traditional Communist base behind him. It is equally natural that Achuta Menon should underline the fact that the Left Communists have not been able to achieve the end of instability because of the strength of the Kerala Congress and Muslim League against whom they did not fight. But these initial reactions are wearing off and there seems to be an appeal for rethinking on both sides — each, of course, insisting that the other needs to do more of it! Rather than attempting ideological-political unity, much less organisational merger, it would be more to the point to try for joint campaigns and movements from issue to issue. If this approach is adopted the verdict of the election can still be the basis for the advance of democracy in Kerala even though the State may be without a democratic government.

Working of Public Undertakings

Annual Report on the Working of Industrial and Commercial Undertakings of the Central Government for the year 1963-64 Ministry of Finance, Government of India, March 1965; iv+182 pp.

THE balance-sheets and annual reports of the Central Government's industrial and commercial undertakings are required by statute to be presented to Parliament. In addition, a composite review of all such undertakings was published for the first time in 1962 relating to 1960-61. Since then this review has been published annually and the latest relates to 1963-64. It covers 61 undertakings in which the Central Government has some investment; it also contains a chapter on 10 others, like the Damodar Valley Corporation, in which the Central Government has some investment, without being directly responsible for their management. It excludes departmental undertakings, like the Chittaranjan Locomotive Works, the ordnance factories, etc.

The 61 undertakings have been classified into four categories: "undertakings under construction", "running concerns", "promotional and developmental undertakings" and "financial institutions". Among the running concerns, Hindustan Steel has been separated from the rest and treated separately in view of its size.

Investment

The total investment in the 61 undertakings stood at Rs 1,780 crores at the end of 1963-64, showing an increase of Rs 309 crores over the previous year. Of this, the Central Government contributed the lion's share: 94 per cent (see Table 1). The distribution of total investment among different industries is given in Table 2. The Report says that Government policy is to evolve a capital structure in new undertakings in which equity and loans are roughly equal. At present the proportion of equity capital in total investment is higher. It stands at Rs 1,039 crores as against Rs 741 crores of loans. This imbalance is due to past investments, repayment of loans by some undertakings, and initial investment in the form of equity in new undertakings. The Report anticipates a further investment of Rs 320 crores in public undertakings during 1964-65, and a total investment of Rs 2,400 crores by the end of the Third Five Year Plan. The distribution of property, or gross block, of the public undertakings in various States as on March 31, 1964 is given in Table 3.

The Report proceeds to deal with each category of undertakings separately. For each of them it presents a consolidated balance sheet and a profit and loss account (or income and expenditure account in the case of promotional and developmental undertakings and financial institutions), as well as an analysis of the accounts of each undertaking.

Undertakings Under Construction

Fourteen undertakings are described as being under construction. These undertakings had 30 different schemes under implementation during the year at an estimated total cost of Rs 1,300 crores. Investment in these undertakings at the end of the year stood at Rs 397 crores and accounted for 22 per cent of total investment (see Table 4).

The most important undertakings in this category, in terms of investment, are Heavy Electricals, Heavy Engineering Corporation, Neyveli Lignite Corporation, Indian Refineries and Bokaro Steel. Indian Refineries was amalgamated with Indian Oil on September 1, 1964 to form the Indian Oil Corporation. The construction of Bokaro steel plant was originally entrusted to Hindustan Steel, but a separate company, Bokaro Steel, was incorporated on January 29, 1964. The two oldest undertakings still under construction are Heavy Electricals and Neyveli Lignite Corporation, both having been incorporated in 1956. Heavy Engineering Corporation, Ranchi, and Indian Refineries were incorporated in 1958, and Bokaro Steel in 1964.

The report throws some light on the reasons for the delay in completing the Heavy Electricals project. The project report was received in November 1956. But subsequently adjustments were made in the types of products, entailing changes in the design of the plant and raising costs. Then in September 1963 the Government approved the execution of certain ancillary and supplementary works to provide for diversification of production, and also approved in the same month an expansion of the plant to

manufacture steam turbines and turbo-alternators.

Hindustan Steel

Hindustan Steel has been treated as a separate category by itself because the investment in it, Rs 804 crores, represents 45 per cent of all investment in running concerns. HSL's turnover in 1963-64 was Rs 181 crores, as compared to Rs 124.4 crores in the previous year, and there was a gross surplus of Rs 45 crores. After providing for depreciation and interest, this turned into a loss of Rs 4.8 crores, as compared to a loss of Rs 23.9 crores for 1962-63. (Due to certain adjustments relating to previous periods, the loss at the close of the year rose to Rs 6.8 crores.) The cumulative loss rose from Rs 61.6 crores in the previous year to Rs 68.4 crores at the end of 1963-64.

Production in HSL's three steel plants had more or less reached installed capacity during the year. Production of ingots and saleable steel was 97 per cent and 94 per cent, respectively, as against 83 per cent and 76 per cent last year. The selling price of steel of all categories was controlled up to March 1, 1964. Since then price control has been retained only on certain items in short-supply, following the recommendations of the Raj Commmittee. The prices of decontrolled categories are fixed by a Joint Plant Committee in which Hindustan Steel is represented along with other main producers.

Programmes for expansion of all the three plants are under way. The Rourkela plant is being expanded to 1.8 million tonnes of ingot capacity, Bhilai to 2.5 million tonnes, with provision for further expansion to 3.5 million tonnes during the Fourth Plan, and Durgapur to 1.6 million tonnes, also with scope for further expansion to 3.5 million tonnes during the Fourth Plan.

An alloy steel plant is being put up at Durgapur with an initial capacity of about 0.1 million tonnes of ingots. Construction is behind schedule and the plant is expected to go into production in 1967 instead of 1966.

Hindustan Steel also owns and manages a fertiliser plant at Rourkela which uses the nitrogen released in steel making. The Fertiliser Corporation of India operated the plant till April 30, 1964 on behalf of Hindustan Steel. However, to secure greater coordination through common control of both the steel and fertiliser plants, its management was taken over by Hindustan Steel. Production in 1963-64 was only 25 per cent of rated capacity, due to inadequate supply of coke-oven gas.

Other Running Concerns

There are 33 concerns other than HSL which are classified as running concerns. Of these the first annual accounts for two—Janpath Hotels, incorporated in September 1963, and Central Road Transport Corporation, established in March 1964—were not due yet. For the Minerals and Metals Trading Corporation 1963-64 was the first year of operation. In terms of percentage of paid-up capital the aggregate net profit of the remaining 30 concerns rose to 8.1 per cent from 7.3 per cent. Similarly, the percentage of net profit to net worth rose to 6.9 per cent from 6.4 per cent. Gross profit as a percentage of capital employed, however, remained stationary at 7.5 per cent.

Taken individually, two concerns suffered losses, eight showed a decline in profitability (among them the National Coal Development Corporation and the State Trading Corporation) and 20 improved their profitability, formost among them Hindustan Machine Tools, Hindustan Antibiotics, Air-India and Indian Airlines.

Developmental and Financial Undertakings

There were nine promotional and developmental undertakings. Total investment in them at the end of the year under review was Rs 117 crores (equity Rs 94 crores; loans Rs 23 crores) as compared to Rs 81 crores in the previous year. This forms 6.6 per cent of total investment in public undertakings (Table 4). The working results of these undertakings showed an excess of income over expenditure of Rs 66 lakhs, after taking into account grants totalling Rs 45 lakhs from the Central Government.

Four undertakings are classified as financial institutions. Total investment in them was Rs 80.9 crores (equity Rs 13 crores, loans Rs 67.9 crores) at the end of 1963-64 as against Rs 68.2 crores in the previous year. This forms 4.5 per cent of the total investment in public sector undertakings (Table 4). Their working results showed an excess of income over expenditure of Rs 88.9 crores. Of this Rs 87.6 crores came from the Life Insurance Corporation and Rs 1.3 crores from the Industrial Finance Corporation.

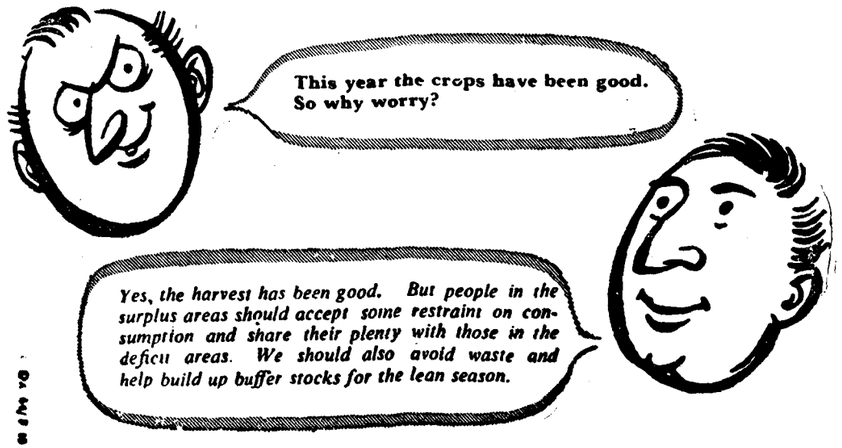
Total	*3,92,239*	*3,43,860*	*1,03,79*	*91,25*

The total investment (excluding loans) of the Central Government in the 10 undertakings not managed by the Central Government amounted to Rs 64 crores at the end of 1963-64. The bulk of this, Rs 59 crores, was in the Damodar Valley Corporation and Oil India. Eight of these Undertakings declared dividends of which the share of the Central Government was 2.01 crores. This worked out to a return of 11 per cent on a capital investment of Rs 18.17 crores. The Damodar Valley Corporation, one of the remaining two concerns, had received upto 1962-63 Rs 51.2 crores and Rs 1.1 crores for power and water supply, respectively, on a net capital expenditure of Rs 164.1 crores.

Internal Resources



The Third Five Year Plan envisages a contribution of Rs 300 crores from public sector undertakings in the form of "internal resources". Internal resources represent the amount available after providing for working expenses, current replacements, interest and dividend. This amount may be retained by an undertaking for financing its capital outlay, and will consist of mainly depreciation provision, appropriation to the different reserves, and any other provision in excess of actual requirements and amounts "carried forward' to next year in the balance sheet.

During the first three years of the Third Plan total internal resources amounted to Rs 128 crores, of which the addition in 1963-64 was Rs 60.9 crores. Almost half of this came from Hindustan Steel (Rs 28.3 crores), the second largest contribution being that of the Fertiliser Corporation of India, with Rs 6.9 crores. However, the Fertiliser Corporation was at the top of the list of undertakings which had used internal resources for the creation of capital assets, having utilised Rs 28 crores.

The turnover of all the undertakings (excluding financial institutions) totalled Rs 550.1 crores, an increase of 33 per cent over last year's figure of Rs 414.9 crores. Of this about Rs 33.3 crores were from undertakings under construction which had started production during the year. The turnover in 22 running industrial concerns, inincluding Hindustan Steel, and in 5 units of undertakings under construction, was Rs 332.2 crores. The turnover of the nine promotional and developmental undertakings was Rs 11.7 crores, and that of 10 undertakings engaged in trading, transport, construction and miscellaneous activities was Rs 206.2 crores. Of these, the turnover of the Indian Oil Company showed an increase of Rs 31 crores, from Rs 21.4 crores to Rs 53.4 crores. The turnover of the State Trading Corporation, however, decreased from Rs 86.8 crores during the previous year to Rs 80.4 crores in 1963-64, reflecting the transfer of trade in mineral ores and metals to the new Minerals and Metals Trading Corporation of India.

The total working capital of Hindustan Steel and the 31 other running concerns on March 31, 1964 was Rs 264 crores, representing 7.7 months' value of production in business of these undertakings. The inventories held by Hindustan Steel at the close of the year aggregated Rs 95.3 crores. This represented 9 months' value of production as compared to 10 months' last year. Inventories held by the other running industrial concerns represented an average of 14 months' production. Some of these undertakings, however, held inventories which were very high indeed. Hindustan Aircraft and Hindustan Shipyard held inventories of the value of 40 and 37 months' production, respectively. The broad distribution of inventories of the running industrial concerns is given in Table 5.

Table 6 shows the number of employees of the public undertakings and wages and salaries paid during 1963-64, as compared to the previous year. The number of employees in the public undertakings increased by 14 per cent over the previous year.

Planning and Growth in Pakistan

Amartya K Sen

The Strategy of Economic Planning : A Case Study of Pakistan by Mahbub ul Haq; Oxford University Press, Karachi; 278 Pp; Price in India Rs 31.25.

"ALL economic plans read alike." Thus begins this treatise by Mahbub ul Haq on the strategy of economic planning. "If one picks up the plans of India, Pakistan, Ghana, Egypt, Nepal or Ceylon, at random, what is surprising is not their apparent differences but their basic similarity. This is no accident. This basic similarity in planning techniques is due to the basic similarity of their problems of development." If this is true of development planning in general, it is all the more true of development planning in India and Pakistan, for our problems are remarkably similar. In view of this, it is perhaps more than a little surprising how little study of planning experience in Pakistan is made in our country. And if the Indian economist wants an introduction to the subject, he cannot do better than be guided by Mahbub ul Haq's astonishingly lucid presentation.

Growth Philosophy

The book has seven chapters and three Appendices. There is, to start with, a chapter on approaches to economic planning, where the problems of accumulations of capital are discussed in the context of "a growth philosophy" in general, and in terms of four alternative definitions of a "socially necessary rate of growth", in particular. Four criteria of adequacy are used: (a) to maintain per capita incomes; (b) to absorb net current additions to labour force during the plan period; (c) to keep the country abreast of its underdeveloped neighbours in its economic race with them; and (d) to maintain the momentum of development and lead to a self-sustained growth in the long run.

The literary arguments are supplemented by numerical exercises of a contrast between what Haq calls "the Russian model" and "the Rostow model", which "is basically a comparison of high and low growth rate models and has nothing to do with the political background of each model". Haq concludes that "the sacrifice of consumption is less, not more, in choosing a higher growth model". The clue to the apparent paradox is in judging "sacrifice" of consumption not in terms of the ratio of consumption to income, which individuals tend to do, but in terms of alternative profiles of consumption level as such. With a 25 year horizon that Haq uses, combined with a given capital-output ratio, the result is indeed not surprising, and fits in well with recent discussions of optimum accumulation in terms of a Harrod-Domar type of model. Haq argues his case extremely persuasively, and supporters of "bold planning" in India will find it useful to look through this section carefully, including his pointed reminder that "if India and Pakistan manage to maintain an annual growth rate of 5 per cent and pass through roughly the same 'take-off' period as Rostow identifies for many of the Western countries, their per capita income after another twenty years will be no higher than the present-day per capita income in Egypt".

Shadow Prices

The second chapter goes into the "rationale" of planning decisions. There is a versatile discussion of "shadow prices", with rapidly alternating presentation of economic theory and practical problems, with the discussion concentrating on the shadow prices of unskilled labour, capital and foreign exchange. What Haq takes up is really an exercise in the theory of the "second-best", and the reviewer finds this chapter a little too sanguine. However, it should be borne in mind that Haq claims no greater merit for his rules of thumb in shadow prices than that "there is some virtue in deriving rough and ready shadow prices for planning purposes and in experimenting with them on a basis of trial and error, till economic theory provides a better basis for the empirical derivation of shadow prices". There are, in addition to all this, interesting discussions on the role of an "infrastructure", and some useful thoughts on controls, and on government policies related to conflicting objects like growth and social justice.

The third chapter is on a long-term growth model for Pakistan. This is done largely at an aggregative level, using considerations outlined in the previous two chapters. In this chapter and the ones that follow Haq's role as one of the chief architects of Pakistan's economic planning has to be borne in mind, for Haq shuttles between his own notions of optimality and the ideas implemented in Pakistan's planning. Haq is no blind admirer of the way things are going in his country; indeed quite the contrary. But he sees hopeful signs in "the recent revision of the Second Plan...in favour of a higher growth path."

Haq envisages a bold plan of export expansion, but notes himself that "such 'high' targets for exports will cause eyebrows to be raised because Pakistan has been having considerable difficulty in maintaining her export earnings, let alone increasing them". He indicates several channels of possible expansion, including a closer trade link with India. Even with all this export optimism, however, Haq sees no way of escape from building up a sizeable capital goods sector within the economy. This touches on a point of some controversy in India today, and the Indian reader might lament the fact that Haq does not give more data on the comparative economics of domestic production and exports, with which he is undoubtedly concerned as a practical planner in Pakistan, and which undoubtedly forms the raw materials to his conclusions that he reports in this section.

Regional Planning

To the reviewer, much the most interesting and important chapter in the book is Chapter 4, which goes into models for regional planning. The question of the contrast between the two wings of Pakistan has been a burning one in that country, and not surprisingly Haq devotes a great deal of time and analysis to a study of this problem. The background to the problem is lucidly clarified. He starts with a comparison of formal income data, which indicates that in 1959-1960, the per capita income of West Pakistan was 29 per cent higher than that in the eastern wing. Then several refinements are introduced. The remarkable difference in the structure of relative prices in the two wings is noted. Under such circumstances comparison of real incomes has several notorious difficulties. Haq uses a basis of comparison which will probably be criticised by some, but which seems to have some strong merits. He notes that "in national income terms, one ton of rice in East Pakistan has more than twice as much value as one ton of wheat in West Pakistan, whereas one ton of rice has roughly the same nutritional value as one ton of wheat". When Haq makes a correction for this, taking nutritional equivalence to be equivalence in terms of satisfaction, it turns out that the "true" extent of the disparity in per capita incomes of West and East Pakistan in 1959-1960 was about 60 per cent rather than 30 per cent.

How sound is this correction? It might be thought that it runs quite counter to consumers' sovereignty which provides the basis for conventional national income comparisons, and in some sense it does. But perhaps not as much as might appear at the first sight. There is no doubt that an East Pakistani will get a great deal more satisfaction from a ton of rice than he will get from a ton of wheat, nutrition or no nutrition. But what is being compared is not how much satisfaction an East Pakistani gets from one ton each of the two crops, but how much satisfaction an East Pakistani gets from a ton of rice compared with the satisfaction that a West Pakistani gets from a ton of wheat. And it is not at all clear why it should be assumed that the relative prices of rice in East Pakistan and wheat in West Pakistan represent relative satisfactions that the two groups of people get from a ton each of the respective cereals.

Relevant to India

The whole problem arises from the fact that conventional national income comparisons make sense when the two groups compared can be assumed to have the same tastes and when they face a uniform set of prices. Neither condition holds, and the contrast in both the fields is very sharp. Under these circumstances assuming nutritional equivalence to be the same thing as equivalence in terms of satisfaction is still open to doubts, but does not seem to be inferior to any other basis of comparison that one can think of. In this exercise, Haq suggests an approach that might well be found interesting and useful in the context of regional national income comparisons in India also.

The detailed vector-comparison that Haq supplements his analysis with is also quite significant, and confirms his thesis that conventional national income comparisons understate the degree of disparity. It seems that "an average West Pakistani consumes about 19 times as much electricity, about 10 times as many cars, about 8 times as much tea and petrol, about 7 times as many radios, about 6 times as many cigarettes, about 3 times as much cloth and sugar, and about twice as much paper and coal as an average East Pakistani."

Disparity and Government Policy

It turns out also that the disparity has been growing between the two wings, and part of the reason seems to have been the result of government policy itself. Haq estimates that each year 1 to 2 per cent of East Pakistan's income has been transferred annually to West Pakistan, and this transfer along with a disproportionately higher allocation of foreign borrowings and aid, has allowed West Pakistan to maintain an investment rate of 12 per cent with a regional saving rate of only 7 per cent in the pre-Plan period (up to 1955) and 5 per cent in the period of the First Five Year Plan. The other side of the coin is seen in East Pakistan's regional saving rate of about 7 per cent in both these periods with a gross investment rate of 5 per cent in the pre-Plan period and of 6 per cent in the period of the First Plan.

In the light of this background, Haq considers alternative models for regional planning. He rejects any plan that will increase the present disparities, and considers the requirements of an egalitarian plan that will eliminate the disparity altogether by 1985. A plan of maintaining constant disparities is also considered, but since this is done in absolute terms, with differential rates of population growth, this amounts to some intensification of disparities of per capita income. The implications of the model of elimination of disparity are judged to be unrealistic in terms of the necessary marginal savings required and also in terms of the possible upper limit to the acceleration of the pace of growth in East Pakistan. Haq ends up by recommending a regional plan lying somewhere in between the maintenance of the disparity and complete elimination of it. The exact plan outlined is relatively less instructive from the point of view of economic insight, than the considerations underlying the problem that Haq analyses with such lucidity and force.

Chapter 5 goes into an evaluation of Pakistan's First Five Year Plan. The targets and policies are discussed, and the underlying methodology is analysed. The neglect of a producer goods sector and of mining comes under heavy fire, and so does the neglect of primary education in contrast to higher education, and the lack of a satisfactory agricultural policy. The picture about domestic savings is discouraging, related to what Haq finds to be an inadequate spelling out of policies in this field, and it appears that the marginal rate of saving was *minus* 21 per cent in this period.

Haq, however, gives better marks to the Second Plan, which came into operation in 1960, and which is just reaching completion. Some shortcomings are, however, listed, and the Indian reader might find it interesting to note that Haq's list of these is very similar to what seem to have come out to be the shortcomings in his neighbouring country as well. I cannot resist the temptation of quoting: "These include: lack of basic information on private investment, domestic saving, foreign exchange component and income distribution; distortion of Plan priorities in the course of actual implementation; an inordinate rise in the cost of various projects above the original estimates; increase in the general price level affecting the cost of development; excessive dependence of project-type assistance which conflicts with the sanctity of national planning; and the lack of consumption planning."

Moderate Blue-print

The last chapter outlines a "blueprint for Pakistan's Third Five Year Plan", which starts with the classic statement that "blue-prints are usually embarrassing"! In some ways this is indeed a weaker chapter than the rest of the book, as in fact one would expect. Its main usefulness lies in clarifying the lessons learnt from the earlier two plans, and in putting into focus some of the general ideas that form the core of Haq's general approach to planning. As a document it is not unlike various proposals that make the rounds in New Delhi about a year and a half before the next Plan is due to begin. The tone here is rather more moderate in contrast with the radicalism of the earlier chapters of the book, and some of the readers could feel that the pointed analysis of the

earlier part of the book does not get adequate representation in the blueprint put forward by Haq. This might, however, be a futile complaint, for it is perhaps shaped as much by the considerations of economic optimality outlined by Haq, as it is by his conservative evaluation of political feasibility. There are three Appendices to the book, providing the background sums to Chapters 3, 4 and 5.

Altogether the book is a very impressive one, and the reader will find Haq's presentation of Pakistan's planning problems to be extremely lucid and interesting, and his general approach to development planning to be deep and instructive. Some of the more technically minded readers might lament the absence of such creatures as input-output tables and other modern quantitative techniques of development planning. But the document is not concerned with that kind of issue at all, and goes deeply into a type of planning problems that fit in well with Haq's own fields of interest.

There is, however, one technical point on which I would like to take issue with Haq. This is on his suggestion that "in the case of unskilled labour, it should be legitimate to use a shadow price which is x per cent lower than the market price if unemployment is x per cent in the country". Why? Haq points out that "if all the labour force can be employed with the existing total wage bill, it will increase

INDIAN COTTONS LABELLED

·SANFORIZED· REGD TD MK

carry the identical assurance of quality and shrinkage control anywhere in the world

All fabrics bearing the label 'SANFORIZED', in India and the world over, carry the same assurance of a reliable, uniform standard of shrinkage control recognised and trusted by millions wherever cottons are sold.

Last year, many of the 56 registered users of the trademark in India recorded an impressive rise in exports—five, seven, eight and even nine times above their 1963 figures. Even more significant, India's exports for the first nine months of 1964 of cloth labelled 'SANFORIZED' exceeded the total of similar exports for the whole year of 1963 by over 30%! A positive indication that use of the trademark helps our fabrics to earn more and more foreign exchange.

Such a spectacular increase in exports is proof enough that Indian fabrics labelled 'SANFORIZED' can compete successfully in world markets. They are in demand because they conform to the same shrinkage standard as cloth bearing this trademark anywhere in the world.

Issued by Cluett, Peabody & Co., Inc. (Incorporated in the U.S.A., with limited liability) proprietor of the registered trademark 'SANFORIZED'. The proprietor uses this trademark or permits its use by registered users, only for tested fabric which meets its strict residual shrinkage requirements.

For information: 'Sanforized' Service, 95, Marine Drive, Bombay 2

the total production without reducing the total investible funds. This means that if a certain percentage of the labour force remains unemployed at the ruling wage rate, then the wage rate should be 'reduced' by the same percentage so as to employ all the labour force with the same fund as before."

One can view a shadow wage rate in two ways: either as a pure *accounting* concept without any change in the actual cost of employing labour to employers, or as the cost of labour employment that is *actually reflected* on to the employer through taxes and subsidies. In the context of the former, there is obviously little justification for the proposed shadow price. Since the origin of the problem that Haq considers is the consumption-creating effect of additional employment, even when there is surplus labour, it is not clear how an x per cent reduction in the accounting wage rate without any change in the actual wage rate will make the allocation right. For the private sector, however, he takes the concept in the latter sense, and recommends that the employers be actually subsidised to the extent of x per cent of his wage cost, and the cost of it be met by taxation on the wage earners in general; or alternatively, by taxing profits.

But is this all right? If we do grant that the fiscal machinery is so powerful that it can keep the consumption level constant through these means irrespective of the wage bill, should not then the relevant shadow price simply be given by the appropriate alternative marginal productivity of labour? (Note that considerations of the second-best type are not introduced.) Perhaps the following procedure will make the point involved clearer. We assume unemployment and a fiscal machinery of the type considered by Haq. Let the government first consider a shadow wage rate of zero, by subsidising the entire wage rate and having the desired level of consumption through taxes of one kind or another. If at this shadow wage rate of zero, the entire labour force is absorbed and there is an excess demand, then clearly this was the wrong wage rate. Then, instead, a positive shadow wage rate is considered, and higher and higher values of this wage rate is taken until the labour market completely clears. Presumably at this point the marginal product of labour in every field just equals the wage rate and, therefore, equals each other. Except through a pure coincidence there is no reason to expect that this wage rate will turn out to be just equal to that obtained by taking x per cent off the initial market level of wages when x is the percentage of initial unemployment.

The essential point to note is that if the fiscal machinery is really powerful enough to keep consumption at the level desired, i e, to give the desired pattern of capital accumulation, then the only condition that the labour market has to satisfy (assuming that other markets are competitively cleared) is that the marginal productivities be equated all around and equal the supply price of labour. The current ratio of unemployment does not come in at all unless we happen to make some coincidental assumptions. If we wish to bring in fiscal limitations, as some people have tried to, then the relevant labour cost can be calculated only by explicitly bringing in the extent of the limitation. If there are some distortional effects of taxation, or some other costs attached to a high level of taxation, that too must be brought in. There is no *a priori* reason to expect that the shadow wage rate calculated in this way, with an explicit statement of the fiscal limitations and an explicit statement of the objective function involving present and future consumption will turn out to be equal (or even be close) to x per cent below the initial market wage rate when x is the proportion of initial employment. I should, however, add that this point is not crucial to Haq's approach to development planning, and indeed whether the rule of thumb of shadow wage rate that is proposed by him is taken or not, does not affect the general run of his arguments in the rest of the book.

Goodwill at Economists' Level

In conclusion, it is worth emphasising that Haq's admirable book should be studied by all students of development planning, not only because of the light it throws on the problems of Pakistan, but also because of the general range of issues that Haq succeeds in covering in this slender volume. The question of regional disparities is, in particular, an extremely important one for practically all underdeveloped countries, irrespective of whether it is as big as India, or whether it is as small as British Guiana. Haq himself is from West Pakistan, but his wife, who is an able economist in her own right, is from the East. The work is acknowledged by Haq to have been done in close co-operation with her, and indeed it seems to be a very good team to work on this thorny question on regional disparity. Indeed, the question of regional allocation has engaged some of the best brains of Pakistan, as indeed one would expect. The same interest, I am afraid, has not been expressed on this question in India. No doubt this is partly because the contrast takes a particularly sharp form in Pakistan because of its division into two nearly equal wings, whereas in India the regional disparities get more diffused because of the variety of Indian divisions. But this does not mean that the problem is any less serious in India, and in fact the "real" income contrast between some of the Indian States (e g, Punjab and Orissa) may well turn out to be greater than that between the two wings of Pakistan. Indian economists can gain considerably from studying this aspect of Pakistani economists' thinking.

One final comment on the economic thinking in the two neighbouring countries may not be out of place. Not only are the economic problems faced by the two countries similar, one is continuously struck by the impartiality and goodwill in terms of which the best Pakistani economists seem to discuss the problems involving the two countries. This is in sharp contrast with the feeling of competition that the leaders of the two countries are known to feel, and a study of the impact of which on planning provides one of the themes that Haq discusses, viz, the plannig objective to "rival growth rates experienced in neighbouring underdeveloped countries". Haq's analysis of this "economic competition" is eloquent. "This economic competition may be overtly publicised or dimly felt; it may be the reflection of a political struggle or an ideological competition; it may be overplayed sometimes to attract attention and get more aid (as India's competition with China) or underplayed sometimes to keep public expectations in check (as Pakistan's competition with India); but it remains a hard reality." Indeed it does, but the benign side of the reality includes the fact that the penultimate sentence will probably be resented by proportionately just as many Pakistanis, as the sentence before that will be resented by Indians. And at the risk of sounding somewhat sentimental and gooey, I would like to suggest that in this there is a lot of hope.

When Durgapur's 1500 ton blast furnace

Provide Electrification for blast furnaces? It's just the job for G.E.C., who have specialised in heavy electrical installations for so many industries. In Durgapur, G.E.C. are playing their part in providing the electrification for the new 4th Blast Furnace, the Gas Cleaning Plant and the Material Handling Plant, being supplied by Head Wrightson. When commissioned, the giant furnace will increase Durgapur's production by over half a million tons of ingot steel a year.

Integrated steel plants, mines, refineries, chemical factories, textile mills, naval dockyards... G. E. C. have experience of every kind of electrification project, in both heavy and light engineering industries. G.E.C.'s know-how is your guarantee of a job well done. If your problem is electrical—call G.E.C.

Structure of Trade Union Organisation

P K Ghosh

The structural organisation of the Indian trade union movement has been shaped by a variety of factors.

Predominance of unskilled and semi-skilled workers, vast differences in employment conditions in different industries and industrial regions, workers' concern with their immediate problems at the plant level, and the leadership of outsiders eager to maintain their hold over isolated small unions have combined to foster the growth of independent industrial unions, particularly of the one-shop variety.

The solidarity and cohesion which go with homogenous national unions are thus lacking. Horizontal organisations in the form of trades councils and co-ordinating committees are occasionally formed at the city level, but these are mostly ad hoc *bodies.*

The diverse pulls of political ideologies and sharp differences among the trade union leaders have remained too strong so far to allow a national trade union centre to be established.

THE character and philosophy of a country's labour movement are closely bound up with the structural pattern of its trade unions. The structure of union organisation not only determines the strength and cohesion of membership, but also plays an important role shaping inter-union relations, union policies, control of unions and the possibilities of union reform.[1] The growth of trade unionism in India has been a fascinating subject of study in more than one respect. The origin of the movement lay in the philanthropic zeal of social reformers, but it has acquired a distinct political tinge in more recent times. The rank and file workers have also developed a class consciousness with the emergence of new industrial towns over wider areas and their conglomeration in particular regions.

Whether the labour movement will become a recognisable social force in due course of time is a matter of conjecture. But there is no doubt that it is increasingly gaining ground as a distinct political force entrenched, as it is, in some of the key sectors of the economy. In any case the present trends indicate that potentially organised labour is destined to play an important role in the industrial society of tomorrow. The future in this respect is impregnated with interesting possibilities in view of the new strategies which organised entities are likely to devise and adopt in a mixed economy. The present paper aims at tracing the evolution of the organisational structure of trade unions in India, and analysing the implications of that evolution with reference to inter-union relations and national trade union policies.

The term 'Organisation' signifies a co-ordinated set-up geared to the achievement of specific objectives. The structure of an organisation indicates the relative position of its constituents determining the scope of their respective functions and the degree of mutual dependence in the common endeavour. The organisational structure of any institution may be either horizontal or vertical. In a horizontal organisation, the units are at the same level of authority in their respective spheres of activity. For mutual co-operation and functional co-ordination the constituents have a council or board in which representatives discuss common issues, lay down common policies and programmes of action. The unity thus derived rests on the realisation of the commonness of issues and the conditioning factors which make for the significance of mutual co-operation. The relationship between the constituents in a vertical organisation is hierarchical. This presumes more than one level of authority in the set up, the lower level constituents being subordinate to those at the higher level.

Organisation at Various Levels

The hierarchical relations in this type of organisation may be of two kinds, viz, federal or unitary. The constituent elements may be united in a federation thereby retaining their independent status except for certain common purposes and ends. The federating body has powers and responsibilities only with regard to the matters of common concern. The constituents are affiliated to the federation and surrender their right of independent action over a specific area or in respect of broad policies. In the alternative, there may be a central body with direct membership of the constituents and possessing unitary power and authority. The constituents enjoy only delegated powers, and function as so many arms and wings of the parent body. They have no independent authority nor any separate entity of their own.

To start with it may be useful to recognise the alternative bases of trade union organisation at the primary level. The basis of organisation may be somewhat restrictive or liberal. Thus workers may be organised on the basis of identity of 'crafts' or 'occupations' or 'clearly defined skills' (Craft Unions); or on the basis of employment in a particular industry or trade (Industrial Unions); or on the basis of employment under a common employer owning more than one establishment (Common Employment Unions); or membership may be open to all workers irrespective of the craft or industry in which they are employed (General Unions). But small, independent unions organised at the shop, plant or local level do not become viable units. They do not have sufficient organisational strength to face the opposition of employers who are also organised in their own interest. Moreover, to influence state action in the interest of the working class they have to have an united front to initiate desirable moves and counteract the power and influence of the employers' organisation. Trade unions at the primary level must therefore be united on the regional or national plane whether on the basis of crafts, industries, or in a general way.

The organisational structure with wider coverage may be centred round homogeneous national unions with direct membership of the workers. It may have local units at the plant level acting as so many branches. The central body may also form zonal or regional committees for effective co-ordination of activities over limited areas, the general policies and programmes being laid down by the central union. Alternatively, trade unions formed at the plant level may be united in a federation with the individual unions retaining their separate existence. They enjoy autonomy of action except for certain common policies framed by the federal body. The essential difference between the two types of vertical organisations is that the national union exercises direct control over the activities of its constituents whereas the federation is more or less a co-ordinating body having regulatory

powers which the affiliated unions choose to surrender in mutual interest. Yet another way in which the primary unions may retain their right of independent action as well as separate entity and also derive the benefit of organisational unity, is by means of horizontal association. At the local level, the independent unions may form 'trades councils' or 'co-ordinating committees'; at the regional or district level there may be Regional/District Committees or Councils, while at the national level, the representatives of national unions or federations may constitute the national trade union centre. This form of organisation obviously presupposes the existence of a broad basis of trade union unity at all levels.

The relative merits of industrial unions over the craft and general unions are well known. In India, as in many other countries of South-East Asia, the trade union movement has been predominated by industrial unionism. Craft unions did not thrive in the early stages of industrialisation because of the small number of recruits in skiled occupations and the corresponding predominance of semi-skilled and unskilled employees in the working class. Partly this was also due to the lack of initiative on the part of skilled workmen who enjoyed better conditions of employment as a result of their relative scarcity. Later on, when large industrial establishments adopted capital intensive methods of production and the size of industrial workers increased, the scope of craft unionism was further reduced through the diffusion and dilution of industrial skils. There are exceptions no doubt to this general trend. The Ahmedabad Textile Labour Association which is a local federation of several craft unions is the most outstanding example of union organisation on craft basis. Similar organisations also exist in certain professional occupations like those of the working journalists, maritime workers, etc. But these are not the common union types.

On the other hand, general unionism has also not found favour with union organisers as working conditions differ from industry to industry, and workers belonging to any particular industry cannot feel certain that sectional interests would be made a common cause. Moreover with the growth of industrial employment, workers have been more urgently concerned with the improvement of working conditions in particular establishments rather than fighting for any general cause. Actually this single motivation in unionisation has led to the formation of more one-shop or plant-level unions than unions for particular industries as a whole. For more or less the same reason, the basis of unionisation has been the 'place of work' rather than the 'place of residence'. The leadership has encouraged this trend in their own interest. It is obviously easier to maintain one's hold over small unions organised at the plant level. General unions have a tendency to become too big to be controlled and managed by union leaders having limited ability. It is true that one-shop unions have small membership which makes them financially and organisationally weak. But with larger membership, the strength of general unions is also reduced by sectional pulls and coterie formation on industrial and occupational lines, besides the common malady of religious, linguistic and political cleavages among members, which pervade all types of unions.

Federations vs National Unions

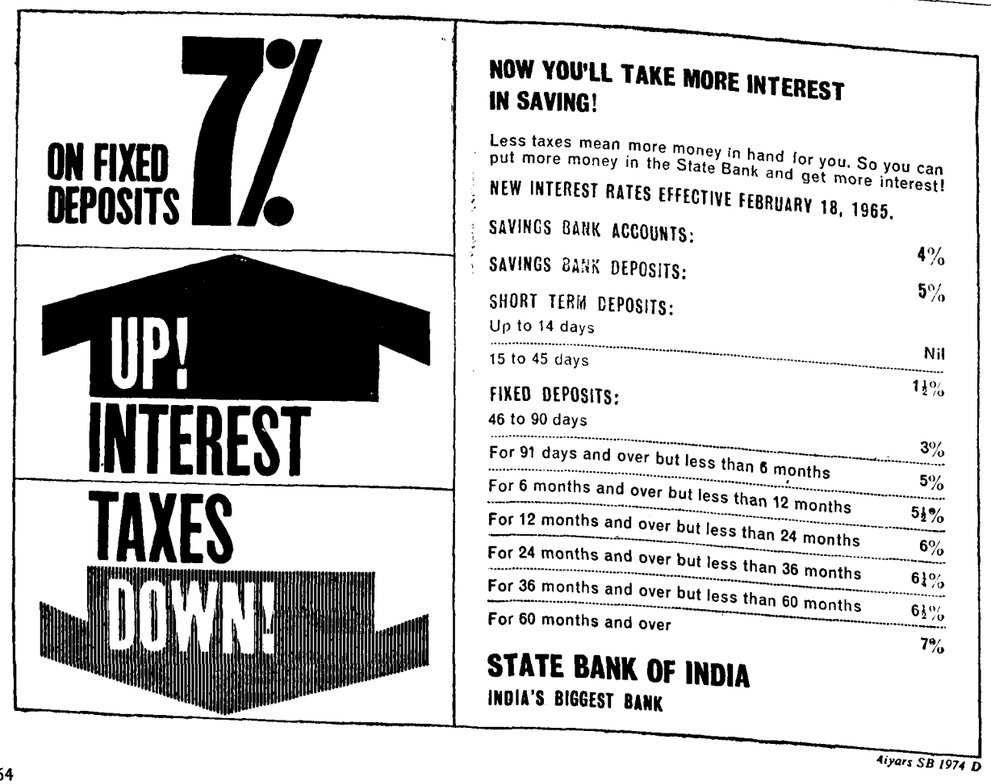
Trade unions at the shop or plant level cannot function effectively if they remain in isolation. There are three reasons which make for the growth of organisations on a wider plane: (a) to co-ordinate the activities of small unions in the general interest of all workers, (b) to counteract the organised strength of employers, and (c) to influence the legislative and administrative organs of the state in the workers' cause.

An unmistakable trend in this growth is the emergence of federal organisations with affiliated unions, and the virtual absence of national unions with direct membership of workers. There are at present four all-India national federations and a large number of industrial federations. In the former category are: the Indian National Trade Union Congress (INTUC), All India Trade Union Congress (AITUC), Hind Mazdoor Sabha (HMS) and the United Trade Union Congress (UTUC). Among the more important industrial federations are the National Federation of Railwaymen, All India Defence Employees Federation, All India Seafarers' Federation, Port and Dock Workers' Federation, National Federation of Post and Telegraph Workers' Unions. Of course, the federal structure does not pervade the entire field. The number of unaffiliated trade unions is quite large. Out of about 6600 trade unions which submitted returns in 1959-60, only 1500 were reported to have been affiliated with federations which numbered as many as 66.[2]

Ordinarily a federation is a loose type of organisation, in which the affiliates retain separate entity and power of decision making on their own initiative. The federation is at best a co-ordinating body having powers to negotiate with employers' organisations and make representation to the Government on matters of general importance. This does not make for the same kind of organisational unity in the workers' ranks as could possibly be had in the alternative form of homogeneous national unions with unitary powers of regulation and control. An important source of strength of trade unions in the United States is said to be the 'existence of national unions which, in times of need, can marshall the finances, the leadership and the moral support of members throughout an industry, not simply in one plant or locality.'[3] The same kind of cohesion, solidarity and strength cannot surely be had in the federation of independent unions.

Since there is decentralisation of power in a federal organisation, it is sometimes contended that the diversity of employment conditions in different establishments justify a federal structure of trade unions. For it is within such an organisation that local unions can maintain close touch with the workers and thus handle specific problems more promptly as well as in accordance with the local conditions. Dearth of capable leadership is a serious handicap in national unions especially because leadership is yet to grow out of the rank and file workers and because of the absence of educated personnel in the membership of unions. Basically it is also difficult to finance and administer national unions with direct membership spread over the country. On the other hand, foreign experience suggests that these unions often lead to over-centralisation of powers and oligarchic management. Moreover, it suits the convenience of outside leaders to retain greater independence of action at the local level as the growth of homogeneous national unions poses a threat to their power and prestige. Communal, linguistic and political rifts create inter-union rivalry. Thus even small unions are keen on retaining separate organisational entity and as much power of independent action as possible. This line of reasoning, however, takes only a

short-sighted, narrow view of things, and is a sign of immature unionism. For organisational solidarity and strength are more important in trade union organisation. These are better assured under the homogeneous national unions than in federal organisation.



Although a vertical structure of organisation through federation of independent unions is more conspicuous in India, there is some indication of a horizontal structure also evolving side by side. At the local (city) level, or the regional (district) level the trade unions have felt the obvious need for mutual co-operation and co-ordination of activities. There are instances of co-ordinating committees or trades councils being formed in the more important industrial towns. The earliest organisation of this kind was the Bombay Trades Council formed sometime in 1928. But it did not survive the test of time. Other similar attempts also led to the formation of only temporary ad hoc committees for limited ends e g, securing mutual support at the time of making a representation or organising strikes. Such co-ordination committees were formed in Ahmedabad (1952), Jamshedpur (1953) and Calcutta (1955) for staging general strikes.

Multiple Trade Union Centres

The most crucial aspect of horizontal organisation is however the growth of more than one national trade union centres based on political ideologies. The significance of a single united national centre of trade unions arises from four essential needs: (a) presenting an united front of the working class as a separate force influencing social and economic policies; (b) initiating and influencing legislation of national importance in the interest of workers; (c) to help, guide and coordinate the policies and programmes of independent trade unions; and (d) to represent the working class in international bodies.

In a democratic society it requires leadership of an exceptional calibre to forge the necessary unity in the trade union movement so as to make it a recognisable social force. The International Labour Organisation which provided the initial spurt in many a country to organise national trade union centres, also gave birth to the All India Trade Union Congress in 1918 constituting the first united platform of the working class in India. Within the next three decades, trade unions grew in number and derived increasing strength. Being centred in some of the key sectors of the developing economy — modern factories, transport, mining and plantations — the movement not only acquired political significance, but also became one of the 'few concrete identifiable forces in the huge unorganised population mass of India.'[4] No wonder that the political parties and leadership of various shades of opinion desired to secure the allegiance of the working class to strengthen whatever cause they upheld.

The communist-nationalist coalition dominated the leadership of the AITUC till 1929 when the moderates broke away and formed the Indian Trade Union Federation with 30 affiliated unions. This organisation amalgamated with the National Federation of Labour which was brought into existence in 1933. In the meantime the more radical elements among the communists left the AITUC and formed the Red Trade Union Congress in 1931. These dissensions weakened the labour movement and efforts were made to reunite the dissident groups. The Red TUC merged with the AITUC in 1935 but the original position was reestablished after another five years. The NTUF became an affiliate of the AITUC in 1938 and finally merged with it in 1940.

Rift in AITUC

The unity was however shortlived. A rift was again precipitated when a section of the leadership desired to actively support the Government's war effort. They seceded from the AITUC in November 1941 and organised a rival central federation—the Indian Federation of Labour — with as many as 182 affiliates. At the end of the war the AITUC emerged again as the most dominant trade union body on the national plane. But then came realignments of a more fundamental nature. Within two years of independence, the trade union movement was split into four rival bodies and created similar divisions among the unions at the primary level. The militancy of the AITUC was considered to be a threat to the political philosophy of the ruling party based on industrial peace and a moderated approach to the labour movement for the sake of orderly progress. Thus the Indian National Congress entered the field of trade unionism and formed the INTUC in May 1947. In December 1948 was born the Hind Mazdoor Sabha (merging the IFL) on the initiative of the socialist labour leaders who were neither in agreement with the militancy of the AITUC, nor felt happy with the INTUC's policies of moderation and compromise. Another group of socialist leaders ranging in their views between the AITUC and the HMS formed yet another central organisation in May 1949 known as the UTUC, and proposed to carry forward the movement on non-party lines.

The Indian trade union movement is thus pulled in different directions by the four national federations which are at the apex of the organisational structure to-day. Divisive pulls on the basis of political views and trade union methods are also known to have created rifts among the ranks of the industrial federations. The organisations at the base as much as those at the apex are yet to discover a broad basis of unity so as to establish an united trade union centre on the national plane. The INTUC enjoys the tacit support of the ruling party and is considered to be the most representative all-India organisation of the working class. But the membership of its close rival — the AITUC — comprises a sizeable proportion of the organised workers in India. And even if the numerical strength of the HMS and the UTUC would appear to be small, their significance in the working class movement is much greater in view of their hold on the unions organised in some of the more progressive sectors of the economy. Above all, there are quite a large number of unaffiliated unions besides the independent industrial federations[5]

Some Conclusions

The structural organisation of the Indian trade union movement may thus be said to have grown out of a large variety of factors. Predominance of unskilled and semi-skilled workers, diversity of employment conditions in different industries and industrial regions, the workers' concern with their immediate problems at the plant level, and the leadership of outsiders eager to maintain their hold over isolated small unions, have combined together to foster the growth of more independent industrial unions particularly of the one-shop variety. The organisational structure has assumed a distinctly vertical pattern with federal bodies claiming a more predominant place. This has meant only a loose type of unity among the trade unions at the local/plant level.

The solidarity and cohesion which go with homageneous national unions are thus lacking in the present state of unionism in India. Horizontal organisations in the form of trades councils and co-ordinating committees are occasionally formed at the city level but these are mostly *ad hoc* bodies. Trade union unity at the all-India level is yet to be achieved. The diverse pulls of political ideologies and sharp differences among the trade union leaders on union methods have remained too strong so far to allow a national trade union centre being established.

The remedy to this state of affairs would seem to lie with the workers themselves. For if the workers are conscious of their strength in unity and throw up leaders from their own ranks, the objectives of trade unionism as such are bound to replace the objectives foisted on it by political creeds and dogmas as well as the vested interests of outside leaders. A national front of the working class will then emerge and play its due role in social transformation, shaping the destiny of workers as much of the nation.

5 An unprecedented though temporary unity was achieved in 1960 during the Central Government employees' strike which was organised by different Central Federations of Government employees' unions, and was backed by the three rival national Federations—AITUC, and UTUC.

Concern over Agriculture in Asia

AGRICULTURE and trade were the outstanding topics of the debate on the economic situation of Asia which marked the beginning of the ECAFE annual session in Wellington, New Zealand, on March 16. The question that concerned most of the delegates was how to instil new life into a sluggish agriculture and to turn the scales of foreign trade more in favour of Asian countries. Trade and agriculture, instead of hindering development, should become its dynamic force, the delegates emphasized.

The delegates stressed the seriousness of Asian economic problems aggravated as they were by increasing political and military difficulties in the Region. The discussion was also given a sense of urgency and gravity by the fact that it was taking place at mid-point of the United Nations Development Decade and not so long after the Geneva Conference on Trade and Development. Asian production, it was observed, was lagging behind target figures and national income growth was below the Decade's goal.

The Budget and Foreign Investment

Mahesh Bhatt

The whole approach to taxation of income from foreign investment in India is based on the premise that taxation is a major impediment to foreign investment.

This is a premise of doubtful validity. Studies conducted in the capital exporting countries show that taxation is not a major factor influencing investment abroad.

However, even assuming that tax concessions have some influence of a psychological nature in creating a climate favourable to investment, their effectiveness is considerably reduced by the practice in the capital exporting countries of taxing the entire world income of their citizens. And where this is avoided by tax-sparing agreements, there emerges a distinct inducement to repatriate earnings from the capital importing countries.

These considerations have to be borne in mind while examining the 1965-66 Budget proposals relating to taxation of foreign individuals and companies.

TO attract foreign investment in India the 1965-66 Budget continues and extends the scope of the policy of giving tax concessions to foreigners and foreign enterprises. The major change made in the Budget in the taxation of non-residents other than companies is the abandonment of the concept of 'total world income.' At present such non-resident assessees are charged to tax on their income arising or received in India at the maximum rate of income-tax (including surcharge) plus super tax at 19 per cent, amounting in all to 48.37 per cent. In the case of non-resident assessees whose income attracts super-tax at a rate higher than 19 per cent, super-tax is charged at the higher rate. However, if the non-resident exercises the option to be assessed on his income in India at the average rate of tax applicable to his total world income, tax is charged on that basis. Under this system the non-resident had to declare both his Indian and world income, although the tax was levied only on the Indian income. This method of assessment led to taxation of the personal income of many non-residents at unduly high rates. Besides this, there was the difficult administrative problem of determining and ascertaining the total world income. The change made in the 1965-66 Budget, undoubtedly would provide considerable tax relief to non-residents.

Favoured Treatment

It should be also noted that although a non-resident will not be able to avail of the minimum exemption limit and also of the personal allowances for married individuals which are available to a resident, he will continue to enjoy allowances on expenses wholly and necessarily incurred in the performance of the duties — living allowance, travelling allowance and children allowance of Rs 2,000 per child or 25 per cent of his total income, whichever is less.

Further as a consequence of the changes in the Finance Act, 1964, a non-resident who derives any income from purchasing goods in India and exporting them will not be liable to tax on such income even though he may have an office or agency in India and even though the goods may be subjected to some kind of manufacturing process before being exported from India. Similarly, any income carned by a foreigner on tour of duty in India is exempted from income-tax if his stay does not exceed in the aggregate a period of 90 days in any financial year.

Taxation of Companies

The 1965-66 Budget extends the scope of tax-exemption enjoyed by foreign technicians. Under the existing provisions, in the case of a technician who has special knowledge and experience in industrial or business management techniques his income from salary is exempted for a period of six months while in the case of other technicians this period of exemption is three years if the contract of service is approved by the Government and is further extended for two years if the tax on his income is paid by his employer. The 1965-66 Budget extends this latter exemption to a further three years, i e, upto a maximum of five years. Thus the total tax holiday enjoyed by a technician in India would be eight years, instead of five years as at present.

With regards to non-resident companies no major changes are made except in the capital gain tax. If non-residents or foreign companies invest the whole or a part of the capital gains accruing to them, the tax on capital gains or a proportionate part thereof will be refunded to them. The purpose of this concession is to encourage reinvestment in the economy. Here it is also necessary to note that in the 1964 Finance Bill a large number of non-resident companies who have invested in Indian companies or who are giving technical assistance to Indian industries were given major tax concessions. For example, the income earned by non-resident companies by way of fees for rendering services is taxed at 50 per cent. Similarly, at present on income from dividend payable by a Sec 103 company (on old 23A company) or a wholly-owned subsidiary of such a company which is engaged in priority industries (some 16 industries are mentioned) the rate of tax is only 15 per cent. If such dividend is payable by an Indian company the rate of tax is 25 per cent. But the most important change made in last year's Budget is the complete abolition of super-tax on inter-corporate dividends. It is true that in respect of incomes other than dividend income, royalties or fees for technical services or interest from tax-free Indian securities, the rate was raised from 63 per cent to 65 per cent. It may be noted, however, that the income tax and super tax rate of 65 per cent would be levied only after taking into consideration the various exemptions and reliefs, such as the five-year tax holiday for new industrial undertakings and hotels, the Development Rebate, etc.

Comparisons Misleading

If these various tax concessions are taken into consideration it would be obvious that any comparison of the tax rate on foreign companies in India with that in other countries would be extremely difficult, if not misleading. The net burden would depend on the nature of income received by the companies. Similarly, any international comparison of marginal tax rates applicable to individuals must take into account the base to which these rates are applied. It is true that marginal rates of taxation in India are quite

high but due to various tax concessions and tax-exemptions, the base on which these rates are applied is considerably narrowed, with the result that the effective rates in India may not be very unfavourable as compared with the effective rates in other countries.

Moreover, in the case of non-resident companies which are merely branches or subsidiaries of international concerns, there is scope for them to reduce the tax burden by 'profit shifting'. Since such companies sell or buy from the foreign company of the same group, the prices charged are in fact internal accounting prices. It is well known that an international concern operating through a chain of subsidiaries can easily "shift" its profits from one country to another by changing the prices which the subsidiaries charge to one another. Thus the profits made in refining petroleum may be under-stated by invoicing export at unduly low prices and by invoicing imports at high prices.

Wrong Premise

The whole approach to taxation of foreign income in India is based on the doubtful premise that taxation is the obstacle impeding foreign investment and that hence tax concessions can act as an incentive to foreign investment. But several studies in U S A, which is one of the greatest exporters of capital, show that taxation does not play a very important part in influencing investment abroad. It has been observed that for many economically less developed countries the tax system is relatively unimportant, compared to other factors impeding investing.*

The more important obstacles to foreign investment are (1) the underdeveloped state of the economy itself; (2) scarcity of domestic capital; (3) limited market or restricted potential demand; (4) the unavailability of credit facilities or skilled or industrially disciplined labour and technicians; (5) inadequacies in the country's transportation power, health and educational facilities; (6) political uncertainty and unrest; (7) ignorance of foreign investor about investment opportunities; (8) uncertain and erratic changes in economic and taxation policies; and, (9) procedural delays, etc.

Assuming that tax concessions have some indirect influence of a psychological nature in creating a climate of general encouragement to investment, its effectiveness is considerably reduced because of the general practice in the capital exporting countries of taxing the entire world income of their citizens. In such a situation any concession given to foreigners in the capital importing countries only results in increase in the revenues accuring to the Governments of the capital exporting countries, leaving the burden on the investor unchanged, except in those cases where the rates of tax in the capital importing countries are relatively higher. Of course, some of the capital exporting countries have shown recently their readiness to make adjustments in their tax structure in order to encourage overseas investment. India has recently entered into such tax-sparing agreements with Japan and West Germany, and U K and U S A also have moved in this direction. Such tax-sparing agreements in addition to providing the tax credit for foreign taxes paid in the country of income origin, also give credit for taxes that would have been paid in the country of income origin if certain tax exemptions had not been given.

Tax-Sparing Agreements

It should be noted that such tax-sparing agreements are destructive to progressivity and equity in the tax structure of both capital importing and capital exporting countries and, therefore, go against the very spirit of double taxation agreements which aims at equal treatment of equally situated individuals whatever may be the source of their income. What is more important is the fact that such agreements do not eliminate or modify the numerous obstacles impeding foreign investment. In fact, such agreements are likely to provide incentive to foreign investors to withdraw income from the capital importing country instead of reinvesting them in the country of origin. For example, tax-holiday type of concessions are available only for the first few years and if the investor wants to benefit from such concessions the tax-sparing agreement would provide an incentive to withdraw earnings from the capital importing country.

Another important implication of tax-sparing agreements is that they bring the largest benefits to the most profitable enterprises with the result that the capital exporting country sacrifices considerable revenue in subsidising very profitable investment, whose development-worth from the view point of the capital importing country may be questionable. Further, it need not be emphasized here that when an enterprise is very profitable it needs less incentives, not more.

Self-Defeating Concessions

Another factor which reduces the effectiveness of tax concessions is the tendency on the part of the many capital importing countries to copy tax concessions given by one another with the result that the competing concessions largely cancel out each other. Here there is a clear case for international discussion possibly leading to conventions or agreements that would eliminate the competition which undoubtedly exists at present.

Besides this, one of the ways of increasing foreign investment is to encourage reinvestment. We have already observed that existing tax-sparing agreements are likely to encourage withdrawals at the very time when we need more foreign investment. Perhaps what is needed at present is some kind of agreement with the capital exporting countries that they would tax the incomes of their citizens only when the incomes are withdrawn from the capital importing country. Such a provision would discourage withdrawals and encourage reinvestment in the country of origin if other impediments are removed. It is also possible to encourage non-resident companies to retain profits by taxing such profits preferentially.

Finally, investment whether foreign or domestic depends on profitability and the profitability of investment is guaranteed in India because the building up of the infra-structure of development and the increased tempo of investment in the Plans, coupled with the continuation of a restrictive import policy, ensure an expanding and profitable domestic market. This is clear from the fact that the earning

* See Barlow and Wender: "Foreign Investment and Taxation". According to this study, one of the important factors retarding the inflow of foreign investment was that potential foreign investors were either ignorant or disinterested. This indicates the need for opening more investment centres for providing information to foreign investor about investment opportunities in India.

The U N study on "The Effects of Taxation on Foreign Trade and Investment" also found that taxation was not a major factor inhibiting investment abroad.

of U S investments in India were as high as 20.6 per cent in 1962, whereas the figure in respect of certain other Asian countries and Latin America was lower. Similarly, a study of the British Board of Trade shows that British direct investments in India had an earning ratio of 9.4 per cent which was higher than similar investment in the U S, Canada and Australia.

It is true that taxation cannot be totally neglected as one of the factors influencing profitability and, therefore, the foreign investment. Nevertheless, it would be more correct to maintain that what investment, whether foreign or domestic, needs is not just lowering of taxation (which may be of doubtful utility in attracting foreign investors particularly, for the reasons stated above) but stability in economic policies in general and taxation policies in particular.

CHAIRMAN'S STATEMENT

The Chartered Bank

Statement by the Chairman, Vincent Alpe Grantham, Esq

THE following are extracts from the text of the Statement by the Chairman, Vincent Alpe Grantham, Esq, to be presented at the One-Hundred-and-Eleventh Annual General Meeting of the Stockholders of The Chartered Bank to be held at the Bank's premises at 38, Bishopsgate, in the City of London, on Wednesday, the 31st day of March 1965, at 12 Noon precisely:

With events, both political and economic, moving at an ever-increasing rate in the countries in which The Chartered Bank Group operates, we have all the time to deal with more and more complex problems. Not only do the banking propositions themselves tend to become more unorthodox but sudden restrictions, or changes in local regulations, can at any time alter the scope or the risk and add to the complexities of our day-to-day business.

Fortunately the wide knowledge obtained by our officers and staff in the countries in which they are working has gone a long way towards overcoming our difficulties, retaining the goodwill of our customers and keeping the reputation of the bank very high.

Finally, the responsibility for directing the bank's affairs in a highly competitive banking area falls on the general management and in the last few years they have had to contend with increased competition, not only from local national banks, formed and often assisted by their governments, but with the aggressive activities of the foreign departments of the British and American banks. That last year we succeeded in increasing our profits in spite of this added competition and some political setbacks is a tribute to all concerned.

We are pursuing our policy, started in the mid-thirties, to train and use local officers at every opportunity and it is unfortunate that even an acceleration in this programme has failed to satisfy some countries and we are encountering difficulty in obtaining entry and work permits for our European officers.

The Court of Directors

Mr. D. L. d'A. Willis, a managing director of Lazard Brothers & Company Limited, has been appointed a director of the bank and the Stockholders will be invited to confirm his election at the approaching annual general meeting.

Tours

In August, accompanied by the Chief General Manager, I visited San Francisco for the opening of our new subsidiary, The Chartered Bank of London and of the new agency of The Chartered Bank in that city. The Chief General Manager was present at the opening of The Commercial Bank S.A.L. in Tripoli, Libya in June with Sir Evan Jenkins and Sir Tom Hickinbotham and he also attended the annual meetings of the International Monetary Fund and the World Bank in Tokyo in September.

Mr. Stafford Northcote visited Australia in December in connection with our acquisition of a shareholding in the Mutual Acceptance Company Limited and Mr. A. T. Hobbs has recently returned from a tour of the bank's branches in India and Pakistan. During the year Mr. R. A. S. Lane visited our Hamburg office and also our branches in Vietnam, Cambodia, Thailand and Indonesia.

The Mutual Acceptance Company Ltd., Sydney

Before the year ended we were able to complete successfully talks which had been taking place with the Mutual Acceptance Company Ltd., of Sydney as the result of which the bank has taken a 40% interest in the equity capital of the Australian company which, when fully paid-up, will amount to an investment of A£1,922,235.

The Mutual Acceptance Company Limited was established in Sydney as a hire purchase company in 1936 and over the years, excluding the war period when hire purchase activities literally ceased, the Company's business has prospered, the years from 1950 onwards having shown outstanding progress. The dividend history of the Company has been satisfactory and a policy of diversification into the various fields of finance has been followed so that Mutual now have a substantial investment in mortgage loans and leasing in addition to the conventional field of hire purchase for household goods and motor vehicles. There is every reason to expect considerable expansion in the Australian economy in the years to come and we are sure our first investment in Australia will prove profitable to ourselves and to our new partners with whom we are very pleased to be associated. Our Chief General Manager, Mr. W. G. Pullen, has been invited to join the Board of Mutual and our shareholding will be registered in the name of Hatton Court Pty. Limited, which has been formed as a wholly owned Australian subsidiary of the bank.

The Chartered Bank of London

This wholly-owned subsidiary of ours was officially opened and commenced business in August in very attractive premises on California Street in the business and banking centre of San Francisco.

Our initial advertising created considerable interest in the bank and satisfactory progress is being made in this and in our new agency, opened concurrently with the bank.

We consider ourselves fortunate in having among our first directors Messrs. Leslie C. Dorking, Ben K. Lerer and Stanley Powell senior, three well known and respected San Francisco businessmen.

The Commercial Bank, S. A. L., Libya

The above bank, in which our Group has a forty-nine per cent shareholding, opened for business in Tripoli in June and, although we hope to have a further branch in Benghazi shortly, business has been slow to build up.

We are, however, fortunate to have as our Chairman His Excellency Saddigh Bey Muntasser, an influential and well-known local figure, and any spread of the country's wealth to the people and an extension of the banking habit should be reflected in our figures next year.

Allahabad Bank Limited

Our Indian subsidiary will be celebrating its Centenary in April and Mr.

Pullen and I plan to visit India to join in this important event. The Allahabad Bank is the oldest joint stock bank in India and, as evidence that it has not lost its virility over the century, twelve new branches were opened in the past year and further expansion is planned. I informed you at this time last year that we had welcomed Mr. S. P. Puri as the first Indian Chairman of our subsidiary and, as is fitting in this Centenary year, the Board has been further strengthened by the addition of four eminent Indian gentlemen who have accepted invitations to serve as directors.

This Year's Accounts

The Bank's capital and published reserve with the balance on profit and loss account now total £17,663,195 which figure includes the proceeds of the Rights Issue in March 1964.

The continuing growth in the business of the Bank and its wholly- owned subsidiaries, reflected in the increase of £185,400 in this year's net profit, is evident from the Consolidated Balance Sheet, the total of which at £600 millions is higher than that at the end of last year; this in spite of the loss of our branches in Indonesia and Iraq and compulsory closing in Cambodia.

"Current and Other Accounts" and "Fixed Deposits" now total £480 millions as compared with £463 millions at the end of 1963.

The upward trend in "Advances to Customers and Other Accounts" noticed in previous years has continued. As you will see from the Consolidated Balance Sheet this item is again a record at £235 millions, an increase of £22 millions on the previous year's figure.

Profits and Dividends

I am pleased to report that, after making the usual provisions, Consolidated Net Profit for the year is £1,254,778 an increase of £185,400 on that for 1963. This increase is largely attributable to further expansion of business reflected in the increase in Advances to which I have already referred.

With the balance of profit brought forward from last year of £574,024 the amount available for disposal is £1,828,802. Of this sum £100,000 has been transferred to Reserves for Contingencies and £450,000 to Reserve Funds which now stand at £9,700,000. This sum includes the share premium of £1,100,000 arising from the Rights Issue in March 1964.

The interim dividend of 7½% less income tax paid in September 1964 absorbed £353,718 and it is now proposed to pay a final dividend at the same rate, making 15% for the year. The balance then to be carried forward to the next year will be £571,365.

Capitalisation Issue

Stockholders will have received my letter of 3rd March notifying them that an Extraordinary General Meeting of the Stockholders will be held on 31st March 1965 to consider the recommendation of the Court of Directors that £770,000, being part of the sum standing to the credit of the Reserve Fund, be applied in paying up in full 770,000 new shares of £1 each; these shares to be issued to Stockholders whose names were on the Register at the close of business on 20th February 1965 in the proportion of one new share for each £10 Stock held. If the Stockholders assent to the capitalisation of £770,000, it is the intention of the Court of Directors to transfer a similar amount from Reserve for Contingencies Account to the Reserve Fund.

Overseas Survey

A year ago I introduced my review by deploring the extent to which the economic situation in the countries where The Chartered Bank Group operates is too often dominated by politics, and in 1964 nationalistic tendencies and changing political alignments imposed costly and unfair penalties on our business. It seemingly matters not to some countries that our branches have been operating in them for over one hundred years, through good times and bad, and have helped to open them up and build up their present wealth, or that we are still playing an important part in their overseas trade and local investment when, at the whim of a dictator or on some national pretext, our business and properties can be taken from us overnight. In Burma and Iraq it was under the guise of nationalisation, to which we apparently cannot object as long as fair and adequate compensation is given with reasonable promptness. We have yet to receive compensation from either government, and in Iraq, where steel-helmeted troops occupied our premises overnight, we have yet to receive back our sterling capital and reserves, which under international law should be paid immediately as a preliminary to talks on compensation for our business and properties. In Indonesia our business and local assets have been taken away from us after over one hundred years because of Britain's support of Malaysia and in Cambodia we were closed down because of strained diplomatic relations between that country and the United States and Great Britain.

We would like to see a greater awareness on the part of our government of the effects on British business of diplomatic moves, and perhaps a shouldering of some of the responsibility, and although often nothing can be done to counter expropriation and discrimination arising from ultra-nationalism, the accumulated loss of this country's overseas investments and the income from them must be reaching figures that make nonsense of further plans for investment in developing countries. Perhaps the time has come when there should be an Investment Guarantee Corporation as well as one for exports. The World Bank at least has come out in a most forthright manner against the stealing of the assets of one country by another and countries guilty of such acts cannot look to the World Bank for help until proper compensation has been paid.

It is sad to have to comment so forcibly on the evils of ultra-nationalism at a time when so many countries, and the happiness and standard of living of their peoples, depend upon internationalism. Too often too, those politicians who are most nationalistic in their own countries want, and think they are entitled, to play a prominent role in the international scene.

The coverage of this review is changing slightly for no comments are given on any countries unless we have officers with first-hand knowledge living in them.

India

This year has not been a happy one for India and at its end the government itself admitted the situation was still "extremely grim". Certainly the most important single event of the year was the death of Premier Nehru, who had achieved a position of unique distinction in India and was regarded with affection and respect throughout the world. While it was not to be expected that his successor, Premier Shastri, could attain such a commanding position upon taking office, it was unfortunate that almost at once he was faced with a food crisis more serious than has occurred in India since 1943.

Agriculture is of crucial importance to India, since any failure here could in the last resort undermine the nation's political and economic stability. Nevertheless food supplies failed to increase for the third year running and the resulting scarcity, in conjunction with a fifteen per cent rise in the price level, sparked off a serious outbreak of rioting and industrial discontent. The situation was exacerbated by the hoarding of stocks in anticipation of further price increases and the breakdown of the food distribution system, the latter being blamed largely on excessive government interference. Attempts to persuade States with food surpluses to assist those with shortages were only partly successful and one of the most disturbing features of the crisis was the reluctance of the various States to co-operate. The situation has now been alleviated by massive wheat shipments from the U S A and the prospects of good domestic crops in the near future. This near escape from famine conditions only served once again to highlight the alarming growth of population and the necessity for emphasis on agriculture rather than on industrial development. It is difficult to understand why, in the face of this situation which could baulk all endeavours for economic progress, government circles and officials for the most part enthuse over steel plants and merely tolerate suggestions for improving agriculture. I have been pointing out what I considered was this wrong emphasis for many years and although more is now being done for agriculture there is still a need for substantial reform, for clearly amongst the many changes needed is the abolition of a law which restricts holdings to well under economic units. More time too should be spent in education of the farmers and they should be granted greater security of tenure.

Industry, with all the attention devoted to it, did not have the favourable performance expected, perhaps because it had to contend with a proliferation of government regulations and severe tax burdens. Expansion was further hampered by the inflationary pressures generated by food scarcity and heavy governmental defence expenditure. Power supplies were often inadequate and stringent import controls at times left industrial sectors short of raw materials or equipment. Under government direction the banks applied a credit policy which, whilst it did not rigidly limit the availability of credit, made it very expensive. Foreign private capital continues to be essential for further growth but an adequate supply is not likely to be attracted so long as government regulation is so restrictive and the return so small.

One can only be sympathetic with hard-working and often dedicated officials who are trying to bring this vast economy through its difficulties, but doubt must remain after the experience of the last few years whether the official policies they have to conform to are along the right lines. If theirs is a losing battle, as it sometimes appears to be, there is no doubt that the socialistic trend, the growth of a bureaucracy that has to demand more and more State controls (central government bills totalled 106 in 1956 and 340 in the last Lok Sabha) and the increase in State trading, is mainly responsible. In this respect India is really at the cross roads, for it has either to go on as it is perpetuating a lifeless economy or it has to reduce taxation and controls and give the private sector freer rein. At the moment unreasonably high taxation is the greatest stumbling block in the path of economic growth, and will remain so until it is reduced to an extent that will restore confidence and promote the investment necessary for a rapid increase in production. Some minor tax concessions have been made but they made no serious impact and furthermore the government still has not come to grips with labour.

India which should have low labour costs has very high ones in relation to output, mainly because left wing trade unionists have never been officially confronted and arbitration bodies still give rulings without reference to the country's economic needs or the plight of its people generally. It is perhaps not so serious for manufacturing costs to be above world levels in exchange savers but it is a very different thing when it comes to exports and, as the State trading departments have found, barter with iron-curtain and other countries is really no answer to this.

India is far from devitalised and would respond immediately to the right tonic, which must include lower taxation. It can be contended that the penal taxation now exists largely perhaps because of wrong thinking that the comparatively few in the population able to pay taxes would have to be mulcted for the benefit of the millions on subsistence level. In fact, it is on that comparative few that India depends for the vitality of its economy, and the further contention that lower taxation means increased inflation overlooks the vast area of government expenditure and the economies that could be effected there. In any case it is doubtful if the present efforts to contain inflation are all that successful although, as I have mentioned earlier, the Reserve Bank has introduced drastic liquidity measures for the commercial banks. One effect of this has been a restriction of credit for legitimate business and it also contributes to the stagnation in the capital market which is causing so much concern.

Public apathy to new issues is making underwriting a very hazardous commitment and little improvement in this section can be expected so long as investments are still subject to capital gains tax, wealth tax and partial income tax. The recent concession by government of free tax certificates to investors taking up shares in certain types of companies does not tackle the fundamental problems of high taxation and lack of confidence and it is a sad commentary that no successful scheme has yet been found for bringing out and utilising the vast hoard of gold in the hands of the people and that gold is still being smuggled in and paid for by money that could be going into investment. One encouraging aspect is that over the year exports reached a record level and, after taking loans and grants into account, more than covered imports. Despite this, however, foreign exchange reserves remain small and the need to repay the principal and interest on past loans is now an added burden. As long as India remains heavily indebted to overseas sources this burden can only increase and makes the expansion of exports all the more vital. "Big planning" has always involved overseas aid coupled with larger deficit financing and the inevitable inflationary repercussions, and it is satisfactory that there are indications that the Fourth Five Year Plan, due to start in 1966, will be trimmed to a more realistic basis than its forerunners and with perhaps a more significant role assigned to private enterprise.

Though Mr. Shastri has successfully maintained India's position of neutrality vis-a-vis the rest of the world no further progress has been made towards the establishment of cordial relations with Pakistan and China. In fact, India can obtain little satisfaction from recent events on its north-east frontier, whilst Kashmir is now

not only an undiminished external problem but is becoming a more formidable internal one as well. This has happened too when unfortunately the country has reached a stage in its progress when there is a definite conflict of interest between defence and development. It is to be hoped that it will prove possible to limit defence expenditure and keep development spending on heavy industry within reasonable bounds in order to give the country a much needed period of retrenchment. Such action could see India making the slow but steady recovery we know to be possible.

Pakistan

Field Marshal Ayub Khan's re-election as President of Pakistan was not only a personal triumph but a vital common-sense decision which should ensure a continuation of the stability he has given to the country since 1958. His heavy majority won in free elections is declared confirmation that the nation recognises that his leadership has been a prime factor in the orderly progress that has been made during the last few years and has brought Pakistan an enhanced reputation in international affairs.

Perhaps the greatest benefit the President could now give his country would be good relations with India, for the economic gains from closer co-operation and the saving in reduced defence costs would free resources that could advantageously be deployed in further raising the standard of living of the people. To heal a quarrel however needs goodwill on all sides and, notwithstanding a more promising atmosphere towards the end of Mr. Nehru's life, the relations between the two countries have not greatly changed and are still strained.

The position is not without hope however for trading links remain open and recently Pakistan agreed to supply rice to India in exchange for coal, railway equipment and other goods in spite of its own shortage and what may be more important, internal events in Kashmir itself may finally force a solution on all concerned. Until Pakistan is able to trust India's intentions the massive build-up in arms there will continue to be condemned, and Britain and the United States will be condemned for their part in it and receive little goodwill for the substantial efforts they make to assist Pakistan. This lack of goodwill may underlie the deep animosity in some quarters to foreign business, banking, etc, which manifests itself in what seems to be harassment and discrimination, which can only nullify to some extent the objects of the generous treatment afforded to foreign private investment in participation with local concerns.

The successful conclusion of the second five year plan owes much to overseas investments and aid, mainly from the West, for without it the gap caused by rising imports and near static exports would have reduced foreign exchange reserves to a degree that must have restricted internal development. As it is the government has been stimulated to embark on a third five year plan with even more ambitious goals and with total expenditure doubled. During that period servicing foreign grants and loans will place an increasing burden on the country's foreign balances and the percentage of the annual exchange earnings required for the repayment of principal and interest has increased from four per cent in 1960/1 to ten per cent in 1963/4. This led the Governor of the Central Bank to warn that too great a dependence on foreign loans can lead a country to accept commitments beyond its capacity for repayment.

It is, however, in Pakistan's favour that last year the first benefits of the government's programme of land reclamation, flood control, drainage and fertiliser distribution were apparent in increased agricultural output. The yields of cotton and rice per acre started to rise, and to some extent the government schemes have left agriculturists much less at the mercy of calamitous droughts and floods. A record year is expected for the tea crop but the growing rice yield still leaves the output of foodgrains short of population requirements. Jute manufacture continues undiminished and, in spite of a series of strikes during the year, the industry remains strongly competitive. Two points to note in this general picture of expansion are a serious shortage of skilled workers and the unprecedented level of money expansion which has accompanied the economic growth. Whether the country can absorb such expansion year after year is open to doubt and the authorities are taking steps to prevent inflationary pressures undermining future development.

These higher yields in agriculture, with continued investment in industry, a booming private sector and steady prices can only augur well for Pakistan's future. The rate of growth of population is worrying and a balance will have to be struck and maintained between the east and the west wings, which may be very costly, but with free enterprise continuing to have its chance there is cause for optimism. Politics have in the past upset the best laid plans but the politicians have now been given time to show that they are not just coasting along on the President's popularity but are themselves prepared to work honestly in the country's interests, and we should see a more concerted all-out national effort.

Ceylon

Most of Ceylon's troubles are man-made and once again politics overshadowed trade and industry and little or no progress was made over the year towards stabilising the national economy. A continued left-wing swing bodes ill for the country's businessmen, and even more so for outsiders with investments and interests in Ceylon, and towards the end of Mrs. Bandaranaike's government there was little pretext that the further socialistic measures proposed had justification on economic grounds. Amongst the proposals was the control of managing agencies and all commercial and industrial undertakings. The independence of the foreign banks was also threatened by the scheme, first to nationalise them and then incorporate them in a new import/export banking corporation outside their control. In the end, it was the government threat to individual liberty and its measures to control the press that raised enough opposition to bring about the downfall of the government. The forthcoming elections are expected to be hard-fought and close but in Ceylon, with its proliferation of political parties, final alignments can mean more than votes.

No matter which party wins the election it will face a formidable task in getting the country onto its feet. From the outset it will lose control unless it is prepared to stand up to the left-wing and restive trade unions. Food subsidies should be cut in an effort to balance the budget, for in what must be one of the highest taxed countries in the world, there is no further scope for raising additional revenue from business and the businessman. All this too has to be done before opposition in the country again grows from the legacy of shortages, rising prices and an over-expanded bureaucracy.

Externally too the prospects are equally depressing for Ceylon's foreign exchange reserves are too near the point of exhaustion to give any leeway. The last government signalled the position very clearly when it took the drastic and perhaps unethical, even unwise, step of declaring a moratorium on the remittances of profits and dividends. Clearly some of Ceylon's creditors, perhaps rice suppliers like Burma and China, were pressing the country for overdue payments or were restricting credit.

This picture could brighten quickly and considerably if Ceylon should find itself with a government determined to eschew politics and work wholeheartedly for the restoration of the economy, for such a government would gain the confidence and goodwill of its people and of the outside world and Ceylon's friends would then give the help that cannot be justified when a country has set its course counter to its own interests.

Following the Prime Minister's visit to Delhi for talks on the vexed question of the future of residents in Ceylon of Indian origin, it was agreed that five-hundred-and-twenty-thousand of these would be taken back to India and that Ceylon would absorb three-hundred-thousand and grant them citizenship. This programme of repatriation is to be phased over a number of years and although a good start has been made the success of this scheme will depend very much on continued good faith and co-operation on both sides.

There will be widespread sympathy for Ceylon and for those who suffered in the cyclone which struck the north and the east of the island in December and severely damaged the port of Trincomalee.

Conclusion

This review covers an area which must figure large in all future plans for increased international trade and the recent crisis in sterling has not only shown the importance of that currency to world trade but has emphasised that Britain's own share of it must be maintained and if possible increased.

A greater awareness of this on the part of our government has seen a quick implementation of some of the recommendations of the Plowden Report and a tremendous export drive includes directive to the Diplomatic Service to concentrate on commercial work and helping the visiting businessman. With respect, I would say that in many ways the British overseas banks can be even more helpful for they have usually closer associations with and deeper roots in the countries where they operate. They have a specialised knowledge of local business, and of the credit-worthiness of local businessmen and firms, many of which are already customers.

Our interested ministries could, therefore, with advantage make more use of the vast branch networks at the disposal of the British overseas banks, and should in any case work closer with them in the area of their operations. Too often banks like ourselves are left out of and not even consulted about the financial side of trade arrangements, which is in marked contrast to what happens in other countries. Governments abroad realise fully the contribution their overseas commercial banks can make to invisible exports and national business is passed through them and national funds placed with them. In this respect perhaps it is time our Treasury dropped outmoded rules and prejudices and worked more along the lines of the United States.

Finally, I would like to stress another reason for our government fully supporting the British overseas banks in business and in all their difficulties. The friendship and respect existing over the years between our officers and businessmen and officials has helped to insulate sterling in those countries against precipitate action through loss of confidence in it arising from exaggerated utterances of politicians or the ill considered writing of economists. If there are branches of banks like ourselves in a country enquiries regarding sterling usually come to us and fears can be assuaged—but when we have been forced out of a country direct action by the authorities without consultation is likely to be taken to the detriment of our currency.

AROUND BOMBAY MARKETS

Indecisive Mood

Wednesday, Morning

DALAL STREET struggled hard last week to push its way up but could not make any significant headway. While technical considerations favoured recovery, neither were the bears anxious to cover their sales nor were bulls inclined to lend fresh support to the market in view of the disquieting news from the border areas. And political uncertainty was not all that the market had to contend with. Shri B R Bhagat had ruled out any modification in the dividend tax on the rather flimsy plea that it would encourage frittering away of corporate profits. The Prime Minister told the FICCI session that there was no alternative to heavy taxation. Soon came the Finance Minister's statement which cautioned against any hope of modification of his Budget proposals in respect of the corporate sector; T T K said that current tax revenues from the corporate sector would not be sacrificed for the purpose of giving tax concessions.

Political uncertainty and responsible official statements discounting prospects of the much-sought-after relief in corporate taxation could have easily given a big jolt to the market. But since it had already been completely shaken-up, the market absorbed the new shocks with amazing calmness. Though a few scrips like Indian Dyestuff and Standard Mills did strike new lows, the market as a whole managed to keep above the previous week's low point.

The Finance Minister Krishnamachari did not merely caution against any hope of modification of his Budget proposals but he also made some other observations which indicated that he did not care much for the stock market. While conceding that the stock market had a part to play in "this semi-capitalistic society of ours" he was quick to add that if it did not function, other institutional substitutes would have to be found. In the context of an economy of the size that existed in the country, in terms of money the amount of scrips available in the share market was negligible.

While informed opinion is inclined to share T T K's view that the stock market is not really so important as it is generally made out to be and that it is not an indicator which gives the real estimate of prosperity of the economy, there is a great deal to be said in favour of modifying the Budget proposals in a way which would give a psychological boost to the market without any significant loss to the exchequer. Suitable modifications of the dividend tax and the capital gains tax could go a long way in improving the investment climate in the country.

COTTON

A Big Change

A SIGNIFICANT change has come about in the situation obtaining in the cotton market. Excepting Bengal Deshi which has been keeping

remarkably firm on keen export buying, the prices of other cottons have continued to drift lower. Several varieties which once fetched fancy premiums are now available at or below the ceilings and some varieties where quality is not up to the mark are quoted more than 5 per cent below the ceilings — the level at which the Indian Cotton Mills' Federation stands committed, on its own accord of course, to lift all the cotton that might be offered to it during the season.

Farmers, traders and merchants who had been sitting tight on their stocks when prices were quoted well above the statutory ceilings — the price control notwithstanding — are now anxious to market their goods below the ceilings and are even critical of the authorities for not coming to their rescue. If cotton prices have declined below the ceilings it is not due to any firm action taken by the Government to enforce the price control order. The fall in prices is due partly to the Federation's scheme of controlled purchases of cotton by mills, but mainly to the acute financial stringency and increased flow of arrivals with the progress of the season. Crop estimates which had revised downward with every rise in prices are now being revised upward with the decline in prices. Even after the cotton crop had gone beyond the reach of the weather, it has been varyingly estimated between 60 lakh bales and 54 lakh bales and the latest estimates place the crop around 57½ / 58½ lakh bales. One really wonders whether the crop estimates are at all dependable.

Concern Unwarranted

Serious concern has been expressed by cotton growers and traders over the recent decline in cotton prices. It is quite natural for growers and also for traders to feel uneasy at any fall in prices because of the depreciation in the value of their stocks. But surely, one cannot expect the crop to be marketed at the ceiling rates which cotton growers have begun to regard as virtual floor prices. Unless it is argued that the ceiling prices compare unfavourably with the prevailing prices of other agricultural commodities, a decline of 10 to 15 per cent below the ceilings should be regarded as a normal phenomenon and it should in fact be welcomed even for the healthy functioning of the market.

The controversy regarding Cambodia cotton continues and with prices registering a further substantial decline, the controversy has assumed more serious proportions. The Federation's insistence that the cotton should be surveyed by the EICA sworn surveyors, that their verdict in regard to appropriate ceilings should be final and further that the offer to sell must be a firm one, has been characterised by traders and growers as an attempt to implement monopoly purchase through the back-door. But if the trade is really anxious to dispose of its cotton at 5 per cent below the ceilings which virtually amounts to selling at the ceilings since the trade is saved the burden of carrying stocks with it, there is no reason why it should not abide by the Federation's terms; the verdict of EICA sworn surveyors ought to be regarded as final. Presumably to pacify the discontented growers and traders, the Federation has sent its representatives to Saurashtra to purchase some quantity of Cambodia cotton the prices of which had declined sharply in recent weeks. It is also considered likely that the Federation may consider the question of relaxing the present limits on cotton stocks to be held by the mills.

OILSEEDS

Steadier Sentiment

OILSEEDS prices last week hardened still further mainly in the hope of an imminent announcement about the export policy for vegetable non-essential oils. That the Government will permit free export of vanaspati and also release anything between 20,000 and 35,000 tons of groundnut oil for export is taken almost for granted. Prospects of a limited quota of groundnut HPS are also believed to be fairly promising. While the Government is still marking time for a favourable opportunity for announcing the export policy, considerable purchases of groundnut oil are reported to have already been made in anticipation of an export quota. With the emergence of good buying, sellers have become reserved. Groundnut oil ready has been remarkably steady between Rs 21 and Rs 21.50 (per 10 kgs) for some time. Prices of other oils — mustard oil and linseed oil — have also firmed up recently. It is difficult to say how exports, when allowed, will fare because a great deal will depend on the incentives scheme and the tax credit for exporters.

CAPITAL VIEW

Foreign Relations in a Tangle

Romesh Thapar

THESE days there is a smell of death at the Ministry of External Affairs. It has a full time minister now—that is, when he is not involved in something else. Conferences or meetings of experts and department heads seldom take place. Visitors float in and float out, none the wiser about what India thinks or feels. Bureaucrats, accustomed in the old days to take orders from the top, to toe the Nehru line, satisfied that they were being pushed in some direction, sit in explosive silence as one sector or another of a policy carefully built up cracks, as it were, under the weight of indecision.

Among those who are still interested in foreign policy, the talk is general that we have managed with an extraordinary demonstration of humility and patience—and silence *(sic!)*—to confuse and bewilder our closest friends. Despite the polite noises made in public, both here and abroad, about India's role and mission, the opinion offered the other day in a private conversation by a hard-boiled, cynical foreign policy planner captures the real agony: "What's he (the Foreign Minister) waiting for? A foreign expert?" The preparation deadline of the Algiers Afro-Asian Conference approaches, and we are doodling over cashew-nuts and cups of coffee.

With the USA merrily testing her napalm bombs and gas warfare techniques against the Vietnamese, and the Soviet Union getting angrier and angrier at what appears to be a deliberate attempt to wreck the possibilities of a *detente* at a time when China is working overtime in the communist world to mobilise support for her no-compromise stand in international affairs, we have been content to remain more or less silent because we wishfully believe that China is being hurt in the process. This assessment is so puerile that even the western experts who in their own interest persuaded us to remain silent are amazed at our gullibility.

The lazy doodling at the higher echelons of the Ministry of External Affairs is not only helping to buttress the Maoist thesis that India is no longer the ally of Asia and Africa, but is placing a severe strain on our alliance with the Soviet Union—an alliance which in the past strengthened the independent role of our foreign policy. It is no exaggeration to state that the impression prevails in Moscow that just as Pakistan is moving away from her embarrassing commitments to SEATO and CENTO, India is permitting herself to wander, absent-mindedly maybe, into the western camp. The polite, propagandist talk in public can no longer hide this fact. And there are misunderstandings with the Arabs.

New Trends Not Understood

That this is happening at a time when there is more need than ever before for India to work closely together with the Soviet Union and the Arabs is inexplicable, unless, of course, we reach the conclusion that Prime Minister Lal Bahadur and Foreign Minister Swaran Singh are unable to understand the trends now taking shape in the world.

The nationalist-chauvinists who rule China have decided to intensify their so-called ideological confrontation with the Soviet Union. They have made clear that they would risk a widespread conflagration in South-East Asia in order to defeat the US interventioning physically rather than permit them a face-saving retreat *via* a Geneva-type conference. They have, by this fact, indicated that their present policy is dictated by the desire firmly to consolidate a Communist Vietnam as a stepping stone into regions further south where Malay fights Malay. Having blunted the influence of India, China moves to humble the rising influence of the Malay whose homelands cover Malaysia, Indonesia and even parts of the Philippines. Then, China dreams of being the only influence in Asia.

The adventurist Maoists have found themselves an useful ally for their operations against a stubbornly viable India. Ayub's Pakistan, according to information reaching New Delhi, plans to step up its border activities against India. Over the past few weeks, we have faced concerted attempts in the west and in the east to create a limited confrontation. Indeed, there are some students of Pakistani developments who believe that Mao may well encourage Ayub to push for military settlements at various points along the border very much in the style adopted by China from 1959 to 1962. Anyhow, it would do us no harm always to keep this in mind.

To counter these moves and to correct the growing impression in Asia and Africa that we are exploiting our frontiers with China in order to squeeze economic and military aid out of the West, and hence are impotent in the battle against foreign intervention and neo-colonialist activity in Asia and Africa, it is imperative that we lose no time in explaining to the governments and peoples of Asia and Africa our position with regard to immediate and perspective tasks. We

are certainly not equipped at the moment to do this. We have to thrash out the issues which have confused us—and they are not a few.

The reluctance in certain sections of the ruling party to order this clarification is undoubtedly due to the fear that the assessment might offend this or that power which is aiding us. This fear is baseless. We received aid and friendship from many diverse quarters in the past not because we were seen to be servile, but because we were clear as to our objectives and the aid-givers realised that our influence was not to be scoffed at. Today, it is true, we lack self-confidence—and this breeds servility. But it would not take long to revive the spirit of our people if this government of Lal Bahadur would only make up its mind to locate national interests and to defend them unflinchingly.

President Nasser's reaction to the meddling of West Germany in West Asia holds many lessons for New Delhi, lessons which, incidentally, we were teaching not so long ago to our friends in Asia and Africa. In a twisted kind of way, Ayub and Bhutto in Pakistan have proved that even commitments to SEATO and CENTO need not be an inhibiting factor within an international situation which is rapidly transforming. General de Gaulle's postures, too, have relevance. And there are other examples from Africa to refresh minds dulled by the confusions of the past few years.

To begin with, we have to learn to live with the border problems spawned by China and Pakistan. It is folly to chase solutions and compromises when both these neighbours are interested only in perpetuating tension which they believe will lead to a political crack-up in India and the further dismemberment of a subcontinent. It is even greater folly to test our friends in Asia and Africa on their reaction to these essentially local tensions. There is wide sympathy for India, but this cannot be expressed within the context of the ramified power alignments at the moment. We should have the maturity to appreciate this, to move in such a manner as to strengthen ourselves internally and to build our influence externally even as we live with these problems without imposing them on others.

The Vietnam crisis calls for immediate action by India. The unilateral escalation of the conflict by Washington which has been permitted over the past few weeks may well be stage-managed to open the way for a peace initiative, but it would be short-sighted for us to assume that the Maoists would permit a compromise which would allow the USA to remain entrenched in the area. A solution to be viable must take into consideration the possibility of establishing a wider grouping of States—a federation of North and South Vietnam, Cambodia and Laos—able to defend its sovereignty against the aggressive, impatient presence of a China which seeks to dominate Malay thinking to the south. In other words, the defence of sovereignty in Asia must become the responsibility of the Asians, not of the foreign intruder. This is the only way to confront the Maoist adventurers.

Balance of Power in Asia

India should take the lead in projecting a plan which not only brings the barbarous war in Vietnam to an end, but also consolidates those forces (even within the North Vietnam government) which seek a bigger, genuinely independent State (be it of the communist variety) on the borders of China. France has seen the wisdom of this approach. The Soviet Union, too, can be expected quietly to approve of such a development. It is for India to mobilise support for the plan in Asia and Africa, to rid it of cold war connotations. The Malay peoples to the South, now sought to be divided by the confrontation between Malaysia and Indonesia, would soon perceive how their interest was linked with such a plan.

A tremendous effort would have to be made by Asia and Africa to mobilise support to establish the viability of a multi-national State in the north and a Malay State in the south, but in so doing it would be possible to discipline the chauvinist elements in Peking and to open the way for stability in South East Asia. Enemies and friends would change character in the process. New dimensions would be added to political and economic activity in the region. A healthy balance of power in South-East Asia would pay dividends in South Asia, and help us free ourselves of dependence on interested foreign powers.

The trouble with our policy planners, if they exist, is that they fail to think in perspective. For example, over a period of years, we have been ambivalent about developing two crucial alliances as the anchors of our foreign policy—the Soviet alliance internationally and the Arab alliance within the Afro-Asian assembly of nations. Both alliances serve our national interest. Yet, we have permitted a gradual erosion of the earlier contacts. Today, both alliances are threatened because there is little faith in our capacity to sustain the policies of the Nehru Era. The internal crisis of confidence is reflected in our inability to take any really positive stand on any international issue. In this way, an opportunity is being given to certain dogmatic, but influential, elements in the Soviet Union and the Arab world to sever what few links remain.

The forthcoming conference in Algiers of Asian and African nations is one of those events which we could utilise to reassert our inspirational role. Arriving at the conference fully committed to a worked out policy of peace and stability in South-East Asia, we could argue forcefully for the recognition of the Soviet Union as a part-Asian power. Such a step would in the long run associate this part of the world with some of the crucial issues which tend to get lost in the agitpropism which China is apt to indulge in. It would also radicalise thinking in Afro-Asia along more purposeful lines, towards collective action in the interests of the area.

We continue to imagine that we are too weak and isolated to fight a sustained fight for policies which we believe reflect the interest of the region more accurately than those sponsored by a nation like China which plans spheres of influence for itself. Fortunately, we now have no antiquated notions about big power status. This is all to the good. It creates goodwill for us. But we have to learn zealously to push the concept we hold to be relevant in this new age—indeed, with the same zeal with which the Maoists push their's—and we do not have to be embarrassed because we have not exploded a nuclear device. In passing, there is no harm in reminding ourselves and others that Afro-Asia would not be the same thing without India!

It is with some such spirit, ready to be angry when the occasion demands, that we need to begin to untangle our foreign relations. If we delay, the tangle might become a knot, a knot that cannot be untied.

Working towards a

bigger future

BHARAT BIJLEE

New Horizons. *Bharat Bijlee are one of India's pioneers in the manufacture of Electric Motors. Today, with almost two decades of experience, Bharat Bijlee maintain this tradition and have recently started manufacturing motors with Class E insulation, Flame Proof Motors and other special designs.*

Siemens Collaboration. *The establishing of close relations with Siemens (Germany) in 1958 has helped in accelerating Bharat Bijlee's development. The new plants being built at Kalwa will have advanced production and testing facilities. These plants will greatly increase Bharat Bijlee's productive capacity and will ensure that the high standard of Bharat Bijlee's products is maintained.*

Bharat Bijlee's Role in National Development. *Today Bharat Bijlee serve in many fields. Bharat Bijlee transformers are used all over India to supply power for rural and urban electrification, and for the growing needs of industry. Bharat Bijlee motors are used in such diverse fields as: Textiles, Sugar, Chemicals, Machine Tools, and other Light and Heavy Industries...and Agriculture.*

High standards of quality have earned Bharat Bijlee regular orders from discriminating customers like: HINDUSTAN MACHINE TOOLS, INVESTA MACHINE TOOLS & ENGINEERING CO., CHITTARANJAN LOCOMOTIVE WORKS, HINDUSTAN STEEL LTD. (Rourkela and Durgapur), and many other leading industrial enterprises.

These are telling facts. They are the reasons why Bharat Bijlee can view their challenging future with confidence.

Budget in Retrospect

THE criticism that the Budget marked a retreat from socialism pained him, the Finance Minister said in his reply to the general debate on the Budget in the Lok Sabha. But unless he had credited Members of Parliament with complete lack of perception, this criticism he should have anticipated when he framed the Budget. What is there in the Budget that links it to the socialist objectives of the Congress or the Plan? Its basic premise, almost explicitly stated, is that to give a new momentum to the economy it is more important to stimulate private saving and investment than to enlarge public saving and investment. Not explicitly stated, but no less discernible, is the assumption that in fiscal policy at any rate the objective of a more equitable distribution of income ought to receive no priority. Folowing from these, the changes in corporate taxation all aim at enlarging the resources of corporations and the substantial reduction in personal tax rates will put more income in the hands of those who constitute, income-wise, the top two or three per cent of the population.

These concessions, all "in the interests of higher production and greater efficiency", have been made, the Finance Minister said, "without sacrificing the claims of the Plan". This claim needs to be examined. The total public sector Plan outlay in 1965-66, taking the Centre and the States together, is Rs 2,225 crores. This marks a decline in the rate of increase of public outlay on the Plan, from about 17 per cent in 1964-65 to 12 per cent in 1965-66. And investment in the Central Government's commercial and industrial undertakings in 1965-66 is actually smaller, in absolute terms, than in the previous year!

The Economic Survey no doubt states that total public sector outlay in the Third Plan will be Rs 8,000 crores as against the original provision of Rs 7,500 crores. But in real terms what does this 7 per cent higher outlay mean when we consider the over 25 per cent increase in prices since the beginning of the Plan? In industry, for instance, by the time of the Mid-term Appraisal of the Plan in the latter half of 1963, the estimate of investment needed to carry through the public sector programme had been revised upwards by almost Rs 500 crores or about 28 per cent of the original estimate. Even in financial terms, public sector outlay has exceeded Plan provision mainly in agriculture and transport; elsewhere the Plan figures of outlay will be barely achieved. Is it so certain, then, that the distribution of real investment between the private sector and the public sector has conformed to the proportions envisaged in the Plan and has not been altered to the disadvantage of the latter? If it has been so altered, as there seems to be every reason to believe, should not its correction receive some attention in the Budget?

There have been, of course, shortfalls in private investment too, in some of the highest priority industries. But, on the other hand, in each Plan period, a very large proportion of the community's savings has been diverted into non-priority industries and into speculation in real estate and commodities in short supply. Every Plan has laid down which are the industries to be developed and to what extent. But the means which have been provided for ensuring that private investment flows into these industries in the required quantities — control of capital issues, provision of supplementary finance by Government-sponsored finance corporations, licensing of imports and allocation of scarce materials — have proved to be most inadequate. On paper the idea that a sophisticated scheme of fiscal incentives will work where these administrative devices have failed has its attractions. The Finance Minister, at any rate, appears captivated. But there are others with fairly acute knowledge of the functioning of the economic system who have maintained that neither administrative controls nor fiscal-monetary gimmicks will work without fundamental changes in the structure of the economy—in the motives and methods of functioning of the banking system, for instance.

In any case, the basic problem is certainly not one of making up short-

falls in private investment in priority industries by transferring public resources. It is one of shortage of resources for investment in Plan schemes, in both the public and private sectors, due mainly to the diversion of a large part of the economy's savings into private non-Plan expenditure and, since the Chinese aggression, into the defence build-up. The failure to regulate private investment and to channel savings into the Plan in adequate measure was reflected in the need to have two versions of the Third Plan — a physical plan and a financial plan. It can be seen once again in current exercises in the preparation of the Fourth Plan, in the desperate attempts to equate an aggregate of physical programmes to a certain financial figure when it is plain enough that it will cost much more.

Financial Devolution

IS the purse-string perhaps the strongest bond that binds the Central and State Governments together? In our brand of federalism, about one-quarter to one-half of the total revenues of each State is derived from the Centre, by way of shares in taxes centrally levied and collected and grants-in-aid. The revenue heads left entirely to the States are relatively inelastic and prohibition has closed one lucrative source. On the other hand, apart from Plan outlays, the States have to cope with other financial pressures such as growing debt charges and the demands of their employees for scales of pay commensurate with that of the Central Government. In the circumstances, pleas for larger shares are presented quinquennially before each Finance Commission.

The latest recipient of the pleas is the Fourth Finance Commission, now at work. It has heard, for instance, from the Madras Government that the States' share of Union Excise duties should be raised to 50 per cent (from the present 20 per cent) and that "population" should be the sole criterion governing its allocation; from the Maharashtra Government that "collection" should be the sole basis for the division of the income tax; and from the Rajasthan Government that the factor of "area" should also be considered for the reason that geographical size adds to the administrative as well as developmental responsibility of a State.

The arithmetic of devolution which, judging from its terms of reference, is the principal concern of the present Finance Commission, covers grants-in-aid also. Properly interpreted, this would involve principles extending beyond the simple rules of division. The accepted role of grants-in-aid is that of a final dole for meeting what has frequently been termed the "residual fiscal needs of the States". This is a devise for ironing out, to some extent, the wide disparities between the more and less advanced States; but it could also make a mockery of autonomy since it permits the Central Government to assume financial responsibilities that should rightly belong to the States. The last Finance Commission pointed out that "there is a general feeling that the contents of the autonomy of the States are being diluted not only by the prescription of detailed directives on subjects within the State list but also by unilateral financial decisions taken". In the five years since that pronouncement was recorded, the feeling appears to have grown. In a strongly-worded memorandum to the Fourth Finance Commission the Madras Government has gone to the extent of saying that planning itself "entails a measure of limitation on the freedom of the States because it visualises a pattern of utilisation of resources which cannot be deviated from without risking the failure of the Plan", and that "no further restrictions on States should be found necessary". The Memorandum further argues: "the promotion of a sense of independence and vigour in planning at the level of the State, with realistic regard to local conditions and circumstances is a desirable end in itself and from this standpoint too the present arrangements for canalising Central assistance for the Plan, call for a radical review".
